1.0 INTRODUCTION

The National Environmental Policy Act (NEPA) of 1969 (42 U.S. Code [USC] 4321 et seq. 1969) and the Council on Environmental Quality (CEQ) Regulations for Implementing the Procedural Provisions of NEPA (40 Code of Federal Regulations [CFR] 1500-1508) require federal agencies to use all practicable means to ensure that high quality environmental information is available to public officials and citizens before decisions are made and before actions are taken. NEPA and CEQ regulations require the preparation of a detailed written environmental impact statement (EIS) for proposed actions that constitute a major federal action. Major federal actions include those actions with effects that may be major and that are potentially subject to federal control and responsibility (40 CFR 1502.4, 1508.11, and 1508.18). Public scoping for the proposed Mid-Barataria Sediment Diversion Project (MBSD Project) was conducted in accordance with the scoping requirements set forth in 40 CFR 1501.7 and outlined in Section 3.0 of this report.

The regulatory authority of the U.S. Army Corps of Engineers (USACE) includes, but is not limited to, Section 10 of the Rivers and Harbors Act of 1899 and Section 404 of the Clean Water Act (CWA). These acts (collectively referred to as Section 10/404) authorize the Secretary of the Army, acting through the Chief of Engineers, to regulate: (1) activities and structures in navigable waters of the U.S., including construction, excavation, or deposition of materials in, over, or under such waters, or any work that would affect the course, location, condition, or capacity of those waters, and (2) the discharge of dredged or fill material into wetlands and other waters of the U.S. at specific disposal sites. In addition, Section 14 of the Rivers and Harbors Act of 1899, codified in 33 USC 408 (Section 408), authorizes the Secretary of the Army to grant permission for the alteration, occupation, or use of a USACE civil works project, if the Secretary determines that the activity will not be injurious to the public interest and will not impair the usefulness of the project. Only after notice and opportunity for public hearing can the Department of the Army (DA) issue Section 10/404 permits and Section 408 permissions for proposed projects.

The Coastal Protection and Restoration Authority of Louisiana (CPRA or the Applicant) is proposing to construct, operate, and maintain a Mid-Barataria Sediment Diversion Project (MBSD Project), which is a multi-component river diversion system intended to convey sediment, freshwater, and nutrients from the Mississippi River at approximate Mississippi River Mile (RM) 60.7, in the vicinity of the town of Ironton, in Plaquemines Parish, Louisiana to the mid-Barataria Basin. After passing through a proposed intake structure complex at the confluence of the Mississippi River and a proposed intake channel, the sediment-laden water would be transported through a conveyance channel to an outfall area in the mid-Barataria Basin located in Plaquemines and Jefferson Parishes.

Because the construction and operation of the proposed MBSD Project has the potential to directly and indirectly impact wetlands and other waters of the U.S., navigable waters of the U.S., and to alter multiple USACE civil works projects, CPRA

submitted a Joint Permit Application on June 22, 2016 and a Section 408 Permission Request Letter on January 13, 2017 to USACE, New Orleans District (CEMVN) for a DA Section 10/404 permit and Section 408 permission, respectively.

In addition to informing the USACE decisions, the EIS may be used to inform decisions that the *Deepwater Horizon* (DWH) Natural Resource Damage Assessment (NRDA) Louisiana Trustee Implementation Group (LA TIG) may make regarding restoration planning in the Barataria Basin under the Oil Pollution Act (OPA) and the *Deepwater Horizon Oil Spill Final Programmatic Damage Assessment and Restoration Plan and Final Programmatic Environmental Impact Statement* (PDARP/PEIS) (DWH NRDA Trustees 2016a¹) and associated Record of Decision (ROD) (DWH NRDA Trustees 2016b²).

This scoping report presents and summarizes the scoping comments received at the public scoping meetings and throughout the 60-day comment period. These comments have been considered by CEMVN and the DWH NRDA LA TIG³ and will be utilized in developing the draft EIS.

2.0 PROPOSED PROJECT

2.1 Description

The proposed MBSD Project consists of a controlled sediment and freshwater intake diversion structure in Plaquemines Parish on the right descending bank of the Mississippi River at RM 60.7, with a conveyance system that would discharge sediment, freshwater, and nutrients from the Mississippi River into an outfall area within the mid-Barataria Basin in Plaquemines and Jefferson Parishes. The conveyance system would cross a portion of Louisiana Highway 23 (LA 23) and the New Orleans Gulf Coast (NOGC) Railroad, and alter a portion of the Mississippi River and Tributaries Program, Mississippi River Levee (MR&T Levee) and other USACE projects. When operational,

1 Deepwater Horizon Natural Resource Damage Assessment (DWH NRDA) Trustees. 2016a. Deepwater Horizon Oil Spill: Final Programmatic Damage Assessment and Restoration Plan and Final Programmatic Environmental Impact Statement.

2 Deepwater Horizon Natural Resource Damage Assessment (DWH NRDA) Trustees. 2016b. Record of Decision for the Deepwater Horizon Oil Spill: Final Programmatic Damage Assessment and Restoration Plan and Final Programmatic Environmental Impact Statement.

3 On April 4, 2016, the LA TIG was established in Appendix 2 of the Consent Decree resolving civil claims by the DWH NRDA Trustees against BP Exploration and Production Inc. arising out of the DWH oil spill. (See *United States v. BPXP et al.*, Civ. No. 10-4536, centralized in MDL 2179, In re: Oil Spill by the Oil Rig "Deepwater Horizon" in the Gulf of Mexico, on April 20, 2010 (E.D. La.)). The LA TIG is comprised of: the State of Louisiana (which includes the following state agencies: CPRA, Louisiana Department of Wildlife and Fisheries (LDWF), Louisiana Oil Spill Coordinator's Office (LOSCO), Louisiana Department of Natural Resources (LDNR), and Louisiana Department of Environmental Quality (LDEQ)), the National Oceanic and Atmospheric Administration (NOAA), the U.S. Environmental Protection Agency (EPA), the U.S. Department of the Interior (DOI), and the U.S. Department of Agriculture (USDA).

the proposed MBSD Project would discharge up to 75,000 cubic feet per second (cfs) of sediment, freshwater, and nutrients into the mid-Barataria Basin during periods when Mississippi River flows are 450,000 cfs or greater at the U.S. Geological Service (USGS) gage at Belle Chasse, Plaquemines Parish, Louisiana. When Mississippi River flows are below 450,000 cfs at the Belle Chasse gage, the proposed MBSD Project would maintain a base flow of up to 5,000 cfs.

Construction of the conveyance channel would require that a portion of LA 23 and the NOGC Railroad be raised and relocated over the conveyance channel. A number of other public and private facilities and utilities would also require relocation due to the construction and/or operation and maintenance of the proposed MBSD Project. The proposed Project would require a pump station and a new canal to direct drainage flows to the new pump station to accommodate impacts to features of existing drainage systems caused by the MBSD Project.

2.2 Applicant's Stated Purpose and Need

CPRA's Joint Permit Application dated June 22, 2016, states that the purpose of the proposed MBSD Project is to reconnect and re-establish the natural or deltaic sediment deposition process between the Mississippi River and the Barataria Basin, as a long-term resilient, sustainable strategy. The Applicant further states that the proposed MBSD Project is needed to reduce land loss rates and sustain wetlands injured by the DWH oil spill through the delivery of sediment, freshwater, and nutrients.

3.0 NEPA SCOPING PROCESS

NEPA regulations require an early and open process for determining the scope of issues to be addressed in an EIS and for identifying the significant issues related to a proposed action. This process is referred to as scoping (40 CFR 1501.7). As part of the NEPA scoping process, the lead agency may hold an early scoping meeting or meetings. In addition, as part of the scoping process, the lead agency shall:

- invite the participation of affected federal, state, and local agencies, any affected tribal nations, the Project applicant, and other stakeholders;
- determine the scope and the significant issues to be analyzed in depth in the EIS;
- identify and eliminate from detailed study the issues that are not significant or that have been covered by prior environmental review;
- allocate assignments for preparation of the EIS among the lead and cooperating agencies, with the lead agency retaining responsibility for the statement;
- indicate any public environmental assessments and other EISs that are being or will be prepared that are related to but are not part of the scope of the

impact statement under consideration;

- identify other environmental review and consultation requirements so the lead and cooperating agencies may prepare other required analyses and studies concurrently with, and integrated with, the EIS as provided in 40 CFR 1502.25; and
- indicate the relationship between the timing of the preparation of environmental analyses and the agency's tentative planning and decision-making schedule.

A Notice of Intent (NOI) to prepare an EIS for the proposed MBSD Project was published by CEMVN in the Federal Register on October 4, 2013 (78 FR 61843). A supplemental NOI was published by CEMVN in the Federal Register on April 27, 2017 (82 FR 19361) following the receipt of a modified DA permit application. The formal 60-day public scoping comment period for the EIS began on July 6, 2017 and ended on September 5, 2017.

The public scoping process included three meetings held in Jefferson and Plaquemines Parishes. Notices of the public scoping meetings were sent through email distribution lists, posted on CEMVN's Mid-Barataria Sediment Diversion EIS website (<http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS>), and mailed to public libraries, government agencies, and interested groups and individuals. Scoping meeting dates and locations were advertised in the following local newspapers on the following dates:

- Plaquemines Gazette, July 4 and 11;
- The Times Picayune, July 5 and 14; and
- The Advocate, July 5 and 17.

The newspaper scoping meeting ads included a note stating that Vietnamese translation would be available at the meetings, and that translation services in other languages were available upon request.

A total of 282 people signed the attendance records at the three scoping meetings (Table 1). These included, but were not limited to, private citizens, industry stakeholders, non-governmental organizations, and elected and public officials. A copy of the sign-in attendance record sheets for each scoping meeting is provided in Appendix A.

Table 1. Scoping Meeting Locations, Dates, and Number of Attendees		
Location	Date/Time	Number of Attendees
Leo Kerner City Park Multipurpose Complex, 235 City Park Drive, Lafitte, LA	July 20, 2017/5:00 – 8:00 pm	71
Belle Chasse Auditorium, 8398 Highway 23, Belle Chasse, LA	July 25, 2017/5:00 – 8:00 pm	126
Port Sulphur Community Center, 278 Civic Drive, Port Sulphur, LA	July 27, 2017/5:00 – 8:00 pm	85

The scoping meetings consisted of a 30-minute open house, followed by a 30-minute presentation of the proposed Project by representatives from CEMVN, CPRA, and the LA TIG, followed by a two-hour open house forum. The open house session provided attendees with an opportunity to visit a series of display panels that showed maps of the proposed Project area, listed the goals and objectives of the Project, and provided an overview of the NEPA process and how to submit public comments on the Project for the EIS. CEMVN staff were available to answer questions. CPRA, the LA TIG, and NOAA also had posters and display tables that provided information about NRDA and the Marine Mammal Protection Act as they pertain to the proposed Project, and staff on hand to answer questions. Throughout the three-hour scoping meetings, court reporters were available to transcribe any verbal comments that attendees offered about the Project and the NEPA process. The public scoping meeting transcripts are provided in Appendix B.

Because commercial fishing interests were expected to have a large representation at the public scoping meetings for the proposed Project, and there is a large Vietnamese community within the larger commercial fishing industry in Louisiana, the scoping meetings provided accommodations for Vietnamese translation of the meeting presentation, submission of Vietnamese comments, and translation of questions and answers at the display panels. Non-English speakers requiring Vietnamese translation of the presentation were provided earphones through which a translator provided real time translation during the presentation. The translator was also available to record public comments provided in Vietnamese and translated into English for the official public comment record.

4.0 SUMMARY OF SCOPING COMMENTS

4.1 Overview

This section provides a general summary of the comments received during the public scoping process. All public comments in their entirety have been made a part of the administrative record and are provided in Appendix C, organized in alphabetical order by last name for ease of reference. Comments that were submitted by agencies or organizations (identified by those comments submitted with formal signatures or letterheads) are named by the agency or organization rather than an individual's name.

CEMVN received a total of 871 individual comment submissions via emails, letters, comment cards, and verbal comments transcribed at the public scoping meetings. Of these submissions, 555 (64 percent) included identical (form) letters signed by different individuals. Approximately 744 (85 percent) of comment submissions were from commenters that gave Louisiana addresses. The remaining comments were from people residing in other U.S. states, and one comment was received from England. Individual commenters identified an affiliation in 195 of the comment submissions, representing 62 unique affiliations. These affiliations included government agencies, non-governmental environmental organizations, and organizations representing commercial, social, cultural, or recreation associations.

All public scoping comments were reviewed and will be used to inform the scope and development of the EIS. Section 4.4 at the end of this document provides the name of all individuals, agencies, and organizations that submitted comments and indicates the EIS chapters in which each commenter's comments will be considered (Table 3). Table 2 below lists the primary topics that were identified in the comment submissions and the chapter of the draft EIS that will likely address each comment topic. EIS chapters that will address comments include Purpose and Need; Alternatives; Affected Environment; Environmental Consequences, which includes Cumulative Impacts and potential mitigation measures; Compliance with Other Environmental Laws and Regulations; and Public Involvement. Comment submissions that provided input on multiple issues will be addressed in multiple EIS chapters. Examples of the primary comment topics expressed in the comment submissions are summarized in Section 4.3 below.

Comment Topic	PN	ALT	AE	EC	CLR	PUB
Alternatives Analysis		X				
Public Coordination						X
Project Operations		X		X		
Timeframe/Schedule	X				X	
Adaptive Management and Monitoring		X		X		
Land loss and Sea Level Rise	X	X	X	X		
Flooding and Storm			X	X		
Geology and Sediment Transport			X	X		
Wetland Impacts			X	X		
Water and Sediment Quality			X	X		
Protected Species			X	X		
Marine Mammals			X	X		
Commercial Fishing			X	X		
Fish Resources			X	X		
Socioeconomics and Environmental Justice			X	X		
Land-Based Transportation and Public Utilities		X	X	X		
Navigation			X	X		

Table 2. Example Comment Topics Expressed in Public Comments and Draft EIS Chapters that Will Address Them ^{1,2,3}						
Comment Topic	PN	ALT	AE	EC	CLR	PUB
Environmental Impact Analysis and Modeling				X		
Cumulative Impacts				X		
Other		X		X		
¹ Many comments provided input on multiple issues and therefore will be addressed in multiple chapters of the draft EIS. ² PN = Purpose and Need, ALT = Alternatives, AE = Affected Environment, EC = Environmental Consequences, CLR = Compliance with Other Environmental Laws and Regulations; and PUB = Public Involvement ³ Information presented in Table 2 is based on preliminary binning of comments after the scoping period. Comment topics may be addressed in other sections of the DEIS and FEIS.						

4.2 Summary of Comment Topics: Form Letter versus Unique Letters

Approximately 555 (64 percent) of all comment submissions were form letters, all of which stated support for the proposed Project. The form letters had five primary themes, including:

- Land loss: Without action, Barataria Basin could lose an additional 550 square miles of land over the next 50 years.
- Timeframe/schedule: Request that the USACE act swiftly through all phases of the Project.
- Alternatives: All analyses of the proposed MBSD Project and its effects on the Barataria Basin should also consider the effects of NOT building this Project, which would result in continued loss that threatens our communities, wildlife, and culture.
- Public engagement: Regularly share information with the public and other stakeholders throughout the EIS and permitting process and at critical milestones.
- Adaptive management in operations: The operation of the proposed MBSD Project should provide as much flexibility as possible to modify operations over time in response to changing environmental conditions.

The unique (non-form) letters (316 letters) showed more variation in the types of comments expressed. Approximately 23 percent stated support for the proposed Project, 54 percent stated opposition, and 23 percent did not state support or opposition to the proposed Project. The topics expressed in comment submissions are explained in Section 4.3 below.

4.3 Examples of Comments by EIS Topic

Paraphrased examples of comments, both for and against the proposed Project, that illustrate recurring themes observed in the comment submissions are shown below, organized by topic category. All public scoping comments, including those not shown below, have been reviewed and will be used to inform the scope and development of the EIS. Appendix C includes all comments submitted.

4.3.1 Alternatives Comment Topics

Some of the comments suggested various alternative Project plans and alternative features to be considered for analysis in the Alternatives chapter in the draft EIS. Below are examples of comments related to this category.

- Sediment diversions have long-term benefits that constructed marsh creation projects do not; mainly that they can continuously build land over time and sustain existing and created wetlands.
- Sediment diversions and marsh creation projects should be used in tandem to increase their effectiveness over time.
- The EIS should analyze marsh creation projects through the beneficial use of dredged material as an alternative to the proposed Project.
- Marsh creation projects through the beneficial use of dredged material are much less damaging to the fisheries and the environment, and studies show that over a period of 50 years, these projects were more economically feasible than diversion projects.
- Plaquemines and Jefferson Parishes would get immediate protection from coastal flood surges by building rock barriers to slow down storm surge. It took hundreds of thousands of years to build the Louisiana estuary with the natural rise and fall of the Mississippi River's alluvial valley, and the proposed Project will not promise protection to anyone soon.
- The land-building capacity of the proposed diversion Project due to the availability of sediment in the river water is questionable. The uncertainty surrounding the projected land-building capacity of the proposed diversion and the experimental nature of the project make it difficult to arrive at an accurate cost-benefit analysis.
- Recommend that the proposed diversion Project include the creation of "Chenier-like" ridges in the freshwater areas extending into more brackish areas to slow down the flow of water and allow phytoplankton and zooplankton to remediate some of the excess nutrients, insecticides, and herbicides contained in the river water. Ridges would also create barriers for

storm surge and wind.

- The Project should include the construction of canals or bayous to disperse the main flow with some type of terracing or ridges to manipulate the current; when the water is allowed to meander away from the main flow is where the best restoration happens.
- Tidal saline waters should be pumped into the diversion outfall area to mitigate excess nutrients and allow for oxygenation of river water to prevent hypoxia.
- Consider using the excavated material from Project construction to raise the ground in Ironton, fortify the back levee, or fill in borrow pits rather than placing all excavated material in a disposal area.
- Consider an alternative Project design that includes risk reduction measures for Ironton and surrounding communities, such as raising homes to prevent flooding.
- Study the benefits of building the conveyance channel upriver from the proposed location, farther away from residences.
- Consider an alternative that does not include costly upgrades to the NOGC railroad and redirect this money toward other improvements.
- Consider an alternative plan that does not include the RAM Terminals coal export terminal.
- Compare the proposed Project to a future-without-Project alternative.
- Don't just compare the Project to the No Action alternative; compare it to other coastal restoration alternatives that will not cause such adverse impacts on commercial fisheries.
- Conduct an alternatives study to compare potential costs and benefits of implementing a smaller diversion project in conjunction with using dredging/pipeline sediment delivery for marsh creation. The diversion could then be operated at lower volumes causing less environmental problems and fewer user conflicts.
- Maximize the silt load as much as possible. When the diversion is open at high sediment level and flowing full stream, the addition of dredges pumping into the conveyance channel may take advantage of full sediment load.
- Request that the guide levees on the Project be built to the 100-year hurricane and flood protection standard so that levee construction and

highway bridging will not have to be modified at a later date.

- Request explanation of having two gates versus a more cost-effective option of one gate.
- Submit Project alternatives that include economic and operational mitigation for fisheries, as well as alternatives that include marsh creation.
- Review multiple disposal areas, including areas in the western reach of the Barataria Waterway to reduce tidal events for the Upper Barataria coastal communities and possibly lessen flooding impacts due to the proposed Project.

4.3.2 Public Coordination Comment Topics

Some of the comments expressed support for public coordination and offered suggestions for optimizing the public engagement process. These comments will be addressed in the Public Coordination chapter of the draft EIS. Examples of this comment topic are provided below.

- Recommend that the decision-making process for this Project be transparent to the public.
- Including the public in this process can help shed light on threats and concerns that those lacking experience and local knowledge may miss.
- As the state's proposal for the scale of the proposed diversion has increased, estuarine fishers' role in the decision-making process for the Project has decreased.
- Need public engagement to come up with a consensus for operations.
- A public meeting should have been held in Lafourche Parish.
- Recommend that from this point forward you seek public comment at a public meeting in Lafourche Parish.
- Scoping should have been held within the Barataria Basin. Future meetings should be more accessible to stakeholders living within the basin.
- The state has not done enough to inform the fishermen and engage them through the planning process. CPRA (the Applicant) has not spoken publicly about how the Project would impact fisheries.
- Establish a gulf oyster industry stakeholder group for consultation during the development of the draft EIS.

- To date, only clear information has been received regarding the diversion's ability to build land; those in charge must study and circulate equally robust information about its effects on industry-dependent species (shrimp, oysters, crab, finfish, etc.) and Louisiana's commercial fishermen and coastal residents.
- Create forums for addressing commercial fishermen and their communities' concerns.
- Request more specific discussion about the Project with navigation stakeholders.

4.3.3 Project Operations Comment Topics

Below are examples of comments related to how the Project would be operated. These comments will be addressed in the Alternatives and Environmental Consequences chapters of the draft EIS.

- Request clarification as to whether the diversion will flow continuously or only when the river is above a certain velocity at the Belle Chasse gauge.
- The proposed Project suggests that the diversion would flow at a 5,000 cfs minimum flow at all times; this may be both impossible and unwarranted.
- Concerned that there is no legal mechanism or other means of enforcing any particular operational regime or operational parameters for the proposed diversion.
- The key to sustainability for fisheries is salinity at the right time of year. How will the operational regime be balanced for achieving the salinity regime best for fisheries sustainability versus building land at a reasonable rate?
- The oyster is primarily a bimodal spawner from April to May and again from September to November. How will the introduction of freshwater in the late winter/spring influence spring gonadal development? If the spring gonadal development and spawn is lost due to excessive fresh water input to the bay, how may this influence the fall spawning cycle?
- Running diversions primarily in the spring when up-stream water volume is highest will suffocate juvenile shrimp, crabs, and other species that use the bay to reach maturity from March to May. This will drastically impact both the size and volume of shrimp in the bay and gulf.
- Need public engagement, especially with commercial fisher people, to come up with a consensus for operations.

- Recommend that the proposed diversion carry as much sediment (suspended and/or bedload) from the river as possible and incorporates pulsing (fluctuating the amount of water diverted) to optimize sediment delivery to receiving area wetlands. To aid in optimizing sediment delivery, recommend incorporating a network of sediment monitoring stations/gauges upriver of the potential diversion to provide advanced notification of sediment pulses moving down-river so that opening of diversion structures can be planned/coordinated a few days in advance (and affected interests can be forewarned). Placement of sediment/turbidity gauges early during the planning phase would greatly improve the data needed to develop and select an operation plan that would maximize sediment delivery.
- Consider operations that prevent or minimize adverse impacts on wetlands due to prolonged inundation and focus on the overall enhancement of the entire Project area.
- Concerned about the 5,000 cfs base flow rate. A total freshwater closure at times of low-river would mimic pre-levee hydrological conditions, would be beneficial for marine fisheries, and would allow for a gradation from saltwater to freshwater marsh types as was historical in Louisiana. When you are not getting the benefits of silt, close off the freshwater.
- An operational plan must be developed that is approved by all parties including representatives from the navigation industry.
- The operations plan should be developed with coordination from non-profit organizations to mitigate fisheries damages and damages to marine mammals under the Marine Mammal Protection Act and the Endangered Species Act.
- Concerned that CPRA, after talking about this operations plan as a concept since 2012, has not submitted an operations plan since the last round of scoping for this Project in 2011.
- If tax dollars will be spent to restore the coast, the best use of that money is to operate the Project at full capacity to maximize benefits to wetlands. If the Project isn't operated to its capacity, then building it is a waste of money.
- Suggest that a comprehensive basin-wide operation plan be developed to coordinate all the diversions and siphons for the health of the basin.

4.3.4 Timeframe/Schedule-Related Comment Topics

Some comments were related to expediting the permitting process and implementation schedule for the Project. These comments will be addressed in the Purpose and Need, and Compliance with Other Environmental Laws and Regulations

chapters. Below are examples of comments related to this category.

- Recommend that the permitting process be sped up. Total decimation of the marsh in Buras has happened in a short time, and it is happening daily throughout the state. The EIS process should not go on for years.
- Five years to achieve a permit for a project that is just one of many cornerstone projects in our state's Coastal Master Plan is completely unacceptable.
- Our land loss crisis is severe and urgent and will only worsen unless we act, and that means ensuring swift, effective implementation of the state's Coastal Master Plan, including the MBSD Project.
- A delay of two years behind the previously published Project timeline is unacceptable in light of the Project already having 30-plus years of analyses and studies completed. With such an extensive background of research, a completion date of October 2022 is too long and shows the inability of our federal partners to be able to expedite vital public works initiatives.
- Request that the USACE as well as all other federal agencies assist with expediting permits for the project.
- The scoping report should be completed and released to the public as soon as possible.

4.3.5 Adaptive Management and Monitoring Comment Topics

Some of the comments were related to suggestions for applying adaptive management, flexibility, and a monitoring program to the Project operation plan. These comments will be addressed in the Alternatives and Environmental Consequences chapters of the draft EIS. Below are some examples of comments related to this category.

- There needs to be a robust, long-term monitoring program that begins well in advance of initial operations to collect baseline data during permitting and construction.
- A robust adaptive management plan should be included in the EIS that provides the range of adaptive management options and their potential effects, the process for reviewing operational decisions and monitoring data using the best available science each year, and a regular means of communicating and interacting with the public about any planned changes to operations.
- The preferred alternative should provide the flexibility to modify operations

over time in response to changing environmental conditions.

- An adaptive management approach to the operations plan should include feedback from fishers (referred to as Traditional Ecological Knowledge) to gain insight on seasonal and annual fishery practices and seasonal fluctuations on where fish are located.
- Resilience for a fishery and its community must be at the core of adaptive management as much as land building and land maintenance.
- Suggest the creation of basin-level, multi-agency advisory committees that would provide scientific recommendations to guide the operation of the structure, ensuring a watershed approach in the operation of all basin diversions and siphons to meet restoration goals.
- Recommend that a monitoring and adaptive management plan (MAMP) be developed in consultation with scientists, natural resource agencies (including, among others, the National Marine Fisheries Service), and the public. The MAMP should clearly identify variables and issues to be monitored and describe the monitoring plan. Include the MAMP in the draft EIS so that it is available for public/stakeholder review and comment.
- The Project is located in a dynamic environmental context, so flexibility must be incorporated into the operation plan to operate this asset to its highest and best use in any environmental situation.

4.3.6 Land loss and Sea Level Rise Comment Topics

Below are examples of comments related to land loss. These comments will be addressed in the Purpose and Need, Alternatives, Affected Environment, and Environmental Consequences chapters of the draft EIS.

- Consider impacts to the basin under No Action. Barataria Basin has experienced tremendous change with tens of thousands of acres of wetlands having been converted to open water, threatening communities, industry, and wildlife.
- The 2017 State of Louisiana Coastal Master Plan predicts with the No Action alternative, Barataria Basin will lose roughly 550 square miles in the next 50 years under the medium future scenario.
- The draft EIS should describe the causes of wetland losses and conversion to more saline types, including the impact of isolation of the Mississippi River from its delta.
- It is important to have a reasonable estimate of the likelihood of successful

restoration in light of climate change and sea level rise.

- The USACE should study the impact of increased rates of sea level rise on the ultimate success of the diversion as a tool for rebuilding land in coastal Louisiana.
- The losses our region would continue to face without this diversion—from an environmental, cultural, and economic standpoint—would be devastating and irreversible.
- The Mid-Barataria Sediment Diversion is a big piece in the overall solution to the issues of coastal erosion.
- The land loss crisis here in Louisiana is so severe and urgent that action must be taken now. The proposed diversion would be a very important step to help protect the future of this very complex and diverse ecosystem.
- This project is desperately needed on the fast track; citizens' way of life and homes are in danger. Many people moved out of the area because of Hurricane Katrina. Without this Project there will be a loss of more residents.
- Land loss in South Louisiana is very apparent. It's imperative to use the land-forming power of the Mississippi River to build new land to buffer coastal communities.

4.3.7 Flooding and Storm Risk Reduction Comment Topics

Some of the comments were related to the proposed Project's potential impact on flooding and storm risk reduction. These comments will be addressed in the Affected Environment and the Environmental Consequences chapters of the draft EIS. Below are examples of comments related to this category.

- Lafitte and other communities near the Davis Pond diversion are subject to flooding when the Davis Pond diversion is operated at 10,000 cfs. The proposed MBSD diversion would introduce approximately 700 percent more water into those areas, exacerbating flood hazards in those communities that are already highly susceptible to flooding.
- The long-term benefit of natural sediment accumulation and land building will create sustainable wetlands that are vital to the community's storm resiliency.
- Request strong coordination with the USACE project team on the West Bank Non-Federal Levee System currently under design to ensure the projects are working together.
- The diversion will increase flooding in low-lying communities.

-
- Diversion-related flooding is likely to impact Vietnamese and Cambodian fishermen's homes and displace their families, and inflict physical damages to the fishing vessels docked in these low-lying areas.
 - Request that the USACE evaluate the effects of increased water levels within the Upper Barataria Basin, specifically in the coastal communities of Grand Isle, Jean Lafitte, Barataria, and Crown Point.
 - Assess whether punching a hole in the levee will destabilize the remaining river levee.
 - Study how the Project will impact river levees and back levees, including how conveyance channel walls and the proposed pump station could change flooding dynamics around Ironton and surrounding areas. Ground this analysis in the current height and structural integrity of river levees and back levees.

4.3.8 Geology and Sediment Transport Comment Topics

Some of the comments were related to geology and sediment transport. These comments will be addressed in the Affected Environment and Environmental Consequences chapter of the draft EIS. Below are examples of comments related to this category.

- In the CPRA documentation for the Basis of Design reports, there are indications of the existence of faults and recent fault activity in the immediate vicinity of the Project. Recommend that a thorough subsurface geological evaluation of the Project vicinity be conducted to determine the location of geological faults, the recent history of fault movement, and the effects of active faults on subsidence rates and variations in the thickness of highly compactible soils.
- Recommend that a review of the subsurface geology in the Project area using oil and gas industry 2-D and 3-D seismic data be performed and the potential rate of horizontal and vertical displacement due to fault movement be estimated.
- Will guidance documents and regulations from other states be considered and modified to help develop mitigation techniques to accommodate horizontal and vertical displacement due to fault movement in the Project area?
- Request that the USACE evaluate Sediment Retention Plans to maximize land accretion.
- An indirect impact resulting from the diversion may be the future loss of

sediments from being delivered to the Birds Foot Delta and hence the Delta National Wildlife Refuge (NWR). Request that estimates of sediment transport changes to the Delta NWR as a result of the proposed diversion be determined and provided for the life of the Project.

- Will the stability of the land around the diversion be affected, and will the Project affect the stability of nearby elevated homes?
- The sediment that the Mississippi River carries has continually declined. It is questionable how much sediment can be derived from this Project.
- Study how the Project may affect federally maintained navigation channels, oil field access channels, and natural streams.

4.3.9 Wetland Impacts Comment Topics

Below are examples of comments related to wetland impacts. These comments will be addressed in the Affected Environment and the Environmental Consequences chapters of the draft EIS.

- The diversion would make brackish wetlands more susceptible to storm surge.
- Investigate whether the Project would create “flotant” marsh that is much more susceptible to hurricanes and storm surge than saline/brackish marsh.
- There is scientific uncertainty regarding the potential wetland responses to large-scale river diversions. Some research findings suggest that nutrient loads in diverted waters, combined with low salinity, could reduce soil shear strength and make affected marsh habitats more susceptible to wind and hydrologic forces. Other reports document significant amounts of marsh erosion associated with natural diversions of the Mississippi River. This literature suggests it may take significant numbers of years for wetlands near the outfall location to recover from such impacts.

4.3.10 Water and Sediment Quality Comment Topics

Examples of comments related to water quality and sediment quality are provided below. These comments will be addressed in the Affected Environment and the Environmental Consequences chapters of the draft EIS.

- When the diversion is open, will the river still maintain enough head pressure or flow to maintain freshwater conditions in the Bird’s Foot Delta in Venice? Concerned that funneling so much water from the main flow of the river will allow further saltwater intrusion into the Bird’s Foot Delta.

- Nitrates, phosphates, chemical pesticides, mercury, and other pollutants in Mississippi River water will be delivered into the basin by the proposed Project.
- Establish baseline monitoring of water and sediment expected to flow through the diversion for fecal coliform. Set a maximum daily limit and flow rate on fecal coliform amounts that ensures that Department of Health limits are not breached that would result in unnecessary area oyster closures.
- Establish a baseline level through monitoring of dissolved oxygen content and nutrient loading.
- Establish baseline monitoring of water and sediment for fecal coliform.
- Anticipate enough water gauges and instruments.
- Mississippi River water contains high levels of Atrazine, an herbicide used in farming practices, that could prove hazardous to marine life and wetland stability in the Project area.
- Prior water quality sampling of Mississippi River water has found Atrazine, Fipronil, and Chlorothalonil entering the marsh at the Bayou Lamoque Ballendock structure.
- Issues that should be studied include the impact of increased nutrient levels and the potential for increased eutrophication in coastal bays as a result of the Project.
- Diversions should be designed to minimize unacceptable levels of eutrophication and contaminant introduction. Even micro-plastics may become a concern with such large volumes of water shunted into the wetlands.
- Monitoring of the Davis Pond and Caernarvon diversions indicated that some chemicals were being introduced into the receiving areas from the Mississippi River at increased levels.
- Analyze sediment samples to determine toxicity levels for substances such as lead, mercury, PCBs, and other harmful chemicals. Ensure that there are enough water gauges and instruments installed in multiple locations in the basin to gather comprehensive and real-time data on water quality, flow, salinity, dissolved oxygen, fecal coliform, circulation pattern, and sediment flow.
- To monitor chemicals transported by the diversion, recommend that during the study the USACE undertake periodic water quality sampling to help

determine if chemical concentrations could begin to pose a threat to fish and wildlife resources in the Project area.

- Currently, water from the Mississippi River causes a dead zone (hypoxic zone) the size of Connecticut in the Gulf of Mexico each year. Algae blooms are also highly likely once freshwater is introduced into the Barataria Basin.
- The diversion will potentially create hypoxia above the Bayou Dupont marsh creation. When the Naomi siphon wasn't running in 2015 and 2016, hypoxic conditions were identified northwest of the Pen. The Naomi Siphon has two pipes functioning at this point. The hypoxia associated with them has not been accounted for.
- Because of the Bayou Dupont marsh creation project, hypoxic effects to the north are seen because the newly created marsh is blocking the flow of tidal waters. Salinity north and northwest of the Bayou Dupont project has remained near zero since its construction, demonstrating that tidal mixing isn't occurring and is contributing to hypoxia. Will the proposed Project cause similar impacts?
- The Mid-Barataria diversion may create large areas of hypoxia and expand the current area of hypoxia in the Naomi Siphon area.
- Salinity gradients radically increase the diversity of fish and plants.
- While the "dead zone" is located offshore and generally away from oyster grounds, the oyster industry has seen in recent years an increase in the number of "mini-hypoxic" zones that have negatively affected oysters in nearshore areas where oysters are harvested. The expanding hypoxic dead zone and lowering of salinity levels through freshwater releases for the Caernarvon and Davis Pond Sediment Diversions and the Bonnet Carre Spillway are indicators of the potential threat to oyster populations posed by this diversion.
- Concerned that sediment and water diversion into upper estuaries will cause hypoxic dead zones in areas that are highly important to a variety of juvenile aquatic species.
- The introduction of massive quantities of freshwater into the basin will have widespread adverse impacts on water quality.

4.3.11 Protected Species Comment Topics

Recurring comments were related to threatened and endangered species, examples of which are shown below. These comments will be addressed in the Affected Environment and Environmental Consequences chapters of the draft EIS.

- Entrainment issues through diversion structures off the Mississippi River and associated with dredging operations in the river are two potential effects on the pallid sturgeon that should be addressed in the study. With entrainment of pallid sturgeons through the diversion structure being a possible issue, potential methods (such as structure modifications) should be assessed to reduce possible entrainment and/or return entrained pallid sturgeons to the river. A population viability analysis (PVA) is recommended to evaluate the risk of the diversion on pallid sturgeons.
- Manatee occurrences have been reported just south of the Project area. Human activity is the primary cause for declines in species number due to, among other reasons, entrapment in flood control structures. If siltation or turbidity barriers are used for the Project, they should be properly secured, made of material in which manatees cannot become entangled, and be monitored to avoid manatee entrapment or impeding their movement.
- The primary effects expected on sea turtles will be due to habitat impacts. These impacts are likely to include changes in water quality and chemistry, sedimentation impacts, as well as habitat loss. These habitat impacts are also expected to cause the loss and redistribution of prey species.
- The EIS should evaluate the short-term and long-term potential direct, indirect, and cumulative impacts of the Project on threatened and endangered species.

4.3.12 Marine Mammals Impacts

Below are examples of comments related to marine mammals. These comments will be addressed in the Affected Environment and Environmental Consequences chapter of the draft EIS.

- One potential impact from major diversions is to resident populations of marine mammals, specifically bottlenose dolphins. Freshening an entire estuary is possible with major sediment diversions, which could affect dolphin health as they do not readily relocate.
- Concerned about the families of dolphins that reside in the Barataria Basin. Many of them are ill from the BP oil spill. If they are exposed to large quantities of river water, they may suffer high mortality rates.
- Dolphins in the Barataria Basin are a genetically different population from others in the Gulf of Mexico. Local fishermen in the basin have described personal experiences in seeing sick or dead dolphins as a result of the BP oil spill and fear that more dolphins will get sick or die as a result of the Project.

4.3.13 Commercial Fishing Comment Topics

Many comments were related to fisheries as an industry or livelihood. These comments will be addressed in the Affected Environment and Environmental Consequences chapters of the draft EIS. Examples of comments related to this category are provided below.

- The river water will bring additional sedimentation that will settle indiscriminately over oyster reefs, in some cases smothering the crop.
- The fecal coliform levels in the Barataria estuary will dramatically increase with the introduction of huge volumes of Mississippi River water. Because of this, oyster harvesting closures implemented by the Department of Health will be greatly expanded to include areas many miles away from the diversion outfall. This would make oyster farming virtually impossible within the Barataria Basin because oysters need at least two, and up to four years of stable salinity (10-25 parts per thousand [ppt]) and water quality to grow to market size.
- Establish a baseline salinity average and flow rate between the preferred range of oysters of 15-30 ppt.
- Establish a gulf oyster industry stakeholder group.
- Having community and individual outreach involvement is a giant step in the right direction, but those efforts have not diminished the anxiety and uncertainty that fisher men and women express with regard to potential impacts from the proposed diversion.
- A 5,000 cfs continuous flow may well render estuarine fisheries to unsustainable harvest levels, especially if flowing during warm water periods.
- If an estuarine fishery is displaced from Barataria, how will that natural resource in adjacent Louisiana estuaries be influenced by a potential increase in fishing pressure? Will state management of the fishery need modification?
- Shrimping has drastically declined in the past few years, making it difficult for fisher men and women to make money. With the Project in place things may be even worse.
- Modeling results have suggested that a 75,000 cfs controlled sediment diversion into mid-Barataria Bay would have significant impacts on oysters, finfish, and shellfish (including shrimp).
- That much freshwater poured into the bay during the spring months when shrimp and other seafood are spawning will most likely kill them all. Oysters

- will die instantly and baby shrimps and crabs will not have enough time and oxygen to move away from such a huge surge of freshwater. The diversion will certainly have a negative impact on fishing businesses economically.
- The Fiscal Year 2018 Senate Energy & Water Appropriations Bill includes the following language in its committee report: "The Committee encourages the Corps, when conducting or reviewing environmental assessments or environmental impact statements for navigation or coastal restoration projects in areas where oyster reefs exist, to consider water quality and salinity impacts on those reefs and, when appropriate, to mitigate any negative impacts."
 - Develop mitigation recommendations for public oyster reef and private lease areas where oyster loss is expected to be significant as a result of the Project.
 - Fully map Barataria Bay/Basin oyster reefs and lease areas in order to establish pathways for sediment deposit and ensure those deposits do not cover or silt over oyster grounds.
 - Disclose what the state is planning to do with the thousands of oyster leases in Barataria Bay and adjoining waterways.
 - Some shrimpers may not be able to adapt to the potential negative impacts of sediment diversions without assistance. The range of vulnerability and ability to adapt is widely varied by socioeconomics and business operations of each shrimper and further complicated by the uncertainty of the magnitude with which Project impacts may occur. A thorough analysis of concerns on the front-end will lead to more expeditious construction and more effective operation of the proposed Project in the long-term.
 - The commercial fishing interests from Mississippi have seen firsthand the impacts diversions can have and therefore express strong concerns over any future projects that aim to divert water and/ or sediment from the Mississippi River.
 - The EIS should identify the impacts of the diversion on brown shrimp, white shrimp, oysters, and other seafood that is the foundation of Louisiana's third largest industry.
 - Diverting oyster leases will create job decline throughout southeast Louisiana. Without mitigation funding for job training, many regional oystermen will be without jobs.
 - Suggest a loan or grant program for commercial fishing or small businesses to assist in transitioning or perform upgrades to be able to be resilient and continue fishing.

- The EIS should investigate mitigation measures for commercial fishing interests such as the relocation of oyster leases and “alternative oyster culture” using off-bottom technology.

4.3.14 Fish Resource Comment Topics

Some comments were related to biological fish resources. These comments will be addressed in the Affected Environment and Environmental Consequences chapters of the draft EIS. Below are examples of comments related to this category.

- The timing of diversion flows may impact larval stages of shrimp.
- The loss of fish resources may impact predator-prey systems and may alter food webs.
- There is evidence that shrimp populations have declined with the Caernarvon freshwater diversion. This Project may have the same results and should not be implemented.
- The number and size of the shrimp population have been reduced because of other diversions that have operated in the area.
- Many advocates of the Project point to Caernarvon as a model for how to operate a diversion project for maximum sediment delivery. Unfortunately, advocates of that project overlook the damage done to oysters in the process from the increased sedimentation and reduction in salinity levels due to the greater freshwater releases.
- A thorough assessment of the marine resources that would likely to be impacted by this Project should be conducted during the draft EIS phase with the help of commercial fishermen who currently and historically operate in the areas likely to be impacted. These assessments will help to collect baseline data so that researchers can accurately quantify Project-induced changes in biomass and mortality for areas within the Mid-Barataria Basin.
- Conduct surveys and stock assessments to establish baseline population estimates on oyster abundance prior to project construction. Conduct annual follow up surveys and assessments once the project is operational to evaluate the impact of water flows, oxygen levels, and sedimentation on area oyster populations in both public reefs and private leases.
- Diversions limited to winter and early spring operations could potentially diminish spring spawning and spat and favor a more successful fall oyster spat set, and would more closely mimic historical freshwater introductions in the basin.

- The outflow of river water from the Project will dramatically shift salinities from brackish to fresh for multiple periods during the course of a year; thus killing oysters when salinities drop below 5 ppt.

4.3.15 Socioeconomics and Environmental Justice Comment Topics

Some of the comments were related to potential Project impacts on local economies and communities. Many of these comments were submitted by fisher men and women, some of which were translated from Vietnamese and Cambodian. These comments will be addressed in the Affected Environment and Environmental Consequences chapters of the draft EIS. Examples are shown below.

- A comprehensive economic analysis of the seafood industry and the impacts the proposed Project should include not only the direct impacts of areas in the outfall vicinity but also surrounding areas that would normally benefit from vibrant marine resources as they migrate throughout the Gulf Coast region. Such an analysis should factor in both recreational and commercial transient fishing vessels that operate in the region regularly, even though they may reside or operate in another state for a significant portion of any given year.
- A socioeconomic analysis is needed to assess the Project's expected impact on the Gulf of Mexico oyster industry.
- The impact on businesses by the diversion must be discussed but should not stop a project that benefits the health of both the coast itself as well as its inhabitants.
- Directly or indirectly, this Project is going to take many livelihoods. Venice, Myrtle Grove, Belle Chasse, all of the surrounding areas that deal with seafood are going to take a hit from it.
- Decades of neighboring land loss and the destruction caused by recent storms Katrina and Gustav have impeded business investment and business growth, and reduced employment in Plaquemines Parish's coastal areas. There is strong pessimism among small and large businesses that the "delay of action" and "no-action alternative" to the Mid-Barataria Diversion Project will cause current businesses to continue to delay investment, discourage hiring, and relocate. The EIS should describe the economic impact to the parish tax base, school taxes, business revenue, family income, federal and state investment, and social and mental health impacts due to delaying Project implementation and the "no action alternative" of this Project.
- Many fisher people in the Project area have no other skillset besides shrimping and say they are too old to learn new skills. Knowing very little English is an additional impediment they have to finding another livelihood.

- Many shrimp fishing families moved here from other countries knowing very little English and became fisher people in the basin partly because of this. They have small boats and fish specifically in the basin to be closer to their home and keep fuel costs down. They fear that the Project will force shrimp fisheries to move south into deeper, more saline ocean waters where bigger, more expensive boats are necessary to fish. They fear they will lose their income to support their families and would need to relocate out of the area.
- Children of shrimp fishermen in the Project area expressed concern that their fathers would lose their fishing business and they would not be able to finish high school and go to college.
- Request that the EIS study the Project impacts on shrimpers, family, quality of life, and communities, including the many families that rely on shrimping not only for their income but also for their food.
- The Project will cause dramatic losses in commercial and recreational shrimp and crab harvests from the Barataria Basin. The loss of the fisheries for income and as a means of sustenance will cause major hardship and bring about economically forced displacement of families from the coastal communities that surround the Barataria Basin. Those communities include Cut-off, Golden Meadow, Leeville, Grand Island, Lafitte, Myrtle Grove, Grand Bayou, Happy Jack, Port Sulphur, Empire, Buras, and Venice. With the displacement of their fisherman families, many of these communities will lose much of their core social-cultural fabric.
- Commercial fishers are business people who are an integral part of the “Human Environment” within the pending EIS being prepared for the Project. This includes the charter boat industry and the ancillary businesses such as fuel docks, marinas, hardware stores, motels, and grocery stores that rely on fishers and recreational groups for revenue.
- Like any sustainable business, there is a need for fishers to develop future strategy planning, which requires a degree of predictability based on past experiences. The problem is that coastal restoration activities have not routinely provided fishery businesses with definitive answers to reinforce their ability to rely on past experiences to plan their future actions and investments.
- There needs to be more regular transparency so that commercial fishing people know whether to continue to invest in their operations.
- Recommend looking at progressive contracting language to encourage contractors to work with local community based organizations to promote training, workforce development, and hiring for restoration projects.
- Communities such as the Native Americans in Grand Bayou, Vietnamese

-
- fishermen, and low-income resident fishers of Plaquemines, Jefferson, and Lafourche Parishes may be adversely impacted by this project.
- The proposed diversion would have a disproportionate impact on low-income and minority populations along the coast who rely on fisheries as a means of earning a living.
 - Will the state have a mitigation plan ready to help the industry, especially for those commercial fishermen who rely on the fisheries in the basin for their livelihood?
 - Request a socio-economic analysis of the project's expected impact on the Gulf of Mexico oyster industry. The analysis should encompass not only oyster harvesters and private leaseholders, but oyster processors, dealers, distributors, wholesalers, retailers and restaurants as well, not only within the State of Louisiana but including other gulf states given that Louisiana oysters are processed and distributed widely within the region. The analysis should also assess the economic impact on local communities, employment, and governments as well as the impact on the cultural fabric of these communities.
 - Recommend analyzing the short- and long-term direct and indirect economic and social effects on individuals, households, businesses, and communities caused by continuing land loss and saltwater intrusion in the proposed Project area.
 - Time is a critical component in a comprehensive assessment of the true cost-benefit of a project; recommend that the USACE use trajectory economics for assessing the flow of economic services in their evaluations of the proposed Project when compared to other means of coastal restoration.
 - A thorough socioeconomic evaluation should be undertaken, based on fishery model outputs and established socioeconomic valuation methodologies. This information should be based on both short-term and long-term fishery model outputs both with and without project implementation.
 - Consistent with Executive Order 12898, the economic and social/cultural effects on particularly vulnerable populations (tribal groups, minorities, and low-income populations) should be assessed. A description of the labor markets in the affected communities within the proposed Project area will allow better understanding of the employment choices that people in these vulnerable populations have as many of these communities are likely to be rural and thus isolated.
 - Inundating the bay with fresh water will kill most shrimp larvae in the area. Those that do survive will be pushed farther out into the gulf, beyond the
-

water boundary designated by Louisiana Wildlife and Fisheries Commission. This will disallow the majority of Vietnamese and Cambodian fisher people, most of whom have small vessels, from participating in the industry, forcing them to find employment and possibly residence elsewhere.

