2066	E-2028	2020-07-29	USACE Project Website		Richard Grooms	Richard		Grooms	Birmingham	AL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X

I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General							X	X	X	X				X	
2087	E-2049	2020-07-29	USACE Project Website		Ruth Anne Hicks	Ruth	Anne	Hicks	Georgetown	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

2108	E-2070	2020-07-29	USACE Project Website		Scott Jennings	Scott		Jennings	New Orleans	LA	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X			X

I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X	
2121	E-2083	2020-07-29	USACE Project Website		Steven Zeit	Steven		Zeit	Palm Bay	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. 2141	E-2103	2020-07-29	USACE Project Website		Sylvia Mastandrea	Sylvia		Mastandrea	Clearwater	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X

Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General						X	X	X	X			X			

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

2162	E-2124	2020-07-29	USACE Project Website		Valorie Catalano	Valorie		Catalano	Dade City	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. 2180	E-2141	2020-07-30	USACE Project Website	The Meraux Foundation	Blaise Pezold	Blaise		Pezold		LA	I would like to express that I am in favor of the Mid Breton diversion. As a supporter of the project, I think I would be doing a disservice to my community without asking some important questions about how the diversion will function. I have hosted and attended many "Coastal Conversations" and asked these questions. I have yet to hear an appropriate response. 1.) Many CWPPRA projects are in design and being implemented in the Breton Basin. These projects are a part of a larger concept called the "Breton Land Bridge". The land bridge is situated perpendicular to the outfall of the Mid Breton diversion. If every project is built this will limit sediment distribution within the Basin. Or at best channelize outflow. Outfall management specifics are seriously lacking and should be modeled. 2.) Capturing sediment and building a land buffer is the overall goal of the Mid Breton. West Bay in lower Plaquemine has shown that river diversions need a form of SRED to capture sediment. Vegetation is the most affordable option for capturing sediment and stimulating wetland expansion. Currently the Science of Vegetative SREDs is non-existent. Considerable cost savings can be achieved by studying the feedback between the river and certain types of vegetation. Giant Cut grass (Zizaniopsis miliacea) would be low hanging fruit. Questions are how should they be spaced? How should they be orientated. At what rate can they help speed the goals of the project? 3.) If public seed grounds/natural oyster beds are killed by an opening, then does the state reseed public seed grounds (that are currently over harvested) or do they build living shoreline reefs? I would prefer a living shoreline reef. Or are the natural reefs compensated at all? Who would handle implementation CPRA or LDWF? 4.) What is the inundation period and what triggers it? So say we have a wind driven high water event for 2 weeks and then at the end of that we have a high river that opens it for 2 weeks. This would be too long of a period of inundation for Spartina patens and would lead to massive die offs. Are wind driven high water events taken into consideration or is it solely a flood stage on the river? If you need me to elaborate on any of my questions, then feel free to contact me at the email below. Thank you for hearing my comments. Have a great day!	1	0	Wetlands, Waters / General									X	X	X	X

2186	E-2147	2020-07-30	USACE Project Website		Carrie Saffer	Carrie		Saffer	Boerne	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General							X	X	X	X			X

2207	E-2168	2020-07-30	USACE Project Website		Jamie Fairchild	Jamie		Fairchild	Sugar Land	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X			X

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

2214	E-2175	2020-07-30	USACE Project Website		Jill Mastrototaro	Jill		Mastrototaro	Ridgeland	MS	As someone who has lived, worked, and recreated for over 20 years in the Mississippi River Delta, I am deeply aware of its importance to the birds, wildlife, and people of the Gulf of Mexico. Thus, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Having lived in southeast Louisiana for 15 years, I understand that Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects, as well as impacts and benefits to the Central Gulf of Mexico and Mississippi Sound. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders using multiple communication approaches. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is little time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X			X	
2215	E-2176	2020-07-30	USACE Project Website		Jo Anne Neaves	Jo	Anne	Neaves	Hollywood	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X			X	
2228	E-2189	2020-07-30	USACE Project Website		Kay Bray	Kay		Bray	Lafayette	LA	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. 2229	E-2190	2020-07-30	USACE Project Website		Kelly Messer	Kelly		Messer	Metairie	LA	I am a supporter of the Coalition to Restore Coastal Louisiana, the first nonprofit in Louisiana dedicated to coastal restoration. I am writing regarding the permit application for the Mid-Breton Sediment Diversion, which has been submitted by the Louisiana CPRA. This is a critical project necessary to help protect coastal Louisiana and rebuild land that is rapidly being lost. Sediment diversions have been recognized for decades as necessary tools to rebuild land by reconnecting the Mississippi River to wetlands that have been cut off from the sediment, nutrients, and fresh water that built and have historically maintained our coast. In the EIS for this project, please answer the following questions: • What are the impacts to people, wildlife, habitats and fisheries of Breton and Mississippi Sounds if the Mid- Breton Sediment Diversion is or is not built? • How will this project reduce impacts from hurricanes and storms? • How will this project affect other existing or planned coastal restoration and flood protection projects in the area that are included in the state's Coastal Master Plan? Thank you for your consideration of these questions. I urge you to complete this scoping report as thoroughly and quickly as possible. We have no time to lose in protecting coastal Louisiana. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Storm Protection / General									X	X	X	X				
2230	E-2191	2020-07-30	USACE Project Website		Kim Bigley	Kim		Bigley	Houston	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General							X	X	X	X			X		
2248	E-2209	2020-07-30	USACE Project Website		Melissa Miers	Melissa		Miers	Borger	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General							X	X	X	X			X		

Mid-Breton Sediment Diversion EIS

2268	E-2229	2020-07-30	USACE Project Website		Sharon Rich	Sharon		Rich	South Daytona	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X

Mid-Breton Sediment Diversio
Scoping Comment Matrix
November 10, 2020

2291	E-2252	2020-07-31	USACE Project Website		Hannah Cohen	Hannah		Cohen	New Orleans	LA	I am a supporter of the Coalition to Restore Coastal Louisiana, the first nonprofit in Louisiana dedicated to coastal restoration. I am writing regarding the permit application for the Mid-Breton Sediment Diversion, which has been submitted by the Louisiana CPRA. This is a critical project necessary to help protect coastal Louisiana and rebuild land that is rapidly being lost. Sediment diversions have been recognized for decades as necessary tools to rebuild land by reconnecting the Mississippi River to wetlands that have been cut off from the sediment, nutrients, and fresh water that built and have historically maintained our coast. In the EIS for this project, please answer the following questions: •1. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? 2. What, if any, are the impacts of the proposed diversion on Mississippi Sound and the short-term and long-term fisheries productivity of Breton Sound and Mississippi Sound? 3. What effect will this project have on storm surge vulnerability in Louisiana and Mississippi? How does storm surge vulnerability vary with and without this project? 4. Will you study the specific effect of the diversion on communities of color and ways to address possible inequities that result from its construction and operation (i.e. reduced fisheries, economic impact, cultural impacts)? a. Has racial makeup of the proposed affected communities been studied or will it be studied to determine how this project will effect communities of color? b. How will racially and economically marginalized communities affected by the diversion be compensated for possible future economic impact from the diversion?	1	1	Wildlife & Habitats / Storm Protection / Socioeconomics							X	X	X	X			X
2292	E-2253	2020-07-31	USACE Project Website		Janelle Murphy	Janelle		Murphy	Galveston	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. 2295	E-2256	2020-07-31	USACE Project Website		John Morello	John		Morello	Baton Rouge	LA	I am a supporter of the Coalition to Restore Coastal Louisiana, the first nonprofit in Louisiana dedicated to coastal restoration. I am writing regarding the permit application for the Mid-Breton Sediment Diversion, which has been submitted by the Louisiana CPRA. This is a critical project necessary to help protect coastal Louisiana and rebuild land that is rapidly being lost. Sediment diversions have been recognized for decades as necessary tools to rebuild land by reconnecting the Mississippi River to wetlands that have been cut off from the sediment, nutrients, and fresh water that built and have historically maintained our coast. In the EIS for this project, please answer the following questions: • What are the impacts to people, wildlife, habitats and fisheries of Breton and Mississippi Sounds if the Mid-Breton Sediment Diversion is or is not built? • How will this project reduce impacts from hurricanes and storms? • How will this project affect other existing or planned coastal restoration and flood protection projects in the area that are included in the state's Coastal Master Plan? Thank you for your consideration of these questions. I urge you to complete this scoping report as thoroughly and quickly as possible. We have no time to lose in protecting coastal Louisiana.	1	1	Wildlife & Habitats / Storm Protection / General							X	X	X	X			

Mid-Breton Sediment Diversio

2297	E-2258	2020-07-31	USACE Project Website		Jonathan Micek	Jonathan		Micek	Boca Raton	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. Urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General							X	X	X	X

Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General				X	X	X	X		X
2317	E-2278	2020-07-31	USACE Project Website		Patricia Tucker	Patricia		Tucker	San Antonio	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. 2323	E-2284	2020-07-31	USACE Project Website		Robert Gorman	Robert		Gorman	Thibodaux	LA	I am a supporter of the Coalition to Restore Coastal Louisiana, the first nonprofit in Louisiana dedicated to coastal restoration. I am writing regarding the permit application for the Mid-Breton Sediment Diversion, which has been submitted by the Louisiana CPRA. This is a critical project necessary to help protect coastal Louisiana and rebuild land that is rapidly being lost. Sediment diversions have been recognized for decades as necessary tools to rebuild land by reconnecting the Mississippi River to wetlands that have been cut off from the sediment, nutrients, and fresh water that built and have historically maintained our coast. In the EIS for this project, please answer the following questions: • What are the impacts to people, wildlife, habitats and fisheries of Breton and Mississippi Sounds if the Mid-Breton Sediment Diversion is or is not built? • How will this project reduce impacts from hurricanes and storms? • How will this project affect other existing or planned coastal restoration and flood protection projects in the area that are included in the state's Coastal Master Plan? Thank you for your consideration of these questions. I urge you to complete this scoping report as thoroughly and quickly as possible. We have no time to lose in protecting coastal Louisiana.	1	1	Wildlife & Habitats / Storm Protection / General								X	X	X	X

2338	E-2299	2020-08-01	USACE Project Website		Bernie Martin	Bernie		Martin	Port Orange	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X	
2339	E-2300	2020-08-01	USACE Project Website		Bill Scheerer	Bill		Scheerer	Apollo Beach	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. 2340	E-2301	2020-08-01	USACE Project Website		Carson Lucas	Carson		Lucas		LA	I am a supporter of the Coalition to Restore Coastal Louisiana, the first nonprofit in Louisiana dedicated to coastal restoration. I am writing regarding the permit application for the Mid-Breton Sediment Diversion, which has been submitted by the Louisiana CPRA. This is a critical project necessary to help protect coastal Louisiana and rebuild land that is rapidly being lost. Sediment diversions have been recognized for decades as necessary tools to rebuild land by reconnecting the Mississippi River to wetlands that have been cut off from the sediment, nutrients, and fresh water that built and have historically maintained our coast. In the EIS for this project, please answer the following questions: • What are the impacts to people, wildlife, habitats and fisheries of Breton and Mississippi Sounds if the Mid-Breton Sediment Diversion is or is not built? • How will this project reduce impacts from hurricanes and storms? • How will this project affect other existing or planned coastal restoration and flood protection projects in the area that are included in the state's Coastal Master Plan? Thank you for your consideration of these questions. I urge you to complete this scoping report as thoroughly and quickly as possible. We have no time to lose in protecting coastal Louisiana.	1	1	Wildlife & Habitats / Socioeconomics / Storm Protection / General								X	X	X	X			X

I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General							X	X	X	X			X		
2360	E-2321	2020-08-02	USACE Project Website		Ernie Simoneaux	Ernie		Simoneaux	Covington	LA	Please consider an alternative that greatly reduces environmental impact and maximizes short- and long-term storm protection. Here is a suggested alternative. Guide flood waters and dredged material into a leveed containment basin. Once the containment basin fills with river water, during a flood cycle, flood water flow into the containment basin should be stopped. After the river level has dropped, water from the containment basin should be allowed to drain or be pumped back into the river. Dredge material can be added to force the water back into the river and fill the containment area to create wetland or dryland. Do not allow river water to enter Breton Sound. The levee surrounding the containment basin will provide storm protection as soon as it is constructed. As the containment basin fills with sediment, it will provide additional storm protection. The basin may be preserved as a freshwater wetland or filled to become dryland. Once the containment basin is appropriately filled with sediment, additional openings can be made in the containment basin levee leading to secondary containment basins where additional storm protection, freshwater wetlands or dryland can be built. The storm protection provided by the filled containment areas should be greater than the deltas expected to be formed by the current diversion design. The environmental impact should be reduced to the area of the containment basins.	0	0	General							X	X	X	X					Guide flood waters and dredged material into a leveed containment basin. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X	
2386	E-2347	2020-08-03	USACE Project Website		Jane Gilbert	Jane		Gilbert	Singer Island	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

2402	E-2363	2020-08-04	USACE Project Website		Alannah Corcoran	Alannah		Corcoran	New Orleans	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Louisiana's coast is being hit hard by climate change and the land is receding daily. Not only does this impact ecosystems, but it impacts HUMANS and HISTORY. We must save the coast and protect all humans of Louisiana and all the rituals and love for the land of the gulf coast. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? As a New Orleans resident, impact on the coast is relevant as the surrounding land serves as a protective barrier. New Orleans has faced lots of hardship in result of climate change and we need all hands on deck: from individual support, policy support, and big businesses to protect our coast and to protect the city	1	1																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																										</

	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	----

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

2407	E-2368	2020-08-04	USACE Project Website		Cecelia Dumois	Cecelia		Dumois	Saint Petersburg	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	General / Wildlife & Habitats / Socioeconomics								X	X	X	X			X	
2408	E-2369	2020-08-04	USACE Project Website		Charles R. Stiegler	Charles	R.	Stiegler	Metairie	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. The coast protects our cities from storm surge and also includes one the the continent's great estuaries. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Are diversions the best method for building and sustaining land in the Breton Basin? What impact will not constructing this project have on storm surge vulnerability in Louisiana? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? Recovery of the coastal land loss protects our cities and industry from storm surge and begins the restoration of our estuaries to pre-levee (and corps) conditions. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Socioeconomics / Wildlife & Habitats								X	X	X	X			X	
2409	E-2370	2020-08-04	USACE Project Website		Cherie Epley	Cherie		Epley	Clearwater Beach	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. 2410	E-2371	2020-08-04	USACE Project Website		Cheryl Przygocki	Cheryl		Przygocki	New Orleans	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. As a native New Orleanian and a lover of my home state, with all the unique culture it contributes to the world, I believe we need to protect this wonderful place from sea-level rise. This is a most worthy project. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? It will save us all on the end I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X	
2411	E-2372	2020-08-04	USACE Project Website		Christopher Johnston	Christopher		Johnston	Metairie	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion?	1	1	General / Socioeconomics / Wildlife & Habitats							X	X	X	X			X		
2412	E-2373	2020-08-04	USACE Project Website		Daniel Henling	Daniel		Henling	Seattle	WA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. I grew up in New Orleans and enjoyed canoeing in the waterways and wetlands in and around the city and south Louisiana. Although I did not spend time at the coast, I came to love the flora and fauna of the area and these - along with the people who live in the area - are threatened by the continual encroachment of the Gulf. I also learned much about the importance of a healthy environment during my studies as a biology major at Tulane University and am very concerned about the need to correct the many mistakes humans have made that are causing the coastal lands to wash away. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? Although I no longer live in Louisiana, I keep myself informed about the area by reading the New Orleans Advocate/Times-Picayune and other local publications and my concern for the health of those communities is strong - as is the case for many who were raised in the area but have moved away for economic reasons. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Socioeconomics / Wildlife & Habitats							X	X	X	X			X

2414	E-2375	2020-08-04	USACE Project Website		Gary Delahoussaye	Gary		Delahoussaye	New Orleans	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land.Louisiana's land loss crisis is urgent and will only worsen unless we act -- and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. I've been fishing an hunting out of Venice LA for 40+ years. Words do not do justice to the incredible changes to our coast and wetlands over the past 40 years. In my opinion we should take very available means to somehow save our coast and wetlands. I am an avid fisherman for speckled trout and redfish. I believe that diversions make it tougher for me to catch these targeted species - but I will GLADLY accept those consequences if we can save or restore our coast and wetlands. I am a 100% supporter of the diversions and proposed diversions into the future. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What impact will not constructing this project have on storm surge vulnerability in Louisiana? The wetlands and land loss over the past 5o years is truly indescribable. We have to take immediate and strong actions to SAVE our coast and wetlands. If we were able to restore some it -- that is even better. I'm just not so optimistic about restoring millions of lost acres of wetlands. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats / Socioeconomics								X	X	X	X			X	
2415	E-2376	2020-08-04	USACE Project Website		James Riopelle	James		Riopelle	New Orleans	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act -- and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. 1. not losing my home to erosion 2. hurricane protection for my home, New Orleans, and other communities in delta 3. wildlife & sea life protection The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Are diversions the best method for building and sustaining land in the Breton Basin? What impact will not constructing this project have on storm surge vulnerability in Louisiana? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? Do you plan to study and release the future impacts on the ecosystem, wildlife andcommunities of not constructing and operating the Mid-Breton Sediment Diversion? Saving our homes, the quality of life, and wildlife I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats /								X	X	X	X				
2416	E-2377	2020-08-04	USACE Project Website		Janyce McLean	Janyce		McLean	Canyon Lake	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. 2418	E-2379	2020-08-04	USACE Project Website		Kate Adams	Kate		Adams	New Orleans	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Louisiana's coast is important to me because it is habitat for myriad living creatures, including me and my family. It is important to me for my tax dollars to help ameliorate the damage that human beings have inflicted on this beautiful place. This is a matter of ethical co-habitation and survival. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? The Mid-Breton Sediment Diversion project is important to me, my family, and my community because it is a crucial component of the master plan for protecting our future. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X

2420	E-2381	2020-08-04	USACE Project Website		Matthew Mims	Matthew		Mims	New Orleans	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Our coast acts asa buffer from hurricanes and is home to our seafood industry. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? The river needs to be allowed to act more naturally and allow sediment to go into our marshes instead of flowing into the open gulf. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X			
2421	E-2382	2020-08-04	USACE Project Website		Maura Wood	Maura		Wood	Baton Rouge	LA	What are the potential non-environmental benefits of the Mid-Breton diversion structure itself, along with the “campus” on which it is located? Large engineering projects are rarely thought of, planned, or constructed to be accessible to the public, visually attractive, and educational. In addition to maximizing the building of land, please examine the possibilities in which the structure itself becomes an economic driver and an asset to the parish and community: 1. Public access: When the Bonnet Carre Spillway opens, people travel to Norco to watch. When access to the Bayou Bienvenu Platform was improved, it became a “must-stop” for bus tours, bicyclists, green groups, families and others wanting to understand more about New Orleans and its relationship to water. The Physical Model of the Lower Mississippi River was conceived as a cutting-edge improvement to an important scientific tool. Some big picture thinking during the design process added a public access and education component. Consequently, the Physical Model is a draw for groups of all ages. Increased numbers of people visiting an area offer increased economic opportunities. 2. Public amenity: From time to time I have heard a concern that a diversion will create a de facto as well as symbolic divide between two sides of the parish that will be detrimental to the communities and livelihoods in the areas surrounding the diversion. The structure itself will be designed and operated to capture the most sediment. That doesn't preclude adding landscaping, sidewalks along the guide levees, shade, lighting, parking, restrooms, docks, and observation areas that are attractive and inclusive of the community and its interests. The Mid-Breton “campus” can be a huge amenity for the community at large as well as visitors from all over. 3. Public education: The Mid-Breton Sediment Diversion, when built, will be one of the most ambitious restoration projects undertaken under the Coastal Master Plan. People from all over the world will want to see this feat of engineering. They will want to understand how the diversion works. They will want to hear about how the restoration projects fit together and enhance each other. The Large-Scale Physical Model at the Center for River Studies exemplifies a successful multi-media experience – interactive guided tours, attractive informational signage, and self-guided time with the model itself. A public education component at the site of the Mid-Breton structure will attract more visitors and create more opportunities for economic benefits. NEPA requires that the DEIS reflect a comprehensive examination of impacts, including recreational, cultural, and historical aspects. Given that, please identify, quantify, and evaluate these non-environmental benefits of the Mid-Breton Sediment Diversion in the DEIS.	0	0	Socioeconomics / General								X	X	X	X					X	
2422	E-2383	2020-08-04	USACE Project Website		Monroe M. Howell	Monroe	M.	Howell	Thibodaux	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. the coastal zone is vital to occupational, recreational, cultural, and aesthetic aspects of out lives The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? It will help restore lost land, help buffer storm effects I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Socioeconomics / Wildlife & Habitats								X	X	X	X			X			

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

2423	E-2384	2020-08-04	USACE Project Website		Peter Mehiel	Peter		Mehiel	Pass Christian	MS	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Coastal erosion is a big problem in Louisiana. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Are diversions the best method for building and sustaining land in the Breton Basin? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? Don't want filthy Mississippi River water diverted into Mississippi Coast I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wildlife & Habitats / General / Socioeconomics / General							X	X	X	X			X	
2424	E-2385	2020-08-04	USACE Project Website		Rachel Detoro	Rachel		Detoro	Navarre	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	General / Socioeconomics / Wildlife & Habitats							X	X	X	X			X	
2425	E-2386	2020-08-04	USACE Project Website	Harvey Canal Limited Partnership	Ray Fuenzalida	Ray		Fuenzalida	Harvey	LA	Please allow me to submit these public comments as to the proposed sediment diversion program. As a member of the WBIA,General Manager of a real estate investment group and private Owner of real estate on the Westbank, I am all in favor of the sediment diversion programs. There should be more of them. This is the only place in the entire country that was built on millenia of sediment (silt). There is no rock here, just soil. And the leveeing of the Mississippi River began the destruction of South Louisiana. Oil field canals didn't help but the real culprit is us not allowing the river to overflow its banks and replenish the soil for thousands and thousands of square miles. So, for me, I think we need as much sediment diversion as we can possibly get. And yes, I know there is a short term effect on the ecosystem. But it is only short term. And if we don't do this, we will have no ecosystem at all.	1	0	General							X	X	X	X			X

2432	E-2393	2020-08-04	USACE Project Website		Simone Maloz	Simone		Maloz	Metairie	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Louisiana's coast is important not just to me and my family who live in the greater New Orleans area, but to the entire nation as well because of our contributions in oil and gas, seafood, culture, sugar cane and so much more. The Mid Breton sediment diversion is a cornerstone project in our plan for a sustainable coast in the future, and while we must acknowledge and address any negative impacts, we must also acknowledge and address a future without action and positive impacts to our storm protection, and economic and environmental sustainability. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? I appreciate the leadership shown by the Corps during this current scoping process, and respectfully urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wildlife & Habitats / Socioeconomics / General	X	X	X	X			X	
2433	E-2394	2020-08-04	USACE Project Website		Stephanie Linam	Stephanie		Linam	Benicia	CA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. All wetlands are important and must be protected The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Are diversions the best method for building and sustaining land in the Breton Basin? What impact will not constructing this project have on storm surge vulnerability in Louisiana? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? I live in the SF Bay Area in California and there are a lot of wetlands here to protect. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wetlands, Waters / Wildlife and Habitats / General	X	X	X	X			X	
2434	E-2395	2020-08-04	USACE Project Website		Susan Babbitt	Susan		Babbitt	Philadelphia	PA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. We must protect distinctive environments and species. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. What impact will not constructing this project have on storm surge vulnerability in Louisiana? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? The safety of communities must be preserved. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wildlife & Habitats / Socioeconomics / General								
2435	E-2396	2020-08-04	USACE Project Website		Tac Carrere	Tac		Carrere		LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Louisiana's coast is a protective barrier that protects fisheries, communities, cultures and infrastructure of national importance. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. 1- What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? 2- Are diversions the best method for building and sustaining land in the Breton Basin? 3- What are the specifics of environmental offsets that will be sustainably implemented to protect fisheries and endangered aquatic species in the Breton and Mississippi Sound areas? If successful with sustainable mitigated impacts to fisheries and listed endangered aquatic species the Mid Breton Sediment Diversion will help save this rich estuarine national treasure. Sustainable and broad ongoing environmental offsets need to be a part of the operational culture for these diversions. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats / Fisheries	X	X	X	X			X	

Mid-Breton Sediment Diversion EIS

2444	E-2405	2020-08-05	USACE Project Website		James T. Lynch	James	T.	Lynch	Bayfield	CO	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. A fantastically productive estuary needs to be enhanced and protected. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? As an integral zone for fisheries, wildlife, and a buffer for unforeseen climatic events; this area needs the optimal enhancements and dedication. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wildlife & Habitats / Fisheries / General								X	X	X	X				
2445	E-2406	2020-08-05	USACE Project Website		Janet Martinez	Janet		Martinez	Miami	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

2447	E-2408	2020-08-05	USACE Project Website		John Dale "Zach" Lea, PhD	John	Dale	Lea, PhD	-	-	Please consider an alternative Mid-Breton Sediment Diversion Project design that prevents long-term, negative environmental impacts on Breton Sound and maximizes short- and long-term storm protection. Here is a suggested alternative. Guide flood waters and dredged material into a leveed containment basin. Once the containment basin fills with river water, during a flood cycle, flood water flow into the containment basin should be stopped. After the flood has passed and the river level has dropped, water from the containment basin should be allowed to drain or be pumped back into the river. Adding dredged material to the basin should help force river water back into the river. Do not allow river water to enter Breton Sound; thereby, preventing long-term, negative environmental impacts on Breton Sound. The levee surrounding the containment basin will provide storm protection as soon as it is constructed. "No waiting" as is required by the current design using flood-water-carried silt to build a delta. As the containment basin fills with sediment, it will provide additional storm protection. The basin may be preserved as a freshwater wetland or filled to become dryland. Once the containment basin is appropriately filled with sediment, additional openings can be made in the containment basin levee leading to secondary containment basins where additional storm protection, freshwater wetlands or dryland can be built. Rather than one large diversion containment area, several smaller-sized storm protection containment basins should be built in several places along the river, better targeting storm protection. The storm protection provided by the filled containment areas should be greater than provided by the deltas expected to be formed by the current diversion design. Using containment basins, the storm protection can be better sited for effective, targeted storm protection. The environmental impact should be reduced to the area of the containment basins.	0	0	Water Quality / Wetlands, Waters								Guide flood waters and dredged material into a leveed containment basin. Once the containment basin fills with river water, during a flood cycle, flood water flow into the containment basin should be stopped. After the flood has passed and the river level has dropped, water from the containment basin should be allowed to drain or be pumped back into the river. Adding dredged material to the basin should help force river water back into the river.
2448	E-2409	2020-08-05	USACE Project Website		Kayne Babin	Kayne		Babin	Duplessis	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. We are losing not just our land but our way of life and our history, with every foot of lost ground. My family arrived in Louisiana in 1764, and lived off the land for centuries between farming, hunting and gathering of natures bounty. This way of life is threatened by land lost, from subsidence with no sediment to rebuild and poor decisions of allowing subdivisions to build in flood plains and disrupt natural water flow. Please let's start doing what's right for nature and us as Louisianans. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? To rebuild are at least maintain the land for us and our future generations so they can enjoy fishing and hunting are just the beauty of it. If we do nothing we will not just lose land but one of the most important seafood estuaries in the country, and its fishery's. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wildlife & Habitats / Wetlands, Waters / Socioeconomics		X	X

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

2452	E-2414b	2020-08-06	USACE Project Website	USFWS	Joseph A. Ranson	Joseph	A.	Ranson	Lafayette	LA	(CONTINUED) discovered within or adjacent to proposed project activities, then an evaluation must be performed to determine whether the project is likely to disturb nesting bald eagles. That evaluation may be conducted on-line at: http://www.fws.gov/southeastles/baldeagle . Following completion of the evaluation, that website will provide a determination of whether additional consultation is necessary; a copy of that determination should be provided to this office. The Division of Migratory Birds for the Southeast Region of the Service (phone: 404-679-7051, e-mail: SEmigratorybirds@fws.gov) has the lead role in conducting such consultations. Should you need further assistance interpreting the guidelines or performing an on-line project evaluation, please contact this office. The proposed project would be located in an area where colonial nesting waterbirds may be present. The Service recommends that a qualified biologist inspect the proposed work site for the presence of nesting colonies during the nesting season during the planning phase and prior to construction. To minimize disturbance to colonial nesting wadingbirds (i.e., herons, egrets, night-herons, ibis, and roseate spoonbills), anhingas, and cormorants, all activity occurring within 1,000 feet of a rookery should be restricted to the non-nesting period (i.e., September 1 through February 15, exact dates may vary within this window depending on species present). In addition, the Service recommends that on-site contract personnel be informed of the need to identify colonial nesting birds and their nests and how to avoid disturbance of birds and their colonies. We appreciate the opportunity to review the Notice of Intent and associated permit application, and to provide comments during the DEIS scoping period. We look forward to our continued involvement in this project moving forward. If you or your staff have further questions regarding the above letter or would like to meet and discuss our recommendations, please contact Mr. Ronny Paille of this office at 337-291-3117. 2453	E-2414a	2020-08-06	USACE Project Website	USFWS	Joseph A. Ranson	Joseph	A.	Ranson	Lafayette	LA	The U.S. Fish and Wildlife Service (Service) has reviewed the Notice of Intent to Prepare a Draft Environmental Impact Statement (DEIS) for the construction, operation, and maintenance of the Proposed Mid-Breton Sediment Diversion (Diversion). The Coastal Protection and Restoration Authority of Louisiana (CPRA) has requested approval from the U.S. Army Corps of Engineers, New Orleans District (CEMVN) to construct, maintain, and operate this Diversion, located on the east bank of the Mississippi River at River Mile 68.6 above "Head of Passes" near Wills Point in Plaquemines Parish, Louisiana. The proposed Diversion would be designed to deliver sediment, freshwater, and nutrients from the Mississippi River into the Breton Sound Basin. CEMVN intends to serve as the lead federal agency in preparing an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA).The EIS for CPRA's proposed Diversion will inform a permit decision for a Department of Army (DA) permit pursuant to Section 404 of the Clean Water Act (Section 404) and Section 10 of the Rivers and Harbors Act of 1899 (Section 10), and permissions under Section 14 of the Rivers and Harbors Act of 1899 (Section 408). In addition to informing CEMVN's decisions, the EIS may inform decisions by the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NOAA NMFS) that may be required under the Marine Mammal Protection Act (MMPA), and any additional regulatory or permit processes that may be required for the Diversion, to the extent practicable. The Service submits the following comments in accordance with the National Environmental Policy Act of 1969 (83 Stat. 852, as amended; 42 U.S.C. 4321 et seq.), the Migratory Bird Treaty Act (MBTA, 40 Stat. 755, as amended; 16 U.S.C. 703 et seq.), the Endangered Species Act (ESA) of 1973 (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq.), the Bald and Golden Eagle Protection Act (BGEPA) (54 Stat. 250, as amended, 16 U.S.C. 668a-d), and the Fish and Wildlife Coordination Act (FWCA; 48 Stat. 401, as amended; 16 U.S.C. 661 et seq.).Project Description. CPRA describes the Diversion as a large scale, complex ecosystem restoration project intended to convey sediment, fresh water, and nutrients from the Mississippi River into the Breton Sound Basin in an effort to reduce coastal land loss and sustain surrounding wetlands. When the Mississippi River discharge is 450,000 cubic feet per second (cfs) or greater at Belle Chasse, Plaquemines Parish, Louisiana, the proposed Diversion would discharge up to 75,000 cfs of sediment, freshwater, and nutrients into the Breton Sound Basin. When Mississippi River flows are below 450,000 cfs at Belle Chasse, the proposed Diversion would maintain a base flow of up to 5,000 cfs.The proposed Diversion control structure would be constructed on the Mississippi River batture of the left descending bank, at approximately 68 miles above "Head of Passes." Extending eastward from that control structure, would be a conveyance channel with guide levees on either side, extending through the Mississippi River Levee, beneath Louisiana Highway 39, and through the non-Federal back levee. The outfall channel would convey sediment, fresh water, and nutrients into the Breton Sound Basin and would include a narrow pilot channel connecting to River Aux Chenes. If constructed as proposed, the Diversion footprint would directly impact approximately 309 acres of jurisdictional wetlands and approximately 52 acres of waters of the U.S. Operation of the proposed Diversion will result in impacts, both positive and negative, to the Breton Sound Basin. Marshes in the immediate outfall area would be converted to an actively accreting delta consisting of accreting mud flats and marshes, as well as the formation of multiple distributary channels. According to CPRA, the area of change and transition to be potentially impacted within the Breton Sound Basin encompasses 5,277 acres of existing jurisdictional wetlands and 2,225 acres of waters of the U.S. The proposed	0	0	Wildlife & Habitats / General		X	X	X	X	X	X

