

## LOUISIANA COASTAL AREA (LCA) PLAQUEMINES PARISH, LA, MEDIUM DIVERSION WITH DEDICATED DREDGING AT MYRTLE GROVE, ENVIRONMENTAL IMPACT STATEMENT SCOPING DOCUMENT

---

### Introduction

The National Environmental Policy Act (NEPA) of 1969 established a nationwide policy requiring an environmental analysis of impacts as a result of proposed major Federal actions affecting the environment. A Notice of Intent to prepare a draft Environmental Impact Statement (EIS) for the Medium Diversion at Myrtle Grove with Dedicated Dredging, Louisiana Coastal Area (LCA) was published in the Federal Register (Volume 75, Number 199) on October 15, 2010:

[http://frwebgate1.access.gpo.gov/cgi-bin/TEXTgate.cgi?WAISdocID=igU9pV/1/1/0&WAISaction=retrieve.](http://frwebgate1.access.gpo.gov/cgi-bin/TEXTgate.cgi?WAISdocID=igU9pV/1/1/0&WAISaction=retrieve)

The U.S. Army Corps of Engineers, New Orleans District, and the local sponsors, the Office of Coastal Protection and Restoration are working together to prepare the draft EIS.

### Scoping Process

The scoping process is designed to provide an early and open means of determining the scope of issues (problems, needs, and opportunities) to be identified and addressed in the draft EIS. Scoping is the process used to: a) identify the affected public and agency concerns; b) facilitate an efficient draft EIS preparation process; c) define the issues and alternatives that will be examined in detail in the draft EIS; and d) save time in the overall process by helping to ensure that the draft statement adequately addresses relevant issues. Scoping is a process, not an event, or a meeting; it continues throughout the development of the draft EIS and may involve meetings, telephone conversations, and/or written comments. Scoping is a critical component of the overall public involvement program. An intensive public involvement program will be initiated and maintained throughout the study to solicit input from affected Federal, state, and local agencies, Indian Tribes, as well as interested private organizations and individuals. This scoping report represents and summarizes the scoping comments expressed at the public scoping meetings, as well as written comments received during the comment period ending December 15, 2010. Scoping meeting public notices were mailed to interested parties in October 2010. The public notice provided three questions as a means of focusing the public's comments and concerns related to the proposed project:

- 1. What are the most important issues, resources, and impacts that we should consider in the EIS?*
- 2. Are there any other alternatives or modifications to existing alternatives that we should consider in the EIS?*
- 3. Are there other problems or opportunities that we should be aware of?*

Public scoping meetings regarding the proposed project were held at:  
Joseph's Hall, Crown Point, Louisiana on November 9, 2010;  
The South Lafourche Levee District, Galliano, Louisiana on November 10, 2010; and  
The Woodland Plantation, Port Sulphur, Louisiana on November 18, 2010

All scoping meeting participants who requested to be on the study mailing list, as well as those people who provided written comments, will be included on the study mailing list and will receive copies of this scoping report.

### Authority

This EIS will be tiered off of the programmatic EIS for the LCA Ecosystem Restoration Study and Record of Decision dated November 18, 2005. The U.S. Army Corps of Engineers, New Orleans District, is conducting this feasibility study under the authority of the Water Resources Development Act (WRDA) of 2007 that authorized the LCA program. Specifically, Section 7006(c)(1)(E) of the act authorizes the Secretary of the Army to carry out the Medium Diversion at Myrtle Grove with Dedicated Dredging project in accordance with the restoration plan set out in the Chief's Report dated January 31, 2005.

### Purpose and Need

The primary purpose of this project is to provide additional sediment and nutrients to nourish highly degraded existing fresh to brackish wetlands in shallow open water areas of the mid- and lower Barataria Basin.

### Project Activities

There are two primary activities associated with this project. 1) the restoration of highly degraded fresh and brackish wetlands in shallow open water areas of the mid- and lower Barataria Basin through the construction of a medium diversion structure (2,500-15,000 cfs) in the Mississippi River levee that would provide additional sediment and nutrients to the degraded wetlands; and 2) dedicated dredging from the Mississippi River at a rate of 2M cy per year for several years that would provide for the creation and protection of up to 19,700 acres of new wetlands over the life of the project.

### Comments

Twenty-seven people attended the meeting on 9 November 2010 in Crown Point, LA, with 12 people providing oral comments at the meeting. Approximately 20 people attended the meeting on 10 November 2010 in Galliano, LA, with 16 people providing oral comments at the meeting. Approximately 53 people attended the meeting on 18 November 2010 in Port Sulphur, LA., with 19 people providing oral comments at the meeting. Six written comments were received during a 60 day comment period. Scoping comments (Figure 1) were sorted into categories in order to more efficiently address issues of concern about the scope of the proposed project and the evaluation of impacts in the draft EIS. Table 1 also provides the sections where the comments may be discussed in the draft EIS.

| <b>Table 1. Scoping Comments</b>            |                           |   |
|---|---------------------------|---|
| <b>Comment</b>                              | <b>Number of Comments</b> | <b>Section of draft EIS where comments may be discussed</b>   |

## FISH AND WILDLIFE SERVICE

646 Cajundome Blvd.

Suite 400

Lafayette, Louisiana 70506

November 15, 2010

Colonel Edward R. Fleming  
District Commander  
U.S. Army Corps of Engineers  
Post Office Box 60267  
New Orleans, Louisiana 70160-0267

Dear Colonel Fleming:

The U.S. Fish and Wildlife Service (Service) has reviewed the Department of the Army, Corps of Engineers (Corps), Notice of Intent (NOI) to prepare a Draft Supplemental Environmental Impact Statement (SEIS) for the Louisiana Coastal Area (LCA) – Plaquemines Parish, Louisiana, Medium Diversion with Dedicated Dredging at Myrtle Grove Feasibility Study. The NOI was published in the Federal Register on October 15, 2010 (75 FR 63447; Department of Interior No. ER 10/899). The LCA Program was authorized by the Water Resources Development Act of 2007, and this SEIS will be tiered off of the programmatic EIS (LCA – Louisiana, Ecosystem Restoration Study, November 2004) for that program. The Service submits the following comments in accordance with the National Environmental Policy Act of 1969 (83 Stat. 852, as amended; 42 U.S.C. 4321 et seq.), the Migratory Bird Treaty Act (MBTA, 40 Stat. 755, as amended; 16 U.S.C. 703 et seq.), the Endangered Species Act (ESA) of 1973 (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq.), the Bald and Golden Eagle Protection Act (BGEPA) (54 Stat. 250, as amended, 16 U.S.C. 668a-d), and the Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661 et seq.).

The proposed project would be located along the Mississippi River, near river mile 60, above the Head of Passes. It would occur along the right descending bank of the Mississippi River in the vicinity of Myrtle Grove, Plaquemines Parish, Louisiana. The proposed project would include both a freshwater diversion feature and a dedicated dredging component for wetland creation. As recommended in the January 31, 2005, U.S. Army Chief of Engineers Report, the freshwater diversion feature would consist of a gated, box culvert diversion structure that could convey flows ranging from 2,500 to 15,000 cubic feet per second. That report also recommends dedicated dredging and the placement of approximately 2 million cubic yards of material from an existing shoal in the Mississippi River. That dredging would be conducted annually for a period of 16 years and, in conjunction with the proposed diversion, would create up to 13,400 acres of emergent marsh and sustain an additional 6,300 of marsh in the Barataria Basin. Such a project would not only allow for rapid marsh creation, but it should provide long-term sustainability for those marshes. It is also expected to maximize the amount of acreage created by capitalizing on incremental accretion of diverted sediment (75 FR 63447).

According to the 2004 LCA Study Report, ecological modeling indicates that within the next 50 years all saline and brackish marsh, and approximately 40 percent of the intermediate marsh, in the Barataria Basin will be lost; that loss can be attributed to lack of sediment input and continued soil subsidence. It states that the proposed project features have the potential to prevent significant future land loss where currently predicted to occur in the central portion of the Barataria Basin. The 2004 LCA Study Report has also determined that the Medium Diversion with Dedicated Dredging at Myrtle Grove Project, coupled with the Modification of Davis Pond Diversion, (which have been collectively titled the Mid-Barataria Basin Reintroductions Opportunity) would satisfy three of the four critical needs criteria identified in that report. Those criteria are: (1) it would prevent future land loss where predicted to occur, (2) it would restore fundamentally impaired deltaic function through river reintroduction, and (4) it would protect vital socioeconomic resources. Criteria number designations correspond to those assigned in that report (U.S. Army Corps of Engineers 2004).

The pallid sturgeon (*Scaphirhynchus albus*) is an endangered fish found in Louisiana, in both the Mississippi and Atchafalaya Rivers (with known concentrations in the vicinity of the Old River Control Structure Complex); it is possibly found in the Red River as well. The pallid sturgeon is adapted to large, free-flowing, turbid rivers with a diverse assemblage of physical characteristics that are in a constant state of change. Detailed habitat requirements of this fish are not known, but it is believed to spawn in Louisiana. Habitat loss through river channelization and dams has adversely affected this species throughout its range. Entrainment issues associated with dredging operations in the Mississippi and Atchafalaya Rivers and through diversion structures off the Mississippi River are two potential effects that should be addressed in future planning studies and/or in analyzing current project effects. Should the proposed project directly or indirectly affect the pallid sturgeon or its habitat, further consultation with this office will be necessary.

The proposed project area (as defined in the 2004 LCA Study Report) is known to provide nesting habitat for the bald eagle (*Haliaeetus leucocephalus*), which was officially removed from the List of Endangered and Threatened Species on August 8, 2007. Bald eagles nest in Louisiana from October through mid-May. Eagles typically nest in mature trees (e.g., bald cypress, sycamore, willow, etc.) near fresh to intermediate marshes or open water in the southeastern Parishes. Breeding bald eagles occupy "territories" that they will typically defend against intrusion by other eagles, and that they likely return to each year. Major threats to this species include habitat alteration, human disturbance, and environmental contaminants (i.e., organochlorine pesticides and lead). Bald eagles are vulnerable to disturbance during courtship, nest building, egg laying, incubation, and brooding. Disturbance during these critical periods may lead to nest abandonment, cracked and chilled eggs, and exposure of small young to the elements. Human activity near a nest late in the nesting cycle may also cause flightless birds to jump from the nest tree, thus reducing their chance of survival.

Although the bald eagle has been removed from the List of Endangered and Threatened Species, it continues to be protected under the MBTA and the BGEPA. The Service developed the National Bald Eagle Management (NBEM) Guidelines to provide landowners, land managers, and others with information and recommendations to minimize potential project impacts to bald eagles, particularly where such impacts may constitute "disturbance," which is prohibited by the BGEPA. A copy of the NBEM Guidelines is available at:

<http://www.fws.gov/southeast/es/baldeagle/NationalBaldEagleManagementGuidelines.pdf>.

Those guidelines recommend: (1) maintaining a specified distance between the activity and the nest (buffer area); (2) maintaining natural areas (preferably forested) between the activity and nest trees (landscape buffers); and (3) avoiding certain activities during the breeding season. On-site personnel should be informed of the possible presence of nesting bald eagles within the project boundary, and should identify, avoid, and immediately report any such nests to this office. If a bald eagle nest is discovered within or adjacent to proposed project activities, then an evaluation must be performed to determine whether the project is likely to disturb nesting bald eagles. That evaluation may be conducted on-line at:

<http://www.fws.gov/southeast/es/baldeagle>. Following completion of the evaluation, that website will provide a determination of whether additional consultation is necessary; a copy of that determination should be provided to this office. The Division of Migratory Birds for the Southeast Region of the Service (phone: 404/679-7051, e-mail: [SEmigratorybirds@fws.gov](mailto:SEmigratorybirds@fws.gov)) has the lead role in conducting such consultations. Should you need further assistance interpreting the guidelines or performing an on-line project evaluation, please contact this office.

The proposed project would be located in an area where colonial nesting waterbirds may be present. Colonies may be present that are not currently listed in the database maintained by the Louisiana Department of Wildlife and Fisheries (LDWF). That database is updated primarily by monitoring the colony sites that were previously surveyed during the 1980s. Until a new, comprehensive coast-wide survey is conducted to determine the location of newly-established nesting colonies, we recommend that a qualified biologist inspect the proposed work site for the presence of undocumented nesting colonies during the nesting season. In addition, we recommend that on-site contract personnel be informed of the need to identify colonial nesting birds and their nests, and should avoid affecting them during the breeding season.

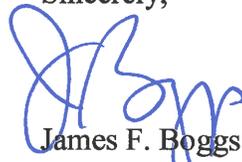

Estuarine wetlands and associated shallow waters within the project area may contain officially designated Essential Fish Habitat (EFH). EFH requirements vary depending upon species and life stage. Categories of EFH in the project area would include estuarine emergent wetlands, estuarine water column, submerged aquatic vegetation, and estuarine water bottoms. Detailed information on Federally managed fisheries and their EFH is provided in the 1998 generic amendment of the Fishery Management Plans for the Gulf of Mexico, prepared by the Gulf of Mexico Fishery Management Council (GMFMC). That generic amendment was prepared in accordance with the Magnuson-Stevens Fishery Conservation and Management Act (MSFCMA); (P.L. 104-297). Recommendations to minimize and/or avoid impacts to EFH should be developed in coordination with the National Marine Fisheries Service.

The President's Council on Environmental Quality defined the term "mitigation" in the National Environmental Policy Act regulations to include: (a) avoiding the impact altogether by not taking a certain action or parts of an action; (b) minimizing impacts by limiting the degree or magnitude of the action and its implementation; (c) rectifying the impact by repairing, rehabilitating, or restoring the affected environment; (d) reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; and (e) compensating for the impact by replacing or providing substitute resources or environments.

The Service's Mitigation Policy (Federal Register Volume 46, No. 15, January 23, 1981) supports and adopts this definition of mitigation and considers its specific elements to represent the desirable sequence of steps in the mitigation planning process. That policy identifies four resource categories that are used to insure that the level of mitigation recommended by Service biologists will be consistent with the fish and wildlife resource values involved. Considering the high value for fish and wildlife and the relative scarcity of the estuarine marsh habitat, those wetlands have been designated Resource Category 2 habitats. The mitigation goal for habitats in this resource category is no net loss of in-kind habitat value. Although it is highly probable that Medium Diversion with Dedicated Dredging at Myrtle Grove Project would provide enough habitat benefits to fully offset negative project-associated wetland impacts, a complete evaluation of mitigation needs will be conducted during the feasibility stage.

We look forward to assisting the Corps in the documentation of existing conditions, development of alternatives, and assessment of effects of project alternatives on Federal trust resources during the subsequent feasibility study. Should you have any questions regarding our comments, please contact David Soileau, Jr. (337/291-3109) of this office.

Sincerely,

James F. Boggs  
Supervisor

Ms. Joan Exnicios, Chief  
Environmental Planning and Restoration Branch  
New Orleans District  
Department of the Army, Corps of Engineers  
Post Office Box 60267  
New Orleans, Louisiana 70160-0267

Dear Ms. Exnicios:

NOAA's National Marine Fisheries Service (NMFS) has received the October 15, 2010, Notice of Intent (NOI) to prepare a draft Environmental Impact Statement for the Louisiana Coastal Area (LCA), Louisiana; Medium Diversion at Myrtle Grove with Dedicated Dredging project. This NOI was not received in the Baton Rouge office until the week of November 15, 2010. According to the public notice, the U.S. Army Corps of Engineers intends to prepare an environmental impact statement (EIS) to evaluate a freshwater diversion of 2,500 to 15,000 cubic feet per second (cfs) of Mississippi River water into the Barataria Basin. Project components include dedicated dredging for the creation of up to 19,700 acres of new wetlands. Resources potentially impacted by project implementation are located in Jefferson, Lafourche, and Plaquemines Parishes, Louisiana. According to the NOI, this EIS will be tiered off a programmatic EIS completed for the Louisiana Coastal Area Ecosystem Restoration Study completed in November 2004.

Aquatic and tidally influenced wetland habitats in portions of the study area are designated as essential fish habitat (EFH) for various federally managed species, including white shrimp, brown shrimp, red drum, lane snapper, dog snapper, and Gulf stone crab. These species are managed by the Gulf of Mexico Fishery Management Council (GMFMC). The attached table lists life stages and subcategories of EFH for these species that would potentially be benefitted or impacted by this project. Primary categories of EFH in the study area include estuarine emergent wetlands; submerged aquatic vegetation; mud, sand and shell substrates; and estuarine water column. Detailed information on federally-managed fisheries and their EFH is provided in the 2005 generic amendment of the FMPs for the Gulf of Mexico prepared by the GMFMC. The generic amendment was prepared as required by the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act, P.L. 104-297).

In addition to being designated as EFH for the species listed in the attached table, water bodies and wetlands in the study area provide nursery and foraging habitats supportive of a variety of economically important marine fishery species, such as striped mullet, Atlantic croaker, gulf menhaden, spotted seatrout, sand seatrout, southern flounder, black drum, and blue crab. Some of these species also serve as prey for other fish species managed under the Magnuson-Stevens

Act by the GMFMC (e.g., mackerels, snappers, and groupers) and highly migratory species managed by NMFS (e.g., billfishes and sharks).

NMFS recommends the EIS include separate sections titled "Essential Fish Habitat" and "Marine Fishery Resources" that identify the EFH and fisheries resources of the study area. These sections should describe the potential impacts, both positive and negative, to those resources that could be caused by the proposed river diversion. While NMFS believes that overall project implementation could be beneficial to protecting and restoring EFH and to maintaining the productivity of marine fishery resources, there are some potential localized adverse impacts that could be caused by structure operations, especially during high flow periods. These impacts include: 1) displacement of less freshwater tolerant, or cold water intolerant, marine fishery species from large areas of wetlands and water bodies that serve as nursery and foraging areas; 2) destruction of productive oyster reefs that serve as habitat and a food source for some fishery species; 3) increased turbidity and associated decreases in coverage of submerged aquatic vegetation in some areas; 4) potential low dissolved oxygen levels in water bodies caused by decomposition of large quantities of algae and/or phytoplankton resulting from high nutrient levels in diverted river water; and, 5) potential reduction in the shear strength of organic soils caused by high nutrient levels in diverted river water. The EFH and marine fishery resource sections of the SEIS should evaluate the potential for any or all of these impacts to occur as a result of the proposed diversion. NMFS recommends these sections of the document also discuss the potential beneficial effects of the proposed diversion on EFH and marine fishery resources. These effects include the maintenance of marsh habitats through the accretion of sediment and input of beneficial nutrients.

The EFH and marine fishery resources sections of the document also should describe and quantify the potential impacts and benefits of the proposed activities on EFH sub-categories (e.g., marsh, marsh edge, submerged aquatic vegetation/seagrass beds, mud bottoms, oyster reefs, and estuarine water column). The appropriate sections should describe the potential impacts and benefits of the diversion on the utilization of these sub-categories of EFH by those fishery species and life stages included in the enclosed table. The EIS should evaluate alternatives to any activities that would result in an adverse impact to those resources to determine if there are less damaging methods to achieve the same result. The overall net benefits of the project on wetland habitats supportive of marine fishery resources should not preclude efforts to minimize the negative impacts of river diversion on fishery resources or EFH. Such alternatives to minimize adverse impacts of maximize beneficial effects includes: 1) reduced fresh water inflows during low river stages and periods less fresh water tolerant species may be found in the project area; 2) direct placement of sediment into the outflow channel during high flow periods to maximize delivery to area marshes; and, 3) placement of marsh terraces or silt fences to help trap sediments and reduce turbidity.

NMFS recommends the EIS include a section titled "Cumulative Impacts" that evaluates project impacts and benefits with other similar projects proposed for, or implemented, in the area. Presently, the existing Davis Pond diversion located in St. Charles Parish can divert up to 10,000 cfs into the Barataria Basin. In addition, siphons near Naomi and West Point a la Hache can

each divert up to 2,000 cfs into the Barataria Basin. The EIS should evaluate the relative need, benefits of, and impacts associated with the diversion of 2,500 to 15,000 additional cfs into the Barataria Basin. The EIS should include evaluations on how all four diversions could be operated in conjunction with each other to minimize adverse impacts and maximize beneficial effects. Considering that the four diversions identified above would impact large areas of the Barataria Basin estuary, the EIS should evaluate the cumulative impacts, including beneficial effects, of multiple diversions of Mississippi River waters on resources of concern.

Please note that our Protected Resources Division is responsible for all issues regarding threatened and endangered species and marine mammals for which NMFS is responsible. For information regarding those resources, please contact Mr. David Bernhart of our Protected Resources Division at (727) 824-5312. For additional information regarding EFH, marine fisheries, or National Environmental Policy Act issues, please contact Mr. Richard Hartman of our Habitat Conservation Division, Baton Rouge Office at (225) 389-0508, ext 203.

Sincerely,

*for* Miles M. Croom

## United States Department of the Interior

FISH AND WILDLIFE SERVICE  
646 Cajundome Blvd.  
Suite 400  
Lafayette, Louisiana 70506

December 8, 2010

Colonel Edward R. Fleming  
District Commander  
U.S. Army Corps of Engineers  
Post Office Box 60267  
New Orleans, Louisiana 70160-0267

Dear Colonel Fleming:

In a letter dated November 15, 2010, the U.S. Fish and Wildlife Service (Service) reviewed and commented on the October 15, 2010, Notice of Intent to prepare a draft environmental impact statement (EIS) for the Louisiana Coastal Area (LCA)—Plaquemines Parish, Louisiana, Medium Diversion With Dedicated Dredging at Myrtle Grove Feasibility Study (75 FR 63447; Department of Interior No ER 10/899). A description of the proposed project and a discussion of the significant fish and wildlife resources (including habitats) that occur within that study area are contained in our November 2010 comment letter. For brevity, that information and discussion is incorporated by reference herein.

The Service would like to supplement the November 2010 letter to include the following additional comment and recommendations for consideration and evaluation in the Myrtle Grove project. These comments should be incorporated with all previously submitted Service comments for consideration. The following comments are provided in accordance with provisions of the Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661 et seq.) and the Endangered Species Act of 1973 (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq.).

Historically, wetlands in the Barataria Basin were nourished by the fresh water, sediments, and nutrients delivered via overbank flooding of the Mississippi River and through its many distributary channels such as Bayou Lafourche, Bayou Barataria, and Bayou Grand Cheniere. As the flow of fresh water and sediments from the Mississippi River was restricted by flood protection levees and the closure of those distributaries, the basin began to gradually deteriorate from saltwater intrusion, subsidence, wave action, and sediment deprivation. Historically, Bayou Perot, and the longer, narrower Bayou Dupont-Bayou Barataria-Bayou Villars channels provided limited hydrologic connection between the upper and lower basin. The hydrologic connections between the upper and lower Barataria Basin are much greater today, due to the Barataria Bay Waterway, Bayou Segnette Waterway, Harvey Cutoff, and substantial erosion and interior marsh loss along Bayous Perot and Rigolettes. The frequency of high salinity events has also increased in the Barataria Basin (Swenson and Turner 1998), probably as a result of the increased tidal connectivity.

To effectively address the above-mentioned issues the Service encourages pulsing (i.e., fluctuating the amount of water diverted) to optimize sediment delivery, whether suspended sediments in the upper river column or if possible, the river bedload. In order to determine the best time to pulse during yearly operations, the project should incorporate a sediment gauge in the river near the diversion structure to

**TAKE PRIDE<sup>®</sup>  
IN AMERICA** 

provide real time information. Placement of the gauge (or other increased monitoring) during the planning phase would greatly improve the data needed to develop and select alternatives that would maximize sediment delivery. In addition, the Service advocates restoring and/or nourishing marsh in the area and using the diversion's influence to provide additional sediments to help sustain the new and existing marshes.

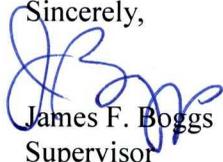

As the Myrtle Grove outfall area naturally fills in, sedimentation management of the outfall area would be needed to achieve full benefits of the diversion. The Service suggest managing the natural crevasse splay to enhance flows across the outfall area by dredging appropriate areas and using the dredged material beneficially to create, restore, or enhance marsh within the basin or surrounding areas of need.

The Service urges consideration be given to aquatic resources when developing the operation of the diversion structure. Though a shift in aquatic resources may be expected and is acceptable, our preference is not to overwhelm the basin but rather to optimizing basin benefits for both aquatic resources and land building and sustainability. In order to fully disclose benefits and impacts to aquatic resources, the Service recommends the use of aquatic modeling during the feasibility study.

The Service recommends this project consider cumulative impacts of the Myrtle Grove diversion, Davis the Pond diversion (up to 10,650cfs), Naomi siphon (up to 2,000cfs) and West Point a la Hache siphon (2,000cfs) into the Barataria basin. The report should discuss how all diversions and siphons could be operated in conjunction with each other to minimize adverse impacts and maximize beneficial effects. The Service suggests that a comprehensive basin-wide operations plan be developed to better coordinate all the diversions and siphons for the health of the basin. In additions affects of other existing projects, such as Donaldsonville to the Gulf, and how they will work with this diversion should be discussed.

We appreciate the opportunity to review the Notice of Intent and to provide comments in the planning stages of the proposed project. If you or your staff have further questions regarding the above letter or would like to meet and discuss our recommendations, please contact Catherine Breau of this office at (504) 862-2689.

Swenson, E. M. and R. E. Turner. 1998. Past, present, and probably future salinity variations in the Barataria estuarine system. Coastal Ecology Institute, Louisiana State University. Baton Rouge, LA. 112 pp.

---

I am a recreational fisherman, duck hunter (lease holder) and camp owner in Myrtle Grove.

I am in favor of the Myrtle Grove Freshwater Diversion Project. I only wish it were in operation today.

I have witnessed firsthand large sections of marsh vanishing over the twelve or so years I have been in the area. If it continues Barataria Bay will one day be at the Mississippi River.

The arguments against seem to be based in greed. Fisherman worry that the area they fish today will change. Of course it will, change is inevitable with or without the diversion project. Man and animal will adapt to the changes just as we always have, or we will move on. Look at how well we adapted to miles of oilfield canals and increased salinity.

Sincerely,

Christopher M Wilke

### BTNEP comments on the Myrtle Grove Sediment Diversion Scoping Meeting

We are submitting the attached written comments on behalf of the Barataria-Terrebonne National Estuary Program (BTNEP) in response to the recent scoping meetings regarding the development of the proposed Louisiana Coastal Area, Medium Diversion at Myrtle Grove with Dedicated Dredging ecosystem restoration project. We appreciate the opportunity to provide these comments on behalf of the BTNEP.

The Barataria-Terrebonne National Estuary Program is one of only 28 National Estuary Programs (NEP) in the United States. We are funded through Section 320 of the Clean Water Act and the State of Louisiana on a 50/50 basis. The state-sponsoring agency is the Louisiana Universities Marine Consortium (LUMCON).

The BTNEP was created in 1990 by an historic agreement between the State of Louisiana and the United States of America. That agreement acknowledged that the Barataria and Terrebonne systems, consisting of the area between the Mississippi and Atchafalaya rivers, were both of national significance and critically threatened. The Environmental Protection Agency, on behalf of the U. S. government, pledged to elevate the status of this entire region to that of a National Estuary. The State of Louisiana fulfilled its part of this pledge by convening hundreds of representatives from business and industry, universities and other educational institutions, local governments, federal and state agencies, NGOs, farmers, agriculture, and fisheries. This group of diverse stakeholders gathered in 1991 to begin the development of a comprehensive plan to restore and preserve the newly designated Barataria-Terrebonne National Estuary.

As such, the BTNEP is committed to practical, meaningful restoration that includes stakeholders in the restoration process, which is the only way to guarantee support of the public and success of any restoration plan. Unfortunately, the insistence of some groups to use large river diversions to restore our eroding coastal landscape, and the exclusion of groups who depend on estuarine species for their way of life, has led us to an endless cycle of arguments regarding how best to accomplish the restoration of the coastal features that are necessary for the maintenance of our unique culture.

In the light of large river diversions being used as a restoration tool, we see this issue coming down to two critical questions:

1. What we do know?
2. What we do NOT know?

### **What we do know?**

1. We know that even small diversions such as Davis Pond, when operated over an extended period of time, have the potential to deliver large amounts of fresh water. Larger diversions have greater potential to freshen the estuary in a shorter time frame. To restore the coastal landscape that we have lost, a diversion should have high amounts of sediment in the diverted water from the river. Diversions of massive quantities of fresh water at Myrtle Grove will result in over-freshening of the Barataria system, whether pulses or continuous flow patterns are used over time. The result will be a fisheries conversion from estuarine dependent species such as oyster, crab, brown shrimp, menhaden, Atlantic croaker, spotted sea trout, and red drum, to fresher fisheries species such as largemouth bass, sunfish, and catfish.
2. We know that the sediment load carried by the Mississippi River has decreased by 50% since 1850 due to the multitude of locks and dams in the upper drainage of the Mississippi River, vastly diminishing the land building capacity of any sized diversion compared to the pre-historical Mississippi River.
3. We know that the idea that river diversions are a “natural restoration technique” and that the idea of delivering sediment harvested from the bottom with dredges should not be used because it is an “unnatural” technique is a misrepresentation of fact. The entire mid and lower Mississippi has been completely hydrologically modified with locks and dams and is not the same river that created southeast Louisiana over the last 7000 years from the seven delta lobe channels it occupied over geologic history. Making cuts across the levee, lining them with concrete, and constructing steel gates that can be opened to let water in with its minimal sediment load is certainly not a natural restoration technique and will not replace or mimic any of the original natural conditions.
4. We know that all of the land in the Mississippi Deltaic plain was formed from catastrophic, periodic land-building events during massive spring floods by the pre-historic Mississippi River. The fact that people live in the Barataria Basin will prevent the free flow of the river water at the level of flooding needed to bring water and sediments over the marshes and ridges needed for postmodern-land building from the river. The minimal amounts of fine-grained sediment available in the Mississippi River carried by these diversions into the Barataria Basin will not result in the much-needed re-creation of land in the time we need it. The people of the Barataria and Terrebonne Basins are in desperate need of relief from the very real impacts of coastal land loss now. They should not have to wait for the passage of geological time spans while the minimal fine-grained sediment that is currently in the Mississippi River water column creates land. Diversions do not take advantage of the bed load from the river and can only entrain fine grained sediments from the top of the water column of the river. This vastly limits their land building capacity. The river has plenty of coarser grained sediment available for

restoration. But it is on the bottom and it can be harvested with dredges and pumped into the Barataria Basin to restore our coastal landscape in a remarkably short time span.

5. Pipeline Sediment Delivery can build large amounts of land in a short amount of time.
6. We know that we absolutely do not have the time to wait 20, 50, 100, or 200 years for untested, unproven promises of wetland restoration and community protection for the ecological and human communities of Southeastern Louisiana.

### **What do we NOT know?**

1. We do not know the actual amount of coarser-grained sediment that the diversion can move nor do we know much of it will be retained in the marsh.
2. We do not know what the impacts of adding massive quantities of water will be to the communities in the Barataria Basin and those communities along the un-leveed Gulf Intracoastal Waterway, especially combined with the other diversions and modifications of existing diversions being discussed now. Proponents of large-scale diversions propose to open the structures only when the coarser grain sediments become suspended during the times when the river is flowing at exceptional velocity. The idea is to take advantage of the land building capacity afforded by the availability of the increased sediment load. However, during the times when the river is flowing at such a massive flow rate, the communities of south east Louisiana are struggling to keep water out of their homes and from overtopping flood protection levees. The last thing they need during these events is a massive quantity of water added to the Barataria Basin for "restoration". The impacts of adding this additional water into the Barataria Basin and the impacts of "backwater" flooding along the unleveed ICWW from Harvey to Morgan City need to be carefully modeled.
3. We do not know how much time it will take to rebuild any area of land in the Barataria Estuary using the Myrtle Grove river diversion. Certainly we have hydrologic and landscape models. However, exceptionally high error rates mean that these tools cannot and will not give us any meaningful prediction of the amount of land we can expect given certain flow volumes. In other words, we don't know what we will get and cannot count on these predictions. According to the description of the Myrtle Grove project by the Louisiana Coastal Wetlands Conservation and Restoration Task Force in the brochure entitled, "Delta Building Diversion at Myrtle Grove (BA-33)," the diversion will build 8,891 acres with the project and 14,500 acres will be lost without the project. The predicted project gains will not keep up or replace land at the same rate as local land loss rates. Based upon the project description, the limited amount of land building capacity will be due to the dedicated dredging component of the project, NOT the diversion.
4. We do not know if the water diversion component of Myrtle Grove will ever be operated. The West Bay Diversion Project in Lower Plaquemines Parish only built land because there was dedicated dredging associated with this project, and then the project was shut down

permanently due to the induction of downstream shoaling and interference with navigation from West Bay Diversion.

- We do not know if this sort of river diversion on the Mississippi will even work. A large river diversion on the Mississippi River has never built land. West Bay at 50,000 cfs only built land because it used dredged material. The water diversion component of West Bay actually eroded some of the land gained by the dredging component. Models that predict land gain are based on TSS levels far up river from the Myrtle Grove location and data collected at Wax Lake Outlet. Extrapolating land building capability from these data sets are completely erroneous because they do NOT reflect the sediment in the river near Myrtle Grove, or the nature of the diversion that will be built at Myrtle Grove. Wax Lake receives bed load or bottom sediment material from the Atchafalaya River, which greatly increases its land building capability but this will NOT be the case at Myrtle Grove. This is the reason why dedicated dredging has been made part of this project. There will be little land built in this project without dedicated dredging and marsh creation.

