APPENDIX B - GEOTECHNICAL

1 INTRODUCTION

1.1 OVERVIEW

The appendix documents geotechnical analyses for levee lifts for future conditions of 2073 intermediate project grades.

1.2 SCOPE

The scope of this appendix is to project lift schedules to the year 2073, based on the previously developed lift schedules to the year 2057, and to perform stability analysis for Mississippi River Levee (MRL)-WBV-9, 10 and 11. Settlement-induced bending moment (SIBM) caused by levee lifts on adjacent T-wall transition, and additional stability measures from the lifts were not included in the analyses. 100-year analysis only looked at RSLR, not settlement.

1.2.1 STUDY AREA

The study area is West Bank and Vicinity, which borders the Mississippi River to the west, north and east, and Lake Salvador to the south.

1.3 GEOTECHNICAL TERMINOLOGY

Consolidation: settlement of soil as a result of dissipation of pore water pressure over time.

Shear strength: the internal resistance per unit area that the soil mass can offer to resist failure and sliding along any plane inside it.

Stability berm: an earthen structure built laterally and adjacent to a levee slope to help keep it stable from sliding.

2 FUTURE WITH PROJECT/ACTION CONDITION

2.1 PRIOR ANALYSIS

“Previously developed lift schedules” or “prior lift schedules” were last prepared in 2014 to estimate levee lifts needed to ensure that previously established design grades were maintained from settlement over time. Consolidation settlement of the foundation was caused by the volume change in saturated cohesive soils due to expulsion of the water

that occupies the void spaces. The volume change was induced by the levee load that compresses the soil layers.

The process of developing prior lift schedules involved creating consolidation parameters from subsurface exploration and testing, estimating stress increase from levee load, and using Settle3D computer program.

Shrinkage and consolidation of levee fill were also considered in the development of lift schedules.

Due to the non-uniform nature of soil's physical structure and substance, settlement was estimated and lift schedules were developed for planning purposes only.

2.2 1% AEP LIFT SCHEDULE ANALYSIS

Survey of levee elevations was performed in November and December 2018. Survey was performed in fourteen survey reaches which consist of different levees. Settlement was estimated and lift schedules developed for the levees with prior analyses.

First, lift schedules previously developed to 2057 for levees of each survey reach were compared to each other and the levee with representative settlement curves was selected. It should be noted that in some cases lift schedules for all levees of a certain survey reach were not previously developed.

Secondly, previously constructed lift was drawn with year and elevation, on the prior lift schedule. Thirdly, the November or December 2018 average survey values of the control levee were plotted. Since survey elevation included the 6-inch thick articulated concrete block if the levee was armored, the survey was lowered 6 inches for the actual levee crown. A settlement curve was then drawn from the actual lift elevation to the survey elevation.

If this settlement curve intersected the new design grade, another levee lift was drawn. The thickness of the lift was similar to the thickness of the prior schedule, or was modified to reduce the number of lifts to save costs. Subsequent lifts were developed as similar shaped curves.

Survey reach 1 consisted of WBV-17b.2, WBV-18.2, WBV-71 and WBV-72. Levee WBV-71 was selected as the representative levee. Prior lift schedules consisting of the design grade from 2007 to 2057 and five lifts were shown as dashed lines. The five lifts were in 2011, 2013, 2017, 2023 and 2045. Design grade from 2007 to intermediate project grade or 100-year new in 2073 was drawn in red. Previously constructed lift (+11.5 in 2013) and 2018 high, average and low surveys were also drawn. Settlement curve in red was then drawn from lift elevation to survey elevation. A lift also in red was developed when the settlement curve intersected the design grade. The maximum lift

thickness followed those of the prior lifts. One lift was required in 2039 to elevation +12, and another in 2052 to +12.5.

Due to the pandemic telework condition, it was not possible to remove the bold grey solid lines from prior work.

Survey reach 2 consisting of the levee WBV-15a.2 was analyzed similarly to survey reach 1.