I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	General / Socioeconomics / Wildlife & Habitats								X	X	X	X		X	
2462	E-2423	2020-08-06	USACE Project Website		Valle Patterson	Valle		Patterson	Jacksonville	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. 2476	E-2437	2020-08-07	USACE Project Website		Ashley Beasley	Ashley		Beasley	Hilliard	FL	Hi, here we are again having to plead with you to protect wildlife and wetland habitat. I've been urging you guys to protect the Okefenokee Swamp for the past year. Hopefully you make the right choice for the environment on both cases. Loss of habitat and ecosystems leads to loss of biodiversity. Which hopefully you all know is vitally important to climate stability, medical and pharmaceutical needs, health of humans and wildlife alike, environmental services like recovery after natural disasters and the list goes on. It's important that we protect and preserve what very little is left of America's land. As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I nderstand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	General / Socioeconomics / Wildlife & Habitats									X	X	X	X			X

2500	E-2461	2020-08-07	USACE Project Website		Brian Cochilla	Brian		Cochilla	Bedminster	NJ	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act -- and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. I'm an American who supports the conservation of my country's natural resources and the safety and well-being of my fellow citizens regardless of where they reside. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? The Mid-Breton Sediment Diversion is important to me and my community because I believe it is a stellar example of protecting and preserving our country's natural infrastructure that may be used not only for the Mississippi River Delta but other areas of the United States including my own. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X

I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X		
2520	E-2481	2020-08-07	USACE Project Website		Cheryl Fischer	Cheryl		Fischer	Boca Raton	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. Mid-Breton Sediment Diversio
Scoping Comment Matrix
November 10, 2020

2547	E-2508	2020-08-07	USACE Project Website		Debbie Stapleton	Debbie		Stapleton	Lessburg	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. Urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X				X

I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X	
2561	E-2522	2020-08-07	USACE Project Website		Diana Strassmann	Diana		Strassmann	Houston	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X			X	

Mid-Breton Sediment Diversio
Scoping Comment Matrix

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

2613	E-2574	2020-08-07	USACE Project Website		J. N. Passty	J.	N.	Passty	San Marcos	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General										X	X	X	X				X				
2614	E-2575	2020-08-07	USACE Project Website		Jack Callahan	Jack		Callahan	New Orleans	LA	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project. I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act -- and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Please address the following questions in the final Environmental Impact Statement: * What is the future fate of the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? * How will the effectiveness of existing marsh creation projects, levees and other Coastal Master Plan projects be impacted without the Mid-Breton Sediment Diversion in place? * What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? * What impact will not constructing this project have on storm surge vulnerability to communities and livelihoods in Louisiana? I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wildlife & Habitats / Socioeconomics / Storm Protection / Fisherines / General													X	X	X	X

I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X	
2630	E-2591	2020-08-07	USACE Project Website		Janet Mattern	Janet		Mattern	Fort Worth	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. 	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

2638	E-2599	2020-08-07	USACE Project Website		Jeff Morgan	Jeff		Morgan	Pilot Point	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I strongly urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. Urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X				X	
2639	E-2600	2020-08-07	USACE Project Website		Jennifer Bowman	Jennifer		Bowman	Jacksonville	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General											X	X	X	X			X		
2647	E-2608	2020-08-07	USACE Project Website		Joanne Seitz	Joanne		Seitz	Boca Raton	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X			X	
2682	E-2643	2020-08-07	USACE Project Website		Kathy Henderson	Kathy		Henderson	Georgetown	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. 2702	E-2663	2020-08-07	USACE Project Website		Larry Whipple	Larry		Whipple	Miami	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. Urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X

I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X				X
2723	E-2684	2020-08-07	USACE Project Website		Linda Huertas	Linda		Huertas	Summerfield	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X	
2743	E-2704	2020-08-07	USACE Project Website		M. Hovespian	M.		Hovespian	Houston	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. 2763	E-2724	2020-08-07	USACE Project Website		Mary Alves Higginbotham	Mary	Alves	Higginbotham	Huntsville	AL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X			X

Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X	
2784	E-2745	2020-08-07	USACE Project Website		Michele Chapman	Michele		Chapman	Georgetown	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

2804	E-2765	2020-08-07	USACE Project Website		Nickola Oram	Nickola		Oram	Spring Hill	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X	
2805	E-2766	2020-08-07	USACE Project Website		Noreen Baker	Noreen		Baker	Austin	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. 2829	E-2790	2020-08-07	USACE Project Website		Pete Quasius	Pete		Quasius	Punta Gorda	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X			X

I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X			X	

Mid-Breton Sediment Diversio

November 10, 2020

2885	E-2846	2020-08-07	USACE Project Website		Shawn McCrohan	Shawn		McCrohan	Naples	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	General / Socioeconomics / Wildlife & Habitats									X	X	X	X			X

I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. Urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General							X	X	X	X			X	
2916	E-2877	2020-08-07	USACE Project Website		Theresa Vining	Theresa		Vining	Dallas	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. Urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General	X	X	X	X		
2936	E-2897	2020-08-07	USACE Project Website		Vicky Greene	Vicky		Greene	Sugar Land	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project. We cannot continue on this path to destroy habitats that are essential to the existence of man. Technology and machines cannot make up the difference for a balance in nature. This is purely natural and must not be disturbed.	1	1	Wildlife & Habitats / Socioeconomics / General	X	X	X	X		X	
2957	E-2918	2020-08-08	USACE Project Website		Barbara Hawkins	Barbara		Hawkins	Lutz	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. 2977	E-2938	2020-08-08	USACE Project Website		Charlotte LeBlanc	Charlotte		LeBlanc	Carencro	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act -- and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Please address the following questions in the final Environmental Impact Statement: * What is the future fate of the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? * How will the effectiveness of existing marsh creation projects, levees and other Coastal Master Plan projects be impacted without the Mid-Breton Sediment Diversion in place? * What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? * What impact will not constructing this project have on storm surge vulnerability to communities and livelihoods in Louisiana? I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wildlife & Habitats / Storm Protection / Fisheries	X	X	X	X		X	
2978	E-2939	2020-08-08	USACE Project Website		Cheryl Croft	Cheryl		Croft	Austin	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. Urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General	X	X	X	X		X

I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X	
2998	E-2959	2020-08-08	USACE Project Website		Donna Bing	Donna		Bing	Houston	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. 3019	E-2980	2020-08-08	USACE Project Website		Irvin Uphoff	Irvin		Uphoff	Montgomery	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X			X

Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X			X	
3041	E-3002	2020-08-08	USACE Project Website		Kari Banta	Kari		Banta	Austin	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. Urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General										X	X	X	X				X
3061	E-3022	2020-08-08	USACE Project Website		Lois Lowry	Lois		Lowry	Caldwell	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act -- and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Please address the following questions in the final Environmental Impact Statement: * What is the future fate of the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? * How will the effectiveness of existing marsh creation projects, levees and other Coastal Master Plan projects be impacted without the Mid-Breton Sediment Diversion in place? * What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? * What impact will not constructing this project have on storm surge vulnerability to communities and livelihoods in Louisiana? I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wildlife & Habitats / Socioeconomics / Storm Protection General									X	X	X	X					X	
3081	E-3042	2020-08-08	USACE Project Website		Michael Brady	Michael		Brady	Lady Lake	FL	I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. I understand that this project will reconnect the river with nearby wetlands, delivering sediment to build and maintain almost 16,000 acres of land over time. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General									X	X	X	X

Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. Urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General	X	X	X	X						
3104	E-3065	2020-08-08	USACE Project Website		Roy Reichenbach	Roy		Reichenbach	Keller	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. Urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X				X
3125	E-3086	2020-08-08	USACE Project Website		Theresa Baldwin	Theresa		Baldwin	Sanibel	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. 3128	E-3089	2020-08-08	USACE Project Website		Todd Wiltz	Todd		Wiltz	Breaux Bridge	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act -- and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Please address the following questions in the final Environmental Impact Statement: * What is the future fate of the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? * How will the effectiveness of existing marsh creation projects, levees and other Coastal Master Plan projects be impacted without the Mid-Breton Sediment Diversion in place? * What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? * What impact will not constructing this project have on storm surge vulnerability to communities and livelihoods in Louisiana? I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wildlife & Habitats / Storm Protection / Fisheries								X	X	X	X					X

3145	E-3106	2020-08-09	USACE Project Website		Glen Poley	Glen		Poley	Merritt Island	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X

Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	Wildlife & Habitats / Socioeconomics / General								X	X	X	X			X	
3167	E-3128	2020-08-09	USACE Project Website		Martin Singer	Martin		Singer	Orange City	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

3191	E-3152	2020-08-10	USACE Project Website		Danielle L'ecuyer	Danielle		L'ecuyer	Jacksonville	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	General / Socioeconomics / Wildlife & Habitats								X	X	X	X		X

Mid-Breton Sediment Diversio
Scoping Comment Matrix
November 10, 2020

3196	E-3157	2020-08-10	USACE Project Website		Eugene Turner	Eugene		Turner	-	-	<p>This is an unsolicited set of comments prepared for the EIS scoping process for the Mid-Breton Sediment Diversion Project. I attended the Zoom meeting on the scoping process (2 July 2020), examined aerial photographs of the area, and published scientific articles on the ecological processes in coastal wetlands. The scoping issues are meant to be the basis for developing and using meaningful criteria for evaluation in the EIS.</p> <p>These comments are provided as a private citizen who has an interest in the stewardship of Louisiana's natural resources. My work address is at LSU, where I have been for 45 years. My expertise includes professional credentials as a research scientist and teacher in wetland ecology at the local, regional and international level. •Are Sea Level Rise (SLR) rates in models up-to-date and annualized? Significance: Realistic SLR rates, now and in the future, are necessary to accurately calculate sediment transport and accumulation, and plant survival from inundation. Current Statues for EIS review requires its consideration.</p> <p>•Are farfield impacts of higher water level and nutrient effects on plants assessed? Significance: Water and sediment distribution at a diversion continues beyond the footprint of the delta proposed to be built. Flooding impacts and lower root strength and biomass are anticipated consequences in the farfield. The biology, in other words, has influences on the engineering proposed.</p> <p>•Are models verified at a landscape level? Significance: Diverting river water for wetland restoration is new, complex and expensive, and so knowing the long-term consequences makes it essential to populate models with empirical results. Three diversions nearby have credentialed and available data to use for this verification.</p> <p>•Are more than trivial alternatives evaluated? Significance: "Other reasonable alternatives may be developed based on comments received through the NEPA scoping process." (From the Public Scoping Meeting Presentation for the Environmental Impact Statement, 2 July 2020)</p> <p>•Are consequences downstream evaluated? Significance: The far-field footprint of impacts extend downstream within Plaquemines Parish. This downstream effect is anticipated based on local and international comparisons of sediment loading and delta size.</p> <p>•Is a Contingency Plan included and an identified trigger for implementation? Significance: A bounds of expectation (risk analysis aka, confidence limits), and an action plan with meaningful content needs to be identified in the EIS for when the diversion is not performing as authorized. What are the bounds of expectation over time? What is the timing of loss and gain (10 y2) of net land loss for the</p>	0	0	Wetlands, Waters / Wildlife & Habitats / General																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																							</

3222	E-3183	2020-08-10	USACE Project Website		R. Eugene Turner	R.	Eugene	Turner	Baton Rouge	LA	This is an unsolicited set of comments prepared for the EIS scoping process for the Mid-Breton Sediment Diversion Project. I attended the Zoom meeting on the scoping process (2 July 2020), examined aerial photographs of the area, and published scientific articles on the ecological processes in coastal wetlands. The scoping issues are meant to be the basis for developing and using meaningful criteria for evaluation in the EIS. These comments are provided as a private citizen who has an interest in the stewardship of Louisiana's natural resources. My work address is at LSU, where I have been for 45 years. My expertise includes professional credentials as a research scientist and teacher in wetland ecology at the local, regional and international level.	0	0	General		X	X	X	X		X

**Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020**

3227	E-3188	2020-08-10	USACE Project Website	Mississippi Sound Conservancy	Tac Carrere	Tac		Carrere	Columbia	MS	The Mississippi Sound Conservancy supports reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land, fisheries and critical habitat. Louisiana's coast and the contiguous Mississippi Sound are significant estuarine systems which are critical habitats for coastal fisheries as well as various endangered marine mammal species. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and Mississippi communities. We request that the Mid Breton Sediment Diversion Environmental Impact Statement address the following questions in the final Environmental Impact Statement: 1. What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? 2. Are diversions the best method for building and sustaining land in the Breton Basin compared to dredge and fill land building methods? 3. What will be the specifics procedures to protect the fisheries and critical habitat from a water quality perspective? 4. What are the specifics of environmental offsets that will be sustainably implemented to protect fisheries and endangered aquatic species in the Breton and Mississippi Sound areas? If successful with sustainable mitigated impacts to fisheries and listed endangered aquatic species the Mid Breton Sediment Diversion will help save this rich estuarine national treasure. Sustainable and broad ongoing environmental offsets need to be a part of the operational culture for these diversions.	0	0	Fisheries / T&E / EFH								
3228	E-3189	2020-08-10	USACE Project Website		Tamara Kaleel	Tamara		Kaleel	Windermere	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversio) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. 3229	E-3190	2020-08-11	USACE Project Website		Alex Harari	Alex		Harari	New Orleans	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act -- and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Louisiana's coast is what helps make our current and future lives here possible. To love New Orleans, as a I do, to the point of choosing to make it my home, means loving Louisiana and understanding the importance of the coast. The coast helps protect the rest of the state from hurricanes, with their increasing intensity. It helps foster a strong wildlife scene, for hunting and fishing. And it provides us with a bounty of foods and quality of life that we will be distraught when it is gone. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? It helps sustain and will rebuild our endangered ecosystem. Without this ecosystem, all of the crucial things that make New Orleans and LA great will be lost to the Gulf. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Socioeconomics / Fisheries / Storm Protection / Wildlife and Habitats	X	X	X	X			X	
3230	E-3191	2020-08-11	USACE Project Website		Ann Lamb	Ann		Lamb	Lauderhill	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversio) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	General / Socioeconomics / Wildlife & Habitats	X	X	X	X			X

The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	General / Socioeconomics / Wildlife & Habitats		X	X	X	X		X	
3251	E-3212	2020-08-11	USACE Project Website		Scott English	Scott		English	Richardson	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	General / Socioeconomics / Wildlife & Habitats		X	X	X	X		X	
3252	E-3213	2020-08-11	USACE Project Website		Steve D. Giordano	Steve	D.	Giordano	St. Petersburg	FL	Thanks for discussing the Mid-Breton scoping process and schedule with me. Given the complexities of this projectand the opportunity for us to incorporate the lessons that we are learning in real time from the EIS developmentprocess for the Mid-Barataria sediment diversion project, NOAA is proposing to provide scoping comments to youby COB Tuesday, September 1. This in no way alters our commitment to the EIS schedule as lined out in the CPP,and will not affect any of our milestone dates.Please contact me with any questions or concerns, and acknowledge your acceptance of this proposed approach.	0	0	General		X	X	X	X		X	

Mid-Breton Sediment Diversio
Scoping Comment Matrix
November 10, 2020

	L-04	2020-08-12	Mailed to USACE	USEPA	Arturo Blanco	Arturo		Blanco	Dallas	TX	The Region 6 office of the U.S. Environmental Protection Agency (EPA) has reviewed the July 2, 2020, U.S. Army Corps of Engineers (USACE), Notice of Intent (NOI) requesting scoping comments to prepare an Environmental Impact Statement (EIS) for the proposed Mid-Breton Sediment Diversion Project on the east bank of the Mississippi River at River Mile 68.6 above “Head of Passes” near Wills Point in Plaquemines Parish, Louisiana. The Coastal Protection and Restoration Authority of Louisiana (CPRA) has requested permits and permissions from the New Orleans District USACE,to construct, maintain, and operate the proposedproject. To inform the public of these decisions, the USACE will prepare an EIS in accordance with the National Environmental Policy Act (NEPA).To assist in the scoping process, EPA is most interested in the following issues: impacts to Water Quality, Air Quality, Tribal Affairs, and Environmental Justice. The following comments are offered for consideration: Water Quality Comments Section 404 of the Clean Water Act (CWA) regulates the discharge of dredged or fill material into waters of the United States (U.S.), including wetlands and other special aquatic sites. A jurisdictional determination provided by the USACE will confirm the presence or absence of wetlands and other waters in the project area. Recommendations: EPA recommends that the EIS include an evaluation of a full range of alternatives with the goal of avoiding and minimizing the impacts to waters of the U.S. while meeting the purpose of the proposed action. It is important that the EIS summarizes criteria used to screen reasonable alternatives, including the CWA regulatory criteria used to develop practicable alternatives, and consideration be given to environmental, logistical, technological and cost criteria. The EIS should provide details of the reasoning used to eliminate alternatives to help in understanding the decision process. Any selected or preferred alternative should be consistent with CWA Section404(b)(1) Guidelines and demonstrate that such alternative is the least environmentally damaging practicable alternative considering all impacts associated with the proposed discharge. Air Quality Comments EPA asks that the EIS provide a detailed discussion of ambient air conditions (baseline or existing conditions), National Ambient Air Quality Standards (NAAQS) and non-NAAQS pollutants, criteria pollutant nonattainment areas, and potential air quality impacts of the proposed project. Such an evaluation is necessary to understand the potential impacts from temporary, long-term, or cumulative degradation of air quality. Recommendations: EPA recommends the EIS describe and estimate air emissions from potential construction, maintenance and operation activities, as well as proposed mitigation measures to minimize those emissions. We recommend an evaluation of the following measures to reduce emissions of criteria air pollutants and hazardous air pollutants (air toxics): •Existing Conditions–We recommend the EIS provide a detailed discussion of ambient air conditions, National Ambient Air Quality Standards, and criteria pollutant nonattainment areas in the vicinity of the project. •Quantify Emissions–We recommend the EIS estimate emissions of criteria and hazardous air pollutants (air toxics) from the proposed project and discuss the timeframe for release of these emissions over thelifespan of the project and describe and estimate emissions from potential construction activities, as well as proposed mitigation measures to minimize these emissions. •Specify Emission Sources–We recommend the EIS specify all emission sources by pollutant from mobile sources (on and off-road), stationary sources (including portable and temporary emission units), fugitive emission sources, area sources, and ground disturbance. This source specific information should be used to identify appropriate mitigation measures and areas in need of the greatest attention. Non road engines should be certified as in compliance with the EPA Tier 4 regulations found at 40 CFR Parts 89 and 1039.	0	0	Water Quality / Air Quality / Environmental Justice									X	X	X	X	X	X		
3254	E-3214	2020-08-12	USACE Project Website		Adam Laurie	Adam		Laurie	New Orleans	LA	I am writing regarding the permit application for the Mid-Breton Sediment Diversion, which has been submitted by the Louisiana CPRA. This is a critical project necessary to help protect coastal Louisiana and rebuild land that is rapidly being lost. Sediment diversions have been recognized for decades as necessary tools to rebuild land by reconnecting the Mississippi River to wetlands that have been cut off from the sediment, nutrients, and fresh water that built and have historically maintained our coast. In the EIS for this project, please answer the following questions: • What are the impacts to people, wildlife, habitats and fisheries of Breton and Mississippi Sounds if the Mid-Breton Sediment Diversion is or is not built? • How will this project reduce impacts from hurricanes and storms? • How will this project affect other existing or planned coastal restoration and flood protection projects in the area that are included in the state’s Coastal Master Plan? Thank you for your consideration of these questions. I urge you to complete this scoping report as thoroughly and quickly as possible. We have no time to lose in protecting coastal Louisiana.	1	1	General / Socioeconomics / Fisheries / Storm Protection / Wildlife and Habitats									X	X	X	X

3261	E-3221	2020-08-12	USACE Project Website		Ellen Blue	Ellen		Blue	River Ridge	LA	When I first went to work for a company that did cultural resources work in the late 1970s, I learned about the work of Woody Gagliano and others who were proposing a sediment diversion from the Mississippi River into the Atchafalaya system, so that the silt from the 23states drained by the Mississippi would not be lost. With a diversion project, it could be restored to its natural function -- rebuilding the coast of Louisiana. Over forty years have passed, and there seems to have been little progress. It is most discouraging to know that so much land is still being lost each day, making not just New Orleans but also much of the state more and more vulnerable to damage from hurricanes and tropical storms. Some things have changed since the 70s. I am now clergy in the Louisiana conference of the United Methodist Church. I have spent the past twenty years teaching at a theological seminary, including immersion classes on the impact of Katrina on churches and the people of south Louisiana. My book, In Case of Katrina (Cascade, 2016), discusses the mandate given by the Holy One to humanity -- to care for the Divine creation. It is human intervention which is preventing sediment from rebuilding the coast, and human intervention which could make a significant step toward healing and restoring the coast -- IF we act soon to do that. The most relevant question your study should be addressing is -- what will happen if you don't divert the sediment? What negative impacts on our culture, our economy, our environment, and our safety will result? Whatever your motivation might be -- whether it be concern for the people who will lose their livelihoods in the fisheries and seafood industries; the reality that hurricanes are going to impact Louisiana again, and we need protection; if you believe this, the knowledge that a Creator wishes us to offer all the care we can for the Creation; or simply respect for geology, geography, and other sciences -- whatever makes you think it is the right thing to do to save the coast, I ask you to please listen to those impulses and expedite the scoping process for the Mid-Breton Sediment Division. Please.	0	0	General / Socioeconomics / Wildlife & Habitats / Storm Protection / Fisheries								X	X	X	X			X	

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

3262	E-3222	2020-08-12	USACE Project Website		Evelyn Evans	Evelyn		Evans	Louisville	KY	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. 3263	E-3223	2020-08-12	USACE Project Website		Fernell Cryar	Fernell		Cryar	Mandeville	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. The Louisiana Coast is vital to our seafood industry and a strong coast will help with storm surges. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? While I live a number of miles from the coast, I know if we do not build up our coast those living here will be in more an more danger as we lose more and more land. Turns the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	Wildlife & Habitats / Fisheries / General / Storm Protection								X	X	X	X				
3264	E-3224	2020-08-12	USACE Project Website		Gretchen Becnel	Gretchen		Becnel	New Orleans	LA	I am a supporter of the Coalition to Restore Coastal Louisiana, the first nonprofit in Louisiana dedicated to coastal restoration. 3265	E-3225	2020-08-12	USACE Project Website	National Wildlife Federation / Restore the Mississippi River Delta	Helen Rose Patterson	Helen	Rose	Patterson	-	-	Thank you for the opportunity to comment on the Mid-Breton Sediment Diversion. This important project has been studied for 35 years and the robust data already available should be included in the Corps' assessment of the project. We have known for decades that Louisiana is experiencing a land loss crisis and we are only just now coming to the point of implementing solutions. We continue to lose land and it is imperative that any analysis of this project consider thoroughly the consequences of not building it in the face of ongoing subsidence and rising sea levels. Specifically, please consider the following: • What will the future of the Breton Sound Basin and the Mississippi River Delta look like without this diversion in place? Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? o Without this project, how will storm surge impact communities? o Without this project, how will sea level rise impact communities? o Without this project, what will happen to habitat for birds and wildlife, such as deer, wintering ducks, alligators, largemouth bass and crawfish? • What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? Because this is a dynamic system, I encourage you to permit the project with as much flexibility as possible in the operations regime. We see with structures like the Bonnet Carré Spillway, and the existing freshwater diversions that a strict operational regime creates substantial challenges in the face of our rapidly changing climate. Specifically, the permit should be clear about adaptive management and its role in determining the operations of the structure. As with any project of this scale, there are serious socio-economic implications. Traditionally, much socio-economic analysis places a higher value on expensive homes, and infrastructure, which leaves vulnerable communities undervalued. It is essential that this draft EIS explores more equitable and just methods of valuing communities. The confluence of many complex factors makes it both very difficult and very important that the EIS does due diligence to understand, analyze and communicate the likelihood of impacts to people and communities, given the projected future environmental conditions (with and without project) and under numerous combinations of variables. In doing so, the EIS should clearly explain what programs and policies could mitigate impacts and the extent to which those avenues will be mandated, should the impacts become realized. To these ends, I ask that the EIS fully investigate the socioeconomic impacts and implications to quality of life across all sectors of stakeholders and communities in the context of both implementing the project and failing to do so. Finally, this project is critical and urgently needed; while all factors, scoping comments, studies, and data must be considered, I do encourage you to actively seek opportunities to expedite the permitting process. We have no time to lose.	1	0	Wildlife & Habitats / Storm Protection / Wetlands, Waters								X	X	X	X			X

3269	E-3229	2020-08-12	USACE Project Website		James Wilson	James		Wilson	New Orleans	LA	Sediment diversions from the Mississippi River are vital to the economy of the state and to help protect us from hurricanes. I support the Mid-Breton Sediment Diversion. The coast is vital to the health of the state. We need protection from hurricanes that the coast provides. The financial well-being of the state depends on fisheries and the work of people engaged in the fishing and shrimping industries. Letting the coast disappear when we could have stopped it is wrong. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. What impact will not constructing this project have on storm surge vulnerability in Louisiana? We have known for decades that sediment diversion would help the situation on the coast. We need to invest in this project that will keep our industries, our people, and our seafood safe and healthy. Reducing the impact of storms even a little will help all the people of south Louisiana and beyond. The Corps of Engineers should finish the Scoping Report as soon as possible so that this situation can be addressed.	1	1	General / Fisheries / Storm Protection									X	X	X	X

In the EIS for this project, please answer the following questions: • What are the impacts to people, wildlife, habitats and fisheries of Breton and Mississippi Sounds if the Mid-Breton Sediment Diversion is or is not built? • How will this project reduce impacts from hurricanes and storms? • How will this project affect other existing or planned coastal restoration and flood protection projects in the area that are included in the state's Coastal Master Plan? Thank you for your consideration of these questions. I urge you to complete this scoping report as thoroughly and quickly as possible. We have no time to lose in protecting coastal Louisiana.	1	1	General / Socioeconomics / Fisheries / Storm Protection / Wildlife and Habitats									X	X	X	X				
3272	E-3232	2020-08-12	USACE Project Website		Kathy Skees	Kathy		Skees	Chuluota	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	General / Socioeconomics / Wildlife & Habitats									X	X	X	X				X

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

3273	E-3233	2020-08-12	USACE Project Website		Kelly Riley	Kelly		Riley	Hatfield	PA	I am a supporter of the Coalition to Restore Coastal Louisiana, the first nonprofit in Louisiana dedicated to coastal restoration. I am writing regarding the permit application for the Mid-Breton Sediment Diversion, which has been submitted by the Louisiana CPRA. This is a critical project necessary to help protect coastal Louisiana and rebuild land that is rapidly being lost. Sediment diversions have been recognized for decades as necessary tools to rebuild land by reconnecting the Mississippi River to wetlands that have been cut off from the sediment, nutrients, and fresh water that built and have historically maintained our coast. In the EIS for this project, please answer the following questions: • What are the impacts to people, wildlife, habitats and fisheries of Breton and Mississippi Sounds if the Mid-Breton Sediment Diversion is or is not built? • How will this project reduce impacts from hurricanes and storms? • How will this project affect other existing or planned coastal restoration and flood protection projects in the area that are included in the state's Coastal Master Plan? 3276	E-3236	2020-08-12	USACE Project Website		Laurie Adams	Laurie		Adams	Baton Rouge	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act -- and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Coastal erosion has taken a toll on Louisiana. Overtime we have lost a considerable amount of wetlands and land and we will continue to lose without mitigation and restoration efforts. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? My understanding it that it will allow sediment to be trapped, reclaimed and over time this will re-build our coast. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Socioeconomics / Fisheries / Storm Protection / Wildlife and Habitats								X	X	X	X			X