So, this brings us to another question. Why are the proponents insisting that a massive diversion be constructed at Myrtle Grove? Why do we need so much fresh water to nourish the wetlands that will be constructed through dedicated dredging and marsh creation? The cost of this massive diversion will be the destruction of fisheries throughout the Barataria Basin, a fishery that has been very productive for Louisiana and the fishermen who depend on it. It's clear from the smaller diversion at Davis Pond that a diversion of small size can freshen most of the Barataria basin. Why bother building such a large diversion when a small to medium-sized diversion (less than 15,000 cfs flow) would do the same job, cost far less and have much more public support?

We suggest the construction of a smaller diversion at Myrtle Grove and the use of long distance Pipeline Sediment Delivery (PSD) to greatly increase the land building capability of our restoration dollars.

### Cost of Time

The following table further illustrates how we should focus our time and money more on a combination of PSD and small diversions/siphons than large river diversions.

| <u>Project</u>                  | <u>Cost</u>   | <u>Acres</u> | <u>Cost/Acre</u> | <u>Years</u> | <u>Acres/Year</u> |
|---------------------------------|---------------|--------------|------------------|--------------|-------------------|
| Bayou Dupont                    | \$27,300,000  | 471          | \$57,962         | 0.3          | 1413              |
| Myrtle Grove                    | \$417,500,000 | 8891         | \$46,958         | 20.0         | 445               |
| PSD used to build Myrtle Grove* | \$417,500,000 | <b>7,203</b> | \$57,962         | <b>5.10</b>  | 1413              |

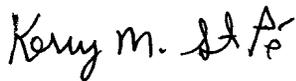

Source: <http://lacoast.gov/reports/gpfs/BA-39.pdf>; <http://lacoast.gov/reports/gpfs/BA-33.pdf>

\*Acres calculated from Bayou Dupont Cost/Acre. Years calculated from Bayou Dupont Acres/Year

One of the major benefits that have been claimed by proponents of large river diversions is that river diversions are less expensive for the same result than using pipeline sediment delivery (PSD) for building land. This is shown by the comparison in the above table but what is the cost of time and are we actually getting the same result? There are three important differences between PSD and large river diversions:

1. Time is a key factor which will determine the success of any restoration effort. As a result, we are NOT getting the same result by just comparing the cost per acre of each project. The use of river diversions to build land as part of the Myrtle Grove project will take an incredibly optimistic 20 years (according to project estimates); whereas, a similar amount of land built using PSD will only take 5.1 years. Each acre of land lost over time compounds the effects of land lost and increases the vulnerability of the remaining land areas. The longer we have to wait on restoration, the less valuable that restoration will be because its effectiveness goes down over time and its cost increases.
2. The startup time for PSD is very small; whereas, construction of a large river diversion could easily take 10 years or more just to become operational (this is based on construction time, repair, and adjustments to ponding area levees, gabions, and box culverts for Davis Pond Diversion).
3. With PSD we know exactly what we are getting at the end of the pipe...land. No complicated mathematical models are needed to make this calculation. We would be getting land that we could see within months, available for ecological uses and coastal community protection within our lifetime! This is the value of meaningful restoration through PSD! Why do we persist in this movement toward unnecessarily sacrificing our estuarine seafood economy for a strategy that may take multiple generations to see any meaningful benefit...if ever?

Sincerely,

Kerry M. St.Pé, Director  
Barataria-Terrebonne National Estuary Program

New Orleans, LA 70160-0267  
[Patricia.s.leroux@usace.army.mil](mailto:Patricia.s.leroux@usace.army.mil)

RE: Scoping comments for the development of the Louisiana Coastal Area, Medium Diversion at Myrtle Grove with Dedicated Dredging ecosystem restoration project

Dear Ms. LeRoux

I am writing on behalf of the Gulf Restoration Network (GRN), a diverse coalition of individual citizens and local, regional, and national organizations committed to uniting and empowering people to protect and restore the resources of the Gulf of Mexico. Please accept into the record these comments regarding the scoping for the development of the Louisiana Coastal Area (LCA), Medium Diversion at Myrtle Grove with Dedicated Dredging ecosystem restoration project (Myrtle Grove). We reserve the right to rely on all comments submitted.

### Nutrients

It is vital to recognize the potential impacts of nutrient (Nitrogen, Ammonia, Nitrate, Phosphorous, etc.) loadings to the receiving wetlands and waters in the Myrtle Grove project. Nutrient levels in the Mississippi River are higher than historical levels. The Corps and the State must thoroughly analyze the impacts of these high levels of nutrients may have on the receiving waters. These potential impacts should include: Dissolved oxygen depletion, harmful and other algal blooms, impacts to wetland root growth, and the formation of hypoxic zones (dead zones). We recognize that there is also the potential that receiving wetlands could beneficially take up nutrients as well, but request that this is not accepted as a given.

## Water Quality

Water and sediment flowing down the Mississippi River is not pristine. It carries pollutants from fields, animal feed lots, municipalities, and industrial sources. Therefore it is important to establish what pollutants are in the River, at what concentrations and loadings, and what potential impact these pollutants might have on the areas receiving this river water and sediment. For example, the Mississippi carries significant levels of Atrazine, which is an herbicide and potential endocrine disrupter. What will river pollutants such as pesticides, herbicides, and industrial chemicals have on the receiving waters and the intended growth of wetlands?

## Communicating different types of diversions

In this scoping process, we request a thorough discussion that differentiates between freshwater diversions and sediment diversions. Members of the public have not been well informed regarding the difference between these two concepts. In the preparation of this EIS we request that these two concepts be juxtaposed and the potential benefits/impacts these types of diversions might present

## Pulsing

As we understand it, the Myrtle Grove diversion might be “pulsed,” instead of free-flowing. We request that in the preparation of this EIS, this concept be better defined and also present several pulsing scenarios. When discussing different pulsing scenarios, we request that the following concepts be included: timing of pulses, duration of pulses, number of pulses in a year, rationale of pulsing, impacts to fisheries (finfish, oysters, shrimp, crabs, etc.), flooding of communities, and land-building potential.

## Consider design capacity greater than 15,000 cfs

As part of this scoping process, we request that design capacities beyond the proposed 15,000 cfs be considered. We are not necessarily advocating for the preferred alternative be more than this amount, but it should be explored in case a larger diversion would be more effective in accomplishing the stated purpose of this project.

## Dedicated dredging

In the drafting of the EIS, we request a thorough discussion of dedicated dredging and how the dredging and diversion will complement each other.

Regarding this concept we request answers to the following questions: how will the diversion compliment the dedicated dredging? What would happen if there were no diversion, only dedicated dredging? How quickly will land be built utilizing the dedicated dredging? Would land built by dedicated dredging eventually erode/subside if there was no diversion? If so how quickly would this land erode/subside?

#### Emphasize/quantify hurricane protection

During the preparation of this EIS, we request that hurricane protection values be quantified for different build scenarios. Utilizing the Multiple Lines of Defense strategy, the restoration of ecosystems can also mean improved storm protection. It is vital that this project both show habitat improvement, as well as increased storm protection for local communities.

#### Project placement

We also ask that multiple locations be analyzed to ensure that the sediment diversion is placed in a location that will maximize sediment delivery. We recognize that there are many competing interests when it comes to placement, but we feel it is imperative to maximize this opportunity to deliver as much sediment as possible.

#### Interaction with other coastal projects

Myrtle Grove cannot be approached in isolation. There are other projects, such as the Davis Pond freshwater diversion and some levee projects that will interact with the Myrtle Grove project. During the preparation of this EIS, we request that past and future projects also be considered. These considerations should include different operation scenarios, as well as assuring that projects that will reduce hydrologic function be avoided.

#### Incorporate sea level rise

It is a fact that sea levels in the Gulf are rising; this compounded by subsidence makes it evident that different sea level rise scenarios be considered in the preparation of this EIS. Further, projections beyond the “project life” should be considered to assess the potential of the sustainability of created wetlands beyond the typical 50 year project life.

### Continued Monitoring

We would like to emphasize that if this project moves forward, and if there are to be additional sediment diversions in coastal Louisiana, it is vital to show that sediment diversions are effective methods of coastal restoration. This is why there must be in-depth and long-term monitoring of this project. Parameters should include, but are not limited to water quality and nutrients (see discussion above), sediment accretion, above ground growth, below ground root growth, damage from future storms (and recovery), vegetation types, nutria herbivory, fish assemblages, and benefits/impacts to local communities

### Adaptive management

If the concept of adaptive management is to be used on a project of this scale, preparation for this must be done on the front-end. Design of this project must include avenues for change in design and operation. Additionally, the design should also include an “exit strategy.” In other words, in case the project does not behave in a beneficial way, methods to significantly alter the project after or during construction should be analyzed.

### No action alternative

When considering the “no action alternative,” we request that the Corps take into account the additional wetlands and ecosystem services that will be lost if the restoration associated with the Myrtle Grove project does not take place.

### Ownership and access

During the development of this EIS, we also suggest the Corps assess issues regarding ownership and access. Specifically, who will own the land created by this project, and how will access to the land and waterways involved in this project be handled, both during construction and post project?

### Conclusion

We appreciate the opportunity to offer questions and suggestions during this scoping process. Additionally, we respectfully request that additional public meetings be held, not just meetings that are required by NEPA. At one of the scoping hearings, Corps employees committed to having community meetings where ideas can be shared and questions can be answered. It was stated that these meetings will be held after the scoping document is compiled. We are looking forward to these meetings, and hope that there will be more of these

type of meetings so the public can be truly involved in the decision-making process

We look forward to a continued dialogue. If you have any questions, please do not hesitate to contact GRN.

For a healthy Gulf,

Matt Rota  
Water Resources Program Director

U.S. Army Corps of Engineers  
P.O. Box 60267  
New Orleans, LA 70160-0267

**Re: Louisiana Coastal Area, Medium Diversion at Myrtle Grove with Dedicated Dredging Ecosystem Restoration Project**

Dear Ms. Leroux:

Restore or Retreat (ROR) is a regional, coastal advocacy, non-profit organization created by concerned stakeholders in the Barataria and Terrebonne Basin who recognized this area was on the brink of an environmental and economic disaster due to increasing coastal land loss and salt water intrusion. Since our inception in 2000, ROR has been actively engaged in the day-to-day effort to aggressively implement sustainable restoration projects for our area and has worked diligently to advocate on the state and federal level for the effective projects that our area so desperately needs and deserves. ROR respectfully submits the following comments regarding the preparation of a Draft Environmental Statement (EIS) for the Louisiana Coastal Area Study (LCA) - Medium Diversion at Myrtle Grove with Dedicated Dredging Project.

*Overall Comments*

We support the general principle behind project scope as stated: "The restoration feature consists of a freshwater diversion ranging from 2,500 to 15,000 cubic feet per second, coupled with dedicated dredging for the creation for up to 19,700 acres of new wetlands," but have the following concerns:

- "Up to 19,700 acres"- Given the cost constraints on the project and the range in scale stated in the scope, how will decisions be made regarding the balance of water diversion and marsh creation? If funds are too limiting to achieve the highest scale identified here, which element of the project will be given priority?" "Ranging from 2,500 to 15,000 cfs"- would an operational plan be implemented? Who would oversee? Is this an estimated average annual discharge? Will pulsing be considered as an alternative? Does pulsing fit within the authorized scope?

*Proposed Action*

While we support the strategy of coupling a fresh-water diversion with dedicated dredging, we do so with caution. Statements included in the project summary and proposed action, such as: "This particular combination of restoration features would allow for the rapid creation of wetland acreage and enable long term-stability" should be tempered. While we believe this type of coupling is a good strategy based on sound theory, we do not have an existing freshwater diversion that has been supplemented with dedicated dredging that has provided the data to prove this statement. This project could have this potential, but we should be cautious not to "oversell" the overall benefit of this project to the public. Our recent experience with the West Bay Diversion has proven how important it is that all involved have a realistic expectation of the outcomes, how quickly they will materialize and the uncertainties involved.

### *Compatibility*

This EIS will be tiered off of the programmatic EIS for the LCA Ecosystem Restoration Study from November in 2004, which was then followed with a Record of Decision in November 2005. After that exhaustive previous analysis, and the developments in understanding which have occurred in the intervening time, what elements of this EIS agrees with/contradicts the 2004 EIS? How will those issues be resolved?

### *Long-term Strategy*

A concern of our organization is whether construction of the proposed project would preclude additional diversion projects from being constructed in the Barataria Basin, either at the same size or larger than the proposed Myrtle Grove diversion. Also authorized as part of WRDA 2007 within the 2005 Chief's Report (LCA) was the "Investigation of Other Large Scale Concepts," like the Mississippi River Hydrodynamic and Delta Management Study, which was intended to encompass the scope of indentifying implementable alternatives that can make the maximal use of river resources through the Mississippi River gulf delta and vicinity. In other words, inventory of other projects currently being planned and implemented for the Barataria Basin needs to occur and the benefits of this project need to be evaluated in that context. How does this project fit into a more comprehensive strategy of restoration of the area and use of the Mississippi River resources?

### *Environmental Impacts*

Environmental impacts should be evaluated on the basis of its effect on the entire Barataria Basin. Resources may move within the basin as a result of the project but will not necessarily be lost completely – this should be considered in the analysis. For example, the impact of the diversion may lead to an increase in white shrimp and decrease in brown shrimp, and/or a shift on the location of their habitat within the Basin, as opposed to being lost completely. This "trade-off" is far different than habitat for the species being lost altogether.

### *Navigation*

As with any project using river resources that is being proposed, navigation is a critical issue, and the following needs should be considered.

- What are the expected 21st century needs of the navigation industry?
- Will their future/anticipated needs be accommodated with this project?
- What is the likely consequence for channel maintenance?
- What are the engineering challenges of integrating expected navigation uses with utilization of river resources with both the use of the freshwater for the diversion and removal of sediment for dedicated dredging?

In conclusion, we think believe the proposed Medium Diversion at Myrtle Grove with Dedicated Dredging project has merit, but this project has many factors that should be taken into consideration, such as: feasibility of stated proposed actions, compatibility with previous studies, long-term strategy for uses of Mississippi River resources, basin-wide environmental impacts, and impacts to and accommodations for navigation.

We look forward to intently following the progress of this study. If you have any questions or if there is anything you should need, please do not hesitate to contact our office at (985) 448-4485.

Sincerely,

Simone Theriot Maloz

RE: Comments on Draft Environmental Impact Statement for the LCA Plaquemines Parish, LA, Medium Diversion with dedicated dredging.

DA: 12/17/2010

The Myrtle Grove diversion and dedicated dredging project should be a model for a next generation of diversions that use a pulsed operation and maximize sediment transport for effective land-building. To ensure a project that leads toward a healthy, thriving ecosystem and sustainable wetland areas, the Environmental Impact Statement must examine a number of factors.

The Myrtle Grove diversion and dedicated dredging should be built to maximize the land-building potential of the project. The alternatives in the EIS should compare the effectiveness of different rates of flow (including flows larger than 15,000 cfs). It should examine strategic placement of material using dedicated dredging to capture and entrain sediment. It should base alternatives on recent scientific research on sediment loads, location, and movement to ensure that the location, design, and operation of the diversion structure maximizes the delivery of sediment. In order to evaluate land-building potential and effectiveness, physical as well as numerical models should be developed and utilized.

Building land is critical to maintaining the culture and economy of the Barataria Basin. A thriving fishery is critical to these purposes as well. The EIS should examine “pulsing” alternatives that consider impacts to oysters and other fisheries while taking advantage of the best opportunities to deliver sediment to build land and sustain the ecosystem. The potential presence of pollutants in the water – nutrients, toxins, and run-off from farm fields – should be thoroughly investigated and evaluated. The EIS should determine whether the water entering the basin as a result of the diversion will cause negative impacts, and should suggest measures to avoid, minimize, or mitigate such impacts if they are present.

The EIS should also examine impacts associated with higher water levels, including the potential for flooding of homes and businesses, which could result from controlled operation of the diversion. It should evaluate changes in water levels and velocities in the Barataria Basin as a result of a Myrtle Grove land-building diversion that could affect communities and industry, and develop alternatives that address and/or mitigate potential harm from flooding.

In addition, alternatives in the EIS should be evaluated for positive or negative effects on dredging volumes in maintained portions of the navigation channel. Potential impacts should be identified and evaluated, and measures should be provided to maximize benefits .

To maximize the potential for land-building, recent science has pointed toward the importance of an effective operational plan to complement an effective diversion design. The EIS should identify key parameters for monitoring, and should propose an operational plan based on these parameters that seeks to maximize land-building and minimize other foreseeable negative impacts to the receiving basin.

Creating sustainable wetlands in the Barataria Basin through the combination of dedicated dredging and sediment diversion will help to halt the highest rates of land loss along the coast, and will provide a “first line of defense” for the state’s largest metropolitan area. The protective value of this wetland buffer should be quantified in the EIS and included as a benefit of the project.

The best available data for addressing the impacts referred to above is the OCPR/NGO/contractor data collection and modeling that has been provided to the Corps. This effort has examined flows up to 75,000 cfs at a preferred sediment-richer location. It has also examined efficient conveyance channel alignment and diversion structure configuration.

In summary, in the face of coastal land loss, the sediment and power of the Mississippi River are resources that must not be wasted. The River must be reconnected with the wetlands in a controlled way, and with an eye to urgency and maximizing the potential for land-building. At the same time, lessons learned from previous fresh-water diversions, concerns of stakeholders, and recent science must be addressed and incorporated in the EIS. Proposed quarterly meetings with stakeholders offer a check point for the project team and the stakeholders. The Myrtle Grove diversion and dedicated dredging should combine effective sediment capture with pulsed operation to mimic the natural delta-building cycle, maintain a thriving ecosystem and fishery, and let the River do what it does: build land.

LCA - Medium Diversion at Myrtle Grove with Dedicated Dredging  
Scoping Comment

Comment: This diversion is needed. This project and the other projects that will be completed will help to rebuild the natural ridge. This area is eroding fast and this should become an accepted project as soon as possible.

LOUISIANA COASTAL AREA MEDIUM DIVERSION AT  
MYRTLE GROVE WITH DEDICATED DREDGING PROJECT  
PUBLIC SCOPING MEETING TAKEN AT JOSEPH'S HALL,  
CROWN POINT, LOUISIANA ON THE 9TH DAY OF  
NOVEMBER, 2010 COMMENCING AT 6:30 P.M.

REPORTED BY:

RACHEL Y. TORRES, CCR, RPR  
CERTIFIED COURT REPORTER

♀

1

MS. RODI:

LCA meeting- 11-9-10.txt  
we'll get started. Good

2  
3 evening. welcome and thank you  
4 for coming. My name is Rachel  
5 Rodi. I work in the Public  
6 Affairs Office for the Army Corps  
7 in New Orleans. We have a good  
8 turnout tonight and thank you for  
9 coming. First of all, we'll  
10 introduce our Corps team. Andy  
11 MacInnes is a project planner and  
12 he can speak to who else is here  
13 from the Corps as well. Patricia  
14 Leroux is the environmental  
15 manager from the state, our  
16 partner. We have Andrew Beall,  
17 Jammie Favorite. Andrew is the  
18 project manager and Jammie is the  
19 LCA program manager, and Russ  
20 Joffrion. Did I say it right?  
21 The project engineer.

22 Also would like to thank  
23 Royce Blanchard from John Young's  
24 order. Marty Winter, the coastal  
25 zone manager, Jefferson Parish.

3

♀

1 And then we have several NGO's;  
2 National wildlife Federation  
3 Environmental Defense Fund,  
4 Coalition to Restore Coastal  
5 Louisiana, Gulf Restoration

LCA meeting- 11-9-10.txt  
6 Network. I hope I didn't miss  
7 anybody. And we also have  
8 partners from FEMA here if you  
9 have any flood insurance  
10 questions after the meeting.  
11 Like I said, Andy will go over  
12 the Louisiana Coastal Area  
13 Program. He will give an  
14 overview of that. And then he  
15 will go over the Myrtle Grove  
16 project, and then Trish will come  
17 up and talk about the NEPA,  
18 National Environmental Policy  
19 Act, and then the formal scoping  
20 process well' open it up for you  
21 guys to come up and give your  
22 comments.

23 With that, I'm going to turn  
24 it over to the Andy.

25 MR. MACINNES:

♀

4

1 Good evening everybody. I  
2 appreciate y'all coming out here  
3 and I look forward to the  
4 opportunity to talk to you about  
5 this project. We're here to  
6 discuss the Louisiana Coastal  
7 Area, LCA Medium Diversion at  
8 Myrtle Grove with Dedicated  
9 Dredging Project. That project

10 LCA meeting- 11-9-10.txt  
11 might sound familiar to a number  
12 of you because it's been around  
13 for a long time and has changed  
14 and been modified in a couple of  
15 different ways over the last  
16 number of years, but believe it  
17 or not, tonight is a good night  
18 and it's a good sign for this  
19 project because we do have some  
20 traction to get the project  
21 moving forward. We have received  
22 a congressional authorization,  
23 and we're here tonight to present  
24 where we are with the study, and  
25 most importantly, receive  
feedback from interested

♀

5

1 stakeholders, the general public  
2 and other people who have an  
3 interest in the project. So  
4 that's our purpose for the  
5 scoping meeting tonight.

6 Next slide. So what I wanted  
7 to do is kind of refresh  
8 everybody's memory about what  
9 developed with the LCA program  
10 over the time period from about  
11 early 2002, 2003 through 2004.

12 So we'll go to the next slide  
13 here. That program was set up,

14 LCA meeting- 11-9-10.txt  
15 and some of you may remember that  
16 originally it was envisioned as a  
17 very large scale, long term  
18 program. It looked at trying to  
19 come up with projects and project  
20 features that would address some  
21 of the severe coastal land loss  
22 problems that coastal Louisiana  
23 was experiencing, and the  
24 original price tag was around \$14  
25 billion. The original timeframe  
was about 30 years, and that

♀

6

1 conceptual project or program,  
2 excuse me, got pushed forward but  
3 was kicked back down by the  
4 administration at the time to  
5 reduce in scope and budget to  
6 something a little bit more  
7 manageable that administration  
8 felt that the cost and the scope  
9 was a little bit too far reaching  
10 to accurately get a grasp of, so  
11 the program got shrunken down to  
12 about \$2 billion and to about ten  
13 years. well, that significantly  
14 reduced overall number of  
15 projects that were comprised  
16 within that LCA program, so to  
17 make a long story short, the LCA

18 LCA meeting- 11-9-10.txt  
19 Medium Diversion at Myrtle Grove  
20 is one of those projects that did  
21 manage to make it through that  
22 cutting process.

23 So you can see some of the  
24 main points of the original LCA  
25 program here. There is a number  
of different conceptual

7

1 restoration types of projects  
2 that have been proposed;  
3 everything from river diversions,  
4 which is what we'll talk about  
5 tonight, to Barrier Island  
6 projects, and it's also looking  
7 at restoring at a more regional  
8 type of level. You know, these  
9 are bigger picture, more  
10 complicated projects. A lot of  
11 you may be familiar with the  
12 CWPPRA program. It's a very good  
13 program that's been around for a  
14 number of years, and that program  
15 looks at much smaller scale,  
16 shorter duration type of  
17 projects. Well, LCA is an amped  
18 up version of the CWPPRA program,  
19 and some of the projects are  
20 quite expensive, and, you know,  
21 may have some significant changes

22 LCA meeting- 11-9-10.txt  
23 for us to have to think about and  
24 consider as we move forward with  
25 coastal restoration in Louisiana.

Next slide. So some of the

8

1 critical needs that were  
2 identified in the 2004 LCA main  
3 report. These speak to a  
4 fundamental problem with the  
5 Louisiana coast. We know we have  
6 constructed levees which have  
7 isolated the wetland basins from  
8 the Mississippi River. That's a  
9 fundamental problem, so a  
10 critical need is restoring a  
11 deltaic process. Also looking at  
12 areas where not only have we lost  
13 land already but where we are  
14 predicted to lose land in the  
15 future over that ten year horizon  
16 and even beyond that, and then  
17 perhaps most importantly is  
18 looking at how we can use coastal  
19 restoration to protect local,  
20 regional and national  
21 socioeconomic issues. That can  
22 be everything from existing  
23 infrastructure to commercial  
24 fisheries to recreational  
25 fisheries to businesses and all

1 of the other socioeconomic issues  
2 that we're interested down here.

3 Next. Okay. So the ten  
4 year, \$2 billion LCA program  
5 identified 15 main projects, and  
6 they are all listed here. The  
7 projects with the large white  
8 circles, one through five, those  
9 are identified as critical near  
10 term restoration projects. The  
11 2004 LCA program specifically  
12 identified those projects as the  
13 -- as being on the short list,  
14 sort of speak. Those are the  
15 projects that need to be  
16 addressed first and foremost.  
17 There was a great deal of  
18 analysis and effort that went  
19 into trying to capture as much  
20 science and engineering and  
21 tangible information and feed  
22 that into the report so we could  
23 jump start those projects. The  
24 Myrtle Grove Diversion project is  
25 one of those five near term

10

1 critical projects. The other  
2 numbers there are classified as a

3 different tier under the LCA  
4 program, so we have been working  
5 on those projects. Our  
6 partnership with the State has  
7 been developing studies for other  
8 projects that affect the  
9 Barataria Basin, the Terrebonne  
10 Basin and the Breton Sound Basin.

11 So that's just a broad  
12 overview of what happens with the  
13 LCA Program. And I remember  
14 seeing some of you at some of  
15 those public scoping meetings  
16 back in 2004. I made some  
17 comments about the projects at  
18 that time, and here we are again.  
19 I know it's like a bad record  
20 sometimes, but, like I said  
21 earlier, this is a good spot for  
22 this project to be in.

23 So now I will jump into some  
24 of the details that were  
25 described and analyzed in the

11

1 main report for the Myrtle Grove  
2 project.

3 So there you can see No. 5,  
4 that's the initially identified  
5 location for the Medium Diversion  
6 at Myrtle Grove. That blue cross

7 hatched area shows preliminary  
8 influence area within the  
9 Barataria Basin. And this is  
10 some text that was pulled from  
11 the 2004 main report. If you are  
12 interested you can actually  
13 download the 2004 report from the  
14 LCA.gov website. I encourage you  
15 to go there and you can keep  
16 track of the projects that are  
17 already underway and being  
18 developed. We have a number of  
19 projects that are about to be  
20 sent back up to Washington for  
21 authorization and you can keep  
22 track of them and you can also  
23 download the main report from  
24 2004, which will contain this  
25 information here, but as you can

12

♀

1 read, we're looking at what is  
2 quoted as a medium size  
3 diversion. Something recommended  
4 in the range of 2500 CFS to  
5 15,000 CFS. There is also a  
6 dedicated dredging component.  
7 This is actually using a  
8 mechanical dredge in the  
9 Mississippi River to dredge  
10 sediment and pump it directly for

11 marsh creation in an outfall  
12 area. There was an initial  
13 estimate of creating  
14 approximately 13,000 acres or so  
15 with dedicated dredging over the  
16 period of life for the project.

17 So there is a couple of  
18 different mechanisms in place  
19 that could be factored into how  
20 this project develops and these  
21 are some of the comments that we  
22 would like to hear about from  
23 you-all tonight if you feel that  
24 something is more important than  
25 another or if this project needs

13

1 to take a particular direction,  
2 that's what we're interested in  
3 getting from interested  
4 stakeholders.

5 Next. This is a little blurb  
6 about the authority that I  
7 mentioned earlier. In 2007  
8 congress passed the water  
9 Resources Development Act.  
10 That's the authorization. That's  
11 basically congress giving the  
12 Corps and State permission to  
13 proceed with the studies that  
14 will determine exactly how the

15 project will look, how big it  
16 will be, what size the diversion  
17 will be, how much water will flow  
18 through it, when water will flow  
19 through it, how much marsh  
20 creation will be the. This  
21 authorization is the green light  
22 to start answering all of those  
23 important questions. As you can  
24 see there at the bottom in the  
25 red text the initial identified

14

♀

1 price tag for this project is  
2 about \$278,000,000. There is  
3 also a provision in the WRDA  
4 authorization that allows you  
5 some wiggle room, sort of speak,  
6 in developing the project, and  
7 that gives you an extra amount of  
8 money that you can use to develop  
9 the project without having to go  
10 back and seek a reauthorization,  
11 so that can push the overall  
12 price tag of this project up to  
13 about \$415 million.

14 As I stated earlier, much  
15 more larger scale, more complex  
16 types of projects, you know, is  
17 what the intent of the LCA  
18 Program was.

19           Next. So in any study that  
20 we start, you have to identify  
21 the problem first. That's your  
22 first step in trying to figure  
23 out, well, how can you solve the  
24 problem, you know, what do you  
25 need to develop that will address

15

♀

1           the issues that you are concerned  
2 with, and so these problems  
3 statements have been developed  
4 for all of the LCA projects and  
5 they speak to a lot of the  
6 problems that we are all very  
7 familiar with; saltwater  
8 intrusion, channelization,  
9 subsidence, those kinds of things  
10 so that gets your mind prepared  
11 for coming up with solutions that  
12 will potentially address some or  
13 all of the problems within your  
14 study area.

15           Now, coincidence with a  
16 problem statement is your goal;  
17 what are you ultimately trying to  
18 do here. To put it in simple  
19 terms, we're really interested in  
20 reducing the current trend of  
21 degradation. One of the things  
22 that the LCA Program looked at

23 was how do you quantify whether  
24 you're project is successful or  
25 not, and they set some categories

16

1 for determining, you know,  
2 whether you're meeting your goals  
3 or not and that could be at the  
4 low end reducing the rate of loss  
5 that a project area is  
6 experiencing, trying to maintain  
7 no net loss, just keep that  
8 current amount of acreage in  
9 place or, you know, if you really  
10 want to shoot for the moon trying  
11 to increase the amount of acreage  
12 within the study area.

13 So here just setting the kind  
14 of generic standard of reducing  
15 the current trend of degradation  
16 is where we are going to start.  
17 what the final study  
18 recommendation will be might  
19 shoot for something ambitious.  
20 You know, creating marsh within  
21 the study area over the 50 year  
22 timing planning timeframe. we  
23 don't yet know. Those details  
24 have just not yet been developed.

25 Next, please. So with the

17

1 problems statement you start  
2 thinking about some of the issues  
3 that are dramatically affecting  
4 your study area. We've seen a  
5 lot these all over the coast.  
6 They are more or less  
7 interchangeable and it's a pretty  
8 lengthy and serious list of  
9 problems that we need to deal  
10 with. It's a complicated process  
11 to figure out how you address  
12 subsidence within an area and how  
13 you address sea level rise. Some  
14 initial projections look at  
15 potential sea level rise rates of  
16 up near four feet over the next  
17 one hundred years. We don't know  
18 if that's going to be true or  
19 not. Time will tell, but these  
20 are things that we certainly have  
21 to plan for. The Corps has  
22 guidance that says you need to  
23 consider these types of things in  
24 developing project solutions,  
25 and, you know, the other issues

18

1 there will be other  
2 considerations that we take into

LCA meeting- 11-9-10.txt  
3 account with construction of a  
4 diversion on the Mississippi  
5 River. There is the potential  
6 that you have increased shoaling  
7 efforts within the Mississippi  
8 River. You know, that might  
9 result in increase dredging costs  
10 for navigation to be maintained,  
11 so we need to think about a lot  
12 of different things, and if you  
13 as interested stakeholders in  
14 this project have other issues  
15 that you want us to pay  
16 particular attention to then  
17 please let us know about them.  
18 we need to hear from you.  
19 You-all offer a certain amount of  
20 expertise that we don't have, and  
21 so we can learn a lot from some  
22 of the things that you have  
23 experienced and are familiar with  
24 with our study area.

25 So these are opportunities

19

1 that had been developed under the  
2 LCA report and they speak to the  
3 type of project that it is. I  
4 mean, in restoring impaired  
5 deltaic function. We don't have  
6 a functioning deltaic system

LCA meeting- 11-9-10.txt  
7 within the basins that are on  
8 either side of the Mississippi  
9 River anymore. Except for the  
10 Mississippi River Delta down at  
11 the end where we have a few  
12 opportunities where water can be  
13 introduced and sediments can be  
14 introduced into basins but it's  
15 not a true deltaic functioning  
16 process anymore. That situation  
17 has been eliminated by  
18 construction of river levees.  
19 Balancing out the salinity  
20 regime. We have seen a  
21 significant amount of habitat  
22 change within the Barataria  
23 Basin, the Breton Sound Basin and  
24 other areas, too, because of the  
25 problems that were identified

20

♀  
1 earlier, like subsidence, like  
2 channelization. So these types  
3 of opportunities will help shake  
4 the direction that the study  
5 takes, and we'll keep these in  
6 mind as we come up with different  
7 types of solutions to develop.  
8 So this is a map that was  
9 embedded within the 2004 main  
10 report. You can see the outline

11 LCA meeting- 11-9-10.txt  
12 of the Barataria Basin there in  
13 that red hatching. It was  
14 initially proposed that this  
15 diversion be located in the  
16 Myrtle Grove vicinity just south  
17 of the Alliance Refinery, for  
18 those of you who are familiar  
19 with the area. We would have an  
20 outfall channel that would cut  
21 through the land that is adjacent  
22 into the river and feed out into  
23 these two areas. Area 1 is  
24 identified as an area that would  
25 have the dedicated dredging  
components would be most affected

21

1 by the sediment introduction  
2 through the diversion structure.  
3 You know, sediments come through  
4 and they tend to settle out as  
5 velocity of the water slows down,  
6 so we anticipated that most of  
7 that affect would be in area 1.  
8 However, the water that does get  
9 introduced from the Mississippi  
10 River has a much more far  
11 reaching effect beyond just Area  
12 1, and so we identified Area 2 as  
13 an area of potential effect for  
14 salinity changes where the basin

15 LCA meeting- 11-9-10.txt  
16 could be influenced by freshwater  
17 that is introduced from the  
18 Mississippi River.