- This study should explicitly identify the impacts of the diversion on brown shrimp, white shrimp, oysters, and other seafood that is the foundation of Louisiana's third largest industry to holistically evaluate the direct effects of diversions not just on marine life, but on the thousands of commercial boat owners, deckhands, fishing-dependent small businesses, and families who rely on them for survival.
- Diverting oyster leases will create job declines throughout southeast Louisiana. As CPRA has not allocated any mitigation funding for fishermen to relocate or train for new careers, many of the region's oystermen will be out of a job.
- Will there be loan and grant programs for commercial fishing and other small businesses to assist in transitioning their operations and perform upgrades to mitigate potential loss?
- Will there be state assistance if the fishing communities have to relocate?
- Will there be a state-led community mitigation plan if key fisheries and/or the entire industry is harmed by freshwater inundation? Will there be a mitigation plan for damaged boats, docks, and gear?
- Concerned about compensation for the fishermen who may be temporarily or permanently displaced by a diversion project. Would a buy-out be in order to prevent fishermen from being bankrupt by the diversion? This is important so they are compensated but also so they cannot block the Project for the rest of us who are adversely impacted by eroding and disappearing wetlands.
- Release the findings on this action's impact on low-income residents.
- How can the proposed action increase employment opportunities for disadvantaged businesses and women-owned businesses?
- Request that the state provide grant assistance for fisher people in the basin to buy larger boats so that they may continue shrimping in deeper waters if the Project adversely impacts shrimp fisheries in the basin.

4.3.16 Land-Based Transportation and Public Utilities Comment Topics

Some of the comments and questions were related to potential Project impacts on land-based transportation and public utilities. These comments will be addressed in

the Alternatives, Affected Environment, and Environmental Consequences chapters of the draft EIS. Below are some examples of comments related to this category.

- The Louisiana Highway 1 roadbed is the only roadway supporting access to Port Fourchon and the Louisiana Offshore Oil Port, servicing 16 percent of America's domestic crude oil production and 5 percent of its natural gas production. Protecting this federally listed "High Priority Corridor", designated as such by the U.S. Congress in 2001, is vital to America's energy production and reserves in the Gulf of Mexico. The proposed Project would help protect this vulnerable but crucial infrastructure with long-term benefits of land building over time.
- Commenter expressed opposition to spending restoration dollars on a rail expansion into Ironton. Pollution, noise, and safety issues led to the removal of the rail from Ironton. Seeking to slip this rail bridge, and environmental review for a rail bridge, into another project with vast political support is unacceptable.
- Clarify why funds from the coastal restoration project are being used for a railroad that is privately owned.
- What will traffic flow be like on LA 23 during construction of the diversion?
- Study anticipated traffic, traffic patterns, and safety implications for the proposed LA 23 bridge and rail bridge. How will Ironton have unimpeded access to LA 23?
- Provide justification for using coastal restoration dollars to build a private rail company bridge that would end in the woods.
- Study what kind of rail traffic is planned for the rail, the economic feasibility and justification of this rail line, how rail traffic would impact the safety of Ironton (particularly evacuation routes in the foreseeable event of a significant weather event), and how rail traffic could impact the river levee.

4.3.17 Navigation Comment Topics

Some comments were related to navigation in the Project area. These comments will be addressed in the Affected Environment and Environmental Consequences chapter of the draft EIS. Examples of comments related to this category are provided below.

- The Mississippi River is a critical waterway for exporting goods from the U.S. to the world market. What are the possible consequences of continued wetland loss in the Barataria Basin on river navigation?

-
- Concerned about increased siltation of navigable waterways near diversion structures generating a need for increased maintenance dredging.
 - If multiple diversions are to be operated simultaneously, or if the river experiences a period of very low stages, sufficient draft for shipping could be threatened.
 - Concerned about potential Project impacts on the navigation channel including the potential development of a scour hole at the entrance to the diversion structure, increased shoaling in the area surrounding the diversion structure, and the flow of water into the diversion canal being strong enough to alter the path of vessels transiting in the general vicinity of the diversion location.
 - CPRA should have dedicated funding set aside to ensure it can fund and execute dredging contracts attributable to the proposed sediment diversion.

4.3.18 Environmental Impact Analysis and Modeling

Some comments were related to how the Project alternatives would be analyzed and environmental impacts would be modeled. These comments will be addressed in the Environmental Consequences chapter of the draft EIS. Examples of comments related to this category are provided below.

- Include local Traditional Ecological Knowledge (TEK) in ecological and climate change modeling of anticipated and/or foreseeable impacts that could impact the MBSD Project design and surrounding areas. Also, complete a TEK study of the Project area that includes nearby and adjacent communities, particularly black and indigenous communities and fishing communities.
- Don't just analyze long-term benefits, also look at near-term (1-5 years) benefits. Is it possible to conduct alternative studies that focus on maximum land building from dredging/pipeline delivery utilizing the smallest diversion possible? The present focus by the state is not the near-term (1-5 years) of how a diversion will economically impact the human factor, but rather the projected long-term (20+ years) benefits of using a massive input of freshwater to move and place sediment.
- Address the following in fisheries modeling for the Project: the significant overlapping of species habitats (for example, white and brown shrimp fishing grounds) in the basin, the circular eddying current that brings gulf and Mississippi River waters up into the estuary through its tidal passes in the basin, and the well-known seasonal "dead zone" of hypoxic to anoxic habitat in the basin.
- If sea levels rise higher or faster than current CPRA projections, how will the

diversion's land-building ability be impacted? At what level of sea level rise do the diversion's effects become negligible? The USACE should study the impact of increased rates of sea level rise on the ultimate success of the diversion as a tool for rebuilding land in coastal Louisiana.

- A river diversion into Mid-Barataria has been studied extensively over the years and the decisions, models, and information gathered from those efforts should be integrated into this present study.
- A means of downplaying negative effects has been by using large-scale modeling that intentionally extends the scope of the model to cover larger areas besides those where the most direct impacts occur. An oyster grower from Lafitte whose leases in the Barataria Bay are rendered useless from the diversion, will not benefit if oyster farming improves elsewhere, far from their home. Recommend that the results of the environmental and economic impacts are divided and presented into smaller identifiable zones, from the direct outfall area of the diversion moving outward. Compare the future success of other marsh creation projects in the Project area with and without the proposed diversion.

4.3.19 Cumulative Impacts Comment Topics

Several comments related to concerns about how the draft EIS would address cumulative impacts of the Project along with other projects in the Project area. These comments will be addressed in the Environmental Consequences chapter of the draft EIS. Below are examples of comments related to this category.

- Consider existing and future coastal restoration projects both in the vicinity of the diversion outfall and within the footprint of freshwater dispersion, and how the proposed Project would impact those projects.
- Recommend examining the cumulative impacts of multiple proposed diversions operating simultaneously.
- Recommend that the EIS consider cumulative impacts of the existing Davis Pond diversion and siphons in the basin. The EIS should discuss how all diversions and siphons could be operated in conjunction with each other to minimize adverse impacts and maximize beneficial effects specifically to migratory birds and other resource species.

4.3.20 Other Comment Topics

There were other comment topics that did not fall under any of the above comment topics. Examples are provided below.

- RAM Terminals coal export terminal: Study how the proposed coal export

- terminal or any pilings in the river and barges sited near/adjacent to the diversion would affect sediment flow and navigation. Study how the coal export terminal may affect water quality in the Project area. This comment would be addressed in the Environmental Consequences chapter of the EIS.
- Land rights: What would happen to the ownership rights (both mineral and surface rights) if the marsh land in question is inundated? Would it erase monuments and call in question ownership between the landowner and the state? This comment would be addressed in the Environmental Consequences chapter of the EIS.
 - Invasive species: The majority of Louisiana's most troublesome invasive species are freshwater-dependent aquatic organisms. These species may expand their range as new diversions come online and create new freshwater habitat. These invasive species could be an impediment to navigation, impact boat launches, displace native species, and have a general negative change on other living resources. This comment would be addressed in the Environmental Consequences chapter of the EIS.
 - Real estate: Investigate whether the land proposed for construction of the diversion is already leased. This comment would be addressed in the Alternatives chapter of the EIS.
 - Levees: Will putting a hole in the levee to construct the diversion Project destabilize the remaining river levee? This comment would be addressed in the Environmental Consequences chapter of the EIS.

4.4 List of Commenters

Table 3 below lists each individual or agency commenter by name and indicates where the comment will likely be addressed in the draft EIS. Comments that were submitted by agencies or organizations (identified by those with formal signatures or letterheads) are named by the agency or organization rather than an individual's name. EIS chapters that will address comments include the Purpose and Need; Alternatives; Affected Environment; Environmental Consequences, which includes Cumulative Impacts; Compliance with Other Environmental Laws and Regulations; and Public Involvement. An individual scoping comment may be categorized under more than one EIS subject matter heading. Appendix C includes all comment submissions, organized in alphabetical order.

Table 3. List of Commenters and EIS Chapters in Which Comments Will Be Addressed

PN=Purpose and Need Chapter, ALT=Alternatives Chapter, AE=Affected Environment Chapter, EC=Environmental Consequences Chapter, CLR=Compliance with Other Environmental Laws and Regulations, PUB=Public Involvement Chapter

B2: Draft EIS Public Review and Public Meetings

Public Meeting Record

Mid-Barataria Sediment Diversion Project EIS

Public Meeting Record

May 1, 2021

Prepared for:

**US Army Corps
of Engineers®**
New Orleans District

Prepared by:

1.0 INTRODUCTION

USACE and TIG held joint public meetings which coincided with the release of the Draft Environmental Impact Statement (DEIS) for the proposed Mid-Barataria Sediment Diversion (MBSD) Project (proposed Project) and Louisiana TIG Draft Phase II Restoration Plan #3.2 (Draft RP) for public review. The purpose of the public meetings was to provide the public an opportunity to present their views, opinions, and information relevant to the proposed Project, the impact analysis, and alternatives evaluation presented in the DEIS and Draft RP. Three public meetings were planned during the Draft EIS/Draft RP public comment period for the proposed Project. Given restrictions on in-person gatherings due to COVID-19 and the uncertainty regarding COVID prevalence in the future, the public meeting planning efforts included logistical planning for these meetings to be held either as in-person or virtual meeting options. At the time of the public comment period on the DEIS and Draft RP, COVID-19 restrictions remained in place in Louisiana so the meetings were held virtually. As such, logistics included accommodations for individuals without internet access.

2.0 GENERAL MEETING FORMAT

The public meetings were scheduled for three hours. However, the meetings would have been allowed to run past the three-hour schedule had there been any attendee who had not yet had the opportunity to provide comment during the three-hour meeting. Each meeting followed the same agenda: An approximately 45-minute pre-recorded presentation was played summarizing the contents of the DEIS and Draft RP, including the alternatives considered, key findings of the impact analysis, and the TIG recommendation. Following the presentation, meeting attendees were given the opportunity to provide oral comments or written comments/questions via a “chat” function within the virtual meeting platform.

To ensure that all attendees who wanted to make an oral comment had both an opportunity to make their comment as well as adequate time to provide their full comment, each commenter was initially limited to three minutes, with the opportunity to continue their oral comment once anyone wishing to provide oral comment had an initial turn to speak. To manage the flow of the oral comment process, anyone wishing to make an oral comment was asked to notify the meeting facilitator either during registration for the meeting or through the chat function of the virtual platform during the meeting. The facilitator called on each person wishing to make an oral comment. At the end of the three-minute comment opportunity, if the commenter wished to continue their comment for an additional three-minute period, a meeting staff member made note of the commenter’s name, and the facilitator called on each of these attendees after confirmation was made that no commenters were waiting for their initial turn to speak. This cycle continued until all oral commenters completed their comments. To avoid potential inappropriate use of the chat box, submitted comments were only visible to meeting staff and not the larger audience. Comments received via the chat function were read by the USACE presenter to the audience. A court reporter was present to record all oral comments, and all comments provided via the chat function were downloaded and added to the public comment record.

Attendees wishing to provide oral comments after the presentation were provided a toll-free phone number through which the oral comment could be recorded. The phone number continued to be accessible throughout the DEIS formal comment period, not just during the live event. All oral comments received through the phone system were transcribed for the administrative record.

Meeting logistics were facilitated and supported by GEC, but CEMVN, CPRA and TIG staff served as the communicators to the public. Other cooperating agencies were present, virtually, at each meeting.

The pre-recorded presentation was posted prior to the live meetings on the CEMVN MBSD EIS website: www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS) and NOAA's Gulf Spill Restoration website (www.gulfspillrestoration.noaa.gov).

The public notice for the meetings, which was posted/distributed two weeks prior to the first public meeting, included links to the above USACE and DWH LA TIG websites so that the public could view the presentations prior to and after the virtual meetings. Both websites also had links to download/view the DEIS and information on various ways to submit comments (by mail, phone, in-person oral or written comments, and electronically through the NPS PEPC system). The link to the NPS PEPC system was a direct link to the PEPC MBSD EIS/RP Comment Page rather than the PEPC Project Page so that individuals redirected from the NOAA or CEMVN webpage would not have to navigate the NPS PEPC system to find the link to submit comments.

In order to accommodate non-English speakers, Vietnamese, Spanish, and Khmer translators provided introductory statements at the beginning of each meeting and were present during the oral comment portion of the meeting. Recorded translated presentations were also made available on the Project websites. The public advertisements for the meetings included Vietnamese and Spanish translation, and included a note stating that Vietnamese translation would be available at the meeting, and that anyone requiring translation in other languages should contact a point person at CEMVN. For virtual meetings, a live presentation was recorded after which a translator provided either recorded voice translation or closed-caption translation, which was added to the recording and posted on-line with the other meeting materials.

3.0 MEETING MATERIALS

3.1 PUBLIC NOTICE

The public notice announcing the filing of the DEIS and RP was published in the Federal Register and posted online at <http://www.mvn.usace.army.mil/Missions/Regulatory/Public-Notices/> and mailed to individuals on the MBSD mailing list. The public notice for the public meetings included the Notice of Availability of the DEIS and RP and the schedule and locations for DEIS public meetings. A copy of the public notice is provided in Appendix A.

3.2 ADVERTISEMENT

Newspaper advertisements were printed in *The Advocate*, *Times-Picayune*, and *Plaquemines Gazette*. Copies of the advertisement is provided in Appendix B.

3.3 POWERPOINT PRESENTATION

SPECIAL PUBLIC NOTICE

SUBJECT: Notice of Availability of the Draft Mid-Barataria Sediment Diversion Project Environmental Impact Statement and Public Meetings

Asunto: Aviso de Disponibilidad del Proyecto de Declaración de Impacto Ambiental del Desvío de Sedimentos de Barataria Media y Reuniones Públicas

CHỦ ĐỀ: Thông Báo Phát Hành Dự Thảo Đánh Giá Tác Động Môi Trường Của Dự Án Chuyển Dòng Trầm Tích Ở Vùng Giữa Lưu Vực Barataria và Các Cuộc Họp Với Người Dân

PERMIT APPLICATION NUMBER: MVN-2012-2806-EOO (Section 10/404)
2013-0634 (Section 408)

APPLICANT: Coastal Protection and Restoration Authority of Louisiana

SUMMARY: The Coastal Protection and Restoration Authority of Louisiana (CPRA or Applicant) submitted a Permit Application to the U.S. Army Corps of Engineers (USACE), New Orleans District (CEMVN) for a Department of the Army (DA) permit under Section 10 of the Rivers and Harbors Act of 1899 (33 United States Code [USC] 403) and Section 404 of the Clean Water Act (CWA) (33 USC 1344) (collectively referred to as "Section 10/404") and submitted a Section 408 Permission Request Letter (33 USC 408) to construct, maintain, and operate the proposed Mid-Barataria Sediment Diversion (MBSD) on the right descending bank of the Mississippi River, at approximately 60.7 miles above "Head of Passes" in Plaquemines Parish, Louisiana. In accordance with the National Environmental Policy Act (NEPA), CEMVN has prepared a Draft Environmental Impact Statement (EIS) to analyze the potential impacts of the proposed MBSD Project and a range of reasonable alternatives, including No Action, on the natural and human environment. The Draft EIS will be used to inform CEMVN's decisions regarding CPRA's permit application and permission request and may inform the decisions of other agencies that will review the proposed MBSD Project as part of their regulatory or permit processes. The information in the Draft EIS will help decision makers, public officials, and citizens to understand the potential environmental impacts of the proposed MBSD Project and its alternatives before decisions regarding the proposed MBSD Project are made.

In addition to informing the CEMVN decisions, the Deepwater Horizon Natural Resource Damage Assessment Louisiana Trustee Implementation Group (LA TIG) has prepared a Draft Phase II Restoration Plan #3.2: Mid-Barataria Sediment Diversion (Draft Restoration Plan) that evaluates granting funding to construct the proposed MBSD Project. The proposal to adopt a final restoration plan to fund construction of the MBSD Project is a separate major Federal action requiring NEPA review by the LA TIG. The LA TIG has cooperated in preparing the Draft EIS, and intends, after independent review, to adopt the EIS to satisfy its NEPA obligations for the Restoration Plan. The LA TIG will issue a separate public Federal Register notice and related information on its website and elsewhere announcing the availability of its Draft Restoration Plan.

All interested persons and organizations are encouraged to review the Draft EIS and Draft Restoration Plan and to submit any comments regarding the proposed MBSD Project, the Draft EIS, and/or Draft Restoration Plan as explained below. Comments will be considered as part of CEMVN's and LA TIG's decision-making processes.

The Draft EIS and supporting documents are available on the Project website at: <http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>, or upon request. The Draft Restoration Plan and supporting documents are available at: <https://www.gulfspillrestoration.noaa.gov/restoration-areas/louisiana>. Hard copies of the Draft EIS and Draft Restoration Plan may also be viewed at the locations noted at the end of this notice. Individuals wishing to view hard copies of the Draft EIS and Draft Restoration Plan should contact the locations regarding viewing hours and COVID-19 restrictions.

The 60-day public review and comment period for the Draft EIS and Draft Restoration Plan will begin on March 5, 2021 and end on May 4, 2021. All comments submitted electronically or by mail via the U.S. Postal Service on or before May 4, 2021 will be considered.

PUBLIC MEETINGS: CEMVN and LA TIG will jointly conduct three Public Meetings to solicit comments on the Draft EIS and Draft Restoration Plan; however, due to COVID-19 safety precautions, these meetings will be virtual. Parties interested in participating in the NEPA process and who would like to learn more about the proposed MBSD Project and/or provide comments on the Draft EIS and/or Draft Restoration Plan are encouraged to participate in one of the following WebEx virtual meetings:

Tuesday
April 6, 2021

9 a.m. CDT

Wednesday
April 7, 2021

1 p.m. CDT

Thursday
April 8, 2021

6 p.m. CDT

Instructions on how to access the virtual meetings by computer or telephone will be provided on the CEMVN's Project webpage approximately two weeks prior to the first meeting.

MEETING FORMAT: Each Public Meeting is scheduled for three hours. Meetings will consist of a brief introduction, pre-recorded presentations by LA TIG, CPRA, and CEMVN, followed by a public oral comment period. The meetings will be transcribed and included in the record.

The Public Meetings will follow the agenda below:

Introduction: Approximately 10-minutes. Welcome message, meeting format, and agenda will be outlined.

Presentations: Approximately 45-minutes (pre-recorded). CEMVN will open the presentation by notifying the public how to comment on the MBSD Draft EIS. Then, CPRA will provide an update on the MBSD design, followed by a presentation by the LA TIG which will present information concerning their ongoing restoration planning efforts and the Draft Restoration Plan. Lastly, CEMVN will provide details about how to navigate and review the contents of the MBSD Draft EIS before the public oral comment session begins.

Oral Comments: Participants will have the opportunity to provide oral comments via the WebEx virtual platform. Each participant will be allowed three minutes to make their comment to accommodate all attendees. Commenters are not limited to one three-minute comment. Once a three-minute oral comment is completed, commenters may re-enter the

WebEx queue to make additional comments. Attendees may ask questions during the three-minute comment; CEMVN and NOAA will only respond with information on the sections of the Draft EIS and/or Draft Restoration Plan that best addresses their question.

HOW TO PROVIDE DRAFT EIS AND DRAFT RESTORATION PLAN COMMENTS: In addition to the oral comment period during the Public Meetings, interested parties are encouraged to comment on the proposed MBSD Draft EIS, and Draft Restoration Plan, and may do so at any time during the public review and comment period time-frame as follows:

- Submit comments **electronically** at: <https://parkplanning.nps.gov/MBSD>
- Submit **written comments** by mail to:
U.S. Army Corps of Engineers, New Orleans District
Attn: CEMVN-ODR-E, MVN-2012-2806-EOO
7400 Leake Avenue
New Orleans, LA 70118
- Submit oral comments via the **toll-free phone number** at: 866-211-9205

You only need to submit your comment via one of these methods. All comments submitted will be reviewed by both the CEMVN and the LA TIG. Instructions for submitting your official comments can also be found on the Project webpage under “Ways to Submit Draft EIS Comments.” All comments made during the comment period time-frame as described above will become part of the record.

TRANSLATION OPPORTUNITIES: All pre-recorded public meeting presentations are in English, but will be available on CEMVN’s Project webpage in English, Vietnamese, Spanish, and Khmer (Cambodian).

Oportunidades de Traducción: Todas las presentaciones previamente grabadas estarán en Inglés, pero están disponibles en Vietnamita, Español e Inglés en la página web del Proyecto CEMVN: <http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>

HỖ TRỢ THÔNG DỊCH: Tất cả các bản trình bày được ghi âm trước bằng tiếng Anh, tuy nhiên chúng sẽ được đăng tải trên trang nói về Dự Án của Công Binh Lục Quân Hoa Kỳ (CEMVN) bằng tiếng Anh, tiếng Việt và tiếng Tây Ban Nha tại địa chỉ: <http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>

Anyone requiring translation in other languages should contact Ricky Boyett at ricky.d.boyett@usace.army.mil or 504-862-1524.

FOR FURTHER INFORMATION: Interested parties unable to participate in the virtual Public Meetings can access the pre-recorded presentations, the MBSD Draft EIS, a link to the Draft Restoration Plan, and additional information on the proposed MBSD Project on CEMVN’s Project webpage at: <http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>.

Martin S. Mayer
Chief, Regulatory Branch

SPECIAL PUBLIC NOTICE

SUBJECT: Public Meetings for the Draft Mid-Barataria Sediment Diversion Project Environmental Impact Statement

ASUNTO: Reuniones Públicas para el Proyecto de Declaración de Impacto Ambiental del Desvío de Sedimentos de Barataria Media

CHỦ ĐỀ: Các Cuộc Họp Với Người Dân Để Dự Thảo Đánh Giá Tác Động Môi Trường Của Dự Án Chuyển Dòng Trầm Tích Ở Vùng Giữa Lưu Vực Barataria

PERMIT APPLICATION NUMBER: MVN-2012-2806-EOO (Section 10/404)
2013-0634 (Section 408)

APPLICANT: Coastal Protection and Restoration Authority of Louisiana

SUMMARY: The Coastal Protection and Restoration Authority of Louisiana (CPRA or Applicant) submitted a Permit Application to the U.S. Army Corps of Engineers (USACE), New Orleans District (CEMVN) for a Department of the Army (DA) permit under Section 10 of the Rivers and Harbors Act of 1899 (33 United States Code [USC] 403) and Section 404 of the Clean Water Act (CWA) (33 USC 1344) (collectively referred to as "Section 10/404") and submitted a Section 408 Permission Request Letter (33 USC 408) to construct, maintain, and operate the proposed Mid-Barataria Sediment Diversion (MBSD) on the right descending bank of the Mississippi River, at approximately 60.7 miles above "Head of Passes" in Plaquemines Parish, Louisiana. In accordance with the National Environmental Policy Act (NEPA), CEMVN has prepared a Draft Environmental Impact Statement (EIS) to analyze the potential impacts of the proposed MBSD Project and a range of reasonable alternatives, including No Action, on the natural and human environment. The Draft EIS will be used to inform CEMVN's decisions regarding CPRA's permit application and permission request and may inform the decisions of other agencies that will review the proposed MBSD Project as part of their regulatory or permit processes. The information in the Draft EIS will help decision makers, public officials, and citizens to understand the potential environmental impacts of the proposed MBSD Project and its alternatives before decisions regarding the proposed MBSD Project are made.

In addition to informing the CEMVN decisions, the Deepwater Horizon Natural Resource Damage Assessment Louisiana Trustee Implementation Group (LA TIG) has prepared a Draft Phase II Restoration Plan #3.2: Mid-Barataria Sediment Diversion (Draft Restoration Plan) that evaluates granting funding to construct the proposed MBSD Project. The proposal to adopt a final restoration plan to fund construction of the MBSD Project is a separate major Federal action requiring NEPA review by the LA TIG. The LA TIG has cooperated in preparing the Draft EIS, and intends, after independent review, to adopt the EIS to satisfy its NEPA obligations for the Restoration Plan. The LA TIG will issue a separate public Federal Register notice and related information on its website and elsewhere announcing the availability of its Draft Restoration Plan.

PUBLIC MEETINGS: CEMVN and the LA TIG will jointly conduct three Public Meetings to solicit comments on the Draft EIS and Draft Restoration Plan; however, due to COVID-19 safety precautions, these meetings will be virtual. Parties interested in participating in the NEPA process and who would like to learn more about the proposed MBSD Project and/or provide comments on the Draft EIS and/or Draft Restoration Plan are encouraged to participate in one of the following virtual meetings:

Tuesday
April 6, 2021

9 a.m. CST

Wednesday
April 7, 2021

1 p.m. CST

Thursday
April 8, 2021

6 p.m. CST

HOW TO JOIN A MEETING:

Using a computer: Register for the public meeting at <https://attendee.gotowebinar.com/rt/9000906063881945359>. Once registered, you will be emailed a link to access the meeting. For additional materials please visit the CEMVN Project website: <http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversions-EIS/>.

By phone: To listen in by phone, dial 415-655-0060 and enter the Access Code 281-590-132 when prompted.

MEETING FORMAT: Each Public Meeting is scheduled for three hours. Meetings will consist of a brief introduction, pre-recorded presentations by LA TIG, CPRA, and CEMVN, followed by a public oral comment period. Interpreters will be available for anyone wishing to make a comment in Spanish, Vietnamese, and Khmer (Cambodian). The meetings will be transcribed and included in the record.

The Public Meetings will follow the agenda below:

Introduction: Approximately 10-minutes. Welcome message, meeting format, and agenda will be outlined.

Presentations: Approximately 45-minutes (pre-recorded). CEMVN will open the presentation by notifying the public how to comment on the MBSD Draft EIS. Then, CPRA will provide an update on the MBSD design, followed by a presentation by the LA TIG which will present information concerning their ongoing restoration planning efforts and the Draft Restoration Plan. Lastly, CEMVN will provide details about how to navigate and review the contents of the MBSD Draft EIS before the public oral comment session begins.

Oral Comments: Participants will have the opportunity to provide oral comments via the virtual platform. Each participant will be allowed three minutes to make their comment to accommodate all attendees. Commenters are not limited to one three-minute comment. Once a three-minute oral comment is completed, commenters may re-enter the queue to make additional comments. Attendees may ask questions during the three-minute comment; CEMVN and NOAA will only respond with information on the sections of the Draft EIS and/or Draft Restoration Plan that best addresses their question.

TRANSLATION OPPORTUNITIES: During the virtual public meetings, presentations will be in English, but Vietnamese, Spanish, and Khmer (Cambodian) pre-recorded meeting presentations will be available on CEMVN's Project webpage by March 30. To hear the pre-recorded presentation in Vietnamese, Spanish, or Khmer without a computer, call the following toll-free phone numbers starting March 30:

- Spanish: 855-786-7103
- Vietnamese: 866-802-8705
- Khmer: 866-802-7702

OPORTUNIDADES DE TRADUCCIÓN: Todas las presentaciones previamente grabadas estarán en Inglés, pero estarán disponibles en Vietnamita, Español e Khmer en la página web del Proyecto CEMVN después del 30 de marzo:
<http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>. Para escuchar la presentación pregrabada en español sin computadora, llame al 855-786-7103 después del 30 de marzo.

HỖ TRỢ THÔNG DỊCH: Tất cả các bản trình bày được ghi âm trước bằng tiếng Anh, tuy nhiên chúng sẽ được đăng tải trên trang nói về Dự Án của Công Binh Lục Quân Hoa Kỳ (CEMVN) bằng tiếng Anh, tiếng Việt và tiếng Tây Ban Nha tại địa chỉ sau ngày 30 tháng 3:
<http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>. Để nghe bài thuyết trình bằng tiếng Việt, hãy gọi 866-802-8705 sau ngày 30 tháng 3.

Anyone requiring translation in other languages should contact Ricky Boyett at ricky.d.boyett@usace.army.mil or 504-862-1524.

All interested persons and organizations are encouraged to review the Draft EIS and Draft Restoration Plan and to submit any comments regarding the proposed MBSD Project, the Draft EIS, and/or Draft Restoration Plan as explained below. Comments will be considered as part of CEMVN's and LA TIG's decision-making processes.

The Draft EIS and supporting documents are available on the Project website at: <http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>, or upon request. The Draft Restoration Plan and supporting documents are available at: <https://www.gulfspillrestoration.noaa.gov/restoration-areas/louisiana>. Hard copies of the Draft EIS and Draft Restoration Plan may also be viewed at the locations noted at the end of this notice. Individuals wishing to view hard copies of the Draft EIS and Draft Restoration Plan should contact the locations regarding viewing hours and COVID-19 restrictions.

The 60-day public review and comment period for the Draft EIS and Draft Restoration Plan began on March 5, 2021 and will end on May 4, 2021. All comments submitted electronically or by mail via the U.S. Postal Service on or before May 4, 2021 will be considered.

HOW TO PROVIDE DRAFT EIS AND DRAFT RESTORATION PLAN COMMENTS: In addition to the oral comment period during the Public Meetings, interested parties are encouraged to comment on the proposed MBSD Draft EIS, and Draft Restoration Plan, and may do so at any time during the public review and comment period time-frame as follows:

- Submit comments **electronically** at: <https://parkplanning.nps.gov/MBSD>
- Submit **written comments** by mail to:
U.S. Army Corps of Engineers, New Orleans District
Attn: CEMVN-ODR-E, MVN-2012-2806-EOO
7400 Leake Avenue
New Orleans, LA 70118
- Submit oral comments via the **toll-free phone number** at: 866-211-9205

You only need to submit your comment via one of these methods. All comments submitted will be reviewed by both the CEMVN and the LA TIG. Instructions for submitting your official comments can also be found on the Project webpage under “Ways to Submit Draft EIS Comments.” All comments made during the comment period time-frame as described above will become part of the record.

FOR FURTHER INFORMATION: Interested parties unable to participate in the virtual Public Meetings can access the pre-recorded presentations, the MBSD Draft EIS, a link to the Draft Restoration Plan, and additional information on the proposed MBSD Project on CEMVN’s Project webpage at: <http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>.

PUBLIC MEETINGS REUNIONES PÚBLICAS HỌP ĐÁNH GIÁ CỦA CÔNG CHÚNG

The Coastal Protection and Restoration Authority of Louisiana (CPRA) submitted a Permit Application to the U.S. Army Corps of Engineers (USACE), New Orleans District (CEMVN) for a Department of the Army permit under Section 10 of the Rivers and Harbors Act of 1899 (33 United States Code [USC] 403) and Section 404 of the Clean Water Act (CWA) (33 USC 1344) (collectively referred to as "Section 10/404") and submitted a Section 408 Permission Request Letter (33 USC 408) to construct, maintain, and operate the proposed Mid-Barataria Sediment Diversion (MBSD) on the right descending bank of the Mississippi River, at approximately 60.7 miles above "Head of Passes" in Plaquemines Parish, Louisiana.

In accordance with the National Environmental Policy Act (NEPA), CEMVN has released a Draft Environmental Impact Statement (EIS) for public review. The Draft EIS will be used to inform CEMVN's decisions regarding CPRA's permit application and permission request. Additionally, the Deepwater Horizon Natural Resource Damage Assessment Louisiana Trustee Implementation Group (LA TIG) has prepared a Draft Phase II Restoration Plan #3.2: Mid-Barataria Sediment Diversion (Draft Restoration Plan) that evaluates granting funding to construct the proposed MBSD Project. The LA TIG has cooperated in preparing the Draft EIS, and intends, after independent review, to adopt the EIS to satisfy its NEPA obligations for the Restoration Plan.

CEMVN and the LA TIG will jointly conduct three Public Meetings to solicit comments on the Draft EIS and Draft Restoration Plan, however, due to COVID-19 safety precautions, these meetings will be virtual. Interested parties are encouraged to participate in one of the following virtual meetings:

Tuesday, April 6, 2021

Guidelines

DETAILS ON TODAY'S WEBINAR

- This webinar will be recorded
- All participants will be muted unless it is your turn to give a verbal public comment

- Submit comments **electronically** at:
<https://parkplanning.nps.gov/MBSD>;
- Submit **written comments** by U.S. mail to:

U.S. Army Corps of Engineers, New Orleans District
Attn: CEMVN-ODR-E, MVN-2012-2806-E00
7400 Leake Avenue
New Orleans, LA 70118

Mailed comments must be postmarked on or
before the comment deadline of May 4, 2021
- Submit **oral comments** via the toll-free number:
866-211-9205
- Submit **comments** during any of the virtual public
meetings held on April 6, 7, and 8.

**You only need to submit your comment via
one of these methods.**

How to Comment on the Draft EIS or NRDA RP

Agenda

VIDEO PRESENTATIONS

- Approximately 35 minutes of video presentations

PUBLIC COMMENT

- We will take comments from members of the public
- Some of you signed up to comment when you registered for the webinar. If you did not sign up to comment and would like to, please enter your name in the questions box and we will get you in the lineup

THE WEBINAR WILL RUN FOR 3 HOURS

Agenda (español)

PRESENTACIONES DE VIDEO

- Aproximadamente 35 minutos de presentaciones de video

COMENTARIOS DEL PÚBLICO

- Aceptaremos comentarios de los miembros del público
- Algunos de ustedes se inscribieron para comentar al registrarse para el seminario web. Si no se inscribió para comentar y desea hacerlo, ingrese su nombre en la casilla de preguntas y lo pondremos en la lista

EL SEMINARIO WEB CONTINUARÁ
DURANTE 3 HORAS

Para escuchar la presentación

Public Comment

FOR THE REMAINDER OF THE WEBINAR WE WILL LISTEN TO COMMENTS FROM THE PUBLIC

- Type your name into the “Questions” box to get into the speaking queue.
- If you have joined by phone and are watching the webinar on your computer, enter your audio PIN if you plan on speaking via phone during the webinar—you will be unmuted at the appropriate time
- You will hear your name when you are up next to speak and will be unmuted by the host
- If you are joining by phone without registering through the webinar, you will not be able to comment during this meeting.

The screenshot shows the GoToWebinar interface. At the top, there is a menu with 'File', 'View', and 'Help'. Below that is a 'Questions' section with a text input field containing '[Enter a question for staff]' and a 'Send' button. The main area is titled 'Audio' and contains several options: 'Computer audio' (unselected) and 'Phone call' (selected). Below these are fields for 'Dial: ###-###-####', 'Access Code: ###-###-####', and 'Audio PIN: ##'. There is also a dropdown menu for 'United States' and a link for 'Problem dialing in?'. At the bottom, it says 'Multi sessions different registrants' and 'Webinar ID: 357-351-315', with the GoToWebinar logo.

Three red callout boxes with arrows pointing to specific elements:

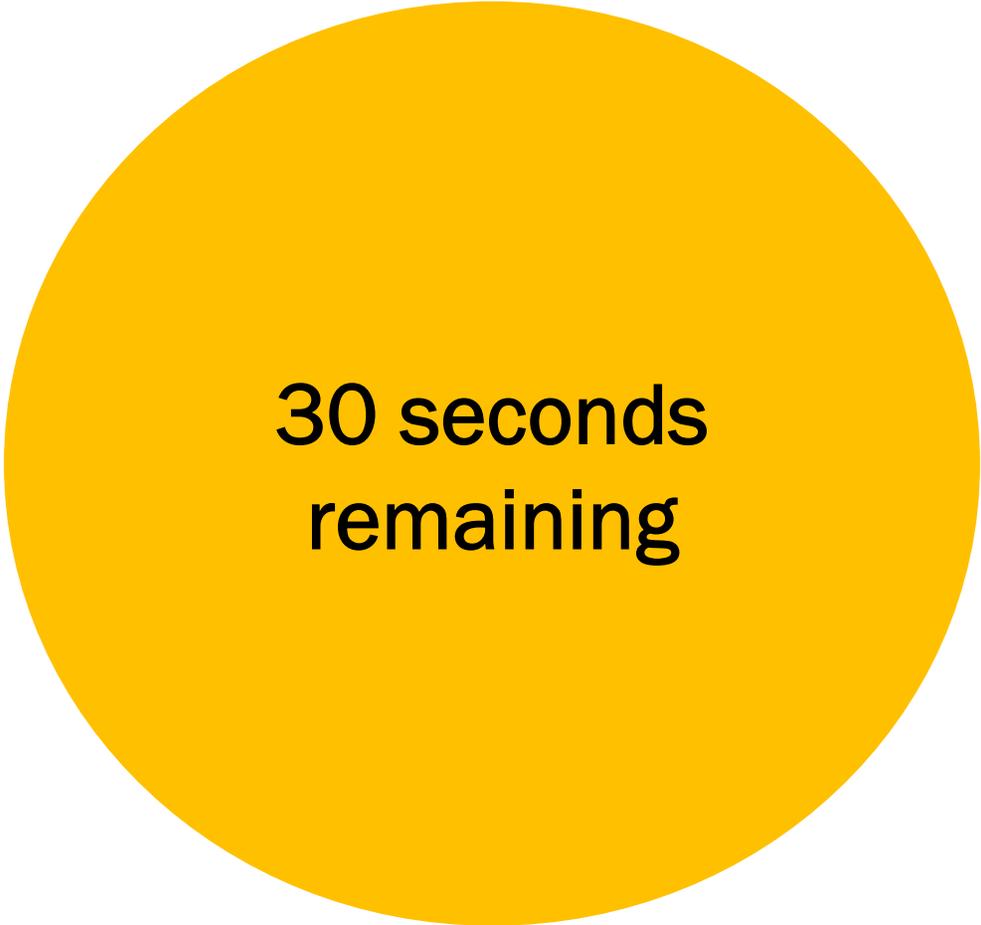

- Top right: "If you call into the meeting with a phone, **do not select computer audio.**" (points to the 'Phone call' radio button)
- Middle right: "If you use a phone, your **unique** audio pin will be here. You must enter this to speak on the call. (Computer audio users do not need a PIN.)" (points to the 'Audio PIN: ##' field)
- Bottom right: "To communicate with staff, send questions here." (points to the 'Send' button)

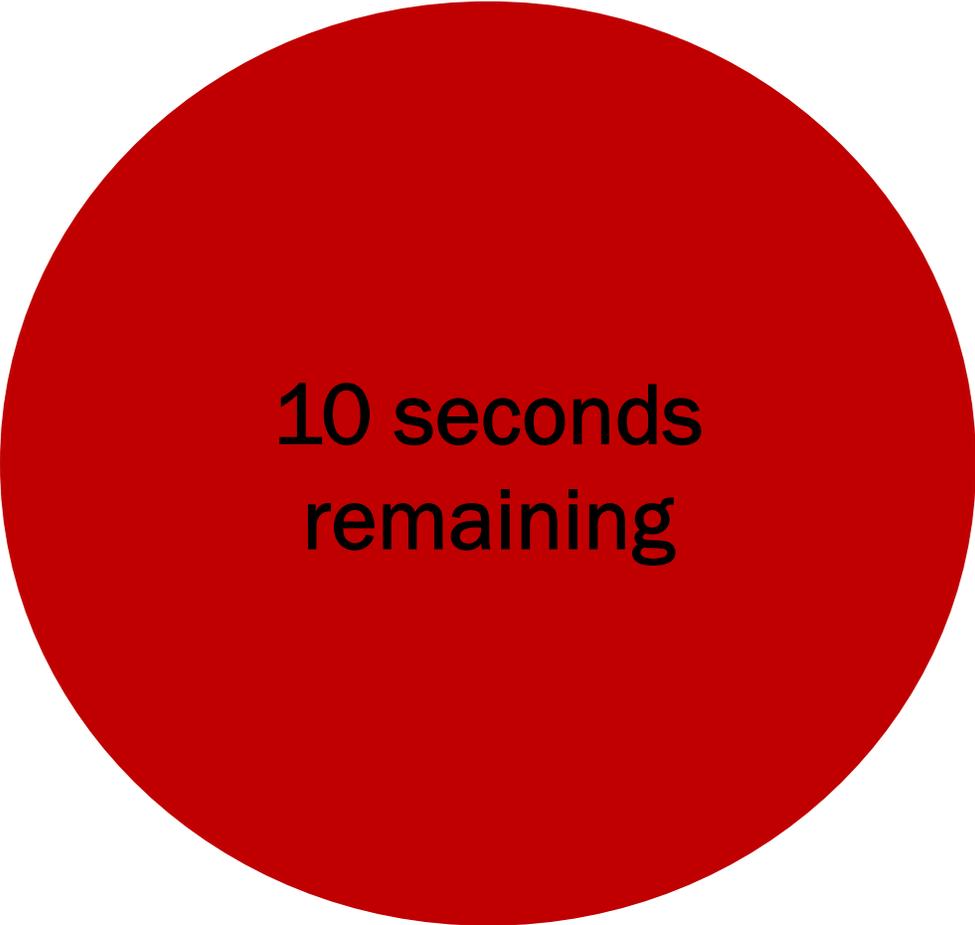

**Comment in
progress**

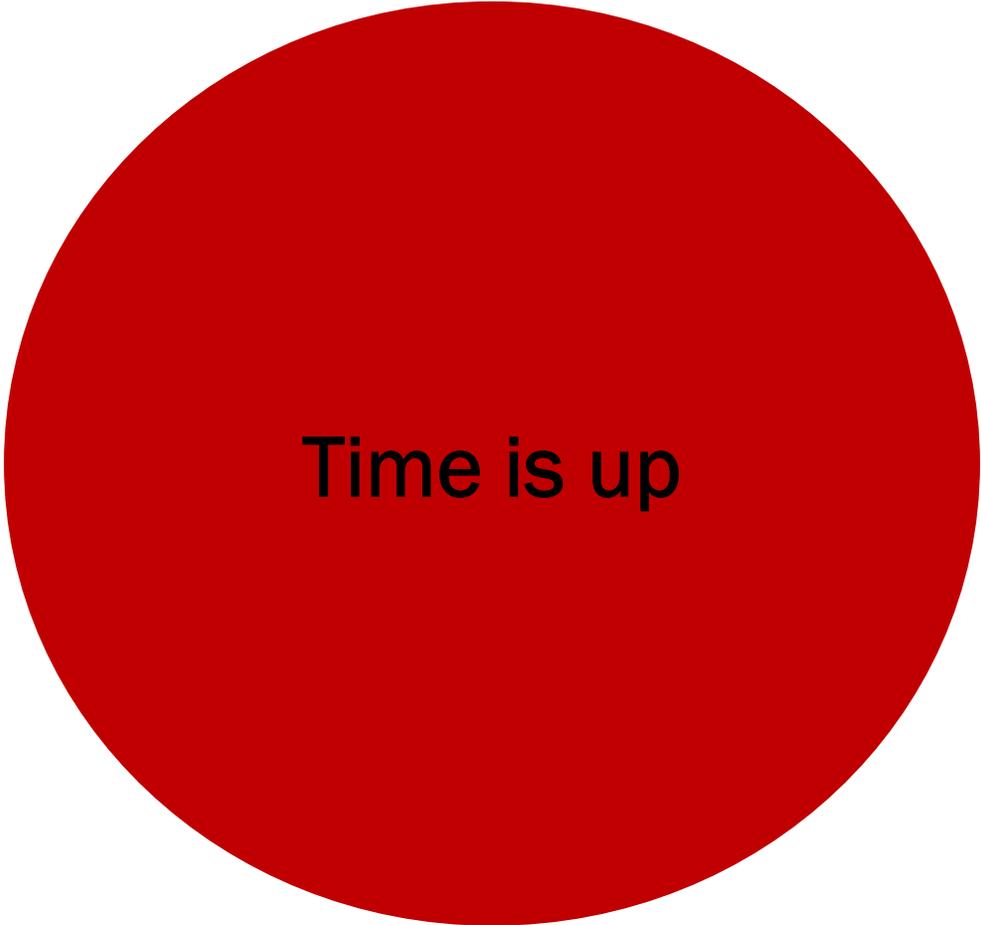

**1 minute
remaining**

**30 seconds
remaining**

**10 seconds
remaining**

We Are Waiting for Additional Public Comments

- Type your name into the “Questions” box to get into the speaking queue.
- Escriba su nombre en la casilla “Preguntas” para estar en la lista de hablantes.
- Nhập tên của quý vị vào hộp “Questions” (Câu hỏi) để được xếp vào danh sách chờ phát biểu.
- វាយបញ្ចូលឈ្មោះរបស់អ្នកនៅក្នុងប្រអប់ “សំណួរ” ដើម្បីចូលទៅក្នុងជួររង់ចាំនិយាយ។
- Materials are available at:
<https://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>
- The last day to give public comments is May 4, 2021.

**We Are Currently
on a Brief Break**

The webinar will resume at XX:XX Central.

- If you would like to make a comment, please type your name into the “Questions” box to get into the speaking queue when we resume the webinar.

- Submit comments **electronically** at:
<https://parkplanning.nps.gov/MBSD>;
- Submit **written comments** by U.S. mail to:

U.S. Army Corps of Engineers, New Orleans District
Attn: CEMVN-ODR-E, MVN-2012-2806-E00
7400 Leake Avenue
New Orleans, LA 70118

Mailed comments must be postmarked on or
before the comment deadline of May 4, 2021
- Submit **oral comments** via the toll-free number:
866-211-9205
- Submit **comments** during any of the virtual public
meetings held on April 6, 7, and 8.

**You only need to submit your comment via
one of these methods.**

B2: DRAFT EIS PUBLIC REVIEW (PUBLIC MEETINGS SUMMARY AND RESPONSES TO PUBLIC COMMENTS)

1.0 INTRODUCTION

The Coastal Protection and Restoration Authority of Louisiana (CPRA or Applicant) submitted a permit application to the U.S. Army Corps of Engineers (USACE), New Orleans District (CEMVN) for a Department of the Army (DA) permit under Section 10 of the Rivers and Harbors Act of 1899 (33 United States Code [USC] 403) and Section 404 of the Clean Water Act (CWA) (33 USC 1344) (collectively referred to as “Section 10/404”) and submitted a Section 408 Permission Request Letter (33 USC 408) to construct, maintain, and operate the proposed Mid-Barataria Sediment Diversion (MBSD) on the right descending bank of the Mississippi River, at approximately 60.7 miles above “Head of Passes” in Plaquemines Parish, Louisiana.

In accordance with the National Environmental Policy Act (NEPA), CEMVN prepared a Draft Environmental Impact Statement (EIS) to analyze the potential impacts of the proposed MBSD Project and a range of reasonable alternatives, including No Action, on the natural and human environment. The USACE is the lead federal agency in preparing the EIS and has coordinated with other agencies with jurisdiction by law or special expertise acting as Cooperating Agencies. The Draft EIS is used to inform CEMVN’s decisions regarding CPRA’s permit application and permission request and may inform the decisions of other agencies that will review the proposed MBSD Project as part of their regulatory or permit processes. The information in the Draft EIS helps decision makers, public officials, and citizens to understand the potential environmental impacts of the proposed MBSD Project and its alternatives before decisions regarding the proposed MBSD Project are made.

In addition to informing the CEMVN decisions, the Deepwater Horizon Natural Resource Damage Assessment Louisiana Trustee Implementation Group (LA TIG) prepared a Draft Phase II Restoration Plan #3.2: Mid-Barataria Sediment Diversion (LA TIG’s Restoration Plan) that evaluates whether to fund construction of the proposed MBSD Project. The proposal to adopt a final Restoration Plan to fund construction of the MBSD Project is a separate major federal action requiring NEPA review by the LA TIG. The LA TIG cooperated in preparing the Draft EIS, and intends, after independent review, to adopt the EIS to satisfy its NEPA obligations for the LA TIG’s Restoration Plan.