For levee WBV-14c.2 in survey reach 3, settlement curve from 2011 lift to 2018 average survey was determined and it was close to prior lift schedule. There was no armoring so the average survey was used. Prior schedules showed the design grades in green, survey elevations in blue, and projected crown elevations in light red. Since prior lift schedules existed in pdf format only, it was not possible to edit information on plate for clarity. New design grades, actual settlement and future lifts were shown in red. The actual lift in 2019 was plotted and settlement curve estimated, following the shape of the curve from 2011 lift to 2018 survey. Due to the pandemic work condition, old work in solid grey line (100-year old) could not be removed for clarity.

WBV-14b.2 in survey reach 4 was analyzed similarly to survey reach 3.

WBV-14a.2 in survey reach 5 is an interior levee with no direct storm surge effect from the Gulf of Mexico. Prior lift schedules showed the design grade in green at +8.5, survey elevations in blue, and projected crown elevations in light red. Actual settlement in gray was drawn from 2012 lift to 2018 average survey and it was close the prior curve. A lift was required in 2019 and the settlement curve in gray was estimated similar to that of the prior schedule.

WBV-06a.2 in survey reach 6 is an interior levee with a design grade at +8.5. Prior analysis was in bold blue. Since prior lift schedules existed in pdf format only, it was not possible to edit information on plate for clarity. Since the settlement curve from construction grade to 2018 average survey stayed above the design grade, no future lifts were required.

WBV-47.1 in survey reach 7 is an interior levee with a design grade at +8.2. Prior analysis was in dotted gray and settlement curve in solid gray. Since the settlement curve from previously constructed lift to 2018 average survey stayed above the design grade, no future lifts were required.

WBV-48.2 in survey reaches 8 and 9 is an interior levee with a design grade at +8.5. Prior lifts were in bold blue and settlement curve in light gray. Since the settlement curve from previous lift to 2018 average survey stayed above the design grade, no future lifts were required.

Prior schedule of WBV-12 in survey reach 10 consisted of four lifts in dashed gray lines. Since latest lift was constructed in 2018, same as survey, settlement curve in solid yellow was assumed to follow curve in prior schedule. It was not possible to remove the solid red and grey line and curves from old work (100-year old) for clarity.

Prior schedules of WBV-MRL-1.2b in survey reach 11 consisted of theoretical settlement and lifts in dashed blue, and actual settlement and projected lifts in yellow. There seemed to be a good correlation between the two. It was not possible to remove the red project grade and grey settlement curve from old work (100-year old).

Projected settlement of WBV-MRL-6.1 in survey reach 12 showed a lift of approximately 1.5 foot in 2040. There seemed to be a good correlation between settlement in prior analysis and actual settlement from the latest lift. It was not possible to remove the red project grade and solid grey settlement curve from old work (100-year old).

Projected settlement of WBV-MRL-7.1 in survey reach 13 showed no required lift. There seemed to be a good correlation between settlement in prior analysis and actual settlement from the latest lift. It was not possible to remove the red project grade and solid grey settlement curve from old work (100-year old).

Projected settlement of WBV-MRL-9 and WBV-MRL-11 in survey reach 13 showed a lift in 2040 and 2060, respectively.

Summary of lift schedules is shown in Appendix A Civil.

2.3 0.5% AEP LIFT SCHEDULE ANALYSIS

0.5% AEP settlement was interpolated between 0.2% AEP and 1% AEP settlement and presented in Appendix A. Considering the level of effort of the study, general reevaluation, interpolation was appropriate.

2.4 LEVEE STABILITY ANALYSIS

Stability was analyzed for raising the WPV-MRL-9, 10 and 11 to the 2073 design grades while shifting the centerline to the flood side to avoid additional right-of-way need on the protected side.

Boring data was collected and strengthlines created. Surveys were conducted in 2020 and representative cross sections selected. GeoStudio Slope/W version 2019 with Spencer's method of analysis was used, and HSDRRS criteria for minimum factors of safety apply. Since Still Water Level (SWL) and Low Water Level (LWL) were not available, Water at Project Grade (WPG) or High Water Level (HWL) was used.