19 So there was some detail that  
20 was pulled together in the 2004  
21 report that recommended a  
22 particular shape and size of  
23 project. Even though we defined  
24 a Medium Diversion as between  
25 2500 and 15,000 CFS, the initial  
recommendation was for a

22

1 structure capable of introducing  
2 around five thousand CFS. In  
3 addition to that, we would have  
4 an outflow channel which would  
5 carry that diverted water into  
6 the estuary on the Barataria  
7 side, be roughly about three  
8 miles long from the river to the  
9 basin, and some of the invert  
10 depth there of the structure to  
11 capture sediment and then force  
12 that water through the channel  
13 into the estuary are listed  
14 there. In addition we would have  
15 to account for some  
16 infrastructure adjustments and  
17 modification, everything from  
18 ensuring that we have continued

19 LCA meeting- 11-9-10.txt  
highway access over Highway 23  
20 during construction, you know,  
21 that is a major evacuation route  
22 for the area of Plaquemines  
23 Parish that is south of Myrtle  
24 Grove, so transportation access  
25 would be need to be maintained

23

1 during construction. We would  
2 also have a non-federal levee on  
3 the backside of the project right  
4 before you get into the estuary,  
5 and now interestingly some of  
6 that area is under consideration  
7 right now for incorporation into  
8 the federal levee system, so  
9 that's a new reality that we're  
10 going to have to plan around and  
11 account for.

12 I haven't seen anything that  
13 explicitly states what the  
14 alignments of this new federal  
15 levee system will be but we will  
16 have to plan for that. There is  
17 a couple of different outcomes  
18 that could occur here with  
19 building a conveyance channel for  
20 the diversion and maintaining a  
21 federal level of protection with  
22 the levee system. That might

23 LCA meeting- 11-9-10.txt  
mean that you either have guide  
24 levees along the side of the  
25 channel that tie into the river

24

♀

1 levee and maintain that minimum  
2 standard of protection. It might  
3 mean that you have a smaller  
4 guide levee and then maybe some  
5 sort of gated structure at the  
6 back end that ties into the newly  
7 created federal levee system. We  
8 don't know what those details  
9 will look like, but we do have to  
10 account for them. Then there at  
11 the bottom you see that we are  
12 talking about potential marsh  
13 creation up to 6500 acres or so.  
14 I want to say that there was an  
15 estimate of dredging  
16 approximately two million cubic  
17 yards per year from the  
18 Mississippi River to create 6500  
19 acres. That wouldn't be done all  
20 at once. That would be done over  
21 a number of years. I think it  
22 was roughly 16 years or so that  
23 that marsh creation would occur,  
24 and there are numerous marsh  
25 creation cells that have been

25

1 targeted and defined in some of  
2 this eroded coastal area that's  
3 in the immediate outfall area, so  
4 the idea is that you place a pipe  
5 and complete your dredging cycle  
6 and fill in some of these cells  
7 as you develop, and then as areas  
8 fill in, you move to the next  
9 site and strategically fill that  
10 new marsh creation around the  
11 outfall of the diversion.

12 Next. So I went back through  
13 the EIS and response to comments  
14 from the 2004 LCA Report. You  
15 know, there were a number of  
16 meetings that were held just like  
17 this soliciting comments from  
18 interested stakeholders. We had  
19 four meetings in 2004. There  
20 were two in Belle Chasse. One  
21 was here in Jefferson Parish and  
22 there was one further south in  
23 Plaquemines Parish as well. So I  
24 just captured the main comments  
25 that were written and described

26

1 in the main report appendix and  
2 you can see that there is a bit  
3 of a theme going on there. You

4 know, the comments that people  
5 made in 2004, I'm going to go out  
6 on a limb here and say they are  
7 go to mimic what comments we  
8 might hear tonight. That's just  
9 a wild guess but we'll see what  
10 happens. The focus is on -- was  
11 on sediment delivery, trying to  
12 capture as much sediment as  
13 possible through this diversion  
14 structure, and if not that, then  
15 focusing on dedicated dredging  
16 from the Mississippi River as  
17 much as possible.

18 So that's an overview of the  
19 LCA main report from 2004 and  
20 what was contained in that report  
21 specifically for the Medium  
22 Diversion of Myrtle Grove with  
23 Dedicated Dredging Project. And  
24 with that I will turn it over to  
25 Trish, our environmental lead,

27

1 and she will go through the NEPA  
2 process for y'all. Thank you.

3 MS. LEROUX.

4 Thank you, Andy. Good  
5 evening ladies and gentlemen.  
6 Thank you very much for coming  
7 tonight. I'm Patricia Leroux and

8 I am the environmental manager on  
9 this project.

10 The National Environmental  
11 Policy Act requires that whenever  
12 a federal action will  
13 significantly impact the  
14 environment that a document is  
15 prepared to inform the public and  
16 to study the impacts on -- the  
17 impacts on the environment. It  
18 ensures that the environmental  
19 and economic impacts are studied,  
20 provided for the public for  
21 informational purposes. This  
22 document that we're going to be  
23 preparing on the Myrtle Grove  
24 Diversion with Dedicated Dredging  
25 is going to supplement the 2004

28

1 Louisiana Coastal Area, Louisiana  
2 Ecosystem Restoration Study.  
3 That's a mouthful.

4 Scoping is an important  
5 portion of this procedure because  
6 it allows the public to provide  
7 us with information, concerns,  
8 feedback that we can consider in  
9 the Environmental Impact  
10 Statement as we're doing this  
11 study. This is just a list of

12 kind of a breakdown of what is  
13 involved in the EIS. It's going  
14 to give us the proposed action,  
15 the need for the project, which  
16 goes back to the problem  
17 statement that was earlier  
18 discussed; project alternatives,  
19 what would happen if there was no  
20 action done at all; and the  
21 proposed action; and then also  
22 alternative locations where we  
23 could avoid or minimize those  
24 impacts that the proposed action  
25 has. Since you-all live out here

29

♀

1 and you-all see things that we  
2 don't see, this portion is very  
3 important because you can think  
4 of something that we can't. This  
5 is just a list of some  
6 environmental concerns that are  
7 going to be covered in the  
8 Environmental Impact Statement.  
9 Some that might be of more  
10 concern than others to people in  
11 living in the area would be the  
12 affects on the fishery, essential  
13 fish habitat as well as wildlife.  
14 Some human concerns are impacts  
15 to recreation as well as noise,

16 transportation, how am I going to  
17 get to work, what kind of effect  
18 is that going to have on me, how  
19 am I going to get to sleep at  
20 night. And also some  
21 socioeconomic concerns; once  
22 again, employment, fisheries, tax  
23 revenues; what is going to happen  
24 to my property; what about flood  
25 protection. These are all items

30

1 that are going to be covered in  
2 the Environmental Impact  
3 Statement.

4 This here will show you a  
5 schedule. It's in the very  
6 preliminary stages. It's a  
7 schedule for the EIS. The Notice  
8 of Intent was published in the  
9 Federal Register on October 15,  
10 2010, so it's a little under a  
11 month ago, and tonight starts the  
12 scoping process. The report is  
13 going to be used in the EIS to  
14 focus on those concerns that you  
15 present to us tonight, so we  
16 really do want your feedback.  
17 Once the report is prepared, a  
18 copy is going to be provided to  
19 anybody who wants one, anybody

20 who signs up for the mailing  
21 list. Some of the questions that  
22 are covered, what are the most  
23 important issues in resources;  
24 are there other alternatives.  
25 Once again, this goes back to

♀

31

1 people living in the community  
2 who see things that we don't.  
3 You might be able to propose  
4 something that we're not thinking  
5 of, and are there other  
6 opportunities we need to be aware  
7 of. What are we not seeing; what  
8 have we not addressed. These are  
9 things that you can provide to  
10 us. Any comments that you wish  
11 to provide can be verbal or  
12 written. You can call me. My  
13 phone number is listed there as  
14 well as my e-mail address. There  
15 is also a mailing address.  
16 Anything that is mailed via  
17 snail-mail has to be post marked  
18 by December 17, 2010.

19 This is a list of the  
20 contacts. Andy is up there as  
21 well as myself. We also have  
22 Andrew Beall, who is the project  
23 manager with Louisiana Office of

24 Coastal Protection and  
25 Restoration as well as our

32

1 project manager, Daimia L.  
2 Jackson, who is also with the  
3 Corps.

4 And at this point turn I am  
5 going to turn it over to Rachel  
6 and she is going to explain the  
7 ground rules for the process.

8 MS. RODI:

9 Okay. Now the fun part, your  
10 turn. We are not making it too  
11 formal tonight. It's a small  
12 room. So what we are going to do  
13 is ask you to come to the middle  
14 of the room. We do have a court  
15 reporter here taking your  
16 comments, so she will get all of  
17 those to Trish who will compile  
18 the report. Make sure we get all  
19 of your words copied down so she  
20 kind of uses her eyes, too, to  
21 see what you are saying, so if  
22 you can stand in the middle and  
23 speak so she can see, that will  
24 be helpful. We ask you to keep  
25 your comments to around three

33

1 minutes. Anything else that you  
2 would like to say, that's  
3 perfectly fine, but please wait  
4 until everyone else has gone and  
5 come back again at the end, and  
6 like I said, if you -- if you  
7 don't want to speak tonight  
8 that's okay, too. We have cards  
9 in the back that you can fill  
10 out. Nathan is waving them  
11 around, and you can give those--  
12 they are postage paid so send  
13 them in like that or e-mail us or  
14 call us. We're here to take your  
15 comments. So with that, if we  
16 want to start, whoever wants to  
17 go first, stand in the middle.

18 UNIDENTIFIED SPEAKER:

19 I was told that you would  
20 have a question and answer --

21 MS. RODI:

22 You can ask questions and  
23 Andy can answer them as far as  
24 verification and clarification as  
25 far as the project, but obviously

34

1 we are not going to be able to  
2 answer where you are going to put  
3 it, things like that. We're here

4 LCA meeting- 11-9-10.txt  
5 tonight to take your suggestions  
6 and comments as to what you think  
7 the Myrtle Grove Project should  
8 include.

9 MR. TRIPP:

10 I have a question, just a  
11 question.

12 MS. RODI:

13 wait. Can you stand in the  
14 middle. We are going to try to  
15 get it all on the record.

16 MR. TRIPP:

17 My name is Jim Tripp. I'm  
18 with the Environmental Defense  
19 Fund. In your presentation, you  
20 had a slide where you listed the  
21 five projects under Section  
22 7006-C and -- right there. Okay.  
23 You label it Study Authority.  
24 Now, my understanding of that is  
25 this is authorizing the  
construction of those projects,

35

1 so if I were labeling that slide  
2 I would call it construction  
3 authority. Now, isn't that  
4 correct or are you correct that  
5 this is merely a study authority?

6 MR. MACINNES:

7 well, that's a good point.

8 The authorization did  
9 specifically identify a  
10 construction report to be created  
11 and prepared with moving forward  
12 on these projects. Part of our  
13 problem is that we don't have any  
14 definition of exactly what a  
15 construction report is in Corps  
16 terminology, so we're taking that  
17 as kind of a two prong approach  
18 to try to preserve what we think  
19 congress meant by terming it a  
20 construction report and also by  
21 the fact that the authorization  
22 categorized these five projects  
23 differently than the other six  
24 and the other four that are  
25 currently underway as well. But

36

♀

1 it's a little bit of a balancing  
2 act because regardless of what  
3 the authorization is, we do need  
4 to determine a lot more detail  
5 with the projects to be able to  
6 satisfy the conditions that are  
7 going to be necessary for  
8 producing a Chief's Report to--  
9 or, excuse me, a construction  
10 report to send up to congress,  
11 so --

LCA meeting- 11-9-10.txt

12

MR. TRIPP:

13

Yeah. I'm just looking at

14

the language. Authorized is

15

carried out. That's not study.

16

Carry out means implement

17

construction, is that what it

18

means or does it mean something

19

else?

20

MR. MACINNES:

21

I'm not one hundred percent

22

certain on that. Mark, do you

23

have any insight?

24

MR. MARK:

25

I think, Jim, you are right.

♀

37

1

The project is authorized for

2

construction based upon a

3

favorable report.

4

MS. RODI:

5

Anybody else want to make a

6

comment?

7

MR. HERRMANN:

8

I have a question. I would

9

like to go back -- -

10

MS. RODI:

11

Can you say your name and

12

where you are from. Stand up.

13

MR. HERRMANN:

14

Ralph Herrmann. Myrtle

15

Grove, Louisiana. I would like

16 LCA meeting- 11-9-10.txt  
17 to go back to the slide where it  
18 showed the information gathered  
19 from the last scoping meetings  
20 that they had.

21 MR. MACINNES:  
22 The public comments.

23 MR. HERRMANN:  
24 Public comments. I assume  
25 y'all read those because  
basically I would imagine exactly

38

1 like you said, going to be the  
2 same. First off, move it to Port  
3 Sulphur. They must have had a  
4 lot of responses that were very  
5 similar to this to make this  
6 list, right. I mean, it must  
7 have been overwhelming because  
8 you didn't just pick these out.

9 MR. MACINNES:  
10 No. I went through and tried  
11 to identify all of the comments  
12 that were specifically related to  
13 the Myrtle Grove project.

14 MR. HERRMANN:  
15 So sediment delivery, focus  
16 on sediment, that seems like  
17 pretty common areas. None of  
18 those did I really see we really  
19 want a diversion. I really got

20 LCA meeting- 11-9-10.txt  
the impression that people really  
21 want sediment dredging via  
22 pipeline dredging. Did y'all get  
23 kind of that out of it?

24 MR. MACINNES:  
25 Yeah. Certainly.

39

1 MR. HERRMANN:  
2 why are we back at this used  
3 diversion again?

4 MR. MACINNES:  
5 well, because part of the  
6 reason is that the authorization  
7 for the project didn't say only  
8 do marsh creation via dedicated  
9 dredging. It was partly that and  
10 also partly create a new  
11 diversion structure that can help  
12 nourish and supplement that newly  
13 created marsh with additional  
14 sediments to be introduced into  
15 the system. You know, the marsh  
16 creation would have a very direct  
17 footprint and the idea is to try  
18 and, you know, utilize two  
19 different approaches here to  
20 achieve a maximum benefit for not  
21 only what you just created  
22 directly but also for areas  
23 beyond what was created and that

LCA meeting- 11-9-10.txt  
ties in with those two different  
study areas that were identified,

40

so, you know, the concept of  
introducing sediment through a  
structure, you know, can only be  
done if it's attached to and  
within a freshwater diversion  
structure. You need the water to  
move that sediment naturally from  
the river.

MR. HERRMANN:

We just created 577 acres in  
Plaquemines Parish. We didn't  
have a diversion. We just did it  
with a little pipe and only took  
three months at twenty something  
million dollars. Just imagine if  
we spent, what was it, \$300  
million without the additional  
levee enhancements and all of  
that. \$300 million you probably  
get like nine or ten thousand  
acres for the same amount of  
money and we get it in a few  
months. We wouldn't wait, I  
think I heard the number throw  
around, 50 years. I'm not going

41

1 to be here in 50 years and  
2 unfortunately most of us probably  
3 won't be.

4 One other question. Could we  
5 go back to the map. Okay. The  
6 Area 2, how far does that go  
7 toward the gulf?

8 MR. MACINNES:  
9 Out into the gulf.

10 MR. HERRMANN:  
11 Out into the gulf. What  
12 would the salinity level be on  
13 the north side of Grand Isle.

14 MR. NATHAN:  
15 That is the information that  
16 we're going to be studying. We  
17 don't have that information yet.  
18 We have not run the models to  
19 determine where the impacts is  
20 going to be. That's part of this  
21 study process and that's going to  
22 be in the future reports, and  
23 that's why we're here. We're  
24 really not going to be answering  
25 questions. What we're after

42

1 tonight are your concerns with  
2 our process with the information  
3 that we're gathering, things that  
4 we should be concerned about,

5 and, you know, and present that  
6 to us so that we can come back  
7 with you in the future and say,  
8 okay, this is what we have seen.  
9 This is the model result. We  
10 don't have those answers yet.  
11 This is the beginning of a new  
12 process for this project. Will  
13 it come out with the diversion, I  
14 don't know. Will it come out  
15 with just dredging, I don't know.  
16 Will we come out with a project  
17 at all, maybe not. It's a  
18 process and we have to go through  
19 that process.

20 MR. HERRMANN:

21 Can I formulate that in a  
22 process of concern?

23 MR. NATHAN:

24 Yes.

25 MR. HERRMANN:

43

1 I am concerned that if this  
2 diversion ran in addition to  
3 Davis Pond that the salinity  
4 might be as low as five parts per  
5 million on the north side of  
6 Grand Isle and that might cause  
7 us to have zero ground trim in  
8 the Baratavia Basin and it might

9 cause us to have zero speckle  
10 trout because we can't support  
11 the spawn because the salinity is  
12 lower than 17 parts per million.  
13 That would be my concern.

14 MR. NATHAN:

15 Thank you for your concern.

16 MS. RODI:

17 Thanks. We got it. Perfect.

18 MS. WOOD:

19 Hey. I'm Maura Wood with the  
20 National Wildlife Federation,  
21 and, Andy, a question for you,  
22 because this is a real concern  
23 and obviously anything at Myrtle  
24 Grove is going to have to work in  
25 synergy with Davis Pond and work

44

1 to maintain the productivity and  
2 the fisheries in the Barataria  
3 Basin.

4 Can you talk about the  
5 concept of a pulse diversion and  
6 what, you know, sort of new  
7 information is out there about  
8 how this might be run and  
9 coordinated with sort of the  
10 natural cycles to both deliver  
11 sediment and address concerns  
12 like that.

13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25

MR. MACINNES:

Yeah. I could speak to that a little bit. Basically the concept, and we've employed this concept on another LCA Project on the Breton Sound Basin is that pulsing, which means much shorter duration but more intense blast of water and sediment from the Mississippi River would occur and that that would be the period of focus that you use to quantify and determine the benefits that

45

♀

1  
2  
3  
4  
5  
6  
7  
8  
9  
10  
11  
12  
13  
14  
15  
16

you get by moving the freshwater sediments and nutrients into your target area. It basically says that there are very opportune times during the year when the river is at a peak capacity for containing suspended sediments, which you want to move from the river into the estuary and focus your operation during that time as opposed to, you know, on the other extreme, a wide open operation where you really pay no attention to when it's operating, you just try and maximize their operation if the river will allow

17 it, and, you know, for example,  
18 the syphons in Plaquemines  
19 Parish, you know, they can  
20 operate when the Mississippi  
21 River at Carrollton is at four  
22 feet or greater, and so, you  
23 know, the scheme there might be,  
24 well, if you have got four feet  
25 or more of water in the river you

46

1 operate the syphons and you don't  
2 pay attention to targeting it at  
3 a specific time. But we're  
4 contrasting that and there's some  
5 new research that's being done  
6 that says, you know, there are  
7 very specific times when the  
8 river is rising, for instance,  
9 that you can really maximize your  
10 sediment capture during that  
11 period and that when the river  
12 plateaus or starts falling, all  
13 of that suspended sediment really  
14 takes a nosedive and what you are  
15 pulling through is a much higher  
16 ratio of freshwater to suspend  
17 the sediment, and if you make  
18 suspended sediment introduction a  
19 primary objective of the project,  
20 well that may mean that you don't

21 operate a structure at that time  
22 because you are not getting the  
23 same amount of benefit.

24 MS. WOOD:

25 So at certain times of the

47

1 year it might be just shut?

2 MR. MACINNES:

3 Yeah. Pulsing could mean  
4 that, yes.

5 MS. WOOD:

6 And that will allow salinity  
7 to come back up in the basin so  
8 that it wouldn't be completely  
9 fresh all of the time?

10 MR. MACINNES:

11 That's right. And that ties  
12 into some of the slides that I  
13 mentioned earlier about your  
14 problem statement and your  
15 opportunities. You know, we need  
16 to go through a process -- this  
17 is a definition of Corps work  
18 that says you go through a very  
19 rigorous repeatable process that  
20 allows you to constantly revisit  
21 some of the assumptions that you  
22 have made, some of the things  
23 that you think are true and make  
24 sure that the answers and

25

recommendations that you are

48

♀

1 proposing will feed back into the  
2 assumptions that you made at the  
3 very beginning. Well, if we set  
4 the objectives for this study to  
5 focus on sediment delivery and  
6 captures much sediment from the  
7 river then that can tie into the  
8 how the structure will operate.  
9 It may mean that you don't  
10 operate when the river has  
11 plateaued or the river is falling  
12 or the river is very low in the  
13 winter season when your, on  
14 average, suspended sediment load  
15 tends to be a lot lower than,  
16 say, early spring, you know,  
17 March, April timeframe when you  
18 have got spring thaws in the  
19 Midwest and, you know, snow pack  
20 is melting and it's pushing all  
21 of the accumulated sediments and  
22 nutrients down the Mississippi  
23 River system.

24

MS. WOOD:

25

so if I could just add my

♀

49

LCA meeting- 11-9-10.txt  
comment to what one thing that  
you need to look at in the EIS  
and that is to examine how to  
maximize sediment delivery while  
addressing other concerns by  
looking at pulsing and a very  
fine tuned operation of how you  
operate the diversion so that you  
are looking at all of these  
parameters when there's shrimp in  
the basin, what temperature can  
oysters would stay in freshwater.  
Um, when is turbidity high in the  
river so we can maximize that  
sediment delivery so that we're  
looking at a far more fine tuned  
operation than we've ever seen  
in, for instance, Caernarvon or  
Davis Pond, which are, if I  
recall correctly can run at 8,000  
CFS if you have got the hit.  
Instead, looking at all of the  
different parameters so that it's  
very finetuned and more closely  
mimics the natural cycle.

♀

50

1 MS. RODI:  
2 Thank you.  
3 MR. HERRMANN:  
4 I have one more question. My

LCA meeting- 11-9-10.txt  
5 understanding is that the river  
6 no longer carries the sediment  
7 load to carry 20, 30 years ago,  
8 right? Is that correct? Sorry.  
9 That's a question. I didn't mean  
10 to do that. I have a concern  
11 that the river no longer has the  
12 sediment load that it had 20, 30  
13 years ago.

14 MR. MACINNES:

15 That's an interesting  
16 concern. I am not the best  
17 person to answer that question as  
18 far as putting an actual number  
19 or the percentage of what the  
20 river may have been, but I can  
21 tell you that the Corps spends a  
22 lot of money and time dredging  
23 the lower end of the river every  
24 single year, and so there's  
25 enough sediment in the river to

51

1 keep that type of operation very  
2 active, so if that's some smaller  
3 percentage of what the river used  
4 to carry, you know, that may be  
5 the case. I don't have the  
6 numbers to give you to say how  
7 much less it is now than what it  
8 used to be, but there still is a

9 very active dredging component  
10 that happens at the lower end of  
11 the river so there is some  
12 quantifiable amount of sediment  
13 that still flows through.

14 MR. HERRMANN:

15 why don't we have land at the  
16 mouth of the river, then, if  
17 there is all of this sediment  
18 load down there?

19 MR. MACINNES:

20 well --

21 MR. HERRMANN:

22 I'm just curious. There is  
23 nothing passed Empire.

24 MR. NATHAN:

25 we dredge the channel. If we

52

♀

1 left the channel alone and didn't  
2 provide navigation, that channel  
3 would fill up, it would backup.  
4 It would divert somewhere else.  
5 It would fill out and build land.

6 MR. HERRMANN:

7 So we don't have best use of  
8 our dredge material?

9 MR. NATHAN:

10 well, we are. We use most of  
11 it beneficially now when we are  
12 dredging.

LCA meeting- 11-9-10.txt  
MR. HERRMANN:

13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25

I thought we just dredged it  
up and it carried off the  
Continental shelf. I might be  
wrong there.

MS. RODI:

We are going away from the  
topic tonight. I saw your hand  
up, sir.

UNIDENTIFIED SPEAKER:

I was going to answer that  
question if you want me to, but  
if you--

53

♀

MR. NATHAN:

1  
2  
3  
4  
5  
6  
7  
8  
9  
10  
11  
12  
13  
14  
15  
16

No. We are going to have an  
opportunity at the end of this to  
come one on one with the State  
people, with us and we can answer  
questions, but what we're really  
after, what we need from y'all  
are these comments, so that's  
what I'm really after tonight.

MS. RODI:

All right, Barry.

MR. COLE:

Barry Cole. I am with the  
Louisiana Audubon Council and  
Sierra Club tonight. You didn't  
mention anything about bedload.

17 You talked about diverting the  
18 suspended sediment. There is also  
19 a bed load component which could  
20 be tapped. Is that going to be  
21 considered as part of the  
22 sediment diversion as well as  
23 just the suspended sediment?

24 MR. MACINNES:

25 It certainly would be

54

♀

1 considered. The tricky part  
2 there is being able to draw  
3 bedload sediment up through a  
4 structure and in this particular  
5 stretch of the river that we're  
6 talking about it can be quite  
7 deep in some places; upwards up  
8 to 180 feet around some beds, so  
9 that presents some challenges to  
10 figure out how to pull bedload  
11 sediment up into a structure, but  
12 those are the exact types of  
13 things that we want to consider  
14 in developing the most efficient  
15 and effective structure that we  
16 can to focus on sediment capture,  
17 so, you know, other than me being  
18 able to say we want to look at  
19 that and explore that concept  
20 further, I don't have any answers

21 LCA meeting- 11-9-10.txt  
22 really about how exactly that  
23 might look or what form it might  
24 take with the structure itself,  
25 but we do want to look at that.

MR. COLE:

55

1 Just a follow-up. Dr. Mead  
2 Allison did a study in the river,  
3 you are familiar, I think that is  
4 funded by the Corps, and he  
5 showed the timing and the pulsing  
6 of bedload as it was moving down  
7 and where it was collecting so  
8 there is a timing issue with  
9 bedload as well as the suspended  
10 sediments.

MR. MACINNES:

Thank you.

MR. COULON:

14 Dan Coulon. I'm an oyster  
15 farmer. My concern is about this  
16 pulsating. Two. One, it shows  
17 that I don't think the wildlife  
18 and Fisheries was included in any  
19 decisions from the State of  
20 Louisiana; otherwise, I don't  
21 think we would have that system  
22 because it certainly -- two most  
23 important things about any  
24 fisheries is a consistent

1 salinity, okay. My other concern  
2 is that you are showing Area 1  
3 and 2 as it is affected by Myrtle  
4 Grove without the added  
5 components of the Diversion from  
6 the Bayou Lafourche area and the  
7 Davis Pond area. We know from  
8 the Davis Pond area you can  
9 freshen the water up all of the  
10 way down to Grand Isle, so if you  
11 are running all three operations  
12 at one time, you can forget about  
13 the fisheries as we know it  
14 today. And that brings my  
15 concern to the ecosociology(sic)  
16 part of it -- the socioeconomic  
17 part of it. We don't have any,  
18 okay, and I know you guys aren't  
19 aware of it, but in 1970  
20 something when we had the oil and  
21 bargo, every individual that lost  
22 their job in this area got in  
23 their little boat, went out into  
24 the basin, made money and  
25 supported their families, so it's

1 a significant part of our

2 economy, our culture, and what  
3 you have done so far you have  
4 almost destroyed it. You know,  
5 we have lost the brown shrimp.  
6 we no longer have that to depend  
7 on, and there are many advantage  
8 to that particular species, so I  
9 would request -- you know, a lot  
10 of the things that I saw there  
11 it's just too many to talk about  
12 tonight, but I would suggest that  
13 we include people who know the  
14 environment down here who are  
15 fishery experts into your  
16 decision making process.

17 My other concern is, of  
18 course, that you-all do these  
19 projects and then you turn them  
20 loose, and the people who are  
21 operating them whether the state,  
22 parish, whatever, they don't  
23 necessarily follow the rules.  
24 There has to be penalties for,  
25 you know, you-all establishing

58

1 something and you say, well,  
2 something like every instance I  
3 know of where the Corps has said,  
4 we are doing something for the  
5 benefit of fisheries, oysters in

6 particular because that's what  
7 I'm familiar with, it was  
8 fabricated figures. Erroneous,  
9 totally incorrect. What happens  
10 is when you introduce freshwater  
11 you merely move the fisheries  
12 further south, so you don't  
13 increase anything. You just move  
14 from one position to the other,  
15 okay. So I have many other  
16 concerns and they are of course  
17 that we participate a little bit  
18 more in these meetings, and we  
19 would like to or eager to do  
20 that. One other concern is that  
21 nowhere in here are we showing  
22 the effects of these diversions  
23 on the infrastructure by highway,  
24 businesses or anything else, and  
25 they are certainly going to be

59

1 affected. We saw that with Davis  
2 Pond. When Davis Pond was let go  
3 we had increased water down here  
4 of a foot and a half, two feet.  
5 Without a doubt every time the  
6 winds came from the south we were  
7 flooded out. Did I talk about  
8 pulsating? Terrible. Terrible.  
9 I have no imagination of how or

10 why that was introduced. You  
11 have destroyed everything. You  
12 have one type of environment  
13 today. You have another type of  
14 environment tomorrow, and it's  
15 not just the marine life you are  
16 affecting, you are affecting the  
17 vegetation. There is no doubt  
18 about it. We have a little trail  
19 right here in -- behind City Hall  
20 in Lafitte. You walk around that  
21 trail different times of the year  
22 you are going to see different  
23 types of vegetation growing  
24 depending on the height of the  
25 water, the temperature,

60

♀  
1 everything, so I would like to  
2 suggest you-all get more expert  
3 input from the people that know  
4 the area.

5 MR. MACINNES:

6 Thank you.

7 MS. RODI:

8 Thank you. Any more locals  
9 that know the area that want to  
10 make a comment?

11 UNIDENTIFIED SPEAKER:

12 He summed it up.

13 MS. RODI:

14           Anyone else? If you don't  
15           mind to state your name and --  
16           MS. KULA:  
17           Tracy Kula, the Louisiana  
18           Bayou Association, Barataria,  
19           Louisiana. I think Dan said most  
20           of what everybody -- our concerns  
21           are already. I think one of the  
22           problems over the years has been  
23           that we -- you do these  
24           Environmental Impact Statements  
25           and then you come back out to the  
61

♀

1           community and present it and  
2           people make their comments and  
3           then you go home and you do or  
4           whatever, you go back and you do  
5           what you are going to do, and it  
6           doesn't really seem to change a  
7           whole lot. What Dan was saying  
8           about participation while the  
9           process is going on I think is  
10          critically important because then  
11          I think that will alleviate that  
12          problem of going back and forth  
13          of nothing changing. If we can  
14          see-- sit in the meeting once a  
15          month, once every other month  
16          with people from the community  
17          can be directly involved in that

18 EIS process as it's being  
19 developed and you can get  
20 feedback from these guys, we have  
21 seen severe changes to our  
22 fishery and incomes in the  
23 Barataria Basin since Davis Pond  
24 has been opened and just let  
25 flow. Brown shrimp fishery has

62

1 been severely damaged from it.  
2 So if you are doing an EIS for  
3 Myrtle Grove then you need to  
4 include impacts from Davis Pond  
5 and the other diversions that are  
6 going on. And I think if we have  
7 those meetings going on, we can  
8 give you that input as you are  
9 going. It will -- if we just  
10 open these things, with all of  
11 that freshwater, it's going to  
12 destroy our community; both our  
13 economy and it is already Davis  
14 pond is causing flooding in our  
15 community when its open full flow  
16 like that. The waters with the  
17 lights out would come over the  
18 roads, so we need to participate  
19 as it goes along.