This report summarizes the public review and comment process for the Draft EIS/LA TIG’s Restoration Plan, including opportunities made available for public comment, details about the public meetings, and a summary of the public comments received throughout the 90-day public review period. Attachment 1 Summary Concern Statements and Responses lists the summary concerns and issues identified in the public comments, along with responses from the USACE and LA TIG. Attachment 2

Public Comments and Responses lists all public comments received along with the USACE and LA TIG's responses.

2.0 AGENCY ROLES IN PREPARING RESPONSES TO PUBLIC COMMENTS

The EIS is intended to inform two decisions. First, the Draft and Final EIS were prepared to inform decisions by USACE under Section 404 of the Clean Water Act and Sections 10 and 14 of the Rivers and Harbors Act of 1899. Second, as explained in the LA TIG's Restoration Plan, the Draft and Final EIS also are being used to inform the LA TIG's decision on whether to finalize its Restoration Plan and proceed with funding the construction of the MBSD Project.¹ As explained in the LA TIG's Restoration Plan, the LA TIG is the group of Trustees responsible for restoring natural resources and services within the Louisiana Restoration Area that were injured by the DWH oil spill.²

USACE is the Lead Agency responsible for preparing the EIS pursuant to 40 CFR §§ 1501.5 and 1508.16. Cooperating Agencies for the EIS are NOAA, USEPA, DOI, USFWS and USDA. USACE and the Cooperating Agencies entered a Cooperating Agency MOU for the EIS dated September 11, 2017, which sets forth the respective roles of the lead and Cooperating Agencies.³ The United States

¹ The adoption of the EIS by the federal agencies of the LA TIG would be completed upon signature of any Record of Decision (ROD) prepared by the federal agencies of the LA TIG.

² As specified in the 2016 Consent Decree and PDARP/PEIS, the DWH NRDA funds were distributed geographically to address the diverse suite of injuries that occurred at both regional and local scales. Specific amounts of money were allocated to seven geographically defined Restoration Areas: each of the five Gulf States (Louisiana, Mississippi, Alabama, Florida, and Texas), Regionwide, and the Open Ocean. The DWH Consent Decree established that each Restoration Area would be governed by a Trustee Implementation Group (TIG). As described in the Consent Decree and specified in the Trustee Council Standard Operating Procedures (SOPs) (DWH NRDA Trustees, 2016b), these TIGs are composed of individual DWH Trustee agency representatives. The LA TIG makes all restoration decisions for the funding allocated to the Louisiana Restoration Area and ensures that its actions are fully consistent with OPA and NEPA requirements, the PDARP/PEIS, the Strategic Restoration Plan, the Consent Decree resolving the civil claims against BP Exploration for the DWH oil spill, and the Trustee Council Standard Operating Procedures.

The LA TIG includes five Louisiana State Trustee agencies and four federal Trustee agencies: the Louisiana Coastal Protection and Restoration Authority (CPRA); the Louisiana Department of Natural Resources; the Louisiana Department of Environmental Quality; the Louisiana Oil Spill Coordinator's Office; the Louisiana Department of Wildlife and Fisheries; the United States Department of Commerce, represented by the National Oceanic and Atmospheric Administration (NOAA); the United States Department of the Interior (DOI), represented by the United States Fish and Wildlife Service (USFWS) and the National Park Service (NPS); the United States Department of Agriculture (USDA); and the United States Environmental Protection Agency (USEPA).

³ Pursuant to the MOU, USACE makes the final determination on the inclusion or exclusion of material in the Draft EIS and Final EIS as to the content or relevance of any material, data, analyses, and conclusions in accordance with applicable laws and regulations and USACE determines whether any

(represented by multiple federal agencies⁴) also entered an MOU with the State of Louisiana to integrate CPRA into the regulatory environmental review and authorization process to the maximum extent allowed by law.⁵

Each of the federal Trustee agencies or its representative is also a Cooperating Agency for the EIS. USACE has coordinated with members of the LA TIG (including the Cooperating Agencies and CPRA) in developing the EIS.

USACE is not a member of the Deepwater Horizon Trustee Council and played no role in development of the LA TIG's Restoration Plan. USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore injuries caused by the DWH oil spill.

Public notices for the public review and comment periods for both the Draft EIS and the LA TIG's Restoration Plan were published on the same date (March 5, 2021). The comment periods ran concurrently. Commenters could submit comments on either the Draft EIS or the LA TIG's Restoration Plan, as indicated below. Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the LA TIG's Restoration Plan and the Draft EIS in its decision making process.

Not all commenters, however, distinguished whether their comments were directed to the LA TIG's Restoration Plan, the Draft EIS, or both. Where appropriate, Appendix B responds to comments from the perspective of NEPA and the Draft EIS (on

necessary modifications to the Draft EIS and Final EIS are required as a result of public, Cooperating Agency or CPRA submitted comments.

⁴ Federal Agencies include the Federal Permitting Improvement Steering Council (FPISC), the Department of the Army (Army), the Department of the Interior (DOI), the Department of Commerce (DOC), including the NOAA Damage Assessment, Remediation and Restoration Program (NOAA DARRP) and the NOAA National Marine Fisheries Service (NOAA NMFS), the Environmental Protection Agency (USEPA), the Department of Homeland Security (DHS), including the U.S. Coast Guard (USCG), and the Department of Agriculture (USDA), including the Natural Resources Conservation Service (NRCS).

⁵ This second MOU, dated January 25, 2018, was entered by the United States with the State of Louisiana, and entitled "Framework for Establishing Discipline and Accountability in the Environmental Review and Authorization Process of the Mid-Barataria Sediment Diversion Project." The purpose of the State MOU was to integrate the State significantly into the environmental review and authorization process, to ensure it participates fully and substantially in the regulatory process to the maximum extent allowed by law, and to acknowledge that CPRA can participate in that process, while allowing the United States to remain objective and open-minded as required by law. The parties also agreed to work collaboratively on all aspects of the EIS and to seek agreement on consideration of public comments in accordance with relevant NEPA regulations. The Cooperating Agency MOU is to be implemented harmoniously with the State MOU.

behalf of USACE and the LA TIG), as well as from the perspective of the LA TIG's Restoration Plan (on behalf of the LA TIG).

With respect to comments on the Draft EIS (including the proposed Project, content and analysis of the Draft EIS, NEPA process, and all related matters), in accordance with the Cooperating Agency MOU, USACE acted as the Lead Agency in developing responses. The LA TIG (in accordance with the Cooperating Agency MOU and State MOU) assisted in reviewing Draft EIS-related comments and in developing responses.

With respect to the LA TIG's Restoration Plan (or other Trustee restoration planning) and OPA, comments were reviewed and responses developed by the LA TIG. To the extent restoration planning or OPA-related comments overlapped with NEPA issues or content of the EIS, USACE provided input with respect to those matters. USACE did not provide substantive input regarding OPA or other Trustee restoration planning, other than reviewing for style and language consistency with the responses to comments on the EIS. Content in responses that discuss the LA TIG's Restoration Plan, OPA, or other Trustee Planning states only the views of the LA TIG.

USACE has reviewed all comments (including studies cited in the comments) submitted during the public review period and will consider all comments regarding the proposed Project, the Draft EIS and Final EIS (including content, analysis, and impacts), the NEPA and permitting processes, and any related matters in its Section 10/404 permitting and Section 408 permission decisions. Similarly, the LA TIG has reviewed and considered all comments as they relate to NEPA and the LA TIG's potential decision(s) on the LA TIG's Restoration Plan (and impacts associated therewith).

3.0 OPPORTUNITY FOR PUBLIC COMMENT

A Notice of Availability (NOA) for the Draft EIS was published in the Federal Register on March 5, 2021. The LA TIG issued a separate Federal Register public notice and related information on its website and elsewhere announcing the availability of its Restoration Plan. The NOAs encouraged all interested persons and organizations to review the Draft EIS and LA TIG's Restoration Plan and to submit any comments regarding the proposed MBSD Project, the Draft EIS, and/or LA TIG's Restoration Plan as explained below. The Public NOA of the Draft EIS and LA TIG's Restoration Plan and notification of the public meetings was emailed out to all individuals and stakeholders on the Project mailing list and advertised in the New Orleans Advocate on March 5th, 2021 and the Plaquemines Gazette on March 9th, 2021. Additional details regarding the public meetings were advertised in the New Orleans Advocate on March 21st and 28th, 2021 and the Plaquemines Gazette on March 23rd and 30th, 2021. Portions of the public notice were translated to Spanish and Vietnamese.

The initial 60-day public review and comment period established by the NOAs for the Draft EIS and LA TIG's Restoration Plan began on March 5, 2021 and was proposed to end on May 4, 2021. However, the 60-day public comment period was extended by an additional 30 days (for a total of 90 days) to June 3, 2021. All

comments submitted electronically, orally, or in writing on or before June 3, 2021 were considered for the Final EIS.

The Draft EIS and supporting documents were available for public review on the Project website at: <http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>, or upon request. The LA TIG's Restoration Plan and supporting documents were available at: <https://www.gulfspillrestoration.noaa.gov/restoration-areas/louisiana>. Printed copies of the Draft EIS and the LA TIG's Restoration Plan were provided for public review at eight public libraries in Belle Chasse, Buras, Cut Off, Harvey, Lafitte, New Orleans, Paradis, and Port Sulphur. In addition, printed copies of the Executive Summary for both the Draft EIS and the LA TIG's Draft Restoration Plan summarizing the details of the documents into a concise, easy to read, document were available in English, Spanish, and Vietnamese at these locations and several other locations within southern Louisiana. Additional details regarding distribution of the Draft EIS documents for public review can be found in Appendix B2 Public Meeting Record of the Final EIS. Additional details regarding distribution of the LA TIG's Restoration Plan for public review can be found in Section 8.0 of the LA TIG's Restoration Plan. Individuals wishing to view hard copies of the Draft EIS and LA TIG's Restoration Plan were advised to contact the locations regarding viewing hours and COVID-19 restrictions.

USACE and the LA TIG coordinated with the SELA Voice organizations to understand the needs of the local communities, including Indigenous communities, regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Restoration Plan and during the public comment period. SELA's recommendations for where to make the Draft EIS and the LA TIG's Restoration Plan available, as well as translation of material related to the Draft EIS and LA TIG's Restoration Plan, were implemented. Spanish, Vietnamese, and Khmer (Cambodian) translators interpreted the meeting and comments in real time during the virtual public meetings. The USACE engaged with local non-profit and community groups to distribute information and materials about the proposed Project and Draft EIS. CPRA also engaged with communities that would be affected.

The public was invited to comment on the proposed MBSD Draft EIS and the LA TIG's Restoration Plan in any of the following ways:

- Electronic comments at: <https://parkplanning.nps.gov/MBSD>
- Electronic comments via email at: CEMVN-Midbarataria@usace.army.mil
- Written comments by mail to: U.S. Army Corps of Engineers, New Orleans District
- Oral comments via the toll-free phone number at: 866-211-9205
- Oral or written comments during any of the virtual public meetings held on April 6, 7, and 8, 2021

These various methods were available to accept comments from the public at any time during the public review and comment period time-frame. Any comments received in other languages were translated into English by interpreters. Comments only needed to be submitted via one of these methods to become part of the record. All comments submitted were reviewed by both the CEMVN and the LA TIG and considered as part of their respective decision making processes.

4.0 PUBLIC MEETINGS

The CEMVN and LA TIG jointly conducted three public meetings to solicit comments on the Draft EIS and LA TIG's Restoration Plan on April 6, April 7, and April 8, 2021 and 9 a.m., 1 p.m., and 6 p.m. Central Time, respectively. Due to COVID-19 related restrictions in place at the time, the meetings were held virtually using an internet/web-based conferencing application and/or via phone line. Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the virtual public meetings on the Draft EIS and the LA TIG's Restoration Plan.

At the beginning of the public comment period, CEMVN posted several pre-recorded videos (prepared by LA TIG, CPRA, and USACE) to CEMVN's Project webpage. The pre-recorded videos consisted of an explanation on how to comment on the Draft EIS and/or the LA TIG's Restoration Plan (USACE), an update on the proposed MBSD Project design (CPRA), information concerning the ongoing restoration planning efforts and the LA TIG's Restoration Plan (LA TIG), and details about how to navigate and review the contents of the Draft EIS (USACE). These videos were consolidated into one presentation which was played at the beginning of each of the three virtual public meetings. This consolidated pre-recorded presentation was also translated into Spanish, Vietnamese, and Khmer and available to access on CEMVN's Project webpage. In addition, dedicated toll-free numbers were provided throughout the public comment period through which the public could listen to the translated pre-recorded presentation in either Spanish, Vietnamese, or Khmer rather than viewing the presentation on a computer. Anyone requiring translation in other languages was advised to contact CEMVN's Public Affairs office.

Instructions on how to access the virtual meetings by computer or toll-free telephone lines were provided on the CEMVN's Project webpage approximately two weeks prior to the first meeting. Each public meeting was scheduled for three hours. The virtual meetings consisted of a brief introduction, the pre-recorded video presentation, followed by a public comment period. Written and verbal translation in Spanish, Vietnamese, and Khmer was available for portions of the virtual meeting webinars. During the webinar, comments could be made verbally or typed into a chat box for the moderator or panelist to read aloud during the meeting. Interpreters were available for anyone wishing to make a comment in Spanish, Vietnamese, and Khmer during the comment portion of the virtual meetings. The meetings were transcribed by a court reporter and included in the Project's Administrative Record. The written transcripts and recordings of each of the meetings can be accessed on CEMVN's Project webpage.

Representatives from the CEMVN were available to listen to public comments regarding the Draft EIS. Representatives from the LA TIG agencies including CPRA, NOAA, the DOI, the USEPA, and the USDA, were available during the webinar to listen to public comments regarding the Draft EIS and LA TIG's Restoration Plan. Webinar panel members provided clarifications and information during the public comment portion of the webinar.

Interested parties that were unable to participate in the virtual public meetings could access recordings of the virtual meeting webinars, the pre-recorded video presentation (in English, Vietnamese, Spanish, and Khmer), the MBSD Draft EIS, a link to the LA TIG's Restoration Plan, written transcripts of the public meetings, and additional information on the proposed MBSD Project on CEMVN's Project webpage at: <http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>.

5.0 PUBLIC COMMENTS ON THE DRAFT EIS/LA TIG'S RESTORATION PLAN

5.1 Introduction

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. The USACE and LA TIG coordinated a public review process for both the Draft EIS and the LA TIG's Restoration Plan. Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the LA TIG's Restoration Plan and the Draft EIS in its decision making process. All public questions and comments submitted during the comment period are addressed in this Response to Comment Appendix and are attached to this appendix. Revisions have been made to the Final EIS based on public comments received on the Draft EIS, input from the Cooperating Agencies, and continued Project evaluation. As described in Chapter 1, Section 1.7 Public Involvement Summary of the Final EIS, changes between the Draft and Final EIS are identified through markings along the margins on the applicable pages. Table 1.7-1 lists the section numbers where changes were made (see Chapter 1, Section 1.7). All public comments received will be considered by USACE and LA TIG in their respective decision making on the proposed MBSD Project. For a summary of public outreach efforts related to the Draft EIS refer to Chapter 7 Public Involvement of the Final EIS and for restoration planning, see Section 1.8 of the LA TIG's Final Restoration Plan.

Many comment responses refer to information in the Draft EIS or LA TIG's Restoration Plan. Some of the responses refer to specific information in subsections, tables, and figures, while others refer to more general topics addressed throughout chapters, resource sections, and appendices. References to the Draft EIS or LA TIG's Restoration Plan therefore vary in specificity depending on the nature of the comment and response.

5.2 Overview of Comments Received

Over the 90-day public comment period, the USACE and the LA TIG received approximately 40,699 comment submissions provided in the following ways: via email to CEMVN; through DOI's Planning, Environment and Public Comment (PEPC) database (<https://parkplanning.nps.gov/MBSD>); submitted in writing or orally during any of the virtual public meetings held on April 6, 7, and 8, 2021; and via voicemail at a toll-free phone number (1-866-211-9205). Forty-three comments were received in either Spanish, Vietnamese, or Khmer and were translated into English.

Of the 40,699 comment submissions, 39,903 (98 percent) included nearly identical (form) letters signed by different individuals. Approximately 796 (2 percent) of comment submissions were unique letters from individuals or organizations/agencies. Only 1,396 (3.4 percent) of the comment submissions were from commenters that gave Louisiana addresses. The remaining comments were from people residing in other U.S. states and U.S. territories, four were from other countries, and three did not provide location information. Individual commenters identified an affiliation in 44 of the comment submissions. These affiliations included businesses, churches and religious groups, civic groups, government agencies, non-governmental organizations, and university or professional societies.

5.3 Comment Response Process

USACE and the LA TIG worked together to review, sort, and respond to comments received on the Draft EIS and the LA TIG's Restoration Plan. Comments were first sorted into groups by topic and issue, consistent with the range of topics addressed in the Draft EIS and the LA TIG's Restoration Plan. To facilitate preparation of responses, USACE and the LA TIG then drafted 'concern statements' to represent multiple similar comments on a topic and to summarize unique comments and lengthy comments; these concern statements were later reviewed against the original comments to ensure all comments were captured. USACE and the LA TIG then prepared responses to the concern statements. The USACE and LA TIG ensured consideration of the original text from each comment when preparing the response. The comment response process was designed to ensure consideration of and appropriate responses to all comments received.

Attachment 1 Summary Concern Statements and Responses of this appendix provides a list of the issues and concerns identified in the comments and the USACE and LA TIG's responses. All public comments and responses are included in full in Attachment 2 Public Comments and Responses of this appendix, organized in alphabetical order by last name.

Agency Correspondence Process	Commercial Fisheries
Affected Environment/Existing Conditions	Environmental Justice
EIS App A: Permit Application (Section 10/404) and 408 Permissions Request	Recreation/Tourism

EIS App T: USFWS Coordination Act Report (CAR)	Public Lands
Request for Comment Period Extension	Land Use/Cover
Intro, Purpose & Need, Proposed Action	Aesthetic and Visual Resources
Project Background	Public Health & Safety/Flood & Storm Hazard Risk Reduction
Compliance with Other Laws, Regs & EOs	Navigation
Restoration and Project Goals and Objectives	Land-based Transportation
Coordination with Other Gulf Restoration Programs	Cultural Resources
Civil Works Projects in Project Area	Hazardous, Toxic, & Radioactive Waste Assessment
Public Participation Process	Cumulative Impacts
Agency Roles Responsibilities, and Coordination	Delft3D Modeling
NRDA Injury Addressed	ADCIRC Modeling
SRP Outcomes/large-scale sediment diversion (SRP Past Analysis)	Navigation Modeling
Process of Alternatives Identification, Screening and Analysis	HSI & Eco Modeling
Functional Alternatives	WVA modeling
Location Alternatives	Additional Considerations in Planning
Operational Alternatives	General Support for Project/RP
Outfall Features	General Critique of Project/RP
Alternatives Considered but Eliminated	Misc Topics- General Comments
New Project Ideas Suggested but not Previously Evaluated	Executive Summary
Applicant's Preferred Alternative/Alternative 1-75K cfs	MAM Plan-General Comment
Other Alternatives Evaluated	MAM Governance
No Action Alternative	MAM Schedule
Eval Standard- Cost to Carry Out Alternative	MAM Data Management & Reporting
Eval Standard- Meets Trustee Restoration Goals and Objectives	Compensatory Wetland Mitigation
Eval Standard- Likelihood of Success	Impacts to Navigation Mitigation
Eval Standard- Benefits More Than One Resource	Property Impacts Mitigation
Eval Standard- Public Health & Safety	Flooding Impacts Mitigation
Eval Standard- Avoids Collateral Injury	Aquatic/Fisheries Impacts (other than commercial) Stewardship and Mitigation Measures
Geology/Soils	ESA-Listed Species Stewardship and Mitigation Measures
Groundwater Resources	Non-ESA-Listed Species Stewardship and Mitigation Measures
Surface Water/Coastal Processes	Essential Fish Habitat Stewardship and Mitigation Measures
Surface Water/Sediment Quality	Cultural Resources Stewardship and Mitigation Measures
Wetland Resources/Waters of the US	Proffered Permit Special Conditions
Air Quality	FWCAR Recommendations
Noise	Other/General Stewardship and Mitigation Measures
Terrestrial Wildlife/Habitat	Marine Mammals Stewardship and Mitigation Measures

Aquatic Resources	Oysters (Commercial Fisheries) Stewardship and Mitigation Measures
Marine Mammals	Brown Shrimp, Crabs and Finfish (commercial fisheries) Stewardship and Mitigation Measures
Threatened & Endangered Species	Recreational and Subsistence Use Stewardship and Mitigation Measures
Socioeconomics	Property acquisition Stewardship and Mitigation Measures
	Environmental Justice Stewardship and Mitigation Measures

5.4 Organization of Comments and Responses in this Appendix

Public comments and responses are provided in two formats in Attachment 1 and 2 of this appendix:

- Attachment 1 Summary Concern Statements and Responses:** Attachment 1 Summary Concern Statements and Responses of this appendix organizes the concern statements and issues identified in the comment letters by topic area corresponding to EIS subject areas and contains responses to each of those concern statements. The summary concerns along with USACE and LA TIG responses are organized by the topics identified in the comment letters and shown in Table 1 above. Readers may search by topic area to view the concerns raised by the public comments and the USACE and TIG responses.
- Attachment 2 Public Comments and Responses:** Each commenter's verbatim comment is provided along with the USACE and LA TIG response in Attachment 2 Public Comments and Responses. The attachment is organized alphabetically by commenters' last names. Comments that were submitted by agencies or organizations (identified by those comments submitted with formal signatures or letterheads) are identified by the agency or organization name rather than an individual's name. A table of contents at the beginning of Attachment 1 gives page numbers for each commenter's last name or agency/organization name for ease of reference. In the case of form letters that are substantially alike, one copy of the form letter is included, and each individual or agency/organization who sent it is included in the table of contents. Form letters that were substantively modified by the commenter are included as separate, unique comment letters.

AC10000 – Agency Correspondence

Concern ID: 62958	The Department of Environmental Quality (LDEQ), Business and Community Outreach Division has received your request for comments on the proposed MBSD Project.
	After reviewing your request, the Department has no objections based on the information provided in your submittal. However, for your information, the following general comments have been included. Please be advised that if you should encounter a problem during the implementation of this proposed Project, you should immediately notify LDEQ’s Single-Point-of-contact (SPOC) at (225) 219-3640.
Response ID: 15888	Thank you for your comments. USACE solicited review according to 40 CFR Part 1503.1. If a permit is issued, CPRA would be required to obtain all applicable federal, state, and local permits before starting construction of the proposed MBSD Project.

Concern ID: 62959	The Department of the Interior (Department) has reviewed the Draft Environmental Impact Statement (EIS) for the Coastal Protection and Restoration Authority of Louisiana’s (CPRA) Proposed Mid-Barataria Sediment Diversion Project, Plaquemines Parish, Louisiana.
	The following comments and recommendations are submitted pursuant to the authority of, and in accordance with, the provisions of the National Environmental Policy Act of 1969 (83 Stat. 852, as amended P.L. 91-190, 42 U.S.C. 4321 et seq.), and the Fish and Wildlife Coordination Act of 1956 (48 Stat. 401, as amended; 16 U.S.C. 661 et seq.).
	Upon review of the Draft EIS, the Service finds it addresses all impacts and benefits, including those related to fish and wildlife resources, coastal wetlands, and threatened and endangered species.
	The Applicant’s Preferred Alternative would directly impact 182.9 acres of jurisdictional wetlands and 266.3 acres of vegetated shallows (submerged aquatic vegetation or SAV) and other waters of the U.S. Additionally, because Mississippi River sediments would be diverted up river of the Birdfoot Delta, the Delta would experience a projected indirect loss of 2,891 acres of wetlands by 2070 when compared with the No Action Alternative, of which 926 acres would be indirectly lost on the Delta National Wildlife Refuge (Delta NWR) and 37 acres on Pass A Loutre Wildlife Management Area (Pass A Loutre WMA). The indirect wetland losses to Delta

NWR and Pass- A-Loutre WMA would be offset by the construction of crevasse projects as described in Recommendation #1 of the Draft Fish and Wildlife Coordination Act Report for the proposed MBSD Project. The proposed Project anticipates a net benefit of 13,151 acres of marsh (3,848 AAHUs) near the outfall over the 50-year period of analysis. Overall, there would be positive net benefits to wetland resources in the proposed Project area, with the creation and preservation of emergent wetland habitat of high value to fish and wildlife resources.

The Service has continually been involved throughout the planning and evaluation process for the proposed MBSD Project. The CEMVN and CPRA have been responsive to all our data needs, questions, comments, and concerns. Because of our extensive coordination, and the positive net benefits to wetland resources, all of our comments and suggestions have been sufficiently addressed at this time and the Service has no further comment.

Response ID: 15887

Thank you for your comments. USACE solicited review according to 40 CFR Part 1503.1. If a permit is issued, CPRA would be required to obtain all applicable federal, state, and local permits before starting construction of the proposed MBSD Project.

Concern ID: 62960

The U.S. Environmental Protection Agency (USEPA) has reviewed the U.S. Army Corps of Engineers (USACE) Draft Environmental Impact Statement (EIS) for the Mid-Barataria Sediment Diversion Project, Plaquemines Parish, Louisiana (CEQ Number 20210025). The Draft EIS was reviewed pursuant to the National Environmental Policy Act (NEPA), the Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500 - 1508), and USEPA's NEPA review authority under Section 309 of the Clean Air Act.

USEPA served as a cooperating agency and reviewed and provided technical comments on the Draft EIS during its development. We appreciate participating on issues of importance to the agency including climate change considerations and evaluation of the climate resiliency and adaptation aspects of the proposed Project. In addition, USEPA acknowledges the proactive approach taken to incorporate technical suggestions and factoring a changing climate into the overall modeling for the proposed Project regarding greenhouse gas emissions and climate change. We also acknowledge that this approach was out of recognition that this effort is different from other infrastructure projects in that the proposed action itself is an adaptation/resiliency feature.

In addition, we appreciate working with USACE, CPRA, and the other agencies on the key issues of environmental justice and impact mitigation throughout development of the Draft EIS. The Draft EIS acknowledged in Chapter 4 that the proposed Project may have disproportionately high and adverse impacts on the Project affected area for minority and low-income residents and users of the resources in the area. According to the models, this may include periodic flooding of some residences and businesses during the operation of the proposed MBSD Project. It may also include storm hazards and changes in the composition of fishery species. USEPA encourages and supports the ongoing efforts to effectively address the identified environmental justice impacts in the development of the Draft Mitigation and Stewardship Plan provided in Appendix R1. USEPA strongly recommends that the Final Mitigation and Stewardship Plan include measures to specifically address disproportionately high and adverse impacts related to commercial shrimp and oyster fishing, tidal flooding, and storm hazards identified in the proposed Project area. The mitigation and stewardship measures should include elements designed to consider any unique vulnerabilities and help ensure an equitable distribution of benefits to minority and low-income populations that would be impacted by the proposed Project. USEPA commends CPRA for holding outreach meetings with minority and low-income people in the area to discuss impacts of the proposed Project and related mitigation and stewardship measures.

Response ID: 15886

Thank you for your comments. If a permit is issued, CPRA would be required to obtain all applicable federal, state, and local permits before starting construction of the proposed MBSD Project.

AE10000 – Affected Environment/Existing Conditions

Concern ID: 61711

Coastal land and wetlands along Louisiana’s coast are very valuable to migratory songbirds because these lands are the first land fall after an exhausting flight across the Gulf of Mexico. As the coastline recedes, migratory birds must fly farther and farther from their southern launch point.

Response ID: 16025

The value of Louisiana’s coastal wetlands to migratory songbirds was considered in the Draft EIS. The importance of Louisiana’s coastal habitats to migratory birds, as well as the threats to these habitats, is discussed in Chapter 3, Section 3.9.3.1 in Terrestrial Wildlife of the EIS.

Concern ID: 61727	One major cause for the loss of wetlands over the last 50 or 60 years is mining and drilling operations that were not required by regulatory agencies to replace the marsh loss they caused. So money from the oil and gas industries should be allocated for continued restoration efforts.
Response ID: 16027	The impacts of the oil and gas industry on wetland loss in the Barataria Basin were described in the Draft EIS. This EIS serves as the environmental review required by NEPA to inform USACE's decisions on the Section 10/404 permit and Section 408 permission and the LA TIG's OPA decision regarding funding the construction of the proposed MBSD Project via damages paid by BP following the DWH oil spill (see Section 1.6.1 The OPA and DWH NRDA Decisions of the EIS). USACE requires compensatory mitigation in the form of replacement habitat for its Section 10/404 permits (including those involving oil and gas exploration and production) that will result in wetland losses.
Concern ID: 61716	The ongoing loss of Louisiana's coastal wetlands makes communities increasingly vulnerable to stronger hurricanes and sea-level rise and threatens the health and stability of the entire Barataria Basin upon which a number of communities, wildlife, fish nurseries, sportsman culture, economy, and vital resources depend.
Response ID: 16026	The importance of maintaining wetlands for the protection of coastlines, coastal communities, wildlife resources, and recreation was considered in the Draft EIS in Sections 3.6 Wetland Resources and Waters of the U.S., 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, and 3.16 Recreation and Tourism.
Concern ID: 61732	The climate change crisis has had devastating impacts to natural resources around the world.
Response ID: 16158	The impacts of climate change on the Project area were considered in the Draft EIS. Chapter 3, Section 3.1.3 Climate provides a general overview of climate change and associated impacts in the Project area, which include projected changes in weather patterns, along with continued saltwater intrusion due to sea-level rise contributing to loss and conversion of freshwater marshes. The effects of climate change via projected sea-level rise (see Chapter 4, Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the EIS) were incorporated into the Delft3D Basinwide Model for projecting the impacts of the Project. In addition, as noted in Section 4.7.4 in Air Quality of the EIS, the Project would result in permanent, indirect, minor, beneficial impacts on carbon sequestration and atmospheric greenhouse gas (GHG) concentrations due to wetland creation and restoration within the Barataria Basin.

Concern ID: 61733	Barataria Basin land loss plus the BP oil spill has had and continues to have devastating impacts on communities, birds, and wildlife habitat.
Response ID: 16159	The impacts that land loss and the DWH oil spill have had and continue to have on communities, birds, and wildlife habitat in the Barataria Basin were considered in the Draft EIS. These impacts are discussed throughout Chapter 3 Affected Environment. As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the Project is to restore for injuries caused by the DWH oil spill by implementing a large-scale sediment diversion in the Barataria Basin that would reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts. This EIS serves as the environmental review required by NEPA to inform the LA TIG's OPA decision regarding funding the construction of the proposed MBSD Project using damages paid by BP following the DWH oil spill (see Section 1.6.1 The OPA and DWH NRDA Decisions of the EIS).
Concern ID: 61735	Louisiana's coast is critical to not only the people who live, work, and recreate here, but to the entire nation. World-class fishing attracts people from all over the world. Our ports are a major player in international trade. The nation's energy needs are largely supported by the oil and natural gas industry located along our coast.
Response ID: 16160	The importance of Louisiana's coast to the people who live, work, and recreate here, as well as to the nation, was considered in the Draft EIS. The details about the importance of the Project area's recreational fishing, commercial navigation, and the oil and gas industry are included in Chapter 3, Sections 3.16 Recreation and Tourism, 3.21 Navigation, and 3.2.3 in Geology and Soils, respectively.
Concern ID: 61737	The construction of levees along the Mississippi River precluded land-building sediments from entering Louisiana estuaries, which has caused a loss of Louisiana's coastal wetlands and other problems, such as making properties more vulnerable to hurricane damage and decreasing property values.
Response ID: 16024	The impacts raised by the commenters were considered in the Draft EIS. Information about historic causes of land loss can be found in Chapter 3, Section 3.1.4 Overview and History of the Project Area and Section 3.6.2 in Wetland Resources and Waters of the U.S. The importance of maintaining wetlands for the protection of coastlines, coastal communities, and wildlife resources is discussed in Sections 3.6 Wetland Resources and Waters of the U.S. and 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the EIS. As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS,

the purpose of the Applicant's Preferred Alternative is to implement a large-scale sediment diversion in the Barataria Basin that would reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

Concern ID: 61740

Over time, Louisiana's natural environment is continuing to be destroyed by humans.

Response ID: 16161

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment of the EIS. Past, present, ongoing, and reasonably foreseeable actions and trends in the Project area are discussed throughout Chapter 4, Section 4.25 Cumulative Impacts, including how those actions have and may continue to affect Louisiana's natural environment. The proposed Project is a restoration action intended to restore and sustain wetlands in the Barataria Basin and compensate for damages to natural resources that resulted from anthropogenic causes, for example, the DWH oil spill.

Concern ID: 61741

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40 percent of all migratory birds in North America spend a part of their life in coastal Louisiana.

Response ID: 16162

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment. The use of Louisiana's coastal habitats by a large diversity of birds is discussed in Chapter 3, Section 3.9.3 in Terrestrial Wildlife of the EIS. The benefits that the Project would provide to birds are discussed in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.12 Threatened and Endangered Species of the EIS.

AP10000 – EIS App A: Permit Application (Section 10/404) and 408 Permissions Request

Concern ID: 61857

Commenter asked what the chances of stopping this proposed Project are.

Response ID: 15883

As stated in Chapter 1 Introduction and Purpose and Need of the EIS, CPRA submitted a Joint Permit Application on June 23, 2016 (revised March 16, 2018) and a Section 408 Permission Request Letter on January 13, 2017 to the USACE, New Orleans District (CEMVN) for a

Section 10/404 permit and Section 408 permission for the proposed MBSD Project. The joint permit application and permission request can be found in Appendix A Permit Application (Section 10/404) and Permissions Request (Section 408) of the EIS. Approval of a Section 10/404 permit and a Section 408 permission to construct, operate, and maintain the proposed MBSD Project would be a major federal action and consequently, USACE has prepared this EIS to understand the potential impacts, both beneficial and adverse, associated with the proposed Project and reasonable alternatives to it. The information in the EIS will help USACE to make an informed decision on the Section 10/404 permit and Section 408 permission request. In addition, USACE will take all public comments under consideration in its decision making.

By regulation, the USACE is neither for nor against the proposed Project. USACE has not made any decision regarding the proposed Project and will not make a decision until it issues a Record of Decision after publication and public review of the Final EIS.

In its Strategic Restoration Plan #3 and Environmental Assessment, the LA TIG selected for further evaluation a large-scale sediment diversion to address ecosystem injuries in the Barataria Basin as a result of the DWH oil spill. Following NRDA regulations for restoration planning under OPA (15 CFR, Part 990.30), the LA TIG prepared the Draft Restoration Plan (LA TIG RP 3.2) for the proposed MBSD Project. Based on that LA TIG RP 3.2 and informed by the MBSD EIS (to which the federal agencies of the LA TIG are cooperating agencies) and the public comments received on both documents, the LA TIG will make a decision regarding the implementation of the proposed Project. Following publication of the LA TIG's Final Restoration Plan and the MBSD EIS, conclusion of the NEPA 30-day wait period, and issuance of the LA TIG's NEPA Record of Decision, the LA TIG would finalize its decision (15 CFR § 990.23(c)(2)(ii)(G)) and document such by LA TIG Resolution. Until that time, the LA TIG would not have made a final decision on the proposed Project.

Concern ID: 61858

CPRA should resubmit their permit application with a plan to address the specific damages caused by the DWH oil spill and with alternative means of achieving the “purpose of restoration” (Purpose) for use of the DWH funds.

Response ID: 15884

CPRA submitted a Section 10/404 permit application and Section 408 permission request to the USACE to construct, operate, and maintain the proposed MBSD Project. Chapter 2 Alternatives, Section 2.2 Steps Taken to Identify and Evaluate Reasonable Alternatives of the EIS provides a detailed explanation for the identification and evaluation of a range of reasonable alternatives based on the purpose and need for the proposed MBSD Project.

Chapter 2 of the LA TIG's Final Restoration Plan describes how the LA TIG screened and selected the alternatives considered in the Restoration Plan. Briefly, as discussed in the PDARP/PEIS, the SRP/EA #3, and the Final Restoration Plan, the LA TIG found that impacts of the injuries from the DWH oil spill were particularly detrimental to the resources of the Barataria Basin, which were already in peril as a result of the separation of sediment-loaded river water by levees, subsidence and a changing climate. In the Barataria Basin, marshes already suffering from significant coastal erosion experienced heavy oiling due to the DWH oil spill and subsequently experienced double or triple the rate of marsh loss. The Final PDARP/PEIS (DWH NRDA Trustees, 2016a) documented the nature, degree, and extent of injuries from the DWH oil spill to both natural resources and the ecological services they provide, and the nexus between those injuries and need for restoration within the Barataria Basin. Evaluating restoration strategies that could restore for injuries in the Barataria Basin, the SRP/EA #3 found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured wetlands, coastal, and nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion that is evaluated in the EIS and the LA TIG's Final Restoration Plan. The LA TIG's Final Restoration Plan explains that the proposed Project would best restore for injuries caused by the DWH oil spill by reconnecting and reestablishing sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, freshwater, and nutrients to support the long-term viability of existing and planned coastal restoration efforts. Other restoration projects, including marsh and ridge restoration activities, that would help restore for the injuries caused by the DWH oil spill are being considered and implemented by the LA TIG under their restoration planning efforts.

Deepwater Horizon, Natural Resource Damage Assessment (DWH) Trustees. 2016. Deepwater Horizon Oil Spill: Final Programmatic Damage Assessment and Restoration Plan (PDARP) and Final Programmatic Environmental Impact Statement (PEIS). Available online at: <http://www.gulfspillrestoration.noaa.gov/restoration-planning/gulf-plan>. Accessed May 2017.

Louisiana Trustee Implementation Group (LA TIG). 2018. Final Strategic Restoration Plan and Environmental Assessment #3: Restoration of Wetlands, Coastal, and Nearshore Habitats in the Barataria Basin, Louisiana. Available online at:

http://www.gulfspillrestoration.noaa.gov/sites/default/files/2018_03_LA_TIG_Final_SRP_EA_508-Compliant.pdf. Accessed: March 15, 2018.

Concern ID: 61859

Commenter inquired as to what role the USACE would have in the proposed MBSD Project.

Response ID: 15885

USACE is currently conducting NEPA and other evaluations of the proposed Project for its permitting decisions under the CWA Section 404 and Rivers and Harbors Act (RHA) of 1899 Sections 10 and 14 (33 USC Section 408). USACE is neither a proponent nor an opponent of the proposed Project. If USACE permits the Project, the LA TIG funds the Project and CPRA implements the Project, as a regulating agency, USACE would have continuing authority to ensure that CPRA complies with the conditions of its permit, including inspections as necessary. Because portions of the MBSD Project would alter, occupy, and replace portions of USACE flood risk reduction projects, specifically the Mississippi River Levee and the Plaquemines NOV-NFL Levee, for those portions of the proposed Project, USACE would have construction oversight responsibilities and USACE and CPRA would need to enter agreements governing their respective responsibilities.

CE10000 – Comment Extension

Concern ID: 62487

Several commenters requested additional time to submit comments on the LA TIG's Draft Restoration Plan and Draft EIS.

Response ID: 15768

The public comment period for the LA TIG's Draft Restoration Plan and Draft EIS was originally 60 days (March 5, 2021 through May 4, 2021). On April 23, 2021, USACE and the LA TIG issued a special public notice, announcing a 30-day extension of the public comment periods. With this addition, the public comment period for both documents was 90 days (March 5, 2021 through June 3, 2021).

CH10000 – Introduction, Purpose & Need, Proposed Action

Concern ID: 61872

The purpose and need statement upon which the alternatives analysis was built meets the intentions and goals of the proposed Project and appropriately captures the need to restore injury by reestablishing deltaic processes between the Mississippi River and Barataria Basin.

Response ID: 15828 The commenter's support for and approval of the Project's purpose and need is acknowledged.

Concern ID: 61873 **The proposed Project's impacts are in contradiction with the Project's stated purpose and need to restore habitat and ecosystems damaged by the DWH oil spill given the permanent adverse impacts on fisheries, marine mammals, and water quality. The proposed Project is incompatible with both a healthy environment and healthy economy.**

Response ID: 15829 USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities), and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. If implemented, the proposed Project would deliver sediment, fresh water, and nutrients into the Barataria Basin. While there would be short- and long-term, adverse and beneficial impacts to physical, biological, and socioeconomic resources in the Project area due to the proposed Project, the sediment, fresh water, and nutrients are expected to restore habitat and ecosystems services injured in the northern Gulf of Mexico as a result of the DWH oil spill.

Concern ID: 61874 **It seems that the change to the purpose and need for the proposed Project was designed to limit alternatives. This change was done 6 months after scoping, when scoping was the opportunity for the public to suggest alternatives and could have affected those comments.**

Response ID: 15830 CPRA provided a purpose and need statement for the Project in its June 22, 2016 Joint Permit Application for the proposed Project. In that application, CPRA stated that the purpose of the Project is "to reconnect and reestablish the natural or deltaic sediment deposition process between the Mississippi River and the Barataria Basin" and that the proposed Project "is needed as a long-term resilient, sustainable strategy to reduce land-loss rates and sustain DWH injured wetlands through the delivery of sediment, freshwater, and nutrients." CPRA's stated Project purpose and need was shared with the public during scoping meetings held during July 2017. During scoping, USACE indicated that CPRA's purpose and need for the Project would be considered in the development of USACE's purpose and need statement. USACE developed a draft purpose and need after taking into consideration the purpose and need from CPRA's Joint Permit Application, input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities of the EIS), and input from public scoping.

USACE's initial formulation of the EIS purpose and need was included in a draft Chapter 1 Introduction and Purpose and Need of the Draft EIS, which was circulated to the LA TIG and cooperating agencies for review and comment from May to October 2017. In October 2017, after the LA TIG finalized its draft Strategic Restoration Plan, the LA TIG requested that USACE re-visit the Draft EIS purpose and need. In January 2018, the LA TIG submitted a proposed revised statement of purpose and need in the form set forth in the Draft EIS. During a joint meeting between USACE, the Applicant (CPRA), the LA TIG, representatives of the Council for Environmental Quality (CEQ), and representatives of the FPISC held on January 25, 2018, the participants discussed proposed changes to the purpose and need. The CEQ and FPISC representatives were supportive of the changes to the proposed Project EIS purpose and need and USACE agreed to the change. Subsequently, CPRA submitted a revised Joint Permit Application to USACE on March 16, 2018 containing a revised purpose and need statement for the proposed Project that tracked the revised purpose and need statement for the EIS. Although the purpose and need changed, the Alternatives Working Group (AWG) (formed to identify alternatives to be evaluated in the EIS and consisting of representatives from USACE, representatives from the LA TIG, including the Applicant (CPRA), and representatives from NOAA, NMFS, USEPA, USFWS, USDOJ, and USDA, and the third-party contractor), continued to consider functional alternatives that are not diversions in the EIS. Chapter 2 Alternatives of the EIS explains how numerous functional alternatives did or did not meet the proposed Project purpose of reconnecting and reestablishing sustainable deltaic processes between the Mississippi River to Barataria Basin through the delivery of sediment, fresh water, and nutrients. The public, commenting agencies, and stakeholders had the the opportunity to comment on the revised purpose and need during the public comment period on the Draft EIS. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

In preparing its Restoration Plan, the LA TIG developed the goals and objectives for the proposed Project through an iterative restoration planning process, beginning with the restoration goals in the Final PDARP/PEIS then developing SRP/EA #3 for the restoration of habitat and ecological services in the Barataria Basin, and ending with Project-specific goals. The proposed MBSD Project has been developed to address the specific goals of the wetlands, coastal, and nearshore habitats restoration type; it would restore a variety of interspersed and ecologically connected coastal habitats, restore for injuries to habitats in geographic areas where the injuries occurred while considering

approaches that provide resilience and sustainability, restore habitats in appropriate combinations for any geographic area, and restore the ecological functions provided by those habitats. Tiering off of the PDARP/PEIS, the LA TIG evaluated various restoration alternatives in SRP/EA #3 and found that a combination of “marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats” (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed MBSD Project evaluated in the Restoration Plan.

Louisiana Trustee Implementation Group (LA TIG). 2018a. Final Strategic Restoration Plan and Environmental Assessment #3: Restoration of Wetlands, Coastal, and Nearshore Habitats in the Barataria Basin, Louisiana. Available online at: http://www.gulfspillrestoration.noaa.gov/sites/default/files/2018_03_LA_TIG_Final_SRP_EA_508-Compliant.pdf. Accessed: March 15, 2018.

Concern ID: 61875

The purpose and need is false and misleading and does not follow NEPA guidelines for a concise, basic, essential, and irreducible purpose. The statement is misleading by making the proposed Project itself part of the purpose. The DWH oil spill, including restoring for injuries caused by the DWH oil spill, has nothing to do with the proposed Project other than justifying its use as a source of funding.

Response ID: 15831

As described in Chapter 1, Section 1.4 Purpose and Need of the EIS, NEPA regulations (40 CFR 1502.13) state that an EIS “shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action.” The purpose and need statement should be clear and concise in order to facilitate development of a reasonable range of alternatives. USACE generally focused on CPRA’s purpose and need for the proposed Project and considered the public’s and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities), and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project’s purpose and need for the EIS.

Separate from the USACE process, as discussed in the PDARP/PEIS, the SRP/EA #3, and the Restoration Plan, the LA TIG found that impacts of the injuries from the DWH oil spill were particularly detrimental to the resources of the Barataria Basin, which were already in peril as a result of the separation of sediment-loaded river water by

levees, subsidence and a changing climate. In the Barataria Basin, marshes already suffering from significant coastal erosion experienced heavy oiling and subsequently experienced double or triple the rate of marsh loss. The Final PDARP/PEIS (DWH NRDA Trustees, 2016a) documented the nature, degree, and extent of injuries from the DWH oil spill to both natural resources and the services they provide, and the nexus between those injuries and need for restoration within the Barataria Basin. Evaluating restoration strategies that could restore for injuries in the Barataria Basin, the SRP/EA #3 found that a combination of “marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats” (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in the EIS and Restoration Plan. The LA TIG’s Restoration Plan concludes that the proposed Project would best restore for injuries caused by the DWH oil spill by reconnecting and reestablishing sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

Concern ID: 61877

The proposed Project would eventually and inevitably be made moot due to nature itself so it is not needed.

Response ID: 15833

The EIS acknowledges that the sediment deposition and land building that would occur as a result of the MBSD would occur against a backdrop of significant land loss in the basin and across the region due to subsidence and sea-level rise, so that even as diversion operations are increasing sediment deposition and land creation in the outfall area, some of this acreage would be lost over time due to these ongoing processes. Chapter 4, Section 4.2.3.2 in Geology and Soils of the EIS describes the land-building acreages projected over time due to the proposed Project. In the Final EIS, a discussion has been added to this section to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations.

As part of its restoration planning efforts, LA TIG considers reestablishing deltaic processes (including deltaic sediment deposition and transport of nutrients and fresh water from the Mississippi River to the basin) a critical component of sustaining and restoring wetlands, coastal, and nearshore habitats to help address ecosystem-level injuries in the Gulf of Mexico and to decrease land loss.

The LA TIG agrees that, with or without the proposed Project, coastal Louisiana and the Barataria Basin would experience tremendous land loss. However, the LA TIG believes this background of large land loss makes the habitat created by the proposed Project even more important. Relative to other types of incremental approaches (for example, marsh creation through the application of dredged sediment), the proposed Project would reconnect and reestablish sustainable deltaic processes and support the long-term viability of existing and planned coastal restoration efforts. The proposed Project would reestablish deltaic processes that deliver sediment, fresh water, and nutrients; improve the function of existing habitats; and successfully develop deltaic habitats that connect nearshore and offshore ecosystems. The LA TIG expects that the Project would result in the creation of a maximum of 17,300 acres of land in the Barataria Basin by year 30 of operations; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 of the LA TIG's Restoration Plan).