November 10, 2020

3284	E-3244	2020-08-12	USACE Project Website	Institute for Marine Mammal Studies	Samia Ahmad	Samia		Ahmad	Gulfport	MS	Established in 1984, the Institute for Marine Mammal Studies, Inc. is a non-profit 501 (c)3 organization dedicated to the study and conservation of marine mammals and sea turtles and their environment in the northcentral Gulf of Mexico. This region harbors one of the largest dolphin populations in the United States and is the nursery ground for young dolphins. It is also a critical habitat for the juvenile Kemp's ridley sea turtle which is the most endangered sea turtle in the world. At the time of the MOA 214 Agreement in January of 2018 through the MOU with GHD in August of 2019, the project still was being consider as described under the 2017 Louisiana CMP as a 35,000 cfs diversion hence the MMPA waiver was issued under the assumption that the project was smaller in size. The project was also placed on the FAST-41 dashboard based on the lower flowrate. The underpinning basis of the applicant's pursuit of regulatory relief in the permitting of the project has been founded on the 2017 Louisiana CMP flowrate of 35,000 cfs. We are concerned regulatory and legislative relief was obtained based on the lower flowrate and yet the project obtained the MMPA waiver. The State of Mississippi was never consulted on the MMPA waiver nor was their public input through public comment meetings and notices. In the Notice of Issuance for the MMPA waiver, it states, for the Mid Barataria Sediment Diversion, that NMFS, in cooperation with the CPRA "has developed a marine mammal science plan which includes the collection of baseline data on Barataria Bay dolphins through tagging, health assessments, and modeling. This plan was developed with internal and external marine mammal experts, as recommended by the Commission, who led efforts to collect data on Barataria Bay dolphins after the Deepwater Horizon oil spill (e.g., Smith et al., 2017, Well et al., 2017). Phase I of the science plan is partially complete and NMFS is in discussion with the CPRA on funding for Phase II. For all projects, NMFS intends to continue working with external marine mammal experts to inform development and implementation of a comprehensive marine mammal monitoring plan as part of the State's consultation requirement." At a minimum, we request a similar marine mammal science plan be developed immediately and include the State of Mississippi. Further, the U.S. Geological Survey considers the Breton Sound, Chandeleur Sound, Mississippi/Pontchartrain Basin and the Lower Mississippi River Delta Basin as one Hydrologic Unit or Watershed called the Eastern Louisiana Coastal and Lower Mississippi-New Orleans (HUC 8). These basins east of the Mississippi River are all interconnected coastal estuaries with a diverse group of aquatic resources already under stress from the 2010 Deepwater Horizon Oil Spill (DWH oil spill). Further, these same aquatic resources have been cumulatively impacted over the last decade since the DWH oil spill by releases of diverted river water from the Mississippi River through the Bonnet Carre' Spillway, the Caernarvon Diversion, the breach at the Bohemia Salinity Control Structure known as Mardi Gras Pass and the breaches at Fort St. Phillip Crevasse. Finally, the preservation and restoration of the Mississippi Sound and the Chandeleur Island which extend into the coastal zones of the State of Louisiana and the State of Mississippi is our primary goal in providing these comments. We believe the degradation of these coastal waters over the last decade is a direct result of the DWH oil spill and the river water releases of Mississippi River; which, in addition to reducing the salinity, bring with it insecticides, pesticides, fertilizers, sewage waste, and other pollutants from 31 states and 2 Canadian provinces. . Due to these and other mentioned factors, this project will further degrade the integrity and quality of our aquatic resources though its location is within the boundaries of the	0	1	Biologic / Environmental Justice / Fisheries / T&E / Water Quality / Wetlands, Waters / Wildlife & Habitats									X	X	X	X	X	X

**Mid-Breton Sediment Diversion
Scoping Comment Matrix
November 10, 2020**

3288	E-3248	2020-08-13	USACE Project Website	Louisiana Shrimp Task Force	Alan Gibson	Alan		Gibson	New Orleans	LA	Please accept this letter as our official statement of opposition from the Louisiana Governor's Shrimp Task Force (STF) of the proposed Mid-Breton Diversion Project. We appreciate all efforts in coastal restoration but we have many concerns about this proposed diversion. The Breton Basin estuary is known as one of the largest and most productive estuaries in the world. The National Marine Fisheries Service has designated the estuary as Essential Fish Habitat (EFH) and protected the area in accordance with the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act). Impacts from the proposed diversion may extend as far as the Mississippi Sound, and will adversely affect a wide range of species, including: white and brown shrimp; red drum; dog snapper; lane snapper; grey snapper; bonnet heat shark; Atlantic sharp nose shark; black nose shark; American Oyster; Atlantic croaker; Gulf Menhaden; Spotted Seatrout; Sand Seatrout; Black Drum, Southern Flounder; Blue Crab; Striped Mullet; and mackerel. Many of the referenced species are protected under the Magnuson-Stevens Act. The proposed diversion will harm a number of ecologically and economically significant species in the Breton Basin, including many which are protected under federal law. Families of dolphins call this area their home. They will be exposed to large quantities of river water and may suffer high mortality rates. Over 300 dolphin deaths were reported in the Mississippi Sound due to river water exposures during the 2019 Spillway opening. This diversion would be operated at between 35,000 cubic feet per second and 75,000 cubic feet per second (CFS) whenever the flow of the Mississippi River exceeds 1,000,000 CFS, and at 5,000 CFS whenever the flow of the river is between 200,000 CFS and 1,000,000 CFS. Based on the proposed operational regime and historic Mississippi River flow rate data, the proposed diversion would have been operated at 75,000 CFS for a total of 201 days of the 2019 calendar year, which would have introduced an incredible amount of polluted river water into the Breton Basin. This estimated 9 trillion gallons would have been in addition to the over 10 trillion gallons of river water introduced by the Bonnet Carre' Spillway opening. This would have resulted in tremendous economic hardship to those in the fishing industry. The opening of the Spillway last year resulted in the declaration of a \$258 million fishery disaster by Governor John Bell Edwards. This proposed project will have adverse impacts to water quality throughout the basin and will alter or destroy at least 7,530 acres of Essential Fish Habitat in jurisdictional wetlands and waterways and adversely impact marine mammals and at least six (6) endangered or threatened species. A large number of commercial and recreational species will be devastated, including oysters, shrimp, fish, and crabs, many of which are protected under the Magnuson-Stevens Act. Members of the STF have concerns regarding the proposed diversion's impact on water quality. Nitrates, phosphates, chemical pesticides, mercury, and other pollutants will be present in the freshwater being delivered into the basin by the proposed project. Currently, water from the Mississippi River causes a dead zone (hypoxic zone) the size of Connecticut in the Gulf of Mexico each year. Algae blooms are also highly likely once freshwater is introduced into the Breton Basin. The introduction of massive quantities of freshwater into the basin will have widespread adverse impacts on water quality. This dead zone in the Gulf of Mexico already has an adverse effect on our Louisiana fisheries and this diversion would make those effects even greater.	2	0	Water Quality / Wildlife & Habitats / Fisheries / EFH / Wetland & Waters							X	X	X	X		X	Marsh creation projects using dredge material as an alternative to the proposed diversion.

3292	E-3252	2020-08-13	USACE Project Website		Charlie Hawn	Charlie		Hawn	Athens	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	General / Socioeconomics / Wildlife & Habitats							X	X	X	X		X	

Mid-Breton Sediment Diversio
Scoping Comment Matrix
November 10, 2020

	E-3253	2020-08-13	USACE Project Website		David Hilbert	David		Hilbert	Waveland	MS	Comments below are based on available scientific data, official objections from stakeholder local governments, and other numerous documented objections from an incredible amount of stakeholders based on vast on-the-ground experience and Traditional Ecological/Environmental knowledge (TEK). The following should be considered necessary EIS scoping for LA CPRA's proposed Mid-Breton large scale Mississippi River diversion project: 1) Essential Fish Habitat destruction covered under the provisions of the Magnuson-Stevens Act, which will cause massive fisheries-related disasters, including but not limited to: A) depletion of species dependent on the salinity regime of one of the most productive estuaries in North America; B) the resulting depletion of species indicated will have grave implications for the entire country's level of sustainable domestic seafood production; C) some scientific studies show concern that the resulting depletion of species indicated will have Gulf-wide implications on the entire aquatic food chain; D) while sneaky congressional tactics have obtained a waiver for environmental review under the Marine Mammal Protection Act in the EIS for this project, food chain implications should be thoroughly reviewed to include marine mammals. Based on 2019 spillway-related results of freshwater influence on the dolphin/turtle stock coupled with oyster mortality, the top-to-bottom aquatic food chain problems Indicated by polluted MS River influence warrant thorough review. 2) Economic implications of the destruction of Breton basin's salinity regime including but not limited to: A) Louisiana economic damage in: i) loss of seafood production; ii) loss in seafood production-related industries; iii) loss throughout seafood-related businesses including restaurants; iv) loss in tourism and hospitality industries (marketed heavily on seafood availability and cultural ties). B) Mississippi economic damage from polluted Mississippi River water influence. This is indicated by real-world 2019 spillway-related damages, TEK and scientific data that demonstrates that the volume of this diversion and its potential operating regime will create hydrological and stratification conditions conducive to affecting the Mississippi Sound region through wind/wave forcing in Chandeleur Sound. In addition, all of Mississippi's coastal county governments have issued official resolutions expressing opposition to the project for the aforementioned reasons, and MS's Secretary of State has also issued his office's comments on potential negative effects to MS's economy. These effects include but are not limited to: i) losses in seafood production; ii) loss in seafood production-related industries; iii) loss throughout seafood-related businesses including restaurants; iv) loss in tourism and hospitality industries (given potential effects of Mississippi River pollution of	2	1	General / Socioeconomics / Fisheries / Wildlife and Habitats		X	X	X	X			X

3300	E-3260	2020-08-13	USACE Project Website	Coalition to Restore Coastal Louisiana	Kimberly Davis Reyher	Kimberly	Davis	Rehyer	New Orleans	LA	<p>The Coalition to Restore Coastal Louisiana (CRCL) is the oldest coastal advocacy non-profit in Louisiana. The mission of CRCL is to drive bold, science-based action to drive bold, science-based action to sustain a dynamic coastal Louisiana through engagement and advocacy. We are writing to express our support for the Mid-Breton Sediment Diversion project and to express several issues that we believe the Army Corps should consider in their EIS for this project.</p> <p>Sediment diversions have been studied for decades and we have advocated for their construction since our inception in 1988. We congratulate the Corps and CPRA on finally advancing these critical projects. We ask that the EIS address the following issues and answer the questions we pose below.</p> <p>Socioeconomic concerns</p> <p>As the Mid-Breton Sediment Diversion moves through the engineering and design process, we believe the socioeconomic conditions are critical to regard during the development of these projects. The potential socioeconomic impacts of this project are arguably both the most important to consider and the most uncertain to predict. If the project is implemented, there will be shifts in environmental conditions that will alter the status quo of productivity and location of many commercially harvested fisheries, yet, it will provide a process that reestablishes a deltaic connection to the estuary that, over time, can maintain habitat and increase biodiversity and productivity.</p> <p>If the project (or an adequate alternative) is not implemented then Louisiana should expect the continued trends of degrading, disappearing habitat correlated to diminishing productivity and increasing flood risks. This could mean a very wide spectrum of shifts in socioeconomic status (large, small, positive, or negative) for significant numbers of coastal residents in relation to flooding, insurance costs, home value, dependence on commercial fisheries, mental health, and numerous other factors. In other words, the decision of this project will alter the quality of life for better or for worse, in the near-term and the long-term, and the extent to which any given individual resident will be impacted varies by a wide array of personal, political, and environmental factors. Additionally, there must be consideration and explanation of the potential disproportionate impacts to historically marginalized non-white communities, from New Orleans East through lower St. Bernard and down the East bank of Plaquemines Parish.</p> <p>This confluence of factors makes it both very difficult and very important that the EIS does due diligence to understand, analyze and communicate the likelihood of impacts to people and communities, given the projected future environmental conditions (with and without the project) and under numerous combinations of variables. In doing so, the EIS should clearly explain what programs and policies could mitigate impacts and the extent to which those avenues will be mandated, should the impacts become realized. To these ends, we ask that the EIS fully investigate the socioeconomic impacts and implications to quality of life across all sectors of stakeholders and communities in the context of both implementing the project and failing to do so.</p> <p>Adaptive Management</p> <p>As stated in the Notice of Intent, "If constructed and operated as proposed, CPRA would maintain a base flow up to 5,000 cubic feet per second (cfs) through the Breton Sediment Diversion Structure. When the Mississippi River gage at Belle Chasse exceeds 450,000 cfs in</p>	0	0	General / Socioeconomics / Navigation / Storm Protection / Fisheries / Wetlands, Waters								X	X	X	X			X																																																																																																																																																																																																																																																																																																																																																																																																																																																																							
3301	E-3261	2020-08-13	USACE Project Website		Lolie Kull	Lolie		Kull	-	-	<p>I am submitting my opposition to Louisiana's proposed Mid-Breton large scale Mississippi river diversion project. This project will completely destroy our beaches and coastal waters. It will destroy the habitat for our fish thereby destroying our commercial and recreational fishing.The damage that we endured during the opening of the Bonne Carre Spillway was as small as a drop in a bucket compared to the damage that will come from the millions of gallons of water that will be dumped from the Mid-Breton river diversion project. I understand that the environmental regulations and review will not protect our waters due to changes and exemptions that are now in place. Our wetlands will erode and no longer be able to provide any protection from storms. I, personally, do not understand why Louisiana is supporting this project. It will destroy their gulf waters and impact their commercial and recreational fishing as well. Please do not approve the Mid-Briton large-scale Mississippi diversion project.</p> <p>I fully support the Gulf Coast Resource Coalition's official comments that are included below:Comments below are based on available scientific data, official objections from stakeholder local governments, and other numerous documented objections from an incredible amount of stakeholders based on vast on-the-ground experience and Traditional Ecological/Environmental knowledge (TEK). The following should be considered necessary EIS scoping for LA CPRA's proposed Mid-Breton large scale Mississippi River diversion project:</p> <p>1) Essential Fish Habitat destruction covered under the provisions of the Magnuson-Stevens Act, which will cause massive fisheries-related disasters, including but not limited to:</p> <p>A) depletion of species dependent on the salinity regime of one of the most productive estuaries in North America;</p> <p>B) the resulting depletion of species indicated will have grave implications for the entire country's level of sustainable domestic seafood production;</p> <p>C) some scientific studies show concern that the resulting depletion of species indicated will have Gulf-wide implications on the entire aquatic food chain;</p> <p>D) while sneaky congressional tactics have obtained a waiver for environmental review under the Marine Mammal Protection Act in the EIS for this project, food chain implications should be thoroughly reviewed to include marine mammals. Mid-Breton Sediment Diversio
Scoping Comment Matrix
November 10, 2020

3306	E-3266	2020-08-13	USACE Project Website	350 New Orleans	Renate Heurich	Renate		Heurich	New Orleans	LA	In accordance with the procedure established for coastal restoration projects, The Coastal Protection and Restoration Authority (CPRA) has submitted a Joint Permit Application to the Department of the Army (DA) under the provisions of Section 404 of the Clean Water Act (33 U.S.C. 1344) (Section 404), and Section 10 of the Rivers and Harbors Appropriation Act of 1899, as amended (33 U.S.C. 403) ("Section 10") and a permission request under Section 14 (33 U.S.C. 408) (Section 408) of the Rivers and Harbors Act of 1899 to the U.S. Army Corps of Engineers ("USACE"), at the New Orleans District (CEMNVN) for CPRA's proposed Mid-Breton Sediment Diversion (Proposed Action). The following comments are in response to the scoping process required by the National Environmental Policy Act (NEPA) including the Public Interest Review requirements of 33 CFR Parts 320-332 including 33 CFR Part 325, Appendix B, 33 U.S.C. 408 and 40 CFR Part 230 (Section 404(b)(1) Guidelines). 350 New Orleans (350 NO) is a 501(c)(3) nonprofit connecting our region to the international climate crisis movement led by 350.org. Our mission is to lend support to initiatives in New Orleans that raise consciousness and promote sound policy around the climate crisis. Our organization exists because the climate crisis poses unprecedented threats to life, and coastal Louisiana is especially vulnerable. Rising seas, hotter temperatures, and stronger storms have grave implications for the futures of our coasts, communities, and cultures. It is vitally important that the response to climate change induced sea level rise in Louisiana is just and thoughtful in its execution, and does not unduly sacrifice the wellbeing of communities for the interests of other parties. Summary. The Mid Breton Sediment Diversion project is intended to mitigate the effects of subsidence, as well as the impacts of extreme weather events on population centers in Plaquemine, St. Bernard and Orleans Parishes by creating a human-engineered hydrological diversion of sediment from the Mississippi River to sediment deprived wetlands. It is important to 350 NO that the Environmental Impact Statement (EIS) for the Mid Breton Sediment Diversion considers the full dimensions of this project to ensure that it is the best possible solution to mitigate the effects of climate change induced impacts. This includes the impact not only on the wetlands themselves, and the duration and extent of positive sea level rise and subsidence mitigation impacts, but more importantly the effects on local communities that rely on the wetlands for their livelihoods. Climate Impact Mitigation The stated importance of this project in helping to mitigate land loss and sea level rise is vital to the state of Louisiana, but particularly to the City of New Orleans that is 20 miles upriver from the project site. The forecasted impacts stretch across 3 parishes. New Orleans is facing an increasing threat from sea level rise and hurricanes. If the Mid Breton Sediment Diversion project works as intended, it would help protect the city with healthier marshes and wetlands between the levee and the Gulf. Currently, these ecosystems are being destroyed at an alarming rate with increased saltwater intrusion. However, it is worth noting that although it is beyond the scope of this project, any climate change adaptation project will always be lacking without aggressive carbon reductions. Nonetheless, it is important to understand that any positive benefits and impacts of the Mid Breton Sediment Diversion will be short-lived without a rational and aggressive commitment to lower CO2 emissions in the state, and worldwide. It should therefore be considered in the EIS that benefits, without additional drastic carbon emission reductions, will likely be short lived. Provide Two Scenarios In terms of understanding the full environmental effects of the Mid Breton Sediment Diversion 350 NO suggests that two scenarios should be included in the EIS. Since it	0	0	Water Quality / Wetlands, Waters / Fisheries / Socioeconomics / Wildlife & Habitats

-	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

3312	E-3271	2020-08-14	USACE Project Website		Bonnie and Steven McNeal	Bonnie and Steven		McNeal	Kiln	MS	We DO NOT support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. This project will likely have a devastating impact on shrimp, crab, oyster, and fish development in the Mississippi Sound. As health-conscious seniors who are intently interested in the local economy of our church community in lower Plaquemines, we are concerned about the the man-made effects on families and their welfare. Because we currently reside on the Mississippi Gulf Coast, we are gravely concerned for what has been occurring in both areas. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. What are the impacts of the proposed diversion on the long-term fisheries' productivity of the area from Breton Sound to Mississippi Sound? Are diversions the best method for building and sustaining land in the Breton Basin? What would be the future impacts on the ecosystem, wildlife, and communities of constructing and operating the Mid-Breton Sediment Diversion? The project could potentially devastate many local communities. The project calls for releasing more "fresh water" diversion from the Mississippi River into the Breton Sound/Lake Ponchartrain basin - supposedly to help replace lost wetlands due to historic erosion and storm systems. The diversions would, in fact, release more contaminated sediment flowing down the Mississippi River into Lake Ponchartrain, which would quickly make its way into the Mississippi Sound. The result would disrupt the delicate ecosystem in the Mississippi Sound that helps create a rich environment for production of local shrimp, crabs, oysters, and fish. Over the past two years, unprecedented openings of Louisiana floodgates have dumped enormous amounts of contaminated fresh water into the Mississippi Sound and killed off local shrimp, crab, oyster, and fish populations. The Mid-Breton Sediment Diversion would continue the environmental assault on those waters for years to come - threatening the future of seafood production for generations. Moreover, the diversion plan offers no guarantee of long-term success in building new shorelines in Louisiana. This is an extremely expensive attempt to offset the inevitable ravages of natural erosion of the retreating Louisiana coastline. And it would certainly do much more harm to the Mississippi Sound than any good it MAY produce in Louisiana. Local Mississippi governments have already filed lawsuits to stop this plan.	2	0	General / Socioeconomics / Fisheries / Wildlife and Habitats									X	X	X	X			X	
3313	E-3272	2020-08-14	USACE Project Website		Camp Matens	Camp		Matens	Baton Rouge	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. I own coastal property I am a recreational fisherman The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? We spend a large amount amount of time on the coast I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats / Fisheries / Storm Protection								X	X	X	X			X		
3314	E-3273	2020-08-14	USACE Project Website		David C. Clement	David	C.	Clement	New Orleans	LA	Comments below are based on available scientific data, official objections from stakeholder local governments, and other numerous documented objections from an incredible amount of stakeholders based on vast on-the-ground experience and Traditional Ecological/Environmental knowledge (TEK). The following should be considered necessary EIS scoping for LA CPRA's proposed Mid-Breton large scale Mississippi River diversion project: 1) Essential Fish Habitat destruction covered under the provisions of the Magnuson-Stevens Act, which will cause massive fisheries-related disasters, including but not limited to: A) depletion of species dependent on the salinity regime of one of the most productive estuaries in North America; B) the resulting depletion of species indicated will have grave implications for the entire country's level of sustainable domestic seafood production; C) some scientific studies show concern that the resulting depletion of species indicated will have Gulf-wide implications on the entire aquatic food chain; D) while sneaky congressional tactics have obtained a waiver for environmental review under the Marine Mammal Protection Act in the EIS for this project, food chain implications should be thoroughly reviewed to include marine mammals. Based on 2019 spillway-related results of freshwater influence on the dolphin/turtle stock coupled with oyster mortality, the top-to-bottom aquatic food chain problems Indicated by polluted MS River influence warrant thorough review. 2) Economic implications of the destruction of Breton basin's salinity regime including but not limited to: A) Louisiana economic damage in: i) loss of seafood production; ii) loss in seafood production-related industries; iii) loss throughout seafood-related businesses including restaurants; iv) loss in tourism and hospitality industries (marketed heavily on seafood availability and cultural ties). B) Mississippi economic damage from polluted Mississippi River water influence. This is indicated by real-world 2019 spillway-related damages, TEK and scientific data that demonstrates that the volume of this diversion and its potential operating regime will create hydrological and stratification conditions conducive to affecting the Mississippi Sound region through wind/wave forcing in Chandeleur Sound. In addition, all of Mississippi's coastal county governments have issued official resolutions expressing opposition to the project for the aforementioned reasons, and MS's Secretary of State has also issued his office's comments on potential negative effects to MS's economy. These effects include but are not limited to: i) losses in seafood production; ii) loss in seafood production-related industries; iii) loss throughout seafood-related businesses including restaurants; iv) loss in tourism and hospitality industries (given potential effects of Mississippi River pollution of	2	1	General / Socioeconomics / Fisheries / Wildlife and Habitats								X	X	X	X			X		
3315	E-3274	2020-08-14	USACE Project Website		Dickie Brennan	Dickie		Brennan	Jefferson	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Storm Protection & a healthy Fishery The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? It time for action! Urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats / Fisheries / Storm Protection								X	X	X	X			X		
3316	E-3275	2020-08-14	USACE Project Website		Dwayne Hingle	Dwayne		Hingle	Slidell	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Because it's a beautiful way of life, great places to live and it's home. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. What impact will not constructing this project have on storm surge vulnerability in Louisiana? So we don't loose our coastal land and our culture doesn't fade away. We need to leave it to our children. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats / Fisheries / Storm Protection								X	X	X	X			X		

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

3317	E-3276	2020-08-14	USACE Project Website		Evelyn Sizer	Evelyn		Sizer	New Orleans	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Without the coast, we, the people, aren't protected from the massive influx of water surging our way! The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid- Breton Sediment Diversion in place? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? Without caring for this Diversion, we are missing a link in the chain of barriers that need to secure to protect all areas from water invasion. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats / Fisheries / Storm Protection	X	X	X	X		X	
3318	E-3277	2020-08-14	USACE Project Website		Frank Hendrick	Frank		Hendrick	Belcher	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Louisiana's coast line and coastal waterways are important to the delicate and diverse eco-systems The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? While I reside in the northwest region of Louisiana the project is important to the state of Louisiana. Our coast is an integral part of storm surge/water recharge processes. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats / Fisheries / Storm Protection	X	X	X	X		X	
3320	E-3279	2020-08-14	USACE Project Website		Gregory Mouton	Gregory		Mouton	Scott	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. I hunt and fish the bays and coast land. I see them disappearing every year and would like to see something done to stop the lost of land. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. What impact will not constructing this project have on storm surge vulnerability in Louisiana? I think it is important to all of Louisiana to stop the lost of our state land I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats / Fisheries	X	X	X	X		X	
3321	E-3280	2020-08-14	USACE Project Website		Hugh Fisher	Hugh		Fisher	North Port	FL	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	General / Socioeconomics / Wildlife & Habitats	X	X	X	X		X	
3322	E-3281	2020-08-14	USACE Project Website		James Delery	James		Delery	New Orleans	LA	Brad Laborde, As a land owner in east Plaquemine and St Bernard parishes, I am opposed to the costly Mid-Breton sound diversion. I consider it a second MRGO disaster project wasting the valuable BP money. What we need are more natural cuts from the River into the coastal marsh and let nature take its course. Mardi Gras pass and the crevasse at Fort St Philip prove the point "natural system land building". I consider this comment a first step in stopping a wasteful project benefiting the engineering companies, contractors, and the lobbyist. Again, my family(Borgemouth reality and Livaudais LLC) has suffer too much land loss because of the MRGO. I do not want to see another attempt by man to beat nature with concrete and steel. Man never wins against nature in the long run. I am not opposed to natural bleeds of the river into the marsh to sustain the ecosystem. Water management is the key but nature's cycles must be recognized. We will have good years and bad years with water volumes from the river. That is why nature is in control.	2	0	H&H	X	X	X	X		X	Need are more natural cuts from the River into the coastal marsh and let nature take its course.
3323	E-3282	2020-08-14	USACE Project Website		Jeffrey Gardner	Jeffrey		Gardner	New Orleans	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Mine is just one more voice in support of all the efforts to save and restore Louisiana's wetlands to protect this critical component of the natural habitat that ultimately serves the fundamental and permanent needs of the Mississippi delta. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? The entire Mississippi River system is dependent on assuring the long term sustainability of all components of the system. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats / Fisheries / Storm Protection	X	X	X	X		X	

Mid-Breton Sediment Diversion EIS Scoping Comment Matrix November 10, 2020																					
3324	E-3283	2020-08-14	USACE Project Website	Orleans Audubon Society	Jennifer Coulson	Jennifer		Coulson	New Orleans	LA	Orleans Audubon Society, representing over 1,000 members living in southeast Louisiana, appreciates the opportunity to provide scoping comments for the Mid-Breton Sediment Diversion (MBSD) Environmental Impact Statement (EIS). We have been waiting for decades to see progress on reconnecting the Mississippi River to the Breton Sound Basin (BSB), and are encouraged that the process is finally underway in earnest, with the appropriate support of the Gulf Environmental Benefit Fund of the National Fish and Wildlife Foundation. CPRA Habitat in the Breton Sound Basin has been in decline for decades. Sediment starvation, loss of freshwater and nutrient inputs and rampant canal building contributed to the loss of tens of thousands of acres of wetlands through saltwater intrusion. Salt killed freshwater marsh, swamp forests, and, increasingly, maritime forest on subsiding relict distributary ridges. What is left is a biologically depauperate brackish to intermediate marsh system growing on increasingly unstable organic soils—a marsh in the final stages of the delta cycle, converting to open water. To these insults now must be added the ongoing threat of climate change-induced accelerating sea level rise. The only sustainable solution is to allow the re-establishment of a natural deltaic cycle. Delay is the enemy, especially for a project that began life as the Medium Diversion at White Ditch in a 1984 study. Indeed, the need for projects like this, to reconnect the river’s flanking basins to annual riverine input has been apparent to ecologically attuned observers for over a century. Given the purpose of the MBSD project, to re-establish the natural deltaic cycle by reconnecting the Mississippi River to the Breton Sound Basin, allowing once again the annual riverine flood cycle to build and sustain wetlands and thereby counteracting the effects of natural and manmade disturbances in the basin, we ask the Corps to consider the following questions in the EIS: * Is there an ecologically functional alternative to delta building processes in a delta? That is, can any other project type provide the equivalent physical and ecological benefits and services of the process that built the delta in the first place, given that stasis is neither possible nor desirable in a highly dynamic delta landscape? * What is to be the fate of the wildlife and habitat resources of the BSD if the delta cycle is not re-established? * Will relative sea level rise over the coming decades lead to further collapse of the remaining marsh platform? * Can habitat diversity in the form of the estuarine gradient be renewed and sustained absent annual riverine inputs? * Will relict maritime forests clinging to sinking ridges continue to decline, and if so, what impact might that have on trans-gulf neotropical migratory forest birds? * Inasmuch as existing fresh marsh systems on the lower river below Bohemia on the east bank and in the Birdsfoot (including Delta National Wildlife Refuge (NWR) and Pass a Loutre Wildlife Management Area (NMAA) provide critical habitat for wintering waterfowl, migratory shorebirds, colonial wading birds, and many other organisms, and	0	0	General / Wildlife & Habitats /							
3325	E-3284	2020-08-14	USACE Project Website	Audubon Mississippi / Gulf Islands Conservancy Inc / Healthy Gulf / Land Trust for the Mississippi Gulf Plain / Mississippi Wildlife Federation / The Nature Conservancy, MS Field Office / Wildlife Mississippi	Jill Mastrototaro	Jill		Mastrototaro	Ridgeland	MS	On behalf of the seven undersigned Mississippi-based conservation groups and community organizations, please accept these comments on the U.S. Army Corps of Engineers’ (Corps) July 2, 2020, Federal Register Notice of Intent to prepare a Draft Environmental Impact Statement (DEIS) on the proposed Mid-Breton Sediment Diversion Project. Our organizations are members of the Mississippi Environment Focus Group (MEFG), an informal coalition of non-profits that have been actively working in the Gulf of Mexico region for many decades to support comprehensive conservation programs. The MEFG works to ensure 2010 Deepwater Horizon oil disaster monies are invested in restoration projects that support a healthy coastal Mississippi and Gulf of Mexico ecosystem, build resilient communities, and promote a strong economy. Our groups have long recognized that southeast Louisiana’s wetlands, waters, and living coastal and marine resources, play a vital role in the overall ecological health and community resiliency of coastal Mississippi as well as the entire Gulf of Mexico. We have reviewed information that the applicant, the Coastal Protection and Restoration Authority of Louisiana (CPRA), has publically shared as part of this scoping process, and we respectfully request the Corps address the following issues in a DEIS: o How will Mississippi’s waters be impacted by this project? Will diversion waters from the proposed Mid-Breton Sediment diversion reach Mississippi waters including Mississippi Sound? o Will water quality be affected? o Will algal blooms increase? o Will hypoxic conditions increase? o Will the salinity balance change? o If yes, will the added freshwater offset decades of increasing salinities in Mississippi Sound? o If yes, will the decrease in average salinities be detrimental or positive for estuarine organisms that have been declining over decades as salinities have increased? o How will this project affect other existing/planned restoration or flood protection projects located in coastal Mississippi? o How will this project impact oysters in the Mississippi Sound? Mississippi has obligated and continues to dedicate significant restoration dollars to the recovery of oysters in the Mississippi Sound. Will the Mid-Breton Sediment Diversion have negative or positive impacts on the recovery of oysters in Mississippi or impact these oyster restoration projects? o Will the project have an adverse impact on marine mammals and sea turtles in Mississippi Sound? There have been repeated openings of the Bonnet Carre’ spillway over the last five years. There is concern that the significant introduction of water from the Mississippi River into the Mississippi Sound during the 2019 flood event may have been responsible for a large number of dolphin and turtle deaths in Mississippi Sound. o What will the future of the Breton Sound Basin, the Mississippi River Delta, and the Mississippi Sound look like without this diversion in place? Does the Corps plan to study and release the future impacts on this connected ecosystem, marine and wildlife, and coastal communities of not constructing and operating the Mid-Breton Sediment Diversion?	0	0	Biologic / EFH / Fisheries / T&E / Water Qualities / Wetlands, Waters / Wildlife & Habitats	X	X	X	X		X	