20 MS. RODI:  
21 Thank you.

22  
23  
24  
25

MR. MACINNES:  
Thank you.  
MR. ROTA:  
I will be giving you some

63

♀

1  
2  
3  
4  
5  
6  
7  
8  
9  
10

12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25

more in depth suggestions later.  
There are a few things that I do  
want to highlight. One is --  
MR. MACINNES:  
Your name.  
MR. ROTA:  
I am sorry. Matt Rota with  
the Gulf Restoration Network.  
There is a recent USGS report  
that just came out talking about  
nutrient loads and all of the  
United States rivers are four to  
ten times higher than what they  
should be, what they should be  
historically, and that includes  
the Mississippi River, and I want  
to make sure that in this process  
we're not only looking at  
salinity and things like that but  
also looking at the nutrient  
loading to making sure that we  
aren't overloading the systems  
that we're discharging into.  
Also other water quality  
parameters. I think that, you

1 know, if we are -- if we are  
2 going to move forward with the  
3 sediment diversion, we need to  
4 show that it works. And so what  
5 that means is a lot of  
6 monitoring. I think other water  
7 quality parameters as well. One  
8 thing that intrigued me I know  
9 there is a lot of Atrazine in the  
10 Mississippi River, which is a  
11 nervous side and what is the  
12 effect of putting that into place  
13 where you want to grow plants.  
14 Also, as far as alternatives, I  
15 encourage you to look at being  
16 bold and what would a larger  
17 dedicated sediment diversion look  
18 like. Not that that would be the  
19 option, but don't -- in the  
20 scoping process I encourage you  
21 not to be restrained to the  
22 15,000 CFS. And I would like to  
23 echo again I think one of the  
24 things that should come in this  
25 meeting is the idea of involving

1 stakeholders. Our shrimpers and

LCA meeting- 11-9-10.txt  
2 our fishers down here, oystermen  
3 know this area and you want to  
4 get them included at the  
5 beginning and keep them involved.  
6 That also goes with the  
7 navigation industry. As we know,  
8 induced shoaling can cause a lot  
9 of headaches down the road, and I  
10 know that the NEPA process, EIS  
11 process doing a certain way about  
12 going about things, scoping and  
13 then you get things together,  
14 draft your EIS and all that. I  
15 encourage you to have a lot more  
16 side meetings to make sure that  
17 you have all people on board.

18 The last thing if we come up  
19 with a good idea, last thing you  
20 want to do is get bogged down in  
21 litigation from all sides, and we  
22 don't have that long to save our  
23 coast, so we want to make sure  
24 that everybody is at the table  
25 working together to make sure we

66

♀  
1 can move forward with these,  
2 hopefully not at typical Corps  
3 speed. And, oh, the last thing  
4 is also I think encouraging you  
5 to also couching this in taking a

LCA meeting- 11-9-10.txt  
6 look at -- I didn't see anything  
7 about hurricane protection and  
8 storm protection as one of the  
9 potential benefits of marsh  
10 creation, and I encourage you to  
11 include that in the suite of  
12 benefits and hopefully trying to  
13 quantify what type of protection  
14 can be afforded by a project like  
15 this.

16 MR. MACINNES:

17 Thank you.

18 MR. PULASKI:

19 Chris Pulaski with the  
20 National Wildlife Federation. I  
21 wanted to second the idea of  
22 having an organized monthly or  
23 bimonthly meeting with the  
24 stakeholders area folks. I think  
25 that's a great idea. We have

67

1 been doing a lot of stakeholder  
2 outreach to date and a lot of you  
3 may know some of that information  
4 is available at the front, so we  
5 have got handouts and talking  
6 points and information that we  
7 have been collecting to our  
8 stakeholders outreach. So if  
9 anyone is interested in taking a

10 LCA meeting- 11-9-10.txt  
look, it's back there at the  
11 table and encourage you to do so.  
12 MR. MACINNES:  
13 Thank you.  
14 MR. HERRMANN:  
15 I have a question. The  
16 gentleman mentioned the amount of  
17 load that is in the river today,  
18 what, I'm sorry, how did you  
19 refer to it.  
20 MR. COLE:  
21 Nitrogen and phosphorous.  
22 MR. HERRMANN:  
23 So basically it's like  
24 detergent.  
25 MR. COLE:

♀

68

1 Fertilizer.  
2 MR. HERRMANN:  
3 Is that the same stuff that  
4 causes dead zone in the Gulf?  
5 MR. MACINNES:  
6 Yes.  
7 MR. HERRMANN:  
8 So basically we are going to  
9 introduce 15,000 gallons of that  
10 into the marsh. I'm sorry. That  
11 might be the implication.  
12 MR. NATHAN:  
13 we will talk to you afterward

14 LCA meeting- 11-9-10.txt  
to give an explanation.

15 MR. HERRMANN:

16 I guess the thing is I would  
17 really like all of our discussion  
18 be open so everybody kind of  
19 knows what we are talking about.

20 MR. NATHAN:

21 Right. I understand that.  
22 what I would like to do, we'll  
23 set up a community meeting,  
24 stakeholder meeting and we can go  
25 and sit down and talk about some

69

1 of these things because there are  
2 some advantages of running that  
3 heavily nutrient loaded through a  
4 marsh system. There's some  
5 disadvantages and we need to  
6 discuss that and bring that out.  
7 There is some literature that  
8 says it's good. Some literature  
9 that says it's bad because of  
10 Atrazine.

11 MR. HERRMANN:

12 Are you prepared to discuss  
13 that tonight with everybody here?

14 MR. NATHAN:

15 No. No. We don't have --

16 MR. HERRMANN:

17 Because that's what we would

18 LCA meeting- 11-9-10.txt  
19 like to know. We would like to  
20 know what the result of this is  
going to be on our estuary.

21 MR. NATHAN:

22 I understand that. We will  
23 do that through the process, but  
24 tonight is not what we were  
25 prepared to do, and I know it

70

1 seems frustrating to y'all, but  
2 it's something that we need to do  
3 to start the process.

4 MR. HERRMANN:

5 I understand. Because you  
6 have to have so many scoping  
7 meetings, you have to have EIS  
8 meetings, so we're mostly about  
9 doing business. I would  
10 encourage everybody tonight to  
11 get on the record of whatever  
12 your opinion is to speak up  
13 because if one person gets up and  
14 says we all agree with Mr.  
15 Coulon, well, that's just really  
16 one opinion. Everyone  
17 individually needs to voice their  
18 opinion. Sorry. Thank you.

19 MR. NATHAN:

20 If you don't want to talk,  
21 write it up, mail it to us, it

LCA meeting- 11-9-10.txt  
counts just as much.

22

MS. RODI:

23

If you want to go separately  
and discuss it to our court

24

25

71

♀

reporter afterwards, that's fine,  
too.

1

2

MS. LEROUX:

3

You can e-mail it to me and  
that goes on the record.

4

5

MS. RODI:

6

Next.

7

MR. PEYRONNIN:

8

Steven Peyronnin with the  
Coalition Restore Coastal  
Louisiana, and I enjoy waiting to  
hear a few comments, and it's  
really encouraging that this is  
more of a conversation,  
especially among a lot of people  
that live here, that work here  
that enjoy this environment, and  
it shows also there is a lot of  
information that we need to pull  
in to the discuss the process and  
answer a lot of these questions  
so we can make educated  
decisions, and I hear a lot of  
concerns, so I would like to  
articulate a couple of mine, and

9

10

11

23

24

25

♀

1           it is that this system is  
2           collapsing. It is collapsing  
3           underneath our feet, and that if  
4           we don't take action immediately,  
5           and I think this goes to Jim's  
6           point that, you know, we talk  
7           about the study process, but  
8           there needs to be sense of  
9           urgency and there's a clear  
10          direction from congress that  
11          recognizes the value of this  
12          area, what it means for fisheries  
13          productivity, what it means for  
14          jobs, what it means for  
15          commercial navigation,  
16          recreational navigation, all of  
17          those things are essential, and  
18          there is a clear directive from  
19          congress to act quickly, making  
20          this an urgent issue and we need  
21          you to understand that and  
22          embrace that. The other  
23          challenge here is the money that  
24          is available for us to do  
25          everything that needs to be done

♀

73

1           to try and restore this region.  
2           And I wish that we had the money

3 that this gentleman was talking  
4 about to be able to continuously  
5 dredge material from the river  
6 and rebuild our wetland, and the  
7 sad truth is I have gone knocking  
8 on every door in congress and the  
9 money simply is not there. It's  
10 simply not there to do those  
11 things that we can do that  
12 wouldn't disturb anybody or  
13 anything, and so one of the  
14 answers that we have looked at is  
15 trying to restore some  
16 sustainability in the system so  
17 that I think you are right, 50  
18 years from now I may not be here  
19 but my kids will be and I want  
20 them to have a landscape that  
21 sustains itself and returns  
22 itself back to its normal process  
23 as possible, so one of the things  
24 that I would like you to consider  
25 is how aggressively you can use

74

1 dredge material to put the bones  
2 back on this skeleton and then be  
3 able to nourish that with an  
4 understanding of the sediment and  
5 freshwater you will be  
6 introducing the system so that it

7 can continue to last beyond the  
8 20, 30 year lifecycle that we  
9 seem to be planning for into a  
10 the lifecycle that our culture  
11 depends on which is a lifecycle  
12 of centuries. That's the  
13 timeframe we need to be thinking  
14 about here.

15 The other thing that we need  
16 to be thinking about in the near  
17 term is that this landscape used  
18 to provide critical flood  
19 protection for these communities.  
20 We are starting to see higher  
21 levels of innovation of storm and  
22 rain events and even high tides  
23 and self winds like were being  
24 talked about. So unless we do  
25 something immediately to not only

75

1 provide the flood protection in  
2 the forms of structures and  
3 levees that I know that there's  
4 some ongoing authorizations for  
5 like the Donaldsonville in the  
6 Gulf where we have several  
7 alignments that look at  
8 protecting these type of  
9 communities and further west, but  
10 that has to be built into what

11 we're doing to restore this  
12 system because unless we have  
13 both aggressive restoration,  
14 levee protection and  
15 non-structural planning for our  
16 future we are not doing a whole  
17 lot of good with either one of  
18 those things separately, so we  
19 have to look at how this  
20 diversion or sediment pipeline  
21 delivery will work with the  
22 hurricane protection systems and  
23 also the concerns about running  
24 diversion and creating back  
25 flooding. We can synergize these

76

♀

1 things to where we get both  
2 hurricane protection and  
3 protection from diversions that  
4 are planned for this area by  
5 combining these efforts and  
6 thinking about them. The  
7 salinity regimes, the things that  
8 are so critical to this area that  
9 make it such a productive  
10 fishery, which is the exchange of  
11 freshwater and saltwater. You  
12 know, this Delta produced a lot  
13 of oysters and a lot of shrimp  
14 when there were no levees and a

15 there was a ton of freshwater  
16 coming down the Mississippi  
17 River, so it's not the idea that  
18 we can't have both. We just have  
19 to figure out a way to get back  
20 to the productivity we enjoyed  
21 before we started really heavily  
22 engineering the system.

23 Couple of other things that I  
24 want to talk about. The  
25 operational regime are obviously

77

♀

1 key. The consideration of  
2 alternative locations where you  
3 maximize the delivery of sediment  
4 from the river operating in small  
5 points during the year. That's  
6 how the river built this system,  
7 not with continuous flows of  
8 freshwater, but when we had those  
9 high flows of freshwater with  
10 lots of sediment coming down the  
11 spring, so the pulsing idea I  
12 think does have some potential.  
13 We seen the Bonnet Carre run at  
14 180,000 CFS and fisheries return  
15 to normal, so it's possible that  
16 these two things can be done  
17 together. Some things that you  
18 need to look at is the modeling

19 that the state has done to look  
20 at flow capacities and regime  
21 that give you an idea of where  
22 you see back flooding, fisheries  
23 production and how the dredge  
24 material can be used to take that  
25 water and keep it where we want

78

1 it to go. The westbank technical  
2 analysis. The data and  
3 information derived from the  
4 river loads and bedloads on both  
5 the basin side and the riverside  
6 should be a critical part of what  
7 you are doing. The  
8 Donaldsonville to the Gulf study  
9 as I mentioned, looking at the  
10 Bonnet Carre diversion or the  
11 actual spillway and how it  
12 operates with large flows of  
13 freshwater through the system to  
14 return it to normal. And,  
15 finally, the lake and Atchafalaya  
16 Delta building outlets we see  
17 over in the central part of the  
18 state where the Atchafalaya  
19 delivers an awful amount of  
20 sediment where we're actually  
21 seeing new land grow and new  
22 sediment grow, so, thank you.

23  
24  
25

MR. MACINNES:  
Thank you.

25

Jim Tripp again. Just a  
comments. First of all, to pick  
up with what Steven just said, I  
think a very important part of  
any Environmental Impact  
Statement here is going to be an  
accurate description of baseline.  
What is happening to the system  
if we don't have a project like  
this or other projects that  
convey large amounts of sediment,  
you know, into the system. It is  
losing wetlands. I believe the  
figure of the amount of wetlands  
that have been lost in the  
Barataria Basin over the last 80  
years or something is something  
like 200,000 acres. It's ongoing  
but I think you need to include  
the most accurate data you have  
over the last ten years or so of  
ongoing wetland loss, subsidence  
and erosion and what you  
anticipate over the next 20, 30,  
you know, 50 years. If this were

80

1 a static system or if it was  
2 still building Deltas, we  
3 wouldn't be here tonight. We're  
4 here because of the way the  
5 system is managed. It's a  
6 sediment starved system, and it  
7 desperately needs sediment. One  
8 can look at the different ways of  
9 conveying sediment into the  
10 system when piling on a barge and  
11 bring it in; one could build a  
12 pipeline. Those are expensive.  
13 The idea that you can build a  
14 sediment pipeline cheaply and  
15 operated cheaply you should  
16 include probably based on some of  
17 these comments and information  
18 about that, but it is expensive  
19 to build and expensive to  
20 operate.

21 I think we have heard some  
22 questions about the work quality  
23 in the Mississippi River. I think  
24 it will be useful as part of the  
25 baseline analysis include

81

1 information about water quality  
2 in Barataria Bay, the basin.

3 It's not a pristine system,  
4 sadly. We have heard in more of  
5 words spoken eloquently about  
6 pulsing, but I think we need to  
7 as an alternative look at the  
8 concept of how to optimize a  
9 sediment diversion where the goal  
10 is or one important goal is  
11 maximizing conveyance of  
12 sediment, and there is a limited  
13 period of the year or over  
14 ten-year period, there is a  
15 limited amount of time when that  
16 opportunity is there, so it has  
17 to be really described. Probably  
18 over a ten or 20 year period when  
19 those levels of suspended  
20 sediment would be reached that  
21 really made sense to operate a  
22 sediment diversion, you know, at  
23 capacity, but we might ask the  
24 state to describe some of their  
25 investigations, but I think the

♀

82

1 modeling that, you know, is being  
2 done may be looking at pulsing at  
3 a certain, you know, running  
4 sediment diversion at capacity  
5 for a month or two months out of  
6 the year. The rest of the time

LCA meeting- 11-9-10.txt  
it can be as low as you want.

7  
8 This sediment diversion is not  
9 like Davis Pond. Davis Pond was,  
10 I believe, like Caernarvon,  
11 really designed to put freshwater  
12 into the system for salinity  
13 control. It may not be doing it  
14 well but that's the purpose of  
15 the project. The purpose of this  
16 project should not be that. The  
17 purpose of this project is  
18 conveying sediment. So you are  
19 going to create very changing  
20 conditions in the course of a  
21 year over a ten-year period, but  
22 please remember if you are  
23 apprehensive about what a well  
24 controlled and it is important, I  
25 think any number of people here

83

♀  
1 have done this, to describe the  
2 operational protocol for this  
3 system and how it should be  
4 operating, and there are going to  
5 have to be ways to make sure that  
6 it is done accordingly, but I  
7 think it's important for everyone  
8 to keep in mind what is going to  
9 happen in the system and what are  
10 the fisheries going to be like

11 LCA meeting- 11-9-10.txt  
12 ten, 20, 50 years from now. What  
13 is the storm protection from  
14 wetlands going to be like ten, 20  
15 or 50 years from now if we don't  
16 find ways of conveying large  
17 amount of sediment into the  
18 system. The fact is we do not  
19 have a real sediment diversion in  
20 place in Coastal Louisiana today  
21 other than wax like -- we have  
22 not built a project that is  
23 really designed to large amount  
24 of sediment to building this and  
25 nature, so we have to view this  
as a pilot project or

♀

84

1 demonstration project, and  
2 therefore it's important to treat  
3 it as such in terms of baseline  
4 monitoring that has to go on now  
5 and careful scientific monitoring  
6 during the operation of the  
7 system because we don't -- we  
8 don't have a lot of time.

9 MR. MACINNES:

10 Thank you.

11 MS. RODI:

12 Anyone else?

13 THE COLONEL:

14 I would like to say thank you

15 LCA meeting- 11-9-10.txt  
16 right off the bat. I started at  
17 initial environmentally just like  
18 this just on the other side of  
19 Interstate 310 where it crosses  
20 the Mississippi and the people  
21 there thought that we didn't  
22 listen. That project did not get  
23 past the first initial meeting  
24 because the chief of police and  
25 the superintendent of schools had  
enough data. Took that two

♀

85

1 dimensional picture that we call  
2 a map and a made it four or five  
3 dimensional. Filled it in and  
4 gave us the facts. The community  
5 gave us the facts that we needed  
6 to make a decision that was for  
7 the best interest of the people  
8 of Louisiana, so you may not feel  
9 that we listen to you all of the  
10 time and we're not here to make  
11 everybody happy every time.  
12 Being a serviceman I can  
13 guarantee you that I'm not happy  
14 most of the time, but I can get  
15 tell you that these people  
16 listen. You may not like how  
17 they respond, but I guarantee you  
18 they listen, and I just found out

19 LCA meeting- 11-9-10.txt  
there on the other side of 310 it  
20 just might be that they pull the  
21 plug. Who knows. Thank you.

22 MR. AIRES (phonetically  
23 spelled):

24 My name is Christopher Aires.  
25 I reside here in Lafitte. I'm

86

1 from Caernarvon, Plaquemines  
2 Parish. We had a diversion  
3 behind us. I can give you five  
4 good ones of how it is and I can  
5 give you five bad ones. I would  
6 say the diversion would be good  
7 to the area because of the  
8 saltwater intrusion we have. The  
9 saltwater can come up behind your  
10 house if you don't have no kind  
11 of diversion, so I am not for it  
12 because it's going to do harm  
13 with the dead zone. It's going  
14 to bring a lot of grass and it's  
15 going to change the temperature  
16 of the water, but the sun is so  
17 hot out there, I guess the sun is  
18 going to take care of the  
19 temperature of the water. As far  
20 as all of these diversions help  
21 the area because now we have all  
22 of them pumping stations that is

23 LCA meeting- 11-9-10.txt  
24 pumping all of these streets with  
25 the rains. If the heavy rains  
come and we get Westwego water,

87

1 we get Marrero water, we get  
2 Gretna water, Plaquemines water  
3 and we get all of that trash  
4 water in our estuary if we don't  
5 have no river diversion to help  
6 flush this out, we really going  
7 to be doomed. In Haiti they got  
8 water that is polluting with all  
9 that rain storm, and we don't  
10 want that to happen in our  
11 backyard. The biggest diversion  
12 in the world is Plaquemines  
13 Parish right there, so if they  
14 keep that on, you know how much  
15 pollution we are going to get  
16 from that. We need the diversion  
17 to balance everything out. So  
18 I'm not here for it, I am not  
19 against it, but we need the help.  
20 The river water does help the  
21 area. Caernarvon we had swamp  
22 land our whole lives and flat  
23 land and now we got trees this  
24 big around, so we went from  
25 muskrat hunting to deer hunting.

MS. RODI:

Thank you.

UNIDENTIFIED SPEAKER:

I just want to say one thing.  
From the very beginning these  
massive big projects where you  
are flowing all of this water,  
that's not how the river built  
this thing. You are forcing all  
-- especially in the springtime.  
That water temperature that's  
coming out of that river is cold.  
In the springtime when we have  
crabs and shrimp that need to be  
able to grow -- that need a  
higher water temperature. It's  
not just salinity. It's not just  
about the salinity. There is no  
argument that we need the  
sediment, we need to rebuild that  
estuary or we are not going to  
have a fisheries. We need  
freshwater in the estuary as  
well. But to concentrate this  
stuff in these large amounts in

89

1  
2  
3

one area, Davis Pond, Myrtle  
Grove instead of designing a  
system where when it comes in it

4 then overflows so you don't -- so  
5 it's shallower. You are not  
6 having these huge flows of cold,  
7 highly nutrified water coming  
8 into the estuary. Even the  
9 sediment. In the Atchafalaya  
10 Basin there is huge amounts of  
11 sediment going in there and it's  
12 filling in the swamp and we're  
13 going to lose the Atchafalaya  
14 swamp because of it in attempts  
15 to build land where it should be  
16 finding a way to design this  
17 where it spreads the water and  
18 the sediment over a large area  
19 instead of just concentrating it  
20 like that. The dedicated  
21 sediment where we know we want to  
22 build land, we fully support  
23 that. Finding a way to design  
24 this thing so it is a more  
25 natural flow of both water and

♀

90

1 sediment into the basin needs to  
2 happen, and we have been at this  
3 for, what, 25 years, and that has  
4 been said repeatedly by people  
5 who live down in these areas, and  
6 for some reason these designs  
7 have not occurred. I think you

8 need to focus on that.

9 MS. RODI:

10 Anyone else? Comments,  
11 concerns.

12 MR. BAKER:

13 My name is Andy Baker with  
14 the Lake Pontchartrain Basin  
15 Foundation. Have two things that  
16 I would like to share with you.  
17 We have been monitoring the water  
18 at the Caernarvon Diversion  
19 looking at the turbidity levels  
20 at the water and we found not  
21 surprisingly that the turbidity,  
22 the amount of sediment in the  
23 water varies greatly, and we have  
24 been watching it with this  
25 extended opening this summer that

91

1 actually a small Delta has  
2 started to build up, so we would  
3 say that in the operation of the  
4 diversion or whatever happens to  
5 be built at the end of these  
6 process, we would recommend that  
7 the operators look at the amount  
8 of sediment in the river on a  
9 realtime basis and adaptively  
10 pulse the outflow to maximize the  
11 amount of sediment while, you

12 snow, minimizing the amount of  
13 water that is needed to deliver  
14 that sediment. Also, we have  
15 been looking right across the  
16 river at the Bohemia Pointe a la  
17 Hache area, which if you have  
18 never been down there, it's very  
19 interesting. It's the only place  
20 on the river where there is no  
21 high levee, and so it does have a  
22 more natural flood regime spread  
23 out, more tied to the flooding of  
24 the river, and we think it may be  
25 connected to why the marsh is

92

1 looking so good on that other  
2 side. There is very little marsh  
3 lost and actually some filling in  
4 of canals over there, so adaptive  
5 management and perhaps multiple  
6 small diversions might be good  
7 things to consider.

8 MS. RODI:

9 Thank you. Barry.

10 MR. COLE:

11 Barry Cole again. I just  
12 wanted to emphasize our support  
13 for some of the issues that were  
14 raised by other speakers. One is  
15 the periodic stakeholders during

16 the preparation of the Draft EIS.  
17 I think this is very, very  
18 important. Usually there are no  
19 -- it's the Corps does the draft  
20 and then we get to see the draft  
21 and then we comment on the draft.  
22 I think that input from technical  
23 people in the community, people  
24 who live in the area as well as  
25 the technical expertise on

93

1 fisheries, geology, what have  
2 you, need to be introduced during  
3 the stakeholder meeting that  
4 could be held periodically. I  
5 think it will benefit the Corps  
6 and hopefully get a draft  
7 document that is more acceptable  
8 versus one that has a lot of  
9 errors in it and needs a lot of  
10 correction. It could speed up  
11 the process. We also support the  
12 natural flooding process, the  
13 reintroduction of sediment during  
14 spring floods to try and mimic  
15 that natural cycle. The -- we  
16 support baseline studies very  
17 early in the process to determine  
18 what the baseline is and water  
19 quality nutrients, all of that.

20 There also should be a very  
21 integrated water quality  
22 monitoring program instituted  
23 before and after construction to  
24 see what the impacts are,  
25 especially on the water quality

94

1 issues. We'll submit some more  
2 detailed comments.

3 MR. NATHAN:

4 I am pretty loud mouth so I  
5 probably don't need the  
6 microphone. One of the things  
7 that I was thinking while this  
8 was going on is one of the things  
9 that -- outcomes of this is  
10 report of this meeting, scoping  
11 report, and what I'm going to do  
12 hopefully with the PMs permission  
13 and the PFs permission is when we  
14 finish that scoping report and we  
15 send that out to y'all, after we  
16 send it out, tell you how your  
17 comments are going to be answered  
18 in the EIS the first time we have  
19 a meeting back here to sit down  
20 and answer some of those  
21 questions, so I think that would  
22 be, right now, I'm going to push  
23 for that and hopefully we get

24 that done from our end.

25 MR. HERRMANN:

95

1 I have a question for Ms.  
2 Patricia. You are the  
3 environmental expert?

4 MS. LEROUX:

5 Yes. Yes.

6 MR. HERRMANN:

7 So they are going to build  
8 this diversion in the Myrtle  
9 Grove? I assume.

10 MS. LEROUX:

11 We may. It's still under  
12 consideration but we are not  
13 ruling out any other options.

14 MR. HERRMANN:

15 So in the Environmental  
16 Impact Study you consider things  
17 like how it affects peoples lives  
18 and the location to property and  
19 property values.

20 MS. LEROUX:

21 Absolutely.

22 MR. HERRMANN:

23 So there could be a lot of  
24 several other sites that may be  
25 less affected on peoples houses,

96

1 right.

2 MS. LEROUX:

3 Absolutely. And that is what  
4 is so important about these  
5 scoping meetings. That is why we  
6 want to hear from you. If we do  
7 not hear from you tonight, I  
8 encourage you to e-mail me. My  
9 phone number is right up there.  
10 It's very important that we know  
11 what is happening from people  
12 that live here.

13 MR. HERRMANN:

14 Have you been down to Myrtle  
15 Grove.

16 MS. LEROUX:

17 Yes. As a matter of fact, I  
18 spent two days out there last  
19 week. I am from Gentilly, so I'm  
20 really familiar with Plaquemines,  
21 though.

22 MR. HERRMANN:

23 So you know how close that  
24 diversion is going to be to  
25 peoples houses, right?

♀

97

1 MS. LEROUX:

2 Yes. And that is going to be  
3 considered in the study, so we're

4 LCA meeting- 11-9-10.txt  
going to be looking at all  
5 options, but we don't think of  
6 everything and multiple locations  
7 --

8 MR. HERRMANN:  
9 Somebody should have thought  
10 about 350 home sites a couple  
11 miles from the diversion.

12 MS. LEROUX:  
13 Everything is being  
14 considered. When I say that I am  
15 dead serious. Everything is  
16 being considered. I live here, I  
17 have been -- I was raised here.  
18 My husband was born in Chalmette.  
19 His people are fishermen, so it's  
20 very, very important to me  
21 personally.

22 MR. HERRMANN:  
23 Chalmette is why I live  
24 outside of the levee protection  
25 system.

♀

98

1 MS. LEROUX:  
2 All right, now. But as I  
3 said, if you didn't talk tonight,  
4 if you didn't feel comfortable  
5 standing up or if you think of  
6 something later, please, we have  
7 comment cards, e-mail me, call

8 LCA meeting- 11-9-10.txt  
me, whatever you-all want to say,  
9 we want to hear it. I'm serious.  
10 we really want to hear it because  
11 everything will be taken into  
12 consideration. And thank you  
13 very much for taking the time out  
14 of your busy schedules to show  
15 tonight because it means a lot.

16 MR. MACINNES:

17 I will make myself available  
18 to answer questions that y'all  
19 might have, and I'm happy to chat  
20 with you about anything. Thank  
21 y'all for your time.

22 MR. HELMER:

23 Gary Helmer, H-E-L-M-E-R. I  
24 am just concerned what they got  
25 in mind for the commercial fisher

99

1 man because I see all of this  
2 planning, you know, and I'm  
3 against freshwater. It's killing  
4 us. This would definitely kill  
5 the fisherman. It would be the  
6 final nail in the coffin, and you  
7 can take that to the bank. Thank  
8 you.

9

10 (Whereupon the meeting has been adjourned at 7:57  
11 p.m.)

REPORTER'S CERTIFICATE

I, RACHEL Y. TORRES, a Certified Court Reporter, do hereby certify that the within witness, after having been first duly sworn to testify to the truth, did testify as hereinabove set forth.

That the testimony was reported by me in shorthand and transcribed under my personal direction and supervision, and is a true and correct transcript, to the best of my ability and understanding; that I am not of counsel, not related to counsel or the parties hereto, and in no way interested in the outcome of this event.

1

MS. ROBLES:

2 Hello, everyone. Thanks so  
3 much for coming tonight. I'm  
4 Cheryn Robles, and I'm a  
5 contractor with the Public  
6 Affairs Office at the New Orleans  
7 District.

8 Tonight, we are going to talk  
9 about the proposed medium  
10 diversion at White Ditch --  
11 excuse me; not White Ditch -- at  
12 Myrtle Grove. I'll introduce  
13 several members of our team in a  
14 few minutes, but, right now, we  
15 have the parish president, Ms.  
16 Charlotte Randolph, who's going  
17 to make some opening comments for  
18 us.

19 MS. RANDOLPH:

20 Thank you all for coming.  
21 This is very important to the  
22 future of the eastern side of  
23 Lafourche Parish, so we're glad  
24 that you're here learning more  
25 about it tonight. Thanks to the

3

1 experts who are here to provide  
2 the information for us. Any  
3 effort to bring one grain of  
4 sand, one grain of dirt to  
5 Lafourche Parish is something

20101110 USACE Myrtle Grove Scoping Meeting.txt  
that's important to us.

6  
7 Certainly, we got a close-up look  
8 at it this summer when there was  
9 a little bit of oil on the -- in  
10 those same areas. Now that we're  
11 addressing that issue, now is a  
12 good time, particularly with the  
13 silver lining of the oil spill is  
14 becoming apparent that we will  
15 somehow find a way to benefit  
16 from this, as with any disaster.  
17 And, fortunately, at this point  
18 in time, we've got BP to pay for  
19 it rather than taxpayers. So we  
20 are working through the NRDA  
21 process, through EPA, through  
22 every acronym you can imagine to  
23 see that the money comes to the  
24 areas that need it most, and,  
25 certainly, the

♀  
4

1 Barataria-Terrebonne area is  
2 essential that we do something  
3 and do something now.

4 So, again, I appreciate your  
5 attendance here tonight. Thank  
6 you for coming, the Corps of  
7 Engineers and Audubon Society and  
8 Save Our Coast. So thank you  
9 very much for this, and we'll

20101110 USACE Myrtle Grove Scoping Meeting.txt  
proceed with the presentation.

10  
11  
12

17  
18  
19  
20  
21  
22  
23  
24  
25

Thank you.

MS. ROBLES:

I'm going to welcome everybody who is here from our team tonight: Andy MacInnes, who is the plan formulator; he will be doing the bulk of the presentation. And Patricia Leroux, she's the environmental manager and will be talking about the National Environmental Policy Act compliance element of this project. Also from the Corps, we have the senior project manager, Darrel Broussard, and Daimia

5

♀

1

10  
11  
12  
13

Jackson is the project manager. From the state, we have Jammie Favorite, Wes LeBlanc, and Andrew Beal. We're going to ask that you allow us to get through the whole presentation before you provide your comments. We do have a court reporter recording the questions tonight. And we are going to ask that you just simply provide us your comments, and we won't be responding to them

14 because we don't want to  
15 manipulate any sort of thoughts  
16 or processes; we want it to be as  
17 open as possible and then getting  
18 some brainstorming ideas. So  
19 we're not going to answer you  
20 during the officially recorded  
21 portion of the evening, but we  
22 will be available afterwards.  
23 And all of that will go into the  
24 record as part of the project.  
25 Please -- this is Andy

♀

6

1 MacInnes, and will you please  
2 welcome him. He will give you an  
3 overview of the project.

4 MR. MACINNES:

5 Thank you, everybody, for  
6 coming tonight; it's a neat  
7 opportunity for me to be able to  
8 talk to you about this project.

9 And I wanted to start by  
10 reminding you how we got to this  
11 point. The LCA program, which  
12 many of you are probably familiar  
13 with, started a number of years  
14 ago and has progressed through a  
15 number of iterations to arrive at  
16 this point, where we're actually  
17 to a point we can recommend

20101110 USACE Myrtle Grove Scoping Meeting.txt  
specific projects under that

18  
19  
20  
21  
22  
23  
24  
25

programmatic authority. So what  
Congress authorized in 2007  
through the Water Resources  
Development Act was the catalyst  
to getting these projects started  
that I'll talk to you a little  
bit about tonight and remind you

7

12  
13  
14  
15  
16  
17  
18  
19  
20  
21

a little bit about how we got to  
where we are and then explain a  
little bit more about the  
specific project, the medium  
diversion of Myrtle Grove with  
dedicated dredging.

So the Louisiana Coastal Area  
Program, LCA, initially started  
in the early 2000s, around 2002  
or so, and some of you may  
remember going to some public  
meetings at that point in time.  
It originally started as a very  
regional and large-scale approach  
to solving some of the coastal  
wetland loss problems that  
Louisiana was experiencing, and  
the original intent was to  
develop a very large-scale,  
high-dollar program, to the tune  
of about 30 years and 14 billion

22 dollars. And we developed that  
23 program and had dozens and dozens  
24 of projects, and the  
25 administration at the time said

8

1 that might be a little too much  
2 uncertainty and a little too much  
3 money to push forward at once, so  
4 the program was scaled back  
5 significantly. It went from a  
6 30-year program to about 10-year  
7 program and from 14 billion  
8 dollars to about 2 billion  
9 dollars. So the original group  
10 of projects that was considered  
11 under LCA had to be trimmed back  
12 significantly, and the resulting  
13 group is what we're trying to  
14 develop further through the  
15 project development tonight and  
16 also through other efforts that  
17 the Corps and our state partners  
18 have been working on over the  
19 last couple of years.