Concern ID: 62882**The understated cause of coastal land loss is dredging canals and building spoil banks, which diversions do not address.****Response ID: 15834**

The EIS acknowledges the influence of canals and spoil banks on wetland losses in Barataria Basin (see Chapter 3, Section 3.6.2.2.4 in Wetland Resources and Waters of the U.S. of the EIS), and the analysis has been updated in the Final EIS to include additional technical references regarding the influence of canals on the existing environment in the Barataria Basin. The EIS does not describe the proposed Project as a solution to fully reverse ongoing land-loss trends. The EIS recognizes that the proposed Project is projected to create and maintain only a portion of the wetlands that would otherwise be lost in the absence of the proposed Project over the next 50 years. In addition, Chapter 1, Section 1.2.1 in Project Background and Chapter 3, Section 3.1.4 in Introduction describes the historical reasons for coastal land loss within the Barataria Basin and notes that as a result of this coastal land loss, various agencies and non-governmental organizations have implemented coastal protection, restoration, and rehabilitation projects within the basin. CPRA has identified the proposed Project for implementation based on the recommendations in its Coastal Master Plan and identified large-scale sediment diversions as a restoration tool for sustainable ecosystem restoration to counter the basin-wide effects of erosive processes such as sea-level rise and subsidence.

CH11000 – Project Background

Concern ID: 62008	The commenter expressed concern that the DWH oil spill and development are causing the Gulf Coast ecosystem that sustains us to collapse.
Response ID: 16165	The concerns raised by the commenter were considered in the Draft EIS. Chapter 3, Section 3.1.4 Overview and History of the Project area provides an overview of the adverse impacts that the DWH oil spill and development have had on wetland habitat in the Project area.

CH12000 – Compliance with Other Laws, Regulations & Executive Orders

Concern ID: 62192	Commenter states that CPRA should coordinate with the local floodplain administrators to obtain any needed local permits.
Response ID: 15741	CPRA would be responsible for coordinating as needed with the appropriate floodplain administrator(s) regarding any necessary permits prior to Project commencement if the Project is approved by USACE and funded by the LA TIG.

Concern ID: 62193	A commenter asked why permits were granted for construction of residential homes if there was knowledge of a forthcoming diversion, and why these applicants were not made aware of the diversion when applying for permits.
Response ID: 15742	The USACE is evaluating whether to grant the State of Louisiana's (through CPRA) requested DA Section 10/404/408 permits for the proposed Project. Without those permits, the Project cannot proceed. The LA TIG cannot speak on behalf of the local permitting agency and their consideration of potential future projects in granting residential construction permits. The LA TIG has no authority over decisions regarding the construction or permitting of residential homes.

Concern ID: 62197	Commenter asked what the justification was for the waiver of the Endangered Species Act (ESA).
Response ID: 15744	No waiver of the Endangered Species Act was granted for this proposed Project. USACE initiated formal ESA Section 7 consultation with NMFS on February 24, 2021 and USFWS on July 2, 2021, including submission of a Biological Assessment to each of the Services which analyzes the potential impacts to ESA-listed species. This Biological Assessment, as well as the agencies' response in the form of a Biological Opinion, can be found in Appendix O (Biological Assessment and Biological Opinion) of the Final EIS.

Concern ID: 62198	Commenter asked if there is a signed waiver of the MMPA.
Response ID: 15745	Yes; the signed waiver can be found in Final EIS Appendix S (Compliance Documentation). Additional information about the MMPA waiver can be found at https://www.fisheries.noaa.gov/action/marine-mammal-protection-act-waiver-select-louisiana-coastal-master-plan-projects .
Concern ID: 62503	In the future, CPRA and the LA TIG must fully analyze how proposed and future oil and gas infrastructure would impact the Project and must take the position that permits that excavate or oil marshes would impact Project success and are, therefore, inconsistent with the Project.
Response ID: 15769	EIS Chapter 4, Section 4.25 Cumulative Impacts provides an analysis of the cumulative impacts of reasonably foreseeable future oil and gas infrastructure, including but not limited to the proposed NOLA Oil Terminal, Gulf Coast Methanol Complex, and Venture Global facility.
Concern ID: 62505	A commenter expressed the view that there is bias when the same industries who stand to benefit from the program also research the impact of the program; it is a conflict of interest.
Response ID: 15985	USACE is neither a proponent nor an opponent of the proposed Project. With respect to the EIS, USACE's third-party contractor, GEC, prepared the EIS based on its own research, expertise and review of scientific literature and based on technical reports and information submitted by the permit applicant, CPRA, LA TIG, and/or cooperating agencies. USACE and GEC reviewed such technical reports and information for technical accuracy and sufficiency and for objectivity. NMFS contributed to the portion of the EIS discussing marine mammals in the Project area in Chapter 3 of the EIS, and prepared the portion of the EIS discussing impacts on Marine Mammals in Chapter 4. The Delft3D modeling was performed by the Water Institute of the Gulf (Water Institute) for CPRA and the Water Institute provided information regarding the modeling used in the EIS. USACE and members of the LA TIG reviewed the model parameters and assumptions and determined that they were sufficient for the EIS. GEC executed an Organizational Conflict of Interest Certification attesting that it does not have any financial or other interest in the outcome of the USACE permit application and permission request process. Table 6-1 in Chapter 6 contains a List of Preparers identifying the primary authors of the EIS, their employers and their credentials. As USACE prepared the Draft EIS, draft chapters and sections and the Draft EIS were circulated to the members of the LA TIG and cooperating agencies for multiple rounds of review and comment. Commenters are not identified in the List of Preparers. See EIS Chapter 5, Section 5.2 for further explanation of the EIS preparation process.

Concern ID: 62507

Whether or not the CPRA feels compelled to affirmatively act to reduce impacts on BBES dolphins, the LA TIG's trust duties require that the LA TIG do so. LA TIG cannot allow one resource seriously impacted by DWH to be driven to functional extinction by a project intended to restore another resource.

Response ID: 15969

The LA TIG recognizes the significant impacts the proposed Project would have on Barataria Basin bottlenose dolphins, as discussed in detail in both the EIS and the LA TIG's Restoration Plan. The DWH oil spill resulted in the oiling of more than 1,100 kilometers of wetlands, nearly all of which were located in coastal Louisiana (DWH NRDA Trustees 2016). The heaviest oiling occurred in the Barataria Basin, resulting in substantial injuries to natural resources in the basin (DWH NRDA Trustees 2016). Recognizing that the resulting loss of marsh productivity affected resources throughout the northern Gulf of Mexico ecosystem, the State of Louisiana and the federal Trustees that negotiated the DWH Natural Resource Damages settlement allocated \$4 billion, almost half of the total settlement amount, to restoring Louisiana's wetland, coastal, and nearshore habitats.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources injured by the spill. See the Executive Summary and Section 3.2.1.5 of the Final Restoration Plan. The intended restoration of fresh water flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows.

However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 of the Final Restoration Plan for a discussion of how LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 of the Final Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory

waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project because they believe it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Consistent with the purposes of the proposed Project, the State of Louisiana has the duty, per the Budget Act, to minimize impacts on BBES dolphins. The MAM Plan (Appendix R2 to the Final EIS), the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), and Marine Mammal Intervention Plan (Appendix R5 to the Final EIS) include additional detail regarding the implementation of monitoring, stewardship, and adaptive management measures that would help mitigate potential impacts to bottlenose dolphins.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is

not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62508

The CPRA and LA TIG must revise their analysis of impacts on BBES dolphins in light of Marine Mammal Commission Study, and have incorrectly interpreted BBA18 language as exempting them from the need to take affirmative action to reduce impacts to marine mammals.

Response ID: 15970

The Final EIS includes an analysis of the impacts of the proposed Project on marine mammals, including bottlenose dolphins, in Chapter 4, Section 4.11 Marine Mammals. This includes the incorporation of Booth & Thomas (2021); Garrison et al. (2020); Schwacke et al. (2017) and additional analyses that were completed by Thomas et al. (2021) after the Draft EIS was released for public comment. The BBES dolphin impact conclusion in the Draft EIS was based in large part on Garrison et al. (2020), which predicted that only a "remnant population" of dolphins would continue to exist in Barataria Basin after diversion operations commenced. Thomas et al. (2021), a new study that built on this previous research, found more specifically that an "immediate and severe population-level decline" of 23 percent (95 percent CI 3 to 55 percent) would occur in the first year of operations. Their findings are consistent with the EIS determination of major, permanent adverse impacts to bottlenose dolphins. After the planned 50 years of operation, dolphins in three out of the four strata are predicted to be functionally extinct under the Applicant's Preferred Alternative, with the remaining Island stratum being severely reduced relative to the No Action Alternative (median predicted population size of Island stratum is 85 percent lower [95 percent CI 28-99] under the Applicant's Preferred Alternative than under the No Action Alternative). Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the Applicant's Preferred Alternative is 143 dolphins (95 percent CI 11-706) compared to 3363 (95 percent CI 2831-4289) under the No Action Alternative. In other words, the stock is predicted to be 96 percent smaller (95 percent CI 80-100) under the Applicant's Preferred Alternative than then No Action Alternative.

CPRA states that it is aware of its responsibility to minimize impacts on marine mammal species and population stocks, to the extent practicable and consistent with the purposes of the proposed Project per Section 20201(b) of the Bipartisan Budget Act of 2018. In recognition of the potential for collateral injuries from the proposed Project and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA would implement a suite of stewardship measures. See Section 3.2.1.1.5 of the LA TIG's Final Restoration Plan and Appendix R to the Final EIS. The LA TIG is also committed to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62492	Commenters suggested that no permit should be issued as this Project would violate federal law.
Response ID: 15746	Table 5.1-1 in Chapter 5, Section 5.1 Compliance with Laws, Regulations, and Executive Orders summarizes the Project's status of compliance with applicable federal statutes, executive orders, and policies. Final EIS Appendix S (Compliance Documentation) provides associated documentation of this compliance.
Concern ID: 62502	The Marine Mammal Protection Act waiver granted to allow this Project to circumvent compliance with the Marine Mammal Protection Act should be rescinded and the Project should be forced to go through the entire permitting process.
Response ID: 15968	The Bipartisan Budget Act of 2018, Public Law 115-123, included a requirement that the Secretary of Commerce (as delegated to the Assistant Administrator of the NMFS) "shall issue a waiver of (MMPA prohibitions and requirements)" for three projects, including the proposed MBSD Project. In accordance with this Congressional directive, NMFS issued the waiver on March 15, 2018. As directed by Congress, the waiver operates "for the duration of the construction, operation, or maintenance of the . . . projects." Congress would need to act to allow rescission of the waiver. More information on the waiver can be found at https://www.fisheries.noaa.gov/action/marine-mammal-protection-act-waiver-select-louisiana-coastal-master-plan-projects . The MMPA waiver does not alter USACE's or the LA TIG's NEPA responsibility to evaluate anticipated impacts of the proposed Project on marine mammals. The EIS analyzes and discloses the environmental and economic impacts of the proposed Project, including anticipated effects on marine mammals (see Chapter 4, Section 4.11 Marine Mammals). The NEPA process was not abbreviated to expedite review. All steps in the NEPA process have been followed to allow for public participation and transparency, including scoping, public review and comment periods.
Concern ID: 62504	This area should be protected by the Magnuson-Stevens Fisheries Conservation and Management Act of 1976.
Response ID: 15747	Estuarine and marine areas within the Project area are considered Essential Fish Habitat under the Magnuson-Stevens Fishery Conservation and Management Act. As required by that Act, USACE and the LA TIG formally requested essential fish habitat (EFH) consultation with NMFS on February 24, 2021, regarding the proposed Project. As a cooperating agency in the development of the EIS, NMFS provided technical input for the development of an EFH assessment. NMFS reviewed the EFH assessment and concurred with the USACE's findings of impacts on federally managed fisheries from the construction and operation of the proposed Project. NMFS included two conservation recommendations in its concurrence letter. USACE

and the LA TIG provided interim responses to the NMFS concurrence letter, both noting that they would provide a final response prior to the issuance of any Record of Decision for the Project. The EFH assessment, NMFS concurrence, and the USACE and LA TIG responses can be found in the Final EIS Appendix N (Aquatic Resources including Essential Fish Habitat Assessment).

Concern ID: 62506

Commenters noted that this Project is in direct violation of the Plaquemines Parish ordinance 14 - 52 which prohibits the granting of any permits in Plaquemines Parish regarding the construction and development of additional freshwater sediment diversion projects.

Response ID: 15989

The permit applicant, CPRA, is responsible for compliance with local laws and regulations applicable to the Project.

Concern ID: 62194

The passage of a MMPA waiver in Congress would allow the Project to move forward without adhering to federal measures to protect dolphins, and puts money and greed above the welfare of citizens and animals.

Response ID:15967

The USACE had no role in seeking a waiver from Congress, nor did any LA TIG federal agencies. The MMPA waiver does not alter USACE's or the LA TIG's NEPA responsibility to evaluate anticipated impacts of the proposed Project on marine mammals. The EIS analyzes and discloses the environmental and economic impacts of the proposed Project, including anticipated effects on marine mammals (see Chapter. 4, Section 4.11 Marine Mammals).

Congress passed the Bipartisan Budget Act of 2018, Public Law 115-123 (BBA-18), which recognized the consistency of the proposed Project, among other CPRA projects, with the findings and policy declarations in Section 2(6) of the MMPA. The BBA-18 included a requirement that the Secretary of Commerce, as delegated to the Assistant Administrator of the NMFS, issue a waiver of the MMPA moratorium and prohibitions for the proposed Project. As directed by Congress, on March 15, 2018, NMFS issued the waiver pursuant to BBA-18 and Section 101(a)(3)(A) of the MMPA: "National Marine Fisheries Service hereby issues this waiver pursuant to title II, section 20201 of the Bipartisan Budget Act of 2018 and section 101(a)(3)(A) of the MMPA for the three named projects, as selected by the 2017 Louisiana Comprehensive Master Plan for a Sustainable Coast. The requirements of sections 101(a) and 102(a) of the MMPA do not apply to any take of marine mammals caused by and for the duration of the construction, operation, or maintenance of the three named projects."

BBA-18 also required the State of Louisiana, in consultation with the Secretary of Commerce (delegated to NMFS), to the extent practicable and consistent with the purposes of the proposed Project, to minimize

impacts on marine mammal species and population stocks, and monitor and evaluate the impacts of the proposed Project on such species and population stocks.

More information on the waiver can be found at <https://www.fisheries.noaa.gov/action/marine-mammal-protection-act-waiver-select-louisiana-coastal-master-plan-projects>.

Concern ID: 62196

Commenter asked whether the Federal Government would enforce harder restrictions on harmful nutrients since the Project would remove part of a Federal levee.

Response ID: 15743

USACE regulates the discharge of dredged or fill material into waters of the United States under Section 404 of the Clean Water Act (CWA) and USACE is evaluating whether to grant a CWA Section 404 permit for the proposed Project. As part of its Section 404 permitting process, USACE evaluates whether the proposed discharge meets the USEPA's CWA Section 404(b)(1) Guidelines. Under the Guidelines, no discharge of dredged or fill material may be permitted if (among other things) the nation's waters would be significantly degraded. In its 404(b)(1) analysis, USACE evaluates a proposed discharge's effects on several components of water quality, including physical, chemical and biological characteristics. The CWA Section 404(b)(1) evaluation is not related to the proposed removal of a portion of the Mississippi River Levee and USACE's evaluation will comply with applicable laws and guidance. In addition, the Project is subject to applicable water quality standards through the CWA Section 401 water quality certification, which is administered by the LDEQ.

USACE and the LA TIG are not aware of current laws or regulations that would require harder water quality restrictions or requirements for the proposed Project due to its removal of a section of river levee to divert flow from the river into an adjoining basin. The EIS evaluates the impacts of diversion of Mississippi River water on water quality in the Barataria Basin, (see Chapter 4, Section 4.5.5 in Surface Water and Sediment Quality).

CPRA's Monitoring and Adaptive Management (MAM) Plan for the proposed Project includes water quality monitoring for nutrients and other water quality parameters. This monitoring data would inform future Project management decisions aimed at improving Project effectiveness and/or limiting ecological and/or human impacts when possible. Details regarding the MAM Plan are found in Section 4.27 Mitigation Summary of the Final EIS, and Appendix R2 (Monitoring and Adaptive Management Plan).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive

management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

CH13000 – Restoration and Project Goals and Objectives

Concern ID: 62796

Commenters questioned whether, based on limited scale of wetlands proposed to be constructed, the Project is worth the economic impacts on the communities, industry, and tourism.

Response ID: 16495

The economic impacts that the commenter highlighted were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, Section 4.14 Commercial Fisheries, Section 4.15 Environmental Justice, Section 4.16 Recreation and Tourism, and 4.20 Public Health and Safety. No related edits were made to these sections in response to the commenter's concern.

As part of its Section 10/404 permitting decision-making process, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

CPRA has updated its Mitigation and Stewardship Plan in response to public comments to expand support for job training and alternate business ventures, boat and facility improvements, marketing, and mitigation and stewardship measures (see Appendix R1 to the Final EIS).

These issues were also considered in the LA TIG's Draft Restoration Plan in Sections 3.2.1.5 (Avoids Collateral Injury) and 3.2.1.7 (Public Health and Safety). While these sections were not revised based on this comment, Section 3.2.1.1.5 (Alternative 1 Description - Associated Stewardship Measures) of the Final Restoration Plan has been revised to reflect the updates to the Mitigation and Stewardship Plan noted above.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62797

Commenters questioned the goals and objectives for this Project. They noted that, given the potential for environmental and economic impacts on other resources from this Project, whether the MBSD meets the NRDA criteria to restore for damages caused by the DWH oil spill. They also questioned whether the proposed Project would be appropriate, given that the main driver of wetland loss is historical coastal oil and gas development, not the oil spill. They noted that 80 percent of the acreage projected to be reclaimed or built through the MBSD is privately owned by oil and gas companies.

Response ID: 16606

USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore the damage caused by the DWH oil spill. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH spill in the Louisiana Restoration Area. As explained in the Final EIS, Appendix B2 DEIS Public Review and Public Meetings, Section 2.0 Agency Roles in the Responses to Public Comments, response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes, or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views.

In the Restoration Plan, the LA TIG explained that the DWH oil spill resulted in the oiling of more than 1,100 kilometers of wetlands, nearly all of which were located in coastal Louisiana (DWH NRDA Trustees, 2016). The heaviest oiling occurred in the Barataria Basin, resulting in substantial injuries to natural resources in the basin (DWH NRDA Trustees, 2016). Recognizing that the resulting loss of marsh productivity affected resources throughout the northern Gulf of Mexico ecosystem, the State of Louisiana and the federal Trustees that negotiated the DWH Natural Resource Damages settlement allocated \$4 billion, almost half of the total settlement amount, to restoring Louisiana's wetland, coastal, and nearshore habitats.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree of collateral injuries, to natural resources injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the LA TIG's Restoration Plan). The intended restoration of fresh water flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, as noted in the LA TIG's

Restoration Plan without the proposed Project, sea-level rise, subsidence, and other existing stressors would result in additional marsh loss over time reducing the suitability of habitat for many of the same species that occur in Barataria Basin.

The LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative because the LA TIG believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

In its Strategic Restoration Plan for Barataria Basin (2018), the LA TIG evaluated the potential and extent of collateral injury for a range of restoration techniques. Unfortunately, almost all large-scale restoration comes with some potential for collateral injury. The LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54. In the Restoration Plan, the LA TIG strives to identify an alternative that would provide what it considers the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. Again, see Section 3.2.4 of the Restoration Plan for a discussion of how the LA TIG came to its decision.

In recognition of the potential for collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA would implement a suite of mitigation and stewardship measures (see Section 3.2.1.1.5 [Associated Stewardship Measures] of the Restoration Plan and Appendix R1 to the EIS). The LA TIG is also committed through these measures to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The LA TIG acknowledges the concern regarding wetland loss drivers related to oil and gas activity, as well as the concern over the private ownership of the lands upon which wetlands would be created by the proposed Project. Regardless of the historic drivers of wetland loss, as explained in the Strategic Restoration Plan for Barataria Basin, because the Barataria Basin received the heaviest oiling from the DWH oil spill, the LA TIG believes that restoration activities in that basin are imperative.

With regard to the land ownership issue, the LA TIG's Restoration Plan details the reasoning supporting the location of the proposed Project, which is based on optimizing land building within the basin, regardless of ownership of the underlying land (see Section 2.3.3 [Restoration Planning Process – Proposed MBSD Project Location Alternatives] in the Restoration Plan). Private lands in the outfall area would be subject to the regular permitting processes required to conduct activities in the coastal zone. Activities on private lands would need to be in conformity with the Louisiana Coastal Zone Management Program, La. R.S. 49:214.21 and would be required to comply with the permitting requirements under the program. All coastal use permitting under the program must be consistent with the CPRA Master Plan projects. Additionally, private landowners would be required to comply with any other permitting requirements applicable to the area, including Department of the Army (DA) CWA Section 404 permits.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the

proposed Project, such measures would be required as special conditions of the DA Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62798

A commenter questioned the scale of the goals and objectives of comprehensive integrated ecosystem restoration in response to the DWH oil spill, noting it is overly ambitious. They suggested that DWH restoration focus on the impacts from the oil spill and not on comprehensive ecosystem restoration.

Response ID: 16496

USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore the damage caused by the DWH oil spill. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH spill in the Louisiana Restoration Area. As explained in the Final EIS, Appendix B2 DEIS Public Review and Public Meetings, Section 2.0 Agency Roles in the Responses to Public Comments, response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes, or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views. With respect to the Restoration Plan, the Record of Decision for the Final PDARP/PEIS, published on March 29, 2016, documented the selection of Alternative A: Comprehensive Integrated Ecosystem Alternative as the preferred restoration alternative that would provide ecosystem-scale restoration to partially offset ecosystem-scale losses. Alternative A in the PDARP/PEIS was not selected for the principal purpose of addressing coastal land loss. Rather, as explained in detail in the PDARP/PEIS, Alternative A was selected because the Trustees determined that the best approach to addressing the ecosystem-wide injuries resulting from the spill was to take an ecosystem approach to restoration. One key reason for this was that it was not possible to evaluate with certainty injuries to all of the species that were injured by the spill or to ascertain with precision the extent of injury to each species. The restoration strategy in

Alternative A addressed those uncertainties by emphasizing restoration of habitat types that are critical to the ecosystem that supports the species injured by the spill (including both known and unknown injuries), as well as restoring critical habitat such as coastal marsh that also was injured by the spill, particularly in Barataria Basin. In light of the basis for Alternative A in the PDARP/PEIS, the Project is a particularly appropriate means of implementing that preferred alternative because the restoration of deltaic processes builds marsh and sustains and enhances other existing marshlands, thus strengthening the key habitats that are the basis for the rich nearshore ecosystem that extends into the northern Gulf of Mexico.

Although the LA TIG recognizes the concern by the commenter that they would have preferred a different alternative for the Final PDARP/PEIS, the selection of Alternative A is not being reconsidered in the LA TIG's Restoration Plan. Given the previous selection of Alternative A in 2016, the LA TIG has the responsibility to identify restoration projects that would further the goals of comprehensive, integrated ecosystem restoration as described in the Final PDARP/PEIS. The LA TIG has done this through a series of plans, including the current plan being evaluated for a Mid-Barataria Sediment Diversion. The evaluation of the nexus between the Project and the injury that resulted from the DWH oil spill is presented in Section 2 of the Restoration Plan.

CH17000 – Public Participation Process

Concern ID: 61703

Locals who live and work in the affected area and would be adversely impacted by the proposed Project are disregarded by decision makers for the Project.

Response ID: 15733

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan. Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration Plan and the Draft EIS in its decision-making process. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project. For a summary of public outreach efforts related to the Draft

EIS refer to Chapter 7 Public Involvement of the Final EIS and for restoration planning see Section 1.8 of the LA TIG's Final Restoration Plan.

CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area over the past several years. In addition, since the release of the Draft EIS, CPRA has engaged the public through numerous meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61707

Commenter is concerned that adverse impacts on coastal communities would be disregarded when operating the proposed MBSD diversion, similar to how coastal communities were disregarded in past operation of the Caernarvon Diversion.

Response ID: 15734

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan. Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration Plan and the Draft EIS in its decision-making process. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area over the past several years. In addition, since the release of the Draft EIS, CPRA has engaged the public through numerous meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts. For a summary of public outreach efforts related to restoration planning see Section 1.8 of the LA TIG's Restoration Plan.

CPRA would operate the proposed MBSD Project as described in their Operations Plan. See Appendix F2, Preliminary Operations Plan in the Final EIS. In addition, see Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's

Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans. The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures, except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61707a

Commenter is concerned that adverse impacts on coastal habitats are being disregarded and that adverse impacts similar to those associated with the Caernarvon Diversion would occur.

Response ID: 15734a

Chapter 4 of the EIS contains a summary of the impacts that the Project is anticipated to have on coastal habitats. The commenter's concern regarding the effects of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts

on the natural environment. This summary, which includes discussions on the Caernarvon Diversion is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

Concern ID: 61753

Commenter is concerned that the government would stop spending money in Plaquemines Parish if the parish doesn't support the proposed Project.

Response ID: 15889

USACE is neither a proponent nor an opponent of the proposed MBSD Project. USACE's ongoing and future work in Plaquemines Parish has no connection to this Section 10/404/408 permit review.

CPRA and LA TIG decisions regarding funding for restoration projects, including in Plaquemines Parish, would be handled separately from the decisions related to the proposed MBSD Project. The LA TIG has previously funded restoration projects in Plaquemines Parish through the Natural Resource Damage restoration planning process, and would consider future projects based on the same OPA NRDA criteria that has been used in the past. CPRA's Coastal Master Plan includes both ecosystem restoration and flood protection projects in Plaquemines Parish.

Concern ID: 61754

Commenter expressed the view that decision makers prioritize the proposed Project benefits for New Orleans and disregard how the Project would impact Plaquemines Parish residents.

Response ID: 15890

As discussed throughout Chapter 4 Environmental Consequences of the EIS, operation of the proposed Project would have various beneficial (and adverse) impacts throughout the Barataria Basin that would not be restricted to those experienced by the greater New Orleans area. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. Further, based on the evaluation in the EIS and its OPA evaluation, the LA TIG considers the impacts of the proposed Project, both beneficial and negative to both the environment and the community, including Plaquemines Parish.

Concern ID: 61756

The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation and stewardship measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.

Response ID: 15891

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project

operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61757

Commenters recommended educating the public about the proposed Project as well as the impacts of the No Action

Alternative. There would be a benefit of continued education with the affected communities.**Response ID: 15893**

As part of the Draft EIS process, USACE prepared various materials to educate the public regarding the analysis and impacts included in the Draft EIS. This included an Executive Summary summarizing the details of the Draft EIS into a concise, easy to read, document. Additionally, at the beginning of the public comment period, CEMVN posted to the CEMVN's Project website several pre-recorded presentation videos consisting of an explanation of how to comment on the Draft EIS and/or LA TIG's Draft Restoration Plan, an update on the proposed MBSD Project design, information concerning the ongoing restoration planning efforts and the LA TIG's Draft Restoration Plan, and details about how to navigate and review the contents of the Draft EIS. These pre-recorded presentation videos were then consolidated into one presentation and played at the beginning of each of the three public meetings. This consolidated pre-recorded presentation was also translated into Spanish, Vietnamese, and Khmer and available on CEMVN's Project webpage. In addition, dedicated toll-free numbers were provided during the public comment period on the Draft EIS and LA TIG's Draft Restoration Plan through which Spanish, Vietnamese, and Khmer-speaking individuals could listen to the translated pre-recorded presentation.

Examples of public outreach provided by USACE for the EIS include providing special public notices for the permit application, the scoping process, and for the Draft EIS through newspapers, mail outs, and local libraries. USACE and the LA TIG also coordinated with the SELA Voice organizations to understand the needs of the local communities regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan and during the public comment period. Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the virtual public meetings on the Draft EIS and the LA TIG's Draft Restoration Plan. The Public Notice to announce the Draft EIS Notice of Availability, the Executive Summary for the Draft EIS, the Executive Summary for the LA TIG's Draft Restoration Plan, and the public meeting presentations were translated into Spanish and Vietnamese. As noted above, the consolidated pre-recorded public meeting presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage. As stated in Chapter 7 Public Involvement of the EIS, public engagement has been a vital element of developing and evaluating the proposed MBSD Project. Since 2016, CPRA has participated in nearly 200 outreach and engagement activities focused on the proposed MBSD Project, reaching more than 7,000 people. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to

be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. These outreach and engagement efforts provided the public with an opportunity to ask questions and obtain information about the proposed MBSD Project. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. A summary of these public engagement meetings and public outreach conducted by CPRA can be found in Chapter 7 Public Involvement of the Final EIS.

For more information about proposed Project's operational and adaptive management governance, see Final EIS Appendix R2: Monitoring and Adaptive Management (MAM) Plan. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to Project operations, riverside management, monitoring, maintenance, and adaptive management actions.

In addition, EIS Chapter 4, Section 4.24.3 Operations Impacts in Cultural Resources and Section 4.9 of the Final Mitigation and Stewardship Plan (in Appendix R1 to the Final EIS) discuss the NHPA process and mitigation for the proposed Project. The NHPA Programmatic Agreement developed for the proposed Project through the NHPA Section 106 consultation sets forth the alternative historic and cultural resources mitigation to be implemented by CPRA as part of implementing the Project. An Alternative Mitigation Plan is appended to the Programmatic Agreement and describes in detail the mitigation proposed to resolve adverse effects within the Operational Impacts APE. A website and public education materials are included in the Alternative Mitigation Plan as products to be developed through the alternative historic and cultural resources mitigation. The Programmatic Agreement is provided in Appendix K Cultural Resources Information of the Final EIS and attached as Appendix A to the Final Mitigation and Stewardship Plan located in Appendix R1 of the Final EIS.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project

effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61758

Commenter recommended communicating with people from diverse backgrounds to bring new solutions to practical issues.

Response ID: 15894

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan.

As part of the Draft EIS process, USACE coordinated with the SELA Voice organizations to understand the needs of the local communities regarding the best ways to reach out to these communities prior to the release of the Draft EIS and during the public comment period. Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the virtual public meetings. The Public Notice to announce the Draft EIS Notice of Availability, the Executive Summary for the Draft EIS, and the Executive Summary for the LA TIG's Draft Restoration Plan were translated into Spanish and Vietnamese. The consolidated pre-recorded public meeting presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage.

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in coastal restoration. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area, in an effort to reach out to individuals and

communities to gather information and feedback related to the proposed MBSD Project. In addition, since the release of the Draft EIS CPRA has held numerous in public meetings with the communities impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS.

Concern ID: 61760

Public meetings for this proposed Project, which would drastically alter our estuary forever, should have been in-person since the State of Louisiana is in a modified stage 3 and public gatherings are allowed. Holding virtual public meetings for a project of this importance is unfair to the hundreds that do not have computer skills or accessibility. Commenter requests that USACE and TIG hold in-person meetings regarding the proposed Project.

Response ID: 15895

USACE and the LA TIG held three joint public meetings for the Draft EIS and the LA TIG's Draft Restoration Plan in April 2021. These meetings were held virtually based on COVID-related restrictions in place at the time. Anyone interested in participating in the NEPA or OPA processes, or who wanted to learn more about the proposed MBSD Project and/or provide comments on the Draft EIS and/or the LA TIG's Draft Restoration Plan was able to participate in the meetings via an internet/web-based conferencing application or via toll-free telephone line. Spanish, Vietnamese, and Khmer translators facilitated participation by non-English speakers; key messages from the meeting presentations were translated during the meetings, and the translators were available to interpret participant comments in any of those languages.

At the beginning of the public comment period, CEMVN posted several pre-recorded presentation videos consisting of an explanation of how to comment on the Draft EIS and/or Draft Restoration Plan, an update on the proposed MBSD Project design, information concerning the ongoing restoration planning efforts and the LA TIG's Draft Restoration Plan, and details about how to navigate and review the contents of the Draft EIS on CEMVN's Project webpage. These pre-recorded presentation videos were then consolidated and played at the beginning of each of the three public meetings. This consolidated pre-recorded presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage. In addition, dedicated toll-free numbers were provided during the public comment period on the Draft EIS and Draft Restoration Plan through which Spanish, Vietnamese, and Khmer-speaking individuals could listen to

the translated pre-recorded presentation rather than watching the presentation on a computer.

Multiple ways to comment during the public review period were available including verbally during the virtual meetings, verbally by toll-free telephone number, written via the postal service, and electronically via email and on the comment portal website. In addition, CPRA offered opportunities through local non-profit organizations for the public to sit with representatives from local non-profit organizations who assisted the public in preparing comments regarding the Draft EIS and LA TIG's Draft Restoration Plan.

Printed copies of the Executive Summary of the Draft EIS and the LA TIG's Draft Restoration Plan in English, Spanish, and Vietnamese were provided to libraries and community centers/organizations (see list in Chapter 7 Public Involvement of the Final EIS and Chapter 6 of the LA TIG's Restoration Plan) for those able to visit those locations in person.

All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project. Any future public engagement meetings held regarding the proposed MBSD Project would follow applicable agency guidance for the safety of all participants.

Concern ID: 61953

The public participation process is flawed because the public participation for this proposed Project should extend beyond coastal Louisiana. Expanding certain public participation methods such as media events or environmental NGOs beyond coastal Louisiana would be productive for the proposed MBSD Project. This proposed Project is a great example of one option for restoration after an oil spill and there are likely people beyond Louisiana that have expertise in this field that could be helpful in the public participation process. Ensuring that the proposed Project is able to have the best possible commentary from experts in the field is essential to its success.

Response ID: 15897

The public participation process has been and would continue to be open to all public, agency, and stakeholder input regardless of geographic residence. USACE has provided multiple means for the public to engage in the permit and environmental review processes including providing public notices for the permit application and the scoping process, and for the Draft EIS through Federal Register notices, press releases, newspapers, email/mail outs to distribution lists, and libraries. Materials and information related to the proposed Project are available on the USACE New Orleans District website, including the Draft EIS at <http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>.

The virtual nature of the public meetings held for the Draft EIS and LA TIG's Draft Restoration Plan in April 2021 allowed participants from any geographic residence to participate in the meetings and provide verbal comments through a internet/web-based conferencing application or by telephone. Approximately 39,303 (out of 40,699) comments on the Draft EIS were received from outside the State of Louisiana.

CPRA and the LA TIG would continue to seek input from the public, agencies, and groups interested in and affected by coastal restoration, including the proposed Project if implemented, and other restoration efforts.

Concern ID: 61954

A commenter noted that they attended a scoping meeting in 2017 but were not able to comment.

Response ID: 15899

USACE regrets that the commenter was not able to comment during the 2017 scoping meetings. Note that there were multiple opportunities available to comment on the scoping meetings over a 60-day comment period including in-person orally via a court reporter, written on comment cards or letters either in-person or via the postal service, and via electronic mail.

Concern ID: 61955

Commenters are concerned that all those that are impacted may not be aware of the proposed Project, its impacts, or potential mitigation. There are many people that may not have the knowledge, time, or resources to be deeply involved in these issues, but who also have a stake in what is happening. Consider the needs of these people in making a decision about moving this proposed Project forward. If this proposed MBSD Project and similar projects move forward consider opportunities to better engage people across Louisiana's coast in the value of projects like these and why they are crucial to the future of our region.

Response ID: 15900

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan. Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration Plan and the Draft EIS in its decision-making process. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

USACE and the LA TIG conducted public outreach and provided public comment opportunities throughout the development of the Draft EIS and the LA TIG Draft Restoration Plan. Details on USACE's and the LA TIG's outreach activities and the opportunities provided for public participation can be found in Chapter 7 Public Involvement in the Final EIS.

Examples of public outreach provided by USACE for the EIS include providing special public notices for the permit application, the scoping process, and for the Draft EIS through Federal Register notices, press releases, newspapers, email/mail outs to distribution lists, and provision of hard copies of the Executive Summary and other materials to local libraries and community centers. USACE and the LA TIG also coordinated with the SELA Voice organizations to understand the needs of the local communities regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan and during the public comment period.

Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the virtual public meetings on the Draft EIS and the LA TIG's Draft Restoration Plan. Also, the Public Notice to announce the Draft EIS Notice of Availability, the Executive Summary for the Draft EIS, and the Executive Summary for the LA TIG's Draft Restoration Plan, were translated into Spanish and Vietnamese. The consolidated pre-recorded public meeting presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage.

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area, in an effort to reach out to community groups to gather information related to the proposed MBSD Project. Throughout the public comment period and concurrent with the preparation of the Final EIS and LA TIG's Final Restoration Plan, CPRA has engaged the public through meetings with the communities and groups projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. This included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. CPRA states that it would provide

additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented.

Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts. In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61956

Commenters suggested [USACE and/or CPRA] carefully listen to those impacted by the diversion and have constructive dialogue between stakeholders and CPRA. They recommended to commit sufficient funding and resources necessary to those impacted to sustain their lives and livelihood throughout the diversion process.

Response ID: 15902

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan. Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration Plan and the Draft EIS in its decision-making process. USACE and LA TIG each provided public outreach and comment opportunities throughout the development of the EIS and the LA TIG's Restoration Plan. Details on this outreach can be found in Chapter 7 Public Involvement in the Final EIS.

Since the release of the Draft EIS and the LA TIG's Draft Restoration Plan, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. This included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to

implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61957

Commenters are concerned with the lack of inclusion by CPRA. The CPRA held meetings, reached out to local communities throughout the process; however, the CPRA ignored most, if not all, of the input they received from the communities, shrimpers, crabbers, oyster fisherman, and others.

Response ID: 15903

Chapter 7 Public Involvement of the Final EIS includes a summary of meetings that CPRA held with the communities and groups projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities and groups. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. Refer to the Final Mitigation and Stewardship Plan in Appendix R1, which has been revised since the release of the Draft EIS in response to public input, for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61958

The ability of corporate interests to tilt the agency's decision by flooding it with supportive public comments undermines the fairness, transparency, and ultimate success of this proposed Project. USACE and NPS should be aware of the impacts of corporate-funded advocacy campaigns in support of this diversion.

Response ID: 15904

Comment acknowledged. Public participation is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

Concern ID: 61959

State government, elected officials, CPRA and other state agencies, and local jurisdictions must pivot to centering community expertise as they carry out the proposed MBSD

Project. This would open the door to creating a truly equitable restoration landscape; one where those impacted by the proposed MBSD Project and future coastal restoration projects are proactively engaged and consulted as restoration projects are planned, designed, and implemented.

Response ID: 15905

Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area, in an effort to reach out to community groups to gather information related to their concerns regarding proposed MBSD Project. More recently, CPRA has engaged the public through meetings with the communities impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities including fishers. This included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. A summary of these public engagement meetings and additional outreach can be found in Chapter 7 Public Involvement of the Final EIS. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that CPRA states it would implement as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is

not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61961

Request that CPRA, USACE, and NOAA/TIG work with Plaquemines Parish Councilmember of District 7, Councilmember LaFrance, Sr. to hold community meetings with District 7 communities, such as Ironton, Myrtle Grove and Wood Park, and engage in a question-and-answer session from community.

Response ID: 15906

Concurrent with issuance of the Draft EIS, CPRA has held several public meetings with the communities projected to be impacted by the proposed MBSD Project, including communities south of the diversion from Myrtle Grove south to Grand Bayou and Happy Jack, to solicit input on mitigation and stewardship strategies. Although the EIS indicates that the proposed MBSD Project would not have more than moderate impacts on Ironton, CPRA also held a public meeting in the community of Ironton.. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. CPRA will continue to coordinate regarding these meetings with the Plaquemines Parish government. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the

discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 67230	Commenters commended USACE, the LA TIG, and CPRA on the Restoration Plan, Draft EIS, and stakeholder engagement.
Response ID: 16950	Acknowledged.
Concern ID: 61962	The commenters commend the USACE and LA TIG for their efforts to ensure robust awareness and input into this process. Such engagement is critical to a successful restoration effort, and the commenters recognize the difficulty of designing an engagement process around a project of this scale and scope. The more than 200 public outreach and engagement events referenced in the Draft EIS and NRDA plan demonstrate a notable effort made by CPRA. It is essential that CPRA continue to maintain strong levels of engagement and transparent communication with affected stakeholders as this process progresses. The Final EIS should include a summary of comments and responses and should uphold and further elaborate upon the commitment stated in the Draft EIS (Appendix R2 Monitoring and Adaptive Management Plan, Section 2) for regular stakeholder engagement through the adaptive management program.
Response ID: 15907	USACE and LA TIG acknowledge the comment. Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan. Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where

to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration Plan and the Draft EIS in its decision-making process. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

USACE and LA TIG conducted public outreach and provided public comment opportunities throughout the development of the EIS and the LA TIG's Restoration Plan. Details on USACE's and the LA TIG's outreach activities and the opportunities provided for public participation can be found in Chapter 7 Public Involvement in the Final EIS. The Final EIS includes a Public Meeting Report which includes all comments submitted and the responses to those comments.

Examples of public outreach provided by USACE for the EIS include providing special public notices for the permit application, the scoping process, and for the Draft EIS through Federal Register notices, press releases, newspapers, email/mail outs to distribution lists, and provision of hard copies of the Executive Summary and other materials to local libraries and community centers. USACE and the LA TIG also coordinated with the SELA Voice organizations to understand the needs of the local communities regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan and during the public comment period.

Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the virtual public meetings on the Draft EIS and the LA TIG's Draft Restoration Plan. Also, the Public Notice to announce the Draft EIS Notice of Availability, the Executive Summary for the Draft EIS, and the Executive Summary for the LA TIG's Draft Restoration Plan, were translated into Spanish and Vietnamese. The consolidated pre-recorded public meeting presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage.

Throughout the public comment period and concurrent with the preparation of the Final EIS and the LA TIG's Final Restoration Plan, CPRA has engaged the public through meetings with the communities and groups projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities and groups. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward.

In addition, the Programmatic Agreement developed for the proposed Project through the NHPA 106 consultation sets forth the alternative mitigation to be implemented by CPRA as part of implementing the Project. A website and public education materials are included as products to be developed through the alternative mitigation. See Section 4.9 of the Final Mitigation and Stewardship Plan for the proposed Project (in Appendix R1 to the Final EIS).

Refer to Appendix R1 for the Final Mitigation and Stewardship Plan which describes mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts. Also refer to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 for a description of the adaptive management, governance, and monitoring that CPRA has committed to along with stakeholder engagement during the adaptive management process if the proposed MBSD Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA)

Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61963

The significant, and growing, local opposition to the proposed MBSD Project should be addressed prior to the diversion project continuing.

Response ID: 15908

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan.

All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

Concern ID: 61965

Commenter's recommend that CPRA and the USACE employ a comprehensive suite of communications tools and engagement approaches to share announcements, educate, and engage all interested interstate and regional stakeholders, and solicit broad public input in a coordinated, timely, and transparent manner. These tools could include, but should not be limited to, public meetings and workshops (virtual/in-person as appropriate), webinars, open houses, electronic newsletters, text messages, and social media platforms.

Response ID: 15910

USACE and the LA TIG, including CPRA, acknowledge the suggestions to employ a comprehensive suite of communication tools and engagement approaches to engage all interested stakeholders and would take these suggestions into consideration for future engagement efforts for the proposed MBSD Project. USACE maintains Project materials, including the EIS, on its public website. USACE and LA TIG held virtual public meetings accessible by everyone with access to the internet or a telephone for the Draft EIS and the LA TIG's Draft

Restoration Plan to comply with COVID-related restrictions in place at the time. These public meetings allowed verbal comments during the public comment portion in addition to providing multiple ways for a participant to comment. Spanish, Vietnamese, and Khmer translators interpreted the meeting and comments in real time. USACE has engaged with community groups to distribute information and materials about the proposed Project. CPRA has also engaged with communities that would be affected. See Final EIS Chapter 7 Public Involvement for a description of these efforts.

In addition, refer to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 for a description of the adaptive management, governance, and monitoring that CPRA has committed to along with stakeholder engagement during the adaptive management process if the proposed MBSD Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions.

CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

Concern ID: 62883

Frontline, and especially Indigenous, communities must have a greater say in restoration processes at all phases, from the very beginning of looking for potential restoration projects, all the way through implementation and monitoring. Traditional ecological knowledge (TEK) must be taken into account and considered with equal, if not greater, gravity as academic studies. CPRA should have meetings that include these Indigenous people, their voices, their understanding of the natural world and their compassion for the other entities of the coast.

Response ID: 16404

USACE and the LA TIG, including CPRA, acknowledge the comments and seek engagement and participation from all communities, the public, agency, and stakeholder groups wishing to be involved in the EIS and Restoration Plan processes. USACE and LA TIG coordinated with the SELA Voice organizations to understand the needs of the local communities, including Indigenous communities, regarding the best

ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan. Recommendations for where to make the Draft EIS and the LA TIG's Draft Restoration Plan available so it would be accessible to disadvantaged individuals and groups, as well as recommendations regarding translation of materials related to the Draft EIS and Restoration Plan, were implemented.

Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area, in an effort to reach out to community groups to gather information related to the proposed MBSD Project. In addition, CPRA has engaged the public through numerous meetings with the communities projected to be impacted by the proposed MBSD Project, including several Indigenous communities, to solicit input on mitigation and stewardship strategies. This includes reaching out to local non-profits to assist with and facilitate meetings with the impacted communities, including low-income, minority, and Indigenous communities. This input has resulted in substantial revisions to CPRA's Mitigation and Stewardship Plan since the release of the Draft EIS (see Appendix R1 to the Final EIS). A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. CPRA acknowledges the suggestion to consider traditional ecological knowledge and would take these suggestions into consideration for future engagement efforts. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 to the Final EIS for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

Also, as explained in Chapter 4, Section 4.24 Cultural Resources of the Final EIS, cultural resources consultations have been conducted in accordance with Section 106 of the National Historic Preservation Act. The Section 106 Consulting Parties included USACE (the lead federal agency), the State Historic Preservation Office, the Advisory Council on Historic Preservation, CPRA (the Applicant), LA TIG, and federally recognized Tribal Nations who expressed historic ties to the Barataria Basin. The Programmatic Agreement developed for the proposed Project through the NHPA Section 106 consultation sets forth the alternative mitigation to be implemented by CPRA as part of implementing the Project. This alternative mitigation involves a comprehensive research project regarding the historical cultures of the Indigenous Tribes of Southeastern Louisiana focusing on the Barataria Basin and the larger southeastern Mississippi River delta region to prepare a comprehensive ethnohistoric overview documenting Native American presence and history. A website and public education

materials are included as products to be developed through the alternative mitigation. See Section 4.9 of the Final Mitigation and Stewardship Plan for the proposed Project (in Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63575

The public should be fully informed about the level of funding that CPRA is proposing to fully implement its Mitigation Plan so that the public can meaningfully comment on the adequacy of the proposed mitigation.

Response ID: 15915

Details regarding the funding that will be available for mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for certain measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set

forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63580

CPRA should seek alternative outreach tools to reach typically hard to reach audiences including low-income, minority, and non-English speaking communities.

Response ID: 15914

USACE and LA TIG coordinated with the SELA Voice organizations to understand the needs of the local communities regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan. Recommendations for where

to make the Draft EIS and the LA TIG's Draft Restoration Plan available as well as translation of material related to the Draft EIS and Restoration Plan were implemented. USACE and LA TIG tailored the public meeting process for the Draft EIS and the LA TIG's Draft Restoration Plan based on COVID-related restrictions in place at the time. Public meetings were virtual and allowed an open exchange during the public comment portion. Meetings could be accessed via internet/web-based conferencing application or via telephone. Spanish, Vietnamese, and Khmer translators facilitated participation by non-English speakers; key messages from the meeting presentations were translated during the meetings and the translators were available to interpret participant comments in any of those languages.

In addition to the public meetings, commenters were able to submit their comments via multiple means. Dedicated toll-free numbers were provided through which English-speaking and non-English speaking individuals could listen to pre-recorded presentation information and provide public comment on the Draft EIS and LA TIG's Draft Restoration Plan in their language of choice. The pre-recorded presentation information consisted of an explanation of how to comment, an update on the proposed MBSD Project design, information concerning the ongoing restoration planning efforts and the LA TIG's Draft Restoration Plan, and details about how to navigate and review the contents of the Draft EIS. The Draft EIS was (and is) available on the USACE website. The LA TIG's Restoration Plan was also made available on the LA TIG's website.