Mid-Breton Sediment Diversion EIS Scoping Comment Matrix November 10, 2020																							
3326	E-3285a	2020-08-14	USACE Project Website	St. Bernard Parish Government	John Lane	John		Lane	Chalmette	LA	St. Bernard Parish Government (SBPG) concurs with the United States Army Corps of Engineers (USACE) that the referenced project may "significantly impact the quality of the human environment" (USACE, 2020, p. 1). Please see the below comments, questions, and concerns from SBPG regarding potentially significant issues that should be taken into consideration during the upcoming Environmental Impact Statement (EIS) process. 1.SBPG is concerned that the operational regime is too ambiguous and has not been properly vetted by critical stakeholder groups. The maximum discharge listed in the permit application is 75,000 CFS (USACE, 2019a, p. 2). Additionally, the maximum baseline flowrate is listed as 5,000 CFS and the "trigger" Mississippi River flowrate for opening the diversion at maximum capacity is listed as 450,000 CFS. However, the flowrates included in the Coastal Protection and Restoration Authority (CPRA) Comprehensive Plan for a Sustainable Coast (2017 State Master Plan) and adopted by the State Legislature were as follows: 35,000 CFS (maximum discharge); 2,500 CFS (baseline flowrate); and 600,000 CFS (maximum capacity trigger flowrate). The changes made in the permit application represent a significant increase in proposed cumulative discharge. Such changes (and associated projected increase in adverse impacts to the natural and human environment) have not been properly vetted by critical stakeholder groups. 2.SBPG is concerned that the operational regime will continue to evolve in a manner that exacerbates adverse impacts over time. The gradual depletion of the Mississippi River sediment budget and CPRA's stated commitment to adaptive management may eventually result in the agency making substantial adjustments to the operational regime of the proposed project. CPRA has made similar adjustments to the operational regime of other diversion projects (such as the Caernarvon freshwater diversion) for decades, adversely impacting local fisheries while providing virtually no recourse for impacted stakeholder groups. SBPG is concerned that any initial required compensatory mitigation effort will fail to address future adverse impacts resulting from adaptive management and changes to the operational regime. 3.SBPG is concerned that nutrients and contaminants will adversely impact water quality throughout the Breton Basin. The proposed project "would convey sediment, water, and nutrients into the Mid-Breton Basin... " (USACE, 2019a, p. 2). Such discharges will undoubtedly result in adverse impacts to aquatic resources, commercial and recreational fisheries, wildlife resources, essential fish habitat, and water quality. The recent Gulf of Mexico Freshwater Flooding in Louisiana, Mississippi, and Alabama federal fishery disaster (declared in October 2019) adversely impacted water quality and caused over \$500 million in economic damage throughout the northern Gulf Coast region. 4.SBPG is interested in learning more about the sediment-to-water ratio being delivered and how the proposed project is expected to perform compared to alternative methods of sediment delivery. SBPG, CPRA, and other stakeholders have successfully engaged in largescale coastal restoration activities via dredging and the use of sediment pipelines. Diverting the Mississippi River for the purpose of delivering sediment will likely be less efficient and cost-effective compared to other proven methods of sediment delivery. Additionally, the drastic changes in salinity resulting from the proposed project will undoubtedly have adverse impacts to aquatic resources, commercial and recreational fisheries, wildlife resources, essential fish habitat, and water quality throughout the Breton	0	0	General / Cultural Resources / Environmental Justice / Fisheries / Water Quality / Wetlands, Waters / Wildlife & Habitats									
3326	E3285b	2020-08-15	USACE Project Website	St. Bernard Parish Government	John Lane	John		Lane	Chalmette	LA	(CONTINUED) Basin. 5. SBPG is concerned that the land-building capacity of the proposed project is overstated and that the project will likely cause land loss and increase flood risk. The permit application describes the purpose of the proposed project as being "an attempt to reduce coastal land loss and sustain surrounding wetlands" (USACE, 2019a, p. 1). However, the gradual depletion of the Mississippi River sediment budget has been well documented and increased periods of inundation have been found to adversely impact existing vegetation and contribute to land loss. Consequently, the Expert Panel on Diversion Planning and Implementation (convened by the Water Institute of the Gulf) previously expressed concerns regarding the possibility of the project causing land loss during at least the first ten years of operation (http://www.coastal.louisiana.gov/diversion-resources D. 6. SBPG is concerned that the natural and human environment (including the local economy) cannot sustain the further loss of productive habitat. It has been estimated that the proposed project would adversely impact approximately 7,500 acres of jurisdictional wetlands and waters (USACE, 2019a, p. 2). However, given the ambiguity of the proposed operational regime and potential for future adjustments (adaptive management), the number of estimated acres impacted seems understated. A modeling report recently commissioned by the USACE Engineer Research and Development Center (ERDC) concluded that: [...]diversion-induced inundation results in a reduction in plant productivity, which induces an acceleration of land loss. Significant uncertainty exists with respect to the response of the existing wetland vegetation to diversion-induced inundation. (Brown et al., 2019, p. iii) Such findings illustrate the potential for cascading adverse impacts throughout the Breton Basin and highlight the level of risk and uncertainty surrounding the proposed project. 7. SBPG is concerned that an additional source of freshwater entering the Breton Basin will place southeast Louisiana in a constant state of environmental and economic crisis that exceeds federal, state, and local capacity and resources. Acute influxes of freshwater from the Bonnet Carre' Spillway and the persistent flow of freshwater from Mardi Gras Pass (MGP) and other crevasses on the east bank of the Mississippi River already pose serious threats to the sustainability of aquatic resources, commercial and recreational fisheries, wildlife resources, essential fish habitat, and water quality in the Breton Basin. The adverse impacts associated with these sources of freshwater have been well documented. Prior to 2008, the Bonnet Carre' Spillway had only been opened eight times (1937, 1945, 1950, 1973, 1975, 1979, 1983, and 1997) (USACE, 2019b). The spillway has since been opened six times, including an unprecedented two openings for a record number of days (123) in 2019 (USACE, 2019b). The 2019 Bonnet Carre' Spillway openings severely impacted fish and wildlife and caused harmful algae blooms throughout the northern Gulf Coast region. In June 2019, the governors of Louisiana, Mississippi and Alabama formally requested a federal fishery disaster declaration from the United States Secretary of Commerce. The Secretary granted the request (Gulf of Mexico Freshwater Flooding in Louisiana, Mississippi, and Alabama) in October 2019 (National Oceanic and Atmospheric Administration, 2019a). The State of Louisiana has estimated that at least \$258,462,169 in economic damages occurred as a result of the federal fishery												

Mid-Breton Sediment Diversion EIS Scoping Comment Matrix November 10, 2020																					
3326	E3285c	2020-08-16	USACE Project Website	St. Bernard Parish Government	John Lane	John		Lane	Chalmette	LA	(CONTINUED) disaster. This preliminary assessment is based on biological samples, trip ticket data, and industry surveys, but does not include the residual economic losses that will occur during subsequent years. For example: the eastern oyster, an immobile shellfish that depends upon ideal salinity, will likely take three years to recover. Other commercially significant fisheries that were impacted include shrimp, crabs, and finfish. Finally, the bottlenose dolphin, an ecologically significant and freshwater-sensitive species, became the subject of an ongoing National Oceanic and Atmospheric Administration (NOAA) unusual mortality event on the northern Gulf Coast during the federal fishery disaster (NOAA, 2019b). The cumulative preliminary economic damage estimates in the three impacted states (LA, MS, AL) have now exceeded \$500 million. However, Congress only approved \$88,301,898 in recovery funds and as of this writing, zero disaster relief had been administered to impacted stakeholder groups. According to the United States Global Change Research Program's (2018) Fourth National Climate Assessment, "the severity of compound events-the coupling of surge, discharge from rivers, and heavy precipitation-has increased ... " and "warmer air temperatures have increased the probability of heavy precipitation events.... " in the United States (329). The frequency and duration of Mississippi River flood events and Bonnet Carre' Spillway openings are therefore expected to increase going forward. This prospect alone threatens the ecological and economic sustainability of southeast Louisiana. Compounding matters, the Bohemia Spillway and MGP Hydrocoast program monitors indicated that the Mississippi River was discharging into local waterways at a rate of approximately 45,000 CFS as of June 2019 (Lake Pontchartrain Basin Foundation, 2019). Consequently, the influence of the river at MGP has drastically reduced salinity in local waterways and devastated oyster productivity in once prolific harvest areas such as Black Bay. The ongoing adverse impacts associated with influxes of freshwater into the Breton Basin have already exceeded federal, state, and local capacity and resources, as evidenced by the stalled 2019 federal fishery disaster recovery. The persistent threat of similar events exists absent the existence of the proposed project. 8. SBPG is concerned that the proposed project poses an existential threat to dolphins in the Breton Basin. The USACE has identified the West India manatee as a marine mammal that is "not likely" to be adversely impacted by the proposed project (USACE, 2019a, p. 4). Congress also recently waived the Marine Mammal Protection Act (MMPA) in order to exclude adverse impacts on the bottlenose dolphin from consideration during the permitting process. This decision was made in 2018 based on an earlier version of the operational regime that is substantially different from what was ultimately included in the CPRA's permit application (please refer to #1 above). SBPG urges the USACE to request that the applicant provide an analysis of anticipated adverse impacts to the bottlenose dolphin in order to better inform Congress and the public regarding the impacts of largescale sediment diversions on marine mammals. Additionally, SBPG urges the USACE to request that Congress reconsider the 2018 MMPA waiver based on the operational regime included in CPRA's permit application and a wide range of potential future adaptive management scenarios. 9. SBPG is concerned that the proposed project will damage or destroy the very natural resources and economic functions that federal, state, and local officials have been tasked with restoring in the aftermath of the Deepwater Horizon event. The USACE has stated that										
3326	E3285d	2020-08-17	USACE Project Website	St. Bernard Parish Government	John Lane	John		Lane	Chalmette	LA	(CONTINUED) the "destruction or alteration" of at least 7,530 acres of Essential Fish Habitat (EFH) may occur as a result of the proposed project (USACE, 2019a, p. 4). Additionally, the USACE identified six Federally listed endangered or threatened species "that the proposed project could impact" (USACE, 2019a, p. 4). Other species that are likely to be impacted include: white and brown shrimp; red drum; dog snapper; lane snapper; grey snapper; bonnet heat shark; Atlantic sharpnose shark; blacknose shark; American Oyster; Atlantic croaker; Gulf Menhaden ; Spotted Seatrout; Sand Seatrout; Black Drum, Southern Flounder; Blue Crab; Striped Mullet; and mackerel. In Louisiana, coastal communities and the seafood industry are closely intertwined. Commercial oyster, shrimp, and crab fisheries in the state have a combined annual economic impact of approximately \$2 billion and account for over 22,000 jobs (State of Louisiana , 2019). The economic functionality of Louisiana's seafood industry also has national implications. Over 890 million pounds of seafood were landed in Louisiana during 2017 (second only to Alaska) (National Marine Fisheries Service, 2018). The state is responsible for producing 70% of all oysters and 40% of all blue crabs in the United States (State of Louisiana, 2019), and 25% of all seafood consumed in the country is harvested from Louisiana (Jones, 2015). Although the commercial finfish industry in southeast Louisiana is relatively small compared to other coastal regions , recreational fishing is a critical component of the local economy. November 10, 2020

3326	E3285e	2020-08-18	USACE Project Website	St. Bernard Parish Government	John Lane	John		Lane	Chalmette	LA	(CONTINUED) St. Tammany 81 0 Tangipahoa 11 0 TOTAL: 372 4 One of the stated purposes of the proposed project is to "create, preserve, restore, and sustain wetlands to counteract the effects of natural and man-made disturbances, such as the Deepwater Horizon oil spill" (USACE, 2020). SBPG finds the destruction or alteration of thousands of acres of EFH that support the aforementioned ecologically and economically significant species to be counterproductive. Furthermore, as described above (please refer to #7), the commercial and recreational fishing industries have yet to recover from other natural and anthropogenic disturbances that have occurred since the Deepwater Horizon event, including the 2019 federal fishery disaster. 10. SBPG is concerned that properly mitigating the adverse impacts associated with the proposed project is not feasible and that litigation may cause CPRA and other stakeholder groups to exhaust valuable time and resources. The proposed project will adversely impact over 100,000 acres of State of Louisiana water bottoms currently being leased by commercial oyster harvesters. The USACE "requires compensatory mitigation to offset unavoidable impacts to jurisdictional wetlands and other aquatic resources" (USACE, 2020). The process by which the State of Louisiana acquires oyster leases and compensates harvesters is outlined in the Oyster Lease Acquisition and Compensation Program (OLACP) (LA Revised Statute 56:432.1). Historically, the OLACP has only been invoked to acquire approximately 4,000 acres of oyster leases over a period of fifteen years. In such instances, the cost of each biological assessment ranged from \$25,000 to \$300,000 and the cost of each lease appraisal ranged from \$17,000 to \$70,000. The State of Louisiana has historically compensated leaseholders at a rate of \$50 to \$100 per acre (CPRA Board Presentation, 7/15/20). Fairly compensating thousands of impacted oyster harvesters in the manner described above seems infeasible given the amount of time and resources involved. This will likely precipitate a prolonged litigation process that is detrimental to all parties. 11. SBPG is concerned that the proposed project may do irreparable harm to cultural resources, employment and income, property values, tax revenue, community cohesion, and recreation in eastern St. Bernard Parish. St. Bernard Parish is home to thriving commercial and recreational fishing industries and is proud of its many historic fishing communities, including: Delacroix, Reggio, Woodlake, Yscloskey, Hopedale, and Shell Beach. St. Bernard Parish was subjected to the worst natural disaster in US history (Hurricane Katrina, 2005) and the worst human-caused environmental catastrophe in US history (Deepwater Horizon event, 2010) in a matter of five years. The aforementioned fishing communities were particularly devastated during both events and continue to recover. SBPG is concerned that the risk and uncertainty associated with the proposed project now pose existential threats to cultural resources, employment and income, property values, tax revenue, community cohesion, and recreation in communities that have existed in coastal St. Bernard Parish since the 18th century. Consequently, the St. Bernard Parish Council has passed a number of resolutions since 2008 confirming the parish's firm stance against largescale sediment diversions.										
3326	E3285f	2020-08-19	USACE Project Website	St. Bernard Parish Government	John Lane	John		Lane	Chalmette	LA	(CONTINUED) 12. SBPG is concerned that the proposed project may disproportionately impact cultural resources, employment and income, property values, tax revenue, community cohesion, and recreation among minorities, those living in poverty, and minority- and woman- owned businesses. St. Bernard Parish has a population of 47,244. The parish has become increasingly diverse since Hurricane Katrina (2005), with 24% of the population now identifying as Black or African-American and 10% identifying as Hispanic or Latino. Unfortunately, more than 20% of the parish's population was living in poverty as of 2019. St. Bernard is also home to a thriving business community that relies on natural resources and related industries. The parish is proud to have 1,217 minority-owned firms and 1,200 woman-owned firms among its 3,665 businesses. (United States Census Bureau, 2019) 13. SBPG would like the EIS to address the legacy of environmental and economic harm inflicted on St. Bernard Parish as the result of failed public infrastructure projects and other government interventions. St. Bernard Parish has been subjected to a century of failed public infrastructure projects and other government interventions that resulted in significant adverse environmental and economic impacts: a) the Crevasse (1927); b) construction of the Mississippi River Gulf Outlet (1956); c) levee failures during Hurricane Betsy (1965); d) the Caernarvon freshwater diversion (1991); and e) levee failures during Hurricane Katrina (2005). In each instance, stakeholder groups were never fully compensated for their losses. Consequently, St. Bernard Parish residents are very skeptical of largescale infrastructure projects that involve a high degree of risk and uncertainty. A references page has been included on page 8. November 10, 2020**

	E-3286	2020-08-14	USACE Project Website		Jose Aramburu	Jose		Aramburu	Katy	TX	Dear Brad LaBorde, I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Dear usace, Thanks for your efforts on preserving our wetlands and our way of life. Your dedication and hard work are highly appreciated. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Are diversions the best method for building and sustaining land in the Breton Basin? What impact will not constructing this project have on storm surge vulnerability in Louisiana? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? We depleted the mississippi delta of the amount of rich nutrients needed to compensate for the consolidation of soils I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats / Fisheries / Storm Protection								
3328	E-3287a	2020-08-14	USACE Project Website	Plaquemines Parish Government	Kirk M. Lepine	Kirk	M.	Lepine	Belle Chasse	LA	Plaquemines Parish Government has been an active participant in coastal restoration and hurricane protection initiatives and issues affecting our Parish and the region. As one of the hardest hit regions in U.S. by coastal erosion, subsidence, and sea-level rise as well as natural and man-made disasters, we are supportive of coastal restoration in Louisiana. However, we must ensure that proposed projects do not do more harm than good to our residents, businesses, and communities. As we have previously stated, we have valid concerns over the stated efficacy, size, location, and management of the Mid-Breton Sediment Diversion and its potential negative impacts to crab, shrimp, oyster, and finfish fisheries, our seafood industry, and our hurricane protection system. The true costs and benefits of this diversion's implementation and operations should be determined, additional alternatives (dredging) should be considered, and a plan developed on how the negative implications will be addressed, with emphasis on those whose livelihoods will be at stake. As such, Plaquemines Parish submits the following comments and issues that it requests to be addressed/inves o-ated through the Environmental Impact Statement process and a clear path forward identified. Plaquemines Parish Citizens' Financial & Safety Impacts •Diversions will drastically alter the productivity of commercial and recreational fisheries, causing loss of jobs, undue hardship, and increased costs to people who have historically made their living from fishing in the Parish. •Changes in fisheries will require changes to business operations - new/ larger vessels, increased fuel costs, collapsed market, etc. - which will likely lead to loss of businesses and jobs. •Plaquemines Parish communities that heavily rely on commercial and recreational fishing will be devastated. •Those whose jobs and livelihoods are impacted will require education and job training to transition to another trade of sustainable employment. •As understood in the near term, diversions may potentially cause land loss, especially within the vicinity of the proposed outfall. What is the State's plan to compensate landowners for property and property rights lost / altered/ impaired as a result of diversion construction and operation? •What are the impacts to the base flood elevations to the East Bank residents? If the base flood elevations are increased due to the additional water in Breton Sound, how will this impact flood insurance rates, home elevation programs, and existing homes elevated in the past 10 years? •What is the State's plan to the ensure the safety of inland marine traffic over the course of the project life? Assuming the project works as intended, historic maritime canals, bayous, inlets, etc. will continually shoal in and change course. This plan should include addressing potential loss of access for camps and businesses due to increased shoaling. •In summary, what is the State's plan to address economic impacts and safety concern s of affected populations, which may include job losses, business closures, loss/ reduction in property values, etc. Sufficient funding must be set aside in advance to develop plans and programs that willmitigate/ compensate impacted individuals and communities	2	0	Fisheries / H&H / Storm Protection / Cultural Resources	X	X	X	X			X	Inclusion of a dredging alternative should assist in contrasting that, as opposed to dredging, diversions may in the near-term cause land loss - current modeling indicates that diversions do not show a net land gain until multiple years post operation.
3328	E-3287b	2020-08-15	USACE Project Website	Plaquemines Parish Government	Kirk M. Lepine	Kirk	M.	Lepine	Belle Chasse	LA	(CONTINUED) Fisheries Impacts - Altered Salinity, Turbidity, Hypoxia, Pollution, & Invasive Species • Diversions will decrease salinity and increase turbidity in the Breton Sound and Mississippi Delta estuaries, decreasing the productivity of commercially and recreatio nally important finfish and shellfish species such as crab, oyster, white and brown shrimp, red drum, black drum, speckled trout, flounder, etc. • Diversions will further introduce nitrates, phosphates, other pollutants, such as heavy metals, into the estuary, significantly increasing the likelihood of "dead" or oxygen deficient zones and potentially making fish and shellfish more harmful for public consumption. • Diversions will further increase the likelihood of invasive species, such as the Asian carp and water hyacinths, into the estuary, increasing adverse effects to native aquatic species. • In summary, what will be the impacts of the proposed diversion on Breton Sound, Mississippi Delta, and Pontchartrain Basins' fisheries productivity? This analysis should analyze the collective contributions of the Bonnet Carre Spillway; Caernarvon Diversion; Mardi Gras Pass levee breach and Bohemia Spillway degradation, including recent increases in outflow in the vicinity of the Ostrica Lock system; and other siphons, crevasses, and outfalls in addition to the proposed project. This analysis should include forecasts that indicate that the recent high river trends (ex. multiple Bonnet Carre operations in past 4 years - even twice in 2019) will be more common as opposed to historical events. • How will the proposed diversion's Operations Plan take into consideration the collective direct and indirect impacts of the above freshwater contributors on the Breton Sound, Pontchartrain, and Mississippi River Delta Basins? Rising Water Levels and Increased Storm Risks • Diversions will likely increase the water levels on the basin side against the levee system, increasing levels as high as +3-6 feet and thus decreasing the current system's protective benefits. • Those higher water levels over extended periods of time would damage the levees through under-seepage, erosion, and saturation, thus increasing maintenance costs and the likelihood of levee failure. • Increased artificial water levels that continuously inundate the surrounding marshes will further drive wildlife, especially feral hogs, onto the current levee system. These feral hogs create significant damage to the levee system, which willonly be exacerbated . How will this be addressed? • As understood in the near term, diversions may potentially cause land loss and then will create freshwater marshes that are highly susceptible to saltwater impacts due to storm surges, creating a further loss of a multiple line of natural defense and thus increasing future storm damage impacts. • What will be the impacts to the Parish's forced drainage pump stations on the East Bank? • With the above in mind, what will be the long-term impacts of the diversion's outfall on the East Bank Levee Protection system in the Parish what is the State's plan to address these increased risks through lifting and armoring of the system? This analysis should				X	X	X	X		X		

Mid-Breton Sediment Diversion EIS

November 10, 2020

3328	E-3287c	2020-08-16	USACE Project Website	Plaquemines Parish Government	Kirk M. Lepine	Kirk	M.	Lepine	Belle Chasse	LA	(CONTINUED) reflect forecasts that indicate that future storm events will be more intense and frequent. • What are the proposed operation and maintenance budgets for the project and supporting/impacted infrastructure to ensure structural integrity and navigation safety, and how will they be funded? Diversion vs. Dredging Alternative • As currently proposed, the alternatives to be considered for this project only include variations in diversion size - 35,000 cubic feet per second (cfs), 75,000 cfs (CPRA's preferred alternative), & 115,000 cfs - and a No-Action scenario. A dredging alternative must be included. References to previous studies that address this option are not sufficient, as they are outdated. • Inclusion of a dredging alternative should assist in contrasting that, as opposed to dredging, diversions may in the near-term cause land loss - current modeling indicates that diversions do not show a net land gain until multiple years post operation. Additionally, the alteration of the system to a freshwater ecosystem is more susceptible to the impacts of storm surge. Plaquemines Parish Government's Financial Impact • Loss of tax revenue from potential job losses, business closures, and displaced residents and business will adversely impact Parish budgets and its ability to provide needed services. • The Parish will be responsible for increased costs of maintaining and potentially enhancing flood protection systems that will be impacted by increased water levels basin side - for example, the back levees from Caernarvon to White Ditch will have to be raised to protect from heightened basin elevations and an additional pump station, which will increase O&M responsibilities for Plaquemines Parish Government. • The Parish will be responsible for increased roadway maintenance during construction. Are alternative routes being considered for construction access? • The Parish will be partially responsible for increased workforce development, job training, education, social and other support services to assist those adversely impacted. • With the above in mind, what will be the long-term Parish O&M and other responsibilities that will be born as a result of this project? We appreciate the opportunity to submit these comments for further consideration in the Mid-Breton Sediment Diversion EIS process and look forward to the development of a comprehensive and unbiased analysis for this proposed project.																
3329	E-3288a	2020-08-14	USACE Project Website	The Pontchartrain Conservancy	Kristi Trail	Kristi		Trail	Metairie	LA	The Pontchartrain Conservancy, formerly the Lake Pontchartrain Basin Foundation, appreciates the opportunity to submit scoping comments regarding the Mid-Breton sediment diversion. Pontchartrain Conservancy has actively been working to restore the Breton Basin through advocacy and direct restoration. For example, our reforestation efforts with the help of many partners has resulted in the planting of approximately 40,000 trees in the Caernarvon diversion footprint. Such efforts are orchestrated around the Multiple Lines of Defense concept. The planted trees are directly in front of a Federal and local levee providing a buffer to storm surge and enhancing community resiliency. Our Pontchartrain Coastal Lines of Defense program explicitly identifies these kinds of restoration project throughout the Pontchartrain basin using scientific and engineering analyses. Our recently released technical report describes the surge dynamics that occur within the Breton Basin, and it highlights the importance of wetlands in the footprint of the Mid-Breton Sediment Diversion. Hurricanes which track west of the river, such as Hurricane Isaac, are particularly prone to transferring high surge northward along the east bank of the Mississippi River Levee. It was precisely this phenomenon that caused surge levels in Braithwaite to be higher during Hurricane Isaac than in Hurricane Katrina. The surge translation along the river will occur again, but one way to mitigate this effect is to have healthy wetlands along the east flank of the Mississippi River. The Mid-Breton Diversion is well positioned to rebuild wetlands in this vicinity and reduce storm surge effects. We have seen at other relocations that black willow proliferates as a pioneer species under the influence of Mississippi River discharge, such as at the Caernarvon and Davis Pond freshwater diversions. The Mid-Breton will quickly help build resiliency by producing more wetlands and coastal forest vegetation that is more resistant to storm surge. Maintenance of the Breton land bridge is not only important for storm protection, but also as habitat for economically, recreationally, and culturally important wildlife and we commend the advancement of this project by the Louisiana Coastal Protection and Restoration Authority and many others. The rapidly degrading Breton basin requires immediate attention and this project will help reverse the loss of land and ecological function in this area. It is notable that this project has been previously authorized or approved in various forms by the Corps (LCA) and the state (CMP) for several decades, and therefore has already undergone decades of vetting by scientists and the public. Pontchartrain Conservancy recognizes the important wetland building potential of the Mid-Breton sediment diversion which will act to protect population centers both near the direct impact site and in the greater Pontchartrain Basin region. Communities located outside of the main hurricane protection levee system require additional protection against erosive wave action and devastating storm flooding. Previous planning and modeling efforts for the Mid-Breton sediment diversion have estimated the land building potential of the structure to be 5,066 acres in the short term and 15,831 acres over the next 50 years compared to a future without action. This includes the likely establishment of black willow forests, as has been observed in the footprints of smaller existing diversions, in new areas that can help reduce surge heights along local back levees in rural communities such as Braithwaite. Maintenance and construction of other types of wetland habitat by the diversion will also serve to protect small rural communities that are outside the main hurricane protection levee system. The relative value of the newly created and maintained wetlands are likely much higher for small communities outside of the hurricane protection levee system and this potential difference in value should be accounted for during the scoping process. The diversion will impact wildlife within the	1	0	Storm Protection / Wetlands, Waters / Wildlife & Habitats / Fisheries													
3329	E-3288b	2020-08-15	USACE Project Website	The Pontchartrain Conservancy	Kristi Trail	Kristi		Trail	Metairie	LA	(CONTINUED) Breton basin in many ways. Freshening of the upper basin will increase plant biodiversity with an increase in species that favor fresh water. Some commercial species such as alligator should substantially increase in abundance as has been observed at established freshwater diversions. We expect minimum impact to oyster habitat because the closure of the MRGO and existing freshwater outlets, have already shifted oyster habitat to their historic areas north of the MRGO. We suspect modeling will show that the diversion will have low impact to the currently productive oyster beds, which are nearly all now located north of the MRGO. However, all potential impacts and the economic, cultural, and recreational value associated with these changes both for local communities and the greater southeast Louisiana region should be taken into consideration during the scoping process. Pontchartrain Conservancy understands the importance of community engagement during the NEPA process of a historically controversial project. We appreciate the opportunity to submit scoping comments and encourage the incorporation of the perspective of all potential stakeholders including those outside of the immediate impact area, such as Mississippi, during the NEPA process. We appreciate the effort of all agencies involved with this process and look forward to reviewing the results of the scoping process and the draft environmental impact statement.																
3330	E-3289	2020-08-14	USACE Project Website		Kristi Willis	Kristi		Willis	Austin	TX	I am a supporter of the Coalition to Restore Coastal Louisiana, the first nonprofit in Louisiana dedicated to coastal restoration. I am writing regarding the permit application for the Mid-Breton Sediment Diversion, which has been submitted by the Louisiana CPRA. This is a critical project necessary to help protect coastal Louisiana and rebuild land that is rapidly being lost. Sediment diversions have been recognized for decades as necessary tools to rebuild land by reconnecting the Mississippi River to wetlands that have been cut off from the sediment, nutrients, and fresh water that built and have historically maintained our coast. In the EIS for this project, please answer the following questions: • What are the impacts to people, wildlife, habitats and fisheries of Breton and Mississippi Sounds if the Mid-Breton Sediment Diversion is or is not built? • How will this project reduce impacts from hurricanes and storms? • How will this project affect other existing or planned coastal restoration and flood protection projects in the area that are included in the state's Coastal Master Plan? Thank you for your consideration of these questions. I urge you to complete this scoping report as thoroughly and quickly as possible. We have no time to lose in protecting coastal Louisiana.	1	1	General / Socioeconomics / Fisheries / Storm Protection / Wildlife and Habitats

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

3335	E-3294	2020-08-14	USACE Project Website		Pamela Trochesset	Pamela		Trochesset	New Orleans	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. I am very frightened about the future of south Louisiana because of the continuing loss of land due to coastal erosion. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid- Breton Sediment Diversion in place? What impact will not constructing this project have on storm surge vulnerability in Louisiana? The Mid-Breton sediment diversion project will restore sediment to depleted areas and help to rebuild land there. It will also help to defer a crucial amount of water and this is increasingly important as the Mississippi has been very high every winter and spring for the last few years. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats / Fisheries / Storm Protection								X	X	X	X			X			
3336	E-3295	2020-08-14	USACE Project Website		Richard Haeuser	Richard		Haeuser	Metairie	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. For too long we have heard about the continuing loss of our coastal wetlands while doing little to mitigate the problem. We need to take the steps necessary to grow land, as nature would have done without levees, so that these fertile marshes can continue to provide opportunities for us all to enjoy their bounty and to protect the investment we have made in our coastal communities. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What impact will not constructing this project have on storm surge vulnerability in Louisiana? By building the levees without providing for the continued nurturing of the wetlands created by the Mississippi we have sown the seeds of our own destruction. It is imperative that we begin now to attempt to correct our error. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats / Fisheries								X	X	X	X				X		
3337	E-3296	2020-08-14	USACE Project Website		Robert Gorman	Robert		Gorman	Thibodaux	LA	I am a supporter of the Coalition to Restore Coastal Louisiana, the first nonprofit in Louisiana dedicated to coastal restoration. I am writing regarding the permit application for the Mid-Breton Sediment Diversion, which has been submitted by the Louisiana CPRA. This is a critical project necessary to help protect coastal Louisiana and rebuild land that is rapidly being lost. Sediment diversions have been recognized for decades as necessary tools to rebuild land by reconnecting the Mississippi River to wetlands that have been cut off from the sediment, nutrients, and fresh water that built and have historically maintained our coast. In the EIS for this project, please answer the following questions: • What are the impacts to people, wildlife, habitats and fisheries of Breton and Mississippi Sounds if the Mid- Breton Sediment Diversion is or is not built? • How will this project reduce impacts from hurricanes and storms? • How will this project affect other existing or planned coastal restoration and flood protection projects in the area that are included in the state's Coastal Master Plan? 3338	E-3297	2020-08-14	USACE Project Website	Mississippi Department of Marine Resources	Sharmin Culwell	Sharmin		Culwell	Biloxi	MS	This Proposed Action currently being requested by the Coastal Restoration and Protection Authority (CPRA) to construct , maintain and operate the Mid-Bret on Sediment Diversion project on the east bank of the Mississippi River near Willis Point in Plaquemines Parish is of extreme interest to the State of Mississippi. We have monitored the initial scoping process and meetings for the Draft Environmental Impact Statement (DEIS) and are submitting this comment letter in accordance. The residents of coastal Mississippi and many others have raised significant questions and concerns about the potential effect of this Proposed Action on Mississippi's resources and jurisdictional waters . This is noted in your published transcripts from the July 14, 15 and 16, 2020 virtual scoping meetings. The Mississippi Department of Marine Resources (MDMR) is committed to its mission to restore, enhance and protect these same waters and resources and to accurately informing this process including local questions and concerns. Therefore, MDMR has initiated an independent , Mississippi sourced and guided scientific effort currently identified as the Western Sound Scientific Collaborative (WSSC) to determine potential effects of the Proposed Action on Mississippi waters This includes hydrodynamic modeling based on independently developed boundary conditions intended to illustrate scenarios ranging from nominal flows and durations to hypothetical maximum flows and durations . The results of this effort are to be peer reviewed by a range of experts and organizations not limited to Mississippi and are anticipated to be publicly available by the spring of 2021. Formal DEIS Scoping Comment: The State of Mississippi requests that its jurisdictional waters and resources be fully and completely included in the DEIS and in the process toward the final EIS for this Proposed Action . This should be done in a manner that utilizes, integrates and/or enables comparison with the ongoing Mississippi WSSC assessment and any additional State of Mississippi led efforts to assess the potential ecological and environmental effects of this project. Mississippi will formally contest any EIS for this Proposed Action that does not comprehensively include potential effects for the Mississippi Sound from Louisiana to the Gulfport Channel	0	0	General / H&H								X	X	X	X					X	