20 So if you look at this slide,  
21 this is taken from what was  
22 developed as the overarching  
23 programmatic report that was  
24 finalized in 2004 and was  
25 approved in a chief's report in

1           2005, not long before Katrina  
2           hit. So these statements are  
3           taken from the '04 report and  
4           just describe some of what that  
5           overarching program was trying to  
6           develop and approach. And you  
7           can see some of the concepts that  
8           were pushed forward, such as  
9           barrier island restoration, river  
10          diversions, and that kind of  
11          thing.

12                 So in developing the  
13          overarching programmatic report,  
14          we identified what the critical  
15          needs of the coast was. And  
16          instead of focusing on very  
17          specific issues that could be  
18          implemented in very specific  
19          areas, it looked at a more  
20          wholistic approach, you know,  
21          trying to prevent future land  
22          loss where it's predicted to  
23          occur. You know, we know what  
24          we've lost; at any given point in  
25          time, we can look at the

10

1           satellite images and see what's  
2           gone, but predicting what will be

3           gone into the future is a much  
4           different effort. So we're  
5           trying to focus on what we're  
6           seeing as far as changes in the  
7           coastal system became a very  
8           important concept, and we used  
9           that to try and steer and direct  
10          the programmatic effort to  
11          identify key features that could  
12          address some of these critical  
13          needs like critical geomorphic  
14          structures, fundamentally  
15          impaired deltaic function. We  
16          know that the levees have  
17          effectively cut off the river to  
18          the surrounding wetland basins  
19          like Barataria, and so we want to  
20          try and figure out concepts that  
21          can be used to offset that --  
22          that structure that we have in  
23          place.  
24                 Okay. So the report  
25          identified these 15 projects.

11

1           You can see they're scattered  
2           about southeast Louisiana,  
3           especially. The top five  
4           projects -- you can see they're  
5           the larger white circles there --  
6           those were identified as

7 critical, near-term projects, and  
8 this medium diversion of Myrtle  
9 Grove project is one of these  
10 critical, near-term projects.  
11 What that means is that there was  
12 a lot more information and  
13 analysis and study that went into  
14 identifying the key features for  
15 these five projects. And the LCA  
16 report, each of these five  
17 projects has, you know,  
18 50-something pages specifically  
19 dedicated to each of the  
20 projects. We looked at, you  
21 know, everything from real estate  
22 issues to calculating wetland  
23 benefits and other things like  
24 that that helped narrow down the  
25 focus of a particular project.

12

1 The other projects, 6 through  
2 15, were identified as being  
3 important, but they did not have  
4 the same level of detail. And  
5 Congress looked at those projects  
6 a little bit differently with the  
7 authorization that they gave us  
8 next.

9 So I just wanted to set up a  
10 broad overview of what LCA was,

11           remind you what had happened a  
12           few years ago. Some of you may  
13           remember going to some of the  
14           public meetings. I was at them;  
15           I remember seeing some of you at  
16           the meetings, as well.

17           So, with that in mind, we can  
18           then jump into the specifics of  
19           what we're talking about tonight  
20           with development of the Myrtle  
21           Grove project. So you can see  
22           here it's No. 5; it's been  
23           identified as a medium-sized  
24           diversion -- which, in LCA-speak,  
25           is anywhere from 2500 CFS to

13

1           about 15,000 CFS -- and also has  
2           a significant dedicated dredging  
3           component, approximately up to  
4           6500 acres created over the life  
5           of the project.

6           This text here that you see  
7           is taken from the 2004 report and  
8           speaks about some of the project  
9           features. You can see the size  
10          that it was envisioned as, as far  
11          as capacity of the structure to  
12          divert Mississippi River water.  
13          You can see that it identifies an  
14          acreage amount to be either

15 directly created through the  
16 dedicated dredging or preserved  
17 through the effects of the  
18 diversion and helping to nourish  
19 and maintain existing wetlands  
20 within the study area.

21 MR. FALGOUT:

22 The dedicated dredging, the  
23 6000 acres is from dedicating  
24 dredging or that's from both  
25 proposed delta-building and

14

1 dedicated dredging? How much is  
2 dedicated dredging?

3 MR. MACINNES:

4 well, what was initially  
5 identified under the programmatic  
6 effort was approximately 6500  
7 acres from dedicated dredging  
8 specifically. So this is the  
9 authority that came through in  
10 2007 under the WRDA Act. And you  
11 can see that the letter 'E' there  
12 speaks to authorizing the project  
13 for a construction report to be  
14 turned into Congress, and the  
15 initial budget estimate of the  
16 project is about 278 million  
17 dollars. Now, there's another  
18 provision in WRDA that allows for

19           some of the uncertainty and  
20           increased construction costs that  
21           we all are aware of after  
22           Katrina, and that allows some  
23           wiggle room, so to speak, in  
24           identifying a project with a new  
25           budget cap that can be up to

15

1           150 percent of that amount. So  
2           if you add that extra wiggle room  
3           into the 278 million dollars,  
4           you're looking at something on  
5           the order of 417 million dollars.

6           So in developing the Myrtle  
7           Grove project, the way the Corps  
8           starts a process in figuring out  
9           what particular measures and  
10          features will be recommended is  
11          to start with a problem  
12          statement. And these problem  
13          statements were developed for all  
14          of the LCA projects that we've  
15          been working on, and this just  
16          helps to focus your attention on  
17          what you're really trying to  
18          address. Without understanding  
19          what the problem is, it's harder  
20          to come up with solutions and  
21          recommendations for that  
22          particular problem. So these are

23 applicable to all of the LCA  
24 studies. There's a little bit of  
25 difference in the problems being

16

1 relevant to a particular study  
2 area, but, for the most part,  
3 we're -- in an effort to be  
4 consistent, we're setting up the  
5 problem statements very  
6 similarly.

7 Now, in addition to a problem  
8 statement, you also need to know  
9 what the target is that you're  
10 shooting for, and so developing  
11 project goals becomes a very  
12 important part of the study and  
13 development process and the  
14 report development process. And  
15 so with these goals, which are  
16 also very similar across the  
17 other LCA projects, this gives  
18 you an idea of what you can  
19 develop and propose that will  
20 address the problems that you  
21 just previously identified.

22 So this list of problems are  
23 very common to any coastal  
24 restoration project, whether it  
25 be under the CWPPRA program or

17

1 the CF program, or if we're  
2 talking about NRDA projects that  
3 get proposed. We're all very  
4 familiar with these problems, and  
5 you can pick and choose any  
6 number of them from the list and  
7 apply them to pretty much any  
8 kind of restoration project  
9 across the coast. But these are  
10 the things that we'll be thinking  
11 about and considering as we come  
12 up with a list of specific  
13 recommendations for the Myrtle  
14 Grove project.

15 So in identifying the  
16 problems specifically, you can  
17 also identify opportunities, and  
18 these tie back to the  
19 programmatic effort where I  
20 showed you a slide a few minutes  
21 ago that spoke about this  
22 overarching goal and the regional  
23 approach and what some of the  
24 fundamental issues are, like the  
25 geomorphic function of a

18

1 particular habitat's features or  
2 restoring an impaired deltaic

20101110 USACE Myrtle Grove Scoping Meeting.txt  
3 process. So these opportunities

4 also help define the world that  
5 you're working in and considering  
6 measure development.

7 So this is a map of the study  
8 areas identified in the 2004  
9 report. There's two distinct  
10 areas that you'll notice. Area 1  
11 was identified as the immediate  
12 outfall area of the proposed  
13 diversion channel. It can also  
14 be identified as the area where  
15 that dedicated dredging would  
16 take place and the marsh creation  
17 would be accomplished. So it's a  
18 large area, and there were  
19 efforts to identify specific  
20 marsh-creation cells within that  
21 Area 1, with the concept being  
22 that you might take an area that  
23 is a couple or a few hundred  
24 acres in size and pump sediment  
25 into that area, build your

19

1 containment so it captures all  
2 the sediment that you place, fill  
3 that in, and then you might move  
4 to the next cell and do that on  
5 an annual basis. The acreage  
6 that we envision creating through

7 the dedicated dredging process  
8 wasn't necessarily meant to be  
9 done all at once; it would occur  
10 over time because there are  
11 limited opportunities for how  
12 much dredging you can do in the  
13 Mississippi River, what your  
14 borrow sources might be. You  
15 know, it's a finite amount of  
16 sediment that you can pull out  
17 from any one area and still be  
18 cost-effective. So you might  
19 take the approach, well, we'll  
20 dredge 2 million cubic yards this  
21 year and fill in a couple or a  
22 few hundred acres and then let  
23 that borrow source in the  
24 Mississippi River refill and  
25 replenish itself, and then you

20

1 might go back the next year or  
2 the year after and hit that  
3 source again and then fill in the  
4 other -- some of the other  
5 identified marsh-creation cells  
6 that have been mapped out.

7 So in addition to that  
8 particular area, there's an Area  
9 2 that you notice that is much  
10 larger. And we realize that,

11 although through diverting  
12 sediment and nutrients and fresh  
13 water into your study area, while  
14 you will have an immediate effect  
15 where sediments tend to fall out  
16 within Area 1, you're also going  
17 to have a much larger area that  
18 will have an influence on  
19 salinities and perhaps have an  
20 effect on some of the habitat  
21 types that you see within the  
22 larger Barataria Basin. It's  
23 simply a function of how much  
24 water you might be diverting,  
25 even if it's on the smaller end

21

1 of the spectrum for what was  
2 recommended. You know, something  
3 on the order of 2500 or 5000 CFS  
4 can still have a fairly  
5 significant reach across the  
6 Barataria Basin. So this Area 2  
7 was preliminarily identified as  
8 an area where salinity change  
9 might occur. And this, of  
10 course, is also going to be  
11 highly dependent upon what  
12 happens with the operation of  
13 Davis Pond. That diversion,  
14 which is much further north, up

15 in this area here (indicating),  
16 has a significant effect on  
17 salinities in the Barataria  
18 Basin, and there would certainly  
19 need to be some coordination  
20 between the two projects to make  
21 sure you're not completely  
22 converting the estuary or that  
23 you're operating the structures  
24 at specific times if you wanted  
25 to focus on sediment capture from

22

♀

1 the river. And so there would  
2 need to be coordination between  
3 the two structures.

4 And here's some more details  
5 that were described in the 2004  
6 report. Even though we  
7 identified what was termed as a  
8 medium-sized diversion, 2500 CFS  
9 to 15,000 CFS, the idea was that  
10 a 5000 CFS diversion would be  
11 appropriate for the scale of the  
12 project and in meeting the goals  
13 and objectives that were  
14 identified. There's an  
15 approximately three-mile-long  
16 outfall channel from the  
17 Mississippi River through some of  
18 the pastureland that's adjacent

19 to the river and in the vicinity  
20 of Myrtle Grove. To get to the  
21 marsh side, you have to cut  
22 through a parish back levee; you  
23 also have to realign the state  
24 highway system, Highway 23, which  
25 takes you down to Venice, and

23

1 there might be some other  
2 features that you have to work  
3 around. In some parts of the  
4 area at Myrtle Grove, there's  
5 railroad tracks near the  
6 Mississippi River levee, there's  
7 some other existing  
8 infrastructure that you would  
9 have to consider, and that  
10 becomes very dependent on the  
11 exact alignment that you select  
12 and recommend. So, you know, a  
13 difference of a few hundred feet  
14 or a half a mile or so could have  
15 a significant difference in the  
16 amount of infrastructure that you  
17 end up having to consider and  
18 perhaps move or relocate.

19 So in developing this  
20 presentation and reminding  
21 everybody of what's been done and  
22 where we are and what's been said

23 in the past, I went through the  
24 appendix to the main report,  
25 which is the response to public

24

1 comments that were made in 2004.  
2 And I pulled out the most common  
3 elements that were specifically  
4 related to the Myrtle Grove  
5 project. There were hundreds of  
6 comments made; there were four  
7 public meetings that were held in  
8 Belle Chasse and Jefferson  
9 Parish. And you can see there's  
10 a bit of a theme here; people  
11 were very concerned about  
12 focusing on trying to capture as  
13 much as sediment as possible in  
14 designing the diversion  
15 structure. People had ideas  
16 about where, specifically, it  
17 needed to be located; you know,  
18 you can see there's a comment  
19 about moving it further south  
20 from Myrtle Grove to the Port  
21 Sulphur area. But, for the most  
22 part, the comments that were made  
23 then have been pretty common for  
24 these types of projects and,  
25 really, for most types of

25

1 restoration projects. We know  
2 that sediment plays a very  
3 important role in making a  
4 project successful and, you know,  
5 we knew that then and we still  
6 know that now. We need to make  
7 sure we focus on that as we  
8 develop the project further.

9 So that was my broad overview  
10 of the LCA program and what was  
11 specifically recommended from the  
12 2004 report, and I will now turn  
13 it to over to Trish to talk to  
14 you about NEPA. Thanks.

15 MS. LEROUX:

16 Thank you, Andy. Good  
17 evening, ladies and gentlemen,  
18 and thank you very much for  
19 coming tonight. My name's  
20 Patricia Leroux; I am the  
21 environmental manager for the  
22 medium diversion at Myrtle Grove,  
23 and what I'm going to cover  
24 tonight is just a brief overview  
25 of the NEPA process and what's

26

1 involved as we go about preparing  
2 this environmental impact  
3 statement, which is going to

4 study the impact on the  
5 environment and on the economics  
6 of the area of Myrtle Grove.

7 The National Environmental  
8 Policy Act -- or NEPA, as we like  
9 to call it -- requires that any  
10 time a major federal action has  
11 made a significant effect on the  
12 environment that an environmental  
13 impact statement is prepared so  
14 that we can look at what we are  
15 impacting and we can provide the  
16 public with a statement of what  
17 we are impacting. As I said, it  
18 provides the public with the  
19 opportunity to evaluate the  
20 environmental and economic  
21 impacts of the proposed project,  
22 and this document that we're  
23 going to be preparing is going to  
24 supplement the 2004 programmatic  
25 environmental impact statement,

27

1 which is the LCA Louisiana  
2 Ecosystem Restoration Study.

3 This is something that I  
4 cannot stress enough: This  
5 beginning meeting -- which,  
6 actually we had one last night on  
7 Barataria Boulevard -- but this

8           scoping process is extremely  
9           important in the NEPA process,  
10          and it's extremely important to  
11          the environmental impact  
12          statement. This is the  
13          opportunity for the public to  
14          provide us with comments, with  
15          concerns, with any knowledge that  
16          they have of the area that could  
17          be very pertinent in making the  
18          decisions of the proposed action,  
19          where we're going to place it and  
20          what we're going to do about it.  
21          I'm not going to go over the  
22          entire process involved with an  
23          environmental impact study, but I  
24          will highlight a few things.  
25                 One is the need for the

♀

28

1           project. A big question that we  
2           have to ask ourselves, is there a  
3           need for this project, and that  
4           goes back to what Andy stated  
5           about the project problem  
6           statement. If there's a need,  
7           then we're going to have to state  
8           what that need is.  
9                 Also, alternative locations.  
10          This goes back to scoping. The  
11          public needs to provide us with

12 input. Living in the area,  
13 working in the area, spending all  
14 of your lives in the area, you  
15 have insight that we don't have,  
16 so we ask that you please, during  
17 this scoping process, provide us  
18 with this input so that we can  
19 address it in the impact  
20 statement.

21 A few things that are going  
22 to be looked at in the impact  
23 statement. One is environmental  
24 concerns. This is a listing of  
25 things that we will discuss in

29

1 the statement. I'd like to  
2 highlight a few; particularly,  
3 wetlands, fisheries, and  
4 wildlife. A big recreational  
5 area, a lot of people are  
6 concerned about fisheries because  
7 that is their form of employment.  
8 They're also concerned about  
9 wildlife in the area and what  
10 impact it's going to have.

11 Human-induced concerns,  
12 cultural, recreation, and,  
13 particularly, noise,  
14 transportation. If there's a  
15 diversion, what kind of effect is

16           it going to have on me?  
17           Socioeconomic concerns:  
18           what's going to happen to my  
19           property value? what's going to  
20           happen to my taxes? what's going  
21           to happen to my job? These are  
22           things that we are all going to  
23           look at in this statement, and  
24           we're going to do a detailed  
25           study of them.

♀

30

1           This is a tentative schedule  
2           for the environmental impact  
3           statement. The notice of the  
4           intent was published in the  
5           federal register on October 15th,  
6           and we are now starting the  
7           scoping process. Once again, the  
8           scoping process is your  
9           opportunity, the public's  
10          opportunity, to provide us with  
11          input that we otherwise cannot  
12          get. When the scoping report is  
13          finalized, it's going to  
14          summarize all the information  
15          that we've been provided by the  
16          public. It will be available to  
17          anyone that wants a copy. Anyone  
18          that signs up for the mailing  
19          list or contacts me or contacts

20 the Corps will be provided a copy  
21 of this report once it is  
22 finished. Written comments will  
23 be accepted for 30 days after the  
24 report is finalized.

25 During this scoping process,

31

1 these are questions that,  
2 basically, you need to ask  
3 yourselves in order to come to  
4 finalize how you want to present  
5 your information to us: What are  
6 the most important issues; can  
7 you think of any alternatives  
8 that we might not have thought  
9 of; and are there problems in the  
10 area that we're not aware of.

11 Like I said before, living in the  
12 community, spending your entire  
13 lives here, you have insight that  
14 we don't have.

15 This is my contact  
16 information. If you provide me  
17 with verbal comments, they will  
18 be taken tonight. We also have  
19 comment cards. You can e-mail  
20 me; you can call me. If you wish  
21 to do it snail-mail, comments  
22 must be postmarked no later than  
23 December 17th.

24                   And this is the contact  
25                   information of the pertinent

32

1                   members of the team: Andy, who  
2                   just spoke; myself; Andrew Beal  
3                   with the Louisiana Office of  
4                   Coastal Protection and  
5                   Restoration; and Daimia Jackson,  
6                   who is the project manager.

7                   I am now going to turn it  
8                   back over to Cheryn, and she's  
9                   going to explain a few ground  
10                  rules. Thank you very much.

11                  MS. ROBLES:

12                  As I mentioned when we first  
13                  started, this is an opportunity  
14                  for you to give us as much  
15                  information as possible. So  
16                  we're not going to be answering  
17                  questions during this comment  
18                  period, but we do really want  
19                  your input. When you walked in  
20                  at the sign-in table, there were  
21                  written comment cards. If you  
22                  don't feel comfortable speaking  
23                  in the group, you are more than  
24                  welcome to write your comments  
25                  and, like Trish said, mail them

33

1 to her. The postage is already  
2 paid. They're on the back table.  
3 If you would like to make your  
4 written comments, feel free to do  
5 that.

6 Now we can open it up to  
7 questions. I'd ask that you  
8 please stand up and state your  
9 name because we are recording  
10 this.

11 MS. RANDOLPH:

12 I do have a statement to  
13 read. This is from the South  
14 Lafourche Levee District on  
15 behalf of the Board of  
16 Commissioners.

17 We believe that using the  
18 water and sediment from the  
19 Mississippi River is the most  
20 important method of stopping land  
21 loss in the Barataria Basin. We  
22 feel that both water and sediment  
23 from the river should be managed  
24 in such a way as to minimize as  
25 much as possible the impact on

34

1 our estuarine fisheries.

2 MS. ROBLES:

3 Thank you. Would anyone else

20101110 USACE Myrtle Grove Scoping Meeting.txt  
like to make a comment?

25

MR. FALGOUT:

My name is Ted Falgout. I serve on the Governor's Coastal Advisory Committee, and I serve as chairman of the diversion subcommittee, which, certainly, this pertains to. And I have been a long-time supporter of diversions into Barataria and any other basin we can get water into because I think this is a key component, a major tool in the restoration effort.

What concerns me, and my bad dreams come from Davis Pond, is that, in the process, we end up lacking the will to maximize the ecosystem benefits and want to try to save the critters or do something when those are -- you know, the oysters, the shrimp,

35

1  
2  
3  
4  
5  
6  
7

the alligators, anything in there, is not what's endangered; what's endangered is the land. We are losing marsh; we are turning into open water. And if we don't focus on that problem and worry about all of the other

8 things, like we do so well in the  
9 Corps of Engineers and in the EIS  
10 process, we often miss the boat  
11 and don't get full utilization.

12 And back to what Charlotte  
13 nudged me about, we're  
14 considering spending upwards of  
15 300 million dollars on this  
16 project, and if we're talking  
17 about only a maximum of 15,000  
18 CFS, we're not talking about a  
19 major sediment diversion here.  
20 The sediment will come from  
21 dedicated dredging, perhaps, but  
22 you're not going to get a major  
23 delta-building process of  
24 substance in this basin with a  
25 15,000 CFS diversion. So it's

36

1 something else other than a major  
2 -- the major diversion in the  
3 basin.

4 So given that it's something  
5 else, one of the alternatives  
6 that I think should be considered  
7 is maximize the utilization of  
8 Davis Pond to freshen the  
9 northern basin. And consider,  
10 perhaps, using this amount of  
11 money for Myrtle Grove in

12 dedicated dredging and build  
13 this -- re-create the land bridge  
14 that has been studied and we  
15 spent millions of dollars  
16 evaluating the creation of a land  
17 bridge from just about where  
18 Myrtle Grove is all the way  
19 across the basin, connecting the  
20 Mississippi Ridge to the  
21 Lafourche Ridge, and, of course,  
22 leaving the major waterways open.  
23 But if you could reestablish a  
24 substantial marsh land bridge  
25 across the basin at that point,

37

1 you could then maximize the  
2 efficiency of Davis Pond, keep  
3 the northern part of the land  
4 bridge fresh with Davis Pond  
5 alone, and then have a more  
6 estuarine habitat from there  
7 south. So I would think that  
8 should be an alternative  
9 considered.

10 I'm not saying that that's  
11 the answer because I do support  
12 diversions, but I support  
13 utilizing them (interruption  
14 obscures rest of statement). And  
15 it causes me concern when I see

16 all this we have to coordinate  
17 this with Davis Pond, which means  
18 to me you're going to not use  
19 both of the structures at the  
20 same time at their maximum  
21 capability. And, therefore,  
22 myself as a taxpayer, I am not  
23 getting the best bang for my buck  
24 in this kind of effort. And, you  
25 know, we're in a serious

38

1 situation here; we're falling  
2 into the sea, and we're not  
3 willing to utilize these tools at  
4 their maximum efficiency. And  
5 that's, you know, the world  
6 according to me, of course, but  
7 that's kind of my comment.

8 MS. ROBLES:

9 Thank you, sir. Would anyone  
10 else like to speak?

11 MR. RODRIGUE:

12 Yeah. My name is Jack  
13 Rodrigue. And I agree -- I'm a  
14 horticulturist in this area, and  
15 I agree 100 percent with what Mr.  
16 Ted said. You know, I was  
17 talking with an oyster fisherman  
18 this past week, and he made the  
19 comment how he lost his oysters

20 because of the diversion. And I  
21 didn't tell him my thing, but  
22 when I sit back, I said that's a  
23 good thing because it meant that  
24 the fresh water got that far  
25 down.

♀

39

1 And, you know, once you're  
2 going to start -- if that Davis  
3 Pond would be utilized more often  
4 and let that water flow, when  
5 your salinities would drop, your  
6 trees -- like your wax myrtles,  
7 your willow trees, your oak  
8 trees -- they would start rooting  
9 and land would start forming and  
10 grass would start growing and the  
11 natural things would start taking  
12 place. When the salinities would  
13 drop, the salt would drop and  
14 fresh water could come in. A lot  
15 of stuff would happen naturally.

16 And I really believe what Mr.  
17 Ted said, start utilizing already  
18 what you have in place, and that  
19 would be beneficial. And that  
20 could start happening  
21 immediately. Because just living  
22 in Larose, I know when they first  
23 put the floodgates in Larose.

24

25

you'd see them close every once

40

1

in a while; now, they're closed

2

all the time because there's so

3

much water around us coming, and

4

a south wind could cause us water

5

problems because there's no more

6

land. I believe we really should

7

look at Davis Pond as something

8

that should be utilized more than

9

what it is now.

10

MS. ROBLES:

11

Thank you, sir. Yes, sir.

12

What's your name?

13

MR. BOUVIER:

14

Dickie Bouvier. What Ted

15

said was a lot of -- hundreds and

16

hundreds and thousands of people

17

down this bayou agree and thinks

18

like he does, but they don't want

19

to come over here because you

20

people are the people that has

21

the money doesn't want to spend

22

it. The people are just playing

23

with us, the politicians and

24

everything like that. It's a

25

waste of time. Do some work.

MS. ROBLES:  
Thank you, sir. Would anyone else like to make a comment?  
Yes, sir.  
MR. CAFFERY:  
I'm Hugh Caffery, the chairman of the Bayou Lafourche Freshwater District, and that's one of the projects on the list that you also have. But I see this project as a dovetail as we are here because of this land, and the land is here because of the Mississippi River. If we don't get back to building land instead of losing land, we won't be here as a culture much longer, and we'll have to move as the fresh water is gone.  
And I see this as a key element in reversing that trend. And we can't completely reverse it; it's inevitable one day. But in our lifetimes and those of our, maybe, grandchildren, we can

42

1  
2  
3  
4

provide them a little reversal. And this is a -- I see this Myrtle Grove element of diversion of salt water and sediment

5 replacement from the river  
6 instead of dumping it out in the  
7 Gulf but putting it back in land  
8 where the people live as a key  
9 element.

10 And I'm applauding this  
11 project and here tonight to cheer  
12 it on, to see it move faster and  
13 to completion. I'd like to know  
14 what we, as citizens, can  
15 continue to do. I know paying  
16 attention is important and asking  
17 questions. I've noticed some  
18 about the pulsing, and it seems  
19 to me that's how nature provided  
20 this land, floods and droughts,  
21 floods and droughts, sometimes  
22 great floods, sometimes great  
23 droughts, and it's not a  
24 continuous process, that is, so  
25 I'm interested in seeing this

43

1 project operate as a pulsating  
2 natural mimic of what put us here  
3 to begin with.

4 MS. ROBLES:

5 Thank you. Yes, ma'am.

6 MS. RANDOLPH:

7 Charlotte Randolph, Lafourche  
8 Parish president. I'd like to

9 continue with what Hugh was just  
10 saying here in that the pulsing  
11 is important to emulate what  
12 nature does. But I think we can  
13 attempt to emulate, but it's  
14 better with a sediment pipeline.  
15 And I think allowing Davis Pond  
16 to work in conjunction with the  
17 proposed building of the land  
18 bridge in that area could have a  
19 better impact, and, most  
20 importantly, a quicker impact on  
21 the area involved rather than  
22 what I'm seeing as a very  
23 long-term plan here. The sense  
24 of urgency needs to be involved  
25 in this. Thank you.

♀

44

1 MS. ROBLES:  
2 Thank you. Yes, ma'am.  
3 MS. WHITNEY:  
4 My name is Patty Whitney.  
5 I'm with BISCO, Bayou Interface  
6 Shared Community Organizing, in  
7 Terrebonne and Lafourche.  
8 And, adding on to what  
9 President Randolph just stated,  
10 there's one part of the whole EIS  
11 study process that needs to stand  
12 out above all of the rest, and

13           that is the cost of doing  
14           nothing. We can't afford that.  
15           That has to play the No. 1 role  
16           in any decision that comes down  
17           because doing nothing is not an  
18           option for us. So everything  
19           else has to be regulated by that.

20           I like the idea of pulsing.  
21           I think it -- again, it mimics  
22           the natural process of how we got  
23           here. My concern would be is if  
24           we're pulsing on just a diversion  
25           aspect and we have to wait for

45

♀

1           the borrow sediment to be  
2           refilled that there may be some  
3           times that we don't get enough  
4           there that we can't stop to pause  
5           at this point because of the  
6           delays will kill us. So we do  
7           need to have a serious dredging  
8           process in there. We also need  
9           to respect seriously the  
10          environment and every part of it  
11          because not respecting the  
12          environment is how we got in this  
13          position to begin with. So we  
14          need to make sure that we do  
15          protect every aspect of the  
16          environment.

17           But if we can be smart enough  
18           to put a pipeline all the way up  
19           to Chicago and New York, couldn't  
20           we put a pipeline where they're  
21           building land at the head source  
22           of the Mississippi River and pump  
23           some of that sediment they need  
24           to get rid of down here in a  
25           pulsing place? So, you know,

46

1           there are some things that I  
2           think can be done and that should  
3           be done.

4           And my biggest concern is the  
5           time element for the whole  
6           process. I strongly agree with  
7           an environmental impact study to  
8           understand what's happening  
9           because we didn't do that well in  
10          the past and we're paying the  
11          price now, but something needs to  
12          make sure that this process is  
13          extremely expedited in our case.  
14          Everything that's causing the  
15          problems we're having here now  
16          are not natural. This is not a  
17          natural disaster; this is a  
18          manmade disaster, and I fail to  
19          understand at this point why the  
20          President has not declared a

21 technological disaster so that a  
22 lot of these bureaucratic  
23 processes can be gone around and  
24 timing and funding could be  
25 greatly expedited because this is

47

1 a disaster. It's manmade, it's  
2 national in scope, and it should  
3 be declared a technological  
4 disaster, not a natural disaster.

5 MS. ROBLES:

6 Thank you, ma'am.

7 MR. FALGOUT:

8 I mean, the problem we are  
9 having is, as I mentioned, our  
10 basin is turning into open water,  
11 okay, and there's no more  
12 friction in here. And every inch  
13 of marsh we lose is an inch more  
14 friction we lose in this basin  
15 and the greater tidal change we  
16 have. And when we have a  
17 southeaster come in, we'll get  
18 seawater all the way to Lafitte  
19 in a day's time now when it would  
20 take weeks to happen. And when a  
21 norther comes through, we got  
22 fresh water all the way to Grand  
23 Isle because there's nothing that  
24 stops it from working, so the

♀ 25 estuarine function is no longer

48

1 available. It is almost  
2 impossible to have a sustainable  
3 oyster industry because of these  
4 wide fluctuations, and as the  
5 marsh further deteriorates, it  
6 will be harder and harder to do  
7 that.

8 And I would like, when  
9 viewing alternatives, to consider  
10 -- review this dedicated dredging  
11 project that Louisiana has. It's  
12 not a Corps -- it's not an LCA  
13 project, but if we took some of  
14 this material and made this land  
15 bridge here (indicating), that  
16 would stop that water from moving  
17 back and forth so quickly and  
18 would allow the fresh water to do  
19 its function up in the northern  
20 basin and allow a sustainable  
21 oyster and shrimp fishery down  
22 here. You know, instead of just  
23 putting a glob of big ol'  
24 sediment here, you still got this  
25 big gap opening up. It's

♀ 49

1 helpful, but it could be utilized  
2 in a much more efficient way if  
3 you went across the basin with it  
4 and did, you know, something like  
5 that following that land bridge  
6 kind of a project that we are  
7 working on.

8 MS. ROBLES:

9 Thank you. Yes, sir, in the  
10 back row.

11 MR. GAUTHE:

12 Yes. David Gauthé, also with  
13 BISCO. I just want to relate how  
14 important it is, I think, for you  
15 guys to make sure that local  
16 people are involved with these  
17 decisions. You know, every time  
18 I look at a map, you look at the  
19 lower part of Lafourche Parish  
20 and the land that there's, and  
21 it's the only area all along the  
22 Gulf Coast that has a lot of land  
23 because of a decision back in the  
24 '80s, I guess -- or maybe it was  
25 in the '60s -- to pass taxes to

50

1 do this was done by local people.  
2 They really know what they're  
3 doing, so I really encourage  
4 y'all to put as much effort.

5 Every project does not have that  
6 advisory committee of local  
7 people in that final war room  
8 that puts the project together,  
9 and I really wish y'all would  
10 consider that.

11 MS. ROBLES:

12 Thank you, sir. Now you.

13 MR. CALLAHAN:

14 My name is Barney Callahan.  
15 I'm here representing the  
16 Louisiana Wildlife Federation,  
17 and I'm a past president of that  
18 organization and currently  
19 serving as chairman of the  
20 Coastal Restoration and  
21 Protection Committee for that  
22 organization. We're here in  
23 concert tonight, a couple of us  
24 with NWF, and showing our support  
25 for diversions. The NWF and LWF

51

1 are currently in a campaign right  
2 now to promote the use of  
3 reconnecting the river and  
4 revitalize our marshlands out  
5 there, and we appreciate the  
6 national profile that we've been  
7 getting on that. We have a lot  
8 of people throughout the nation

9 who are beginning to recognize  
10 our plight down here. We  
11 certainly agree with the concept  
12 and are looking forward to  
13 working with the Corps on any  
14 obstacles that may come to make  
15 these projects come forward to  
16 the forefront.