The Executive Summary for the Draft EIS and the LA TIG's Draft Restoration Plan were translated into Spanish and Vietnamese and were available at libraries and community centers/organizations. The complete Draft EIS and Draft Restoration Plan with appendices were also available as either a printed copy and/or electronically (thumb drive) at these locations.

Since the release of the Draft EIS and the LA TIG's Draft Restoration Plan, CPRA conducted public outreach to communities projected to be impacted by the Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with impacted fishers and communities, including Indigenous communities and low-income and minority communities. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including through Coastal Connections meetings and use of community non-profit, non-governmental organizations for additional outreach. CPRA has also committed to stakeholder engagement and input during the adaptive management process if the proposed MBSD Project is implemented.

CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

Concern ID: 61964

CPRA has failed to hold any meetings about the proposed Project in the State of Mississippi as they have publicly promised they would do.

Response ID: 15909

The joint public meetings for the Draft EIS and the LA TIG's Draft Restoration Plan in April 2021 were held virtually through an internet web-based conferencing application due to COVID-related restrictions in place at the time. Participation and comments were not geographically limited to any particular location. Anyone interested in learning more about the proposed MBSD Project and/or who wanted to participate in the NEPA or OPA processes or who wanted to provide comments on the Draft EIS or the LA TIG's Draft Restoration Plan was able to participate in the meetings via the internet and/or a toll-free telephone line – including anyone located in Mississippi.

During each of these meetings, USACE and the LA TIG played a pre-recorded presentation that included information about how to comment on the Draft EIS and/or the Draft Restoration Plan, an update on the proposed MBSD Project design, information concerning the ongoing restoration planning efforts and the LA TIG's Draft Restoration Plan and details about how to navigate and review the contents of the Draft EIS. This pre-recorded presentation was also available in several languages including Spanish, Vietnamese, and Khmer.

Further, public meetings were not the only forum through which concerns could be shared. Many means to comment during this the public review period were available including verbally during the virtual meetings, verbally by toll-free telephone number, written via the postal service, and electronically via email and on the comment portal website. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

CH18000 – Agency Roles, Responsibilities, and Coordination

Concern ID: 62185	The commenter is concerned with the expedited permitting process and is opposed to cutting corners and changing rules or laws without fully determining the environmental or economic impact.
Response ID: 15738	While the Mid-Barataria Sediment Diversion Project permitting process is being conducted utilizing the Fixing America's Transportation Act (FAST-41) process, the process was not expedited. The intent of FAST-41 is enhanced coordination, transparency, predictability, and accountability in federal environmental reviews and authorizations. It does not modify any underlying statutes, regulations, or mandatory reviews. The environmental review and permitting processes has not cut corners, and through the EIS, USACE has analyzed and disclosed the environmental and economic impacts of the proposed Project. CPRA filed its DA permit application for the proposed Project in 2016 (revised in 2018). USACE expects a decision on CPRA's application in December 2022.
Concern ID: 62186	The commenter would like to know the view point of the National Park Service, Jefferson Parish Council, Lafitte Area Independent Levee District and Town of Lafitte on the proposed Project.
Response ID: 15765	Comments on the Draft EIS submitted by Mayor Kerner of the Town of Lafitte can be found in Appendix B2 (DEIS Public Review and Public Meetings) of the Final EIS. No formal comments on the Draft EIS were submitted by the National Park Service, Jefferson Parish Council or the Lafitte Area Levee District. All comments received have been fully considered and incorporated into this public comment and response appendix and all original comments received are included in the Final EIS.
Concern ID: 62187	The commenter believes that decisions have already been made to approve or fund the proposed Project.
Response ID: 15766	USACE, in its role as the lead federal agency, is responsible for preparing the EIS and ensuring fulfillment of the NEPA process with respect to its decisions on CPRA's Section 10/404 permit application and Section 408 permission request. The Final EIS will inform USACE decision making on the Department of Army Section 10/404 permit and Section 408 permission relative to the proposed Project. By regulation, the USACE is neither for nor against the proposed Project. USACE has not made any decision regarding the proposed Project and will not make a decision until it issues a Record of Decision after publication and public review of the Final EIS.

The LA TIG federal agencies (NOAA, DOI, USEPA, and USDA) participated in the NEPA process as cooperating agencies for the EIS to support LA TIG decision making on the Restoration Plan. The role of the LA TIG is to prepare a Restoration Plan to evaluate the Project and its alternatives under the requirements of the Oil Pollution Act (OPA). The LA TIG proposed a preferred alternative in the Draft Restoration Plan. Decisions regarding the selected alternative are made in the Final Restoration Plan and decisions regarding funding will not be made until the completion of all required administrative waiting periods.

Concern ID: 62188

The Draft EIS is not an objective analysis; the document has several errors which show a clear bias toward opposition to the proposed Project by favoring perspectives on controversial scientific issues surrounding Mississippi reintroduction that assert it would do more harm than good.

Response ID: 15767

The USACE and the LA TIG considered the best information and data available to them in their efforts to objectively evaluate the impacts of the proposed Project and its alternatives. Additionally, resource agencies with regulatory authority and subject matter experts for resources potentially impacted by the proposed Project engaged with USACE throughout the EIS development process to ensure an adequate and thorough analysis of Project impacts. Federal agencies that make up the LA TIG (NOAA, DOI, USEPA, and USDA) participated as cooperating agencies in the development of the EIS. The LA TIG intends to use the EIS to inform their decision under NRDA on whether to fund the implementation of the Project.

Concern ID: 62880

A fully implemented environmental study is critical to the future safety and viability of our most vulnerable communities. The federal permitting process for the diversion projects has not given the commenter the confidence to provide support for their implementation at this time. The commenter has questions surrounding the issuance of the Marine Mammal Protection Act (MMPA) waiver approved by Congress under the 2018 Congressional Budget Act that has led to the fast tracking of the (EIS) timeline by 3 years in the name of coastal restoration.

Response ID: 15740

While the Mid-Barataria Sediment Diversion Project permitting is being conducted utilizing the Fixing America's Transportation Act (FAST-41) process, the process was not expedited. The intent of FAST-41 is enhanced coordination, transparency, predictability, and accountability in federal environmental reviews and authorizations. It does not modify any underlying statutes, regulations, or mandatory reviews. Similarly, the MMPA waiver does not alter USACE's or the LA TIG's NEPA responsibility to evaluate anticipated impacts of the proposed Project on marine mammals. The EIS analyzes and discloses the environmental and economic impacts of the proposed Project, including

anticipated effects on marine mammals (see Chapter 4, Section 4.11 Marine Mammals). The NEPA process was not abbreviated to expedite review. All steps in the NEPA process have been followed to allow for public participation and transparency, including scoping, public review and comment periods. In recognition of the potential for collateral injuries from the proposed Project, and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA would implement a suite of mitigation and stewardship measures. See Section 3.2.1.1.5 of the LA TIG's Final Restoration Plan and Appendix R to the Final EIS. The LA TIG is also committed to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill. Section 20201(b) of the Bipartisan Budget Act of 2018 also requires the State of Louisiana, in consultation with the Secretary of Commerce (delegated to NMFS), to the extent practicable and consistent with the purposes of the proposed Project, to minimize impacts on marine mammal species and population stocks, and monitor and evaluate the impacts of the proposed Project on such species and population stocks.

Concern ID: 62881

The Louisiana Department of Wildlife and Fisheries (LDWF) appreciated the opportunity to be included in the collaborative writing process as part of the Louisiana Trustee Implementation Group (LA TIG) during the Draft Environmental Impact Statement preparation to ensure appropriate species of concern were considered and no important recreational or commercial species were omitted from impact determinations. The commenters concur with the recommendations made by the U.S. Fish and Wildlife Service in the Draft Fish and Wildlife Coordination Act Report (Draft EIS, Appendix T and summarized in Chapter 5) and look forward to remaining a collaborative partner as this EIS is finalized. Importantly, the commenters remain committed to participating fully in the continued development of the associated Mitigation Plan and Monitoring and Adaptive Management Plan.

Response ID: 15739

USACE appreciates LDWF's input into the Draft EIS and the Final EIS. CPRA and the LA TIG appreciate the agency's continued participation in the development of the Mitigation and Stewardship Plan and Monitoring and Adaptive Management Plan.

Concern ID: 64825

One commenter provided a link to NMFS correspondence submitted in response to CPRA's 2013 Solicitation of Views request from the early stages of Project planning.

Response ID: 16488

NMFS submitted a response to CPRA's Solicitation of Views in 2013. NMFS has participated as a cooperating agency in the development of the EIS for the proposed Project, providing information and technical analysis throughout the EIS development. Impact analyses associated

with NMFS' trust resources, which are living marine resources generally including certain marine mammals, sea turtles, marine fish and anadromous fish, shellfish, critical habitat, EFH, and aquatic habitat, can be found in Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S., Section 4.10 Aquatic Resources, Section 4.11 Marine Mammals, Section 4.12 Threatened and Endangered Species, and Section 4.14 Commercial Fisheries of the EIS.

CH20000 – NRDA Injury

Concern ID: 62677	A commenter identified that after all of the work that went into saving birds in the immediate time following the oil spill, it would be a waste of resources to let those efforts go to waste.
Response ID: 16498	The LA TIG agrees with the commenters that the immediate response efforts of saving birds and wildlife need to be followed by long-term restoration projects that benefit these resources. One of the primary goals of the Project is “to create, restore, and sustain wetlands and other deltaic habitats and associated ecosystem services.” These habitats provide food, shelter, and nursery grounds for numerous ecologically and economically important species, including birds that were the focus of immediate response efforts after the DWH oil spill.
Concern ID: 62678	Commenters recognized the challenges facing Louisiana and the connection between stabilizing the coastline and restoring the overall health of the ecosystem, which is the goal of the Restoration Plan.
Response ID: 16499	The LA TIG agrees with the commenters regarding the ecological challenges faced along Louisiana’s coastline. The impacts of DWH oiling were ecosystem-wide and spanned multiple trophic levels, necessitating an ecosystem-scale restoration effort. One of the goals of the Project is “to create, restore, and sustain wetlands and other deltaic habitats and associated ecosystem services.” That balance is discussed in Section 3.0 (OPA Evaluation of the Alternatives) of the LA TIG’s Restoration Plan, where its OPA evaluation addresses both the Project’s benefits to multiple resources as well as its ability to meet Trustee goals and objectives.
Concern ID: 62683	Commenters from Plaquemines Parish noted that they feel shortchanged; while the impacts of the oil spill are in their parish, they have not had the help from the State or BP.
Response ID: 16501	An overview of the impacts of the oil spill on Plaquemines Parish can be found in Section 2.1 (Parish and Community Descriptions) of the Socioeconomics Technical Report (Appendix H1 to the EIS). Effects

were most evident in ethnically diverse (for example, Black, Native American, Asian, and Cajun and Creole) south Plaquemines Parish, where the economy relies mainly on the oil industry and fisheries. The EIS evaluates the anticipated impacts of the proposed MBSD Project on the human environment (including ecological, economic, cultural, and social resource effects); that analysis includes looking at the existing conditions of various natural and socioeconomic resources that were affected by the DWH oil spill (see EIS Chapter 3 Affected Environment and Appendix H1 Socioeconomics Technical Report). The EIS projects that the diversion would have both adverse and beneficial impacts on Plaquemines Parish resources affected by the oil spill (see EIS Chapter 4 Environmental Consequences and Appendix H1 Socioeconomics Technical Report). The state's or BP's post-spill assistance to the residents of Plaquemines Parish is beyond the scope of the EIS.

The LA TIG acknowledges the commenters' concern that Plaquemines Parish has not received help after the impacts of the DWH oil spill. As described in the LA TIG's Restoration Plan, the LA TIG selected the location of the Project in the Mid-Barataria Basin in Plaquemines Parish because this location is close to oiled shorelines but farther away from additional erosive forces found in the Lower Barataria Basin.

Concern ID: 62685

Commenters reflected on their own experience with the DWH oil spill and the aftermath in Barataria Bay and expressed support for the diversion as a way to restore the ecosystem impacted by the spill.

Response ID: 16502

The LA TIG acknowledges the support for the Project from commenters who were active in the response to the DWH oil spill and continue to be concerned with the long-term health of the ecosystem. The LA TIG agrees that the Project would provide a critical element for comprehensive, integrated ecosystem restoration to address the injuries from the DWH spill.

Concern ID: 62687

A commenter suggested that the restoration goal should be clarified, noting the purpose should be to "restore elements injured" rather than "restore injuries" resulting from the DWH oil spill.

Response ID: 16503

The LA TIG acknowledges the commenter's close reading of the LA TIG's Draft Restoration Plan and agrees that the phrase "restore injuries" could be confusing to the reader. In the LA TIG's Final Restoration Plan, the phrase "restore injuries" has been replaced with the more common phrase "restore for injuries," as the goal is to restore what was injured.

Concern ID: 62689

Commenters noted the breadth of the injury from the fresh water released to help push back oil from the DWH spill on Louisiana's

Response ID: 16504	resources, including marsh islands, wetlands, crabs, white and brown shrimp, oysters and oyster reefs, dolphins, finfish and many species of birds.
	<p>The impacts of freshwater releases during the DWH response were considered in the Draft EIS. More specifically, Chapter 3, Section 3.14.3 (Oyster Fishery) and Section 3.10 (Aquatic Resources) of the EIS acknowledge the impact of the oil spill response on aquatic resources, including SAV, shrimp, oyster fisheries, and fish.</p> <p>The LA TIG agrees with the commenters that the impacts of the DWH, including the oil spill and the response actions, were an ecosystem-level injury affecting multiple resources and species. This includes the impacts from the releases of fresh water from Caernarvon and Davis Pond to push oil out of estuaries to reduce oil impacts to these habitats and the species that reside in them. Unlike the proposed Project, however, the release of fresh water in response to approaching oil was not planned in a way that allowed for a functional transition to a restored ecosystem. The LA TIG's Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin, which would benefit multiple resources. Injured resources not addressed in this Restoration Plan have either been addressed by previous restoration plans or are intended to be the focus of future restoration plans issued by the LA TIG.</p>
Concern ID: 62680	Commenters noted the long-term impacts that have been felt since the oil spill 10 years ago and supported using the natural land-building power of the Mississippi River to maintain and restore the health of the entire ecosystem for the future.
Response ID: 16500	<p>The long-term impacts of the oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss notes the ongoing impact of the DWH oil spill on wetland loss, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species provides an overview of the adverse impact of the oil spill on key aquatic species within the Barataria Basin.</p> <p>The LA TIG believes that reconnecting and reestablishing deltaic processes between the Mississippi River and Barataria Basin is critical for supporting the long-term viability of existing and planned coastal restoration efforts. These deltaic processes include sediment retention and accumulation and new delta formation. As discussed in Section 3.2.1.6 Benefits Multiple Resources of the LA TIG's Restoration Plan, through reconnecting and reestablishing these sustainable deltaic processes, the Project would help restore the habitat and ecosystem services injured in the northern Gulf of Mexico by the DWH oil spill.</p>
Concern ID: 63758	Commenters noted that the Deepwater Horizon (DWH) oil spill is not a primary or contributing factor in Louisiana's coastal land

loss and that instead, levees built for flood control purposes, including those built by the U.S. Army Corps of Engineers, have long been a cause of land loss and subsidence. They expressed that because the DWH oil spill is not a cause of wetland loss, there is no basis for the claim that the MBSD will restore impacts caused by the oil spill, and thus NRDA funds would be inappropriately used for the Project.

Response ID: 16607

The many factors contributing to land loss in Louisiana were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 in Wetland Resources and Waters of the U.S. acknowledges the multiple factors contributing to land loss in the Project area.

USACE's involvement with the proposed Project is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under the Clean Water Act Section 404 and River and Harbors Act, Sections 10 and 14 (33 USC Section 408). USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore damages caused by the DWH. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH spill in the Louisiana Restoration Area. Response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views, as explained in Section 2.0 Agency Roles in the Appendix B2 DEIS Public Review and Public Meetings.

As discussed in the PDARP/PEIS, the SRP/EA #3, and the LA TIG's Final Restoration Plan, the LA TIG found that impacts of the injuries from the DWH oil spill were particularly detrimental to the resources of the Barataria Basin, which were already in peril as a result of the separation of sediment-loaded river water by levees, subsidence, and a changing climate. In the Barataria Basin, marshes already suffering from significant coastal erosion experienced heavy oiling and subsequently experienced double or triple the rate of marsh loss. The Final PDARP/PEIS (DWH NRDA Trustees, 2016a) documented the nature, degree, and extent of injuries from the DWH oil spill to both natural resources and the services they provide, and the nexus between those injuries and need for restoration within the Barataria Basin. For example:

- The DWH oil spill resulted in over 1,100 kilometers of wetland oiling Gulf-wide. Approximately 95 percent of this marsh oiling occurred in coastal Louisiana, with the heaviest oiling in the Barataria Basin (PDARP/PEIS, Table 4.6-2; Nixon et al., 2015). The heaviest oiling occurred in marshes dominated by *Spartina alterniflora*, a perennial deciduous grass, and *Juncus*

roemerianus, a flowering plant species (Visser et al., 1998; Lin and Mendelssohn, 2012; Silliman et al., 2012). These marshes provide critical habitats for estuarine-dependent species throughout the Gulf of Mexico.

- The marsh edge was severely oiled and injured, and the impacts of this oiling were documented in the Barataria Basin. Growth rates of juvenile brown and white shrimp along this oiled marsh edge were reduced by up to 50 percent compared to those collected near shorelines that did not experience oiling (for example, Rozas et al., 2014; van der Ham and de Mutsert, 2014). Growth rates of red drum along heavily oiled marsh shorelines were also reduced by approximately 50 percent in 2010 relative to non-oiled shorelines, and these reduced growth rates persisted through at least 2013 (for example, Powers and Scyphers, 2016).
- Impacts of DWH oiling were ecosystem-wide, spanning multiple trophic levels. The negative effects of oiling on plants and lower trophic levels from the nearshore food web (for example, amphipods, shrimp, snails) caused a cascade of impacts on higher trophic levels.
- Substantial injury to marsh birds likely occurred. Birds that were present in the marsh habitat during the DWH spill were likely exposed to oil via multiple pathways. Heavily oiled marsh areas had extensive oiling on vegetation and soils, and contained oil-contaminated prey.
- Marsh grasses help maintain the habitat in the Barataria Basin by protecting the marsh edge from erosion. Extensive oiling and loss of marsh vegetation in the Barataria Basin created an acceleration of land loss following the oil spill. The accelerated erosion due to the spill resulted in the permanent loss of coastal wetlands over large portions of the Barataria Basin (see Table 2-1; Silliman et al., 2012, 2015, 2016; McClenachan et al., 2013; Zengel et al., 2015; Turner et al., 2016).
- Marsh edge serves as the gateway for the movement of organisms and nutrients between intertidal and subtidal estuarine environments. Injuries to a specific resource in the nearshore marine ecosystem could cause direct and indirect effects on offshore resources. For example, Gulf killifish, a key connector of energy between marsh and open Gulf waters, are among the largest of the Gulf forage fish and are preyed upon by wildlife, birds, and many sport fish. Water column resources injured by the spill include species from all levels in the northern

Gulf of Mexico food web, including estuarine-dependent species (DWH NRDA Trustees, 2016a).

Other examples of impacts on specific species and resources, as described in the PDARP/PEIS, demonstrate that the DWH oil spill created an ecosystem-level injury to the Gulf of Mexico that necessitates an ecosystem-level restoration strategy.

Evaluating restoration strategies that could restore for injuries in the Barataria Basin, SRP/EA #3 found that a combination of “marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats” in the basin and in the broader northern Gulf of Mexico (LA TIG, 2018, page 3-32). As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in the LA TIG’s Restoration Plan. The LA TIG finds that the proposed Project would best restore for injuries caused by the DWH oil spill by reconnecting and reestablishing sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

Concern ID: 62675

Commenters noted that the impacts of the DWH oil spill on wetlands, wildlife, birds, communities, and land loss are still felt by this region and in particular, Barataria Basin where 95 percent of the oiling occurred. These impacts are exacerbated by decades of saltwater intrusion, sea-level rise, and subsidence.

Response ID: 16497

The impacts of the DWH oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss of the EIS notes the ongoing impact of the DWH oil spill on wetlands, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species of the EIS provides an overview of the adverse impacts of the oil spill on key aquatic species within the Barataria Basin.

The LA TIG agrees with the commenters that the impacts of the DWH oil spill are significant in this region and thus the LA TIG is committed to continuing to plan and implement significant restoration projects like the LA TIG’s Preferred Alternative in the Restoration Plan. The LA TIG’s Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin. These habitats are critical components of the broader northern Gulf of Mexico ecosystem and suffered the greatest degree of oiling in Louisiana due to the DWH oil spill.

CH21000 – SRP Outcomes

Concern ID: 62636	Despite concerns expressed about the potential harm that a large-scale sediment diversion could have on bottlenose dolphins in the Barataria Basin, the LA TIG finalized the SRP/EA #3 in March 2018, selecting as its Preferred Alternative a suite of restoration approaches that included the proposed Project.
Response ID: 16608	<p>USACE was not involved in the SRP/EA #3. USACE is not involved in the process to restore damages caused by the DWH oil spill.</p> <p>As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, response content pertaining to the LA TIG’s Draft Restoration Plan, the OPA and/or NRDA processes or other Trustee Planning was developed by the LA TIG and states only the LA TIG’s views.</p> <p>In the SRP/EA #3, the LA TIG evaluated the extent to which the alternatives would prevent future injury as a result of the Deepwater Horizon (DWH) oil spill and avoid collateral injury including furthering impacts to bottlenose dolphins in the Barataria Basin. It found that marsh creation projects in Barataria Basin can help prevent future erosion injuries to marsh vegetation and soils in areas that suffered increased erosion as a result of the DWH oil spill. Restoration of marsh habitat also helps prevent future injury to estuarine-dependent resources, such as fish, crustaceans, and marsh birds that lost supporting habitat through the oil spill and through subsequent increased erosion. The SRP found that the operation of a large-scale sediment diversion would result in reductions in salinity in the Barataria Basin, and that reduction would adversely impact BSE marine mammals, including the stock of bottlenose dolphins in Barataria Bay, possibly resulting in illness and death.</p> <p>USACE’s Draft EIS evaluated impacts to bottlenose dolphins in Chapter 4, Section 4.11 Marine Mammals. As stated in that section, changes in salinity projected to occur as a result of operating the diversion are anticipated to have major, adverse, permanent impacts on the bottlenose dolphin population within the Barataria Basin. No edits based on this comment were made to Chapter 4 of the Final EIS.</p> <p>These potential impacts to marine mammals were also included and considered by the LA TIG in its Draft Restoration Plan (see Section 3.2.1.5 [Avoids Collateral Injury]). As with the EIS, because these impacts were considered in the Draft Restoration Plan, no related edits were made to the main body of the Final Restoration Plan.</p> <p>In recognition of the potential collateral injury to bottlenose dolphins and in response to public comments on this issue, CPRA would be</p>

responsible for ensuring the implementation of four key stewardship measures as part of the proposed Project to benefit dolphins in Louisiana; the last of these has been developed since the release of the Draft Restoration Plan in response to public concerns about potential marine mammal impacts. They are:

- A state-wide stranding program for 20 years intended to improve the survival and health outcomes of marine mammal populations injured by the DWH spill, especially coastal and estuarine stocks of bottlenose dolphins. Enabling a more rapid response to a live stranded cetacean would increase that animal's chance of survival by reducing the time spent on the beach, reducing stress on the animal, providing rapid treatment, and, if appropriate, transport to an authorized rehabilitation facility for additional treatment and care. In addition, this program would improve diagnoses of the causes of illness and death in cetaceans to better understand natural and anthropogenic threats, which would inform restoration planning and monitoring and adaptive management (see Section 3.2.1.1.5 [Associated Stewardship Measures – Alternative 1] of the Final Restoration Plan).
- Activities that would reduce stressful interactions between dolphins and humans, such as: reducing dolphin mortalities associated with recreational fishing; reducing illegal fishing of dolphins; and assessing and mitigating the impacts of marine vessels, noise, and other threats on marine mammals in the Barataria Basin. See Section 3.2.1.1.5 (Associated Stewardship Measures – Alternative 1) of the Final Restoration Plan for more details.
- Additional stranding surge capacity in response to unusual marine mammal mortality events (see Section 3.2.1.1.5 [Associated Stewardship Measures – Alternative 1] of the Final Restoration Plan).
- A Marine Mammal Intervention Plan, which outlines a spectrum of response actions for dolphins affected by the operation of the diversion, ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. For more information, see Appendix R5 to the Final EIS.

In considering the operation of the diversion, CPRA developed a detailed MAM Plan to evaluate the proposed MBSD Project's benefits

and impacts on the Barataria Basin and consider how the management of the diversion may be adapted to better meet Project goals (see Appendix R2 [Monitoring and Adaptive Management Plan] to the EIS). In addition to performance monitoring to measure progress toward the proposed MBSD Project's restoration objectives, and to better understand the ecological functions and services provided by the proposed Project, the MAM Plan also includes monitoring to characterize the nature and extent of potential collateral injuries. CPRA's adaptive management strategies to minimize impacts to BBES dolphins from Project operations include a framework for coordinating stranding response activities during operations, and a post-operational commitment to evaluate the ability of diversion operations to be modified to meet Project goals while reducing impacts to marine mammals. Marine mammal related monitoring and adaptive management activities have been updated since the release of the Draft EIS to include more details regarding the process through which operational data would be used to evaluate potential modifications to those strategies and protocols.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship

Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63327

The Draft EIS lacks a reasonable range of alternatives under the National Environmental Policy Act (NEPA) because the LA TIG's Environmental Assessment (EA) conducted through SRP/EA #3 was insufficient. While the public was invited to comment on the TIG SRP/EA#3, it goes without saying that an EA is not as detailed as an EIS. The commenter stated that the decision making conducted in the TIG's SRP/EA #3 should have been conducted by the TIG in an EIS instead of an EA because the purpose of an EIS is to apprise decision makers of the disruptive environmental effects that may result from their decisions during that stage of the planning process when there are a maximum range of options (see Conner, 848 F.2d at 1446). Taking actions in the interim that could limit those options undermines the purpose and effectiveness of the NEPA process.

Response ID: 16609

The range of reasonable alternatives evaluated in the EIS was based on alternatives that would satisfy the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. The LA TIG and CPRA crafted CPRA's statement of purpose and need, which built on the LA TIG's analyses in SRP/EA #3, including its initial screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need statement and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the purpose and need.

As described in Chapter 2 of the EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were evaluated, including other available coastal restoration tools and methods. The screening criteria included key concepts from the purpose and need including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; and supporting the long-term viability of existing and planned coastal restoration projects; and consistency with the SRP/EA #3 and the Louisiana Coastal Master Plan. Based on a review of the various alternatives against these

criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2 Alternatives, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were eliminated from further detailed analyses as described in Chapter 2, Section 2.6 (Summary of Alternatives Considered But Eliminated From Detailed Analysis). Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

With respect to analyses conducted in the SRP/EA #3, the LA TIG built on the Final PDARP/PEIS and its recommendation that strategic restoration planning could be beneficial to focus on a particular region. The SRP was utilized to transition from the PDARP/PEIS's programmatic, comprehensive scale to a tiered, geographically specific evaluation that assessed restoration strategies that could restore injuries in the Barataria Basin. This resulted in the preparation of SRP/EA #3. The LA TIG found, based on its evaluation in the EA portion of the SRP/EA that: (1) the PDARP/PEIS included a thorough evaluation of the potential range of environmental effects that could result from the various restoration approaches and techniques analyzed in the PDARP/PEIS; (2) the analysis of the environmental consequences of those approaches and techniques in the PDARP/PEIS remains valid; (3) the effects of the restoration approaches and techniques, including the projects selected for further planning and environmental review, evaluated in the SRP/EA were within the range of impacts evaluated in the PDARP/PEIS; and (4) any new information regarding the environmental consequences of the restoration approaches and techniques, including the projects selected for further planning and environmental review, evaluated within SRP/EA #3 were within the range of and consistent with the environmental impacts identified and analyzed within the PDARP/PEIS. The LA TIG's review of the environmental effects of the restoration techniques considered in SRP/EA #3, as well as comments submitted by the public, did not reveal any substantial change in the action evaluated in the PDARP/PEIS; or any new information indicating significant environmental issues or circumstances presented by application of the restoration techniques and approaches specifically in the Barataria Basin. As a result, the LA TIG concluded that the EA completed with the SRP was sufficient and consistent with applicable NEPA requirements.

CH22000 – Process of Alternatives Identification, Screening, and Analysis

Concern ID: 61879

Commenters questioned why other alternatives are not being considered other than No Action and a sediment diversion with various levels of flow rates. CEQ's regulations require that the EIS rigorously explore and objectively evaluate all reasonable alternatives, which is a requirement that the Draft EIS does not meet. Consider analyzing a range of other alternatives, options, and tools that better preserve and protect the environment and minimize the severe impacts to Louisiana fisheries, the communities, and the entire Gulf Coast ecosystems.

Response ID: 15835

The range of reasonable alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2 of the Draft EIS (Alternatives), an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2, Sections 2.2

through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in its SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in its Restoration Plan. The LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

Concern ID: 61883

Define a Plan that focuses on building Spartina marsh to help restore for the injuries caused by the DWH oil spill.

Response ID: 15838

USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore the damage caused by the DWH oil spill. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH oil spill in the Louisiana Restoration Area. As explained in the Final EIS, Appendix B2 DEIS Public Review and Public Meetings, Section 2.0 Agency Roles in the Responses to Public Comments, response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views.

With respect to the Restoration Plan, the commenter is correct in noting the extensive injury to Spartina from the DWH oil spill and the importance of marsh edge and Spartina in wetland productivity. However, the overall injury in Louisiana and the Barataria Basin from the DWH oil spill impacted shorelines as well as many of the species of flora and fauna that rely on those shorelines. To address the scale of ecosystem-level injury and current state of ecosystem decline in the Barataria Basin, in its “Strategic Restoration Plan and Environmental Assessment #3: Restoration of Wetlands, Coastal, and Nearshore Habitats in the Barataria Basin, Louisiana” (LA TIG 2018) the LA TIG selected for further development a large-scale sediment diversion to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin and contribute to the ecosystem-level restoration necessary in Barataria Basin, beyond restoring for only Spartina marsh. By implementing the proposed Project, the MBSD is expected to make ecosystem-level improvements, including benefits to Spartina marsh wetlands ecosystems broadly.

Louisiana Trustee Implementation Group (LA TIG). 2018. Final Strategic Restoration Plan and Environmental Assessment #3: Restoration of Wetlands, Coastal, and Nearshore Habitats in the Barataria Basin, Louisiana. Available online at: http://www.gulfspillrestoration.noaa.gov/sites/default/files/2018_03_LA_TIG_Final_SRP_EA_508-Compliant.pdf. Accessed: March 15, 2018.

Concern ID: 63601

The basis for alternatives development involved various groups including the Applicant which is a conflict of interest and disregards NEPA requirements for reasonable alternatives that are practical or feasible.

Response ID: 15839

As explained in Chapter 2, Section 2.2 Steps Taken to Identify and Evaluate Reasonable Alternatives of the EIS, the alternative development process was conducted by an Alternatives Working Group (AWG) led by USACE in coordination with LA TIG (comprised of federal and state agencies, including the Applicant CPRA), and cooperating federal and state agencies. The USACE is the lead federal agency in preparing the EIS and coordinates with other agencies with jurisdiction by law or special expertise acting as cooperating agencies (see EIS Chapter 1, Section 1.8 Agency Roles and Responsibilities of the EIS). The USACE as the lead federal agency is primarily responsible for implementing the NEPA process for the EIS. The LA TIG will also use the EIS to inform the NRDA decision under OPA regarding funding the construction of the proposed MBSD (see EIS Chapter 1, Section 1.6.1, in Scope of the EIS). A Memorandum of Understanding (MOU) between the USACE and the federal and state cooperating agencies established the Project Federal Coordination Team (NOAA, NMFS, USEPA, USDOJ, and USDA) and allowed the integration of the State, including CPRA, significantly into the environmental review and

authorization process to the extent authorized by law. NOAA's National Marine Fisheries Service and DOI's United States Fish and Wildlife Service retained independent discretion to make regulatory decisions under their respective statutory authorities. Refer to Appendix D1 Alternatives Working Group Summary of the EIS for additional details on the AWG.

The AWG collaborated to identify a reasonable range of alternatives to be carried forward for detailed analysis in the EIS that met the requirements for the NEPA review process associated with each federal action (Section 10/404 and Section 408 for USACE; NRDA funding for LA TIG). The AWG worked to refine and conduct the alternatives screening process to evaluate a wide range of alternatives, taking into consideration feasibility, practicability, location, design, and operation in an objective and transparent manner. The screening process was a multi-agency review process and considered information available from previous studies, decision-making needs of the lead agency (USACE) and cooperating agencies, NEPA requirements (for example, 40 CFR 1502.14), NRDA restoration planning efforts, information and modeling input provided by CPRA, and public and agency scoping comments.

Concern ID: 63615

While marsh creation projects are powerful at building land in strategic locations, at the end of the day they fail to sustainably address one of the causes of land loss (lack of continued sediment input), and the scale is severely limited due to restricted amounts of suitable borrow material. In addition, the types of sediment that a sediment diversion will convey highlights a marked difference with marsh creation. Therefore, it is not the case that marsh creation projects provide the same benefits as diversions.

Response ID: 15840

The commenters' support for the Project is acknowledged. Table 2.3-1 in EIS Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives describes whether various alternatives, including a large-scale sediment diversion into Barataria Basin and a large-scale marsh creation project, met the screening criteria for the proposed Project. Additional information related to the marsh creation alternative has been added to Section 2.3.5 Large-Scale Marsh Creation for the Final EIS.

Concern ID: 64382

A cost-benefit analysis should be taken into consideration for the proposed Project.

Response ID: 15841

NEPA does not require that an EIS contain a cost-benefit analysis unless it is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of the proposed project and therefore, does not require a financial cost-benefit accounting for its decision. However, as part of its

permitting decision, USACE conducts a public interest review, which weighs the probable harms of a proposed project against its prospective benefits.

Consistent with OPA regulations, the LA TIG has evaluated in the Restoration Plan a range of alternatives based on multiple criteria including the cost to carry out each alternative, the likelihood of success, the extent to which future injury will be prevented and avoid collateral injury, the extent of benefits to more than one natural resource, and the effect on public safety. This analysis can be found in Section 3 of the LA TIG's Restoration Plan.

Concern ID: 61880

Commenter expressed concern regarding societal choices the Project presents such as whether to prioritize the economic well-being of one industry or the economic sustainability of the region at large.

Response ID: 15836

Under NEPA, the EIS was prepared to analyze environmental impacts, both beneficial and adverse, that may result from construction, operation, and maintenance of the proposed MBSD Project and its reasonable alternatives. Proposed measures to avoid, minimize, and mitigate impacts on resources were also suggested by CPRA and have been summarized in Chapter 4, Section 4.27 Mitigation Summary and in CPRA's Final Mitigation and Stewardship Plan in Appendix R1 of the Final EIS. As part of its decision-making process, USACE will conduct a public interest review in which the project's probable harms will be weighed against its prospective benefits.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is

not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61881

The Mid-Barataria Sediment Diversion has been well researched, the range of alternatives evaluated in the Draft EIS is reasonable and meets the purpose and need, and seems a prudent plan of action versus the choice of doing nothing.

Response ID: 15837

The commenter's support of the proposed Project is acknowledged.

CH23000 – Functional Alternatives

Concern ID: 61991

CPRA has chosen an inland project in an area where there was zero or minimal direct impacts from the DWH oil spill. Consider an appropriate realignment of CPRA priorities to use DWH oil spill settlement funds to directly restore areas directly impacted by the spill, such as Bay Jimmy, the Cat Islands, Elephant Island, Dutch Island, Beauregard Island, and Mendicant Island. To use funds outside the impact zone seems outside of what is urgent and proper.

Response ID: 16017

Chapter 2, Section 2.4.1 in Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow of the Draft EIS described the screening analysis conducted to evaluate the alternatives based on geographic location. In addition, the EIS considered a barrier island alternative as a functional alternative to the proposed Project. While the EIS acknowledges that barrier islands play a critical role in reducing land loss, this alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.4 in Step 1: Evaluation of Functional Alternatives for details on why this barrier island alternative was eliminated from further analysis in the EIS.

The LA TIG identified the Barataria Basin in the SRP/EA #3 as the location for the proposed Project because within Louisiana, the Barataria Basin suffered the most severe and persistent oiling from the

DWH oil spill. It is also an “area of critical need” due to its significant and continuing land loss. As part of the LA TIG’s restoration planning efforts, the Restoration Plan describes their coordination with other Gulf Restoration Programs to maximize the overall ecosystem impact of DWH NRDA restoration efforts through use of DWH oil spill funds (see Section 1.8 in SRP/EA #3).

The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining marsh ecosystem in the Barataria Basin that more closely resembles historic conditions. This sustained marsh ecosystem is expected to benefit many fish and wildlife species in the basin south of Lafitte, including many of those negatively affected by the spill, such as red drum, largemouth bass, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species.

In addition, the LA TIG’s Restoration Plan indicates that these benefits would not only accrue throughout the Barataria Basin but, through the transport of marsh productivity, also in the offshore ecosystems of the northern Gulf of Mexico. As stated in the Restoration Plan, by reestablishing deltaic processes, the proposed MBSD Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

Concern ID: 61995

Commenters suggested that restoration of the Barataria Basin would be nearly impossible if the proposed MBSD Project is not permitted, and Louisiana is at an extremely crucial decision point. The coastal wetlands are starving for sediment input. Dredging alone cannot save the wetlands, the processes that originally built them must be reestablished.

Response ID: 16018

The commenter’s support of the proposed Project is acknowledged. The EIS acknowledges that a large-scale sediment diversion meets the purpose and need of the proposed Project while large-scale marsh creation does not meet the purpose and need. Details on marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. Additional information related to the marsh creation alternative has been added to Section 2.3.5 Large-Scale Marsh Creation for the Final EIS.

Concern ID: 61996

A commenter inquired about what sustainable, efficient options are available to hold onto wetlands and support other coastal restoration and protection investments as sea-level rise increases.

Response ID: 16014

The Draft EIS considered sea-level rise in the assessment of impacts of the proposed Project alternatives. Refer to Chapter 4, Section 4.1.3.2

in Approach to Evaluation of Environmental Consequences for a description of how the Delft3D Basinwide Model factors in sea-level rise projections. Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S. of the Draft EIS found that the proposed MBSD Project would have beneficial impacts on wetlands in the Barataria Basin where wetlands would be sustained and created by the diversion of sediment and fresh water from the Mississippi River.

CPRA's Louisiana Coastal Master Plan evaluates other options for coastal restoration taking into account future sea-level rise. The implications of sea-level rise are also a component in the design and development of all LA TIG restoration projects.

Concern ID: 61997

A commenter suggested that USACE consider looking at other options including diversions through more than one watershed.

Response ID: 16013

The geographic scope of this EIS is the Barataria Basin and the Mississippi River birdfoot delta. The purpose and need for the proposed MBSD Project is specific to the Barataria Basin and a diversion outside of the basin would not meet that purpose and need. CPRA and the LA TIG targeted Barataria Basin for restoration because, in addition to the high rates of erosion occurring in the basin, wetlands in the Barataria Basin experienced some of the heaviest and most persistent oiling and associated response activities from the DWH oil spill. CPRA is currently seeking a DA permit for another large-scale sediment diversion in the Breton Sound Basin, the Mid-Breton Sediment Diversion (see Chapter 4, Section 4.25 Cumulative Impacts).

Concern ID: 61999

A commenter provided a specific reference for use in the EIS regarding diversions and coastal wetland restoration/creation. (Turner RE, Boyer ME 1997. Mississippi River diversions, coastal wetland restoration/creation and an economy of scale. Ecological Engineering 8: 117-128)

Response ID: 16331

The reference has been reviewed, included in the list of references, and some additional information has been included in Chapter 2, Section 2.3.7 Multiple Small-Scale Diversions of the Final EIS.

Concern ID: 62000

The proposed MBSD Project design should be enhanced to provide regular water flows and sediment loading (via moveable slurry pipelines, or similar systems) to areas that can benefit most between Lafitte and Grand Isle.

Response ID: 16016

Chapter 2, Section 2.3.6 in Step 1: Evaluation of Functional Alternatives of the Draft EIS evaluated an alternative that includes a sediment diversion with marsh creation. Refer to this section for additional details on why this alternative was eliminated from detailed analysis. It was determined that marsh creation activities have been and are likely to continue to be implemented in the basin and are reasonably foreseeable. Reasonably foreseeable marsh creation activities are

considered in the cumulative impact sections of the EIS (see Chapter 4, Section 4.25 Cumulative Impacts).

If this comment is referring to piping sediment directly into the conveyance channel to maximize sediment/water ratio, such an alternative was determined not to be practical or feasible from a technical or economic standpoint. Utilizing the lateral bar adjacent to the diversion in the Mississippi River as a sediment source for the piped sediment would decrease the efficiency of the diversion and availability of sediment. Piping sediment from a more distant source would not be cost efficient due to the distance and maintenance of the pipeline and could result in impact to navigation. Further, piping sediment directly into the conveyance channel could alter the movement of sediment within the channel, increasing maintenance costs. (See EIS Chapter 2, Section 2.4.4 in Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow and Appendix D2 Eliminated Alternatives Matrix.

The LA TIG notes that it has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Restoration Plan 3.3: Upper Barataria Large-Scale Marsh Creation Project). These activities would complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

Concern ID: 61998

The true cost of acreage created by diversions is higher than acreage created by dredging because the cost of adverse negative impacts to our seafood industry among other things.

Response ID: 16015

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

The impacts on the seafood industry were considered in the Draft EIS. The EIS acknowledges in Chapter 3, Section 3.14.7 in Commercial Fisheries that the seafood industry represents a major source of jobs and income in Louisiana, which includes commercial harvesters, seafood processors and dealers, seafood wholesalers and distributors, and retail sales. Chapter 4, Section 4.14 Commercial Fisheries discusses regional economic impacts and community impacts on the shrimp, oyster, crab, and finfish fisheries, noting that communities with a high reliance on these landings may be most heavily impacted, and

that indirect effects may include impacts to fish license holders, crew, dealers, suppliers, and seafood processors.

The cost effectiveness of the proposed Project was evaluated in the LA TIG's Restoration Plan. While the commenters suggest that marsh creation through dredging would cost less than the proposed Project, the LA TIG does not believe that comparing the costs of a sediment diversion to marsh creation projects using dredged material captures the benefits of the proposed Project. Most importantly, as explained in the LA TIG's Restoration Plan, the goal of the proposed Project is to create a long-term sustainable ecosystem through the reestablishment of deltaic process. Marsh creation through the use of dredged material would not bring fresh water or nutrients to the basin on an ongoing basis, and therefore would not nourish surrounding wetlands on an ongoing basis. Furthermore, assuming an initial dredge placement event with no further maintenance, the benefits of marsh created with dredged material would diminish relatively quickly compared to marsh created by the proposed Project due to subsidence, erosion, and sea-level rise; thus, the temporal nature of proposed Project benefits would also be markedly different. For these reasons, the LA TIG believes that comparing the costs of dredge placement to the costs of the diversion does not capture the full picture of the diversion's ecological benefits. The costs and benefits of the proposed Project were considered and discussed in the LA TIG's Draft Restoration Plan. No related edits have been made to the Final Restoration Plan.

Finally, while the proposed Project involves implementing a large-scale sediment diversion in the Barataria Basin, the Applicant also proposes to place suitable dredged and excavated material in three beneficial use areas, resulting in localized elevation increases that are expected to result in the establishment of wetland vegetation. Therefore, the Project is projected to provide marsh creation benefits using both the diversion of fresh water and sediment, as well as through dredged material placement.

CH24000 – Location Alternatives

Concern ID: 61865

Commenters asked why the location was chosen as the site for the proposed MBSD Project, since it is so close to and impacts the Myrtle Grove Subdivision.

Response ID: 15936

Chapter 2, Section 2.4.1 Evaluation of Location Alternatives under Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow in the Draft EIS, detailed the evaluation of alternatives based on geographic location and the

reasoning for selecting the proposed location for the MBSD Project. Consideration for the location of the proposed MBSD Project took into account the proximity of the diversion intake to a point bar in the Mississippi River that could serve as a continuous, long-term sediment source for the diversion in combination with the outfall location and receiving basin being well suited to gain benefits from a sediment diversion, the potential for accretion of sediment in the Barataria Basin, and the creation, maintenance, and sustainability of existing and future wetlands and marshes. In addition, previous studies have considered several general locations for a sediment diversion from the Mississippi River into the Barataria Basin, including the upper, middle and lower parts of the basin and were used in the evaluation in the EIS. The impacts of the proposed MBSD Project and its alternatives, particularly on Myrtle Grove, can be found in Chapter 4 Environmental Consequences under each of the Project's resources.

Concern ID: 63999

Commenters asked to consider the alternative of building a sediment diversion near Edgard to end the need to open the Bonnet Carré Spillway.

Response ID: 15937

Chapter 2, Section 2.4.1 Evaluation of Location Alternatives under Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow in the Draft EIS, detailed the evaluation of alternatives based on geographic location and the reasoning for selecting the proposed location for the MBSD Project. Consideration for the location of the proposed MBSD Project took into account the availability of sediment from the Mississippi River, the potential for accretion of sediment in the basin, and the creation, maintenance, and sustainability of existing and future wetlands and marshes. While Edgard is located within the defined proposed Project area which is the Barataria Basin and the Mississippi River birdfoot delta, it is located within the Upper Barataria Basin. During the EIS alternatives analysis process it was determined that alternatives in the Upper Barataria Basin would not meet the purpose and need. Siting the diversion in the Upper Barataria Basin would promote the long-term sustainability of existing marshes since the marshes are still relatively intact and more protected from the combined influence of erosion, relative sea-level rise, and saltwater intrusion relative to the lower reaches of the basin. However, it would not effectively promote the sustainability of newly created marsh or restoration of degraded marsh in the middle or lower basin, which is where the need to restore new and preserve existing marsh is greater than in the upper basin due to sea-level rise and coastal erosion (see Chapter 2, Section 2.4.1.3 Application of Additional Considerations to Potential Alternative Locations in Upper, Middle, or Lower Barataria Basin).

The LA TIG identified the Barataria Basin in their restoration planning as the location for the proposed Project because it suffered the most

severe and persistent oiling from the DWH oil spill. In addition, CPRA's Louisiana Coastal Master Plan does consider other diversions for the Pontchartrain Basin including the Maurepas Diversion (River Reintroduction into Maurepas Swamp).

Additionally, the purpose of the proposed MBSD Project is not flood risk reduction. USACE operates the Bonnet Carré Spillway for emergency flood control and the spillway's design capacity is 250,000 cfs, much greater than the proposed MBSD. Building a sediment diversion near Edgard would likely not negate the need for operation of the Bonnet Carré Spillway, although that question has not been analyzed as part of this Project.

CH26000 – Outfall Features

Concern ID: 61867

Commenter requested that the EIS explain whether there is any proof that the marsh terrace outfall features would perform and function as proposed in the Draft EIS.

Response ID: 15938

Chapter 2, Section 2.5 Step 3: Evaluation of Sediment Diversion Outfall Features of the EIS discusses the evaluation of sediment diversion outfall features as part of the screening process for alternatives. Marsh terracing has been widely implemented in the past as part of coastal restoration projects to build and retain marsh areas and the federal agencies represented on the LA TIG and CWPPRA Task Force have utilized or endorsed the use of marsh terraces. Marsh terraces are a design feature engineered to enhance deposition and retention of suspended sediments, reducing turbidity, increasing marsh-edge habitat, increasing overall primary and secondary productivity, and maximizing access for marine and estuarine organisms. To understand how the marsh terrace outfall features would perform as part of the MBSD Project, Delft3D Basinwide Modeling was used, which aided in informing the analysis as presented in Chapter 4 Environmental Consequences of the EIS.

Concern ID: 61868

Alternative designs in the outflow area should be considered to minimize the impacts due to the outflow into the Barataria Basin.