HSDRRS Slope Stability Design Factors of Safety

Analysis Condition	Required Minimum Factor of Safety	
	Spencer Method ¹	Method of Planes ²
End of Construction ³	1.3	1.3
Design Hurricane ⁴ (SWL)	1.5	1.3
Design Hurricane (SWL) w/ dry PS borrow pit ¹⁰	1.3	1.3
Water at Project Grade (levees) ⁵	1.4 (1.5) ⁶	1.2
Water at Construction Grade (levees) ⁵	1.2	N/A
Extreme Hurricane (water @ top of I-walls) ⁵	1.4 (1.5) ⁶	1.3
Extreme Hurricane (water @ top of T-walls) ^{5a}	1.4 (1.5) ⁶	1.2
Low Water (hurricane condition) ⁷	1.4	1.3
Low Water (non-hurricane condition) ⁸ S-case	1.4	1.3
Water at Project Grade Utility Crossing ⁹	1.5 (1.4)	1.3 (1.2)

Centerline borings for WBV-MRL-9 consisted of WB-85.3-U, WB-84.5CU, R-85.75-RUC, R-84.5-RUC and W-87.4-U drilled in 1971 to 2010 with depths of 130 feet to 150 feet. Toe borings consisted of WB-84.75UPT, WB-84.2UPT, R-85.75-RUT, R-84.5-RUT and R-86.8-UR drilled in 1968 to 2010 with depths of 130 feet to 150 feet.

Centerline borings for WBV-MRL-10 consisted of R-88.2-AU drilled in 1973 with depth of 130 feet. Toe borings consisted of ACT-2UT, R-88.2-AUT, 5-UL, 4-UL, 1-U and U-1 drilled in 1947 to 2002 with depths of 60 feet to 100 feet.

Centerline borings for WBV-MRL-11 consisted of ASA-5UCL, ASA-2UCL, W-92.2-UC, W-94.8-U, W-94.5-U, W-93.9-U, R-90.25-RU, W-94.4-U, W-90.8-U, R-89.1-RUC, R-88.49-UR, and R-89.7-UR drilled in 1969 to 2007 with depth of 60 feet to 220 feet. Toe borings consisted of M-94.4-UR, M-94.2-UR, M-94.0-UR, W-95.1-UT, W-94.5-UT, W-93.9-UT, W-94.9-UT, W-94.7-UT, M-94.6-UL, R-89.7-URT and R-89.1-RUT drilled in 1969 to 2007 with depths of 90 feet to 230 feet.

Since the minimum factors of safety were met, WBV-MRL-9 and WBV-11 were able to be raised and the alignment shifted to the flood side. WBV-MRL-10 raise did not meet the required factor of safety and a floodwall was recommended.

2.5 ASSUMPTIONS AND RISK

The assumption was that settlement curves follow the same trends as those of the curves developed to 2057. In lieu of sufficient data (latest lift occurred after survey), settlement curve was assumed to follow prior lift schedule. To be conservative, the same assumption also applies to subsequent lift schedules following a first lift with a small amount of settlement. Risk should be reasonable. Stability aspect was performed for a few selected WBV-MRL levees and considered a reasonable risk. SIBM was not considered at this stage and risk should be reasonable.

3 LEVEE COMPOSITION

A typical levee is constructed of high plasticity clay or low plasticity clay with less than 35% sand and 9% organic material. The clay is compacted to at least 90% maximum dry density at a moisture content of within +5% to -3% optimum moisture content.

4 SETTLEMENT MONITORING / CONSTRUCTION IMPLEMENTATION

An initial construction grade is typically approximately 2-3 feet higher than the design grade at the start of the design life. The purpose for that is: to account for a settlement balance, allow for strength gain in the foundation due to consolidation, minimize the increase in required levee footprint, and maintain the constructed crown at or above the design life for approximately 5-7 years. When the time-rate settlement curve (i.e. placed at the construction grade elevation) is scheduled to cross the assumed linearly-varying design elevation line on the lift schedule/plot, another lift is required. If authority/funding is in place, MVN or the NFS will start looking into this approximately a year or so before the time-rate settlement curve theoretically crosses the design line so that surveys can be taken to verify the theoretical calculations. After the first lift, a balance is also aimed for construction lift height, foundation conditions, and lift duration. It is usually the intent to stay within the ROW limits for additional lifts.