17 A number of these projects I  
18 see on here -- I've been to some  
19 of the scoping meetings just as  
20 we're in here tonight -- and I'm  
21 glad to see that this one project  
22 is up in the top five. Without a  
23 doubt, the Barataria-Terrebonne  
24 Basin is in need of some  
25 immediate attention. It's -- I

52

1 guess could best be described as  
2 the hole in the heart of  
3 Louisiana. That needs to be  
4 addressed. We're looking at  
5 information here from 2004. You  
6 know, that's six years and  
7 running, again. We used to  
8 measure our land loss in years  
9 and months and weeks. I'm seeing  
10 things now that are detailed to  
11 the minutes of how many acres per  
12 minute we're losing, and that's

20101110 USACE Myrtle Grove Scoping Meeting.txt  
not getting any better for us.

13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25

So we certainly need to all go forward from this meeting and bring the information and ask for, again, meetings like this we appreciate the opportunity to comment on.

There were a couple of other things I wanted to speak of, that LWF has long been an advocate of use of -- beneficial use of sediment. It has been recognized for a long time that we're

53

♀

1  
2  
3  
4  
5  
6  
7  
8  
9  
10  
11  
12  
13  
14  
15  
16

pouring it down the river; it's going off the Continental shelf, and things like this could certainly use some of that sediment and the dredging operations, taking it, force-dredging it, using mechanical means to speed up the process. I think Mr. Falgout has some excellent ideas on that.

One of the things that I see as a resident of Lafourche Parish -- I was born and raised in Terrebonne Parish, but recently moved to Thibodaux, and, you know, I certainly want to commend

17 the efforts in the revitalization  
18 of the Lafourche -- Bayou  
19 Lafourche. I see some of that  
20 work going on in the north end  
21 near Donaldsonville right now,  
22 and it's looking real good. But  
23 one of the things I noticed is  
24 similar to some of the bayous  
25 that have been starved in

54

1 Terrebonne Parish is that  
2 Lafourche's water also -- I mean,  
3 we're getting more water; we're  
4 doing these projects to get more  
5 water flow down Bayou Lafourche,  
6 but, again, are we using it in  
7 places that we could filter it  
8 into the marsh? I don't know of  
9 any other places other than like  
10 the Intracoastal Canal that even  
11 have the opportunity to bring  
12 some of that water down Bayou  
13 Lafourche, which is a natural  
14 throughway, again. But we should  
15 also look at bringing in some of  
16 that water from the eastern side  
17 along with the Davis Pond project  
18 that might help to supplement  
19 some of this effort in here. I  
20 see a lot of water flowing down

21 that bayou that, again, is  
22 probably going out the mouth of  
23 the bayou out there for non-use,  
24 maybe not necessarily  
25 sediment-laden water, but

♀

55

1 certainly fresh water that can be  
2 used to benefit the area. And I  
3 appreciate the opportunity to  
4 comment.

5 MS. ROBLES:

6 Thank you, sir. Would anyone  
7 else like to make a comment?

8 Yes, sir.

9 MR. MATHERNE:

10 Nic Matherne, director of  
11 Coastal Energy and Environment  
12 here in Lafourche Parish.

13 I have two kids; one's two  
14 and a half and one's about to  
15 make a year in December, and if  
16 we're lucky, this project alone,  
17 by itself, nothing else, we may  
18 be able to see effects in their  
19 grandkids' lifetime. I think  
20 Ted's painted a good picture  
21 saying we have to have that  
22 skeletal structure there in place  
23 for a diversion like this to  
24 nourish. You know, I've heard

25

♀

56

1 battle between, you know,  
2 diversions are what's going to  
3 save us, or bringing sediment  
4 from outside the system in is  
5 what's going to save us. But I  
6 think the best argument is that  
7 neither one of those are the  
8 solution by themselves. It's a  
9 both/and rather than an  
10 either/or.

11 And we have to be aggressive;  
12 we can't afford to be timid  
13 anymore. We've sat on our hands  
14 for far too long. We've taken  
15 into account way too many of  
16 these, you know, smaller special  
17 interest groups that are tunnel  
18 vision. We have to have the  
19 greater estuaries' best interests  
20 in mind. And I think, you know,  
21 like a lot of us have been saying  
22 so far, we need to use what we  
23 have already and put it to its  
24 potential. Let's see what Davis  
25 Pond can do for a long period of

♀

57

1 time. You know, yes, our oyster

2 industry may suffer, but success  
3 stories in history don't happen  
4 without some kind of sacrifice.  
5 And we need to be aggressive; we  
6 will have to make some  
7 sacrifices. But, in the end,  
8 it's going to be for the better  
9 of our entire area: Fisheries,  
10 you know, landowner interests,  
11 everything included, everyone  
12 will benefit if we take a  
13 basin-wide approach.

14 MS. ROBLES:

15 Thank you, sir. Yes, ma'am.  
16 Oh, I'm sorry; he hasn't spoken  
17 yet.

18 MR. KEMP:

19 My name is Paul Kemp with the  
20 National Audubon Society, and I  
21 want to go on record in 2010 that  
22 the National Audubon Society is  
23 still in support of this project.  
24 I hope that the next time that I  
25 come to one of these things,

58

1 we're talking about planting  
2 grass or counting birds or  
3 something like that, not whether  
4 or not we're going to do this  
5 project. So, you know, all these

6 are excellent comments. The main  
7 thing is that when we put it all  
8 together, it has to be something  
9 much larger than what's conceived  
10 in the WRDA. And I know the  
11 state is already working on a  
12 more ambitious approach, and I  
13 encourage y'all to get into that  
14 very quickly, not constrain  
15 yourself to the obsolete  
16 language.

17 MS. ROBLES:

18 Thank you, sir. And, yes,  
19 ma'am, would you like to make  
20 another comment?

21 MS. WHITNEY:

22 Patty Whitney with BISCO. I  
23 just came back -- and this  
24 gentleman was there, as well, at  
25 the world Deltas Conference in

59

1 New Orleans, and there were parts  
2 of it that were pretty  
3 enlightening. There were  
4 scientists there from almost all  
5 of the major delta areas of the  
6 world, and, to a person, every  
7 single one of them made the  
8 comment that Louisiana does not  
9 have time for any more studies.

10           we have to do something now, or  
11           all is lost, period.

12           And there's an added factor  
13           that we need to really be aware  
14           of in the urgency of why this  
15           needs to be done is sea-level  
16           rise. Because I know a lot of  
17           people in these communities tend  
18           to have a very focused idea on  
19           the idea of sea-level rise, but  
20           the science and the truth of the  
21           matter is it's here. It's not  
22           when it's coming; it's here. And  
23           if we don't do something  
24           immediately, it's lost; we might  
25           as well not do anything; we'd

60

1           just as soon all move because we  
2           have to do it now or it won't be  
3           enough even if we do it. So we  
4           have to do it now, and we have to  
5           ensure that that land is there to  
6           protect us when the sea starts  
7           coming up more.

8           MS. ROBLES:

9           Thank you, ma'am. Yes, sir.

10          MR. TRIPP:

11          My name is Jim Tripp. I work  
12          for the Environmental Defense  
13          Fund. I am the last thing in the

14 world from a local; I live in  
15 Manhattan. Why do I care about  
16 what's going on down here? This  
17 is a world-class delta. This is  
18 the seventh-largest delta in the  
19 world -- or was. The Mississippi  
20 Basin is the third-largest  
21 watershed in the world. It  
22 carries 200 million tons of  
23 sediment to the Gulf every year.  
24 Most of that is wasted or lost.  
25 The system is deteriorating. I

61

1 care about this because this is a  
2 nationally vital ecological  
3 asset. It's also a nationally  
4 vital economic asset.

5 A major reason this whole  
6 system is collapsing -- and it is  
7 collapsing; 10 years from now,  
8 there will be -- as Ted was  
9 saying, there will be more open  
10 water; 20 years, there will be a  
11 lot more open water -- a major  
12 reason is because the river is  
13 confined close to the Gulf, and  
14 the sediment is either ending up  
15 in the Gulf in the mouth, where  
16 it's being dredged, or it's going  
17 out the mouth of the river into

18 the Gulf, where it's not doing  
19 any good. The only major way of  
20 restoring this ecosystem is to  
21 use the energy of the Mississippi  
22 River to move sediment into this  
23 wetland system. On the longer  
24 term, whatever that means, that  
25 may mean some very large

62

1 diversions that can move large  
2 amounts of sediment when the  
3 river is high carrying a lot of  
4 sediment.

5 But, today, we have not built  
6 a single sediment diversion  
7 project. We can't start with a  
8 giant, very large-scale diversion  
9 project; we have to figure out  
10 how to do it, and this is the  
11 project to do it. This is -- as  
12 far as the Barataria-Terrebonne  
13 Basin is concerned, this is the  
14 only project on the drawing board  
15 right now that is and could be  
16 designed to be a significant  
17 sediment diversion project that  
18 is designed to have more capacity  
19 during high-river flows where  
20 studies that have been done by  
21 the state, by Dr. Lee Allison,

22 showed there is much more  
23 sediment being carried in the  
24 river. And you have the capacity  
25 there to move that sediment, the

63

1 sediment-rich water during  
2 high-river flows, such as we saw  
3 in April and May of 2008.

4 This is, in my view, a  
5 demonstration project; it is a  
6 way to learn how to do this. And  
7 if we don't do it at this scale,  
8 we'll never do it, and you're  
9 never going to solve the problems  
10 on this coast just with a lot of  
11 sediment pipelines all over the  
12 place or dedicated dredging. And  
13 I'll tell you, from a national  
14 point of view, you will never  
15 galvanize the interest and the  
16 attention of the people of the  
17 United States and Congress who  
18 are going to have to find the  
19 ways to pay for this.

20 So this is an important  
21 project, not only for the central  
22 Barataria Basin, which it is  
23 designed to affect, but for the  
24 entire coastal system. We know  
25 from what the state has done that

♀

1 the amount of sediment at  
2 high-river flows when the river  
3 is rising is something on the  
4 order of 50 times what it is  
5 during low-river flows. So the  
6 art of a pulsing sediment  
7 diversion is to figure out how to  
8 capture the river, or a  
9 significant piece of the river,  
10 when it's sediment-rich and  
11 moving that sediment into the  
12 system. And then, when the river  
13 is falling, you reduce it way  
14 down; you could reduce it to  
15 zero; you could reduce it to  
16 5000 cubic feet per second. But  
17 that's the opportunity that we  
18 have here. I know there are a  
19 lot of local concerns, but the  
20 real opportunity here is to  
21 figure out how to do this, and  
22 that's why we strongly support  
23 this project.

24 I fully agree with you in  
25 terms of time. The amount of

1 time that we're taking to do this

2 is outrageous. My personal goal,  
3 which I state over and over  
4 again, is that all the LCA  
5 projects that Andrew showed here  
6 should be completed within  
7 five years, and the largest-scale  
8 projects ought to be completed  
9 within ten years. It is an  
10 emergency. It should be declared  
11 an emergency because if we don't  
12 deal with this in a big, major  
13 way, the oil and gas system is  
14 going to run into problems, the  
15 urban levee systems are going to  
16 be more exposed to this, you  
17 know, urban water. We're going  
18 to be -- and the fisheries, in  
19 the long-term, are going to  
20 collapse. You look at the  
21 Blum/Roberts paper, you know,  
22 eight years down the road, there  
23 isn't going to be anything here,  
24 so what kind of a fishery is it  
25 going to be? So this is our

66

1 opportunity to jump-start it.  
2 And I'll tell you, as Andy  
3 knows and Mark Wingate and Darrel  
4 Broussard, who are here, we are  
5 driving the Corps, and we are

6 driving the Corps as crazy as we  
7 can to accelerate this. And  
8 then, at the same time, then  
9 we'll have something to go to the  
10 Congress to say, we need to get  
11 money to do this. Right now, we  
12 don't have an exciting sediment  
13 diversion project, you know,  
14 ready to go. So if someone says,  
15 I'll willing to write you a  
16 check, we don't have anything.  
17 And the state has been doing a  
18 terrific job -- Andrew Beal is  
19 here -- working with contractors,  
20 looking at different alternatives  
21 in terms of pulsing capacity  
22 above 15,000 to 30 and 45. That  
23 doesn't mean if you have a  
24 project with  
25 45,000-cubic-feet-per-second

67

1 capacity that it's going to  
2 operate at that level all the  
3 time; it may operate when the  
4 river is high, two weeks, four  
5 weeks, eight weeks, or something  
6 like that, and the rest of the  
7 time, it is something entirely  
8 different. So it's possible to  
9 dovetail the operation of that

10 kind of sediment-pulsing project  
11 with Davis Pond, operate that  
12 accordingly. And the state has a  
13 plan for a sediment pipeline in  
14 another LCA project, which is the  
15 Barrier Island Restoration  
16 Project. So this is the basin,  
17 the Barataria Basin, where we  
18 have four different kinds of  
19 projects that can move forward  
20 concurrently: a modification to  
21 Davis Pond to make it carry more  
22 settlement; the Myrtle Grove  
23 project, if it's designed to  
24 carry a lot of sediment when the  
25 river is high; then the

68

1 long-distance sediment pipeline,  
2 which is an expensive project;  
3 and the barrier island project.  
4 And if we do all those together  
5 and do them within the next three  
6 to five years, we'll then begin  
7 to have the tools to really do  
8 something in terms of restoring  
9 this system. So we strongly  
10 support this project.

11 MS. ROBLES:

12 Yes, sir.

13 MR. PULASKI:

14 I'm Chris Pulaski with the  
15 National Wildlife Federation. I  
16 wanted to reiterate what Jim  
17 said, certainly, and Barney, too.  
18 We've enjoyed working with the  
19 Louisiana Wildlife Federation on  
20 nationalizing the issues that we  
21 face here.

22 We've been attending and  
23 certainly plan on attending the  
24 meetings next week, but some of  
25 the concerns that we heard last

69

♀

1 night that some of you around  
2 here may be thinking about, too,  
3 the storm water, looking at --  
4 you know, in some areas, they're  
5 flooding now just with a heavy  
6 rain event, so what happens with  
7 additional water? So we want to  
8 make sure that storm water runoff  
9 is taken into consideration in  
10 the areas around here. Also,  
11 water quality and monitoring that  
12 water that's coming down and in a  
13 realtime fashion so that that  
14 information can then, in turn, be  
15 plugged into a management plan  
16 that the operators of the  
17 diversion can coordinate.

18                   And then, for those of you  
19                   who have additional concerns, I  
20                   certainly urge you to write to  
21                   the Corps or e-mail or call and  
22                   let them know. There's  
23                   information out on the tables out  
24                   there that we provided that  
25                   summarizes a lot of the outreach

70

1                   that we've been doing for almost  
2                   a year now, folks from Terrebonne  
3                   and Barataria areas, about  
4                   sediment diversion. So I  
5                   encourage you to take a look at  
6                   that; maybe that will help kind  
7                   of get your head around all the  
8                   information that's being flooded  
9                   -- no pun intended. I'll stop  
10                  there. Thank you.

11                  MS. ROBLES:

12                  would anyone else like --  
13                  yes, sir.

14                  MR. BAKER:

15                  Andy Baker, Lake  
16                  Pontchartrain Basin Foundation.

17                  Almost everything I had to  
18                  say has already been said  
19                  probably better than I could, but  
20                  I would like to go on the record  
21                  again as being fully in support

20101110 USACE Myrtle Grove Scoping Meeting.txt  
of river diversions, including

22  
23  
24  
25

Myrtle Grove. I encourage you  
to, as has been said, think of  
this as a necessarily tool, but

71

1  
2  
3  
4  
5  
6  
7  
8  
9  
10  
11  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25

only one tool among many. Also,  
we suggest that you consider  
building it as large as possible.  
Even though it may rarely be run  
at its full capacity, realtime  
monitoring of the sediment load  
in the river can tell when to let  
it flow at its maximum capacity.  
Also consider, possibly, some of  
the more innovative ideas, you  
know, within the shorter time  
frame that we're working with  
about ways to inject sediment  
from dredging into the diversion  
at its highest flow. And,  
also -- I guess we also need to  
learn from experiences at  
Caernarvon and Davis Pond about  
some of the potentially negative  
impacts and craft a real  
system-wide management plan to  
maximize the positive and  
minimize the negative impacts.  
Thank you.

MS. ROBLES:

1           Thank you. Is there anyone  
2           else who hasn't spoken that would  
3           like to speak?

4           MS. DUET:

5           I would like to say one thing  
6           just to reiterate what was said.  
7           I'm Cynthia Duet. Three days in  
8           with the National Audubon Society  
9           now, but I'd like to challenge  
10          the project team to modify that  
11          goal. Reduce the trend of loss  
12          by, what, five buckets? You  
13          know, pick a percentage; modify  
14          your goal and then meet it. That  
15          would be a really neat thing to  
16          see on goals; that's a good  
17          question.

18          MS. ROBLES:

19          Thank you. Patty, would you  
20          like to speak again?

21          MS. WHITNEY:

22          Yeah. And she said something  
23          that made me think of something  
24          else. So just real quick before  
25          I forget what she was saying, I

73

1           had a thing with -- an issue with  
2           the thing, too. It's like

3           somehow it was not quite saying  
4           "build land." It was like "keep  
5           land from going away," but it  
6           wasn't saying "make new land."  
7           So I'd like it to actually -- the  
8           goal should state, we need land,  
9           period; create land, period.

10           But another aspect of this,  
11           Chris spoke about monitoring and  
12           air and water quality monitoring  
13           up in here. That may also be a  
14           good thing down the line if we  
15           can speed up this process,  
16           considering the BP incident and  
17           the need for an alternative or  
18           adaptive economic development  
19           strategy for this area. That may  
20           be jobs involved at the local  
21           level for people to be as part of  
22           a management system in those  
23           types of monitoring programs for  
24           a long-term basis. So that could  
25           also be a positive for this type

74

1           of program going forward.

2           MS. ROBLES:

3           Are there any more comments?

4           (No response.)

5           MS. ROBLES:

6           Okay. We're going to put our

7 contact information back up.  
8 Again, there are paid comment  
9 cards -- postage-paid comments  
10 cards in the back. This is also  
11 Trish's information if you would  
12 like to submit your additional  
13 comments. Or if you have  
14 questions tonight, we can answer  
15 some of them, but if you have  
16 some more comments, please write  
17 Trish or call or send us a  
18 letter. And we'd love to hear  
19 from you.

20 Thank you very much for  
21 coming tonight. Please drive  
22 safely.

23  
24 (Whereupon the meeting was concluded at 7:48  
25 p.m.)

MEETING MINUTES FOR THE U.S. ARMY CORPS OF  
ENGINEERS NEW ORLEANS DISTRICT MEDIUM DIVERSION  
AT MYRTLE GROVE PUBLIC SCOPING MEETING, HELD AT  
THE WOODLAND PLANTATION, 21997 HIGHWAY 23, PORT  
SULPHUR, LOUISIANA, ON THE 18TH DAY OF NOVEMBER  
2010, COMMENCING AT 6:32 P.M.

REPORTED BY:  
MARK A. SMITH, CCR, RPR  
CERTIFIED COURT REPORTER

♀

1

MS. RODI:

2 Good evening. Thanks for  
3 coming. My name's Rachel Rodi.  
4 I represent the Army Corps of  
5 Engineers Public Affairs, New  
6 Orleans Office. Tonight's  
7 meeting is about the Louisiana  
8 Coastal Area Medium Diversion of  
9 Myrtle Grove with Dedicated  
10 Dredging Project, and thanks for  
11 coming.

12 First, we'll just go over a  
13 quick agenda before I introduce  
14 our speakers. I would like to  
15 thank Billy Nungesser, parish  
16 president, for coming; he's going  
17 to give some brief remarks. Then  
18 we're going to go into our  
19 project planner, which is Andy  
20 MacInnes; he's going to go over  
21 the project. And then Patricia  
22 Leroux, here in the front, is the  
23 environmental manager; she's  
24 going to talk about the NEPA  
25 requirements. And then, also,

3

1 I'll introduce Andrew Beal, who  
2 is in the back; he is the project  
3 manager for the state of  
4 Louisiana.

5 with that, sir, you want to

20101118 USACE Myrtle Grove Scoping Meeting.txt  
make some remarks, Mr. Nungesser?

6  
7

17  
18  
19  
20  
21  
22  
23  
24  
25

MR. NUNGESSER:

I just want to thank y'all for coming tonight and sharing this with the public, and, hopefully, we'll get some good dialogue about what the parish thinks of the project and where we think our priorities are. So thank y'all for coming out here and showing us the project.

MS. RODI:

Thank you. With that, I'm going to turn it over to Andy MacInnes.

MR. MACINNES:

Good evening, everybody. My name is Andy MacInnes. I'm a project planner for the Corps of Engineers. And just as a little

4

♀

1  
2  
3  
4  
5  
6  
7  
8  
9

bit of background, I used to work for the Plaquemines Parish government, actually, for a little over four years. From 2003 through 2007, I handled all of the coastal zone management for the parish, did a lot of GIS work, and know quite a few faces in the crowd. So it's great to

10 see you all out here again, and  
11 it's a privilege for me to be in  
12 this position to be able to talk  
13 to you about this project.  
14 working for the parish a few  
15 years ago, I was one of the  
16 audience members when the LCA  
17 programmatic study was underway  
18 and made some comments about how  
19 that programmatic authorization  
20 should proceed and what the  
21 Myrtle Grove diversion project  
22 should look like. So here it's  
23 come full circle, and I get to  
24 present to you, you know, what  
25 has happened, what has developed,

5

1 and solicit some more comments  
2 and input from you all tonight.  
3 So I thank you for being here.  
4 And, with that, I'll give you  
5 a little bit of a background and  
6 overview of what happened with  
7 the 2004 LCA report. That's when  
8 it came out; it was officially a  
9 chief's report in 2005. And just  
10 to give you a little background  
11 information, it was set up as a  
12 programmatic authorization.  
13 There is a number of projects

14 that compose the overall LCA  
15 program, and some of the maps  
16 that are in the back -- this one  
17 on your right in the corner  
18 (indicating) shows a number of  
19 projects, about 15 projects, that  
20 have been compiled and pulled  
21 together under this LCA  
22 programmatic authorization.  
23 well, the Myrtle Grove project is  
24 one of those 15 projects, and so  
25 we had a recommendation that

6

♀

1 proceeded under that 2004  
2 program. And here we're going to  
3 start the effort to really refine  
4 the details and try and hear from  
5 you what you feel is very  
6 important for us to consider as  
7 we develop the project. If you  
8 have concerns about the project,  
9 we want to hear about them, and  
10 if you have suggestions for how  
11 the project should proceed  
12 forward, then we'd like to hear  
13 about that. And we can  
14 incorporate that into the  
15 finalization of the details.

16 So this is some text that was  
17 taken from the LCA programmatic

20101118 USACE Myrtle Grove Scoping Meeting.txt  
authorization. You can see that

18  
19  
20  
21  
22  
23  
24  
25

there is a number of different  
approaches that were outlined,  
including the use of different  
types of restoration tools:  
There are barrier island  
recommendations, there are  
Mississippi River water diversion

7

♀

18  
19  
20  
21

recommendations, and that kind of  
set the stage and the framework  
for all of the projects to  
synergistically operate with each  
other so that you get the most  
benefit. You systematically look  
at what the needs of a particular  
area are and come up with the  
best recommendation.

So the critical needs that  
were identified in 2004, listed  
there for you, you can see that  
what LCA has tended to focus on  
as opposed to some of the other  
programs that you might be  
familiar with. It's more of a  
strategic development of critical  
geomorphic structure and function  
within the different hydrologic  
basins; in this case, the  
Barataria Basin.

22  
23  
24  
25

information, LCA was developed  
originally as a 30-year,  
approximately 14-billion-dollar

8

1  
2  
3  
4

19  
20  
21  
22  
23  
24  
25

program. That's how it was set  
up; it was very large in scale  
and cost and also in time frame.  
well, as that recommendation was  
building momentum and moving  
forward, we had feedback from the  
administration at the time that  
said, that might be a little too  
long-term, it might be a little  
too expensive, and it might be a  
little too complicated to develop  
a suite of projects that will  
adequately address some of these  
critical needs that we're talking  
about. So the overarching LCA  
program got scaled down  
significantly from that original  
recommendation, and what we  
proceeded forward with turned  
into a 10-year program and  
approximately 2 billion dollars;  
that was the extent of what the  
administration felt was  
achievable and understandable at  
the time. And, of course, you

1 always have political realities  
2 that you need to deal with and  
3 budget realities, so that was  
4 what was pushed forward. So the  
5 critical needs kind of fit within  
6 that scope and scale, 10 years  
7 and 2 billion dollars.

8 So here's a slide that shows  
9 all of the projects that are  
10 recommended under the LCA  
11 programmatic authorization, and  
12 you can see there's a great deal  
13 of concentration in southeast  
14 Louisiana. A number of studies  
15 have already gotten underway, and  
16 we're just about to the point  
17 where we can send a report up to  
18 the Chief of Engineers. And from  
19 that point, it ends up going to  
20 the Office of Management and  
21 Budget for review, and that's  
22 where it gets considered for  
23 eventual construction funding.

24 The project work we're here  
25 to talk about tonight, the medium

10

1 diversion of Myrtle Grove, is No.  
2 5 on the graphic there. You can

3           see that it is obviously located  
4           on the west bank of the  
5           Mississippi River and would feed  
6           into the Barataria Basin. It is  
7           identified as a critical  
8           near-term restoration project.  
9           That is distinct from some of the  
10          other projects in the LCA  
11          programmatic authorization in  
12          that it's one of the top five; it  
13          has been determined to be one of  
14          the five most critical projects  
15          under that overarching program.  
16          Some of the others there, the  
17          larger white circles that you  
18          see, one through five, we have a  
19          project that is in that near-term  
20          critical restoration strategy  
21          framework that's down at the  
22          barrier shoreline that consists  
23          of Shell Island and the Caminada  
24          Headland in Jefferson Parish.  
25          That also is a critical

11

1           geomorphic-structure-type project  
2           and therefore is placed as a  
3           higher-priority project. So we  
4           do have a couple of them here in  
5           Plaquemines Parish.

6           So that kind of sets the

7 stage for what happened a few  
8 years ago. You know, the  
9 programmatic -- LCA programmatic  
10 effort tried to identify what  
11 needed to be done under the scale  
12 and the time frame and the cost  
13 for coastal Louisiana. So here  
14 I'm going to give you some  
15 background information on the  
16 Myrtle Grove project  
17 specifically. So, as explained,  
18 No. 5 feeds into the Barataria  
19 Basin. This text is taken  
20 directly out of the 2004 report.  
21 I'm not going to read it for you,  
22 but you can see that it is  
23 comprised of a diversion  
24 structure. There is also a  
25 dedicated dredging component that

12

1 was recommended, so you have a  
2 one-two punch, so to speak, in  
3 how to achieve your restoration  
4 goals. The benefits of the  
5 diversion include introducing  
6 sediment and fresh water  
7 nutrients into the Barataria  
8 Basin. You get a  
9 preservation-type effect for some  
10 of the existing marsh that is

11           there from the diversion  
12           operating, and then, in addition  
13           to that, you also have an effort  
14           that actively mines sediments  
15           from the Mississippi River and  
16           pumps that into the outfall area.  
17           And I've got a slide in a couple  
18           of minutes here that you'll see  
19           what has been identified as the  
20           most likely location for some of  
21           that dredged material to be  
22           placed. Some of you also may be  
23           familiar with the Bayou Dupont  
24           project that is operating under  
25           the CWPPRA program. The state's

13

♀

1           been helping to lead that effort,  
2           and that was a very successful  
3           project that just finished up  
4           this summer and consisted of a  
5           very similar effort where they  
6           mined sediments from the river  
7           just upriver from the Alliance  
8           Refinery and dedicated that  
9           dredged material into containment  
10          cells and built up approximately  
11          450 acres of marsh. We were just  
12          out there about a week and a half  
13          ago. It looks great; there's a  
14          lot of vegetation that's starting

15 to colonize that area, and it  
16 looks really good. So that could  
17 be what the dedicated dredging  
18 component for this project looks  
19 like.

20 Okay. So in order for us to  
21 get to the point that we can  
22 start to work out the exact  
23 details and understand what types  
24 of features are going to be  
25 developed for this project, we

14

1 have to have an authorization  
2 from Congress; it literally takes  
3 an act of Congress to give you  
4 the green light to get started on  
5 this effort. So you can see  
6 these are the top five projects  
7 that I mentioned earlier, the  
8 near-term critical projects, and  
9 you can see the original  
10 estimated price tag for this  
11 project: 278 million dollars.  
12 That was developed pre-Katrina,  
13 and I'm sure many of you are  
14 aware that costs have really  
15 skyrocketed since Katrina;  
16 everything across the board has  
17 gone up: Labor rates have gone  
18 up; fuel charges have gone up;

♀

19 mobilization charges have gone  
20 up. So, in understanding that,  
21 the authorization here that gave  
22 us the green light to get  
23 started, Congress said, well, we  
24 understand that costs and  
25 expenses have increased, so we'll

15

1 allow a 150 percent wiggle room,  
2 so to speak, with this estimated  
3 price tag. So you essentially  
4 can add another half of that 278  
5 to the total, and you end up with  
6 approximately 417 million dollars  
7 that can be worked with to  
8 develop this project.

9 So in allowing the effort for  
10 each of the individual projects  
11 to move forward, you start by  
12 identifying a problem statement.  
13 You know, you have to understand  
14 what you're trying to fix first  
15 before you can intelligently  
16 develop alternatives and measures  
17 to address the problem. So the  
18 problem statements for all of the  
19 LCA projects that are currently  
20 underway were developed at the  
21 same time, and we've modified  
22 some text to address the

23 particular project area that  
24 we're talking about. But we  
25 start here as we start to

♀

16

1 consider, you know, what a  
2 project is going to look like,  
3 whether it's going to be more  
4 diversion than dredging, more  
5 dredging than diversion. You  
6 know, we don't yet know; we're  
7 going to solicit those kinds of  
8 comments from you all tonight,  
9 but this is a starting point:  
10 Identify your problem, and then  
11 you go figure out how to solve  
12 it.

13 And in conjunction with a  
14 problem statement, the goal, the  
15 overarching goal of the LCA  
16 program and projects is to  
17 ultimately reduce the trend of  
18 degradation in our study areas.  
19 You know, we want to try and set  
20 a target that we can  
21 realistically achieve, and I  
22 think you all understand that the  
23 targets are very important, and  
24 they're also very challenging.  
25 We're all aware of what coastal

♀

17

1 Louisiana is facing as far as the  
2 rates of wetland loss go, how  
3 severe it is, what's already been  
4 lost, and what we would expect to  
5 lose in the future. So reversing  
6 or reducing that trend of  
7 degradation is a very important  
8 concept, and in the 2004 effort,  
9 there were a couple of tiers of  
10 what reversing that trend might  
11 mean. You can, for instance,  
12 consider slowing your rate of  
13 loss by 50 percent. You know, if  
14 you know that by doing nothing,  
15 you're going to lose 100 acres  
16 over the next year, you might set  
17 your target through restoration  
18 efforts to reduce that to only  
19 50 acres lost. You're still  
20 losing, but you've reduced the  
21 rate. You can also consider a  
22 concept such as no net loss, just  
23 maintain what you have. And that  
24 might be considered a bit of an  
25 undershoot, but, like I said

18

1 earlier, you know, it's quite a  
2 challenge to hold on to what we

3 do have now. So that becomes an  
4 important consideration. Also,  
5 LCA identified perhaps increasing  
6 your rate of over no net loss by  
7 50 percent; for instance, so if  
8 you knew that you had 100 acres  
9 currently, you might try to have  
10 150 acres by the time you get  
11 done with your period of  
12 analysis.

13 So in trying to develop  
14 different measure types that will  
15 address the problems of our  
16 particular area, you list them  
17 out and you can come up with  
18 opportunities or different  
19 structural features that seek to  
20 offset some of these causes of  
21 the problem that you're studying.  
22 These problems are witnessed  
23 across the coast, and it sets the  
24 framework for figuring out what  
25 you want to do and what you can

19

1 do to address some of these. You  
2 might not be able to really do  
3 much about tropical events, for  
4 instance. It's identified as a  
5 problem because we all know what  
6 tropical storms and hurricanes

7 can do for the wetlands in a  
8 particular study area. What you  
9 can propose and develop in  
10 response to addressing the  
11 problem of tropical events, well,  
12 that becomes something you either  
13 consider and move forward within  
14 the study, or you might say,  
15 well, maybe that's not something  
16 we can do; maybe we need to  
17 instead focus more on the  
18 problems of saltwater intrusion  
19 or hydrologic modifications. So  
20 we want to keep all of these  
21 things in mind, and I ask you all  
22 to keep these in mind, too, as  
23 you consider comments you might  
24 make for us as we consider  
25 different ways to achieve success

20

♀

1 with this project.  
2 So this is a list of some of  
3 the opportunities that have  
4 already been put on the table and  
5 we've considered just in this  
6 very early stage of the project.  
7 So you can see that the theme of  
8 each bullet item up there speaks  
9 to a particular type of  
10 restoration feature; for

11 instance, the first one, the  
12 statement "restore impaired  
13 deltaic function," well, what  
14 does that really mean? It means  
15 trying to figure out a way around  
16 the fact that we have levees that  
17 go from the Jefferson Parish line  
18 up in Belle Chasse all the way  
19 down to Venice on the west bank.  
20 So restoring some sort of deltaic  
21 function becomes a theme that we  
22 can focus on. And how do we  
23 achieve success in addressing  
24 that theme? well, by restoring  
25 some sort of deltaic function by

21

1 the creation of a diversion  
2 structure. Likewise, some of the  
3 other bullets there, directly  
4 create marsh through dedicated  
5 dredging; that's another way for  
6 us to focus our attention on a  
7 theme for achieving success with  
8 the project.