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

3339	E-3298	2020-08-14	USACE Project Website		Sian Roussel	Sian		Roussel	Takoma Park	MD	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Louisiana is home to thousands and precious to all. It's rich biodiversity needs to be protected and allowed to thrive. The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? I am from New Orleans. My family has lived in Louisiana from before it was part of the United States. Climate change and heavy industry continue to erode and pollute Louisiana's precious waterways and wetlands. This sediment diversion is needed to help protect the Louisiana coast. I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats / Fisheries / Storm Protection								X	X	X	X			X	
3340	E-3299	2020-08-14	USACE Project Website		Susan Cooper	Susan		Cooper	New Orleans	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. I was born and raised in Louisiana.....fisherman's paradise. The continued damage and loss of our coastline is a loss for us all. The beauty of this state, and the bounty of wildlife and foliage here cannot be measured.... The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? If it affects the natural habitat and ecosystems long associated with Louisiana, it is of great importance to me! I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.	1	1	General / Wildlife & Habitats / Fisheries								X	X	X	X				
3341	E-3300	2020-08-14	USACE Project Website		Troy Simpson	Troy		Simpson	-	-	I am concerned about any diversion and subsequent levees to the Mississippi River. I have lived in Hancock County Mississippi my entire life (except 10 yrs US Navy). I witnessed first hand Hurricanes Camille and Katrina. I believe our community is be sacrificed to protect other communities. Please protect our families also.	2	0	Storm Protection										X					
3342	E-3301	2020-08-14	USACE Project Website		Wayne Cherry	Wayne		Cherry	Dallas	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	General / Socioeconomics / Wildlife & Habitats															
3343	E-3302	2020-08-14	USACE Project Website		Wendy McDonald	Wendy		McDonald	Bay St. Louis	MS	I am opposed to this project because of the tragic impact on the Mississippi Gulf Coast AGAIN! This is not appropriate, it is not good for the environment and it is NOT the best way to restore the Louisiana Wetlands. Dredge the Mississippi River and quit lining the pockets of beg construction that will not solve the problem and only create MORE problems.	2	0	General				X	X		X			X					
3344	V-03	2020-08-15	1-855 Public Number		Jim Delery	Jim		Delery	St. Bernard Parish	LA	This is Jim Delery owner in St. Bernard in Plaquemines Parish. I am opposed to the Mid-Breton Sound diversion. It is a waste of public money. Its effectiveness is going to be marginal. We have primary examples Mardi Gras Pass the crevass is Fort St. Philip. All the other distribution points of the river in Venice in from Point la Hache on down and we need to open up more cuts, spend less money and not do a major disaster we do not need a second Mr. Go expense. A lot of money wasted. I am pro diversion, but I believe that we can accomplish it by opening up the river, particularly below Point la Haches on the East Bank and flow it against across the marsh and hope that we attain settlement. Fort St. Philip is positive proof. What can happen and look at the other deltas. Wax Lake located below with Bayou la Loutre, South Pass all of those how they have moved sediment out, but we've got to restore our ecosystem in the balance in fresh water management is more critical to a healthy and vibrant coastal system. My email address is XXXX@hotmail.com. My phone number is XXX-XXX-XXXX. Again, XXXX@hotmail.com. I am opposed to the Mid-Breton Sound diversion.	2	0	Wetlands, Waters / General														Open up the river, particularly below Point la Haches on the East Bank and flow it against across the marsh and hope that we attain settlement.

Scoping Comment Matrix
November 10, 2020

3345	PM3-8	2020-08-15	Public Scoping Meeting - Session 3 / USACE Project Website		Alisha Renfro	Alisha		Renfro	-	-	Over what timespan will the benefits and impacts of this project be considered? Thank you for this opportunity to provide scoping comments on the Mid-Breton Sediment Diversion. I also appreciate the time effort that was taken in providing multiple opportunities to learn more about the project with online sessions. Louisiana's coast – from its swamps to its barrier islands – is not just a beautiful place, but provides so much to the people of Louisiana as a rich habitat that supports fish and wildlife, provides an abundance of recreation opportunities, and serves as the protective buffer for so many of our coastal communities. Unfortunately, that coast is peril and its continued loss will mean a change in the way of life for so many people, like myself that call this home. The Mid-Breton Sediment Diversion is an important project that is vital to the long-term future of Louisiana's coastal habitats. The scale of benefits from this project to the Breton Sound Basin would be unrealized using other restoration methods. The construction and operation of this project will influence the Breton Sound Basin and add to the complexity of an already complex system. As a result, the EIS analysis for this project must carefully consider the future both with and without the project to understand the long-term consequences of continued land loss on the people, communities, and wildlife of the coast and should answer the following questions: * What will the Breton Sound Basin and the entire Mississippi River Delta look like without the Mid-Breton Diversion? * What would the continued land loss in Breton Sound with the project mean for the people, communities and wildlife of Louisiana? How would that affect available habitat? How would that change risk vulnerability for coastal communities, including New Orleans? * Are there marsh creation projects in or near the diversion footprint that could work synergistically with the Mid-Breton Diversion? Could the diversion extend the project lifespan? * Are there any other project types that could be used to deliver the same scale of expected project benefits over the long-term? * How important are the marshes benefited from the project in providing risk reduction to nearby communities? * By diverting sediment from the river, would the project decrease dredging requirements for the lowermost part of the river channel over the short or long-term? Does that result in a significant cost savings? * Will the waters from the diversion reach east to Mississippi Sound? * What are the direct economic impacts of project construction to the local and regional community? * Could material dredged from the diversion channel during construction be used to create marsh? Thank you so much for the opportunity to participate in the scoping process for the Mid-Breton Diversion. This is the first step, but an important step in this process and I look forward to seeing the scoping report in the next few months and participating where possible throughout this process.	0	0	General / Wildlife & Habitats / Fisheries

**Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020**

3348	E-3305a	2020-08-15	USACE Project Website	Louisiana Hypoxia Working Group	Doug Daigle	Doug		Daigle	Baton Rouge	LA	I am submitting the following comments for the NEPA Scoping Process for the proposed Mid-Breton Sediment Diversion Project on behalf of the Louisiana Hypoxia Working Group. These comments are intended to present and clarify a number of policy issues relating to the Gulf of Mexico Hypoxic Zone, nutrient pollution, and the proposed project. The Group was formed in 2003 to coordinate implementation in Louisiana of the Action Plan for Reducing, Mitigating, and Controlling Hypoxia in the Northern Gulf of Mexico (2001), and continues to meet as a monthly forum for interested agencies, researchers, and stakeholders to share information and promote activity related to the current version of the Action Plan (2015). The annual hypoxic zone that forms off the continental shelf in Louisiana's coastal waters is the result of nutrient loading from the Mississippi River Basin* to the Gulf of Mexico, delivered largely through the Mississippi and Atchafalaya Rivers, along with a number of smaller rivers and streams that drain from the coast. Nutrient loading in the Mississippi River Basin and the size of the Gulf Hypoxic Zone are primarily measured by the U.S. Geological Survey (USGS), and Louisiana State University and the Louisiana Universities Marine Consortium (LUMCON), respectively, working with partner agencies and institutions. The proposed project intersects with the issue of nutrients in the Mississippi River and Gulf of Mexico in a number of ways. Nutrients figure prominently in purpose of the project as described in the Federal Register posting of July 2, 2020, which would be a "large-scale, complex ecosystem restoration project intended to convey sediment, fresh water, and nutrients from the Mississippi River into the Breton Sound Basin in an effort to reduce coastal land loss and sustain surrounding wetlands." Water quality is listed as one of the "Potentially Significant Issues" that the Corps of Engineers and Cooperating Agencies will consider in the Environmental Impact Statement (EIS) prepared for the project. The State of Louisiana, the Corps, and a number of the Cooperating Agencies for the project EIS (Environmental Protection Agency, USDA Natural Resources Conservation Service, National Oceanic and Atmospheric Administration, U.S. Fish & Wildlife Service) are members of the Mississippi River/Gulf of Mexico Watershed Nutrient Task Force (hereafter "Task Force") which developed and is charged with implementing the Gulf Hypoxia Action Plan (working with partner federal, state, and local agencies and the private sector.)** The current version of the Gulf Hypoxia Action Plan (2015) has two core parts, a Coastal Goal and Interim Target: We strive to reduce the five-year running average areal extent of the Gulf of Mexico hypoxic zone to less than 5,000 square kilometers by the year 2035. Reaching this final goal will require a significant commitment of resources to greatly accelerate implementation of actions to reduce nutrient loading from all major sources of nitrogen and phosphorus in the Mississippi/Atchafalaya River Basin (MARB). An Interim Target of a 20% reduction of nitrogen and phosphorus loading by 2025 is a milestone for immediate planning and implementation actions, while continuing to develop future action strategies to achieve the final goal through 2035. The Updated Coastal Goal and Interim Target of the Action Plan are tied to a commitment on the part of agencies on the Task Force: Federal agencies, States, Tribes and other partners will work collaboratively to plan and implement specific, practical and cost-	0	0	Water Quality

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

3350	E-3307a	2020-08-15	USACE Project Website	AmeriPure Oysters	John Tesvich	John		Tesvich	Buras	LA	<p>To Whom it May Concern:</p> <p>AmeriPure Processing Company, Inc. is based in Louisiana, and our company depends on a supply of oysters coming from the area that will be negatively affected by the proposed project. I am writing in strong opposition to the project because of the extreme environmental upheaval it will cause in the Breton and Chandeleur Sounds including the adjacent bays and bayous where most oysters are currently cultivated.</p> <p>The Mid-Breton sediment diversion project, as currently designed, would severely damage more than 100,000 acres of oyster beds that are within 30 miles of the planned diversion's outfall area. The inner section of the Breton Sound estuary from the Mississippi River north to the MRGO channel, including Black Bay and California Bay, contain a wide distribution of historical oyster reefs that have been commercially harvested for well over 150 years. By all historical accounts, many of these reefs were there when Louisiana was first colonized by western Europeans. These historical oyster reefs are a significant part of the Essential Fish Habitat (EFH) in this estuary, and are a great natural asset of our parishes, our state, and our country.</p> <p>The referenced project would severely alter historical salinities within the estuary. This, in turn, will kill the live oysters on the reefs. Without the benefit of live, water-pumping oysters, the reefs will additionally be over-burdened with sedimentation from the river diversion. That eventually will smother and bury the existing reefs, and the reefs will be lost. Killing well established, productive historical oyster reefs and covering them with sand is neither coastal restoration nor flood protection. Whether deliberate or not, it is a coastal redesign; it is a wasteful taking of a valuable public natural asset for dubious and questionable purposes.</p> <p>Proven wetlands restoration methods, such as dredging technology, are available to the applicant that can achieve restoration without the socioeconomically detrimental effects of the referenced project and with minimal impact to the greater ecosystem and EFH within an estuary.</p> <p>The applicant has not addressed the major socioeconomic impact that this project will cause, in fact they are minimizing it. Applicant's assertion that the project is "self-mitigating" is absurd, and should be treated accordingly. The applicant has not sufficiently studied and offered alternative designs of this project that help to minimize the project's unintended environmental and socio-economic consequences.</p> <p>The existing river diversions and crevasses on the Mississippi River, including Caernarvon, Fort St. Phillip, and the crevasse at the Bohemia Salinity Control structure, offer timely evidence on what river water diversions can and cannot do. There is clear empirical evidence from past history that river diversions are not the best tool to use for wetlands restoration in salt water and brackish areas. The USACE has published a long-term study of the effects of crevasses at Ft. St. Phillip in which it concluded that the crevasse as a "land loss accelerant". Even with all of the empirical evidence that seriously question the applicant's claims, they are pushing blindly forward based solely on unvalidated and questionable computer models, in their goal to re-design the coast.</p> <p>Be keenly aware that applicant, with support of moneyed interests, who live outside of the project's impact area, are the ones</p>	2	0	General / Wildlife & Habitats / Fisheries / Storm Protection											Proven wetlands restoration methods, such as dredging technology, are available to the applicant that can achieve restoration without the socioeconomically detrimental effects of the referenced project.
3350	E-3307b	2020-08-16	USACE Project Website	AmeriPure Oysters	John Tesvich	John		Tesvich	Buras	LA	<p>(CONTINUED) supporting this project while most local stakeholders in Plaquemines and St. Bernard parishes are mostly against it. Sound familiar? Think -- MRGO. Think -- blowing up the levee at Caernarvon in 1927. There are too many haunting similarities. This project is just one step in the proponent's goal to redesign the lower Mississippi River. It will not enhance flood protection, but make it worse. This project is a part of Louisiana's Great Coastal Boondoggle. I repeat for emphasis: Applicant's assertion that the project is "self-mitigating" is absurd, and is a slap in the face to the respectable citizen-stakeholders that will be severely impacted by their actions.</p> <p>In conclusion, the questionable projected benefits of this project are not worth the well-defined adverse environmental and socioeconomic impacts it will cause. Furthermore, applicant can change the design in order to minimize impacts, and has other methods available that can achieve its stated goal of wetland restoration with less negative impacts. I ask that the USACE look at this project most critically</p>														
3351	E-3308	2020-08-15	USACE Project Website		Mike Mariana	Mike		Mariana	Belle Chasse	LA	<p>I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act -- and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion.</p> <p>Maintaining our coast is important because it is an essential part of our culture, provides a habitat for many animal species, and because it provides vital protection against hurricanes. Is must be preserved and allowed grow again.</p> <p>The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement.</p> <p>Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound?</p> <p>What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin?</p> <p>Again, the Mid-Breton Sediment Diversion is so important because it will help preserve our culture, save vital animal species, and help rebuild the natural hurricane protection system. Southeast Louisiana would not be the same without it.</p> <p>I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible.</p>	1	1	General / Wildlife & Habitats / Fisheries / Storm Protection											
3352	E-3309	2020-08-15	USACE Project Website		Rebecca Nelson	Rebecca		Nelson	Kiln	MS	<p>As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land.</p> <p>Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time.</p> <p>I urge the U.S. Army Corps of Engineers (Corps) to:</p> <ul style="list-style-type: none">* Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects.* Detail the impacts of not building the Diversion on bird and wildlife species of concern.* Be transparent by regularly sharing information with the public and other stakeholders.* Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project.* Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. <p>There is no time to waste. I urge the Corps to act swiftly through all phases of the project</p>	1	1	General / Socioeconomics / Wildlife & Habitats

3353	E-3310	2020-08-15	USACE Project Website		Richard Ziegler	Richard		Ziegler	Saint Bernard	LA	I support reconnecting the Mississippi River to the delta through sediment diversions to build and sustain land. Louisiana's land loss crisis is urgent and will only worsen unless we act – and that means ensuring swift, effective implementation of the Mid-Breton Sediment Diversion. Richard Ziegler these diversions will destroy the marsh and estuaries we have left dredging is the best way The Mid-Breton Sediment Diversion will have major implications for coastal Louisiana and communities, and I want the Army Corps of Engineers to address the following questions in the final Environmental Impact Statement. Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion? What happens to existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place? What are the impacts of the proposed diversion on the long-term fisheries productivity of the area from Breton Sound to Mississippi Sound? What impact will not constructing this project have on storm surge vulnerability in Louisiana? Are diversions the best method for building and sustaining land in the Breton Basin? Because it how we make living I urge the Corps to act swiftly through all phases of the project. Please complete the Scoping Report as quickly as possible	1	1	General / Wildlife & Habitats / Fisheries								X	X	X	X			X				
3354	E-3311a	2020-08-15	USACE Project Website	Mississippi Commercial Fisheries United	Ryan Bradley	Ryan		Bradley	Long Beach	MS	Please accept this letter on behalf of the Mississippi Commercial Fisheries United, Inc. ("MSCFU") in regards to the Louisiana Coastal Protection and Restoration Authority's ("CPRA") application to permit activities in relation to the Mid Breton Sediment Diversion Project ("MBSD"). MSCFU is a non-profit 501(c) 6 business alliance of commercial fishermen, seafood businesses, and consumers of the natural resources our members provide. The majority of MSCFU members are active participants in a variety of commercial fishing activities in Mississippi and Louisiana territorial waters as well as the federally managed waters of the Gulf of Mexico. As a result, our constituents are vitally dependent on healthy marine ecosystems; especially, those estuarine systems of the Breton Basin that are proposed to be impacted by the aforementioned sediment diversion project. The Mid Breton Basin estuary is essential fish habitat for a wide variety of culturally and economically significant recreational and commercial marine resources that are vital to the heritage and sustainability of coastal communities. The proposed project and subsequent impact area has a high potential to cause severe economic injury to fishing dependent communities that both fish directly in the vicinity of the impacted area and those that depended on the Breton Basin as estuary for healthy juvenile aquatic resources that can grow and move further offshore for further recreational and commercial exploitation. The entire Gulf Coast seafood industry has experienced devastating setbacks over the past decade from natural and man-made disasters such as hurricanes, the BP Deepwater Horizon Oil Spill, Harmful Algae Blooms, freshwater and sediment diversions, excessive rainfall, and under reported prolonged hypoxic events that have diminished, displaced, and now threatens the very livelihood of multi-generational fishing families across the Gulf Coast. The proud heritage of the seafood industry is at stake more now, than it ever has been. The average age of the U.S. commercial fisherman is getting older every year as there are less and less young fishermen coming into the industry at an early age. Without incoming commercial fishermen to replace our aging veteran fishermen; the public at large stands to lose significant access to the bountiful natural resources of the Gulf Coast waters and along with it the invaluable traditional ecological knowledge that has been passed down from generation to generation. Therefore; MSCFU, hereby respectfully presents the following concerns and recommendations on the proposed project in hopes that the ultimate decision makers will duly consider the economic, cultural, and overall importance that the proposed projects impact area has on the entire Gulf Coast seafood industry. CONCERNS: Our members express sincere concerns over the health and reproductive capacity of Louisiana's marsh estuary systems that are extremely important to commercial fisheries should the proposed MBSD project become fully implemented. Estuarine systems throughout the marsh serve as critical habitat for a variety of natural resources such as shrimp, oysters, crabs, and fish. Commercial fishermen, seafood business and seafood consumers are greatly dependent on these resources being healthy, abundant, and consistently available. The proposed MBSD project impact area is a primary estuary for these economically important resources. It should be noted that the year 2017 produced the largest dead zone at the mouth of the Mississippi River in recorded history according to the National Oceanic and Atmospheric Administration (NOAA). There are grave concerns that sediment and water diversion into upper estuaries will cause similar hypoxic dead zones in areas that are highly important to a variety of juvenile species. Essentially, the primary concern is that the MBSD project and similar projects will cause irreparable harm to the seafood industry by destroying essential fish habitat in the impacted zones. The project's intended outcomes	2	0	Cultural Resources / Fisheries / H&H / Water Quality / Wetlands, Waters / Wildlife & Habitats											X	X	X	X			X	
3354	E-3311b	2020-08-16	USACE Project Website	Mississippi Commercial Fisheries United	Ryan Bradley	Ryan		Bradley	Long Beach	MS	(CONTINUED) are perceived as long-term (decades) and will greatly reduce the biodiversity and abundance of vitally important marine resources in the short-term. This project will likely contribute to a significant loss in revenue for oyster harvesters, shrimpers, and crabbers in the areas impacted and also in surrounding areas as well. Example: In 2019, the Army Corps of Engineers opened up the Bonnet Carré Spillway in Louisiana for several months. The impact to the commercial fisheries in Mississippi as a result of this spillway opening was devastating. Oysters, crabs, and shrimp harvest plummeted in the western Mississippi Sound during the months following this event. The impact was so detrimental that the oyster and crab fishery in Mississippi was declared a disaster and the states of Mississippi, Louisiana, and Alabama requested over \$500 million in disaster relief to restore and conserve natural resource habitats that were directly impacted. Mississippi's oyster reefs continue to struggle to recover from this event and similar diversions to this day. The commercial fishing interest from Mississippi have seen firsthand the impacts these diversions can have and therefore express strong concerns over any future projects that aim to divert water and/ or sediment from the Mississippi River. The proposed MBSD project will have multiple impacts to fisheries that commercial harvesters are dependent upon and that have not been fully evaluated or have been grossly underestimated thus far. These impacts include (A) continual sediment displacement that will smother essential oyster and shrimp habitat; (B) severe changes in water temperature that will directly affect the normal growth of a variety of juvenile marine species; (C) substantial increases in the frequency and duration of hypoxic events that will contribute to an increase in mortality of aquatic resources; and (D) the displacement of a variety of commercially important marine resources along with the fishermen whom harvest them. Overall, this project will have a devastating impact to both the culturally important marine resources and the fishing communities whom depend upon them. There are also legitimate concerns over the general feasibility of the proposed project and questions regarding if the proposed project's ecosystem services can actually be achieved in a reasonable time frame with minimal impact to fishing dependent communities that have a long history of operating in the impacted area. (A) The impact to sediments in essential fish habitat from the proposed MBSD project will have substantial impacts in the short-term. Species such as oysters will be completely silted over on-bottom and will experience 100 % mortality in areas directly impacted. Species such as shrimp which require years of undisturbed bottom habitat to be able bury in the sediments to evade depredation and to spawn. (B) Severe changes in water temperature from the constant throttling of a cold Mississippi River discharge outflow at the maximum rate of up to 75,000 cfs will drastically alter the dynamics of essential fish habitat that is critically dependent on stable warm temperatures to optimally grow a plethora of marine species that are economically and culturally important. (C) It is expected that a substantial increase in the frequency and duration of hypoxic events would be observed immediately following sediment discharges should this project be implemented. Similar conditions in water, sediments, and other pollutants have greatly contributed to an ever-expanding dead zone. Legitimate concerns have been raised that if this diversion project is implemented that it would be expected to cause similar dead zone within vital estuarine habitat before a majority of the species could grow large enough														X	X	X	X			X

Mid-Breton Sediment Diversion EIS Scoping Comment Matrix November 10, 2020																								
3359	L-05a	2020-08-16	Mailed to USACE	Big River Coalition	Sean M. Duffy, Sr.	Sean	M.	Duffy, Sr.	Metairie	LA	The Big River Coalition (BRC) was created in Fiscal Year 2011 in response to the announcement by the Commander of the United States Army Corps of Engineers’ (USACE) Mississippi Valley Division that channel maintenance on the Mississippi River Ship Channel, Gulf to Baton Rouge (Louisiana) would be limited by the dedicated funding (Operations and Maintenance [O&M] budget). Prior to this position change the Mississippi River Ship Channel received preferential treatment and often received additional funding from other USACE projects. After the 1989 grounding of the M/V MARSHAL KONYEV (Pilottown) that virtually closed the Ship Channel to all traffic, the USACE’s Headquarters announced in a position statement that it would maintain the nation’s most critical navigation channel. The BRC originally focused on obtaining additional funding to supplement the shortfall in the Corps’ O&M budget, to strive to establish a legislative firewall around the Harbor Maintenance Trust Fund and to represent members of the Mississippi River navigation industry in matters related to coastal restoration. As our membership grew and continued to make effective progress on these initiatives, members supported the Coalition’s commitment to actively advocate for the deepening of the Mississippi River Ship Channel Gulf to Baton Rouge to 50 feet. The BRC is concerned about the Mid-Breton Sediment Diversion (MBSD) proposed by the Coastal Protection and Restoration Authority (CPRA) and the impact the project will have on the Mississippi River Ship Channel and recommends the following items be reviewed in the Environmental Impact Statement process. The proposed Sediment Diversion will by design reduce the energy within the Ship Channel and encourage deposition in the immediate area of the Diversion structure. As with previous Sediment Diversions the navigation industry must request that the CPRA be ordered to maintain the Ship Channel at authorized and historic dimensions in the area impacted by this proposed project. In order to accomplish this, changes in the hydrology and available depth in the Ship Channel and within Wills Point Anchorage must be maintained and sufficient funding to dredge impacted areas should be held in escrow by the USACE or proper authority. During the Public Scoping meetings held online the CPRA made several comparisons of the Mid-Breton Sediment Diversion to two freshwater diversion structures, specifically the Davis Pond Freshwater Diversion located at Mile 118 Above Head of Passes (AHP) and the Caernarvon Freshwater Diversion located at Mile 82 AHP. The Davis Pond Diversion diverts freshwater from the Mississippi River at a maximum of 10,000 cubic feet per second (cfs) while the Caernarvon Diversion diverts a maximum of 7,500 cfs of flow from the Mississippi River. Comparing the impacts of small Freshwater Diversions that are not designed to transport sediment with a true “Sediment Diversion” is inherently misleading. Especially based on the operation of the West Bay Sediment Diversion and failure to maintain the Pilottown Anchorage as detailed in the Cost Sharing Agreement. The Coalition also suggests that the USACE review all details about the success of the West Bay Sediment Diversion as a project designed to restore 9,831 acres in a 20-year lifetime. The Diversion structure was officially opened in November 2003 and is just a few years shy of the 20-year target. Based on a lack of shared modeling it is hard to track the success of this Sediment Diversion, but of course the success or lack of success offers important insights to critical decision-making. In fact, the Coalition is concerned about the MBSD proposal based on experience with the creation and operation of the West Bay Sediment Diversion at Mile 4.7 Above Head of Passes on the right descending bank (western side). The maritime industry voiced their concern prior to the creation of that diversion, knowing that it would increase	0	0	H&H / Navigation / General										Support the beneficial use of dredged materials as a viable, substantial and sustainable form of coastal restoration with the ability to create land or restore wetlands in minutes by removing the impediment of sediment from the Ship Channel.
3359	L-05b	2020-08-17	Mailed to USACE	Big River Coalition	Sean M. Duffy, Sr.	Sean	M.	Duffy, Sr.	Metairie	LA	(CONTINUED) shoaling in the Mississippi River Ship Channel and the Pilottown Anchorage area below the diversion and increase river currents above the diversion site. The main concern was indeed specific to shoaling within the Pilottown Anchorage (Mile 6.7 AHP to Mile 1.5 AHP) as the USACE does not have the authority to dredge outside of the Ship Channel. Because of this the maritime industry only agreed to the West Bay Diversion’s construction because of the approved conditions included in the document titled “COST SHARING AGREEMENT BETWEEN THE DEPARTMENT OF THE ARMY AND THE STATE OF LOUISIANA, FOR CONSTRUCTION, OPERATION, MAINTENANCE, REPAIR, REPLACEMENT, REHABILITATION AND MONITORING OF THE WEST BAY SEDIMENT DIVERSION PROJECT (MR-03) PLAQUEMINES PARISH, LOUISIANA.” The Cost Sharing Agreement (CSA) was executed on August 29, 2002 by the Department of Natural Resources, State of Louisiana and the USACE. The following is reproduced from Page #3 of the CSA: “...Included as a Project feature is the maintenance of the outermost (eastern) 250-foot wide strip of the Pilottown Anchorage area and the entire width of the adjoining access area between the strip of Pilottown Anchorage and the Mississippi River navigation channel. Advanced maintenance of the Pilottown Anchorage area shall be undertaken to account for the anticipated shoaling induced by the Project (Emphasis supplied). Below the conveyance channel, the anchorage and access areas shall be maintained at the depth existing at the time the Phase One interim conveyance channel is constructed. Above the cut, three 45-foot deep by 1,500 feet long anchorage berths shall be constructed and/or be maintained...” In 2009 the Coastal Wetlands Planning, Protection and Restoration Act passed a motion that removed this commitment from the operational structure of the CSA. The navigation industry is concerned about the impact the proposed MBSD would have on the Ship Channel, especially based on a maximum discharge of 75,000 cubic feet per second that is 25,000 cubic feet per second higher than the maximum proposed rate for the West Bay Diversion. There is no doubt this diversion will increase deposition in the Ship Channel and within the Wills Point Anchorage. In contrast to the West Bay Diversion the MBSD is not in an area the USACE performs channel maintenance dredging. Therefore, any shoaling in the channel and within the Wills Point Anchorage should be removed by the applicant as mitigation for the life of the project by the CPRA. The Coalition requests that the USACE lead an effort to properly model the impact of the hydrology changes and shoaling in the vicinity of the proposed diversion structure before approving the Permit Application. According to recent surveys of the Pilottown Anchorage done by the USACE’s Mississippi Valley Division at the request of the CPRA there are over 60 million cubic yards of material within the Pilottown Anchorage. In the Federal Register Notice, the CPRA is documented as stating that this project is self-mitigating, clearly that is not true based on the impacts of the only existing Sediment Diversion, the West Bay Sediment Diversion. “CPRA proposes this project as a large scale ecosystem restoration that is self-mitigating.” The navigation industry must remain vigilant in protecting our deep-draft anchorages, the Coalition has pursued a remedy to the shoaling in the Pilottown Anchorage with the USACE and through proposed legislation and funding changes unsuccessfully through the U.S. Congress for years. The crisis in the Pilottown Anchorage continues and the Mid-Breton Sediment Diversion located at approximately Mile 68 AHP will incur shoaling at the Wills Point Anchorage location from Mile 67.6 AHP to Mile 66.5 AHP. Wills Point Anchorage .An area 1.1 miles in length along the left descending bank of the river extending from mile 66.5 to mile 67.6 above Head of Passes. The width of the anchorage is 600 feet. The													