Response ID: 15939

Alternative outfall features that could potentially expedite Project-related benefits were considered in the Draft EIS. As part of the Applicant's Preferred Alternative, CPRA incorporated features into the design of the Project to aid in expediting anticipated Project benefits (see Section 2.8.1.1.2 Basin Outfall Area and Delta Formation Area). These features include beneficial use of material from construction of the diversion channel to create marsh in designated areas within the outfall area, and an outfall transition feature. Due to public scoping

comments received, the EIS also considered potential features in the outfall area such as canals, bayous, impoundments, weirs, and chenier-like ridges to manipulate the flow of water and sediment for water quality and sediment retention benefits, to create barriers for storm surge and wind, and to redirect waters away from oyster production and sensitive areas. However, these features were eliminated from consideration because of the potential for such features to impede delta formation. Refer to Chapter 2, Section 2.5 Step 3: Evaluation of Sediment Diversion Outfall Features for evaluation of these alternative outfall features as part of the alternatives screening process.

In consideration of public scoping comments, and because of the possibility of expediting anticipated Project-related benefits, while not interfering with the proposed Project's purpose, two types of outfall features (in addition to construction of the outfall transition feature and beneficial use of material from the diversion channel) were reviewed for further consideration in the Draft EIS. These included ridges and marsh terraces outside of the area where the delta would be expected to initially form. After evaluating these two outfall features, marsh terracing was chosen as a Project feature in the range of alternatives to be analyzed further in the EIS because marsh terraces are often used to reduce wave energy within an area, to protect eroding or recently restored shorelines, or to promote sediment deposition and resultant benefits. See Section 2.5.1 Additional Considerations.

CH27000 – Alternatives Considered but Eliminated

Concern ID: 61966

The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.

Response ID: 15971

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and

nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred

Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

Concern ID: 61970

The only alternatives in the EIS are diversions at different flow rates. The EIS has not listed other possible methods on building land in the Barataria Basin. One alternative is to study the creation of barrier islands and compare the result with the diversion alternative. Also consider fortifying the barrier islands with sheet piles, boulders, and rocks, and dam all pipeline canals and washed-out marsh openings with concrete dams.

Response ID: 15972

The Draft EIS considered barrier islands as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.4 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS. While barrier islands play a critical role in reducing land loss, they are not intended or designed to transport sediment, fresh water, or nutrients.

Past investments through a multitude of restoration programs have resulted in the restoration of every major barrier island in the Barataria Basin. CPRA's Coastal Master Plan includes programmatic barrier island restoration to support future maintenance of the restored islands. However, CPRA has stated that fortifying barrier islands with hard structures is not feasible.

Concern ID: 61971

Commenters noted that consideration of multiple smaller and less intrusive diversions would be better suited than one large one that changes everything and destroys a way of life.

Response ID: 15973

The EIS considered multiple small-scale diversions as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.7 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS, including the lack of appropriate range of sediment sizes and increased cost. Additionally alternatives with a single, smaller (50,000 cfs) diversion have been carried forward for detailed evaluation in the EIS; this includes the 50,000 cfs with terraces feature alternative.

Concern ID: 61973

Consider dredging the passes (south pass and south east pass) to relieve pressure on rising rivers and let the natural process of

Response ID: 15974	<p>building the river there, along with rock jetties along the Louisiana coastline, support growth and protect from oncoming storms. Then use dredging to build up specific areas inland.</p> <p>This alternative as presented, specifically dredging the passes and building rock jetties to create marsh, would not meet the goals and objectives as stated in the purpose and need and described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives in the EIS. Similar to marsh creation alternatives (as described in Chapter 2, Section 2.3.5 Large-Scale Marsh Creation), it would not deliver enough fresh water, nutrients, and fine sediments to sustain existing and created wetlands beyond the marsh creation area and over the long-term would require repeated lifts and maintenance through placement of additional dredged material. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.</p> <p>Other similar restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan, which will be updated in 2023, and by the LA TIG through Natural Resource Damage restoration planning.</p>
Concern ID: 61974	<p>Consider the alternative that consists of a combination of diversions and dredging.</p>
Response ID: 15975	<p>The EIS considered a sediment diversion combined with marsh creation alternative as a functional alternative to the proposed Project. See the explanation in Chapter 2, Section 2.3.6 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why combination alternatives were eliminated from further analysis in the EIS.</p>
Concern ID: 61976	<p>Instead of the diversion, consider using berms or living shorelines along the coast line to help reduce coastal flooding. The berms would hold back the soils and help build the land behind them.</p>
Response ID: 15976	<p>The Draft EIS considered a shoreline protection alternative (including berms and living shorelines) as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.3 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS.</p>
Concern ID: 61977	<p>While other restoration project types, such as marsh creation, have been suggested in lieu of large-scale diversions, these project types would fail to build and sustain significant amounts of land in the Barataria Basin over the 50-year Project lifespan due to subsidence, sea-level rise, and erosion. Dredging alone cannot save the wetlands, the processes that originally built them must</p>

be reestablished. The power of the river allows more land-building potential to be harnessed than could be had with dredges at a fraction of the cost, and the benefits are long-lasting, even in the face of sea-level rise and hurricanes.

Response ID: 15977

The commenter's support of the proposed Project is acknowledged. The EIS concludes that a large-scale sediment diversion meets the purpose and need of the proposed Project while large-scale marsh creation does not meet the purpose and need. Details on marsh creation alternatives including sustainability and the reasons for elimination from further detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. Additional information related to the marsh creation alternative have been added to Section 2.3.5 Large-Scale Marsh Creation for the Final EIS.

Concern ID: 61978

Commenter inquired how much more land could be built by dredging as compared to the land that the diversion would build.

Response ID: 15978

Details on marsh creation alternatives including sustainability and the reasons for elimination from further detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. Additional information related to the marsh creation alternative has been added to Section 2.3.5 Large-Scale Marsh Creation for the Final EIS. Because the marsh creation alternative was screened out, the EIS does not contain such a comparison.

Further, the LA TIG does not believe that comparing a sediment diversion to marsh creation projects using dredged material captures the benefits of the proposed Project. Most importantly, as explained in the LA TIG's Restoration Plan, the goal of the proposed Project is to create a long-term sustainable ecosystem through the reestablishment of deltaic process. Marsh creation through the use of dredged material would not bring fresh water or nutrients to the basin on an ongoing basis, and therefore would not nourish existing and created wetlands on an ongoing basis. Furthermore, assuming an initial dredge placement event with no further maintenance, the benefits of marsh created with dredged material would diminish relatively quickly compared to marsh created by the proposed Project due to subsidence, erosion, and sea-level rise; thus, the temporal nature of proposed Project benefits would also be markedly different. For these reasons, the LA TIG believes that simply comparing land-building capabilities of dredging and against a sediment diversion does not capture the full picture of the diversion's ecological benefits. The costs and benefits of the proposed Project were already considered and discussed in the LA TIG's Draft Restoration Plan.

Finally, while the proposed Project involves implementing a large-scale sediment diversion in the Barataria Basin, the Applicant also proposes

to place suitable dredged and excavated material in three beneficial use areas, resulting in localized elevation increases that are expected to result in the establishment of wetland vegetation. Therefore, the Project is projected to provide marsh creation benefits using both the diversion of fresh water and sediment, as well as through dredged material placement.

Concern ID: 61980

The permit application does not give adequate consideration to alternative methods of achieving the purpose. The permit application gives consideration only to different sizes of diversions. This forces a decision to implement a diversion of some size. It ignores other alternatives for achieving the purpose that are less expensive, provide immediate storm protection, and promote wildlife-based industries such as the sports-fishing, shrimp, crab, and oyster industries. For example, it gives no consideration to the use of inshore islands.

Response ID: 15979

CPRA's permit application requests USACE authorization of the Applicant's Preferred Alternative (75,000 cfs sediment diversion with 5,000 cfs base flow). The EIS evaluates the Applicant's Preferred Alternative and a range of reasonable alternatives, including No Action, based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS consistent with CEQ NEPA regulations. As described in Chapter 2 Alternatives of the EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan.

Details of the screening process including screening criteria are described in Chapter 2 Alternatives, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS. Similar to marsh creation alternatives, inshore islands typically involve dredging and movement of sediment to increase the elevation of uplands to create, or improve the abundance and quality of, nesting habitat for birds. Inshore islands would not meet

the goals and objectives as stated in the purpose and need in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives of the EIS.

Prior to USACE's preparation of the EIS and the LA TIG's preparation of the Restoration Plan, the LA TIG evaluated restoration strategies that could restore injuries in the Barataria Basin in SRP/EA #3. In that document, the LA TIG found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in the Restoration Plan. However, it is worth noting that the LA TIG has also funded, and will continue to fund, other types of restoration projects that provide ecosystem services lower in the basin (for example, the Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Chapter 2, Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of the process the LA TIG used to identify alternatives for its SRP/EA#3. See Chapter 4, Section 4.25 Cumulative Impacts of the EIS for a discussion of marsh creation projects in the Barataria Basin that are anticipated to provide complementary ecosystem services with the proposed Project.

Louisiana Trustee Implementation Group (LA TIG). 2018. Final Strategic Restoration Plan and Environmental Assessment #3: Restoration of Wetlands, Coastal, and Nearshore Habitats in the Barataria Basin, Louisiana. Available online at: http://www.gulfspillrestoration.noaa.gov/sites/default/files/2018_03_LA_TIG_Final_SRP_EA_508-Compliant.pdf. Accessed: March 15, 2018.

Concern ID: 61982

Consider using suction dredge of Mississippi River beneficial material in South Pass, Pass A Loutre, Tiger Pass and other tributaries to pump the river sand material through pipelines. This material can be delivered up to 25 - 30 miles upriver and could be used to build a series of ridges that can be planted with sustainable foliage.

Response ID: 15980

This alternative as presented, specifically dredging the passes and other tributaries and creating marsh, would not meet the goals and objectives as stated in the purpose and need in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives of the EIS. Similar to

marsh creation alternatives (as described in Chapter 2, Section 2.3.5 Large-Scale Marsh Creation), it would not deliver enough fresh water, nutrients, and fine sediments to sustain existing and created wetlands beyond the marsh creation area and over the long term would require repeated lifts and maintenance through placement of additional dredged material to maintain a marsh elevation despite subsidence and sea-level rise. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Other similar restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan, which will be updated in 2023, and by the LA TIG through Natural Resource Damage restoration planning.

CH28000 – New Project Ideas Suggested but not Previously Evaluated

Concern ID: 61885	Consider the alternative of reducing the size of Bay Long Pass and 4 Bayou Pass to slow the tide water and save land instead of implementing the proposed MBSD Project.
Response ID: 15981	<p>This alternative as presented, specifically reducing or narrowing the passes, would not meet the goals and objectives as stated in the purpose and need as described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.</p> <p>Other similar restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan, which will be updated in 2023, and by the LA TIG through Natural Resource Damage restoration planning.</p>
Concern ID: 61886	Consider changing the operating plan for Davis Pond and coordinate both diversions to maximize environmental benefits.
Response ID: 15982	<p>There are no plans at this time to change the operating plan for the Davis Pond Freshwater Diversion Project. As discussed in Chapter 5, Section 5.3 Fish and Wildlife Coordination Act Report Recommendations of the Draft EIS, as part of the Fish & Wildlife Coordination Act consultation, USFWS has recommended, and CPRA has agreed to develop a basin-wide operations and basin monitoring</p>

data repository to help in the general coordination among diversion operators, within their authorizations.

As part of the evaluation of the proposed Project and potential alternatives, the Delft3D Basinwide model runs and the EIS assumed operations of other diversions consistent with their current or anticipated operational protocols, including the Davis Pond Freshwater Diversion for the hydrodynamic and water quality simulations. The Davis Pond Freshwater Diversion was not included in the Delft 3D morphological modeling simulations.

Based on Delft3D Basinwide Modeling results, proposed MBSD Project operations are expected to reduce the frequency with which the Davis Pond Freshwater Diversion would be operated during certain months of the year to meet its current operational guidelines. Refer to Chapter 4, Section 4.5.7 in Surface Water and Sediment Quality of the EIS for further details on the projected number of days for the Davis Pond Freshwater Diversion opening. Potential impacts to the Davis Pond Freshwater Diversion will be further considered as part of the 408 process for the proposed MBSD Project.

Concern ID: 61888

Consider the alternative of allowing the levees to sink, erode, and collapse down to a normal height with annual widespread overflow distribution of the sediments in the historic and gentle way that would not have the sudden, disruptive impacts as seen with existing and planned diversions. Restoration of natural processes is the best way to replenish and preserve our renewable natural resources.

Response ID: 15983

This alternative of removing levees and restoring natural processes is not feasible and was not considered further because levees are necessary for flood risk reduction for the communities and industries that line the Mississippi River in Barataria Basin. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Concern ID: 61890

Consider suggestions such as barging in wood chips and placing in shallow waters, and using old sunken ships and barges to build land.

Response ID: 15984

Suggestions such as barging in wood chips and other organic material to the sediment deposited by the diversion or building upon old sunken ships and barges would not meet the scope and the scale of the proposed Project or its purpose and need, and therefore, would not be practicable. While alternative materials such as these may fill in small-scale areas, fill material such as these would not address the proposed Project's purpose of restoring deltaic processes to the Barataria Basin. Therefore, they were eliminated from further consideration. This

alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Concern ID: 61892

Consider including in the design of the diversion the planting of black, red, and white mangroves to create and sustain land in the Barataria Basin, as well as planting bald or related species cypress trees to aid in the retention of land. Even dead trees would stabilize the soils.

Response ID: 15986

The Draft EIS acknowledged impacts on wetland vegetation and terrestrial vegetation due to the proposed MBSD Project in Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S. and Section 4.9 Terrestrial Wildlife and Habitat, respectively. While mangroves can provide areas of soil retention, their relative lack of cold tolerance does not currently allow growth throughout the entire coast of Louisiana. Red or white mangroves are not currently found in Louisiana because they are not as cold tolerant as black mangrove, although as the climate changes, CPRA recognizes that dedicated plantings of black mangrove and exploratory plantings of other mangrove species are a potential option in areas that are not currently suitable. Cypress trees are a viable option today and have been used (along with willows) to stabilize newly deposited sediments at the outfalls of existing diversions. CPRA would consider these options in the outfall area as part of future adaptive management efforts, especially to the extent base flows would provide suitable freshwater habitat, as well as to increase sediment stabilization and retention.

Concern ID: 61894

Consider the alternative of tearing down spoil banks and backfilling abandoned canals before, in addition to, or instead of implementing the proposed MBSD Project.

Response ID: 15987

This suggested alternative would not meet the goals and objectives as stated in the purpose and need and described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives. It would not re-establish deltaic processes between the Mississippi River and Barataria Basin through the delivery of sediment, fresh water, and nutrients. However, the EIS acknowledges the influence of canals and spoil banks on wetland losses in Barataria Basin (see Chapter 3, Section 3.6.2.2 in Wetland Resources and Waters of the U.S. of the Final EIS), and has updated the analysis to include additional technical references regarding the influence of canals on the existing environment in the Barataria Basin. The EIS does not describe the proposed Project as a solution to fully reverse ongoing land-loss trends. The EIS recognizes that the proposed Project is projected to create and maintain only a portion of the wetlands that would otherwise be lost in the absence of the proposed Project over the next 50 years.

This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Other similar restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan and the LA TIG through Natural Resources Damage restoration planning.

Concern ID: 61895

Commenters suggest using a sediment diversion to selectively build land by directing sediment to a contained area, such as a colmates system or large-scale marsh creation containment area. A controlled system of dredging to create dry land coupled with a system to contain sediment-infused river water in specific areas outside of the levee protection system would be most beneficial to create more land exactly where it's needed.

Response ID: 15988

This method of sediment transport and/or sediment containment and land building would not meet the proposed Project's purpose and need of reconnecting and reestablishing sustainable deltaic process between the Mississippi River and the Barataria Basin. A colmate or other means of large-scale marsh creation using dewatered sediment would allow for sediment to be transported from the Mississippi River to the Barataria Basin and deposited into a location confined by containment berms, which would create an impoundment where the suspended sediment would settle out of the water column over time to create a marsh platform. Once the area dewatered and the platform stabilizes at an appropriate marsh elevation, the berms would be degraded or gapped to allow fish passage and hydrologic exchange. While this type of system would create marsh, it would not be a passive system and would require active management and maintenance, including potentially pumps to ensure sediment transport, mechanical gapping/degrading of the retention berms and periodic lifts to combat the effects of subsidence. It would not reestablish natural deltaic processes. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Concern ID: 61896

Add salt injection points directly downstream of the river sediment flow before it gets into the basin so that the volume of fresh water is reduced.

Response ID: 15990

This outfall feature alternative was considered in the Draft EIS but was not fully evaluated because it does not meet purpose and need for the Project because it does not restore the natural deltaic process between the Mississippi River and Barataria Basin through the introduction of fresh water, sediment, and nutrients from the Mississippi River into the Basin. Refer to the Eliminated Alternatives Matrix in Appendix D2 of the EIS. Additionally, the basin will experience periodic introduction of

more saline water naturally through tidal processes and storm events. Potential impacts associated with changes in salinity are addressed in Chapter 4, Section 4.5 Surface Water and Sediment Quality.

Concern ID: 61897

Consider alternatives that transport more sediment and sand and less water, such as a conveyor belt or barge and utilizing a processing plant that removes the sediment from the Mississippi River to filter and neutralize the sediment before transport.

Response ID: 15991

This suggested alternative would not meet the goals and objectives as stated in the purpose and need as described in Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives. CPRA's intent is to reestablish sustainable deltaic processes between the Mississippi River and Barataria Basin through the introduction of fresh water, sediment, and nutrients from the Mississippi River into the Basin. Additionally, in light of the volume and nature of the material that would need to be transported, a conveyor belt is not feasible. In addition, as described in Chapter 2, Section 2.4 Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow the proposed Project is designed to maximize sediment bed load transport. Previous studies of the Mississippi River have documented the positive correlation between river discharge and sediment load, demonstrating that higher river discharge levels are generally correlated with higher sediment loads. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Concern ID: 61898

Consider using the funds to move people out of the area instead of implementing the proposed MBSD Project.

Response ID: 15992

This suggested alternative would not meet the goals and objectives as stated in the purpose and need as described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives. It would not reestablish sustainable deltaic processes and help restore habitat and ecosystem services injured by the DWH oil spill. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Concern ID: 61899

Consider building a man-made river instead of implementing the proposed MBSD Project.

Response ID: 15993

This suggestion is not inherently different than the proposed Project which consists of a man-made conveyance structure. The proposed MBSD Project would provide a controlled riverine connection to the Barataria Basin. No edits have been made to the Final EIS.

Concern ID: 61902	Consider opening the Morganza Spillway instead of implementing the proposed MBSD Project.
Response ID: 15995	The Morganza Spillway, operated by USACE for emergency flood control, discharges into the Atchafalaya Basin. The scope of this EIS is the Barataria Basin and the Mississippi River birdfoot delta, which is the defined proposed Project area. This suggested alternative would not meet the purpose and need to reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin. The LA TIG identified the Barataria Basin in the SRP/EA #3 as the location for the proposed Project because within Louisiana, the Barataria Basin suffered the most severe and persistent oiling from the DWH oil spill. This suggestion would not provide any land-building benefits in the Barataria Basin because it is located outside of the basin. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.
Concern ID: 61903	Divert some of the Mississippi River water off to other states and areas.
Response ID: 15996	The proposed MBSD Project purpose and need is to reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin. The LA TIG identified the Barataria Basin in the SRP/EA #3 as the location for the proposed Project because within Louisiana, the Barataria Basin suffered the most severe and persistent oiling from the DWH oil spill. This suggestion would not meet the purpose and need because it would not connect the Mississippi River to the Barataria Basin. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.
Concern ID: 64005	Consider an alternative that creates a split system to capture and concentrate sediment in one stage, followed by a transfer of the captured sediment to a separate second stage which delivers that sediment with a reduced volume of water having a chosen composition in terms of salinity and nutrients. This can be accomplished by capturing sediment in basins within the channel bottom, while curving the main channel back to the Mississippi River to return the majority of river water to the Mississippi, and delivering a more sediment-focused slurry to Barataria Bay via a separate outfall channel. A dredge operating in the basins, powered by river current, would move the captured sediment, under well-controlled conditions, the short distance from the basins to the outfall channel.
Response ID: 15997	This suggested alternative would not meet the goals and objectives as stated in the purpose and need as described in Chapter 1, Section 1.4

Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives. The purpose of the project is to reestablish sustainable deltaic processes between the Mississippi River and Barataria Basin through the delivery of sediment, fresh water, and nutrients from the Mississippi River into the Basin. Details as submitted by the commenter regarding this alternative are lacking making it difficult to evaluate. Based on the description provided by the commenter, it seems that this alternative would transport primarily coarse-grained sediments (for example, larger sediments and sand) collected in the Mississippi River and conveyance channel into the Basin, but, due to the collection method, would not convey substantial finer grained sediments (for example, clay and silt) that are necessary to sustain existing wetlands in the Basin. Also, with the significant reduction in fresh water transported into the Basin, this alternative would not transport sufficient fresh water or nutrients to meet the purpose and need. Further, it is unclear whether or how the proposed alternative would mobilize the collected coarser-grained sediments. As explained in Section 2.4.3.2 Application of Additional Considerations to Capacity Alternatives of the Final EIS, a sufficient volume of water is needed to mobilize and entrain coarser-grained sediments and transport them into the Basin. The commenter's description of the alternative suggests a significant reduction in the volume of water that would pass through the diversion channel. Absent diversion flows, the commenter did not explain how this alternative would transport these coarser sediments to the Basin other than to mention a "dredge operating in the basin." Marsh creation through dredging was evaluated in the Draft EIS and eliminated from detailed consideration. See Section 2.3.5 Large Scale Marsh Creation of the Final EIS. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

CH30000 – Applicant's Preferred Alternative/Alternative 1 – 75K cfs

Concern ID: 61911

Commenter inquired about design and operational features of the proposed MBSD Project including pump station(s) and elevation and design grade of the guide levees.

Response ID: 15998

Chapter 2, Section 2.8.1.1 in Action Alternatives Carried Forward for Detailed Analysis of the Final EIS includes a description of the proposed MBSD Project including Project design features, which has been updated based on 60 percent designs since the Draft EIS. Also refer to the Design Documentation Report in Appendix F1 Design

Documentation Report (60% Design) of the Final EIS for additional information regarding the proposed Project design.

Concern ID: 61912

CPRA should consider alternative flow triggers, designs, and features in the operations plan and design of the proposed MBSD Project in order to minimize impacts. CPRA should also consider adjusting diversion design elements such as triggers, peak flows, volumes, and nutrient loads over the first years of operation to minimize impacts. These adjustments could minimize impacts to dolphins, oysters, brown shrimp, and other aquatic organisms. Some commenters suggested limits be imposed by USACE, others suggested an operating plan that is tied to specifics, while others emphasized flexibility tied to real-world experiences. CPRA should also consider alternative methods of operating the proposed MBSD Project, such as operating the diversion during winter when water levels in the basin are lower and can accept high volumes of water from the diversion.

Response ID: 15999

The proposed MBSD Operations Plan can be found in Appendix F2 Preliminary Operations Plan of the Final EIS. As stated in the Chapter 4, Section 4.4.4.2.4 Sediment Transport in Chapter 4 Surface Water and Coastal Processes, sediment transported by the Mississippi River is primarily comprised of fine sediments, with higher river flows (typically occurring in the spring) suspending more coarse-grained sediment that are important in delta building (see Chapter 3, Section 3.4 Surface Water and Coastal Processes). Fine-sediment transport through the diversion would be generally proportional to water flow in the river. The intake channel was modeled and designed to divert a high sediment-to-water ratio while minimizing energy loss (to maintain flow and sediment transport through the diversion complex) and impacts on the river. The amount of sediment carried through the diversion would vary by year, depending on flow rates in the river and the corresponding variation of diversion operations. As explained in Chapter 2, Section 2.8.1.3 Project Operations in Action Alternatives Carried Forward for Detailed Analysis, the Mississippi River discharge of 450,000 cfs would be the standard operations “trigger to open the diversion for flow (above the base flow)”. Operations (with the exception of a base flow up to 5,000 cfs) would cease when the river discharge falls below 450,000 cfs or when certain emergency triggers are met (such as in advance of hurricanes or when a spill of hazardous substances occur in the river). When the Mississippi River flows exceed 450,000 cfs, the gates would be fully opened (above base flow). At river flows of 450,000 cfs, the diversion flow would be approximately 25,000 cfs, and flows would increase proportionally as the river flow increases. This ramp would continue up to maximum diversion capacity flow of 75,000 cfs when the river reaches a flow of 1,000,000 cfs.

An alternative related to operational triggers specific to sediment concentration was considered but determined not to be technically feasible or reasonable because data and technology do not currently exist to support this operational regime (refer to the Eliminated Alternatives Matrix in Appendix D2 of the EIS). According to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS, as part of the adaptive management and monitoring process, CPRA would consider potential ways to optimize diversion operations based on Project performance and success and would assess potential operational changes that may minimize impacts to basin resources where practicable after sufficient operational data become available for analysis.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61913	While a commenter acknowledges temporary habitat degradation with the Applicant’s Preferred Alternative, the commenter supports the Applicant’s Preferred Alternative.
Response ID: 16000	The commenter’s support of the proposed Project is acknowledged. Refer to Chapter 4, Section 4.9 Terrestrial Wildlife and Habitat of the EIS for terrestrial wildlife and habitat impacts.
Concern ID: 61914	The information provided in Chapter 2 Alternatives of the EIS regarding diversion flows at given Mississippi River flows is confusing.
Response ID: 16001	As described in the EIS, when the Mississippi River flows exceed 450,000 cfs, and the gates are fully opened, the diversion flow would increase to approximately 25,000 cfs, and thereafter flows would increase proportionally as the river flow increases up to maximum diversion capacity flow of 75,000 cfs when the river reaches a flow of 1,000,000 cfs. Chapter 2, Section 2.8.1.3 Project Operations in Action Alternatives Carried Forward for Detailed Analysis of the Final EIS has been revised to clarify the description of proposed Project operations.
Concern ID: 61915	Standard operating plans should include diverting as much water as possible from the Mississippi River when a category 4 or 5 storm approaches to reduce loss of life and damage to property.
Response ID: 16002	As stated in Draft EIS Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis, the Operations Plan for the proposed MBSD Project calls for the diversion structure to be closed when the relationship between the water levels in the Mississippi River and the Barataria Basin would create a reverse flow or when other stop triggers or “Emergency Operations” are met, including spills and other hazardous discharges, navigation impediments, climatic conditions such as tropical depressions or named storms, diversion structure damage or emergency, and public safety as described in the Applicant’s Operations Plan. Regarding climatic conditions, the Operations Plan states that CPRA will close the diversion gates and suspend all flows through the diversion when tropical activity (depression or named storm) is forecasted to impact the Barataria and Mississippi River Basins. The structure would be closed in advance of storm impact to avoid affecting water levels in the Mississippi River or the Barataria Basin. After passage of an event and without unnecessary, unexpected impacts, operations would resume per the Operations Plan. Refer to Appendix F2 Preliminary Operations Plan of the Final EIS for further details on the Operations Plan.
Concern ID: 61916	The proposed Project should have a design life beyond 50 years.
Response ID: 16003	The proposed Project design life would extend beyond 50 years. This is not to be confused with the 50-year analysis period used in the EIS. The 50-year analysis period corresponds with the Delft3D Basinwide

Model simulations, which were run over 5 decades (beginning in 2020 and run through 2070). USACE typically uses a 50-year period of analysis for its water resources projects. The EIS analyzes operational impacts resulting from operation and maintenance of the alternatives during the 50-year analysis period. Analysis of potential impacts past 50 years was determined to be too speculative to assist in understanding or decision making regarding the proposed Project.

Concern ID: 61917

Commenters expressed concerns over CPRA's potential for mishandling of the operation and long-term maintenance of the proposed MBSD Project, particularly pointing to CPRA's past inadequate operations and maintenance of other diversions.

Response ID: 16004

CPRA would operate the proposed MBSD Project as detailed in the Operations Plan, which is found in Appendix F2 Preliminary Operations Plan in the Final EIS. In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated proposed Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required

by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61918

Prior to and during the implementation of the proposed MBSD Project, consider ways to slow down the flow of the water in the basin for the sediment to work and to stop tidal surge, including dredging and filling, building islands, and planting vegetation to prevent erosion.

Response ID: 16005

CPRA considered ways to slow down the flow in the basin during design and alternatives development of the proposed MBSD Project. Chapter 2 Alternatives of the EIS describes the various alternatives that were considered including several diversion outfall features (see Section 2.5, Step 3: Evaluation of Sediment Diversion Outfall Features). Marsh terracing is an outfall feature that was included in the reasonable range of alternatives evaluated in the EIS because these features are often used to reduce wave energy, protect eroding or recently restored shorelines, or to promote sediment deposition. However, results of the impact analysis showed mainly negligible to minor differences in impacts when terrace alternatives were compared to alternatives without terraces. If the proposed Project is implemented, CPRA would consider potential ways to optimize diversion operations including outfall management based on Project performance and success as part of the adaptive management and monitoring process.

Refer to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained

draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

In addition, other restoration strategies in coastal Louisiana similar to what is being proposed are being currently implemented or considered by CPRA in their Coastal Master Plan and the LA TIG through separate NRDA restoration planning.

Concern ID: 61919

Commenter requested information on the proposed annual operation and maintenance budgets for the proposed MBSD Project and how would they be funded.

Response ID: 16006

If the proposed Project is permitted and funded, CPRA states that information on the proposed annual operation and maintenance budgets for MBSD Project will be provided to the public through CPRA's Annual Plan. Details on the state funding cycle, CPRA's request for operations funding, and inclusion in CPRA's Annual Plan can be found in the CPRA's Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS.

Concern ID: 61922

The design features of the proposed Mid-Barataria Sediment Diversion Project are lacking in innovation and creativity. Commenters suggests inclusion of innovative design, such as

Response ID: 16009	<p>converting hydraulic energy to electricity and potential solutions for combating climate change, as part of the proposed Project.</p> <p>CPRA states that the proposed Project would be the first of its kind and size that would create a sustained deltaic connection between the Mississippi River and the Barataria Basin.</p>
Concern ID: 63957	<p>Commenters expressed concern that walls from the diversion structure could fail and flood out the local communities.</p>
Response ID: 16011	<p>As described in Chapter 2, Section 2.8, Action Alternatives Carried Forward for Detailed Analysis of the Draft EIS, the proposed Project design includes earthen guide levees that would be constructed along both sides of the diversion conveyance channel. The portion of the guide levees on the protected side of the New Orleans to Venice Levee system (NOV-NF-W-05a.1) would be designed and built as hurricane and storm damage risk reduction against storm surges that may enter the diversion channel. A gated control structure would also be built on the Mississippi River side of the conveyance channel, and the gate would be closed prior to and during storm events. In addition, because the proposed MBSD Project would use, occupy, and/or alter the Mississippi River Levee, the New Orleans to Venice Levee, and the Mississippi River Navigation Channel, which are USACE projects, CPRA has requested permission under 33 U.S.C. Section 408 to construct and operate the proposed MBSD Project. The USACE Section 408 Review process includes a review of the technical adequacy of the proposed MBSD Project design to alter the Mississippi River and NOV-NFL levees and to deliver appropriate flood risk reduction in place of those levees, including all appropriate technical analyses, including geotechnical, structural, hydraulic and hydrologic, construction, safety and operations and maintenance requirements. A Section 408 permission would not be granted unless the proposed modifications to the USACE projects would not limit the ability of the USACE project to function as authorized and would not compromise any authorized USACE project purposes.</p>
Concern ID: 64020	<p>A comprehensive plan for operating the diversion is lacking. Diversion operations should not be based solely on when flows in the Mississippi River exceed 450,000 cfs or only operate at maximum capacity when Mississippi River flows reach 1,000,000 cfs, but instead should rely on multiple factors for determining when to operate the diversion. The comprehensive plan should also include some flexibility in operations including triggers for water releases and for closing the diversion. The design should be modified to allow continued use after significant sea-level rise.</p>
Response ID: 16012	<p>CPRA would operate the proposed MBSD Project in accordance with the Operations Plan which can be found in Appendix F2 Preliminary Operations Plan of the Final EIS. Chapter 2, Section 2.4.2 in Step 2:</p>

Evaluation of Operational Alternatives – Location, Operational Trigger, Capacity, and Base Flow of the Draft EIS described the evaluation of various operational triggers during the alternatives analysis. It was determined that the 450,000 cfs operational trigger would best meet the purpose and need and would be the standard operations trigger (see Chapter 2, Section 2.4.2.1 Application of Additional Considerations to On/Off Trigger Scenarios). Additionally as stated in Chapter 2, Section 2.4.3.2 Application of Additional Considerations to Capacity Alternatives, flow in a sediment diversion is variable. When the diversion is operating, the flow rate through a diversion is controlled by the difference in water surface elevation between the Mississippi River and the Barataria Basin (the head differential). When the Mississippi River flow and stage are high, this high head differential would push a higher volume of water and sediment through the diversion into the Barataria Basin. When the Mississippi River flow and stage are low, there would be less energy to push water and sediment through the diversion. Thus, depending upon the flow rate in the Mississippi River and the head differential, flow in the diversion would be variable, up to a defined maximum capacity.

The diversion is designed for passive operation rather than active operation. Once opened, the head differential determines the flow rather than pumps or another active feature.

Full operations (with the exception of a base flow up to 5,000 cfs) would cease when the river discharge falls below 450,000 cfs or when certain emergency triggers are met (such as in advance of hurricanes or when a spill of hazardous substances occurs in the river).

Triggers for closing the structure when river discharge is above 450,000 cfs include spills and other hazardous discharges, navigation impediments, climatic conditions such as tropical depressions or named storms, diversion structure damage or emergency, and public safety.

As stated in the Chapter 4, Section 4.4.4.2.4 Sediment Transport in Section 4.4 in Surface Water and Coastal Processes, sediment transported by the Mississippi River is primarily comprised of fine sediments, with higher river flows (typically occurring in the spring) suspending more coarse-grained sediment that are important in delta building (see Chapter 3, Section 3.4 Surface Water and Coastal Processes). Fine-sediment transport through the diversion would be generally proportional to water flow in the river. The intake channel was modeled and designed to divert a high sediment-to-water ratio while minimizing energy loss (to maintain flow and sediment transport through the diversion complex) and impacts on the river. The amount of sediment carried through the diversion would vary by year, depending on flow rates in the river and the corresponding variation of diversion operations. The operation plan allows for diversion

operations that capture the high sediment loads associated with rapidly rising river discharges and effectively addresses relative sea-level rise.

If the proposed Project is implemented and once operational, CPRA would consider potential ways to optimize diversion operations based on Project performance and success as part of the adaptive management and monitoring process. Refer to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS.

The Project MAM Plan in the Final EIS Appendix R2 provides examples of possible outfall management actions, such as spoil bank gapping or construction of water-directing features, that CPRA may consider in the future as potential adaptive management actions aimed at improving Project effectiveness and limiting ecological and/or human impacts when possible. This will be based on assessment of Project performance and monitoring data and recommendations of the CPRA's Project Adaptive Management Team to CPRA's Project Operations Management Team.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 65187

Commenter inquired as to what year the proposed MBSD Project is planned to be operational.

Response ID: 16695

Construction would not commence until after the USACE decision on the Section 10/404 permit and Section 408 permissions request. As described in EIS Chapter 2, Section 2.8.1.4 Project Construction Activities in Action Alternatives Carried Forward for Detailed Analysis, once begun, the proposed Project would require 3 to 5 years of construction which would occur in several phases.

Concern ID: 61920

Commenters recommended that there must be a flood gate on the marsh side of the diversion structure to protect the residents of Plaquemines Parish from being inundated.

Response ID: 16007

As described in Chapter 2, Section 2.8, Action Alternatives Carried Forward for Detailed Analysis of the Draft EIS, the proposed Project design includes earthen guide levees that would be constructed along both sides of the diversion conveyance channel. The portion of the guide levees on the protected side of the New Orleans to Venice Levee system (NOV-NF-W-05a.1) would be designed and built as hurricane and storm damage risk reduction against storm surges that may enter the diversion channel. A gated control structure would also be built on the Mississippi River side of the conveyance channel, and the gate would be closed prior to and during storm events.

CPRA considered a diversion structure with a back gate structure on the basin side (which is the marsh side). After detailed design and cost consideration, however, CPRA proposed eliminating the back gate design and proceeded with a diversion structure with hurricane/guide levees and no back gate structure. CPRA determined that the proposed Project without a gate structure is generally lower risk due to its passive operation relative to the active operation of a gate structure. In addition, the guide levees are proposed to be constructed to an elevation equivalent to a 2 percent Annual Exceedance Probability (AEP) (50-year storm) and will connect to the NOV-NF-W-05a.1 levee. CPRA worked with USACE to complete a USACE Risk Assessment of this proposed design through the Section 408 process.

Concern ID: 61921

Commenter supports the use of adaptive management, but notes that it has been poorly used in the past. Suggests building adaptive management requirements into the current design to allow for future releases above 75,000 cfs.

Response ID: 16008

The proposed MBSD Project as designed would have a maximum diversion flow capacity of 75,000 cfs when the Mississippi River flow reaches approximately 1,000,000 cfs or higher. Therefore, the proposed MBSD Project would not have the capacity to transport more

than 75,000 cfs, which precludes the suggested adaptive management of flows higher than 75,000 cfs. Refer to EIS Chapter 2, Section 2.8.1.3 Project Operations in Action Alternatives Carried Forward for Detailed Analysis for additional details regarding proposed Project operations. However, CPRA does intend to adaptively manage the proposed Project. CPRA's Monitoring and Adaptive Management (MAM) Plan can be found in Appendix R2 of the Final EIS. CPRA's MAM Plan describes how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to Project operations, riverside management, monitoring, maintenance, and adaptive management actions.

In the Restoration Plan, the LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54 and strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting Trustee goals, having a high likelihood of success, and avoiding collateral injury. While a 150k cfs diversion would be expected to deliver more ecological benefits to land creation and marsh building than the LA TIG's Preferred Alternative, it would also incur more collateral injuries and pose a greater risk to human health and safety; thus, it was not selected as preferred. See Chapter 3, Section 3.2.4 of the Final Restoration Plan for a discussion of how the LA TIG came to its decision.

Concern ID: 61923

The proposed MBSD Project should be redesigned to achieve two objectives: build storm surge protection as well as create the environmental conditions for the expansion of the oyster industry.

Response ID: 16010

Storm surge protection is not a purpose of the proposed Project but it is a projected benefit for some areas, while it will increase storm surge and flooding risk for other areas (see EIS Chapter 4, Section 4.20.4.2, Operational Impacts, Storm Hazards in Public Health and Safety, including Flood and Storm Hazard Risk Reduction). Restoring for oysters does not meet the intent of the proposed Project, which is to reestablish sustainable deltaic processes and help restore habitat and ecosystem services injured by the DWH oil spill. The Project is projected to help positively impact habitat for numerous species impacted by the spill and to negatively impact habitat for other species impacted by the spill.

Concern ID: 67231

Consider adding improvements, such as using the proposed railroad bridge crossing and channel guide levees as hurricane evacuation routes to the Project, to get more value out of the Project.

Response ID: 16951

1. Emergency Evacuations for Plaquemines Parish are coordinated with USACE-New Orleans District, LADOTD, Plaquemines Parish Sheriff's Department, GOHSEP, and other entities as
-

needed. Evacuations through the Eastern Tie-In of the Hurricane and Storm Damage Risk Reduction System (HSDRRS) in Oakville, Louisiana are routed north via Louisiana Hwy 23. The proposed railroad bridge would have dual access for authorized personnel to cross the project from the Mississippi River Levee for railroad and project operations, maintenance, and flood fighting purposes.

2. The upstream or northern guide levee would serve as a guide levee for diversion flows from the Mississippi River to Barataria Basin. Additionally, the guide levee would serve as a flood risk reduction levee replacing a portion of and as part of the New Orleans to Venice (NOV) flood risk reduction levee. The proposed guide levees would allow access for authorized personnel to access the Project for operations, maintenance, and flood fighting purposes.

The proposed Project would relocate Louisiana Hwy 23 in kind (or equivalent to the existing roadway) maintaining the current evacuation route. An alternate evacuation route for Louisiana Hwy 23 is not part of the MBSD Project and would not advance the stated purpose and need as stated in EIS Chapter 1, Section 1.4 Purpose and Need.

CH31000 – Other Alternatives Evaluated

Concern ID: 61871

Alternative 5, Variable Flow up to 150,000 cfs, should be chosen for implementation because it provides substantially greater benefits at the higher flow, with only marginally increased adverse effects, most of which could be mitigated by the same measures being proposed for the 75,000 cfs Applicant's Preferred Alternative.

Response ID: 15944

CPRa submitted a joint Section 10/404 permit application and Section 408 permission request to USACE for the construction, operation, and maintenance of a 75,000 cfs sediment diversion (Applicant's Preferred Alternative). The EIS evaluates the Applicant's Preferred Alternative and five additional action alternatives as well as the No Action Alternative in order to inform USACE's permit and permission decisions and the LA TIG's NRDA decision in compliance with the statutes, orders, and policies outlined in EIS Chapter 5 Consultation and Coordination.

In the Restoration Plan, the LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54, and made every effort to identify an alternative that would provide the right

balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. As noted in the LA TIG's Restoration Plan, while the 150,000 cfs Alternative was projected to provide greater ecological benefits than the LA TIG's Preferred Alternative, it was also expected to cause greater collateral injury and greater risks to public health and safety. See Chapter 3, Section 3.2.4 of the Final Restoration Plan for a discussion of how the LA TIG came to its decision. Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

The Mitigation and Stewardship Plan (Appendix R1 to the EIS) has been designed by CPRA to mitigate the projected impacts of the 75,000 cfs sediment diversion (Applicant's Preferred Alternative). Different or additional mitigation could be needed to address the projected impacts of the proposed Project if a large capacity diversion (150,000 cfs) were to be selected.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404

permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

CH32000 – No Action Alternative

Concern ID: 61870

If no action is taken, the resources may suffer even greater impacts in the future, along with the local ecology, economy, communities, and culture.

Response ID: 15941

The concerns raised by the commenters were considered in the Draft EIS. The EIS evaluates anticipated conditions in the Barataria Basin if no action is taken. Within the EIS, the No Action Alternative enables a comparison of anticipated future conditions without the proposed Project to anticipated future conditions with the proposed Project and the alternatives. Refer to Chapter 4 Environmental Consequences of the EIS, for a description of anticipated conditions under the No Action Alternative for each of the resource areas evaluated. The Delft3D Basinwide Model was used to forecast conditions that would occur under the No Action Alternative which helped to inform the analysis in Chapter 4.

Concern ID: 64151

Commenter is concerned with the CPRA's apparent desire, in both the Draft EIS and Mitigation Plan, to condition its obligation to mitigate impacts to properties and communities, through its continuing reference to the current vulnerability of those communities or the fact that those communities would become more vulnerable in the future even under the No Action Alternative. Although many areas outside levee protection are in fact vulnerable and may become more vulnerable as sea-level rises and wetlands loss continues, many of those communities would not feel the full impacts for a decade or more absent the proposed diversion. Moreover, the causes of coastal wetlands loss can, at least in part, be attributable to the State's historic, and continuing, permitting of the destruction of coastal wetlands for pipeline and navigation canals, and the like.

Response ID: 15942

In the EIS, the No Action Alternative is evaluated to understand the anticipated changes in the environment that would occur irrespective of the proposed Project.

In addition, the Delft3D Basinwide Model was used to assess impacts of the No Action Alternative. For each resource in Chapter 4 Environmental Consequences, Sections 4.1 through 4.24, the analysis of the impacts for each Project action alternative is compared to the impacts under the No Action Alternative. The EIS acknowledges both the deteriorating conditions that are projected to occur under the No Action Alternative, as well as the degree to which the Applicant's Preferred Alternative and other action alternatives would alter those projected impacts, including in some cases by accelerating potential adverse impacts.

Additionally, the EIS acknowledges the influence of canals and spoil banks on wetland losses in Barataria Basin (see EIS Chapter 3, Section 3.6.2.2.4 in Wetland Resources and Waters of the U.S.), and the analysis in the Final EIS has been updated to include additional technical references regarding the influence of canals on the existing environment in the Barataria Basin. In addition, Chapter 1, Section 1.2.1 History of the Barataria Basin in Project Background and Chapter 3, Section 3.1.4 Overview and History of the Project Area in Introduction describes the historical reasons for coastal land loss within the Barataria Basin and notes that as a result of this coastal land loss, various agencies and non-governmental organizations have implemented coastal protection, restoration, and rehabilitation projects within the basin. These existing conditions have been factored into the analysis in the EIS.

The mitigation and stewardship measures proposed by CPRA for proposed MBSD Project impacts described in Chapter 4, Section 4.27 Mitigation Summary of the Final EIS and in the Final Mitigation and Stewardship Plan (Appendix R1) are based on the understanding of anticipated impacts described in Chapter 4 Environmental Consequences, Sections 4.1 through 4.24. CPRA's Final Mitigation and Stewardship Plan provides details on the mitigation and stewardship measures CPRA would implement prior to the proposed Project beginning operations to ensure that the measure's benefits are in place in advance of the Project impacts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to

implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

EC10000 – Eval Standard – Cost to Carry Out Alternative

Concern ID: 66342

The cost of the diversion is not justified and the project is questionable.

Response ID: 16772

The NEPA regulations do not require a cost-benefit analysis for the EIS unless such an analysis is relevant to an agency's decision. USACE generally assumes that a permit applicant has made its own economic evaluation regarding the costs of a proposed project. However, as part of its public interest review, USACE will weigh the harms that would be caused by the Project against its potential benefits.

In the LA TIG's Restoration Plan, the LA TIG considers the cost to carry out the Project consistent with the Restoration Plan alternatives evaluation criteria, 15 CFR §990.54.

Concern ID: 61852

The cost per acre of marsh creation by the diversion is far higher than a corresponding alternative of marsh creation through the use of dredged material. Marsh creation through a diversion takes 50

years unlike marsh creation through dredging. In addition, brackish/salt marshes (which would be created by dredging) are more resilient than freshwater marshes, and thus marsh created through dredging would be a more sound investment of restoration funding than a sediment diversion.

Response ID: 16617

The timing of marsh benefits created by the proposed diversion was considered in the Draft EIS in Chapter 4, Section 4.6.5 Wetland Resources, Operational Impacts. In response to these comments, additional detail has been added regarding the resiliency of fresh marsh compared to brackish marsh in the Final EIS, Sections 4.6.5.1.2.3 Soil Shear Strength and 4.6.5.1.2.4 Land Accretion. Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

While the commenters suggest that marsh creation through dredging would cost less than the proposed Project, the LA TIG does not believe that comparing the costs of a sediment diversion to marsh creation projects using dredged material is relevant for several reasons. Most importantly, as explained in the LA TIG's Restoration Plan, the goal of the Project is to create a long-term sustainable ecosystem through the reestablishment of deltaic process. Marsh creation through the use of dredged material would not bring fresh water or nutrients to the basin on an ongoing basis. The benefits of marsh created with dredged material would diminish over time without maintenance in the form of additional pumping events due to subsidence and sea-level rise; thus, the temporal nature of Project benefits in the absence of periodic maintenance would also be very different. The costs and benefits of the Project were fully considered by the LA TIG and are discussed in the Draft Restoration Plan in Section 3.2.1.2 Cost to Carry Out the Alternative.

Concern ID: 61853

The amount of acres of habitat that would be restored through the preferred alternative would not justify its high cost. Given Louisiana's annual coastal habitat loss rate, investing in a nearly \$2 billion Project that would provide relatively little benefit compared to this annual loss is not justifiable.

Response ID: 16618

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless it is relevant to the agency's decision. USACE generally assumes that a permit applicant has conducted its own economic evaluation of the costs of a proposed Project. USACE will conduct a public interest review as part of its permit decision-

making process, which weighs the anticipated harms of a project against its anticipated benefits.