9 So this is a graphic of the  
10 study areas that were developed  
11 from the 2004 effort. It became  
12 apparent as we got through the  
13 effort to identify how to proceed  
14 with the project that we would

15 have two distinct areas to treat  
16 differently. Area 1, for  
17 instance, is what was identified  
18 as the area that either would  
19 tend to contain most of the  
20 identified cells for marsh  
21 creation directly, where you pump  
22 sediments from the river and fill  
23 those areas in, and, also, that's  
24 an area of immediate influence  
25 for the proposed diversion

22

1 structure. So that area tends to  
2 be the area of concentration  
3 where a lot of the nutrients and  
4 sediments that are diverted  
5 through that diversion structure  
6 tend to fall out; you have a lot  
7 more potential for accumulation  
8 of sediments and eventual  
9 conversion to vegetation within  
10 that area.

11 However, you contrast that  
12 with Area 2, which could be the  
13 effects that are noticed by  
14 salinity changes from the fact  
15 that you're introducing fresh  
16 water into the estuary, and that  
17 has a much larger and broader  
18 reach than the area that tends to

20101118 USACE Myrtle Grove Scoping Meeting.txt  
be affected more with sediment

19  
20  
21  
22  
23  
24  
25

deposition. So it's an issue we  
have to consider, and, you know,  
based on the recommended size of  
the project in the 2004 efforts,  
which is up to about 15,000 cubic  
feet per second, it's very likely

23

♀

1  
2  
3  
4  
5  
6  
7  
8  
9  
10  
11  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22

that when that structure is  
operating, you could see salinity  
changes, although we don't yet  
know exactly how much that might  
be, but you could see that within  
Area 2 there, in addition to Area  
1.

So these are the details that  
were outlined in the 2004 effort.  
The initial concept was to  
recommend a 5000 CFS -- cubic  
foot per second -- structure even  
though there was a framework  
developed that said -- they  
called it a medium-sized  
diversion. Medium-sized, in this  
case, could mean anything from  
2500 CFS on the small end to up  
to 15,000 on the higher end. In  
addition, you would have some  
sort of outflow channel that  
would direct that introduced

23 fresh water, nutrient and  
24 sediment water, into the basin  
25 itself. So where the location

24

1 was identified just south of the  
2 Alliance Refinery, you would have  
3 approximately 15,000 feet of  
4 outflow channel to connect  
5 between the river and the estuary  
6 side. Putting that type of  
7 structure and channel in requires  
8 some modifications to Highway 23.  
9 It also might, depending on the  
10 exact location, require some  
11 engineering considerations for  
12 the railroad spur that goes a  
13 little bit beyond the Alliance  
14 Refinery. The nonfederal levee  
15 system that exists below Naomi  
16 down to the West Point area, now  
17 that area is changing, and,  
18 because of the storm, of course,  
19 it's under consideration for  
20 incorporation into the federal  
21 levee system. That's a big  
22 consideration we need to plan  
23 around because we can essentially  
24 do one of two things: we can  
25 either create an outfall channel

25

1           that connects the river to the  
2           estuary, and if we place that  
3           through a federal levee system,  
4           we can either construct the guide  
5           levees on that channel that also  
6           have to tie into the federal  
7           system to ensure that that  
8           minimum level of protection is  
9           maintained, or you can take  
10          another approach, which is,  
11          perhaps, to put some sort of  
12          gated structure on the back end  
13          of the outfall channel just  
14          before it gets into the estuary.  
15          So, that way, you can seal off  
16          the system if need be, you know,  
17          should a storm approach or should  
18          tidal levels get significantly  
19          increased on the back side. So  
20          those are things that we'll have  
21          to plan for, as well, and that's  
22          going to be a bit dependent upon  
23          what shape and location the  
24          federal levee system takes.

25                 And the dedicated dredging

26

1           component that was recommended in  
2           the programmatic effort  
3           identified approximately 6500

4            acres of direct marsh creation.  
5            That wouldn't necessarily be done  
6            all at once; to build that much  
7            acreage right off the bat is a  
8            very long-term and expensive  
9            endeavor, so the idea is to build  
10           a little bit at a time. And the  
11           way it was developed was to  
12           suggest, perhaps, mining on the  
13           order of 2 million or so cubic  
14           yards of sediment directly from  
15           the river every year. If you  
16           just use a quick rule of thumb,  
17           you can translate 2 million cubic  
18           yards based on an assumed water  
19           depth into approximately 400  
20           acres or so of marsh creation,  
21           and you do that one year, you let  
22           your borrow source within the  
23           Mississippi River refill -- you  
24           know, the sediment supply is a  
25           renewable resource -- and then,

27

♀

1            as you target specific cells for  
2            marsh creation, you let your  
3            borrow source refill, you go back  
4            the next year, you identify  
5            additional cells for marsh  
6            creation, and you dredge again,  
7            you pump to a different location

8 and start working towards that  
9 ultimate goal of approximately  
10 6500.

11 And this will end my part of  
12 the presentation for you all, but  
13 I put this slide together because  
14 I wanted everyone to keep in mind  
15 that these are comments that were  
16 made in 2004 at the public  
17 scoping meetings that were held;  
18 there were a couple held in Belle  
19 Chasse, there was one in Harvey,  
20 I believe, and I think another  
21 one on the western side of the  
22 basin. And it's interesting  
23 because the comments that were  
24 made back then, six years ago,  
25 are pretty similar to comments we

28

♀

1 hear at public meetings that we  
2 held last week. You know, the  
3 concept is still fundamentally  
4 the same; people have opinions,  
5 and they've held those opinions  
6 for a long time. And I wanted to  
7 just put this up here so you  
8 remember what was said. You can  
9 go through the EIS that's  
10 available for public download on  
11 the LCA.gov website and download

12 an entire 2-inch-thick binder of  
13 all of the public comments that  
14 were made if you'd like to read  
15 each one. But I pulled out the  
16 more relevant comments that were  
17 specifically related to the  
18 Myrtle Grove project for you to  
19 just look at tonight.

20 So I think that ends my part  
21 of the presentation, and I'm  
22 going to turn the microphone over  
23 to Trish Leroux, who is our  
24 environmental lead for the  
25 project, and she's going to talk

29

1 about some NEPA requirements.  
2 Thank you.

3 MS. LEROUX:

4 Good evening, ladies and  
5 gentlemen, and thank you very  
6 much for coming. My name is  
7 Patricia Leroux, and I'm the  
8 environmental manager on this  
9 project.

10 Briefly, what I'm going to  
11 cover tonight, I'm going to give  
12 you an outline of what process we  
13 take. We use the National  
14 Environmental Policy Act, or  
15 NEPA, when we are starting a

16 project. Basically, NEPA  
17 requires that whenever a federal  
18 project significantly impacts the  
19 environment that we perform a  
20 study and document the impacts of  
21 the proposed action. The  
22 document will allow the  
23 environmental and economic  
24 information to be available to  
25 the public so that you can review

30

1 it and decide for yourself  
2 whether you feel that it's  
3 adequate.

4 The scoping process -- which  
5 is part of the NEPA process,  
6 which is what we're in right  
7 now -- the scoping process is  
8 your opportunity. This is a very  
9 important part of the NEPA  
10 process. This is where you guys  
11 can have the chance to come and  
12 tell us what you feel with  
13 regards to the proposed action.  
14 You live here, you see things  
15 that we don't see, so you need to  
16 tell us what you're seeing, what  
17 you're feeling, and what your  
18 thinking is.

19 This is just a brief outline

20 of the environment impact  
21 statement study. I'm not going  
22 to go through everything, but I  
23 am going to highlight the need  
24 for the project. This goes back  
25 to the project problem statement

31

1 that Andy mentioned earlier. Do  
2 you see a reasonable need for  
3 this project? And, as I said, it  
4 goes to the project problem  
5 statement: what's the problem?  
6 Do we really need this project?  
7 Additionally, as I mentioned  
8 before, because you live in the  
9 area of the proposed project, you  
10 can possibly provide us with  
11 alternative locations,  
12 alternative ideas; instead of the  
13 proposed action, maybe you can  
14 come up with something else, and  
15 this is your opportunity to do  
16 so.

17 This is just a listing of  
18 some environmental concerns.  
19 Once again, I'm not going to read  
20 through all of them, but I am  
21 going to highlight some of the  
22 environmental concerns, such as  
23 wetlands, essential fisheries, as

24 well as wildlife, water quality,  
25 air quality, which affects the

32

1 fisheries.

2 Human-induced concerns, such  
3 as storm water runoff,  
4 recreational facilities, noise,  
5 transportation. Is this going to  
6 keep me up at night? How am I  
7 going to get to work in the  
8 morning? Is it going to affect  
9 my commute?

10 Socioeconomic concerns, just  
11 a listing of them. A lot of  
12 people are going to be worried  
13 about, what is this going to do  
14 to my flood protection? How is  
15 this going to affect my  
16 insurance? How is this going to  
17 affect my taxes? What's this  
18 going to do to my property?

19 This is a schedule. Just  
20 starting the environmental impact  
21 statement. Right now, we are in  
22 the scoping process. As I  
23 mentioned, this is your  
24 opportunity to come forward and  
25 tell us what you think and feel.

33

1           Now, once the scoping report  
2           is completed, it will be  
3           available to anybody who is  
4           signed up for the mailing list if  
5           you wish to receive a copy of it.  
6           Also, I'm sorry; I failed to  
7           mention written comments will be  
8           accepted for 30 days after the  
9           release of the scoping report.

10           Scoping questions. This is  
11           basically things that we want you  
12           all to think of when you're  
13           asking us -- when you're  
14           providing your input to us. What  
15           are the most important issues?  
16           Are there any alternatives?  
17           Can't stress enough: You live  
18           here; you work here; you see  
19           things that we don't, so you need  
20           to let us know if you can think  
21           of something else that we can do.  
22           And are there any other problems  
23           or other opportunities that we  
24           need to be aware of?

25           This is my information, my

34

1           contact information: e-mail,  
2           physical address, and phone  
3           number. Any comments during the

4 scoping process that you don't  
5 wish to make here -- or, after  
6 the report has been released, any  
7 comments you wish to make on the  
8 report itself -- can be sent to  
9 me. You don't have to come up to  
10 me and talk; you can just send me  
11 something or pull me aside.

12 And this is the contact  
13 information -- we've heard from  
14 Andy earlier tonight. Also, we  
15 mentioned Andrew Beal as well as  
16 myself and Daimia Jackson, who is  
17 project manager.

18 And, at this point -- as I  
19 said, my summary is going to be  
20 brief -- I'm going to turn it  
21 back over to Rachel, she's going  
22 to lay out a few ground rules,  
23 and we can move forward. Thank  
24 you.

25 MS. RODI:

♀

35

1 Okay. I hope you guys are  
2 paying attention because now it's  
3 your turn. As everyone's said  
4 before, this is your opportunity  
5 to give your comments, your  
6 questions, your concerns. We're  
7 not answering questions about

20101118 USACE Myrtle Grove Scoping Meeting.txt  
8 specifics about the project

9 because we're in the very  
10 beginning of the study stage, and  
11 this is your opportunity to give  
12 us your input as to how you want  
13 the project to look going  
14 forward. So just kind of trying  
15 to set that up up front; we're  
16 just taking your comments and  
17 your concerns about the project.

18 We are going to ask you to  
19 keep your comments to about three  
20 minutes; we do have a timer if  
21 anyone starts going too long.  
22 And if you do have another  
23 comment that you want to make  
24 after you make your first one,  
25 that's fine; we just ask that you

36

1 let someone else that hasn't  
2 spoken yet speak first, and then  
3 you can come back up. And if you  
4 don't feel comfortable coming up,  
5 that's fine; we have a court  
6 reporter here that you can talk  
7 to afterwards; you can give your  
8 comments directly to him. We  
9 also have written comments cards  
10 that are postage-paid you can  
11 turn in. And you can always call

20101118 USACE Myrtle Grove Scoping Meeting.txt  
or e-mail Trish, and her

12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25

information will be back up in a couple of minutes.

So, with that, I'm going to start. Cheryn is here, our microphone lady, and she's going to pass it around. I think Mr. Nungesser had a comment to make.

MR. NUNGESSER:

Three minutes; that's tough. A couple of comments first. I think I speak for the majority of the people in Plaquemines when I say that anything that was

37

♀

1  
2  
3  
4  
5  
6  
7  
8  
9  
10  
11  
12  
13  
14  
15

planned before Katrina that we don't modify to reduce storm surge and flood protection incorporated in it from day one is absurd. To spend one dollar on anything -- we won't live long enough to see this happen if we don't. You said it was a No. 1 project in 1992 in Jefferson Parish. I can guarantee you today it's not the No. 1 project. You keep saying in 1994 all these great comments were made. In 1995, our world changed forever. We -- excuse me; 2005. So a year

16 before Katrina, any plans in the  
17 state, the federal government,  
18 anything, need to be altered for  
19 our survival; not for what's  
20 pretty, not for what looks good,  
21 for survival. We will not be  
22 here by the time this project --  
23 I know it keeps y'all employed,  
24 but we will not be here. You  
25 know, Colonel Lee spent two years

38

1 here. He did a lot of things.  
2 He's gone; his day is finished.  
3 These people have to live here  
4 the rest of their life. I have  
5 never been to one of these public  
6 hearings where the Corps has  
7 changed direction. They have  
8 been dog-and-pony shows.

9 So I'm going to leave y'all  
10 with a question tonight. I want  
11 to know from the Corps what is it  
12 going to take to make you change  
13 direction, other than short of a  
14 lawsuit? Is it going to take me  
15 to get a petition signed by the  
16 three surrounding parishes 80  
17 percent? If you tell me you'll  
18 change direction if I do that, I  
19 will start tomorrow because it is

20101118 USACE Myrtle Grove Scoping Meeting.txt  
20 that important to our survival.

21 we're not against diversions, but  
22 you wouldn't spend your money  
23 doing that if you lived here; you  
24 wouldn't do it. Anything that  
25 does not reduce the storm surge

39

♀  
1 -- Gustav projection to the  
2 Barataria Basin was 34 feet. We  
3 were talking about putting boats  
4 on the roof from my three-story  
5 office building. So all that  
6 fancy work you did on the canal  
7 wouldn't have helped us. But  
8 pumping eight foot berms across  
9 the Barataria Basin -- and we  
10 have the data; we spent a million  
11 dollars of parish money to show  
12 you that an eight-foot ridge blow  
13 a storm surge 8 to 1 over a mile  
14 of marsh grass. But we keep  
15 pumping marsh grass, and the  
16 thunderstorms keep washing it  
17 away. So when are you people  
18 going to think and spend it like  
19 it's your money? Thank you.

20 MS. RODI:

21 P. J. Hahn in the back, as  
22 well.

23 MR. HAHN:

24

First of all, I'd like to

25

thank everybody that showed up

♀

40

1

here tonight. Obviously, this is

2

something that everyone's

3

concerned about, and especially

4

the NGOs that have been here

5

tonight and the folks of

6

Plaquemines Parish.

7

I'd just like to point out a

8

couple of things. West Bay

9

Diversion. West Bay Diversion

10

was studied -- we only have three

11

diversions in the state, and West

12

Bay is one of them. It was

13

studied for 12 years, 28 million

14

dollars used to build that

15

diversion. Here it is five years

16

later, and we're going to shut it

17

down. The same things that are

18

promised here tonight were

19

promised for that, but it didn't

20

work.

21

We're not against diversions;

22

we need diversions, but we need

23

the sediment; we need to pump.

24

And I'd just like to put that out

25

there. Without the dredging,

♀

41

1           these diversions aren't going to  
2           do it. Thank you.

3           MS. RODI:

4           Again, when you speak, just  
5           state your name and your address  
6           or where you're from.

7           MR. SIRAGUSA:

8           My name is Eric, and I live  
9           in Kenner. But just from reading  
10          a lot about the coastal erosion,  
11          and just -- we have a fishing  
12          camp out in Belle Chasse, and  
13          I've seen some stuff. And it  
14          does work. I mean, they've done  
15          studies from the Davis Pond and  
16          the Caernarvon, and some people  
17          -- it's kind of like a little  
18          miscommunication. It's not just  
19          the sediment, but, I mean -- I'm  
20          for it. I mean, some people --  
21          it takes time, but one of the  
22          main things it does is you get in  
23          fresh water from the river, the  
24          Mississippi River, and it's going  
25          into these areas and it's pushing

42

1           the salt water that's in those  
2           areas back into the Gulf, and you  
3           got more fresh water. And the  
4           thing with that is -- one of the

5 things -- like, you have the  
6 erosion is -- well, I mean,  
7 you're pushing the salt water  
8 back out because when you have  
9 the salt water building up, it  
10 kind of starts to destroy all the  
11 vegetation, and then it kind of  
12 leads to erosion. I mean,  
13 there's other things, too, but  
14 like you mention about testing,  
15 you know, like a hiking test  
16 (phonetically spelled) or  
17 something, measure the sediment.  
18 Another one, I don't know if  
19 y'all have thought of, but, like,  
20 testing the salinity levels  
21 because that really makes a big  
22 difference, and the higher the  
23 salinity, the more stress it puts  
24 on the plants. And when you lose  
25 the plants, you just have just

♀

43

1 that mud, and the waves from the  
2 hurricanes, it destroys the mud.  
3 But, like y'all mentioned, I  
4 mean, you know, you can put more  
5 dirt, but as long as you build  
6 stuff like this and you got the  
7 fresh water, the diversion just  
8 pushing the salt back out, it

9 kind of gives you more of a  
10 chance.  
11 And kind of like with Billy,  
12 I kind of understand how you  
13 said, like, you don't want to put  
14 money into it if you're got going  
15 to get anything or if it takes  
16 forever, but just -- just -- you  
17 know, just building this, I mean,  
18 and then, you know, you'll see if  
19 you measure the salinity, the  
20 salinity's going drop. And it  
21 takes time, but if you don't,  
22 you're just going to -- it's  
23 going to happen again. The more  
24 erosion you have, then when you  
25 have the hurricanes, and it will

44

♀

1 destroy more. But then it's  
2 going to destroy more of houses  
3 and cities. I mean, building up  
4 the marsh and all that, it's like  
5 a buffer zone; it helps protect a  
6 lot of residents. And it's --  
7 and I've just been reading a lot;  
8 I was an environmental major for  
9 a while, and it just -- I mean,  
10 what else can you do? I mean, if  
11 you want to protect a lot of  
12 people, you got to put money in,

13 and, I mean, there's really no  
14 other good things -- I mean -- I  
15 mean, when y'all thought of this,  
16 it was one of the most smartest  
17 ideas to help protect it. I  
18 mean, you built the levees -- I  
19 mean, the levees -- anyway.

20 MR. TESVICH:

21 Hi. I'd like to thank the  
22 Corps. I'm John Tesvich,  
23 chairman of the Louisiana Oyster  
24 Task Force and president of the  
25 Louisiana Oyster Growth

45

1 Association. I was born and  
2 raised in south Plaquemines, and  
3 I've got some notes here I wanted  
4 to just go through.

5 why dredge into a diversion?  
6 You're talking about 228 million.  
7 The gentleman just said, you  
8 know, we need to do something.  
9 Yeah, we need to do something,  
10 but I agree with Billy. 228  
11 million, now you want to dredge  
12 into this diversion? You already  
13 have it in the pipe coming out of  
14 the river; you have it in the  
15 pipe coming across the levee, and  
16 you're going to pump it right

17           into the diversion? The  
18           diversion just spills it over the  
19           wide area building a quarter inch  
20           a year. That doesn't make sense.  
21           You already have it in a pipe;  
22           put it where you want it. You  
23           can build land in a few days.  
24           why put it in a diversion?  
25           Diversion water just spills it

46

1           all over the place. It's going  
2           to fill up our holes where we  
3           fish; it's going to cover our  
4           oystereries; it's going to cover  
5           everything. It just creates more  
6           destruction. Water is  
7           indiscriminate; it's just like a  
8           flood; it goes all over the  
9           place. If you have it in a pipe,  
10          put it where you want it, where  
11          you need it, where we can have  
12          something to protect us from the  
13          storm surge, like Billy  
14          mentioned. why put it -- it  
15          doesn't make sense. You know,  
16          you're trying to enhance the  
17          diversion's land-building, but  
18          then you have it controlled and  
19          then you put it and lose control  
20          of it in a diversion; that

21 doesn't make sense. It's not  
22 engineering -- that's not smart,  
23 and the Corps of Engineers' idea,  
24 I really -- you know, you have to  
25 take another look at that. why

47

1 do that?

2 critical needs. Critical  
3 needs. Again, what Billy  
4 mentioned, critical needs are  
5 more and so very apparent now  
6 after Katrina. This is not a  
7 critical need. This will not  
8 build land in our lifetime, and  
9 it will not save us from storm  
10 surge.

11 The other thing, the false  
12 assumption is river diversions  
13 are cheap, and this assumption we  
14 need to reconnect the river with  
15 the estuary is the cheapest way  
16 of building land. We don't want  
17 to pump. We don't want to burn  
18 carbon fuels to pump it, but  
19 you're pumping it anyway. You  
20 know, to build land, you have an  
21 environment cost that you have to  
22 consider here, and there is an  
23 environmental cost. And by  
24 pumping, using the money to pump

25

sand where you want it is a lot

48

1

more efficient in so many ways.

2

Deltaic function was

3

mentioned. That wasn't part of

4

the delta in the last 2000 years.

5

Barataria Bay has been an

6

estuary. The delta has been

7

south of Barataria Bay for a

8

couple of thousand years or more;

9

I don't know how long. But the

10

Barataria Bay has been there, so

11

it's not a delta. Now you want

12

to create a delta there. Some

13

people want to create this little

14

delta. I've seen the pictures of

15

an overlaid copy of a delta in

16

Barataria Bay. We don't want a

17

delta in Barataria Bay.

18

Barataria Bay is our estuary.

19

It's very important to us.

20

The other thing, restore

21

altered salinity review. We're

22

already controlling salinity.

23

I'm not against controlling

24

salinity, and if this is a small

25

diversion to control salinity in

49

1 that marsh to bring nutrients to  
2 the marsh in that surrounding  
3 area, I'll support it. But to do  
4 anything more than that does not  
5 make sense.

6 Environmental impacts, also,  
7 when you're talking about  
8 anything more than a small  
9 diversion, you're creating  
10 greater environment impacts on  
11 the fisheries in Barataria Bay;  
12 you're altering the salinities  
13 beyond historical levels, and  
14 that's really not called for. It  
15 will not help us. Thank you.

16 MS. RODI:

17 Thank you, Mr. Tesvich.

18 MR. LAMBERT:

19 My name is Captain Ryan  
20 Lambert. I've been a guide in  
21 Plaquemines Parish for some 30  
22 years now, and I've watched it go  
23 away day by day. And it's  
24 accelerating rapidly as we speak.  
25 And it's a two-fold process:

50

1 we're going to have to build and  
2 pump sand in order to get things  
3 done right now for storm surge  
4 capacity, but, at the same time,

5 if we don't introduce the fresh  
6 water and let the fresh water  
7 aquatics grow and to keep the  
8 predation of our species, whether  
9 it be shrimp or crabs or finned  
10 fish, it's going to be a two-fold  
11 process. If we do not introduce  
12 the diversions to keep those  
13 berms there and to keep all the  
14 mud that we're going to pump in,  
15 whether it be for storm surge or  
16 others, it's redundant. You can  
17 build all you want. I watched it  
18 go away every day for 30 years  
19 because we took it away. Take  
20 something like a small thing of  
21 Spanish Pass. Five years we've  
22 been waiting for cost-sharing  
23 issues, and, at the same time,  
24 all that marsh has eroded away  
25 and filled up Yellow Cotton Bay.

♀

51

1 Yellow Cotton Bay was the  
2 economic engine that drove 100,  
3 200 boats every day to come  
4 there, and people would buy bait  
5 from everyone, gas, whatever.  
6 Now, it's 12 feet deep. It was 8  
7 or 9 feet deep; now, today, it's  
8 12 feet deep because all that

9 moisture eroded and fell right in  
10 there. why? Because we shut off  
11 Spanish Pass. You've got to have  
12 the fresh water going in order to  
13 maintain these estuaries, and, at  
14 the same time, we have to build  
15 those berms; we have to, you  
16 know, get this -- it's all going  
17 to have to come together. You  
18 know that, you know, and we'll  
19 fight that fight; we'll fight,  
20 you know, the oysters, whether  
21 it's too much salinity, too much  
22 fresh water. We're going to have  
23 to come to a happy medium, but we  
24 still need the diversions.

25 MS. RODI:

52

1 Thank you.

2 MR. LAWRENCE:

3 My name is Warren Lawrence,  
4 and I live in Myrtle Grove. I  
5 don't know; they use that term  
6 Myrtle Grove very loosely. The  
7 Myrtle Grove area is a small  
8 area, and, I mean, when you  
9 pinpoint and you say "Myrtle  
10 Grove," you're not talking about  
11 a mile and a half of the section  
12 of Plaquemines Parish; you don't

13 give a detail of what truly  
14 effect it has on our community of  
15 Myrtle Grove where I live. The  
16 only thing I say is when private  
17 industry took over and wanted to  
18 build land in Myrtle Grove, they  
19 pumped sediment where they wanted  
20 it. They directionally put it,  
21 and in no time, they built the  
22 acreage that they have there. If  
23 you're going to build land and  
24 you want to build it, do it --  
25 put it just like the gentleman

53

1 said: Pump it the way you want  
2 the mud.  
3 I'm a plumber, and where the  
4 leak's at is starting out at the  
5 Gulf. We are at land when I was  
6 a kid -- I'm 70 years old -- they  
7 used to have passes at the Gulf  
8 -- Four-By-Pass (phonetically  
9 spelled), Bayou Chalant -- I  
10 can't even find these places.  
11 And I think what Billy said is  
12 the ultimate thing. Look at what  
13 the Netherlands did: They didn't  
14 start at the town and work out to  
15 the sea; they started at the sea  
16 and protected the surge. I don't

17 need sand in front of my house; I  
18 got to knock the wave down so I  
19 still have a home. Thank you.

20 MS. RODI:

21 Thank you. Another hand up  
22 somewhere. Over here  
23 (indicating).

24 MR. MCELROY:

25 Baird McElroy with Conoco

54

1 Phillips in Houma. We own one of  
2 the former holdings of Louisiana  
3 Land, which is the largest  
4 private wetlands landowner in the  
5 state. We are in favor of this  
6 project and others like it. We  
7 reserve the right, though, to see  
8 some specific design features  
9 before we can agree to such  
10 canals and railroad relocations  
11 and whatnot. Thank you.

12 MS. RODI:

13 Anyone else?

14 MR. VUJNOVICH:

15 Yeah. Pete Vujnovich, oyster  
16 fisherman, president of  
17 Plaquemines Oyster Association.  
18 Generally, the oyster industry  
19 gives this perception that we're  
20 against diversion, and we're not

21           against diversion; we're just  
22           probably against the concept that  
23           people think it's going to create  
24           land overnight and stuff like  
25           that. Naturally, you know, it

55

1           took 500 to 1000 years to build  
2           the delta when the river came  
3           through -- flowed freely, so to  
4           say. So we support diversions in  
5           the sense that for controlling  
6           salinity, and we recognize the  
7           importance of it. But we also  
8           see, as Billy and P. J. had said,  
9           and John Tesvich, it's a critical  
10          time. We have to invest our  
11          money specifically and  
12          strategically to protect not only  
13          the fishing communities but the  
14          public community, the housing,  
15          the levee system, things like  
16          that.

17                I see a lot's lacking with  
18                the development of this project.  
19                There's no operational plan;  
20                there's really no goals and  
21                objectives kind of defined with  
22                specifics to know how it's going  
23                to operate and stuff like that.  
24                So, like this gentleman, we kind

25

♀

56

1 to speak on it later to see -- to  
2 come up with the plan. Show us,  
3 you know, what kind of  
4 environmental changes; come up  
5 with some kind of operational  
6 plan. Give us something to go  
7 by; otherwise, you know, we're  
8 looking at -- you're talking  
9 about putting a slit in the  
10 levee, letting the water in it  
11 and pumping some sand, yet  
12 there's no strategy to it. So  
13 thank you.

14 MS. RODI:

15 Thank you. Anyone else?

16 MR. ST. PÉ:

17 I'll try to keep this down to  
18 three minutes. I cut my comments  
19 down. My name is Kerry St. Pé.  
20 I'm director of the  
21 Barataria-Terrebonne National  
22 Estuary Program.

23 It's always nice to be back  
24 in Port Sulphur, the place of my  
25 birth. I grew up here. In fact,

♀

57

1 I went to church here, and I

2 spent a lot of time in here,  
3 although the place I spent a lot  
4 of time in isn't here, the  
5 confessional.

6 Anyway, I represent an  
7 agreement, an agreement that was  
8 reached over a five-year period  
9 working with scientists, oyster  
10 fishermen, state agencies,  
11 federal agencies, scientists -- I  
12 said that already. Anybody you  
13 can imagine was involved with  
14 that effort. We reached  
15 agreement. We defined what our  
16 definition of restoration was.

17 BTNEP is committed to  
18 practical, meaningful restoration  
19 that includes stakeholders in the  
20 restoration process. This is the  
21 only way to guarantee support of  
22 the public and success of any  
23 restoration plan, and you have to  
24 start with an agreement.

25 Unfortunately, the insistence of

58

♀

1 some to use large river  
2 diversions to restore our eroding  
3 coastal landscape and the  
4 exclusion of groups who depend on  
5 estuarine species for a way of

6           life has led to an endless cycle  
7           of arguments regarding how best  
8           to accomplish the restoration of  
9           the coastal features that are  
10          necessary for the maintenance of  
11          our unique culture. In light of  
12          large river diversions being used  
13          as a restoration tool, we see  
14          this issue coming down to two  
15          critical questions: what we do  
16          know and what we do not know.

17                 First, what we do know. We  
18          know that even small diversions,  
19          such as Davis Pond, when operated  
20          over an extended period of time,  
21          have the potential to deliver  
22          large amounts of fresh water.  
23          Larger diversions have greater  
24          potential to freshen the estuary  
25          in a shorter time frame. To

59

♀

1           restore the coastal landscape  
2           that we have lost, the diversion  
3           should have amounts of sediment  
4           in it -- the diversion water from  
5           the river. Diversions of massive  
6           quantities of fresh water at  
7           Myrtle Grove could result in  
8           over-freshening of the Barataria  
9           system, where the pulses or

10 continuous patterns are used. We  
11 know that sediment load in the  
12 Mississippi River has decreased  
13 by 50 percent just since 1850  
14 due the multitudes of locks and  
15 dams in the upper drainage of the  
16 Mississippi River, vastly  
17 diminishing the land-building  
18 capacity of any sized diversion  
19 compared to a previous historical  
20 Mississippi River. We know the  
21 idea that river diversions are a  
22 natural restoration technique and  
23 that the idea of delivering  
24 sediment harvested from the  
25 bottom with dredges should not be

60

1 used because it is an unnatural  
2 technique is a misrepresentation  
3 of fact. The entire mid- and  
4 lower Mississippi River has been  
5 completely hydrologically  
6 modified with locks and dams and  
7 is not the same river that  
8 created southeast Louisiana over  
9 the last 7,000 years from the  
10 seven delta lobe channels it  
11 occupied over geologic time.  
12 Making cuts across the levee,  
13 lining them with concrete, and

14 constructing steel gates that can  
15 be operated to let water in with  
16 its minimal sediment load is  
17 certainly not a natural  
18 restoration technique and will  
19 not replace or mimic any of the  
20 original natural conditions.

21 we know the fact that people  
22 live in Barataria Basin will  
23 prevent the free flow of river  
24 water at the level of flooding  
25 needed to bring water and

61

1 sediments over the marshes and  
2 reeds needed for postmodern  
3 land-building from the river.  
4 The minimal amounts of fine-grain  
5 sediment available in the  
6 Mississippi River carried by  
7 these diversions into the  
8 Barataria Basin will not result  
9 in the much-needed re-creation of  
10 land in the time we need it. The  
11 people of the Barataria and  
12 Terrebonne Basins are in  
13 desperate need of relief from the  
14 very real impacts of coastal land  
15 loss now. They should not have  
16 to wait for the passage of  
17 geologic time spans to see land

18 built from a diversion.  
19 Diversions do not take  
20 advantage of the bedload from the  
21 river and can only entrain  
22 fine-grained sediments from the  
23 top of the water column of the  
24 river. This vastly limits their  
25 land-building capacity. The

62

1 river has plenty of  
2 coarser-grained sediment  
3 available for restoration, but it  
4 is on the bottom and it can be  
5 harvested with dredges and pumps  
6 into the Barataria Basin to  
7 restore our coastal landscape in  
8 a remarkably short time. We know  
9 that we absolutely do not have  
10 the time to wait 20, 50, 100 or  
11 200 years for untested, unproven  
12 promises of wetland restoration  
13 and community protection for the  
14 ecological and human components  
15 of southeastern Louisiana.