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

3359	L-05c	2020-08-18	Mailed to USACE	Big River Coalition	Sean M. Duffy, Sr.	Sean	M.	Duffy, Sr.	Metairie	LA	(CONTINUED) inner boundary of the anchorage is a line parallel to the nearest bank 200 feet from the water's edge into the river as measured from the LWRP. The outer boundary of the anchorage is a line parallel to the nearest bank 800 feet from the water's edge into the river as measured from the LWRP. There remain concerns related to the flow of 75,000 cfs counter to the flow of the channel, especiallyfor shallow-draft traffic. Wills Point already represents a tight maneuver for the neopanamax class of vessels presently calling the Mississippi River Ship Channel and the deepening of the Mississippi River Ship Channel to 50 feet will over time increase the standard size ship calling the River. As part of the EIS discovery the operational plan for the management of the proposed structure should be developed, normal occurrence of high river, flooding and the impact of Tropical Storms or Hurricanes occur more now than in recorded history.The honorable goal of restoring wetlands should not compromise the safety of navigation on the nation's most prolific artery of trade. The navigation industry is also concerned by problems associated with the failed Bohemia Salinity Control Structureat Mile 43.7 AHP that continues to grow and capture more of the Mississippi River's thalweg. This area if referred to by many as "Mardi Gras Pass"but the truth is this area was created by another failed control structure, had the area not been excavated Mardi Gras Pass would in all likelihood never have formed. There is no doubt that the loss of up to 100,000cfs in a 20-milereach of the Ship Channel will have negative impacts on the hydrology in the navigation channel, that must be resolved.The navigation industry believes that this breach should be closed or controlled, left unimpeded it will continue to capture more of the channel flow and introduce increased shoaling in the immediate area. For those reasons we support the Louisiana Department of Wildlife and Fisheries recent recommendation that the break in the Ship Channel at Mardi Gras Pass be closed by a structure as part of their Oyster Management and Rehabilitation Strategic Plan:"The plan also calls for building a new, \$24.3 million water control structure at Mardi Gras Pass, a crevasse of the Mississippi River bank at the Bohemia Spillway in Plaquemines Parish that allows freshwater into areas where oysters have traditionally been grown. The state has not supported past efforts by Plaquemines officials to rebuild the structure, and the pass now funnels freshwater and sediment to areas east of the spillway."The CPRA should also be requested to update misleading dialogue that it uses to describe and promote the MBSD project. The following quotes are reproduced from the CPRA Websites (links listed below):CPRA: Mid-Breton Sediment Diversion Overview"Sediment diversions have the potential to create tens of thousands of acres of land, as opposed to dredging projects that only create hundreds of acres."https://coastal.la.gov/our-work/key-initiatives/diversion-program/project-benefits/"Sediment diversions have the capability to build tens of thousands of acres of land along our state's coast. Latest modeling results show that, on average, a sediment diversion will deliver between 2-3 million cubic yards of sediment a year, providing sustainability and increased storm surge protection for coastal communities."https://coastal.la.gov/our-work/key-initiatives/diversion-program/project-benefits/The Big River Coalition has worked closely with the U.S. Army Corps of Engineers and other members of the Beneficial Use of Dredged Material Subcommittee that have restored 10,665 acres of wetlands with beneficially used dredged sediment below Venice, LA since 2009. In subsequent years cutterhead dredges have beneficially used over 3 million cubic yards of material. In fact, in recent years three new single year records of over 20 million cubic yards of material have been beneficially used. In 2019 a record of 24.7 million cubic yards.														
3359	L-05d	2020-08-19	Mailed to USACE	Big River Coalition	Sean M. Duffy, Sr.	Sean	M.	Duffy, Sr.	Metairie	LA	(CONTINUED) of material were used to restore 1,724 acres in the environmentally sensitive birds'-foot delta. The Coalition and navigation interests all believe in and support the beneficial use of dredged materials as a viable, substantialand sustainable form of coastal restoration with the ability to create land or restore wetlands in minutes by removing the impediment of sediment from the Ship Channel. The Federal Register Notice references the following study under Item #4, 4. Alternatives. "including the LCA Medium Diversion at Myrtle Grove with Dedicated Dredging Feasibility Study"...The Feasibility Study states:"Dedicated dredging of sediment mined from the Mississippi River would complement this feature." The undersigned was intrigued by the definition of dedicated dredging and requests that a proper definition of the suggested term "Dedicated Dredging"be offered. It could indeed resemble the idea of mitigating for the impact of shoaling that would occur in the area of the proposed and future Diversions and adds credence to our request to mitigate for the impact to the Ship Channel for the life of the proposed project. The Coalition would be concerned about any additional dredged material being placed into the River in the area of the MBSD, for reasons already mentioned above and related to the impact on the Ship Channel. The Coalition requests that the USACE work to protect navigation on the Mississippi River Ship Channel and not approve projects that could compromise commerce on the Ship Channel. The USACE should also request that this project account for the maximum authorized channel depth of 55 feet as approved in the Water Resources Development Act of 1986. The Coalition does believe that having the ability to meet with the applicant would be well served,but that a significant amount of background information is missing and should first be secured.The USACE Mississippi Valley Division along with the National Oceanic and Atmospheric Administration's National Weather Service jointly produced a document titled,"Precipitation Trends in the Mississippi River Watershed" This report details the leading cause for increased periods of high rivers are the increasein precipitation around the world. New Orleans area residentsoften use the required operationof the Bonnet Carré Spillway as a metricfor flooding, the last decade has been thewettest in the last 125 years and all records for the required use of the Spillway have been set in the last decade.The modeling of future diversions or navigation structures must include updates upon recent precipitationlevelsto proper highlight the length of time the structures could operate. Longer operational times will increase both the sediment being deposited in the area and the freshwater levels released into thebasin, surely things like increased algal bloomswill be properly referenced by others. The following quote is reproduced from the Conclusion of the "Precipitation Trends in the Mississippi River Watershed"document:"Also, there has been a 37 percent increasein precipitation falling in very heavy rain events over the Midwest during the past few decades. Therefore, the frequency and the magnitude of floods have increased due to more rain and a significant increase in the frequency of very heavy rainfall events."The Big River Coalition strives to maximize the economic efficiencies that promote increased maritime commerce and international trade. The Lower Mississippi River Deep-Draft Ports Complex (Baton Rouge, South Louisiana, New Orleans, St. Bernard, and Plaquemines) is an economic superhighway of international trade and the nation's busiest port system.The cargoes moved through these five ports account for nearly 70 percent of the Nation's grain exports and more than 20 percent of the Nation's coal and petroleum cargoes. The economic impact of the Lower Mississippi River Deep-Draft Ports Complex is nationally significant. The Mississippi River has an estimated \$ 735.7 billion annual														
3359	L-05e	2020-08-20	Mailed to USACE	Big River Coalition	Sean M. Duffy, Sr.	Sean	M.	Duffy, Sr.	Metairie	LA	(CONTINUED) impact on the nation's economy and is responsible for approximately 2.4 million jobs (585,000 jobs on the Lower River –Cairo, IL to the Gulf of Mexico and 1.86 million plus jobs on the Upper River-Lake Itasca, MN to Cairo, IL and including the IL River).														
3360	E-3315	2020-08-16	USACE Project Website		Alisha Gaubert	Alisha		Gaubert	Houston	TX	As a native Louisianian who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project.	1	1	General / Wildlife & Habitats / Fisheries											

**Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020**

3361	E-3316	2020-08-16	USACE Project Website		Brad Humber	Brad		Humber	Gautier	MS	The Mid-Breton Sediment Diversion Project presents a unique opportunity to aid in the rebuilding of marsh habitat and associated wetlands that once relied on the historical flows of freshwater and nutrient rich sediment that built these critical habitats. These systems provide a variety of critical habitats for fisheries and marine life, including several rare, threatened, and endangered species. I support reconnecting vital wetland systems and restoration of critical flows to replenish and restore the marsh wetlands through a sustainable approach. I request the Mid-Breton Sediment Diversion Environmental Impact Statement address the following questions in the final Environmental Impact Statement: 1. What are the anticipated long term impacts or implications to the fisheries and estuarine habitats within the Breton Sound and the adjacent Mississippi Sound? 2. How will any impacts to existing estuarine and marine systems from the construction to the operation of the diversion project be mitigated to ensure long term success? 3. Will flows released from the diversion project mimic historical flow patterns that would have naturally fluctuated similar to seasonal flow patterns of other nearby rivers, such as the Mississippi River? 4. Will the sediment diverted include both coarse and finer sediments that would have historically occurred? 5. What adverse effects could the sediment diversion project have on long term sustainability of habitats within the Mississippi Sound, such as the barrier islands and their associated littoral habitats, oyster reefs, and sea grass beds? The Mid-Breton Sediment Diversion can be successful in restoring and sustaining critical habitats that may be lost or have been lost. In order to ensure long term success and sustainability this project must not risk endangering other critical habitats while trying to save some in the process. Please confirm receipt of this comment and please add my information to any and all electronic distribution list to	0	0	Fisheries / Wetlands, Waters / Wildlife & Habitats / T&E	X		X	X		X	
3362	E-3317a	2020-08-16	USACE Project Website	Restore the Mississippi Delta	Briane Moore	Briane		Moore	New Orleans	LA	The organizations of the Restore the Mississippi River Delta appreciate the opportunity to provide comments on the Mid-Breton Sediment Diversion (Mid-Breton SD). For years, our scientists and policy experts have worked with state and federal agencies in Louisiana to confront the challenges of rapid coastal land loss and its corresponding implications for our natural resources and the local and national economy. We commend the Louisiana Coastal Protection and Restoration Authority for advancing this vital project and Gulf Environmental Benefit Fund of the National Fish and Wildlife Foundation for giving critical support. The Breton Sound Basin has experienced tremendous change over time. Tens of thousands of acres of wetlands have been converted to open water and habitat has been altered by saltwater intrusion. This has caused the loss of ridges and wetlands, threatening communities, industry and wildlife. We have limited time to act and must come together to permit and construct the Mid-Breton Sediment Diversion as quickly as possible. Every day we delay, we lose additional wetlands, reducing the natural resources and ecosystem services they provide. Following the closing of the public comment period on August 16, 2020, we request that the Scoping Report be released by mid-November. We suggest that it not only be a record of the public meetings and public comments, but also include details about the scope of work, methods and data to be used, and resources to be considered. We recommend that the Scoping Report also examine the timeline for project permitting, identifying tasks that could be completed concurrently and other opportunities for timesaving. Such a detailed report is achievable within a short period, given the extensive amount of existing information on the project. To that end, we offer the following comments and recommendations in the hopes of providing useful context and information to inform and expedite drafting of the Scoping Report and EIS.Background Conditions Baseline conditions are continually changing in the Breton Sound Basin. The National Environmental Policy Act (NEPA) was originally passed to ensure impacts to the environment are disclosed during federal actions; however, this EIS is being undertaken to support a project that is aimed to address decades of historical and projected environmental damage caused by previous actions. In Breton Sound Basin, distributary closures, levees built for flood control, and deep channels such as the Mississippi River Gulf Outlet (MRGO) dredged for navigation have severed the Mississippi River from its surrounding wetlands, caused erosion and increased salt-water intrusion, resulting in a degrading wetland system that is in the final accelerated phase of the delta cycle--reversion to open water; and the loss of forests. Without the historic input of sediment from the Mississippi River, the Breton Sound Basin has been deteriorating with high rates of wetland land loss, and those rates are only predicted to increase in the future without large-scale restoration action. The Fisk 1947 map of coastal Louisiana shows the basin to be composed of a dense network of wetlands interlaced with bayous and small bodies of open water. Older, less precise maps indicate an even higher proportion of wetlands have converted to open water. By contrast, today, tens of thousands of acres of wetlands have been converted to sizable bodies of open water now described as bays. Since the 1930s, more than one thousand acres of land have been lost in Breton Sound Basin (Couvillion et al. 2017). The role of deltaic wetlands in providing habitat and refuge is integral to the larger food web of the Gulf of Mexico (Day et al. 2014).	0	1	General / Wetlands, Waters	X	X	X	X	X	X	Sediment diversions and marsh creation projects can be used synergistically, however, to increase land-building efficiency particularly in the short-term and could help extend the lifespan of nearby marsh creation projects. Utilizing the dredged material from construction of the channel could supplement mitigation efforts in the shorter period.
3362	E-3317b	2020-08-17	USACE Project Website	Restore the Mississippi Delta	Briane Moore	Briane		Moore	New Orleans	LA	(CONTINUED) Consequently, we strongly encourage consideration of the systemic consequences for deltaic, estuarine and marine species from continued wetland loss and deltaic collapse. This analysis should include a focus on where the tipping point lies, if action isn't taken to rebuild this declining deltaic system, that will result in a drastic loss of critical habitat that supports some of the most productive fisheries in both the nation. Today, the Breton Sound Basin is not a healthy and stable ecosystem. The Mid-Breton SD is needed to build and sustain wetlands over the long term that are resilient in order to help promote and restore health and stability to the Basin. A future without the project would witness further increased ecological instability that would result in long-lasting and far-reaching consequences. Purpose of the Project As the State's permit application indicates, the purpose of the Mid-Breton SD is to reconnect and re-establish the natural deltaic sediment deposition and hydrological connections between the Mississippi River and Breton Sound Basin to build and sustain land and counteract the effects of natural and manmade disturbances in the basin. As the 2017 Coastal Master Plan states, "We have to use sediment diversions to build land in certain parts of the coast, or we risk ecosystem collapse" (CPRA 2017). It is critical that any analysis of the Mid-Breton SD project and its effects on the surrounding environment account for the highly dynamic and rapidly degrading nature of the Mississippi River Delta. Louisiana's land loss crisis is large-scale and must be addressed with large-scale solutions. Marsh creation as a means of restoration can yield important near-term, localized results, but this approach is limited with regard to land sustainability and restoration of natural processes, as well as by limited availability of sediments sourced outside the deltaic system, i.e., carried downstream into the delta area by the Mississippi River (Khalil et al. 2011). If we consider this along with the constraints of both natural and financial resources needed to implement marsh creation projects, it is not possible for marsh creation alone to meet the need to address coastal land loss at the scale necessary (Merino et al. 2011). Thus, marsh creation is not a suitable alternative to sediment diversions. Sediment diversions and marsh creation projects can be used synergistically, however, to increase land-building efficiency particularly in the short-term and could help extend the lifespan of nearby marsh creation projects. There is evidence from existing diversions that suggests placement of dredged material can increase land accretion rates in the receiving basin (Barras et al. 2009; Yuill et al. 2016). Strategically located marsh and ridge creation sites, constructed in conjunction with a diversion, would provide both a substrate onto which the suspended sediment from the river can settle in the future and a skeletal framework to guide deposition in open water (Reed 2004). Building on Past Studies The Mid-Breton Sediment Diversion (previously known as the Medium Diversion at White Ditch) has been studied since 1984 (USACE 1984). We have a rich knowledge about the project that should lend itself to rapid completion of the NEPA analysis. These years of studies have also included years of public meetings and involvement. From the initial project proposed in CWPBRA to Coast 2050 and ICA to the Coastal Master Plan, there has been extensive engagement with stakeholders and the public on this project.				X	X	X	X	X		

Mid-Breton Sediment Diversion EIS Scoping Comment Matrix November 10, 2020																						
3362	E-3317c	2020-08-18	USACE Project Website	Restore the Mississippi Delta	Briane Moore	Briane		Moore	New Orleans	LA	(CONTINUED) Scientists have been studying this project for over 35 years and have built a robust modeling infrastructure, invested in research to improve model assumptions, and generated immense data sets that are readily available to evaluate the effects of alternatives in a relatively short time frame. After alternatives are developed, these tools can expedite a careful determination of how each alternative, including the No Action alternative, affects the environment. Predictions based on salinity, habitat responses and life history stages of important wildlife and fisheries species should be made to the bestof our ability, project performance metrics outlined, and monitoring of project effects should be conducted, as part of a robust adaptive management plan to understand and improve management over time. The Scoping Report should anticipate using information from the many in depth investigations regarding the effects of the Mid-Breton SD since it was first proposed in the White Ditch area in 1984 (USACE 1984). For instance, the programmatic EIS prepared for the 2004 Louisiana Coastal Area Ecosystem Restoration Final Report and the Mississippi River Hydrodynamic and Delta Management Study, although never finalized, developed the modeling infrastructure to evaluate diversions along the river - including the Mid-Breton SD - in more detail (Meselhe et al. 2012). The 2017 Coastal Master Plan predicts that the Mid-Breton Diversion will build and sustain 5,066 acres in the near term and 15,831 acres over the next 50 years compared to a future without action under the medium future environmental scenario. The 2017 Coastal Master Plan considers the Mid-Breton SD in a broad context that includes a large number of other diversions, marsh creation, ridge restoration and other restoration and protection projects (CPRA 2017). In order to increase efficiency, these documents should be incorporated by reference in the record of this scoping process. Additionally, over the decades of studying this diversion, decisions were reached on certain fundamental questions - many as part of previous NEPA investigations. In the interest of efficiency, these decisions should not be re-hashed. Location and Flow Capacity of Mid Breton Sediment Diversion A feasibility study conducted under Louisiana Coastal Area (LCA) (USACE 2010) authorized under WRDA 2007 to study four maximum flow alternatives for the White Ditch study area – 5,000 cfs, 10,000 cfs, 15,000 cfs and 35,000 cfs. Five locations were also studied for siting the diversion structure – Location 1 at Will’s Point; Location 2 at White Ditch; Location 3, just north of Phoenix; Location 4 at Phoenix and Location 5 between Phoenix and Pointe à la Hache. At the time, Location 3 and Alternative 4 (35,000 cfs) were chosen. In 2013, a preconstruction analysis by the Corps as well as other studies (USACE 2013, ARCADIS and The Water Institute 2013) recommended that this project be moved to Location 1 (Will’s Point) for several reasons including: ● Location 1 is higher in the basin and study area which increases residence time for introduced sediments thereby increasing the likelihood for their settlement and capture;● Suspended sediment concentrations are the highest at Location 1 which translates to increased benefits on the bayside; ● Will’s Point is on a sandbar at the inside of a bend, and calculated Sand Water Ratio is thus at its maximum; ● Location 1 is positioned in a river bend where flow patterns carry sediment into the entrance of the diversion structure; and											
3362	E-3317d	2020-08-19	USACE Project Website	Restore the Mississippi Delta	Briane Moore	Briane		Moore	New Orleans	LA	(CONTINUED) ● At Location 1, particularly for larger grain-sized material, Sediment Water Ratios (SWRs) are calculated to be greater than 1.0. Scientists and engineers hired to analyze the project by CPRA have concluded that expanding the maximum flow of the diversion from 35,000 to 75,000 cubic feet per second (cfs) will capture more sediment from the Mississippi River without further freshening the sound, thereby maximizing land-building more cost effectively. Thus, in the beginning of 2019, CPRA announced that the capacity of Mid-Breton Sediment Diversion would be increased to 75,000 cfs. The State proposed an initial operational strategy that would open the diversion at a base flow up to 5,000 cfs and when the Mississippi River flow is above 450,000 cfs at Belle Chasse gage, the structure will release sediment-laden freshwater into the Breton Basin up to a maximum of 75,000 cfs when river discharge at Belle Chasse reaches 1,000,000 cfs. In order to ensure that the management and operation of the Mid-Breton SD provided the greatest benefits into the future, the alternatives evaluated, and ultimately the preferred alternative, should promote conveyance of sediment from the Mississippi River into Breton Sound Basin and maximize sediment delivery relative to water delivery. At the same time, the operational plan should provide sufficient flexibility to modify operations over time in response to changing information provided by monitoring environmental conditions and project outcomes. Selection of such an alternative, after appropriate analysis of possible effects on the environment, will allow the diversion operations to be adaptively managed to maximize benefits and minimize harm. For this EIS, the range of alternatives, which are proposed to be modeled and compared against the no action (baseline) alternative are a diversion with a maximum flow of 35,000 cfs, 75,000 cfs and 115,000 cfs. Each of these maximum flows will be analyzed with a base flow of 2,500 cfs and a 5,000 cfs (USACE 2020). All alternatives developed for the EIS should be clearly linked to the Purpose and Need for the project.Adaptive Management/Monitoring Over the past few years, the State and the Corps have conducted modeling of impacts of various proposed operational strategies on wetlands that shows net acres of wetlands sustained and built by each decade and the effects to hydrological factors on the basin, including salinity. We anticipate that the EIS will utilize this modeling capacity to assess other impacts of the diversion operations to maximize land built and sustained in Breton Sound Basin while minimizing harm. However, modeling alone cannot be precise in terms of consequences of operation strategies on various resources, in particular as we look ahead many years and then decades. This imprecision is magnified by the dynamic nature of the delta and possible future conditions in terms of wetlands loss, sea level, subsidence, storm impacts and other factors. Responding within an adaptive management framework to the dynamic nature of the coast, future effects from sea level rise and the complex outcomes from a sediment diversion requires the development of a robust, long- term monitoring program. This effort should begin well in advance of initial operations, collecting baseline data throughout the permitting and construction period. A good monitoring and research program in the river and the receiving basin is essential, as noted above, to observe conditions before, during and after operations, and to assess project effects and outcomes. Sediment diversions are an innately flexible restoration tool that can be modified and adapted over time based on outcome conditions.											

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

3362	E-3317e	2020-08-20	USACE Project Website	Restore the Mississippi Delta	Briane Moore	Briane		Moore	New Orleans	LA	<p>(CONTINUED) desired and best available science. Operational decisions for the Mid-Breton SD in any given year should supplement overall operational strategies using predictions of river and basin conditions, the outcomes of the previous years’ operations, and other information to enhance adaptive management decisions. To ensure transparency in adaptive management decision-making, plans should include a regular means of communication and interaction with the public about the intention to change or maintain operations, and the scientific justification for the decision.</p> <p>In anticipation of this, the detailed Scoping Report should map out clear, articulated environmental goals and objectives for managing and operating the Mid-Breton SD, setting the stage for a robust adaptive management plan in the EIS. In addition, the Scoping Report should ensure that a detailed evaluation and prioritization of key uncertainties that would affect the project are evaluated as part of the EIS. The EIS must carefully link any adaptive management plan to the stated Purpose and Need of the project and describe the potential geographic scope and temporal scale within which the adaptive management plan will operate. An adaptive management program allows future modifications and operational decisions to occur in response to what has been learned during initial operations under the umbrella of this EIS.Public Involvement and Transparency</p> <p>Unfortunately, public involvement in a typical NEPA process is usually restricted to gathering stakeholder comments and suggestions during scoping, which occurs early in the NEPA process, after which little information is available until the draft EIS is released and public comment is once again requested. However, 40 CFR 1506.6 - Public involvement – encourages ongoing information exchange with the public, such as status reports on elements of the NEPA process as it proceeds. The Federal Permitting Dashboard’s Best Practices Report also highlights public involvement principles for particular emphasis, such as providing clear goals for stakeholder and public participation, and flexible venues and opportunities for stakeholder engagement.</p> <p>Transparency, given the scale and complexity of this project, is crucial during all phases of planning, construction, and operation. To that end, the detailed Scoping Report should identify additional milestones on the path to the EIS– in particular when the Final Array of Alternatives is formulated and again when the Tentatively Selected Plan is chosen – that represent opportunities for sharing information that will enhance public understanding of the ongoing NEPA analysis.</p> <p>The Scoping Report should also identify or create potential venues for sharing information on a more consistent basis. Monthly meetings of the Coastal Protection and Restoration Authority Board and bi-monthly meetings of the Governor’s Advisory Commission on Coastal Protection, Restoration and Conservation should provide regular opportunities for public comment. In addition, consideration could be given to creating new venues for representatives from both stakeholders and agencies to participate in such tasks as reviewing metrics to measure the project’s performance against the stated environmental goals. Creating an environment that fosters communication and collaboration with the public will go a long way toward achieving desired outcomes from the Mid-Breton SD.</p> <p>Our recommendations are:</p> <p>1. The Scoping Report should be completed and released to the public by mid-November 2020 and posted on the CPRA and MVN sites</p>									
3362	E-3317f	2020-08-21	USACE Project Website	Restore the Mississippi Delta	Briane Moore	Briane		Moore	New Orleans	LA	<p>(CONTINUED) The report should include a detailed roadmap of steps to complete the DEIS, including a clear timeline of activities that identifies any potential opportunities to condense the permitting timeline.</p> <p>2. The many decisions that have already been made through official NEPA processes and other studies should be incorporated by reference into the Scoping Report, and from there into theEIS, particularly when doing so represents a clear efficiency for the Mid-Breton SD Permitting Timeline.</p> <p>3. In preparation for drafting the EIS, the Scoping Report should recognize the highly dynamic and rapidly degrading nature of the Mississippi River Delta as part of the Background Conditions that lend such urgency to the permitting and construction of the Mid-Breton SD. The Purpose and Need as stated in the permit application appropriately places an emphasis on reconnecting the Mississippi River with its delta.</p> <p>4. The DEIS scope should include a robust evaluation of a future without action alternative. The repercussions of the “no action” alternative should inform consideration of the long-term systemic consequences of continued wetland loss and deltaic ecosystem collapse. Analysis of project effects should include the importance of stemming these declines, associated habitat losses to maintaining and sustaining resources throughout the deltaic ecosystem, including living marine resources, and answer the following questions:</p> <p>A. Breton Sound</p> <ul style="list-style-type: none">● What will the future of the Breton Sound Basin and the Mississippi River Delta look like without this diversion in place? Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion?➢ What effect will this project have on storm surge vulnerability in Louisiana? How does storm surge vulnerability vary with and without this project?➢ Without this project, how will sea level rise impact communities and livelihoods?➢ Without this project, what is the future fate of habitats essential for birds and wildlife, such as deer, wintering ducks, alligators, largemouth bass and crawfish in the near and long term?● How will the effectiveness of existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place?● Are diversions the most cost effective method for building and sustaining land in the Breton Sound Basin over the long term? <p>B. Mississippi Sound</p> <ul style="list-style-type: none">● How important are the marshes in the proposed Mid-Breton Diversion receiving basin to the health and productivity of Mississippi Sound and its surrounding landforms?● How important are the marshes in the proposed Mid-Breton Diversion receiving basin for providing storm-surge risk reduction to Mississippi coastal communities, and to Mississippi barrier islands and beaches?● Will diversion waters from the proposed Mid-Breton Sediment diversion reach Mississippi waters including Mississippi Sound? If so									

Mid-Breton Sediment Diversio
Scoping Comment Matrix
November 10, 2020

3362	E-3317G	2020-08-22	USACE Project Website	Restore the Mississippi Delta	Briane Moore	Briane		Moore	New Orleans	LA	(CONTINUED) ● Will diversion waters from the proposed Mid-Breton Sediment diversion reach Mississippi waters including Mississippi Sound? If so, what is the impact? 5. Given the need for active adaptive management supported by a long-term monitoring program, early collection of data is encouraged to create a robust baseline. The preferred alternative should provide as much flexibility as possible to modify operations over time in response to changing environmental conditions. Identifying uncertainties in environmental effects and communicating and addressing these uncertainties with stakeholders will be key to developing strong adaptive management plans to ensure the long-term project success. Operations plans should embody the concept of active adaptive management, which prioritizes learning as a primary management function, and the overall operation plan should be modified over time in response to what is learned. 6. In the interest of transparency, the detailed Scoping Report should identify milestones and opportunities for releasing information and enhancing public understanding of the ongoing NEPA analysis. Regularly scheduled venues for sharing of information should also be identified and/or created. 7. The detailed scoping report should include a recent analysis of hurricane surge in the Breton-Borgne Region. This analysis indicates, with certain hurricane tracks, significant surge is pushed along the east bank of the Mississippi River toward Braithwaite and Caernarvon, which are outside the Federal levee system. However, the Mid-Breton Sediment Diversion will help rebuild wetlands along the path of surge movement and reduce the surge effects on local communities. Mid-Breton will also develop a coastal forest of black willow trees, which provide greater resistance to surge and wind compared to typical marsh grass (Lopez et al. 2020). 8. The detailed scoping report should consider the recent study (Scott, 2019) of the economic impact of the construction of the Mid-Breton sediment diversion, which found that during the estimated five-years of construction of the project approximately 1.2 billion dollars would be generated in revenues from new sales. Of this, nearly \$306.2 million in new earnings is estimated from an average of 1,195 jobs created. In addition to the total sales revenues, local and state governments will also collect \$13.9 million and \$24.2 million respectively. 9. While the Corps “requires compensatory mitigation to offset unavoidable impacts to jurisdictional wetlands and other aquatic resources.”(Federal Register / Vol. 85, No. 128 / Thursday, July 2, 2020 / Notices, pp. 39892), we recommend that this project be considered self-mitigating given the potential and scale of the outfall area. Utilizing the dredged material from construction of the channel could supplement mitigation efforts in the shorter period. We appreciate the commitment of all agencies involved in this process, and applaud the intention to prepare one environmental impact statement (EIS) that will satisfy all requirements under applicable laws. We recognize the scoping process is a critical milestone in the preparation of an EIS. Thank you for the opportunity to comment and provide recommendations on this urgent and important project.															
3363	E-3318	2020-08-16	USACE Project Website		Ella Delio	Ella		Delio	-	-	Southeast Louisiana Voices of Impacted Communities and Environments (SELA VOICE) is a coalition of community-based and environmental organizations convened by the Greater New Orleans Foundation. Members of our coalition work with the most vulnerable coastal communities in Southeast Louisiana to center their voices in the coastal issues that impact their lives and livelihoods. As independent organizations, the members of SELA VOICE are well versed in their specific communities’ concerns, knowledge, and strengths. This coalition brings members’ expertise together to address issues of coastal restoration, protection, and adaptation. Our vision is that coastal communities are actively engaged in decisions that impact their lives; this allows us to achieve equitable and effective solutions to coastal problems and ultimately strengthen coastal communities. Attached are our coalition’s suggested impacts to be studied and alternatives to the Mid-Breton Sound Sediment Diversion per the Army Corps’ scoping process. These scoping comments represent the following organizations’ knowledge of the coast and its residents: Bayou Interfaith Shared Community Organizing, the Coalition to Restore Coastal Louisiana, Coastal Communities Consulting, Inc., Healthy Gulf, Lower Ninth Ward Center for Sustainable Engagement and Development, Mary Queen of Vietnam CDC Inc., South Louisiana Wetlands Discovery Center, the United Houma Nation, and Zion Travelers Cooperative Center. While our organizations represent a wide spectrum of positions on coastal restoration, these comments reflect the cumulative questions and concerns raised by various stakeholders across the communities we serve. The Greater New Orleans Foundation supports the recommendations that these organizations have come to consensus on. We look forward to seeing these impacts and alternatives reflected in the scoping report, in the Environmental Impact Assessment process, and in the draft EIS. If you have any questions, need clarification on any of these	0	0	General												
3364	E-3319	2020-08-16	USACE Project Website		Greg J. Gasperecz	Greg	J.	Gasperecz	New Orleans	LA	Thank you for the opportunity to submit comments during the scoping phase of the Mid-Breton Sediment Diversion Project (hereinafter: MBSDP) which is proposed by the Louisiana Coastal Protection and Restoration Authority (CPRA). As a lifelong resident of south Louisiana and an outdoor enthusiast, I have personally witnessed the loss of wetlands in the Breton Basin. It is clear that something must be done to reverse the current, continual land loss process in this area. My comments fall into two categories: 1. Questions and Comments on the MBSDP as proposed by CPRA, and 2. Alternate scenario for marshland creation. Questions and Comments on Mid-Breton Sediment Diversion Process as proposed by CPRA 1. The project calls for diverting up to 75,000 cfs of river water during periods when the flow in the river is at least 450,000 cfs at Belle Chasse, La. a. Based on the long term flow data available at Belle Chasse, on average how many days per year will the diversion operate at that flow rate? b. On average, what daily amount of sediment (tons/day) is anticipated to be delivered to the affected wetlands when operating at 75,000 cfs? 2. What is the anticipated gain in new, healthy marsh at five-year intervals after project completion? It seems reasonable to infer that all new land gains will be in areas of freshwater because the sediment will be delivered via the diverted river water. Is this inference correct? If not, can the amount of marshland gain in brackish and saltwater areas be estimated? 3. The soil in marshland areas of the project is often a very sticky clay, which appears to be more resistant to erosion than less consolidated soils. Are natural geochemical processes anticipated that will consolidate the very fine-grained particles in newly deposited wetlands into clays that will help resist natural and man-induced erosion? 4. What will be the impact on water salinity in various areas of the Breton Basin? Which areas will be suitable for non-mobile benthic species, such as clams and oysters, that currently inhabit the brackish areas of the Breton Basin? Will the freshwater zone continually expand over the life of the project, or will an equilibrium be reached with regard to the areal extent of predominantly fresh water? 5. Which species of animals are most likely to be positively impacted by the anticipated increase in the size of the freshwater marsh zone in the area? Which species of commercial fisheries are most likely to be displaced by the increase in size of the freshwater zone? How will commercial harvesting of shrimp, oysters, and crabs and other commercial fisheries be affected? Please address the anticipated harvest amounts and the distances of displacement of these commercial fisheries. 6. Sea level rise is predicted to dramatically increase during the 50-year project lifespan. The US Gulf Coast is particularly subject to greater global variations in sea level rise.	0	0	H&H / Fisheries / Wetlands and Waters								X	X	X	X	X

**Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020**

3365	E-3320a	2020-08-16	USACE Project Website	Coalition For Coastal Resilience & Economy	Ileana Ledet	Ileana		Ledet	New Orleans	LA	On behalf of Greater New Orleans, Inc. and our Coalition for Coastal Resilience and Economy (CCRE), we are submitting public comments during the Mid-Breton Sediment Diversion Scoping Process. This project represents a significant opportunity for Louisiana to implement a sustainable approach to reducing our land loss and rebuilding our wetlands, and we offer support for advancing this project. Greater New Orleans, Inc. (GNO, Inc.) is a regional economic development alliance serving the 10-parish region of Southeast Louisiana focused on opportunities that maximize job and wealth creation and retention, are relevant to the region as a whole and create systematic impact. GNO, Inc.'s Coalition for Coastal Resilience and Economy (CCRE) is comprised of members of the business community and regional stakeholders who coordinate, consolidate and catalyze action on projects that protect and restore our coast. We believe that economic development and coastal restoration are intrinsically linked: by committing to restoring the coast, we protect existing and future investment in Louisiana, while developing an exportable knowledge-based industry and specialized workforce. Implementation of the recommended strategies outlined in Louisiana's Comprehensive Master Plan for a Sustainable Coast lessens economic risk and encourages business growth. As a key project in the Master Plan, the Mid-Breton Sediment Diversion will build new land and sustain existing wetlands by using the power of the Mississippi River to move sediment and fresh water from the river into nearby basins, mimicking nature's historic land-building processes. Regarding the issues we would want to see addressed in the Environmental Impact Statement, we would be interested in learning more about the following: •Can you demonstrate how a diversion project such as this one compares to other methods for building and sustaining land? •How much land creation will occur in our region as a result of this particular diversion project ? •What is the plan for mitigation to industries, mainly fisheries, which may suffer economic losses due to the construction of diversion and the influx of freshwater and sediment? •How is the fisheries adaptation work of organizations such as Louisiana Sea Grant being incorporated in the implementation of this project? •What are the potential implications of not moving forward with the Mid-Breton Sediment Diversion - how would this affect land loss in the region and associated storm surge impact on communities? •How will the Mid-Breton Sediment Diversion affect flood risk for residents and businesses both inside and outside of the Hurricane and Storm Damage Risk Reduction System (HSDRRS)? By supporting projects such as this one, not only are we protecting our livelihoods and assets, but we are developing a knowledge-based industry. According to a 2019 report by Dr. Loren Scott, construction of the Mid-Barataria and Mid-Breton Sediment Diversion projects will support an annual average of more than 2,200 jobs during the seven-year construction period in Plaquemines, St. Bernard, Orleans and Jefferson Parishes. Across those four parishes, the study anticipates regional business sales increasing by \$3.1 billion, with household earnings increasing by approximately \$800 million over those seven years. Along those same lines, GNO, Inc.'s 2019 Coastal Restoration Workforce Outlook addresses the economic potential of coastal projects to further diversify our economy, with hundreds of jobs in operations, maintenance and monitoring, as well as construction. This results in a thriving	0	0	General / Fisheries		X	X	X	X		X	
3365	E-3321b	2020-08-17	USACE Project Website	Coalition For Coastal Resilience & Economy	Ileana Ledet	Ileana		Ledet	New Orleans	LA	(CONTINUED) economy with thousands of environmental scientists, geoscientists, civil engineers, industrial machinery mechanics, construction managers and others working and living along our coast, growing our economy. In closing, we appreciate your agency's ongoing work on these projects, and urge your commitment to moving them forward as expeditiously as possible. The very future of Louisiana's coast and economy depends on it.											
3366	E-3321a	2020-08-16	USACE Project Website		Jacques Hebert	Jacques		Hebert	New Orleans	LA	Please accept this email as my official comments for the scoping process for the Mid-Breton Sediment Diversion. I was born and raised on the East Bank of Plaquemines Parish in the community of Braithwaite Park. I lived there my entire life until I was 18 and left for college. A year later, Katrina struck, and my childhood home and that of my grandparents, who also lived in the neighborhood, along with many other relatives, friends and neighbors were flooded with twelve feet of water. My family made the difficult decision to leave Plaquemines Parish, a place our ancestors had lived for many generations. I saw the emotional toll that this had on my grandparents and so many others who were forced to leave a place they loved and one of the only places many had ever lived in their lifetimes. The East Bank of Plaquemines Parish was never the same and Hurricane Isaac only caused further devastation several years later with even great storm surge. For my grandparents, Hurricane Katrina was the third time they lost to a hurricane with Hurricanes Flossy (1956) and Betsy (1965) also taking their homes. After Betsy, they moved to the community of Braithwaite Park to be further upriver and on higher ground, which they assumed would make them better protected from storms. For 50 years, that was the case, until Katrina ruined everything. Of course, in addition to the passage of time, Plaquemines Parish was also losing wetlands and storm surge protection rapidly in that time, making Braithwaite much more vulnerable when Katrina hit. Like many former residents who have since moved elsewhere, I sometimes drive down Highway 39 and loop through Braithwaite Park and down to Pointe à la Hache, looking at homes of former neighbors that sit completely empty or lots where homes once stood. Increasingly, homes are being elevated 20 feet in the air. However, there's a deep sadness to it all, recognizing that this part of the world will never be the same and may cease to exist unless we act to confront sea level rise, land loss and hurricanes. After many generations on the East Bank of Plaquemines Parish, all that remains for my family is our family tomb at St. Thomas Church in Pointe à la Hache. I now live upriver from Braithwaite Park in the Holy Cross neighborhood of the Lower 9th Ward in New Orleans. I am concerned about my future safety in New Orleans and my ability to continue to live here -- for our entire city and all the people who live here, our cultural heritages, our wildlife and natural resources, our infrastructure -- unless we address our land loss crisis. Am I doomed to repeat the story of my grandparents and so many other people's ancestors who have been forced further north generation after generation as more of our coast disappears and hurricanes, storm surge, tidal flooding and sea level rise have greater impacts on more communities? How can we stop this cycle of destruction and loss? For 30 years, scientists have informed us that we need to reconnect the Mississippi River to wetlands to sustain them with sediment, freshwater and nutrients. Saltwater intrusion and ongoing land loss have decimated our wetland buffer and threaten the future of this entire region and the health of the entire ecosystem on which all wildlife and many jobs depend. In the environmental impact statement, please consider: 1. What impacts will not constructing the Mid-Breton Sediment Diversion have on communities from the EastBank of Plaquemines Parish to St. Bernard Parish to Orleans in terms of flooding from storm surge, sea level rise and tides?	0	0	General / Wildlife & Habitats / Fisheries / Storm Protection		X	X	X	X		X	
3366	E-3321b	2020-08-17	USACE Project Website		Jacques Hebert	Jacques		Hebert	New Orleans	LA	(CONTINUED) 2. Without the Mid-Breton Sediment Diversion, how will land loss change the landscape of the Breton Basin? 3. Without the Mid-Breton Sediment Diversion, how will land loss impact habitat for a variety of wildlife species, including alligators, birds and more? 4. What will happen to Coastal Master Plan projects and investments in levees, marsh creation and more over time without the Mid-Breton Sediment Diversion? 5. What will the impact on the economy of the Greater New Orleans Region be over time as a result of land loss without the Mid-Breton Sediment Diversion? 6. What will the impact on the communities of the Greater New Orleans Region be over time as a result of land loss without the Mid-Breton Sediment Diversion? 7. What will the impact on the cultural and historic sites of the Greater New Orleans Region be over time as a result of land loss without the Mid-Breton Sediment Diversion? 8. What happens to marsh creation projects built by dredging over time as a result of subsidence, saltwater intrusion and erosion? Thank you for your consideration.					X	X	X	X		X	

Mid-Breton Sediment Diversion EIS Scoping Comment Matrix November 10, 2020																								
3367	E-3322a	2020-08-16	USACE Project Website	Restore the Mississippi Delta	Kim Reyher	Kim		Reyher	New Orleans	LA	<p>The organizations of the Restore the Mississippi River Delta appreciate the opportunity to provide comments on the Mid-Breton Sediment Diversion (Mid-Breton SD). For years, our scientists and policy experts have worked with state and federal agencies in Louisiana to confront the challenges of rapid coastal land loss and its corresponding implications for our natural resources and the local and national economy. We commend the Louisiana Coastal Protection and Restoration Authority for advancing this vital project and Gulf Environmental Benefit Fund of the National Fish and Wildlife Foundation for giving critical support.</p> <p>The Breton Sound Basin has experienced tremendous change over time. Tens of thousands of acres of wetlands have been converted to open water and habitat has been altered by saltwater intrusion. This has caused the loss of ridges and wetlands, threatening communities, industry and wildlife. We have limited time to act and must come together to permit and construct the Mid-Breton Sediment Diversion as quickly as possible. Every day we delay, we lose additional wetlands, reducing the natural resources and ecosystem services they provide.</p> <p>Following the closing of the public comment period on August 16, 2020, we request that the Scoping Report be released by mid-November. We suggest that it not only be a record of the public meetings and public comments, but also include details about the scope of work, methods and data to be used, and resources to be considered. We recommend that the Scoping Report also examine the timeline for project permitting, identifying tasks that could be completed concurrently and other opportunities for timesaving. Such a detailed report is achievable within a short period, given the extensive amount of existing information on the project. To that end, we offer the following comments and recommendations in the hopes of providing useful context and information to inform and expedite drafting of the Scoping Report and EIS.</p> <p>Background Conditions</p> <p>Baseline conditions are continually changing in the Breton Sound Basin. The National Environmental Policy Act (NEPA) was originally passed to ensure impacts to the environment are disclosed during federal actions; however, this EIS is being undertaken to support a project that is aimed to address decades of historical and projected environmental damage caused by previous actions.</p> <p>In Breton Sound Basin, distributary closures, levees built for flood control, and deep channels such as the Mississippi River Gulf Outlet (MRGO) dredged for navigation have severed the Mississippi River from its surrounding wetlands, caused erosion and increased salt-water intrusion, resulting in a degrading wetland system that is in the final accelerated phase of the delta cycle--reversion to open water; and the loss of forests. Without the historic input of sediment from the Mississippi River, the Breton Sound Basin has been deteriorating with high rates of wetland land loss, and those rates are only predicted to increase in the future without large-scale restoration action.</p> <p>The Fisk 1947 map of coastal Louisiana shows the basin to be composed of a dense network of wetlands interlaced with bayous and small bodies of open water. Older, less precise maps indicate an even higher proportion of wetlands have converted to open water. By contrast, today, tens of thousands of acres of wetlands have been converted to sizable bodies of open water now described as bays. Since the 1930s, more than one thousand acres of land have been lost in Breton Sound Basin (Couvillion et al. 2017).</p> <p><i>The role of deltaic wetlands in providing habitat and refuge is integral to the larger food web of the Gulf of Mexico (Day et al. 2014).</i></p>	0	0	General / Wetlands, Waters										Sediment diversions and marsh creation projects can be used synergistically, however, to increase land-building efficiency particularly in the short-term and could help extend the lifespan of nearby marsh creation projects. Utilizing the dredged material from construction of the channel could supplement mitigation efforts in the shorter period.
3367	E-3322b	2020-08-17	USACE Project Website	Restore the Mississippi Delta	Kim Reyher	Kim		Reyher	New Orleans	LA	<p>(CONTINUED) Consequently, we strongly encourage consideration of the systemic consequences for deltaic, estuarine and marine species from continued wetland loss and deltaic collapse. This analysis should include a focus on where the tipping point lies, if action isn't taken to rebuild this declining deltaic system, that will result in a drastic loss of critical habitat that supports some of the most productive fisheries in both the nation. Today, the Breton Sound Basin is not a healthy and stable ecosystem. The Mid-Breton SD is needed to build and sustain wetlands over the long term that are resilient in order to help promote and restore health and stability to the Basin. A future without the project would witness further increased ecological instability that would result in long-lasting and far-reaching consequences.</p> <p>Purpose of the Project</p> <p>As the State's permit application indicates, the purpose of the Mid-Breton SD is to reconnect and re-establish the natural deltaic sediment deposition and hydrological connections between the Mississippi River and Breton Sound Basin to build and sustain land and counteract the effects of natural andmanmade disturbances in the basin. As the 2017 Coastal Master Plan states, "We have to use sediment diversions to build land in certain parts of the coast, or we risk ecosystem collapse" (CPRA 2017). It is critical that any analysis of the Mid-Breton SD project and its effects on the surrounding environment account for the highly dynamic and rapidly degrading nature of the Mississippi River Delta.</p> <p>Louisiana's land loss crisis is large-scale and must be addressed with large-scale solutions. Marsh creation as a means of restoration can yield important near-term, localized results, but this approach is limited with regard to land sustainability and restoration of natural processes, as well as by limited availability of sediments sourced outside the deltaic system, i.e., carried downstream into the delta area by the Mississippi River (Khalil et al. 2011). If we consider this along with the constraints of both natural and financial resources needed to implement marsh creation projects, it is not possible for marsh creation alone to meet the need to address coastal land loss at the scale necessary (Merino et al. 2011). Thus, marsh creation is not a suitable alternative to sediment diversions.</p> <p>Sediment diversions and marsh creation projects can be used synergistically, however, to increase land- building efficiency particularly in the short-term and could help extend the lifespan of nearby marsh creation projects. There is evidence from existing diversions that suggests placement of dredged material can increase land accretion rates in the receiving basin (Barras et al. 2009; Yuill et al. 2016). Strategically located marsh and ridge creation sites, constructed in conjunction with a diversion, would provide both a substrate onto which the suspended sediment from the river can settle in the future and a skeletal framework to guide deposition in open water (Reed 2004).</p> <p>Building on Past Studies</p> <p>The Mid-Breton Sediment Diversion (previously known as the Medium Diversion at White Ditch) has been studied since 1984 (USACE 1984). We have a rich knowledge about the project that should lend itself to rapid completion of the NEPA analysis. These years of studies have also included years of public meetings and involvement. From the initial project proposed in CWPBRA to Coast 2050 and ICA to the Coastal Master Plan, there has been extensive engagement with stakeholders and the public on this project.</p>													

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

3367	E-3322c	2020-08-18	USACE Project Website	Restore the Mississippi Delta	Kim Reyher	Kim		Reyher	New Orleans	LA	(CONTINUED) Scientists have been studying this project for over 35 years and have built a robust modeling infrastructure, invested in research to improve model assumptions, and generated immense data sets that are readily available to evaluate the effects of alternatives in a relatively short time frame. After alternatives are developed, these tools can expedite a careful determination of how each alternative, including the No Action alternative, affects the environment. Predictions based on salinity, habitat responses and life history stages of important wildlife and fisheries species should be made to the bestof our ability, project performance metrics outlined, and monitoring of project effects should be conducted, as part of a robust adaptive management plan to understand and improve management over time. The Scoping Report should anticipate using information from the many in depth investigations regarding the effects of the Mid-Breton SD since it was first proposed in the White Ditch area in 1984 (USACE 1984). For instance, the programmatic EIS prepared for the 2004 Louisiana Coastal Area Ecosystem Restoration Final Report and the Mississippi River Hydrodynamic and Delta Management Study, although never finalized, developed the modeling infrastructure to evaluate diversions along the river - including the Mid-Breton SD - in more detail (Meselhe et al. 2012). The 2017 Coastal Master Plan predicts that the Mid-Breton Diversion will build and sustain 5,066 acres in the near term and 15,831 acres over the next 50 years compared to a future without action under the medium future environmental scenario. The 2017 Coastal Master Plan considers the Mid-Breton SD in a broad context that includes a large number of other diversions, marsh creation, ridge restoration and other restoration and protection projects (CPRA 2017). In order to increase efficiency, these documents should be incorporated by reference in the record of this scoping process. Additionally, over the decades of studying this diversion, decisions were reached on certain fundamental questions - many as part of previous NEPA investigations. In the interest of efficiency, these decisions should not be re-hashed. Location and Flow Capacity of Mid Breton Sediment Diversion A feasibility study conducted under Louisiana Coastal Area (LCA) (USACE 2010) authorized under WRDA 2007 to study four maximum flow alternatives for the White Ditch study area – 5,000 cfs, 10,000 cfs, 15,000 cfs and 35,000 cfs. Five locations were also studied for siting the diversion structure – Location 1 at Will’s Point; Location 2 at White Ditch; Location 3, just north of Phoenix; Location 4 at Phoenix and Location 5 between Phoenix and Pointe à la Hache. At the time, Location 3 and Alternative 4 (35,000 cfs) were chosen. In 2013, a preconstruction analysis by the Corps as well as other studies (USACE 2013, ARCADIS and The Water Institute 2013) recommended that this project be moved to Location 1 (Will’s Point) for several reasons including: ● Location 1 is higher in the basin and study area which increases residence time for introduced sediments thereby increasing the likelihood for their settlement and capture;● Suspended sediment concentrations are the highest at Location 1 which translates to increased benefits on the bayside; ● Will’s Point is on a sandbar at the inside of a bend, and calculated Sand Water Ratio is thus at its maximum; ● Location 1 is positioned in a river bend where flow patterns carry sediment into the entrance of the diversion structure; and																	
3367	E-3322d	2020-08-19	USACE Project Website	Restore the Mississippi Delta	Kim Reyher	Kim		Reyher	New Orleans	LA	(CONTINUED) ● At Location 1, particularly for larger grain-sized material, Sediment Water Ratios (SWRs) are calculated to be greater than 1.0. Scientists and engineers hired to analyze the project by CPRA have concluded that expanding the maximum flow of the diversion from 35,000 to 75,000 cubic feet per second (cfs) will capture more sediment from the Mississippi River without further freshening the sound, thereby maximizing land-building more cost effectively. Thus, in the beginning of 2019, CPRA announced that the capacity of Mid-Breton Sediment Diversion would be increased to 75,000 cfs. The State proposed an initial operational strategy that would open the diversion at a base flow up to 5,000 cfs and when the Mississippi River flow is above 450,000 cfs at Belle Chasse gage, the structure will release sediment-laden freshwater into the Breton Basin up to a maximum of 75,000 cfs when river discharge at Belle Chasse reaches 1,000,000 cfs. In order to ensure that the management and operation of the Mid-Breton SD provided the greatest benefits into the future, the alternatives evaluated, and ultimately the preferred alternative, should promote conveyance of sediment from the Mississippi River into Breton Sound Basin and maximize sediment delivery relative to water delivery. At the same time, the operational plan should provide sufficient flexibility to modify operations over time in response to changing information provided by monitoring environmental conditions and project outcomes. Selection of such an alternative, after appropriate analysis of possible effects on the environment, will allow the diversion operations to be adaptively managed to maximize benefits and minimize harm. For this EIS, the range of alternatives, which are proposed to be modeled and compared against the no action (baseline) alternative are a diversion with a maximum flow of 35,000 cfs, 75,000 cfs and 115,000 cfs. Each of these maximum flows will be analyzed with a base flow of 2,500 cfs and a 5,000 cfs (USACE 2020). All alternatives developed for the EIS should be clearly linked to the Purpose and Need for the project.Adaptive Management/Monitoring Over the past few years, the State and the Corps have conducted modeling of impacts of various proposed operational strategies on wetlands that shows net acres of wetlands sustained and built by each decade and the effects to hydrological factors on the basin, including salinity. We anticipate that the EIS will utilize this modeling capacity to assess other impacts of the diversion operations to maximize land built and sustained in Breton Sound Basin while minimizing harm. However, modeling alone cannot be precise in terms of consequences of operation strategies on various resources, in particular as we look ahead many years and then decades. This imprecision is magnified by the dynamic nature of the delta and possible future conditions in terms of wetlands loss, sea level, subsidence, storm impacts and other factors. Responding within an adaptive management framework to the dynamic nature of the coast, future effects from sea level rise and the complex outcomes from a sediment diversion requires the development of a robust, long- term monitoring program. This effort should begin well in advance of initial operations, collecting baseline data throughout the permitting and construction period. A good monitoring and research program in the river and the receiving basin is essential, as noted above, to observe conditions before, during and after operations, and to assess project effects and outcomes. Sediment diversions are an innately flexible restoration tool that can be modified and adapted over time based on outcome conditions.																	

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

3367	E-3322e	2020-08-20	USACE Project Website	Restore the Mississippi Delta	Kim Reyher	Kim		Reyher	New Orleans	LA	<p>(CONTINUED) desired and best available science. Operational decisions for the Mid-Breton SD in any given year should supplement overall operational strategies using predictions of river and basin conditions, the outcomes of the previous years’ operations, and other information to enhance adaptive management decisions. To ensure transparency in adaptive management decision-making, plans should include a regular means of communication and interaction with the public about the intention to change or maintain operations, and the scientific justification for the decision.</p> <p>In anticipation of this, the detailed Scoping Report should map out clear, articulated environmental goals and objectives for managing and operating the Mid-Breton SD, setting the stage for a robust adaptive management plan in the EIS. In addition, the Scoping Report should ensure that a detailed evaluation and prioritization of key uncertainties that would affect the project are evaluated as part of the EIS. The EIS must carefully link any adaptive management plan to the stated Purpose and Need of the project and describe the potential geographic scope and temporal scale within which the adaptive management plan will operate. An adaptive management program allows future modifications and operational decisions to occur in response to what has been learned during initial operations under the umbrella of this EIS.Public Involvement and Transparency</p> <p>Unfortunately, public involvement in a typical NEPA process is usually restricted to gathering stakeholder comments and suggestions during scoping, which occurs early in the NEPA process, after which little information is available until the draft EIS is released and public comment is once again requested. However, 40 CFR 1506.6 - Public involvement – encourages ongoing information exchange with the public, such as status reports on elements of the NEPA process as it proceeds. The Federal Permitting Dashboard’s Best Practices Report also highlights public involvement principles for particular emphasis, such as providing clear goals for stakeholder and public participation, and flexible venues and opportunities for stakeholder engagement.</p> <p>Transparency, given the scale and complexity of this project, is crucial during all phases of planning, construction, and operation. To that end, the detailed Scoping Report should identify additional milestones on the path to the EIS– in particular when the Final Array of Alternatives is formulated and again when the Tentatively Selected Plan is chosen – that represent opportunities for sharing information that will enhance public understanding of the ongoing NEPA analysis.</p> <p>The Scoping Report should also identify or create potential venues for sharing information on a more consistent basis. Monthly meetings of the Coastal Protection and Restoration Authority Board and bi-monthly meetings of the Governor’s Advisory Commission on Coastal Protection, Restoration and Conservation should provide regular opportunities for public comment. In addition, consideration could be given to creating new venues for representatives from both stakeholders and agencies to participate in such tasks as reviewing metrics to measure the project’s performance against the stated environmental goals. Creating an environment that fosters communication and collaboration with the public will go a long way toward achieving desired outcomes from the Mid-Breton SD.</p> <p>Our recommendations are:</p> <p>1. The Scoping Report should be completed and released to the public by mid-November 2020 and posted on the CPRA and MVN sites</p>									
3367	E-3322f	2020-08-21	USACE Project Website	Restore the Mississippi Delta	Kim Reyher	Kim		Reyher	New Orleans	LA	<p>(CONTINUED) The report should include a detailed roadmap of steps to complete the DEIS, including a clear timeline of activities that identifies any potential opportunities to condense the permitting timeline.</p> <p>2. The many decisions that have already been made through official NEPA processes and other studies should be incorporated by reference into the Scoping Report, and from there into theEIS, particularly when doing so represents a clear efficiency for the Mid-Breton SD Permitting Timeline.</p> <p>3. In preparation for drafting the EIS, the Scoping Report should recognize the highly dynamic and rapidly degrading nature of the Mississippi River Delta as part of the Background Conditions that lend such urgency to the permitting and construction of the Mid-Breton SD. The Purpose and Need as stated in the permit application appropriately places an emphasis on reconnecting the Mississippi River with its delta.</p> <p>4. The DEIS scope should include a robust evaluation of a future without action alternative. The repercussions of the “no action” alternative should inform consideration of the long-term systemic consequences of continued wetland loss and deltaic ecosystem collapse. Analysis of project effects should include the importance of stemming these declines, associated habitat losses to maintaining and sustaining resources throughout the deltaic ecosystem, including living marine resources, and answer the following questions:</p> <p>A. Breton Sound</p> <ul style="list-style-type: none">● What will the future of the Breton Sound Basin and the Mississippi River Delta look like without this diversion in place? Do you plan to study and release the future impacts on the ecosystem, wildlife and communities of not constructing and operating the Mid-Breton Sediment Diversion?➢ What effect will this project have on storm surge vulnerability in Louisiana? How does storm surge vulnerability vary with and without this project?➢ Without this project, how will sea level rise impact communities and livelihoods?➢ Without this project, what is the future fate of habitats essential for birds and wildlife, such as deer, wintering ducks, alligators, largemouth bass and crawfish in the near and long term?● How will the effectiveness of existing marsh creation projects, levees and other Coastal Master Plan projects without the Mid-Breton Sediment Diversion in place?● Are diversions the most cost effective method for building and sustaining land in the Breton Sound Basin over the long term? <p>B. Mississippi Sound</p> <ul style="list-style-type: none">● How important are the marshes in the proposed Mid-Breton Diversion receiving basin tothe health and productivity of Mississippi Sound and its surrounding landforms?● How important are the marshes in the proposed Mid-Breton Diversion receiving basin for providing storm-surge risk reduction to Mississippi coastal communities, and to Mississippi barrier islands and beaches?									