5 CONCLUSION

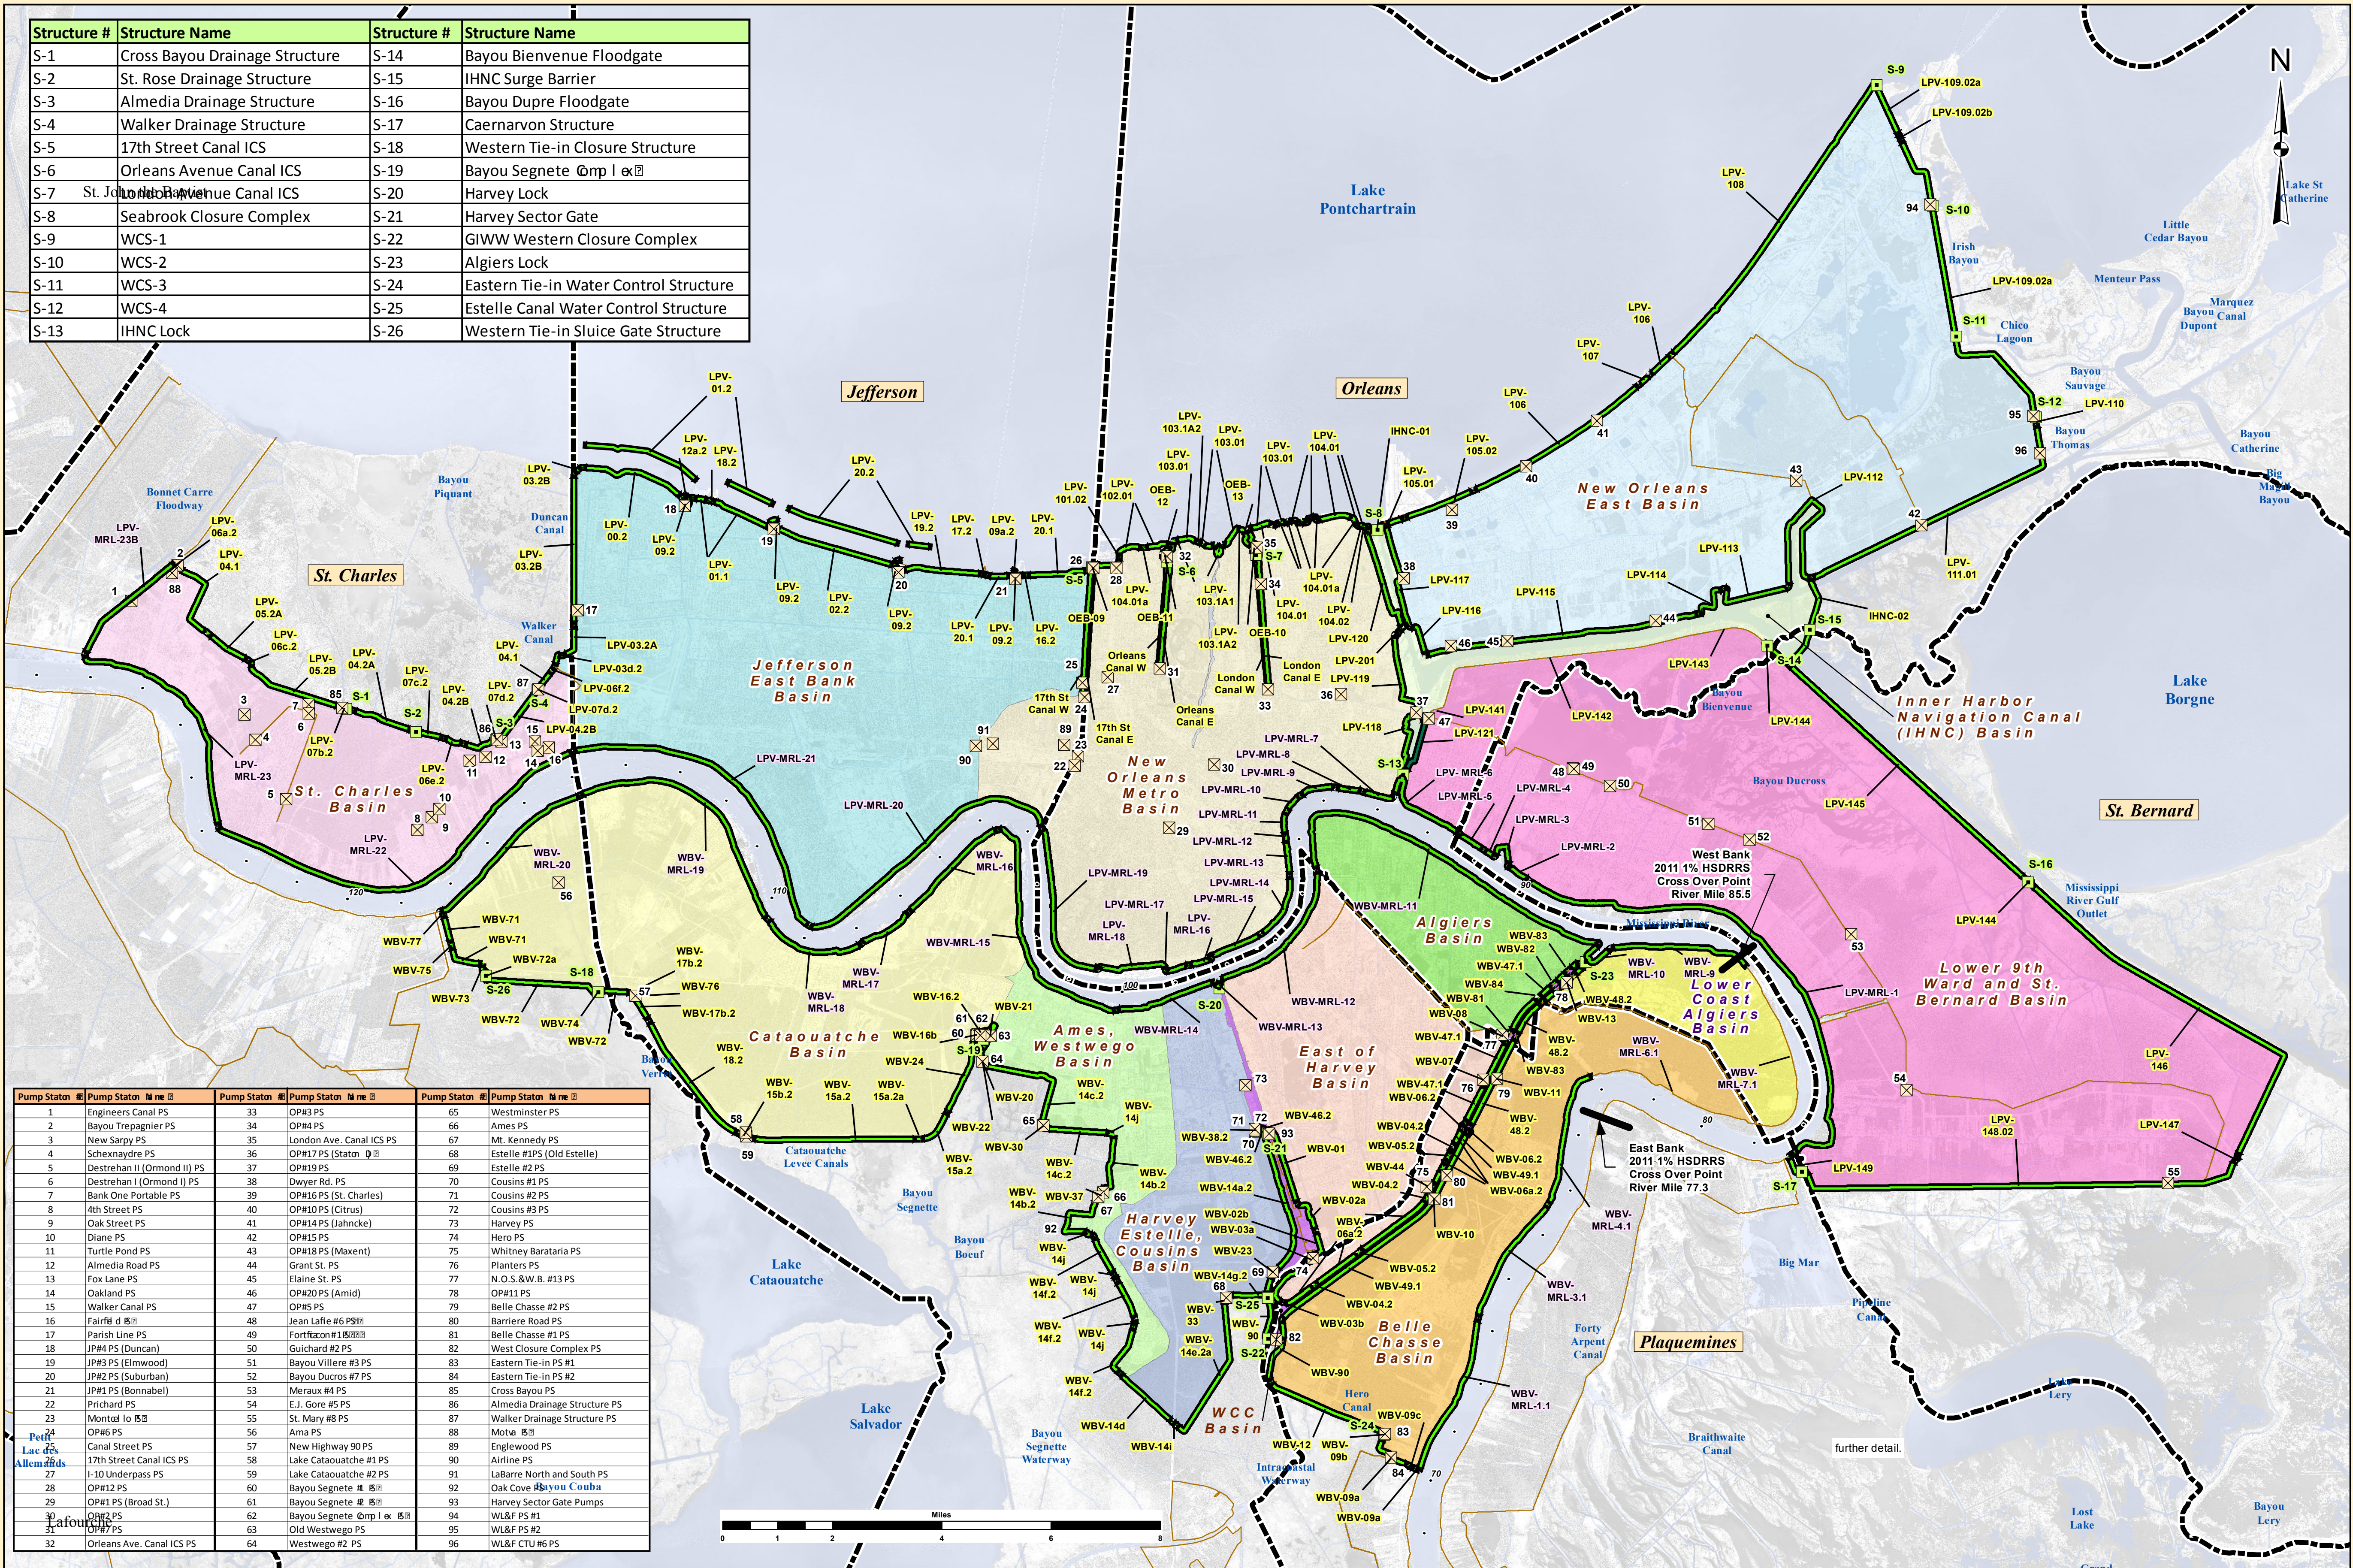

WBV levees can require a number of lifts to maintain the 1% of 2073 intermediate project grade. Lift schedules and estimated quantities are in Appendix A (Civil).