16 what we do not know. We do  
17 not know the actual amount of  
18 coarser-grained sediment that the  
19 diversions can move, nor do we  
20 know how much of it will be  
21 retained in the marsh. We do not

22 know what the impacts of adding  
23 massive quantities of water will  
24 be to the human communities in  
25 the Barataria Basin and those

63

1 communities along the un-leveed  
2 Gulf Intracoastal Waterway,  
3 especially combined with the  
4 other diversions and  
5 modifications of existing  
6 diversions being discussed now.  
7 Proponents of large-scale  
8 diversion propose these  
9 structures only when the  
10 coarser-grain sediments become  
11 suspended during times when the  
12 river is flowing at exceptional  
13 velocity. The idea is to take  
14 advantage of the land-building  
15 capacity afforded by the  
16 availability of the increased  
17 sediment load. However, during  
18 these times when the river is  
19 flowing at such a massive flow  
20 rate, the communities of  
21 southeast Louisiana are  
22 struggling to keep water out of  
23 their homes and from overtopping  
24 flood protection levees. The  
25 last thing they need during these

♀

1 minutes is a massive quantity of  
2 water added to the Barataria  
3 Basin for restoration. The  
4 impacts of adding this additional  
5 water into the Barataria Basin  
6 and the impacts of backwater  
7 flooding along the un-leveed  
8 Intracoastal waterway from Harvey  
9 to Morgan City need to be  
10 carefully modeled.

11 We do not know how much time  
12 it will take to rebuild any land  
13 -- any of the land in the  
14 Barataria estuary using the  
15 Myrtle Grove river diversion.  
16 Certainly, we have hydrologic and  
17 landscape models; however,  
18 exceptionally high error rates  
19 mean that these tools cannot --  
20 will not give us any meaningful  
21 prediction of the amount of land  
22 we can expect given certain flow  
23 volumes. Based upon the project  
24 description, the limited amount  
25 of land-building capacity will be

1 due to the dedicated dredging

20101118 USACE Myrtle Grove Scoping Meeting.txt  
component of this project, not

2  
3  
4  
5  
6  
7  
8  
9  
10  
11  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25

the diversion component.

MS. RODI:

You almost done?

MR. ST. PÉ:

Almost. I'm sorry. We do not know if this sort of river diversion on the Mississippi will even work. A large river diversion on the Mississippi River has never built land. West Bay, the largest diversion on record from the river so far, was at 50,000 cubic feet per second. The only land built was because of the dedicated dredging component of this project. The water diversion component of West Bay actually eroded some of the land built by the dedicated dredging. Wax Lake receives bedload of bottom sediment material from the Atchafalaya River, which greatly increases

66

1  
2  
3  
4  
5

its land-building capacity, but this will not be the case at Myrtle Grove. This is the reason why dedicated dredging has been made part of this project.

6 We suggest the construction  
7 of a small diversion at Myrtle  
8 Grove and the use of  
9 long-distance pipeline sediment  
10 to greatly increase the  
11 land-building capacity --  
12 capability of the restoration  
13 dollars. I submitted in my  
14 written comments a table which  
15 compares Bayou Dupont, Myrtle  
16 Grove, and the pipeline sediment  
17 component. The Bayou Dupont  
18 project built land -- built a lot  
19 of land, 471 acres, in 0.3 years.  
20 The Myrtle Grove water diversion  
21 is predicted to build land at an  
22 incredibly optimistic figure in  
23 20 years.

24 One of the major benefits  
25 that have been claimed by

67

1 proponents of large river  
2 diversions is that river  
3 diversions are less expensive for  
4 the same result than using  
5 pipeline sediment delivery.  
6 There are three important  
7 differences between pipeline  
8 sediment delivery and large river  
9 diversion. Time is a key factor

10 which will determine the success  
11 of any restoration effort. As a  
12 result, we are not getting the  
13 same result by just comparing a  
14 cost per acre of each project.  
15 The use of river diversions to  
16 build land as part of the Myrtle  
17 Grove project will take an  
18 incredibly optimistic 20 years,  
19 according to the project  
20 estimates, whereas a similar  
21 amount of land-building using the  
22 pipeline sediment delivery will  
23 only take 5.1 years. With  
24 pipeline sediment delivery, we  
25 know exactly what we are getting

68

1 at the end of the pipe: land. No  
2 complicated mathematical models  
3 are needed to make this  
4 calculation. We would be getting  
5 land that we could see within  
6 months. I'll leave it there.  
7 Thank you very much.

8 MS. RODI:

9 Thank you.

10 MS. WOOD:

11 I'm Maura Wood. I work for  
12 the National Wildlife Federation.  
13 We have -- we work with several

14 other national groups on coastal  
15 restoration, understanding that  
16 we have to restore our coast in  
17 order to preserve our culture and  
18 our heritage and the livelihoods  
19 that depend on those resources,  
20 that we're going to need the  
21 nation with us to do it, and  
22 we're working to build that  
23 nationwide support and that  
24 support in Congress.

25 So I want to say there's so

69

♀

1 many things here that have been  
2 said tonight that I completely  
3 agree with, and I know that these  
4 will be really valuable things to  
5 be looking at as you all conduct  
6 the EIS looking at various  
7 impacts. I agree with President  
8 Nungesser that everything is  
9 different since Hurricane  
10 Katrina, that any project that  
11 was conceived before then needs  
12 to be reevaluated and probably  
13 modified to accommodate the  
14 conditions that we're looking at  
15 today. When we're talking about  
16 Myrtle Grove, authorizing a  
17 medium diversion with dedicated

18 dredging, we're not talking about  
19 Caernarvon, we're not talking  
20 about Davis Pond, we're not  
21 talking about West Bay; we're  
22 talking about an opportunity to  
23 move to the next level, to take  
24 what we've learned from those  
25 diversions and to consider what

70

1 we need this project to do and to  
2 figure out the best way to make  
3 that happen.

4 The river can build land.  
5 The river is building land. It's  
6 building it at the Wax Lake  
7 outlet where the Atchafalaya  
8 River -- the Wax Lake outlet of  
9 the Atchafalaya River opens into  
10 Atchafalaya Bay. We need to  
11 think about this in the  
12 short-term and the long-term. I  
13 have been -- I think had a unique  
14 privilege and a fun privilege of  
15 going to the Bayou Dupont area  
16 and walking on that brand-new  
17 land that's being built there.  
18 And I think in the short term, we  
19 have the dedicated dredging  
20 aspect of this project, and we  
21 have to look at the best way to

22 use that. We've talked about we  
23 need areas in the outfall area  
24 that will help -- ridges that  
25 will help to trap the sediment

71

1 that the diversion is bringing  
2 in. We need to think about how  
3 best to use that capacity that's  
4 been authorized, and there's new  
5 science out there to help us with  
6 that. Some of it is not  
7 published, but there is new  
8 information about what the  
9 sediment in the river is doing  
10 and how we can time the opening  
11 of the diversion to get the best  
12 amount of sediment that we can  
13 get.

14 I agree that we don't know  
15 what the operating plan is, and  
16 we need to know what that  
17 operating plan is. And we need  
18 an operating plan for this  
19 diversion like we've never seen  
20 for one before. If you look at  
21 the operating plan for  
22 Caernarvon, as I recall, it says  
23 you can open Caernarvon to 8000  
24 CFS if you have the head in the  
25 river to run it. You can do that

1 most of the months of the year,  
2 and I think 20 days out of the  
3 month. Well, we're talking about  
4 something much more fine-tuned  
5 where we look at all of these  
6 different parameters: when is the  
7 turbidity high in the river, when  
8 can we best capture that  
9 turbidity, what's the water  
10 temperature, what impact is that  
11 temperature going to have on the  
12 receiving basin? So I completely  
13 agree that we need to see the  
14 operating plan. It needs to be  
15 part of the preferred  
16 alternative, and it should be  
17 different than and much more  
18 detailed than we've ever seen  
19 before.

20 I agree that you need to look  
21 at the impact to communities.  
22 We're doing this to preserve a  
23 culture and a heritage, and so  
24 that definitely needs to be part  
25 of the examination. And I agree

73

1 with Kerry that the cost per  
2 acre -- well, we can't say it's

3 not important, but we have to  
4 look at everything, short term,  
5 long term, how we can build the  
6 land we need now, but how we can  
7 maintain it over the long term.  
8 It's all going to cost money, but  
9 we have to do it, I think, for  
10 our families and our future,  
11 really.

12 So I hope that you will look  
13 at all those impacts. I look  
14 forward to working with you. One  
15 thing that we've requested is  
16 that we have an opportunity to  
17 meet with y'all on a regular  
18 basis, and I'm going to be  
19 following up on that. So thank  
20 you so much.

21 MR. HAHN:

22 I was sitting in the back of  
23 the room, and I thank you for  
24 giving me one more time on this  
25 because I was doing some math on

74

1 this project. 417 million  
2 dollars is what you guys are at.  
3 Your acreage is, after 20 years,  
4 8,891 acres. And that's a guess  
5 because you don't know; it may be  
6 a lot less. I mean, we don't

7 know. Using a dredge at six  
8 dollars a cubic yard, that same  
9 28 million cubic yards would  
10 create 21,000 acres, and we know  
11 we'd get that. So just economy  
12 of scale. Thank you.

13 MR. HARRIS:

14 Hi, everyone. So I'm  
15 probably one of the few people  
16 here not from Louisiana, so I  
17 want to thank everybody for the  
18 opportunity to come and speak in  
19 this beautiful church in this  
20 beautiful community. My name is  
21 Paul Harris, and I'm the senior  
22 director for the Mississippi  
23 River Environmental Defense Fund.  
24 I've come down here from  
25 Washington, but I work 100

75

1 percent of the time on answering  
2 the question of how we save this  
3 place; how do we save coastal  
4 Louisiana, its people, its  
5 cultures, and the beautiful  
6 landscape that keeps everybody  
7 here. This is a beautiful place  
8 to be and a beautiful place to  
9 live, and that's why everyone is  
10 here in the first place.

11           President Nungesser and Maura  
12           referred to this, and others have  
13           put that question out there. If  
14           after Katrina we haven't stopped  
15           and, let's say, looked at  
16           everything we're doing and said,  
17           what have we learned, how have we  
18           changed, how are we going to do  
19           things right because we are out  
20           of time. A gentleman mentioned  
21           the fact that, you know, you see  
22           these words on a map now that say  
23           "passes," and it's just open  
24           water that there used to be land  
25           there; there used to be a

76

1           landscape, and that has been  
2           disappearing in lifetimes that  
3           are here in the room.  
4           So how do we step back and  
5           answer that question of let's  
6           learn from what we know from  
7           Katrina and put together a  
8           comprehensive package for  
9           addressing the issues of  
10          Barataria Bay, these communities,  
11          and the whole coast? Kerry  
12          mentioned the work that was done  
13          in the early '90s to come up with  
14          a comprehensive management plan.

15 well, the '90s were a long time  
16 ago, as well. We need to step  
17 forward and figure out how to  
18 move forward.

19 The presentation that was  
20 given at the beginning mentioned  
21 the LCA program. It's not just  
22 this project; it's restoring the  
23 barrier islands; it's several  
24 diversions; it's dedicated  
25 dredging with CWPPRA and other

77

1 programs; it's using great tools  
2 like sediment pipelines to  
3 rebuild critical parts of the  
4 basin: ridges that used to be  
5 there, protected elements. But  
6 we still have to get back to the  
7 basic fact that this landscape is  
8 falling apart, and the reason it  
9 is falling apart is because we  
10 have disconnected this landscape  
11 from the river. So we have to do  
12 all of this together.

13 I want to talk about a little  
14 bit about some work that the  
15 Environmental Defense Fund has  
16 done to answer that question of  
17 how are we changing things since  
18 Katrina. Well, one thing is that

19 we in the national environmental  
20 community heard the call. This  
21 is one of our most threatened  
22 landscapes -- it's our most  
23 threatened landscape and our most  
24 threatened cultures and  
25 communities in the country, and

78

1 why are people not here working  
2 on it, why are we not investing  
3 in it? So we stepped up and we  
4 began to work on it and invest in  
5 it in an entirely different way.  
6 We have a great guy, Jim Tripp --  
7 we still have him -- who's been  
8 ringing this bell for 35 years,  
9 but now, across the organization,  
10 there's more than 40 people  
11 working on this. On this  
12 particular project, we came down  
13 and said, how do we take this  
14 project and answer the questions  
15 that've been asked here? How  
16 much land are we going to build  
17 in return for what changes, and  
18 how can we make sure that we know  
19 what those changes are and  
20 minimize them and deal with the  
21 ones that we have to? How do we  
22 build the land, know how much

23 water we have to move, what the  
24 impacts are going to be on  
25 communities, on fisheries? These

79

1 are all really important  
2 questions. My organization went  
3 out and fundraised over half a  
4 million dollars of private money  
5 of individual citizens to put in  
6 place the best modeling that has  
7 ever been done in the world to  
8 answer these questions, and  
9 that's a process we've been  
10 working on with state government.

11 And so I want to ask of the  
12 Corps that it fully integrate  
13 that modeling and bring it into  
14 this evaluation. This evaluation  
15 is meant to answer the question,  
16 what's the project we want, what  
17 does it do, how do we deal with  
18 it? And I'll just add one thing:  
19 It's already brought a whole new  
20 level of information and science  
21 into this question. So, for  
22 example, we learned that during  
23 the big 2008 flood, there was  
24 three times as much water as  
25 there normally is, but there was

80

1           50 times as much sediment.  
2           During that very short period, we  
3           had huge amounts of sediment, and  
4           it was suspended up into the  
5           water column so that if we could  
6           access that sediment right then,  
7           we could have a big impact in  
8           terms of getting sediment out  
9           into the wetlands. And, most of  
10          the time, we wouldn't have to  
11          have all that water flowing in  
12          there. That's a huge  
13          opportunity; that's new  
14          knowledge; that's what we all  
15          need to bring to the table  
16          because we have to answer these  
17          questions, we have to move  
18          forward on these projects. And,  
19          again, I say "projects" because  
20          we're talking about sediment  
21          pipelines, barrier island  
22          reconstruction, diversions meant  
23          to build land. All of it  
24          together is the way we're going  
25          to save this basin, and I hope

81

1           that you all hear from us that  
2           we're committed to you, to this

3  
4  
5  
6  
7  
8  
9  
10  
11  
12  
13

24  
25

communities. And thanks for the  
chance to talk.

MS. RODI:

Thank you. Anyone else that  
has not spoken yet before we go  
on?

MR. LOPEZ.

John Lopez. All I just want  
to say is I think it's great that  
everybody came out and many  
people are speaking. And I just  
want to emphasize, this is a  
scoping meeting, so this is a  
chance -- everybody should be  
very vocal about this and push  
the Corps because this is a  
chance to maybe still, you know,  
mold this project into something  
that can produce the best results  
for the communities here. So,  
once again, I just want to  
applaud you for coming out and

82

1  
2  
3  
4  
5  
6

speaking out, and don't stop  
pushing. Andy's a great guy and  
he can take it; just keep pushing  
him and, hopefully, something  
will come around. Thank you.

MR. BARRON:

20101118 USACE Myrtle Grove Scoping Meeting.txt  
My name is Andrew Barron; I'm

7  
8 the water quality program  
9 coordinator for the  
10 Barataria-Terrebonne National  
11 Estuary Program.

12 And so I know from the  
13 outside, a lot of people think  
14 that what we really need to do is  
15 just shake down the levees and  
16 allow the river to run through,  
17 but, you know, that is -- you  
18 know, the river is not the same  
19 river that it was before, and we  
20 also have people living down  
21 here, people who can get flooded,  
22 people who make a living out  
23 there off of the estuary. As far  
24 as using these diversions to  
25 create land, what are we really

83

1 getting? Do we even know what  
2 we're getting? Again, we have to  
3 use very sophisticated models to  
4 try and predict this. This is a  
5 chaotic system. Any time you're  
6 trying to model water or weather,  
7 it's a very chaotic system; it's  
8 very hard to predict what's going  
9 to happen. And, based on the  
10 amount of sediment that we have

20101118 USACE Myrtle Grove Scoping Meeting.txt  
entrained in the river column

11  
12 nowadays compared to the past, we  
13 don't really have that much  
14 sediment that we can use. Can we  
15 wait on these giant floods, you  
16 know, giant river flood stages,  
17 and then we're going to divert  
18 water when the sediment's  
19 supposedly entrained up in there?  
20 well, of course, we're going to  
21 already be seeing flooding in the  
22 communities when that happens,  
23 all right.

24 So will we -- if we build all  
25 these structures to divert -- you

84

1 know, if we're considering large  
2 river diversions, are we going to  
3 even be able to operate those  
4 structures? we're putting all of  
5 our eggs in the basket, or at  
6 least we're putting a significant  
7 amount of our eggs into the  
8 basket of diversions, okay. What  
9 do we know about diversions? Wax  
10 Lake is in the Atchafalaya River;  
11 it gets bedload from the bottom  
12 of river. It does not get just  
13 the upper suspended sediment load  
14 like we would get from a

15  
16 River. What do we know about  
17 pipeline sediment delivery? We  
18 know exactly what we'll get from  
19 that, and we'll get it in a  
20 relatively short amount of time.  
21 Do we gamble on the future, or do  
22 we go with what we know? That's  
23 my question. Thank you.

24 MS. RODI:  
25 Thank you.

85

♀  
1 MS. FLANDERY:  
2 My name is Lois Flandery, and  
3 I was born in Myrtle Grove, and I  
4 reside and was raised and reside  
5 in Alliance, so I suppose I'll  
6 have to stick with you with  
7 Conoco Phillips.

8 What concerns me, I've missed  
9 the meetings, so to try to speak,  
10 I would really sound stupid. But  
11 what concerns me is changing  
12 Highway 23. And I'm for  
13 dredging; I think keep it simple.  
14 Where's the guy who invented the  
15 barge in Kenner and built the  
16 coast of Brazil? Can't we just  
17 simply stop all these meetings?  
18 The Corps of Engineers will do

19 what they want anyway. The  
20 wasteful wall is going up pretty  
21 quickly in Oakville. None of us  
22 wants it.

23 So I'd like to know if you  
24 have plans to change Highway 23.  
25 My land was taken when I was a

86

1 child. The front yard -- two  
2 highways are on my front yard.  
3 Either the Gulf is going to get  
4 me, or y'all will with the Corps  
5 of Engineering changing the  
6 highway will take the rest of my  
7 land. So is there a plan already  
8 in your mind about changing  
9 Highway 23?

10 MS. RODI:

11 And, again, we're not  
12 answering questions tonight; the  
13 plan has not even been formulated  
14 yet. Andrew?

15 MR. MACINNES:

16 It's okay. All that was  
17 meant by the discussion with  
18 Highway 23 is that we would need  
19 to account for ensuring that  
20 transportation access is not cut  
21 off, that disruptions are  
22 minimized. And, you know, just

20101118 USACE Myrtle Grove Scoping Meeting.txt  
to speak very hypothetically

23

24

here, it could be that there is

25

just a small bridge over the

♀

87

1

outfall canal or something like

2

that. But the evacuation route

3

is certainly understood and

4

recognized, and we would be sure

5

to maintain that type of access.

6

MS. FLANDERY:

7

Thank you.

8

MS. RODI:

9

Thank you. Anyone else who

10

hasn't spoken yet? And, again,

11

if you don't want to speak

12

tonight, that's fine; we have the

13

comment cards. Trish, call her,

14

e-mail her, fax her. Comment

15

cards are in the back. All

16

right.

17

MR. LAMBERT:

18

The problem with us humans is

19

we think in our lifetime, our

20

70 years, but that's what got us

21

in this problem in the first

22

place in the 1800s when we built

23

that levee. And now, 200 years

24

later, we're suffering the

25

problems from doing so. If we

♀

88

1 take and just start dredging  
2 dirt, we'll save ourself from  
3 storms, and that's what we really  
4 need, but we'll ruin the No. 1  
5 fishery in the United States in  
6 doing so. If we don't let mother  
7 nature do it slowly -- now, we  
8 need to do it, but that's not  
9 sustainable. That dirt will not  
10 stay, just like it didn't stay  
11 for the last 200 years, unless we  
12 reintroduce the river into the  
13 marsh. This is plain and simple.

14 You can't tell me it's not  
15 building land, and the river was  
16 that 9 foot all year. I'm in the  
17 marsh every single day, and on  
18 the east side, with little bitty  
19 holes in the rocks, where I put  
20 my postage sign for my investment  
21 land share out of my boat, the  
22 grass is this high (indicating).  
23 I can't put my boat there; I can  
24 walk on it. It's as hard as that  
25 floor. You can't tell me it's

89

1 not building land. But we want  
2 instant gratification for storm  
3 surge protection? Great.

4           Instant gratification is great,  
5           but it's not sustainable, or we'd  
6           still have our marsh. We have to  
7           have diversions in order to  
8           protect our fisheries, to build  
9           freshwater aquatics, which  
10          protects our fisheries, and to  
11          maintain those diversions and  
12          that dirt we're going to put out  
13          there. If not, we just spending  
14          our money for nothing. And,  
15          sure, it will protect us for the  
16          next 20 to 30 years, but then  
17          we'll have to redo it again  
18          because it will be gone.

19                 So we need the diversions in  
20          order to sustain that mud we're  
21          going to put there. You know,  
22          it's great, but when the river is  
23          at 9 foot all year, every time we  
24          don't have a diversion and we  
25          don't have the opening routes,

90

1           we're losing an opportunity. The  
2           flood of 2008, we lost a great  
3           opportunity. That sediment is in  
4           there; we have to let it go into  
5           the marsh. It is building, and  
6           just because you can't walk on it  
7           tomorrow doesn't mean it's not

8 helping. It's got to be.

9 MS. RODI:

10 Thank you.

11 MR. TESVICH:

12 Thank you. I'd like to again  
13 reiterate this Wax Lake  
14 comparison. I've seen this so  
15 many times, and you hear it again  
16 today. And it's enough. You  
17 know, the real engineers, the  
18 science community has to speak  
19 up. I've seen the Wax Lake  
20 diversion and the Atchafalaya,  
21 the delta that was created in the  
22 last 30, 40 years, and I've seen  
23 it superimposed over the  
24 Baratavia Bay. The Wax Lake and  
25 Atchafalaya System is not the

91

1 Mississippi River system. That  
2 is a young river. That river is  
3 scouring out its beds. Like  
4 people said today, that is a  
5 young river. It's scouring out;  
6 it's digging deeper. It's  
7 bringing the sediment down. This  
8 is an old river. This is a  
9 docile river. It rolls. It  
10 will, you know, re-erupt every  
11 seven years or ten years and have

12 a great bedload, and, yes, if you  
13 open it then, you'll get some  
14 sediment. Are you going to keep  
15 that thing closed for seven years  
16 until you get this great river  
17 and then open it? You're going  
18 to have a 228 million dollar  
19 project just sitting there? I  
20 don't think so. Is that a good  
21 expense of our money? It does  
22 not make sense. That's a  
23 fallacy. The fallacy should be  
24 put to bed. The Corps of  
25 Engineers should put that to bed.

92

1 The Wax Lake is not the  
2 Mississippi River. That is a  
3 different system; that will never  
4 happen here. Now, you can pump  
5 and dredge sediment and try to  
6 create something like a Wax Lake  
7 in Barataria Bay, but that's  
8 totally different; that will not  
9 happen here.

10 The other fallacy is that if  
11 we connect the river or we tear  
12 down our levees, that we wouldn't  
13 have this problem. I don't  
14 believe that. I'm a mechanical  
15 engineer. I know that what we

16 did here in our state, we didn't  
17 have to have levees. We still  
18 would've lost this land. We  
19 dredged it, we pumped everything  
20 out of it, from underneath, from  
21 on top. We damaged this, our own  
22 estuary, our state did, for the  
23 natural resources that were  
24 underneath it. And even if we  
25 didn't have a levee, we still

♀

93

1 would have lost all our land.  
2 Just tearing down the levee will  
3 not create land here in the  
4 Mississippi River; that's a  
5 fallacy. And people tell you  
6 that; there just is no truth  
7 behind it. We need to do  
8 something more serious. It's not  
9 about just reconnecting our river  
10 to our levee. We can reconnect  
11 it and we can just let everything  
12 go. And if you live in  
13 Washington, that's fine; you're  
14 living across the lake, it's  
15 great. You know, you did a great  
16 thing, you reconnected the river,  
17 and you think you created  
18 something. But the people that  
19 live here, that invested their

20 culture and all their time and  
21 their livelihoods, they have a  
22 different opinion.

23 We have had a lot of  
24 freshwater diversions. We have  
25 Caernarvon; we have Davis Pond;

94

1 we have Naomi Siphon; we have  
2 Tiger Pass; we have all these  
3 diversions. We have a lot of  
4 experience. West Bay Diversion,  
5 we've seen what it does; it's not  
6 creating anything extraordinary  
7 here. So the people that live  
8 here, you know, have a really --  
9 you know, an opinion, and I think  
10 the Corps has to realize the  
11 local people have to have some  
12 kind of consideration here, and  
13 that's what President Nungesser  
14 is saying. You know, you can  
15 have great ideas, but it's not in  
16 your backyard. You know, you  
17 want to create a freshwater delta  
18 in my backyard, but you don't  
19 want it in Lake Pontchartrain or  
20 you don't want it in Chesapeake  
21 Bay or you don't want it in your  
22 neck the of woods. That's not  
23 right. The river diversion will

24 affect the livelihoods of  
25 thousands of people that live in  
♀ 95

1 the coastal community. We're  
2 already threatened out of  
3 existence, and this -- you know,  
4 if you divert any more than a  
5 small diversion and if you don't  
6 control it correctly, you stand  
7 to just put us completely out of  
8 our business and take our culture  
9 out and end our livelihoods.  
10 Thank you.

11 MS. RODI:  
12 Thank you.

13 MR. FISHER:  
14 I'm Bryon Fisher, and I live  
15 right here. Been here all my  
16 life. And the only thing I got  
17 to say is I'm tired of  
18 practicing. We've practiced all  
19 these water diversions. Let's go  
20 to some other state and practice.  
21 Let's go for the sure thing that  
22 we know works. Once we get that  
23 taken care of, then we can  
24 practice a little more.

25 MS. RODI:  
♀

1 Thank you. Anyone else that  
2 hasn't spoken?

3 MR. CREPPEL:

4 My name is Foster Creppel,  
5 and I live here as well. We've  
6 been talking about things that we  
7 know and things that we don't  
8 know. One thing that we know is  
9 that this is an estuary that was  
10 built by the Mississippi River.  
11 If we think we're going to  
12 restore this estuary without  
13 connecting the river to the  
14 estuary, we're not being very  
15 smart. This whole estuary is a  
16 dynamic, living system. It's not  
17 static, it's going to constantly  
18 change, and it's built by the  
19 river. And there's no way that  
20 we're going to rebuild this  
21 estuary without reintroducing it.  
22 We used to have plenty, plenty  
23 ducks down here and mink and  
24 muskrat. My ancestors were from  
25 Lafourche and Terrebonne

♀

97

1 Parishes. Bayou Barataria is a  
2 freshwater bayou. At one time,  
3 it was connected to the

20101118 USACE Myrtle Grove Scoping Meeting.txt  
Mississippi River. Bayou

4  
5 Detramite (phonetically spelled),  
6 Bayou Lafourche, Bayou Grand  
7 Chenier, these were all  
8 distributaries; they were all  
9 similar to a freshwater  
10 diversion, and there's no way  
11 that we're going to save our land  
12 if we don't reintroduce the  
13 river. I support the freshwater  
14 diversions. Thank you.

15 MS. RODI:

16 Thank you. Anyone else that  
17 has not spoken?

18 MR. SIRAGUSA:

19 Hey. I know that the main  
20 thing is, like, to help save the  
21 coast. As far as like the EIS --  
22 I mean, everybody -- I mean, they  
23 all had -- we all have great  
24 comments -- I mean, techniques,  
25 ideas, and stuff. I think the

98

1 main thing to understand as far  
2 as erosion and all that is just  
3 learning from the past and just  
4 avoiding the same mistakes and  
5 just moving on. And, I mean,  
6 pretty much -- I mean, the main  
7 thing, you know, from the erosion

8 is -- it's the -- I mean, the  
9 river, if you look back in the  
10 1800s or before, I mean, the  
11 river, you know, oscillated and  
12 moved back and forth from Belle  
13 Chasse or whatever southeast back  
14 and forth. I mean, it's obvious.  
15 I mean, okay, you go up north, I  
16 mean, you got the snow and all  
17 that. The water runs off, the  
18 river goes back and forth, and  
19 it's, you know, spreading the  
20 water and sediment and all that.  
21 And, I guess, I mean, if you have  
22 enough money, you know, I mean, a  
23 lot of people kind of favor, you  
24 know, pipeline sediment, the  
25 Netherlands project, freshwater

99

♀

1 diversion. I mean, they're  
2 all -- I mean, no matter what,  
3 you're not going to get something  
4 100 percent perfect. But, I  
5 mean, you start from the first  
6 settlers that came, I mean, you  
7 start -- you know, they start  
8 seeing the river rising, they  
9 start panicking, you started  
10 building the levees, and after  
11 that, it's pretty much the

12 erosion; it just, you know, kept  
13 on coming. I mean, you know,  
14 erosion would start.  
15 I mean, you just -- the river  
16 is not doing what it used to do.  
17 And, to me, just doing things  
18 natural like how it used to do  
19 it -- I mean, the freshwater  
20 diversion, the sediment, I mean  
21 it's, all -- I mean, just -- I  
22 mean, it's all, you know, good.  
23 It's -- just, I mean, I'm kind of  
24 in favor of it all. I mean, you  
25 really can't do just one thing.

100

♀

1 I mean, it's like the EIS  
2 everybody was talking about. I  
3 mean, from just a lot of things,  
4 you know, we're kind of avoiding  
5 again. I mean, like, as far as  
6 the oil drilling and all that,  
7 and you kind of create more  
8 rivers and for the saltwater and  
9 all that. I just -- I mean, a  
10 lot of people kind of -- you  
11 know, time and a quick fix, and  
12 it's going to take time. I think  
13 just from -- just the -- I mean,  
14 of course, the land -- I think  
15 the land -- it hasn't -- as far

16 as erosion, you know, if you look  
17 at it, it's slowed down a lot  
18 compared to before. I mean,  
19 you've got the -- I mean, as far  
20 as the levees, I mean -- some of  
21 the techniques, I mean -- they  
22 stopped the oil drilling to kind  
23 of give the land a chance to come  
24 back, but --

25 MS. RODI:

101

1 Thank you. Anyone else?

2 MR. PULASKI.

3 I'm Chris Pulaski with the  
4 National Wildlife Federation.  
5 I've attended, well, all the  
6 meetings so far, Crown Point,  
7 Galliano. And so I just wanted  
8 to first cover a couple of items  
9 that I heard at some of those  
10 other meetings that I haven't  
11 heard yet, or at least in too  
12 great a detail. But water  
13 quality monitoring is certainly  
14 something we need to be aware of,  
15 and also storm water management  
16 and what sort of impacts the  
17 system could have.

18 But another point that I  
19 wanted to make was with respect

20101118 USACE Myrtle Grove Scoping Meeting.txt  
20 to the Wax Lake delta and what's

21 going on out there, I think we've  
22 referred to that several times,  
23 and as I appreciate it, the  
24 lesson to be learned from Wax  
25 Lake is that it was an accident;

102

♀  
1 it's a result of the floodwater  
2 overflow channel. But that's  
3 what's happening out there. But  
4 that was an accident. Imagine  
5 what we could do with a project  
6 like a pulse sediment diversion  
7 where it's designed to provide  
8 that sediment. So that's all.

9 MS. RODI:

10 Thank you. I'm going to let  
11 Andy make closing remarks and  
12 then we'll -- unless we have any  
13 other comments. Like I said,  
14 comment cards are in the back, or  
15 you can call or e-mail Trish.

16 MR. MACINNES:

17 Again, everybody, thank you  
18 for your time. I know it's a bit  
19 out of your way to come to a  
20 meeting on a weeknight, but I  
21 want to assure you that  
22 comments do matter. And I can  
23 say that because the comments

20101118 USACE Myrtle Grove Scoping Meeting.txt  
that were made for the 2004

24

25

report that some of you attended

103

1

scoping meetings for did

2

influence the projects that got

3

recommended in that program. So

4

it does make a difference, we do

5

listen, and we have a lot to sift

6

through based on the variety of

7

comments that we heard tonight.

8

But it is important, and I

9

appreciate it very much.

10

I'll make myself available

11

after the meeting. If you'd like

12

to ask me any questions or find

13

out some more information, I'll

14

be available. So thank you for

15

your time, and everyone have a

16

good night. Thank you.

17

18 (Whereupon the meeting was concluded at 8:04

19 p.m.)