Mid-Breton Sediment Diversion EIS
Scoping Comment Matrix
November 10, 2020

3367	E-3322G	2020-08-22	USACE Project Website	Restore the Mississippi Delta	Kim Reyher	Kim		Reyher	New Orleans	LA	(CONTINUED) ● Will diversion waters from the proposed Mid-Breton Sediment diversion reach Mississippi waters including Mississippi Sound? If so, what is the impact? 5. Given the need for active adaptive management supported by a long-term monitoring program, early collection of data is encouraged to create a robust baseline. The preferred alternative should provide as much flexibility as possible to modify operations over time in response to changing environmental conditions. Identifying uncertainties in environmental effects and communicating and addressing these uncertainties with stakeholders will be key to developing strong adaptive management plans to ensure the long-term project success. Operations plans should embody the concept of active adaptive management, which prioritizes learning as a primary management function, and the overall operation plan should be modified over time in response to what is learned. 6. In the interest of transparency, the detailed Scoping Report should identify milestones and opportunities for releasing information and enhancing public understanding of the ongoing NEPA analysis. Regularly scheduled venues for sharing of information should also be identified and/or created. 7. The detailed scoping report should include a recent analysis of hurricane surge in the Breton-Borgne Region. This analysis indicates, with certain hurricane tracks, significant surge is pushed along the east bank of the Mississippi River toward Braithwaite and Caernarvon, which are outside the Federal levee system. However, the Mid-Breton Sediment Diversion will help rebuild wetlands along the path of surge movement and reduce the surge effects on local communities. Mid-Breton will also develop a coastal forest of black willow trees, which provide greater resistance to surge and wind compared to typical marsh grass (Lopez et al. 2020). 8. The detailed scoping report should consider the recent study (Scott, 2019) of the economic impact of the construction of the Mid-Breton sediment diversion, which found that during the estimated five-years of construction of the project approximately 1.2 billion dollars would be generated in revenues from new sales. Of this, nearly \$306.2 million in new earnings isestimated from an average of 1,195 jobs created. In addition to the total sales revenues, local and state governments will also collect \$13.9 million and \$24.2 million respectively. 9. While the Corps “requires compensatory mitigation to offset unavoidable impacts to jurisdictional wetlands and other aquatic resources.”(Federal Register / Vol. 85, No. 128 / Thursday, July 2, 2020 / Notices, pp. 39892), we recommend that this project be considered self-mitigating given the potential and scale of the outfall area. Utilizing the dredged material from construction of the channel could supplement mitigation efforts in the shorter period. We appreciate the commitment of all agencies involved in this process, and applaud the intention to prepare one environmental impact statement (EIS) that will satisfy all requirements under applicable laws. We recognize the scoping process is a critical milestone in the preparation of an EIS. Thank you for the opportunity to comment and provide recommendations on this urgent and important project.											
3368	E-3323	2020-08-16	USACE Project Website		Lillian Espinoza-Gala	Lillian		Espinoza-Gala	Lafayette	LA	For decades every Louisiana scientist that I have worked with and respected has objected to building a diversion that will bring the very chemicals that create the dead zone into the fragile delta below New Orleans. I have attended meetings with 500, 700 and 1000 citizens in Thibodaux, Houma, and South Lafourche and in New Orleans and Baton Rouge. Ten years ago I served on the Deepwater Horizon Study Group, Center for Catastrophic Risk Management led by Dr. Robert Bea. After Katrina Dr Bea felt like this would add insult to injury. After the BP Deepwater Horizon oil spill so many scientists across the globe met at conferences in New Orleans and spent a week at a time looking at options in CPRA Master . WE can have navigation canals and ports and perhaps destroy everything south of the Crescent City in the name of saving New Orleans by 2100. Or we can work with nature and use pipeline sediment, dozens of smaller restoration projects and either relocate all communities including those in New Orleans East or require everyone be elevated 20 feet off the ground. We must learn to honor Mother Nature. Two weeks ago I attended a virtual SPE Health, Safety, Environment and Sustainability Conference with oil and gas and environmental leaders from across the globe. The oil and gas industry only has ten years to make the transition away from fossil fuels and focus on elimination Co2 and methane emissions. Many of us are working with Citizen Climate Lobby to pass a carbon fee dividend in Washington DC. This USACE would create a great amount of emission’s and 75,000 cfs would be the death knell for Gulf of Mexico. This will be one of the most extreme hurricane seasons we have had since 2005. The US cannot afford to waste money and time and energy on this project that will destroy our fisheries, the dolphins and the ecosystem in the Gulf of Mexico that remains. Over the last 70 decades the citizens of Louisiana have been pressured into agreeing to USACE projects that have sliced and diced our precious coast ---shattered like broken glass into a million little pieces. If we want New Orleans to endure another Katrina and we want Lafourche and Houma and Nicholls State to be washed away ---this project will result in that fate.	2	0	Wildlife & Habitats / Fisheries								Work with nature and use pipeline sediment, dozens of smaller restoration projects and either relocate all communities including those in New Orleans East or require everyone be elevated 20 feet off the ground.
3369	E-3324	2020-08-16	USACE Project Website		Mark Schexnayder	Mark		Schexnayder	-	-	While I support utilizing the river and it’s sediments to sustain and create coastal estuaries, it would be beneficial to explore ways to accelerate the land-building process by increasing the volume of sediment moved by these projects. If the ratio of sediment to water were able to be increased, this could possibly allow for the goals to be achieved at reduced flow rates. Having a way to control the amount of sediment in the water may also allow for operational time frame flexibility. To super charge the process, additional sediments could be intentionally added into the water column at the intake or within the channel itself. As done with the long-distance slurry pipelines, sediment could be dredged from borrow sites around the structure and injected directly into the outflow canal. Another option would be to barge sediments downriver which were dredged from areas upriver. If successful, the deltaic building process could be greatly sped up and the sediments would be distributed in a more natural pattern, similar to how land is formed further down the river. Please evaluate the feasibility of these and other possible ways to accelerate the land building capacity of the new sediment diversions by adding additional sediment into the diversion from the riverside. Outfall management is another important tool and should be actively used to direct freshwater and sediment away from oyster growing and sensitive estuarian areas. This should also be evaluated for this project. It is important that these concepts be modeled and evaluated to possibly maximize benefits and minimize impacts of this project.	1	0	Fisheries / Wildlife & Habitats	X	X	X	X		X	If the ratio of sediment to water were able to be increased, this could possibly allow for the goals to be achieved at reduced flow rates.To super charge the process, additional sediments could be intentionally added into the water column at the intake or within the channel itself. 3370	E-3325a	2020-08-16	USACE Project Website	Institute of Marine Mammal Studies	Mobi Solangi, PhD	Mobi		Solangi, PhD	Gulfport	MS	Established in 1984, the Institute for Marine Mammal Studies, Inc. is a non-profit 501 (c)3 organization dedicated to the study and conservation of marine mammals and sea turtles and their environment in the northcentral Gulf of Mexico. This region harbors one of the largest dolphin populations in the United States and is the nursery ground for young dolphins. It is also a critical habitat for the juvenile Kemp's ridley sea turtle which is the most endangered sea turtle in the world. At the time of the MOA 214 Agreement in January of 2018 through the MOU with GHD in August of 2019, the project still was being consider as described under the 2017 Louisiana CMP as a 35,000 cfs diversion hence the MMPA waiver was issued under the assumption that the project was smaller in size. The project was also placed on the FAST-41 dashboard based on the lower flowrate. The underpinning basis of the applicant's pursuit of regulatory relief in the permitting of the project has been founded on the 2017 Louisiana CMP flowrate of 35,000 cfs. We are concerned regulatory and legislative relief was obtained based on the lower flowrate and yet the project obtained the MMPA waiver. The State of Mississippi was never consulted on the MMPA waiver nor was their public input through public comment meetings and notices. In the Notice of Issuance for the MMPA waiver, it states, for the Mid Barataria Sediment Diversion, that NMFS, in cooperation with the CPRA "has developed a marine mammal science plan which includes the collection of baseline data on Barataria Bay dolphins through tagging, health assessments, and modeling. This plan was developed with internal and external marine mammal experts, as recommended by the Commission, who led efforts to collect data on Barataria Bay dolphins after the Deepwater Horizon oil spill (e.g., Smith et al., 2017, Well et al., 2017). Phase I of the science plan is partially complete and NMFS is in discussion with the CPRA on funding for Phase II. For all projects, NMFS intends to continue working with external marine mammal experts to inform development and implementation of a comprehensive marine mammal monitoring plan as part of the State's consultation requirement." At a minimum, we request a similar marine mammal science plan be developed immediately and include the State of Mississippi. Further, the U.S. Geological Survey considers the Breton Sound, Chandeleur Sound, Mississippi/Pontchartrain Basin and the Lower Mississippi River Delta Basin as one Hydrologic Unit or Watershed called the Eastern Louisiana Coastal and Lower Mississippi-New Orleans (HUC 8). These basins east of the Mississippi River are all interconnected coastal estuaries with a diverse group of aquatic resources already under stress from the 2010 Deepwater Horizon Oil Spill (DWH oil spill). Further, these same aquatic resources have been cumulatively impacted over the last decade since the DWH oil spill by releases of diverted river water from the Mississippi River through the Bonnet Carre' Spillway, the Caernarvon Diversion, the breach at the Bohemia Salinity Control Structure known as Mardi Gras Pass and the breaches at Fort St. Phillip Crevasse. Finally, the preservation and restoration of the Mississippi Sound and the Chandeleur Island which extend into the coastal zones of the State of Louisiana and the State of Mississippi is our primary goal in providing these comments. We believe the degradation of these coastal waters over the last decade is a direct result of the DWH oil spill and the river water releases of Mississippi River; which, in addition to reducing the salinity, bring with it insecticides, pesticides, fertilizers, sewage waste, and other pollutants from 31 states and 2 Canadian provinces. . Due to these and other mentioned factors, this project will further degrade the integrity and quality of our aquatic resources though its location is within the boundaries of the	0	1	Biologic / Environmental Justice / Fisheries / T&E / Water Quality / Wetlands, Waters / Wildlife & Habitats									
3370	E-3325b	2020-08-17	USACE Project Website	Institute of Marine Mammal Studies	Mobi Solangi, PhD	Mobi		Solangi, PhD	Gulfport	MS	(CONTINUED) State of Louisiana. We believe the proposed Mid-Breton diversion project is not consistent with Coastal Zone Management Act, the Endangered Species Act, the Marine Mammal Protection Act, and the Magnuson-Stevens Conservation and Management Act. We have also reviewed the following: the USACE, Mississippi Valley Diversion, New Orleans District Procedural Review Plan Pursuant to 33 USC 408 approved June 27, 2016; Memorandum for Operations Division of the New Orleans District for Categorical Permission to Alterations to Civil Work Project under Section 408 dated August 30, 2018; New Orleans District Section 408 Submittal Package Guide dated April of 2016; and its applicability. We recognize that a Categorical Exclusion does not apply under 33 CFR 230.9. We reviewed the public comments to the current EC 1165-2-220 because of the public notice given in February of 2018. Many commenters emphasized the need for "improved coordination internally within USACE, with non-federal sponsors, and with requesters, including the ability to have pre-application meetings." Under Article II of the MOA 214 Agreement, Section F states: Unless othe,wise provided by law, rule, regulation, policy or mutual written agreement of the parties, the decision on a Department of the Army permit application pursuant to Section 10 and Section 404 cannot be rendered prior to the decision on the Section 408 request. The granting or denial of permission pursuant lo Section 408 is not a permit action handled by the USACE Regulatory Program, Special conditions may be included by USACE as part of any Section 408 permission. A decision on the Section 408 application for permission cannot be rendered by USACE until the endorsement of ofal/ non-federal sponsors is provided to CEMVN (USACE New Orleans District) oursuant lo Section 3 of the Flood Control Act of 1936, as amended (33 USC 701c), or Section 22l of the Flood Control Act of/ 970, as amended (42 USC 1962d-5b). To date, there has been no discussion with the State of Mississippi regarding mitigation for this project or the MMPA waiver or the revised flowrate increasing it from 35,000 cfs as shown in the Louisiana CMP to 75,000 cfs. Over the last two years, since the MOA 214 Agreement was signed for the MBrSD (January 22, 2018), the -lack of an agreement is evidence that the CPRA has acted in"bad faith" regarding this project. As stated in the - November 13, 1986 Federal Register (51 FR 41236) addressing public comments and changes for 33 CFR Part 320: "The concept of 'mitigation' is many-faceted, as reflected in the definition provided in the Council on Environmental Quality (CEQ) NEPA regulations at 40 CFR 1508.20. Viewing 'mitigation' in its broadest sense, practically any permit condition or best management practice designed to avoid or reduce adverse effects could be considered 'mitigation. 'Mitigation considerations occur throughout the permit application review process and are conducted in consultation with state and Federal agencies responsible for fish and wildlife resources. District engineers will normal/y_discuss modifications to minimize project impacts with applicants at preapplication meetings (held for large and potentially controversial projects) and during the processing of applications." According to 33.CER Part 332.4. Planning and Documentation, preapplication consultations are to occur with "potential applicants for				X	X	X	X	X	X			

Mid-Breton Sediment Diversion EIS Scoping Comment Matrix November 10, 2020																					
3370	E-3325c	2020-08-18	USACE Project Website	Institute of Marine Mammal Studies	Mobi Solangi, PhD	Mobi		Solangi, PhD	Gulfport	MS	(CONTINUED) standard permits [and] are encouraged to participate in preapplication meetings with the Corps [USACE] and appropriate agencies to discuss potential mitigation requirements and information needs." It is the understanding of the State of Mississippi that the CPRA does not possess the funds currently to set aside in order to properly mitigate the project. According to the standards clearly outlined in the various codified rules and laws along with Federal guidelines, CPRA is requested to modify the "proposed action" to include a reasonable range of alternatives including dredging along with mitigation measures that minimize the impacts from the project. This project is large and controversial. As a result of several new laws and judicial decisions, the regulatory program administered by the USACE under 33 CFR Part 320 et seq. has evolved to one involving the consideration of the full "public interest" by balancing the favorable impacts against the detrimental impacts. The State of Mississippi has not been made a part of the EIS process nor requested to be part of the EIS process. Balancing the favorable impacts against the detrimental impacts includes the coastal zone of the State of Mississippi - this is known as the fuU "public interest review." Hence, we would like to bring your attention to the Fargo Moorhead Diversion Project (Fargo project) in North Dakota/Minnesota, where a permanent injunction and cease & desist order was given on September 7, 2017 [Civil Case No. 13-2262 (D530), US District Court, District of Minnesota, Injunction Granted]. The Fargo project involved the diversion of the north-flowing Red River which runs between Minnesota and North Dakota. The proponents of the Fargo project were found to be well-intentioned in their push to begin construction and the opponents were found, quite properly, to fear the environmental degradation as a result of the diversion project. The Fargo project had cleared NEPA and received a Record of Decision; however, the Minnesota Department of Natural Resources rejected the permit for the project. The court's view was clear on the law, stating that Congress had required all necessary permits be obtained prior to construction. The presiding judge, Judge John R. Tunheirn, directed "all parties to work together to find common ground" hence a joint Task Force was formed to develop a balanced solution with parameters that considered local laws. It is our understanding former Administration of the Plaquemines Parish Government has requested NOAA NMFS, under the expanded consultation per 50 CFR 600.920(i), for the Mid Barataria Sediment Diversion, that the Breton Sound be fuUy assessed using empirical data as a result of freshwater inundation already occurring - for example the NOAA NMFS declared Unusual Mortality Event No. 69 in 2019. The UME is defined as occurring from February 1, 2019 to November 30, 2019. During this time at least 337 bottlenose dolphins stranded;-Peak-strandings-occurred-Iretween February-1-;-20t9-and-June-50;-20t9-with-88%-(-299i3-3-9J-of-bottlenose dolphins stranding. The primary cause of the strandings was found to be the lower salinity waters of the Northern Gulf of Mexico. NOAA NMFS, as a member of the NRDA Trustees, prepared the DWH oil spill programmatic EIS known as the PDARD/PEIS (i.e., ROD issued in 2016) and subsequent SRP/EA (i.e., FONSI issued in 2018 for the Barataria Basin) and is fully aware of the "freshwater injuries" as evidenced in those documents and their responses to the Solicitation of Views and scoping comments for the Mid Barataria Sediment Diversion which is the companion diversion project currently being funding under the National Wildlife and Fisheries Foundation Gulf Environmental Benefit Fund, the recipient of the criminal penalties settled by the U.S. Department of Justice consent decree with BP et al.										
3370	E-3325d	2020-08-19	USACE Project Website	Institute of Marine Mammal Studies	Mobi Solangi, PhD	Mobi		Solangi, PhD	Gulfport	MS	(CONTINUED) al. Additionally, the PDARP/PEIS states that "oyster reef, estuarine sand/shell substrates, and marshes are identified as EFHfor red drum and brown shrimp, both federally managed fisheries." Hence, this is not just about oysters though over 29,000 acres in Black Bay and Breton Sound has been decimated from freshwater injuries from Mardi Gras Pass alone. The PDARP/PEIS further states "impacts to these habitats could result in in-kind impacts to the species that utilize these habitats. Depending upon the location and operation of the diversion(s), some displacement of certain fisheries may occur during the period of operation or during the residual effects of freshening." In Breton Sound, the EFH is all of the intermediate, brackish and salt vegetation environment. Both of these documents incorporate, by reference, the MRHDM Feasibility Study under LCA, which is also relevant to the evaluation ofEFH. As a historical note, the USACE published a Notice ofIntent (NOI) to prepare an EIS for the LCA MRHDM Study (77 FR 17037) on March 23, 2012. The study was abandoned in 2016. However, NOAA NMFS was a cooperating agency and collaborative partner in LCA, providing experts on various marine organisms, as well as EFH, contributing to the documentation and analysis of potential impacts. These efforts would continue under LCA's PEIS after an "LCA Plan" is selected such as the MRHDM. As individual projects are selected for implementation, compliance with the Magnuson-Stevens Fishery Conservation and Management Act of 1996 would be fully coordinated with NOAA NMFS. The LCA MRHDM project was the first large scale, long term critical restoration project in the LCA's November 2004 PEIS (i.e., the ROD signed on November 18, 2005); hence coordination was maintained with the NOAA NMFS throughout regarding EFH. The reason this is relevant to the current EIS for the referenced project is NOAA NMFS has documented the impacts from freshwater to the EFH as part of the MRHDM Study. Regardless of which regulatory program the EFH Assessments was made, the freshwater impacts to the EFH are clear. As previously shared in our communications with NOAA NMFS, the MRHDM Study found "the vegetation biomass loss due to inundation was excessive (66% loss of initial biomass in 10 days) ofsaltmeadow cordgrass", which is the dominant plant in intermediate/brackish Louisiana marshes. The models were adjusted "based on the recommendation of a team of vegetation experts that vegetation mortality induced by inundation should be around 50% loss during 30 to 68 days." Hence, we believe roughly 50 to 60% of the Breton Sound estuarine wetland acres are at risk due to inundation by freshwater. This impact, though within the coastal zone of the State of Louisiana, will migrate to the coastal zone of the State of Mississippi. Further, aquatic resources such as brown shrimp, white shrimp, blue crab, bay anchovy, gulf menhaden, red drum, spotted seatrout and eastern oysters will be decimated by the additional river water releases from the Mississippi River. In fact, the east side of the Mississippi River is already experiencing significant impacts to these resources. Another example of impacts from river water release is the delicate spartina patens and submerged aquatic vegetation. Eor example, the "fDARfU" EIS found_thaLinJhe_federally_managed_ean_Lafitt_e_NationalHistorical Park and Preserve, the submerged aquatic vegetation (SAV) was "collaterally injured" as a result of freshwater releases from the Davis Pond Diversion. The NRDA Trustees documented an 83% loss of SAV cover between March 2010 and November 2012. The PDARP/PEIS describes the Davis Pond Diversion (10,650 cfs) and the Caernarvon Diversion (8,800 cfs) as salinity control structures, or freshwater diversions.

3372	E-3327b	2020-08-17	USACE Project Website		Robert Wiygul	Robert		Wiygul	Ocean Springs	MS	(CONTINUED) 3. Impacts of nutrient pollution in the Mississippi River system. 4. Impacts of sea level rise. 5. Impacts of the Mid-Breton diversion proposal on the entire Mississippi Sound. 6. Reasonable alternatives including additional beneficial use of dredged material and multiple smaller diversions Thank you for your consideration of these scoping comments. If you have any questions, please let me know.															
3373	E-3328	2020-08-16	USACE Project Website		Sam You	Sam		You	San Antonio	TX	As someone who cares deeply about the Mississippi River Delta and its importance to the birds, wildlife, and people of the Gulf of Mexico, I support reconnecting the Mississippi River to the delta through projects like the Mid-Breton Sediment Diversion (Diversion) to build and sustain land. Louisiana's land loss crisis affects the entire Gulf region and will only worsen unless we act--and that means ensuring swift, effective implementation of the Diversion. I understand that this vital project will reconnect the river with nearby wetlands, and deliver sediment to build and maintain almost 16,000 acres of land over time. I urge the U.S. Army Corps of Engineers (Corps) to: * Ensure all analyses of the Diversion and its effects on the Breton Basin consider the effects of NOT building this project, such as continued land loss that threatens our communities, birds, wildlife, fisheries, and culture. The analyses should also include impacts to existing marsh creation projects, levees, and other Coastal Master Plan projects. * Detail the impacts of not building the Diversion on bird and wildlife species of concern. * Be transparent by regularly sharing information with the public and other stakeholders. * Ensure the operation of the Diversion provides as much flexibility as possible to modify operations over time in response to changing environmental conditions and what we learn from monitoring the project. * Incorporate 30 years of existing research and resources into this Scoping Report and the subsequent Environmental Impact Study. There is no time to waste. I urge the Corps to act swiftly through all phases of the project	1	1	General / Socioeconomics / Wildlife & Habitats												
3375	E-3330a	2020-08-16	USACE Project Website	GO FISH Coalition	Tracy Kuhns	Tracy		Kuhns	Barataria	LA	GO FISH (Gulf Organized Fisheries in Solidarity & Hope) is a 501(c)3 non-profit, coalition of grassroots organizations from the Gulf Coast that banded together to advocate for the rights of fishermen, restoring the fisheries, and preserving fishing community culture. Our member organizations and the fishing families and fishing communities they represent will suffer direct economic, environmental justice and subsistence harm by the proposed Mid-Breton Sediment Diversion including: shrimpers, crabbers, oystermen, fin fishermen; as well as, Alternative Oyster Culture, crawfish, oyster farmers, charter captains, subsistence fishermen and fisheries related business, both in Louisiana State waters and the Gulf of Mexico. APPLICANT: Coastal Protection and Restoration Authority of Louisiana Comments below are based on available scientific data, official objections from stakeholder local governments, and other numerous documented objections from a wide range of stakeholders based on vast on-the-ground experience and Traditional Ecological/Environmental knowledge (TEK). The following should be considered necessary EIS scoping for LA CPRA's proposed Mid-Breton large scale Mississippi River diversion project: 1) Essential Fish Habitat destruction covered under the provisions of the Magnuson-Stevens Act, which will cause massive fisheries-related disasters, including but not limited to: A) depletion of species dependent on the salinity regime of one of the most productive estuaries in North America; B) the resulting depletion of species indicated will have grave implications for the entire country's level of sustainable domestic seafood production; C) some scientific studies show concern that the resulting depletion of species indicated will have Gulf-wide implications on the entire aquatic food chain; D) while a waiver was granted for environmental review under the Marine Mammal Protection Act in the EIS for this project, food chain implications should be thoroughly reviewed to include marine mammals. Based on 2019 spillway-related results of freshwater influence on the dolphin/turtle stock coupled with oyster mortality and other fisheries landing declines, renders the top-to-bottom aquatic food chain problems indicated by polluted MS River influence render the waiver invalid and warrant thorough review. 2) Economic implications of the destruction of Breton basin's salinity regime including but not limited to: A) Louisiana economic damage in: i) loss of seafood production; ii) loss in seafood production-related industries; iii) loss throughout seafood-related businesses including restaurants; iv) loss in tourism and hospitality industries (marketed heavily on seafood availability and cultural ties). v) loss and/or reduction of income to low income individuals and small business owners vi) loss of subsistence fishing B) Mississippi economic damage from polluted Mississippi River water influence. This is indicated by real-world 2019 spillway-related damages, TEK and scientific data that demonstrates that the volume of this diversion and its potential operating regime will create hydrological and stratification conditions conducive to affecting the Mississippi Sound region through wind/wave forcing in Chandeleur Sound. In addition, all of Mississippi's coastal county governments have issued official resolutions expressing opposition to the project for the aforementioned reasons, and MS's Secretary of State has also issued his office's comments on potential negative effects to MS's economy. These effects include but are not limited to: i) losses in seafood	2	0	Fisheries / EFH / Socioeconomics / Wetlands, Waters												
3375	E-3330b	2020-08-17	USACE Project Website	GO FISH Coalition	Tracy Kuhns	Tracy		Kuhns	Barataria	LA	(COTINUED) production; ii) loss in seafood production-related industries; iii) loss throughout seafood-related businesses including restaurants; iv) loss in tourism and hospitality industries (given potential effects of Mississippi River pollution of phosphates/nitrates and its implications for algal bloom production and resulting Mississippi beach closures); v) loss and/or reduction of income to low income individuals and small business owners vi) loss of subsistence fishing vii) real estate values (given any resulting beach closures season after season due to the project's continual operation over multiple decades). C) Alabama economic damage from effects on seafood production resulting from this project. As indicated by Alabama's officially declared fishery disaster from the 2019 spillway opening, totalling approx. \$100 million, Alabama's seafood processing/distribution industry is heavily reliant on the seafood production from LA and MS operations. i) loss and/or reduction of income to low income individuals and small business owners ii) loss of subsistence fishing D) Texas economic damage from shrimping industry losses.Many large Texas vessels produce from the potentially affected waters east of the MS River during the rotated seasonal basis. This loss in production will have succinct monetary implications for Texas's annual production value. This will be extremely detrimental to Texas because it will be in addition to massive losses in shrimp production from the additionally-proposed Mid-Barataria diversion project. Longstanding NOAA science firmly denotes the westward migration of shrimp from the Barataria basin which becomes a substantial portion of Texas water shrimp landings. In addition, this same NOAA science indicates a single reproductive stock from the MS River to Tampeco, Mexico. The government of Cameron County, TX, home to the largest Texas fleet, has issued official resolution opposing this project for the aforementioned reasons. i) loss and/or reduction of income to low income individuals and small business owners ii) loss of subsistence fishing3) Sustainability issues LA CPRA's own developed science and modeling for this project indicates an operational regime which will push salinity to zero in the entire Breton Basin. Despite claims of potential "adaptive management," this virtually eliminates any gradual salinity changes in the productive estuary necessary to sustain any true seafood production. This proposed project has clear operational requirements for it to produce any wetlands restoration benefits. Years of CPRA claims that they will work to provide new areas of salinity-based seafood production is an impossibility given these operational requirements, which will have a Zero (0) salinity zone meeting a 35+ salinity zone of water. 4) Wetlands development issues Well-respected coastal scientists have produced science which contradicts many of the CPRA's claimed restoration benefits of this project and have thus far been disregarded. This includes the following: A) The COE's own ERDC study which contradicts benefits indicated by CPRA modeling because the CPRA insists on incorporating newly-developed freshwater plant species in their "land building" results. These species are, of course, less surge resistant and also do not fit the criteria of "returning to pre-spill baseline" as required by the federal court settlement which will provide funding for this project; B) Numerous studies indicate that with the Mississippi River's sediment load being a finite sum, robbing sediment through this proposed structure

3375	E-3330c	2020-08-18	USACE Project Website	GO FISH Coalition	Tracy Kuhns	Tracy		Kuhns	Barataria	LA	(CONTINUED) will starve the deltaic system in other areas, thus bringing into question any true “net” positive restoration; C) Numerous studies and NMFS have indicated that the project will damage existing saline grasses, causing weakness which will create grave susceptibility to any surge event in the future; D) The CPRA’s own science has concluded the project will only be capable of obtaining 1/2 teaspoon of sediment per gallon of polluted MS River water diverted into the sensitive estuary, and their modeling clearly shows a negligible amount of wetlands being created or sustained over a 50 year period. A true cost/benefit analysis and mitigation figures must be reviewed as part of the scoping for this project’s EIS. In addition, Gulf Organized Fisheries In Solidarity and Hope, Inc is in full agreement with comments submitted by Dr. Moby Solangi, Institute for Marine Mammal Studies and have attached a copy for your review. Please consider them an addition to our above comments.													
3376	E-3331b	2020-09-01	USACE Project Website	NOAA’s NMFS	Roy Crabtree	Roy		Crabtree	St. Petersburg	FL	(CONTINUED)employed to characterize baseline sea turtle abundance, distribution, and movements within the Breton Sound Basin. Aerial surveys should be conducted for 2-3 consecutive years prior to Breton SD operations, and should take place twice a year to account for potential inter- annual and seasonal differences. Aerial/UAS efforts may be coordinated and/or combined with other similar survey efforts (i.e. Marine mammal aerial/UAS surveys), if found to be appropriate. Vessel based surveys and capture by skimmer trawl (or other netting methods) should be used for capture- mark-recapture (CMR), deployment of satellite tags, and for health assessments. Use of satellite telemetry to study sea turtle movements and obtain dive data necessary to calculate abundance estimates from aerial sightings should also be employed. Two vessel surveys/capture efforts should be undertaken per year, timed with the aerial surveys to the extent possible. An optional third vessel survey/capture effort may be elected, depending on capture success, in order to deploy sufficient numbers of satellite tags. To augment study of pre- and post-operation patterns of sea turtle movements and habitat use, researchers should also identify possible collaborations with other existing sea turtle research groups that may have or be in the process of collecting telemetry and other data pertinent to the region. In addition to health assessments conducted on turtles captured during vessel surveys, enhanced monitoring of the surrounding coastline for sea turtle strandings to identify the causes of strandings whenever possible in order to characterize mortality factors during the pre-operations phase. Habitat and prey monitoring and assessment: Baseline sea turtle habitat and prey distribution within the Breton Sound should be characterized using published data and information collected by groups, such as those studying benthic invertebrates and submerged aquatic vegetation. Also, existing dietary data for sea turtles within the northern Gulf of Mexico should be reviewed and evaluated and we suggest sampling to ensure that prey species relevant to sea turtles are adequately considered. With regard to real-time salinity monitoring, locations of current and proposed monitoring stations (e.g., those maintained by Louisiana and its federal partners) should be reviewed in relation to sea turtle habitat. All of this information should be synthesized in combination with data on sea turtle distribution, movements, and diet to produce a detailed baseline characterization of habitat and prey distribution within the impacted area. The northern Gulf Coast is also important foraging habitat for Gulf sturgeon. Gulf sturgeon are opportunistic suction feeders that tend to forage in calmer marine and estuarine waters that support their macroinvertebrate prey including brachiopods, mollusks, worms, and crustaceans (Mason Jr. and Clugston 1993)1. During foraging periods, Gulf sturgeon generally occupy nearshore areas between 6.5-13 ft (2-4 m) of depth characterized by low-relief sand and silt substrate (Fox et al. 2002)2. In the western portion of their range (including the proposed action area) Gulf sturgeon often forage in silt substrates and tend to stay near the shore or around barrier islands and the passes between those islands (Peterson et al. 2013)3. The proposed Breton SD action area is on the far western edge of the known current range of Gulf sturgeon, and there is very little information on their abundance and foraging behavior in the Breton Basin. The damage assessment efforts that followed the DWH oil													
3376	E-3331c	2020-09-02	USACE Project Website	NOAA’s NMFS	Roy Crabtree	Roy		Crabtree	St. Petersburg	FL	(CONTINUED) spill in 2010 included a large scale tagging and tracking effort for Gulf sturgeon. Unfortunately, there were no tag receivers located in the Breton Basin for that study. The closest receivers were located to the east of the action area, in Chandeleur Sound and the Mississippi River Gulf Outlet channel. There were very few detections of tagged Gulf sturgeon on these westernmost receivers, and it is impossible to know whether those fish (or other untagged sturgeon) may have continued on to the west, into the action area. Due to the current lack of information on Gulf sturgeon abundance and use of the action area, we recommend an array of acoustic tag receivers be deployed within the action area to help inform the required analysis of potential effects on Gulf sturgeon from the proposed project. There are already a good number of tagged Gulf sturgeon from the Pearl River (the closest spawning river to the action area), and more tagging is planned in this area over the next several years, so we do not believe that additional capture and tagging of Gulf sturgeon will be necessary. NOAA Fisheries stands ready to help in the development of a robust study design that will ensure the necessary data are collected to allow a scientifically sound analysis of Gulf sturgeon use of the action area. Marine Mammals Potentially Affected Stocks Common bottlenose dolphins (Tursiops truncatus) inhabit bays, sounds, estuaries (BSE), coastal, shelf, and oceanic waters throughout the northern Gulf of Mexico; currently, 36 stocks are recognized and managed in the northern Gulf. Some stocks have been studied extensively (e.g., Sarasota Bay stock and Barataria Bay stock), while others have never been the focus of concerted research effort to thoroughly define their range, stock structure, movements, habitat use, or other biological parameters. The proposed Breton SD will directly affect the Mississippi River Delta stock (which inhabits Breton Sound), and has the potential to impact two other stocks: the Gulf of Mexico Northern Coastal stock (which inhabits Chandeleur Sound and waters adjacent to the Mississippi River Delta stock), and the Mississippi Sound, Lake Borgne, Bay Boudreau stock. Based on studies elsewhere in the Gulf, it is not thought that significant mixing or interbreeding occurs among the stocks as they have small home ranges and exhibit year-round, multi-year site fidelity. These characteristics make them very susceptible to habitat perturbations such as those expected to be caused by the proposed project. Additional research, as described below, focusing on population structure, movements and range, and physiological and biological responses to freshwater exposure are needed to inform the Environmental Impact Statement (EIS) and future adaptive management and monitoring of the proposed project operations. Other coastal and offshore marine mammal species may be indirectly impacted by the proposed project if it influences more open Gulf of Mexico habitats. Nearshore/continental shelf species include Atlantic spotted dolphin (Stenella frontalis). Should the proposed project result in changes to nutrient inputs, pollutant levels, or salinity fields in habitats in oceanic waters of the inner continental slope (i.e., bottom depths greater than 200m), potential impacts such as increased contaminants and harmful algal blooms (HABs) to species occupying those waters (e.g., sperm whales and a variety of small cetaceans) should also be included in the EIS. Here we focus on bottlenose dolphins as they are the species that would be most impacted by the proposed project. Potential Construction and Operation Impacts