As part of the OPA analysis, LA TIG considered the cost to carry out the Project consistent with the Restoration Plan alternatives evaluation criteria, 15 CFR §990.54. The cost to carry out the Project was evaluated in Section 3.2.1.2 Cost to Carry Out the Alternative of the LA TIG's Draft Restoration Plan. The Project would reestablish deltaic processes that deliver sediment, fresh water, and nutrients; improve the function of existing habitats; and successfully develop deltaic habitats that connect nearshore and offshore ecosystems. Wetlands are one component of a restored ecosystem to be achieved. The LA TIG expects that the Project would result in the creation of a maximum of 17,300 acres of land in the Barataria Basin by year 30 of operations; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 [Alternative 1 Description] of the Restoration Plan). The creation of marsh habitat would provide substantial benefits to nearshore marine ecosystems, water column resources (including fish and invertebrates), birds, terrestrial wildlife, and offshore marine ecosystems (see Section 3.2.1.6 [Benefits Multiple Resources] of the Restoration Plan). Given the high rates of erosion and land loss, the land created by the Project would become even more important to the coastal ecosystem over time.

Concern ID: 62983

There will be ongoing and continuing costs to maintain the structure. Will there be sufficient funds to maintain the Project into the future? Commenters questioned who would have responsibility for the Project's maintenance throughout its operation.

Response ID: 16621

As the Project Implementing Trustee, CPRA would ensure that there is sufficient funding to operate and maintain the Project into the future. Roles and responsibilities regarding the Project are set forth in the EIS in Sections 2 and 3 of Appendix R2 Monitoring and Adaptive Management Plan. CPRA has primary responsibility for the operations, maintenance, and monitoring of the Project.

Concern ID: 61854

The cost of the proposed Project is a sound investment. More specifically, \$2 billion seems a reasonable price for decades of extension of habitat and use. Even though the cost of the Project is high, the price of inaction would be far greater.

Response ID: 16619

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and

therefore, does not require a financial cost-benefit accounting for its decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

The LA TIG acknowledges commenters' belief that the Project would be a sound investment. As part of the OPA analysis, the LA TIG considered the cost to carry out the Project consistent with the Restoration Plan alternatives evaluation criteria, 15 CFR §990.54. The cost to carry out the Project was evaluated in Section 3.2.1.2 Cost to Carry Out the Alternative of the LA TIG's Draft Restoration Plan. The LA TIG has found that the Project costs are commensurate with achieving the goals of comprehensive integrated ecosystem restoration intended to persist for decades even in the face of rising sea levels and continued coastal erosion.

Concern ID: 62982

Anticipated increases in the cost of maintenance dredging induced by diversion operations and anticipated effects on the navigation community must be accounted for in the early stages of diversion planning so that accurate cost-benefit ratios can be considered.

Response ID: 16620

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

The impacts of the Project on maintenance dredging requirements and on the navigation community were addressed and considered in the Draft EIS, in Chapter 4, in the Mississippi River and Barataria Basin "Maintenance Dredging" subsections of Section 4.21 Navigation. USACE has engaged the navigation industry to get its input on the proposed Project's anticipated effects on navigation, including increased sedimentation in the Mississippi River, as part of the EIS process.

In the LA TIG's Restoration Plan, the LA TIG considers the cost to carry out the Project consistent with the Restoration Plan alternatives evaluation criteria, 15 CFR §990.54. The Project budget in the Draft Restoration Plan (see Section 3.2.1.2 Cost to Carry Out the Alternative) included the cost of additional maintenance dredging that would be induced by the Project. Also, monitoring to identify the need for additional maintenance dredging induced by the Project is addressed in

the Restoration Plan Appendix R2: Monitoring and Adaptive Management Plan for the proposed MBSD Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

EC20000 – Eval Standard – Meets Trustee Restoration Goals and Objectives

Concern ID: 62663

Decades of study demonstrate the MBSD is the optimal way to restore the sustainable functionality to the ecosystem injured by the DWH oil spill, including providing benefits to the northern Gulf of Mexico ecosystem injured by the spill. The Project would rebuild and restore coastal wetland habitat, which is vital to the health of the Gulf of Mexico ecosystem and the species that reside within it. It would address a multitude of concerns on an ecosystem-wide and economic scale, would work synergistically with ecosystem restoration projects in the basin, and would create jobs. The Draft Restoration Plan demonstrates the likely benefits of the Project, and the Project would likely help mitigate consequences of future natural disasters and climate change. Not implementing the Project would not only prevent the area from recovering, but would accelerate its degradation over time.

Response ID: 16622

The LA TIG acknowledges the comment and agrees that the Project would deliver fresh water, sediment, and nutrients to the Barataria Basin; reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin (for example, sediment retention and accumulation, new delta formation); and create, restore, and sustain wetlands and other deltaic habitats and associated ecosystem services.

Concern ID: 62664

The Project, instead of restoring coastal Louisiana, would accelerate its degradation. The Upper Barataria Basin, which was not affected by the DWH oil spill, would be negatively affected by the proposed Project in terms of cultural, topographic, and ecological impacts. Because the Oil Pollution Act is designed to restore areas affected by an oil spill to their pre-spill conditions, the proposed Project should not be funded because it does not achieve this goal.

Response ID: 16623

The potential impacts of the proposed Project on affected ecosystems and communities were considered in the Draft EIS. For example, Chapter 3 Affected Environment of the EIS describes existing conditions within the Project area and Section 3.1 Introduction provides an overview and history of the Project area. These existing conditions are factored into the impact analysis in Chapter 4 Environmental Consequences of the EIS. Further, Chapter 3, Section 3.6.2.2 in Wetland Resources and Waters of the U.S. notes the ongoing impact of the DWH oil spill on wetland loss, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 in Aquatic Resources provides an overview of the adverse impact of the oil spill on key aquatic species within the Barataria Basin.

The impacts raised by the commenters were also considered in the LA TIG's Draft Restoration Plan. As described in the Restoration Plan in Section 1.3 (Authorities and Regulations), the goal of the Oil Pollution

Act of 1990, 33 USC 2701 et seq., is to make the environment and public whole for injuries to natural resources and services resulting from an incident involving a discharge or substantial threat of a discharge of oil. This goal is achieved through the return of the injured resources and services to baseline, and compensation for interim losses from the date of the incident until recovery. According to 15 CFR, Part 990.30, restoration is defined as “any action...to restore, rehabilitate, replace, or acquire the equivalent of injured natural resources and services”, and 15 CFR, Part 990.53 (c) (2) specifies that compensatory restoration actions can include actions that provide natural resources and services of the same or comparable type and quality as the injured resources.

Considering the scale of impacts from the oil spill, the LA TIG also understands the importance of increasing the resiliency and sustainability of this highly productive Gulf ecosystem through restoration. As noted in the PDARP/PEIS, diversions of Mississippi River water into adjacent wetlands have a high probability of providing these types of large-scale benefits for the long-term sustainability of deltaic wetlands. As described in Section 2.3.3 (Proposed MBSD Project Location Alternatives) of the Restoration Plan, while a project in Lower Barataria Basin would provide restoration closest to where the heaviest oiling and associated injuries occurred, such a project would also require more time and more sediment to build land given the relatively deep open water in that area, and newly created marshes would be more quickly eroded by waves, tidal action, and storm surge. A project in the Mid-Barataria Basin is close to oiled shorelines but farther away from additional erosive forces found in the Lower Barataria Basin. The LA TIG selected the proposed Project location in the Mid-Barataria Basin because a project in this location would have the capacity to accept and disperse sediments and nutrients and would promote the long-term sustainability of existing and newly created marshes.

The LA TIG recognizes that the proposed Project would result in some adverse impacts to natural resources as described in Section 3.2.1.5 (Avoids Collateral Injury) of the Restoration Plan. However, these injuries occur primarily in the middle and Lower Barataria Basin, and the proposed Project would also restore natural resources that were injured by the DWH spill as described in Section 3.2.1.6 (Benefits Multiple Resources) of the Restoration Plan. The increase in wetland area under the Project is also expected to benefit communities on the West Bank, north of the diversion, by providing increased protection from storm surge (see Section 3.2.1.7).

Because the proposed Project would contribute to restoring natural resources injured by the DWH oil spill to their baseline conditions, the Project is consistent with OPA, the OPA NRDA regulations, the PDARP/PEIS, and the SRP. See Section 3 (OPA Evaluation of the

Alternatives) of the Restoration Plan for more details about the LA TIG's evaluation of the proposed Project and its alternatives.

The LA TIG has also funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 (Screening for a Reasonable Range of Alternatives) of the Restoration Plan provides a detailed discussion of the selection of the location for the LA TIG's Preferred Alternative in the Restoration Plan.

Concern ID: 62665

Commenters suggested that the proposed Project would achieve some benefits relative to the No Action Alternative, but that even if the modeling is correct (which it probably is not), the projected benefits provided by the Project would be very small compared to amount of habitat that is expected to be lost in the Barataria Basin over 50 years. If the models used for the EIS turn out to be accurate, more than 43 percent of the land in the Barataria Basin will have disappeared even with the Project in 30 years. During that time, 105,000 acres of land will be lost, with the Project sustaining only 17,300 more acres than the No Action Alternative (5 percent of the basin's current land area). Because of this background of large land loss, the proposed Project could only be considered a stop-gap measure. Further, commenters cited sources indicating ongoing debate about the effectiveness of large-scale sediment diversions as a land-building strategy and recommended those uncertainties be addressed in the Draft EIS (Blaskey, 2020; Blum and Roberts, 2009; Chamberlain et al., 2018; DeLaune et al., 2013; Suir et al., 2014; Turner et al., 2019).

Response ID: 16624

The issues raised by the commenters were considered in the Draft EIS. For example, the proposed Project's long-term influence on land building and wetland creation has been modeled extensively through engineering and design and the impacts (beneficial and adverse) are described in Sections 4.2 (Geology and Soils), 4.4 (Surface Water and Coastal Processes) and 4.6 (Wetland Resources and Waters of the U.S.) of the EIS. With regard to modeling conducted to determine impacts of the proposed Project, the Delft3D Basinwide Model projections of Project impacts include uncertainties. Uncertainties are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 (Model Limitations and Uncertainty), and in detail in Appendix E (Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties). Uncertainty in model results is recognized in Table 4.2-4 found in Section 4.2.3.2.2.1 Geology, which indicates that land areas are considered accurate within +/- 200 acres and that the error in land gains is +/-300 acres.

As part of developing the EIS, the USACE, together with members of the LA TIG (including cooperating agencies and CPRA), reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives. The cited studies were reviewed and included in relevant analyses in the Draft EIS.

The LA TIG acknowledges the commenters' concerns. As described in the LA TIG's Draft Restoration Plan, the Project would reestablish deltaic processes that deliver sediment, fresh water, and nutrients; improve the function of existing habitats; and develop deltaic habitats that connect nearshore and offshore ecosystems. The LA TIG expects that the Project would result in the creation of a maximum of 17,300 acres of land in the Barataria Basin by year 30 of operations; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 [Alternative 1 Description] of the Restoration Plan). The LA TIG agrees

that, with or without the Project, coastal Louisiana and the Barataria Basin would experience tremendous land loss. However, the LA TIG believes this background of large land loss makes the habitat created by the proposed Project even more important. Relative to other types of incremental approaches (for example, marsh creation through the application of dredged sediment), the Project would reconnect and reestablish sustainable deltaic processes and support the long-term viability of existing and planned coastal restoration efforts. All citations referenced by the commenters were included in the Final EIS and thus were considered by the LA TIG in the Final Restoration Plan.

Concern ID: 62666

It would be inappropriate, and contrary to the stated purpose of restoring injured resources, to use DWH settlement funds to implement a project that would harm the same wildlife (for example, shrimp, oysters, bottlenose dolphins, *Spartina alterniflora*) and ecological services that were negatively affected by the oil spill.

Response ID: 16625

USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore the damage caused by the DWH oil spill. USACE's involvement with the proposed Project is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under the CWA Section 404 and RHA Sections 10 and 14 (33 USC Section 408). USACE is not executing any DWH restoration actions under the OPA. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH spill in the Louisiana Restoration Area. As explained in the Final EIS, Appendix B2 DEIS Public Review and Public Meetings, Section 2.0 Agency Roles in the Responses to Public Comments, response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views.

In the Restoration Plan, the LA TIG explained that the DWH oil spill resulted in the oiling of more than 1,100 kilometers of wetlands, nearly all of which were located in coastal Louisiana (DWH NRDA Trustees, 2016). The heaviest oiling occurred in the Barataria Basin, resulting in substantial injuries to natural resources in the basin (DWH NRDA Trustees, 2016). Recognizing that the resulting loss of marsh productivity affected resources throughout the northern Gulf of Mexico ecosystem, the State of Louisiana and the federal Trustees that negotiated the DWH Natural Resource Damages settlement allocated \$4 billion, almost half of the total settlement amount, to restoring Louisiana's wetland, coastal, and nearshore habitats.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of

collateral injuries, including some high degree of collateral injuries, to natural resources injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the LA TIG's Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, as noted in the LA TIG's Restoration Plan, without the proposed Project, sea-level rise, subsidence, and other existing stressors would result in additional marsh loss over time reducing the suitability of habitat for many of the same species.

The LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing a deltaic process, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Final Restoration Plan because the LA TIG believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the NRDA Trustee's Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

In its Strategic Restoration Plan for Barataria Basin (2018), the LA TIG evaluated the potential and extent of collateral injury for a range of restoration techniques. Unfortunately, almost all large-scale restoration comes with some potential for collateral injury. The LA TIG evaluated

each alternative against a variety of factors, including those outlined in 15 CFR §990.54. In the Restoration Plan, the LA TIG strives to identify an alternative that would provide what it considers the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. Again, see Section 3.2.4 of the Restoration Plan for a discussion of how the LA TIG came to its decision.

In recognition of the potential for collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA will implement a suite of stewardship measures (see Section 3.2.1.1.5 [Associated Stewardship Measures] of the Restoration Plan and Appendix R1 to the EIS). The LA TIG is also committed through these measures to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

	part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.
Concern ID: 62667	One commenter inquired about whether climate scientists had been involved in assessing the potential impacts of the proposed Project.
Response ID: 16626	Multi-disciplinary teams of scientists and professionals contributed to the preparation of the EIS and the LA TIG's Restoration Plan. See Chapter 6 List of Preparers in the Final EIS for the qualifications of the contributors to the EIS. In addition, climate modeling was incorporated into the EIS analysis. The Delft3D Basinwide Model incorporates two different Gulf of Mexico regional sea-level rise scenarios: 2.6 and 4.9 feet (0.79 and 1.5 meters) by year 2100 in addition to local subsidence rates. For additional information on Delft3D Basinwide Modeling, refer to Appendix E Delft3D Modeling of the EIS.
Concern ID: 62668	The Project fails to meet the five objectives that Trustees articulated in the PDARP/PEIS. By diverting Mississippi River water into the coastal zone, the proposed Project would damage water quality and destroy habitat essential to living coastal and marine resources.
Response ID: 16627	USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore the damage caused by the DWH oil spill. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH oil spill in the Louisiana Restoration Area. As explained in the Final EIS, Appendix B2 DEIS Public Review and Public Meetings, Section 2.0 Agency Roles in the Responses to Public Comments, response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views. The ability of the Project to meet LA TIG objectives was considered in the LA TIG's Draft Restoration Plan. In preparing the LA TIG's Restoration Plan, the LA TIG developed the goals and objectives for the proposed Project through an iterative restoration planning process, beginning with the restoration goals in the Final PDARP/PEIS, then developing SRP/EA #3 for the restoration of habitat and services in the Barataria Basin, and ending with Project-specific goals. The LA TIG notes that while the commenter asserts that the proposed Project would fail to meet the goals of the PDARP/PEIS, the PDARP/PEIS in fact included a large-scale sediment diversion as a key restoration technique (see Section 5.5.2.2 [Strategy to Achieve Goals] of the PDARP/PEIS).
	The proposed MBSD Project has been developed to address the specific goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type. More specifically, the proposed Project has been

designed to (1) restore a variety of interspersed and ecologically connected coastal habitats, (2) restore for injuries to habitats in geographic areas where the injuries occurred, while considering approaches that provide resilience and sustainability, and (3) restore habitats and their ecological functions in appropriate combinations.

In developing restoration alternatives, the LA TIG evaluated the proposed Project according to the OPA evaluation criteria, including the extent to which alternatives would prevent future injury as a result of the oil spill and avoid collateral injury, which could include a threat of compromised water quality from the introduction of Mississippi River water into the receiving Barataria Basin (see Section 3.2 [OPA Evaluation of the Alternatives] in the Restoration Plan). That OPA evaluation, as well as related evaluation of impacts to surface water quality evaluated in the EIS, finds that species with a wide range of salinity tolerance (for example, flounder) are not likely to be affected by the water quality changes resulting from operations of the diversion, but could experience minor collateral injuries due to temporary shifts in prey composition and distribution or suboptimal salinity affecting early life stages (see Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan and Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS). Indirect impacts on bottlenose dolphins in the Barataria Basin could occur as water quality (for example, HABs, contaminants) habitat and food web dynamics shift over time. Overall, the operation of the diversion would be expected to have permanent minor to moderate changes in salinity, water temperatures, seasonal trends in total nitrogen and total phosphorus, dissolved oxygen trends, sulfate concentrations, and fecal coliform concentrations in the Barataria Basin (see Section 3.2.1.1 [Alternative 1 Description] of the Restoration Plan and Chapter 4, Section 4.5 Surface Water and Sediment Quality, Table 4.5-4 of the EIS).

Collateral injury and impacts to essential fish habitat are also included as part of the OPA and NEPA evaluation. The proposed Project would be expected to increase the overall coverage and biomass of SAV in the basin once salinity regimes stabilize and new freshwater or intermediate communities become established (see Section 3.2.1.6 [Benefits Multiple Resources – Alternative 1] of the Restoration Plan and Chapter 4, Section 4.10.4.1 in Aquatic Resources of the EIS). SAV is managed as essential fish habitat in the Barataria Basin, providing structured habitat that is of greater value for fish and crustaceans than unstructured habitats, such as soft bottoms (see Section 4.10.4.4 of the EIS). From the proposed Project, the Barataria Basin is projected to retain a diversity of marsh habitat types by 2050, with a projected acreage of approximately 207,000 acres of freshwater/intermediate marsh, 16,600 acres of brackish marsh, and 10,400 acres of saline marsh (see Section 3.2.1.6 [Benefits Multiple Resources] of the

Restoration Plan and Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S., Table 4.6-3 in the EIS). These wetlands provide ecosystem services, including essential fish habitat for fish and crustaceans and other aquatic species as described in Section 3.2.1.6 (Benefits Multiple Resources) of the Restoration Plan.

By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem. The proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Concern ID: 62669

While the proposed Project would harm the aquatic wildlife (for example, shellfish, finfish and dolphins) that currently reside in the Mid-Barataria Basin, that wildlife only resides in the area due to human interventions that cut the basin off from the Mississippi River. The EIS and Restoration Plan should place the impacts in historical context and thereby demonstrate that the Project is truly restorative because it is returning the basin to the conditions that were typical prior to the extensive flood control efforts of the 20th century.

Response ID: 16628

The historic conditions of the Barataria Basin, and how this relates to potentially impacted resources, was considered in the Draft EIS. For example, Chapter 3 (Affected Environment) of the EIS describes existing conditions within the Project area and Section 3.1.4 (Overview and History of the Project Area) in the Introduction provides an overview and history of the Project area. See for example, Figure 3.2-1, Land Area Change in Project Area (1932 to 2016); Section 3.6.2 Wetland Loss; Section 3.6.2.2. Causes of Wetland Loss; Figure 3.6-2 Marsh Type Change in the Project Area, 1968 through 2013. These existing conditions were factored into the impact analysis in Chapter 4 (Environmental Consequences) of the EIS.

Shellfish and finfish historically resided in the Barataria Basin prior the 1930s. Due to land loss over the 20th century, as noted in Section 3.6.2 Wetland Loss of the EIS and Section 3.10.1 Historical Context of the Final EIS, Barataria Bay and surrounding waterbodies have expanded as marsh has given way to open water and more saline conditions have shifted slightly north, creating more suitable habitat for oysters and other species benefiting from brackish or saline waters, such as dolphins, in the mid to lower basin.

The proposed Project is not anticipated to restore the basin to its historic conditions. As noted in Section 3.4.1.2 (Barataria Basin), land loss in the Barataria Basin from 1932 to 2016 resulted in a net loss of 276,036 acres, accounting for 29.1 percent of the land area in the basin (Couvillion et al. 2017). The proposed Project is anticipated to create and/or maintain 12,700 acres of wetlands in the basin by the year 2070 when compared with the No Action Alternative.

The historical context of the Project has also been considered in the LA TIG's Draft Restoration Plan. More specifically, Section 3.2.1.5.3 (Resources with a High Level of Expected Collateral Injury from Alternative 1) of the Restoration Plan notes that the area that would be affected by the proposed Project has been severed from its historical hydrological connection to the Mississippi River, resulting in higher salinity in an area that historically experienced regular freshwater and sediment inputs. The intended restoration of this area would result in collateral injury to species that depend on the current higher-salinity conditions in the basin.

Concern ID: 62671

The Project benefits may last only a few decades.

Response ID: 16629

The potential duration of Project benefits was considered in the Draft EIS. For example, the Project's long-term influence on land building and wetland creation are modeled extensively and the impacts (beneficial and adverse) are described in Sections 4.2 (Geology and Soils), 4.4 (Surface Water and Coastal Processes) and 4.6 (Wetland Resources and Waters of the U.S.) of the EIS.

The potential duration of Project benefits has also been considered in the LA TIG's Draft Restoration Plan. For example, as described in 2.3 (Screening for a Reasonable Range of Alternatives) of the Restoration Plan, the LA TIG determined that a sediment diversion is the best way to achieve a self-sustaining marsh ecosystem in the Barataria Basin. Compared to other restoration methods (for example, marsh creation through the placement of dredged material), sediment diversions offer the greatest long-term sustainability. The Project would reconnect and reestablish sustainable deltaic processes and support the long-term viability of existing and planned coastal restoration efforts.

Concern ID: 63770

A large-scale river diversion is not needed to restore damages from the Deepwater Horizon oil spill and is unrelated to the spill.

Response ID: 16630

Chapter 2, Section 2.2.1 Define Project Objectives of the EIS describes the goals and objectives of the Project, which are based on the Project's purpose and need. As described in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose and need for this Project was developed taking into consideration the Applicant's stated purpose and need, the public's and other perspectives, input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and

Responsibilities), and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC). Chapter 3 (Affected Environment) of the EIS describes existing conditions within the Project area and Section 3.1 (Introduction) provides an overview and history of the Project area, including the DWH oil spill. These existing conditions are factored into the impact analysis in Chapter 4 (Environmental Consequences) of the EIS.

The appropriate means to restore the injuries caused by the DWH oil spill was considered by the LA TIG. As discussed in the PDARP/PEIS, the SRP/EA #3, and the LA TIG's Restoration Plan, the LA TIG agencies found that impacts of the injuries from the DWH oil spill were particularly detrimental to the resources of the Barataria Basin, which were already in peril as a result of the coastal wetland losses (caused by multiple factors including river levees that prevent deposition of sediments through regular flood events, subsidence and a changing climate). In the Barataria Basin, marshes already suffering from significant coastal erosion experienced heavy oiling and subsequently experienced double or triple the rate of marsh loss. In identifying the nexus to injury, the Final PDARP/PEIS (DWH NRDA Trustees, 2016a) documented the nature, degree, and extent of injuries from the DWH oil spill to both natural resources and the services they provide within the Barataria Basin, and the need for restoration to restore for the injuries incurred.

Evaluating restoration strategies that could restore injuries in the Barataria Basin, the SRP/EA #3 found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018, page 3-32) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed MBSD Project evaluated in this Restoration Plan, and finds that it would best restore for injuries caused by the DWH oil spill by reconnecting and reestablishing sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

EC30000 – Eval Standard – Likelihood of Success

Concern ID: 62639

The proposed Project is unlikely to succeed because similar types of projects have failed to build land, and have caused a range of other issues, like destroying habitat, exacerbating flooding, and reducing water quality. Specific examples of similar, problematic projects include the Mississippi River Gulf Outlet, Bonnet Carré Spillway, Caernarvon Freshwater Diversion, Davis Pond, West Bay, Baptiste Collette, Fort St. Philip, and Cubits Gap. In fact, data show that the Caernarvon Diversion in particular was unable to show sustained land gains in the face of Hurricane Katrina-driven losses in wetland habitat (Underwood 1994, Kearney et al. 2011). Davis Pond has seen increased land loss inside the diversion compared to a reference area (Couvillion et al. 2017). Fort St. Philip has lost large areas of wetlands (Suir et al. 2014). While the Atchafalaya River is building land in the Atchafalaya and Wax Lake Deltas, the Atchafalaya River carries more sediment than the Mississippi River does currently (Blum and Roberts 2009), and more of the Atchafalaya River is diverted to each of these deltas and marshes farther south. Additionally, one study identified poor performance of diversions due to many periods of inoperation due to socioeconomic uncertainties (Caffey et al. 2014).

Louisiana. Mississippi River Valley Div., Engineer. Res. Development Center, Mississippi River Geomorphology and Potamology Program. MRG&P Report No. 2. Vicksburg, MS**Response ID: 16631**

The issues raised by the commenters were considered in the Draft EIS. The EIS states in Chapter 2, Section 2.1.1 Overview of Sediment Diversions that CPRA considered information from other diversions in its assessment of the Project alternatives, but because the projects mentioned by the commenters had been designed to discharge primarily water, not sediment, they are not fully comparable to the proposed Project. As explained in the EIS Chapter 4, Section 4.1.3 (Environmental Consequences, Overview of Delft3D Basinwide Model for Impact Analysis), Delft3D Basinwide Modeling software was used to assess impacts of the Project on hydrology, land gains and losses, water quality, and vegetation in the Barataria Basin and birdfoot delta. Using standard professional practice, this physics-based model was validated to the West Bay Sediment Diversion. The West Bay Sediment Diversion is useful for validating the physical processes of erosion and deposition of sediment because it, like the proposed MBSD Project, is a sediment diversion that extracts relatively more sediment in the river. The other diversions cited were designed to primarily deliver water, not sediment, and are less useful comparisons.

The West Bay Sediment Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, "A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that diversions do not lead to appreciable sediment accumulation" (Kolker, A. S., Miner, M. D. and Weathers, H. D. 2012. Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, Estuarine, Coastal and Shelf Science, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005>).

Comparing diversions outside of physics-based numerical modeling has limited value because diversions and receiving environments often exhibit unique behaviors that correlations do not account for. For that reason, the physics-based Delft modeling, even with its limitations and uncertainties, is a better predictor than anecdotal comparisons to Fort St. Phillip or other sites. Uncertainties associated with the validation and application of the Delft3D Basinwide Modeling conducted for the proposed Project were assessed by the West Bay application, sensitivity tests, and by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in EIS Appendix E Delft3D Modeling and incorporated into the EIS conclusions throughout Chapter 4 Environmental

Consequences. While most citations mentioned by commenters were already included in the Draft EIS, the Final EIS has been edited to include Caffey and Petrola (2014) to Chapter 4, Section 4.6.5.1.2.4 Land Accretion.

The likelihood of success of the Project and information from other freshwater diversions was also considered in the LA TIG's Draft Restoration Plan, Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. The proposed MBSD Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the geomorphological features of the Lower Mississippi River as of 2012, including data from the referenced projects. All citations referenced by the commenters were included in the Final EIS and were considered by the LA TIG in the Final Restoration Plan.

Concern ID: 62660

Commenters stated that the proposed Project will not provide the benefits described in the Draft Restoration Plan and EIS. The proposed Project will not stop the problems of sea-level rise and marsh erosion.

Response ID: 16633

How sea-level rise and marsh erosion would affect the proposed diversion's land-building capability has been considered in the Draft EIS in Chapter 4, Section 4.2.3.2 Operational Impacts in Geology and Soils. In addition, sea-level rise and subsidence are explicitly accounted for in the Delft3D Basinwide Model projection of Project impacts, as described in Sections 3.2.4 and 3.2.3, respectively, of EIS Appendix E Delft3D Modeling.

The potential benefits of the Project and how those benefits relate to sea-level rise and marsh erosion have also been considered in the LA TIG's Draft Restoration Plan. The LA TIG agrees that the Project would not stop sea-level rise, subsidence or other erosive forces that result in marsh erosion. However, the Project is designed to counteract these forces by transporting sediment from the Mississippi River to create thousands of acres of marsh that would be sustained over decades, even in the face of erosion and rising sea levels (see Section 3.2.1.6 [Benefits Multiple Resources] in the Restoration Plan).

Concern ID: 62661

The Mississippi River is currently not capable of building land as it used to, in part because it does not carry as much sediment as it used to, and thus the proposed Project will fail. If it were capable of building land, there would be a large land mass at its current outlet.

Response ID: 16634

The capability of the Mississippi River to support land building has been considered in the Draft EIS. For example, Chapter 3, Section 3.4.2.5 Sediment Transport discusses the available sediment in the Mississippi River, noting that studies had shown downward trends in sediment supply in the river through the 1990s, but that since then the volume of sediment (coarse and fine) in the water column has remained fairly constant. The river still carries a massive sediment load, but not as massive as before. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes as described in the EIS in Chapter 3, Section 3.4.2.5 Sediment Transport. The EIS takes this diminished sediment load into account when computing the sediment load that would be delivered to the Barataria Basin via the proposed diversion. This is described in detail in Section 5.2.2 (River Discharge and Sediment Rating Curve) of Appendix E (Delft3D Modeling) to the EIS.

The LA TIG acknowledges the comment and understands the commenters' concern, and this was considered in the LA TIG's Draft Restoration Plan. The Mississippi River does carry a large plume of sediment into the Gulf of Mexico each year. A large delta exists at the mouth of the river, often requiring dredging to maintain navigation. Crevasses have been used to supplement land building in the birdfoot delta, confirming the ability of the river to build and maintain land. The size of the delta is limited by a number of factors, including the depth of the water at the mouth of the Mississippi River and the constant erosive forces affecting the Gulf of Mexico. By comparison, the Project is proposed to be constructed at RM 60.7 of the Mississippi River because this location is capable of capturing and retaining the sediments transported into the Barataria Basin by the Project (see EIS Chapter 2, Section 2.4.1.3 Application of Additional considerations to Potential Alternative Locations in Upper, Middle, or Lower Barataria Basin). As noted above, these issues and analyses are included in the EIS, and are also considered by the LA TIG in its identification of its Preferred Alternative in the Restoration Plan.

Concern ID: 62662

The proposed Project is likely to succeed because other diversions have also built land and restored ecosystems. Specific examples of land-building projects include the Caernarvon Freshwater Diversion, Davis Pond, West Bay, Fort St. Phillip, the Jaws, Wax Lake, and Mardi Gras Pass. Many of the benefits of the Project, in terms of soil creation and microbial processes, are not captured in the engineering of the modeling. Many of the fine sediments transported by the diversion cannot be dredged but are critical soil components.

Response ID: 16635

The benefits to land building of fine sediments transported by the diversion were addressed in the Draft EIS in Chapter 4, Section 4.2.3.2

Operational Impacts in 4.2.3 Geology, Topography, and Geomorphology. The Delft3D modeling conducted for the EIS distinguishes the types of sediment (sands and fine sediments) that would be deposited in the basin. Table 5.2-1 in EIS Appendix E Delft3D Modeling lists the sediment classes included in the model. As described in EIS Chapter 4, Section 4.4.4 Hydrology and Hydrodynamics, sand and fine sediments would contribute to land building in the basin in two ways - by being resuspended and transported elsewhere for deposition and by forming a base layer upon which future pulses of sediment could form marsh or land. The model's physics-based computations showed that the coarser sands would settle out before the finer sediment. As the sediment builds up, discharge velocities would increase over the previously deposited sediment and resuspend it, pushing it farther into the basin. Thus, the model reproduces the natural process of delta building in which successive waves of sediment push farther out, either forming land/marsh or creating a base upon which land/marsh can be formed without moving it by dredging and placement. In addition, Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology of the EIS discusses the geomorphic impacts of diversion operations, including the Wax Lake Outlet, the Caernarvon Freshwater Diversion, the Davis Pond Freshwater Diversion, the Bohemia Spillway, and Bonnet Carré Spillway, and Mardi Gras Pass.

The likelihood of the Project's success and its potential benefits were considered in the LA TIG's Draft Restoration Plan. As part of evaluating the Project and alternatives, the LA TIG considered the likelihood that the Project would succeed and achieve the LA TIG's goals. Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the LA TIG's Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, these sections note that the knowledge gained through the projects noted by the commenters has been applied in designing the Project and evaluating whether and how the Project would restore and sustain critical marshlands. A full description of the range of benefits that would be provided by the Project is also included in Section 3.2.1.6 Benefits Multiple Resources of the Restoration Plan.

Concern ID: 62659

The proposed Project is an experiment, and it is not possible to guarantee its alleged benefits.

Response ID: 16632

The uncertainties associated with the Project's success were considered in the Draft EIS. While the benefits of the Project cannot be guaranteed, the EIS uses state-of-the-art modeling, including but not limited to the Delft3D Basinwide Model, to project the Project's beneficial and adverse impacts. These modeling projections of Project impacts include uncertainties. Following standard professional practice,

model uncertainties are clearly stated in the EIS with respect to the model's quantitative results. Uncertainties are incorporated into the EIS impact conclusions and are briefly summarized in EIS Chapter 4, Section 4.1.3.3 Model Limitations and Uncertainty, and in detail in Section 8.0 Model Limitations and Uncertainties of EIS Appendix E Delft3D Modeling.

The likelihood of success of the Project was also considered in the LA TIG's Draft Restoration Plan. While recognizing the innovative nature of the proposed Project, the Restoration Plan discusses in detail the factors that would contribute to the Project's success. More specifically, Sections 3.2.1.4 (Likelihood of Success - Alternative 1) and 3.2.2.4 (Likelihood of Success - Alternatives 2-6) of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, such a sediment diversion has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Section 3.2.1.4 [Likelihood of Success - Alternative 1] of the Restoration Plan). The Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

EC40000 - Eval Standard – Benefits More Than One Resource

Concern ID: 62637

The proposed Project will benefit habitat, fish and wildlife, levee protection, flood control and navigation. These benefits will help protect coastal resources and communities in Louisiana.

Response ID: 16647

The potential benefits of the Project were considered in the Draft EIS. As described in Chapter 4 (Environmental Consequences), the proposed Project would result in both beneficial and adverse effects on habitat, fish and wildlife, levee protection, flood control, and navigation, depending on the specific characteristics of the species or location involved (for example, a species' life history or salinity preferences, or a levee's height).

The potential benefits of the Project were also considered in the LA TIG's Draft Restoration Plan. As described in Section 3.2.1.6 (Benefits Multiple Resources) of the Restoration Plan, the proposed Project is expected to benefit multiple resources in the Barataria Basin and the northern Gulf of Mexico, including nearshore marine ecosystems, water column resources (including fish and invertebrates), birds, and terrestrial wildlife. The LA TIG also anticipates that the Project would provide public health and safety benefits to the populated areas north of the diversion through increased wetland acreage that would decrease storm surge and wave height.

Concern ID: 62638

The Restoration Plan should be clear that, as stated in the Progress Report on Coordination for Non-point Source Measures in Hypoxia Task Force states, the leading causes of increased amounts of nutrients delivered to the Gulf are upstream sources of nitrogen and phosphorus (that is, agriculture, atmospheric deposition, urban runoff, and point sources like wastewater treatment plants).

Response ID: 16649

Chapter 3, Section 3.10.5.1.4 Nutrient Loading of the Final EIS has been revised to reference the Hypoxia Task Force report and further identify the types of anthropogenic sources that have resulted in increased nutrient loading in the Gulf.

The LA TIG acknowledges the comment about the leading causes of increased amounts of nutrients being delivered to the Gulf and has revised Section 3.2.1.6.5 (Alternative 1 - Benefits to Offshore Ecosystems) of the LA TIG's Final Restoration Plan accordingly.

EC60000 – Eval Standard – Avoids Collateral Injury

Concern ID: 62634

The proposed Project would cause excessive harm to fisheries (for example, oysters and brown shrimp), dolphins, communities and recreational uses, which is unacceptable and would make its implementation a clear violation of OPA. OPA regulations states that proposed restoration actions should be evaluated by “the extent to which each alternative will prevent future injury as a result of the incident, and avoids collateral injury as a result of implementing the alternative”. Because the Project would injure species that were harmed by the Deepwater Horizon oil spill, it should not be implemented, even if it does benefit some habitats and species. Some commenters argued it was also inconsistent or in violation of the 2013 U.S. Court Consent Decree and the BP plea agreement relevant to the National Fish & Wildlife Foundation (NFWF) funds.

Response ID: 16650

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is not evaluating the proposed Project for compliance with OPA and not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG's Draft Restoration Plan, OPA, or NRDA processes represent solely the views of the LA TIG, not USACE.

The potential collateral injuries of the proposed Project were considered in the LA TIG's Draft Restoration Plan.

OPA requires that Trustees develop and implement a plan for restoration, rehabilitation, replacement, or acquisition of the equivalent, of the injured natural resources under their trusteeship. See 33 U.S.C. § 2706(c). OPA further requires federal agencies to propose regulations for the “assessment of natural resource damages.” See § 2706(e). Under 2707(e)(2), any assessment of natural resource damages made in accordance with these regulations creates a rebuttable presumption on behalf of a Trustee in any administrative or judicial proceeding under the Act.

As required by OPA 2706(e), NOAA developed regulations outlining a process for the assessment of natural resource damages. These regulations (hereinafter “NRDA regulations” at 15 CFR Part 990) also

include a process for restoration planning, including the development and evaluation of restoration alternatives.

The 2016 U.S. Consent Decree with BP provides that monies received under the settlement for natural resource damages will be spent as outlined in restoration plans adopted by the Trustees consistent with 15 CFR 990. See Paragraph 19, and Appendix 2. The LA TIG's Restoration Plan is consistent with 15 CFR 990.

Title 15 CFR §990.54 of the regulations outlines a number of areas in which a reasonable range of alternatives should be evaluated to select the preferred alternative. Recognizing that almost all restoration comes with some potential for collateral injury, one factor for evaluation is the extent to which each alternative will prevent future injury and avoid collateral injury. The potential for collateral injury does not preclude an alternative from selection, rather the Trustees must evaluate each alternative under multiple factors, and select a preferred alternative to meet the outlined restoration objectives.

The LA TIG, in selecting the Preferred Alternative in the Restoration Plan, evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 (Identification of a Preferred Alternative), 3.2.1.5 (Alternative 1 – Avoids Collateral Injury), and 3.2.2.5 (Alternatives 2–6 – Avoids Collateral Injury) of the Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems and necessarily entails reverting the current ecosystem to a more natural state that was altered when Mississippi River flows were cut off by construction of levees. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the Preferred Alternative in the Restoration Plan.

The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more

closely resembles historic conditions. As described in Section 3.2.1.6 (Alternative 1 – Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as the Preferred Alternative in the Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project would meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the spill.

The BP Plea Agreement as it applies to NFWF funds is not relevant here as the LA TIG is not authorizing the use of those funds for this Project. Even if it were applicable, the criminal plea agreement expressly contemplates the use of criminal penalties for sediment diversion in Louisiana.

Concern ID: 62635

The proposed Project would cause harm to some species and fisheries, and would increase flooding in some communities, and the EIS does not show that the proposed Project's benefits outweigh these harms. Other less harmful alternatives to the proposed Project should be considered to minimize impacts.

Response ID: 16651

The range of alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. USACE generally focused on the Applicant's purpose and need and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities), and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project purpose and need.

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. Based on a review of the various alternatives against these criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2 Alternatives, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such a cost-benefit analysis is relevant to the agency's permit decision. USACE generally assumes that a permit applicant has made its own economic evaluation regarding the costs of a proposed project and therefore a cost-benefit analysis is not relevant to its decision. However, as part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

The LA TIG is the group responsible for restoring natural resources and services within Louisiana that were injured by the DWH oil spill. In the LA TIG's Restoration Plan, the LA TIG also evaluates a range of alternatives and identifies its Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs) as providing the right balance in terms of likely benefits the Project would achieve and risks related to collateral injury for its NRDA decision. Title 15 CFR §990.54 of the NRDA regulations outlines the criteria that are used to evaluate a reasonable range of alternatives and select the preferred alternative. Recognizing that almost all restoration comes with some potential for collateral injury, one factor for evaluation is the extent to which each alternative will prevent future injury and avoid collateral injury. The

potential for collateral injury does not preclude an alternative from selection, rather the Trustees must evaluate each alternative under multiple factors and select a preferred alternative to meet the outlined restoration objectives.

The LA TIG, in selecting the Preferred Alternative in the Restoration Plan, evaluates a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 (Identification of a Preferred Alternative), 3.2.1.5 (Avoids Collateral Injury – Alternative 1), and 3.2.2.5 (Avoids Collateral Injury – Alternatives 2-6) of the Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems, and necessarily entails reverting the current ecosystem to a more natural state that was altered when Mississippi River flows were cut off by construction of levees. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as its Preferred Alternative in the Restoration Plan.

The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing a deltaic process, the proposed Project is expected to enhance the ecological productivity of the estuary and

improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project would meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the spill.

Concern ID: 63752

Commenters questioned the slow pace of LA TIG restoration planning for marine mammals and noted several restoration actions that have already been submitted to the NRDA restoration project idea portal. They suggested that the LA TIG identify priorities for marine mammal restoration in Louisiana and prepare a Restoration Plan to implement those priorities without delay.

Response ID: 16652

USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore the damage caused by the DWH oil spill. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH oil spill in the Louisiana Restoration Area. As explained in the Final EIS, Appendix B2 DEIS Public Review and Public Meetings, Section 2.0 Agency Roles in the Responses to Public Comments, response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views. The LA TIG acknowledges the comments and notes that because the discussion of specific marine mammal restoration project ideas is beyond the scope of this particular restoration planning effort, no related edits have been made to the LA TIG's Restoration Plan.

The LA TIG recognizes the importance of expediency in restoration of all resources injured by the DWH oil spill, including marine mammals. In the 2016 NRDA settlement with BP, \$50M was allocated to the restoration of Marine Mammals in the Louisiana Restoration Area. Settlement payments from BP began in 2017 and will occur every year for 15 years. Therefore, considerations must be made regarding the priority for expenditures of restoration dollars. There are additional implementation considerations that help to set the pace for restoration for all resources across the Gulf. Since the settlement, the LA TIG has approved two projects from the Marine Mammal allocation: the Assessment of Marine Mammal Physiological Responses to Low

Salinity Exposure and the Louisiana Enhanced Marine Mammal Stranding Network. The LA TIG has also funded the Louisiana Marine Mammal Abundance, Distribution, and Density project from the Monitoring and Adaptive Management allocation.

It is imperative that the LA TIG maximize the effectiveness of restoration efforts for all resources, including marine mammals. Thoughtful, intentional restoration planning is the first step in that process. Considerable data needs exist in regard to the identification and prioritization of marine mammal stressors in Louisiana. In the LA TIG Monitoring and Adaptive Management Strategy (LA TIG 2021), the LA TIG identified fundamental objectives for marine mammals in Louisiana and data needs to support the development of SMART (smart, measurable, achievable, realistic, and time-bound) objectives. These objectives will guide the expenditure of monitoring and adaptive management funding to support better understanding of marine mammal needs in Louisiana and, in turn, support the prioritization of restoration actions for that resource.

The LA TIG will consider the Project suggestions submitted to the DWH project portal when planning for future restoration efforts. The LA TIG appreciates the submission of thoughtful ideas based on the experience and knowledge of our partners and citizens.

Concern ID: 63810

Commenters raised concerns about the consequences if the Project fails and who will pay to compensate those harmed by a failed project, including the tourism and seafood industries.

Response ID: 16653

Each of the Alternatives analyzed in the EIS, except for the No Action Alternative, are expected to meet the purpose and need of the Project, and uncertainties in the quantum of impacts of the Project, both beneficial and adverse, are incorporated into the analyses included in Chapter 4, Environmental Consequences of the EIS. More specifically, salinity impacts of the Project are assessed using the Delft3D Basinwide Model, and this model's projections of future conditions include uncertainties. Uncertainties are incorporated into the EIS impact conclusions and are briefly summarized in the EIS in Chapter 4, Section 4.1.3.3 Model Limitations and Uncertainty, and in detail in Appendix E Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties. Uncertainties related to the Marine Mammals impact analysis are summarized in detail in Chapter 4, Section 4.11.3.1 Marine Mammals, General Caveats to Impact Analysis Approach.

The LA TIG expects the proposed Project to succeed for several reasons, which are discussed in Chapter 3, Section 3.2.1.4 (Likelihood of Success – Alternative 1) of the Restoration Plan.

With regard to fisheries impacts, the LA TIG notes that major, adverse impacts to shrimp and oyster fisheries are anticipated with or without

the proposed Project. While the timing of those impacts may be somewhat accelerated with the proposed Project, major adverse impacts to shrimpers and oyster harvesters are likely regardless of whether the Project is constructed.

CPRA, as a member of the LA TIG, has chosen to focus its mitigation strategies and expenditures on establishing sustainable fisheries for oysters and shrimp rather than on compensating individual shrimpers or oyster harvesters for their particularized economic losses. The LA TIG believes that the provisions of its fishery mitigation plan, valued at approximately \$54 million, along with other restoration actions being funded by the LA TIG, as well as other programs funded by the State through LDWF, would help to achieve that goal and address the impacts of the proposed Project.

CPRA's fishery mitigation plan can be found in the Mitigation and Stewardship Plan included as Appendix R1 to the EIS. Although not being implemented to mitigate the effects of the MBSD, examples of separately funded restoration/fishery improvement actions include: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, CPRA's allocation of \$2 million in adaptive management funding to support off-bottom oyster culture, the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery, and the LA TIG's allocation of \$38 million in recreational use funds to support subsistence and recreational fisheries.

Expected Project impacts on recreation and tourism are summarized in Table 4.16-5 (Summary of Potential Impacts on Recreation and Tourism from Each Alternative) of the EIS. The Mitigation and Stewardship Plan (Appendix R1 to the EIS) includes funding to increase access to recreational fishing sites.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated

Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

EC60100 – Geology/Soils

Concern ID: 61720

The commenter requested that the EIS be revised to properly re-frame impact determinations within the context of the Delta Cycle. While a normally functioning delta includes one or more active delta lobes, it also includes several other older, abandoned, degrading delta lobes. These latter delta lobes have higher-salinity water, low sediment loads, and flora and fauna that are characteristic of higher-salinity waters, including estuarine aquatic species of very high commercial and recreational value. The proposed diversion's impact on these high-value species should not be considered adverse. Such conclusions are fundamentally erroneous because functional deltas require some active deltas, and some abandoned, degrading ones, at all times. One commenter explained that this idea has been best communicated by van Beek and Gagliano (1984) and Roberts (1997).

Van Beek, J.L., and S.M. Gagliano. 1984. Renewal and Use of the Mississippi River Deltaic Plain. Water Science & Technology. 16 (3-4), 699-705.

Roberts, H. 1997. Dynamic Changes of the Holocene Mississippi River Delta Plain: The Delta cycle. Journal of Coastal Research, 13 (3), 605-627.

Response ID: 16169

The commenter's suggestion to include a contextual description of the delta cycle was considered in the Draft EIS. Further, the commenter's concerns regarding the criteria used to evaluate the beneficial or adverse nature of impacts is acknowledged. To help address these concerns, additional discussions of the delta cycle, and the role that the diversion may play in this cycle, have been added to the Final EIS in Chapter 3, Sections 3.1.4.2 Barataria Basin and 3.2.1.1 Historical Context in Geology and Soils, and the literature mentioned in public comments has also been incorporated into this section. Additional discussion related to the Project's impacts on geomorphology and historic deltaic landforms has been added to the Final EIS in Chapter 4, Section 4.2.3.2.2.3 Geomorphology. It is important to note that, as identified in Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative, the No Action Alternative is compared to existing conditions to understand the anticipated changes in the environment that would occur irrespective of the proposed Project. Thereafter, the anticipated environmental consequences of the Project action alternatives are compared to the results of the No Action Alternative analysis. Section ES.1 Introduction and Authority of the Executive Summary in the Final EIS has been revised to include this clarification.

The EIS includes extensive resource-specific explanations of why impacts are considered either beneficial or adverse in Chapter 4, Section 4.2 Geology and Soils. Section 4.2.2 Guidelines for Geology and Soils Impact Determinations specifically explains resource-specific definitions for minor, moderate, and major impacts. To further address concerns related to the classification of impacts, the USACE has added text to the Final EIS in the Executive Summary, Section ES.4.1 Geology and Soils to provide a more thorough overview of both adverse and beneficial impacts. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the Project against its prospective benefits.