WBV-47.1 Lift Schedule Projections

Algiers Canal, East Bank Levees (WBV-48 and WBV-49) Lift Schedule

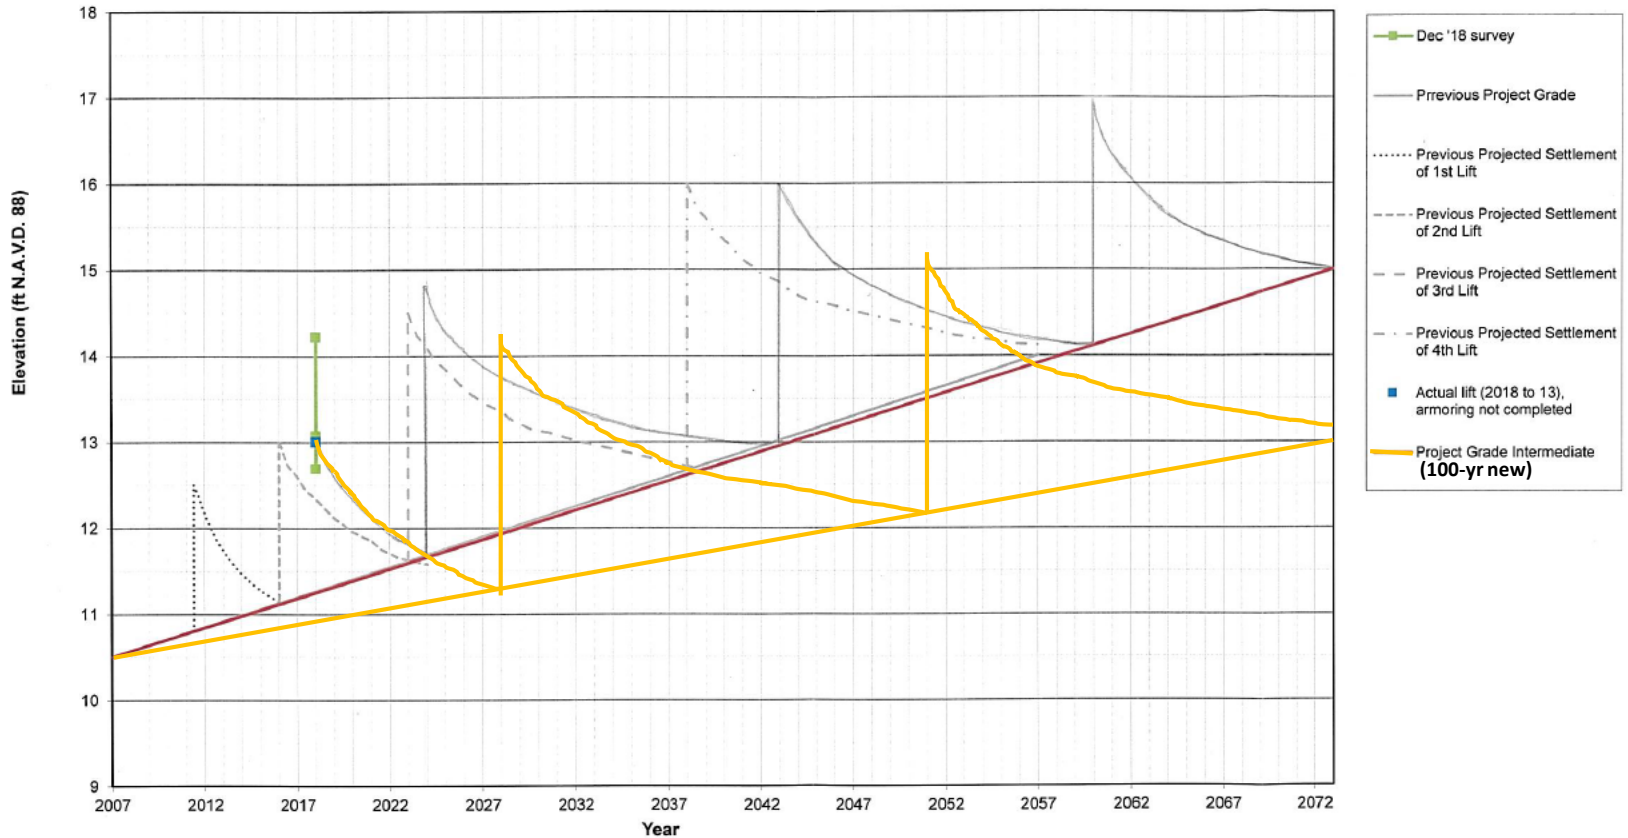

WBV Survey Reach 8 & 9

-The raise in 2014 was to EL+8.8 and P/S berm only was added in 2010.

-The reach presented is the reach that would theoretically require a maintenance lift the soonest. Other reaches may also require a lift but would require one at a later time than this lift schedule is indicating. Therefore, the lift schedule presented will conservatively apply to WBV-48.2, WBV-49.1, and WBV-49.2a projects.