In making its NRDA decision for the proposed Project, the LA TIG would evaluate Project alternatives considering the OPA evaluation criteria in 15 CFR §990.54; public input; and proposed Project mitigation, stewardship, and monitoring and adaptive management measures.

Concern ID: 61768

The commenter stated that the Geology and Soils section of the Executive Summary is not detailed enough. For example, clarify

what the 6 to 8 million cubic yards of dredging during construction is for and why it is described as a permanent, moderate, adverse impact; explain whether this dredging would impact artificial levees or the natural environment; and explain whether the dredged material placed in beneficial use sites would create as well as retain existing marsh. What this should also say is that the diversion is expected to actually decrease the rate of loss of existing marsh, in addition to creating new marsh.

Response ID: 16170

The commenter's concerns regarding dredging that would be undertaken for the proposed Project and the clarity of description of the proposed MBSD Project's impacts on land loss rates were considered in the Draft EIS. To help address the concerns related to dredging, additional details about the proposed Project's impacts on geology and soils during construction have been added to the Executive Summary, Section ES.4.1 Geology and Soils of the Final EIS. Chapter 4, Section 4.2.3.1 in Geology and Soils also includes details about why dredging during construction is required and an explanation of the intensity and adverse or beneficial nature of these impacts.

To address concerns related to descriptions of land-change impacts of the proposed Project, a discussion to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations has also been added. This discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

Concern ID: 61770

The commenter requested that the Geology and Soils section of the Executive Summary clarify what restoration projects the following sentence alludes to and whether those birdfoot delta restoration projects have been successful in the past: "These [landloss] impacts in the birdfoot delta may be partially abated by improving the capture of sediment that is lost to the Gulf through other targeted restoration projects."

Response ID: 16171

The issue raised by the commenter regarding the impact of other planned restoration projects that may abate projected land loss in the birdfoot delta due to diversion operations was addressed in the Draft EIS. Examples of reasonably foreseeable restoration projects aimed to retain sediment in the birdfoot delta are provided in Chapter 4, Section 4.25.2 (Geology and Soils section of Cumulative Impacts). The name of one of these restoration projects—the NRDA/CPRA-sponsored project Pass a Loutre Wildlife Management Area Crevasse Access Project approved in the LA TIG Final Restoration Plan and Environmental Assessment #4—has been added to the Geology and Soils section ES.4.1 of the Executive Summary and to Chapter 4, Section 4.2.3.2.1 in Geology and Soils, Operational Impacts in the Final

EIS. The successes of completed birdfoot delta crevasse restoration projects, such as the CWPPRA Delta Wide Crevasse Program, can be found on the CWPPRA website (<https://lacoast.gov/new/Default.aspx>).

Concern ID: 61771

The commenter expressed concern that the Geology and Soils section of the Executive Summary overstates the negative impact of the proposed diversion on wetlands in the Mississippi River birdfoot delta. Chapter 2 seems to suggest that between 6 and 10 percent of the flow in the river would be diverted from the birdfoot delta during operations. The commenter requested a more detailed explanation of how a diversion of between 6 and 10 percent of the flow of the river would decrease wetlands in the birdfoot delta by 45 percent. The commenter requested that this be explained in more detail.

Response ID: 16172

The commenter's concern regarding the percentage of Project-induced land loss in the birdfoot delta relative to the No Action Alternative was considered in the Draft EIS. To help clarify, a discussion to further explain currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations has been added to the Final EIS in the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology.

As pointed out by the commenter, the Applicant's Preferred Alternative would divert about 6 percent of the flow and about 6 percent of the sediment load of the river (as analyzed by the Water Institute of the Gulf). As shown in the EIS, Chapter 4, Section 4.2.3.2.2.1 Geology, Table 4.2-4, the Applicant's Preferred Alternative would result in increased land loss in the birdfoot delta by about 3 to 6 percent during the first 4 decades of diversion operations and by 45 percent after 50 years of diversion operations.

Concern ID: 61772

The commenter pointed out that Figure 4.2-6 in Chapter 4, Section 4.2 Geology and Soils indicates that by 2070, total acres created by the Project in the basin would be about 10,000 acres. The commenter expressed concern that this contradicts the amount of land created by the Project as stated in the December 18, 2019 presentation by CPRA to the Myrtle Grove Homeowners Association.

Response ID: 16173

The total acres projected to be created by the proposed Project were considered in the Draft EIS. The EIS contains projections derived from the most recent modeling efforts available by the Water Institute of the Gulf, and these projections may differ from those of earlier modeling efforts. A detailed overview of the modeling conducted to project land creation and land-loss impacts of the proposed MBSD Project is provided in Appendix E Delft3D Modeling of the EIS. To help further address these concerns, a discussion to clarify currently ongoing and

future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

Concern ID: 61774

The commenter referred to the recommendations made in McLindon et al. (2017), which stated that data collection is necessary to evaluate the potential for fault slip in the vicinity of the proposed MBSD Project. The commenter stated that in the absence of collecting data necessary to fully develop a probabilistic model for future fault slip events, the values provided in McLindon et al. (2017) can be used to make some framework estimates.

Response ID: 16175

The commenters' concerns regarding the potential for fault slip of the Ironton fault in the vicinity of the proposed Project were considered in the Draft EIS. Further, the commenters' suggestions for acquisition and analysis of additional seismic, sediment core profile, and subsidence data in service of the development of predictive subsurface geological models as discussed in McLindon et al. (2017) is acknowledged. To address these concerns, additional language has been added to the Final EIS to make clear the potential, but unquantified, probability for slip events along the Ironton fault during operations of the proposed Project based upon the framework estimates in the McLindon et al. (2017) provided by the commenters. This additional discussion and a citation for McLindon et al. (2017) has been added to the Geology and Soils section of Chapter 4, Section 4.2.3.2.2.4 Faulting of the Final EIS.

McLindon, C.D., Dawers, N.A., Culpepper, D., Kulp, M.A., and McDade, E. 2017. Comments to the U.S. Army Corps of Engineers, New Orleans District in reference to the Environmental Impact Statement for the Mid-Barataria Sediment Diversion. 11 pg.

Concern ID: 61776

The commenter expressed concern that over recent decades, Louisiana has averaged losing a football field of land every 100 minutes. The proposed Project would take 8 years to construct and 20 years to build 17,400 acres of land. Meanwhile, the state would have lost 147,168 football fields (about 195,000 acres) of coastline waiting on this proposed Project.

Response ID: 16176

The commenter's concerns regarding the pace of land loss occurring in the region and the acres projected to be created by the proposed Project over the 50-year analysis period were considered in the Draft EIS. To provide further insight into these tradeoffs, a discussion has been added to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS. Additionally, as stated

in Chapter 2, Section 2.8.1.3 Project Construction Activities, the proposed Project is expected to require 5 years to construct.

Concern ID: 61780

The commenter expressed concern that the proposed Project would cause detrimental land loss in the birdfoot delta that would cause the birdfoot delta and lower Plaquemines Parish to disappear. All that would be left would be upper Plaquemines Parish, which would be so small that decision makers would merge the parish with Orleans Parish.

Response ID: 16177

The commenter's concerns regarding projected land change in the birdfoot delta and the Barataria Basin (both located in lower Plaquemines Parish) due to diversion operations were considered in the Draft EIS. As explained in Chapter 4, Section 4.2.3.2 Geology and Soils, Operational Impacts, the Project would increase the amount of land in the Barataria Basin, but land in the birdfoot delta would decrease. Under the No Action Alternative, land area in the birdfoot delta would be reduced from 62,800 acres in 2020 to 6,640 acres in 2070 due to sea-level rise and subsidence (see the Final EIS, Chapter 4, Section 4.2.3.2.1 No Action Alternative, Table 4.2-3 Model-projected Total Land Area under the No Action Alternative). By diverting sediment and water upriver, the proposed Project would result in an increased rate of loss in the birdfoot delta, as illustrated in Figure 4.2-7 (Model-projected Change in Land Area). The Project specifically is projected to result in a loss of 3,000 acres in the birdfoot delta by 2070 as compared to the No Action Alternative. Examples of reasonably foreseeable restoration projects aimed to retain sediment in the birdfoot delta are provided in Chapter 4, Section 4.25.2 (Geology and Soils section of Cumulative Impacts). To address concerns related to descriptions of land-change impacts of the proposed Project, a discussion has been added to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

In the Draft Restoration Plan, the LA TIG recognized the potential collateral injuries associated with the Project, including potential land loss in the birdfoot delta. In selecting the preferred alternative, the LA TIG evaluated a reasonable range of alternatives under the factors outlined in the OPA evaluation criteria in 15 CFR §990.54. Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA

decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process. See Sections 3.2.4.7, 3.2.1.5, and 3.2.2.5 of the LA TIG's Final Restoration Plan for more information about the LA TIG's selection of the Preferred Alternative.

Other restoration efforts in the Barataria Basin that are not part of the proposed MBSD Project may benefit land creation in the Barataria Basin. These are discussed in the EIS, Chapter 4, Section 4.25 Cumulative Impacts.

Concern ID: 62150

The land-building results of the Project presented in Chapter 4, Section 4.2 Geology and Soils should include consideration of potential reductions in land building due to hurricanes, which can have a significant impact on any build-up of land.

Response ID: 16178

The commenter's concerns related to the effects of hurricanes and tropical storms on projected future land loss were considered in the Draft EIS; therefore, no related updates have been made to the Final EIS. The EIS includes extensive ADCIRC/SWAN modeling of storm surge and wave height elevation simulations based on historical hurricanes and tropical storms over the Project area for the 50-year analysis period. The details of these modeling efforts and the assumptions involved are provided in Chapter 4, Section 4.20 Public Health and Safety, including Flood and Storm Hazard Risk Reduction and in Appendix P (Flood and Storm Hazards Evaluation). Additional analysis regarding the potential impact of hurricanes on the extent of wetlands in the proposed Project area during operations is included in Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS.

Concern ID: 62152

The commenter questioned whether the basin would lose more land than what the proposed MBSD Project diversion would create on a day-to-day basis.

Response ID: 16179

The commenter's concern regarding the rates of land loss and land projected to be built during diversion operations was considered in the Draft EIS. To further clarify, further discussion has been added of currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

Concern ID: 62157

Since the 1930s, the Barataria Basin has lost more than 276,000 acres of land; if nothing is done, that number will nearly double in just 50 years.

Response ID: 16180

The commenter's concerns regarding the rates of land loss in the region were considered in the Draft EIS in Chapter 3, Section 3.1.4

Overview and History of the Project Area and in Section 3.2.1 Geology, Topography, and Geomorphology. To clarify, a discussion has been added to further explain currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

Concern ID: 62159

The land-building capabilities of this Project are highly exaggerated, and the EIS supports previous findings that the Project may actually accelerate land loss, increasing flood risks. The depletion of historic sediment loads of the Mississippi River is well documented. Given the projected 2000 to 3000-acre land loss in the birdfoot delta cited in the EIS, the projected land-building capabilities of the proposed Project is obviously exaggerated.

Response ID: 16181

The Draft EIS has considered the commenter's concerns regarding the rates of land loss and land projected to be built during diversion operations. To help address these concerns, a discussion has been added to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

Although the Mississippi River is carrying much less sediment than it did in the past, it still carries a massive sediment load. As explained in Chapter 3, Section 3.4.2.5 in Surface Water and Coastal Processes, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes. The Draft EIS Appendix E Delft3D Modeling Section 5.2.2 took this diminished sediment load into account when computing the sediment load that would be delivered to the Barataria Basin.

Concern ID: 62161

The commenter asked what is meant by “sustain 20 percent of the land” and further questioned whether this means the diversion would retain 20 percent of the land that exists now in 2021 or 20 percent of the projected future amount of land in the basin.

Response ID: 16182

The commenter's question regarding the meaning of the word “sustain” in describing the land building projected to take place during operation of the diversion has been considered. To help clarify, a discussion has been added to further explain currently ongoing and future projected land loss and the amount of land that would be created, sustained, or

lost due to Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

In the LA TIG's Restoration Plan in Section 3.2.1.1 OPA Evaluation of the Alternatives - Alternative 1 Description, the LA TIG highlights that by 2070 (the end of the analysis period), the Project is projected to be responsible for creating or maintaining approximately 20 percent of the land that remains in the Barataria Basin at that time. To be clear, this represents the amount of land that would be created or maintained by the Project in 2070 divided by the total amount of land that would remain in the Barataria Basin without the Project in 2070.

Concern ID: 62162

The commenter stated that every day Louisiana loses an estimated 725 acres of wetlands, and the commenter is concerned about how this number, within the same time frame, compares to the amount of land proposed to be built by the Mid-Barataria Sediment Diversion Project. The commenter asked what the projected amount of land loss is estimated to be before balance is achieved once the Mid-Barataria Diversion operations begin.

Response ID: 16183

The commenter's questions regarding the rates of land loss and land projected to be built during diversion operation were considered in the Draft EIS. The rate of land loss in Louisiana is discussed in the Draft EIS Chapter 3, Section 3.1.4. To clarify, a discussion has been added to further explain currently ongoing and future projected land loss without the proposed Project and the amount of land that would be created, sustained, or lost due to proposed Project diversion operations. This discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

Concern ID: 62163

The commenter noted that in addition to Project impacts on wetland creation, the Project would also capture fine-grained sediments and that would maintain existing wetlands, but that discussion lacks clarity. The EIS should more clearly explain that the Project would distribute silts and clays that would provide support for wetlands perhaps as distant as Bayou Lafourche.

Response ID: 16167

The impacts raised by the commenter were considered in the Draft EIS. As described in Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology of the EIS, sand and coarser-grained sediments would be deposited in the outfall area within 0.5-mile of the diversion, while finer-grained sediment would be deposited farther gulfward in the basin. Land gains associated with the Project would primarily occur within 5.0 to 10.0 miles from the mouth of the diversion structure (see Chapter 4, Figures 4.2-2 through 4.2-4). To clarify, Chapter 4, Sections 4.2.3 Geology, Topography, and Geomorphology and 4.6.5.1 in Wetland Resources and Waters of the U.S. have been revised in the Final EIS

to further address the importance of fine-grained sediments for marsh building and sustenance.

Concern ID: 62172

The commenter questioned what pipelines would traverse the sediment diversion between the back levee tie-ins and Bayou Dupont, which is located in the Barataria Basin, and what companies own these pipelines.

Response ID: 16406

The commenter's concern regarding existing pipelines that would be impacted by the diversion were considered in the Draft EIS. The EIS describes pipelines currently known to be present in the Project area based on publicly available pipeline data sources in Chapter 3, Section 3.2.3 Mineral Resources, including ownership of those pipelines. The EIS describes potential impacts to existing pipelines in Chapter 4, Section 4.2.3 Mineral Resources.

Concern ID: 64682

The Delft3D Basinwide Modeling conducted to assess impacts of the proposed Project in the Draft EIS includes incomplete physical components, including a lack of consideration of geological faults, which McLindon et al. (2017) described as incompletely assessed.

Response ID: 16410

The impacts raised by the commenter were considered in the Draft EIS. To clarify, additional language has been added to the Final EIS to make clear the potential, but unquantified, probability for slip events along the Ironton fault during operations of the proposed Project based upon the framework estimates in the McLindon et al. (2017) provided by the commenters. This additional discussion and a citation for McLindon et al. (2017) has been added to Chapter 4, Section 4.2.3.2.2.4 Faulting of the Final EIS.

The USACE agrees that the Delft3D Basinwide Model results include uncertainties. As discussed in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E (Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties), those uncertainties were examined through sensitivity tests and by comparing the No Action Alternative to the Action Alternatives. The results of this comparison are provided in the EIS conclusions throughout Chapter 4 (Environmental Consequences).

As part of developing the EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the proposed MBSD Project EIS impacts analysis of the alternatives.

Concern ID: 62173

This Project touts its ability to build a new river delta where one has never existed. That is not coastal "restoration."

Response ID: 16407	The issues raised by the commenter were considered in the Draft EIS. As shown in Figure 3.2-1 in Chapter 3, Section 3.2 Geology and Soils, much of the Barataria Basin was wetland and terrestrial habitat in the past. Historically, Mississippi River overbank flooding deposited sediment, fresh water, and nutrients into the Barataria Basin during annual flooding cycles, nourishing and sustaining wetland habitats. The EIS Chapter 1, Section 1.2.1 History of the Barataria Basin describes this historic process. To clarify this, discussions of the delta cycle in the Project area have been added to the Final EIS in Chapter 3, Sections 3.1.4.2 Barataria Basin and 3.2.1.1 Historical Context. Additional discussion related to the Project's impacts on geomorphology and historic deltaic landforms has been added to Chapter 4, Section 4.2.3.2.2.3 Geomorphology of the Final EIS.
Concern ID: 61719	It would take 20 years for the Project to create land.
Response ID: 16168	The commenter's concern regarding the timeline required for land building was considered in the Draft EIS in Chapter 4, Section 4.2 Geology and Soils. A discussion has been added to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS. In short, the diversion is projected to create 6,260 acres of land in Barataria Basin in its first 10 years of operation and 12,800 acres by 20 years of operation.
Concern ID: 62166	New developments, oil/gas explorations, housing construction, sewage treatment, and water usage are playing a huge role in subsidence in south Louisiana.
Response ID: 16184	The commenter's concerns related to ongoing regional subsidence and factors that have played a role in subsidence were considered in the Draft EIS. To further recognize these concerns, an additional background description of regional subsidence has been added to Chapter 3, Section 3.4.1.1 Relative Sea-level and Subsidence of the Final EIS.
Concern ID: 62168	The commenter questioned how the new sediment would sustain itself from sinking when more freshwater is added from the proposed diversion given that land subsidence is well documented with impacts ranging from changing drainage patterns and increasing flooding, to the destruction of critical infrastructure.
Response ID: 16185	The commenter's concerns related to ongoing land subsidence were considered in the Draft EIS. Sea-level rise and subsidence were explicitly accounted for in the Delft3D Basinwide Model over a 50-year analysis period, as described in the Draft EIS Appendix E Delft3D

Modeling, Sections 3.2.4 and 3.2.3, respectively. Chapter 4, Section 4.2 Geology and Soils explains how long land-building benefits of the proposed Project would endure during that 50-year period against the background of ongoing subsidence. Section 4.6 Wetland Resources and Waters of the U.S. discusses how sediment transported by the proposed diversion to the basin would not only create new wetlands, but also sustain existing and newly created wetlands. To further recognize concerns related to land subsidence, additional background description of regional subsidence has been added to Chapter 3, Section 3.4.1.1 Relative Sea-level and Subsidence of the Final EIS. To further clarify, a discussion has also been added to explain in more detail currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

Concern ID: 62169

The EIS should discuss how much sediment (not sand sediment, but hard core clay and other core river bottom rocky soil) would be brought to the basin through the proposed MBSD Project diversion. The discussion should include a comparison of that with the amount of sediment needed to rebuild or replace 28 square miles of marsh islands and wetlands.

Response ID: 16186

The commenter's concerns related to the composition and size distribution of sediments projected to be transported by the diversion were considered in the Draft EIS; therefore, no related edits have been made to the Final EIS. Creating and sustaining marshes requires the full range of sediment sizes from sand to fine sediment, and the proposed Project would transfer both sand and fine sediment into the basin from the river via the diversion channel. The EIS describes the anticipated size distribution of sediments projected to be transported into and retained in the Project outfall area in the Barataria Basin under the Applicant's Preferred Alternative in Chapter 4, Section 4.2.3.2 Operational Impacts in Geology and Soils. Chapter 3, Section 3.2 Geology and Soils describes existing sediment size distributions in the Barataria Basin, including both sand and fine-sediment components.

Concern ID: 62171

The commenter questioned whether water bottoms in the Barataria Basin would be damaged or submerged due to the river water entering the basin from the diversion. The commenter further questioned whether CPRA conducted very hardcore samples of the state water bottoms (in lieu of requiring examination of the bottoms with sonar).

Response ID: 16405

The issues raised by the commenter were considered in the Draft EIS. Geotechnical borings were undertaken for the proposed Project throughout the Mid-Barataria Basin in 2015. Results of the

geotechnical surveys were used by the Water Institute to develop the Delft3D Basinwide Model, which was used to assess proposed Project impacts on water bottoms in the Barataria Basin. The geotechnical survey reports were reviewed to characterize the geology and soils in the Project area in Chapter 3, Section 3.2 Geology and Soils. As described in the Bed Elevations section in Chapter 4, Section 4.4.4.2 in Surface Water and Coastal Processes, Operational Impacts, scour potential exists in the immediate outfall area as the diverted flow enters the marsh. However, as this section describes, CPRA engineered an outfall transition feature that would reduce the depth of the potential scour hole in the outfall area to no more than approximately 10 feet below the existing marsh bottom. Also described in Section 4.4.4.2, the proposed Project would have permanent, major (measurable and widespread) beneficial impacts on land building through raised bed (water bottom) elevations in the Barataria Basin, with the largest increases occurring within 10 miles of the diversion structure outlet (see Figure 4.4-3 and Table 4.4-3). No related edits have been made to the Final EIS.

Concern ID: 62544

The commenter expressed concern that adding more volume of fresh water from the Mississippi River into the Barataria Basin would not stop south Louisiana from sinking. Marsh islands, sand dunes, and estuaries provide protection of the shoreline from erosion, but even they would not stop south Louisiana from sinking. The commenter questioned how to solve this problem of subsidence as sea levels continue to rise in the Gulf.

Response ID: 16408

The commenter's concerns related to ongoing regional subsidence were considered in the Draft EIS in Chapter 3, Section 3.2 Geology and Soils. To clarify, an additional background description of regional subsidence has been added to Chapter 3, Section 3.4.1.1 Relative Sea-level and Subsidence of the Final EIS. While subsidence would continue during Project operations, the Project would help offset some of its impacts. Sea-level rise and subsidence were explicitly accounted for in the Delft3D Basinwide Model over a 50-year analysis period, as described in the Draft EIS Appendix E Delft3D Modeling, Sections 3.2.4 and 3.2.3, respectively. Chapter 4, Section 4.2 Geology and Soils explains and illustrates in detail how long land-building benefits of the proposed Project would endure during that 50-year period against a background of ongoing sea-level rise and subsidence.

EC60300 – Surface Water/Coastal Processes

Concern ID: 61781

The commenter questioned whether modeling was conducted for the Draft EIS to determine where sand would settle in the basin,

whether it would settle out near the diversion channel, and whether dredging would be required to remove the sand. Another commenter questioned whether water from the bottom of the river, where sediments are coarser, would be diverted to the basin.

Response ID: 16411

The issues raised by the commenter were considered in the Draft EIS. The Delft3D Basinwide Modeling conducted by the Water Institute of the Gulf for CPRA for the EIS distinguishes the types of sediment that would be deposited in the basin. Yes, sands were included in the modeling. Table 5.2-1 in Appendix E Delft3D Modeling of the EIS lists the sediment classes included in the model. The model's physics-based computations showed that the coarser sands would settle out before the finer classes, as the commenter suggests. The model reproduces the natural process of delta building in which successive waves of sediment push farther out, either forming land/marsh or creating a base upon which land/marsh can be formed (without a need to move it by dredging and placement). CPRA plans to dredge specific areas within the proposed Project limits and within Barataria Basin as needed to operate and maintain the proposed Project, as described in Section 3.2 of EIS Appendix F Preliminary Operations Plan and in EIS Appendix R2 Monitoring and Adaptive Management (MAM) Plan. Likewise, dredging of navigation channels would be assessed and managed through CPRA's MAM Plan (Appendix R2 to the EIS). Dredging in the Barataria Basin is expected to maintain certain dredged navigation channels but not the emerging deltaic front. However, the MAM Plan (Appendix R2) does include consideration of additional measures should they be necessary.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not

included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61782

Commenters expressed concern that there's not enough sediment in the river to achieve wetland and land creation goals of the proposed Project.

Response ID: 16412

The commenter's concerns regarding the sediment load of the river and whether the river carries sufficient sediment to achieve the land projected to be built during diversion operation were considered in the Draft EIS. The Mississippi River carries much less sediment than it did in the past. It still carries a massive sediment load, but not as massive as before. As explained in Chapter 3, Section 3.4.2.5 Sediment Transport, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes. Quantifying the relative contributions of multiple factors to the diminished sediment load is beyond the scope of the Draft EIS. The Draft EIS (Appendix E Delft3D Modeling, Delft3D Modeling Section 5.2.2) takes this diminished sediment load into account when computing the sediment that would be delivered to the Barataria Basin. To help clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations, discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

Concern ID: 61783

The force of the water coming out of the proposed MBSD diversion into the basin would be greater than the proposed MBSD diversion's capability to build land.

Response ID: 16413

The issue raised by the commenter was addressed in the Draft EIS. The Delft3D Basinwide Model used physics-based computations of the

diversion flow's momentum (see Appendix E Delft3D Modeling, Section 5.1) to calculate the forces on sediment and resulting sediment movement (see Appendix E Delft3D Modeling Section 5.2). Those computations showed that the largest, heaviest sediment particles would settle out first and the smaller, lighter particles would be carried farther and deposited as the flow spreads out and slows down. These behaviors are consistent with the known physics of delta-building processes and demonstrate that the diversion would build land in the Barataria Basin.

Concern ID: 61784

The commenter expressed concern that proposed Project operations would divert Mississippi River waters toward the Mississippi Gulf Coast. The results would be far worse than the impact of opening the Louisiana spillways and would be permanent. The Mississippi Gulf Coast would see rising water levels that would intensify the effect of hurricanes. The commenter noted that other studies indicate this, but the Draft EIS does not mention impacts on the Mississippi Gulf Coast.

Response ID: 16414

The geographic area of flooding and other impacts of the proposed Project were considered in the Draft EIS in Chapter 4, Section 4.4.4 Hydrology and Hydrodynamics and Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction. As discussed and illustrated in these sections, the proposed Project would not have more than negligible impacts on the Mississippi Gulf Coast. The proposed Project would divert water into the Barataria Basin, on the west side of the Mississippi River, away from the Mississippi Gulf Coast, not toward it. No related edits have been made to the Final EIS.

Concern ID: 61785

The commenter stated that the USGS has conducted modeling that shows that sea-level rise, subsidence, and the frequency of hurricanes would not allow for benefits of diversions to last multiple decades. The commenter questioned whether these factors were taken into account in the modeling for the EIS.

Response ID: 16415

Modeling conducted by the USGS (for example, Barras et al. 2003. Historical and projected coastal Louisiana land changes: 1978-2050: USGS Open File Report 03-334) was considered in the preparation of the Draft EIS. That work is based on extrapolation of past Barataria Basin behavior and is not directly comparable to the physics-based Delft3D Basinwide Model used to assess the MBSD Project alternatives in the Draft EIS.

Sea-level rise and subsidence were explicitly accounted for in the Delft3D Basinwide Model, as described in the Draft EIS, Appendix E Delft3D Modeling, Sections 3.2.4 and 3.2.3, respectively. Potential land-change effects from hurricanes were not modeled as part of the Delft3D Basinwide Model. The rationale for that omission and explanation of how it was accounted for are provided in Appendix E

Delft3D Modeling, Section 8.1. Storm modeling, described in Appendix P Flood and Storm Hazards Evaluation, included the effects of land building on storm surge and waves but did not simulate either erosion or deposition for reasons given in Appendix E, Section 8.1. No related edits have been made to the Final EIS.

Concern ID: 61786

The commenter stated that something that this Project does not consider is the number of sediments that are trapped upstream by dams farther north on the Mississippi River, calling into question whether there would be enough sediment in the river to build coastal wetlands in the basin. The commenter requested that a study be conducted to determine whether changes like the removal of dams would need to be made upstream of the diversion for the Project to achieve land and wetland creation goals.

National Academies Press. 2011. Sediment Management Alternatives and Opportunities. Missouri River Planning: Recognizing and Incorporating Sediment Management, 88-102.

Response ID: 16416

The commenter's concerns regarding the sediment load of the river were considered in the Draft EIS. The USACE agrees that the Mississippi River is carrying much less sediment than it did in the past. It still carries a massive sediment load, but not as massive as before. As explained in Chapter 3, Section 3.4.2.5 Sediment Transport, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. As stated in the National Academies report cited by the commenter, the possible causes of the diminished sediment load include both trapping by dams and hardening of banklines. Other possible contributing factors include improved farming practices across the river basin, as explained in Chapter 3, Section 3.4 Surface Water and Coastal Processes. Quantifying the relative contributions of multiple factors to the diminished sediment load is a worthy research project, but beyond the scope of the Draft EIS. Appendix E Delft3D Modeling, Section 5.2.2 of the EIS takes the diminished sediment load into account when computing the sediment load that would be delivered to the Barataria Basin. The National Academies Press (2011) citation has been added to the discussion in Chapter 3, Section 3.4.2.5.1 Historical Context in Surface Water and Coastal Processes in the Final EIS.

Concern ID: 61787

The EIS used river hydrology information from as early as 1964 and no later than 2011. Current information was not used. The EIS should contain a hydrology report and the report should be based upon recent data.

Response ID: 16417	The issue raised by the commenter was considered in the Draft EIS. The Mississippi River hydrologic boundary conditions used in the Delft3D Basinwide Model included continuous 50-year historical Tarbert Landing records from 1964 to 2013. For the Delft3D Basinwide Model hydrodynamic simulations, representative hydrographs were selected to represent each decade. The selection was the product of a statistical analysis performed by the Water Institute of the Gulf, as described in Draft EIS Appendix E Delft3D Modeling, Section 5.1.1. In addition, four additional Mississippi River annual hydrographs were selected to represent specific statistical characteristics including the 2011 hydrograph, as the commenter mentioned. It was selected because it represented a particular type of hydrograph - a high discharge, late spring flood. Later years, including those available when the modeling was performed, were considered but did not meet the selection criteria. No related edits have been made to the Final EIS.
Concern ID: 61788	The commenter stated that the Surface Water and Coastal Processes section of the Draft EIS Executive Summary is not detailed enough and impacts summarized should be explained in more detail.
Response ID: 16418	The resource sections throughout Chapter 4 Environmental Consequences of the Draft EIS provide extensive detail for the impacts that are only summarized in the Executive Summary. The commenter should refer to Chapter 4 of the EIS for further explanations of the impact determinations and summaries presented in the Executive Summary. The requested level of detail is beyond the scope for the Executive Summary.
Concern ID: 62202	A contributing factor to rising water levels in the basin is the wind that blows from the south that increases tides all the way up to the northern end of the basin. The loss of the barrier islands and subsidence contribute to the south winds' increasing tides.
Response ID: 16419	The commenter's concern about wind was considered in the Draft EIS. The USACE agrees that wind is an important factor in the estuary. The Delft3D Basinwide Model simulations conducted for the EIS included wind as described in EIS Appendix E Delft3D Modeling, Section 3.2.2. Likewise, subsidence was explicitly included in the model simulations as described in Appendix E Delft3D Modeling, Section 3.2.3.
Concern ID: 62209	There is little discussion in the Draft EIS about the amount of sediment that would be deposited beneath the water's surface by the diversion, changing bathymetry and making sediment available for resuspension and deposition on marsh surfaces far from the diversion.

Response ID: 16421 The Draft EIS includes consideration and discussion of the benefits of the sediment that would be deposited below the Barataria Basin's water surface. Sediment deposited below the water surface can contribute in one of two ways - by being resuspended and transported elsewhere for deposition, as the commenter suggests, and by forming a base layer upon which future pulses of sediment can form marsh or land. These benefits are discussed in Chapter 4, Section 4.2.3.2 in Geology in Soils, Section 4.4.4 Hydrology and Hydrodynamics, and in Section 4.6 Wetland Resources and Waters of the U.S. They are part of the model computations described in Appendix E Delft3D Modeling and are fully incorporated in the results and conclusions of the Draft EIS. No related edits have been made to the Final EIS.

Concern ID: 62210 **An important benefit of the Project is that it would introduce sediment that would not only build wetlands but also increase elevations across a hundred square miles in the basin, which would benefit some fish and wildlife. This would also reduce storm surge threats to nearby communities.**

Response ID: 16422 The beneficial impacts of sediment deposited below the Barataria Basin water surface were considered and incorporated in the Draft EIS in Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology; Section 4.4.4 Hydrology and Hydrodynamics; and in Section 4.6 Wetland Resources and Waters of the U.S. These processes are part of the model computations described in Appendix E Delft3D Modeling and are fully incorporated in the results and conclusions of the Draft EIS. Deposition of sediment by the proposed Project below the water surface would be beneficial to wetlands, fish, and wildlife by being resuspended and transported elsewhere for deposition, as the commenter suggests, and by forming a base layer upon which future pulses of sediment can form marsh or land.

Concern ID: 62211 **The Project would provide prolonged sediment input so critical to this ecosystem and region.**

Response ID: 16423 The Draft EIS considered the benefits of sediment that the proposed Project would deposit into the Barataria Basin. It can contribute in numerous ways, including by being resuspended and transported elsewhere for deposition and by forming a base layer upon which future pulses of sediment can form marsh or land. These benefits are discussed in Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology, Section 4.4.4 Hydrology and Hydrodynamics, and in Section 4.6 Wetland Resources and Waters of the U.S. These processes are part of the model computations described in Appendix E Delft3D Modeling and are fully incorporated in the results and conclusions of the Draft EIS. No related edits have been made to the Final EIS.

Concern ID: 64702

The commenter questioned whether proposed Project operations would change as sea-level rises in the future. The commenter also questioned at what level of sea-level rise would the proposed Project become useless.

Response ID: 16424

The issue raised by the commenter was considered in the Draft EIS. Sea-level rise and subsidence were explicitly accounted for in the Delft3D Basinwide Model over a 50-year analysis period, as described in the Draft EIS Appendix E Delft3D Modeling, Sections 3.2.4 and 3.2.3, respectively. Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology and Section 4.6 Wetland Resources and Waters of the U.S. show in detail how long wetland and land-building benefits of the proposed Project would endure during the 50-year analysis period. Section 4.4.4 Hydrology and Hydrodynamics discusses in detail how long bathymetric (water bottom) benefits would endure during the 50-year period of analysis. As explained in the Draft EIS Appendix F2 Preliminary Operations Plan and summarized in Chapter 2, Section 2.8.1.4 Project Operations, operations would follow the standard operational procedures and emergency operations put forth in Appendix F2 Preliminary Operations Plan until the water levels in the Barataria Basin exceed those in the Mississippi River, at which time the structure would be closed.

For the diversion to become useless (defined for this discussion as no longer diverting sediment), sea level would have to rise by about 9 feet. At that level there would be insufficient water level difference between the Mississippi River and the Barataria Basin to push water, sediment, and nutrients through the structure. The USACE currently projected “High” rate of sea-level rise at Grand Isle, Louisiana, (https://cwbi-app.sec.usace.army.mil/rccslc/slcc_calc.html; https://cwbi-app.sec.usace.army.mil/rccslc/slcc_calc.html) would produce a rise of 6.75 feet in 2100 (the last allowable year in the prediction tool). An unofficial extrapolation of the USACE’s High and Low curves suggests that 9 feet of relative sea-level rise would occur at Grand Isle some time between 2120 and 2300.

As explained in the Draft EIS in Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology and Section 4.6 Wetland Resources and Waters of the U.S., although the amount of wetlands and land that the Project would build and sustain after the first 30 years of operation would diminish, the wetlands and land created or sustained by the Project would become a larger percentage of the total wetlands and land remaining in the basin, as the basin is overwhelmed by sea-level rise and subsidence. Further, throughout the 50-year analysis period of the EIS, the Project would continue to provide a suite of ecosystem service benefits including but not limited to nutrient input and increased freshwater habitat (for freshwater species and SAV) as discussed in the

EIS Chapter 4, Section 4.10 Aquatic Resources and in the Restoration Plan, Section 3.2.1.6 Benefits Multiple Resources.

EC60400 – Surface Water/Sediment Quality

Concern ID: 61812

Commenters expressed concern that the proposed Project would have adverse water quality impacts in the Barataria Basin due to the introduction of nitrate and phosphate from the Mississippi River. Several commenters questioned whether the proposed Project would create harmful algal blooms and hypoxia in the Barataria Basin similar to the hypoxic “dead zone” in the Gulf of Mexico that exists due to nutrients in Mississippi River waters. One commenter expressed concern that the EIS does not adequately assess the potential for the proposed Project to create algal blooms and hypoxia in the basin, other than acknowledging it.

Response ID: 16425

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA’s Mississippi River/Gulf of Mexico Hypoxia Task Force “Hypoxia 101” webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone “water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen” (<https://www.epa.gov/ms-htf/northern-gulf-mexico-hypoxic->

warranted, in the Barataria Basin during Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61815

The discussion in Chapter 3 of excessive nutrient (N and P) loads that create hypoxic conditions treats the problem as a global issue without mentioning the large annual hypoxic zone that forms each year in the proposed Project area.

Response ID: 16426

The Gulf of Mexico hypoxic zone was considered in the Draft EIS in Chapter 3, Section 3.5 Surface Water and Sediment Quality. The proposed Project would not have more than negligible impacts on the Gulf of Mexico hypoxic zone because it is located outside of the Project's area of potential impacts (defined in Chapter 3, Section 3.1.1 [Project Area] of the Draft EIS). Although the Gulf hypoxic zone is not expected to be impacted by proposed diversion operations, because it is near the proposed Project area, the USACE did include a description

and map of the Gulf hypoxic zone in Section 3.5.2.6 in Surface Water and Sediment Quality (see Figure 3.5-6). In response to this comment, the USACE has revised the title of Section 3.5.2.6 (Dissolved Oxygen) to 3.5.2.6 (Dissolved Oxygen and Hypoxia) in the Final EIS so that information about hypoxia in and near the proposed Project area can be more readily found by EIS readers. As explained in the EIS, Chapter 4, Section 4.25.5.2 in Cumulative Impacts, the combined impact of several Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone. Chapter 4, Section 4.25.5.4.4 Nitrogen and Section 4.25.5.4.5 Phosphorus in Cumulative Impacts of the Final EIS have been updated to include a summary of the Gulf Hypoxia Action Plan.

Concern ID: 62264

The commenter expressed concern that the Draft EIS understates the proposed Project's potential impacts on nitrogen and phosphorus in the Barataria Basin and requested that the Final EIS explain how nitrogen (N) to Phosphorus (P) ratios (N:P) indicate the health of waters. While a portion of LDEQ's narrative nutrient criteria calls for the maintenance of natural N:P ratios, this does not account for the fact that while ratios might remain relatively constant, the loading of N and P would certainly increase, likely resulting in increased algal growth (and potentially toxic algae blooms and hypoxic areas). The Draft EIS only refers to half of LDEQ's narrative nutrient criteria, leaving out the half stating that nutrient concentrations that produce aquatic growth that it creates a public nuisance or interferes with designated water uses shall not be added to any surface waters. (L.A.C 33:IX.1113.B.8). The commenter further explained that this portion of the criteria is arguably the most important, as it refers to actual impacts of nitrogen and phosphorus pollution. The commenter stated that the Draft EIS also fails to consider USEPA or other proposed numeric criteria. It is difficult to understand how the authors can make impact determinations when no consideration was given to half of the narrative nutrient criteria and no numeric nitrogen and phosphorus goals are given.

Response ID: 16438

In response to this comment, the USACE has added the full narrative nutrient criteria statement to Chapter 3, Section 3.5.2.4 in Surface Water and Sediment Quality and to Chapter 4, Sections 4.5.5.3 and 4.5.5.4 in the Surface Water and Sediment Quality. As explained in Section 3.5.2.4, "the EPA generated sub-ecoregion reference condition metrics for total nitrogen (0.71 milligrams/liter [mg/L]) and total phosphorus (0.125 mg/L) for the Mississippi River and Barataria Basin concentrations (USEPA 2001). It is important to note that the reference metrics provide a numerical value to compare the Mississippi River and the Barataria Basin nutrient concentrations and are not intended to be

used to evaluate waterbody status relative to the current narrative nutrient criterion.” The USEPA reference metrics, however, are not enforceable criteria.

Proposed Project impacts associated with nutrient loading and algal blooms are addressed in Section 4.10.4.4 in Aquatic Resources of the Final EIS. A reference to Section 4.10 is included in Section 4.5.5.3 in Surface Water and Sediment Quality of the Draft EIS. A reference to Section 4.10 Aquatic Resources has been added to Section 4.5.5.4 (Phosphorus) of the Final EIS. Clarifying language has been added to Sections 4.5.5.3, 4.5.5.4, and 4.25.5.4 in Cumulative Impacts. Appendix R2 Monitoring and Adaptive Management (MAM) Plan includes proposed monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species), in the Barataria Basin during proposed Project operations to guide CPRA’s management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62255

Commenters expressed concern that during proposed MBSD diversion operations, contaminated sediments from the Mississippi River may be routed to the Barataria Basin, where they would cause adverse impacts. One commenter stated concern that because the dilution capacity of the basin is less than that of the Mississippi River, contaminants routed to the basin via the diversion would reach toxic levels because basin waters would not sufficiently dilute the sediment.

Response ID: 16434

Impacts related to contaminated sediment raised by the commenters were considered in the Draft EIS. As noted in Chapter 4, Section 4.5.5.10 in Surface Water and Sediment Quality, recent evaluations of Mississippi River sediments in the vicinity of the proposed Project intake structure indicate that they are free from contaminants at concentrations that would result in detrimental impacts. The dilution referenced in Chapter 3, Section 3.5.3.1 in Surface Water and Sediment Quality refers to movement along the entire length of the river from Minnesota to Louisiana and is not meant to imply that dilution is occurring or needed to dilute elevated concentrations in the proposed Project area. In response to these comments, the USACE has edited Section 3.5.3.1 in Surface Water and Sediment Quality to make this clear in the Final EIS.

Concern ID: 61826

Commenters expressed concern that proposed Project operations would disturb existing oil sediment (from the DWH oil spill) in Barataria Bay.

Response ID: 16431

As explained in Chapter 4, Section 4.4.4 in Surface Water and Coastal Processes, significant scour potential exists in the immediate outfall area of the diversion structure in the basin, which could disturb oiled sediments on water bottoms. However, based on surveys conducted during remediation efforts in the Barataria Basin in response to the DWH oil spill, oiling exposure did not occur in this area, as illustrated in Chapter 3, Section 3.10 Aquatic Resources, Figure 3.10-1 of the Draft EIS. With regard to DWH oiling exposure identified in remediation surveys throughout the rest of the Barataria Basin, proposed Project operations would deposit sediments on water bottoms, which would bury any oiled sediments. Where oiled sediment exists in the birdfoot delta, bed elevations are projected to decrease by 0.2 foot by 2070 as compared to the No Action Alternative (see Figure 4.4-3 in Section 4.4.4 in Surface Water and Coastal Processes) due to reduced sediment load reaching the delta in areas observed to be impacted by oil. Bed elevations in the birdfoot delta are projected to decrease under the No Action Alternative as well. Therefore, proposed Project operations are expected to negligibly disturb existing oil sediment from

the DWH oil spill. Clarification has been added to Chapter 4, Section 4.5.5.10.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS.

Concern ID: 62261

The commenter expressed concern that excessive nutrients in fresh water diverted to the basin during proposed diversion operations could runoff into the Gulf during flooding events and storms. The commenter reported that this occurred in Texas during Hurricane Harvey, when storm-induced flooding inland caused polluted fresh water to travel to coral reefs more than 100 miles offshore in the Gulf. The commenter expressed concern that excess nutrients brought into the Barataria Basin from the Mississippi River via the diversion could add to the already ongoing problems of the hypoxic zone in the Gulf due to runoff events during flooding and storm events, which are becoming more frequent and intense because of climate change.

Response ID: 16437

The issues raised by the commenters were considered in the Draft EIS. As discussed in Chapter 4, Section 4.5.5.5 in Surface Water and Sediment Quality, the proposed Project is not projected to cause monthly dissolved oxygen concentrations to fall below the water quality criterion of 5 mg/L during the 50-year analysis period throughout the Barataria Basin. In fact, dissolved oxygen concentrations associated with the Applicant's Preferred Alternative are projected to generally increase during the analysis period compared to projections for the No Action Alternative modeled by the Delft3D Basinwide Model. The Delft3D Basinwide Model accounts for the influence of algal growth on nutrient and dissolved oxygen concentrations. The Delft3D Basinwide Model results do not suggest that a significant hypoxic zone would form in the Barataria Basin due to proposed Project implementation. Language to this effect has been added to Section 4.5.5.5.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS.

As explained in Section 4.25.5.2 in Cumulative Impacts, Surface Water and Sediment Quality, the combined impact of several Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Concern ID: 61827

The Executive Summary, Section ES.4 (Surface Water and Sediment Quality) is not detailed enough. For example, clarify what criteria were used to classify proposed Project impacts on salinity, fecal coliform, and nutrients as minor, moderate, or major impacts. Also, compare potential water quality impacts with LDEQ water quality standards.

Response ID: 16432

The water quality information requested by the commenter was included in the Draft EIS. Chapter 4, Section 4.5 Surface Water and

Sediment Quality provides detailed information regarding the guidelines for impact intensity determinations, the data reviewed to evaluate impacts, how proposed Project impacts on water quality compare to LDEQ water quality standards, and a detailed discussion of the evaluation of proposed Project impacts on surface water and sediment quality. These details are beyond the scope of the Executive Summary.

Concern ID: 61816

Commenters expressed concern that the proposed Project operations would increase the hypoxic “dead” zone in the Gulf.

Response ID: 16427

The Gulf of Mexico hypoxic zone was discussed in the Draft EIS in Chapter 3, Section 3.5.2.6 in Surface Water and Sediment Quality. The proposed Project would not have more than negligible impacts on the Gulf of Mexico hypoxic zone because it is located outside of the Project’s area of potential impacts (defined in Chapter 3, Section 3.1.1 [Project Area] of the Draft EIS). Vegetative growth expected to occur in the Barataria Basin due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Basin than would reach the Gulf through the Mississippi River. Although the Gulf hypoxic zone is not expected to be impacted by proposed diversion operations, because it is near the proposed Project area, the USACE did include a description and map of the Gulf hypoxic zone in Section 3.5.2.6 in Surface Water and Sediment Quality (see Figure 3.5-6). In response to public comments, the USACE has revised the title of Section 3.5.2.6 (Dissolved Oxygen) to 3.5.2.6 (Dissolved Oxygen and Hypoxia) in the Final EIS so that information about hypoxia in and near the proposed Project area can be more readily found by EIS readers. As explained in the EIS, Chapter 4, Section 4.25.5.2 in Cumulative Impacts, the combined impact of several Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Concern ID: 61817

Commenters stated that information about the Gulf Hypoxia Action Plan (Louisiana Hypoxia Working Group), which calls for a 20 percent reduction in nitrogen and phosphorus loading to the Gulf by 2025, is pertinent to the Draft EIS but is not mentioned. Commenters requested that the plan should be included in the Final EIS.

Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. 2008. Gulf Hypoxia Action Plan 2008 for Reducing, Mitigating, and Controlling Hypoxia in the Northern Gulf of Mexico and Improving Water Quality in the Mississippi River Basin. Washington, DC.

Response ID: 16428	<p>Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. 2013. Looking Forward, The Strategy of the Federal Members of the Hypoxia Task Force. Washington, DC.</p> <p>Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. 2016. December 2016 Update, Looking Forward, The Strategy of the Federal Members of the Hypoxia Task Force. Washington, DC.</p>
	<p>The USACE and the LA TIG agree that the Gulf Hypoxia Action Plan is relevant to the proposed Project area. Therefore, in response to these comments, a discussion about the Gulf Hypoxia Action Plan has been added to Section 4.25.5.4.4 Nitrogen and 4.25.5.4.5 Phosphorus in Cumulative Impacts of the Final EIS. The Hypoxia Action Plan has highlighted the important role that river diversions could play in reducing nutrient loads. In addition, substantial nutrient load reduction could be achieved through the measures being implemented by the other states and entities involved with the Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. These combined efforts could lessen the potential impacts of excess nutrient loads to Barataria Basin and the northern Gulf of Mexico.</p>
Concern ID: 61819	<p>Commenters expressed concern that the proposed Project would have adverse impacts on Barataria Basin’s water quality, wetlands, fisheries, recreational uses, and eroding coastlines due to chemicals, oil and hazardous waste, and/or pollutants in the Mississippi River that would be routed to the Barataria Basin via the proposed diversion.</p>
Response ID: 16429	<p>The impacts raised by the commenters were considered in the Draft EIS. As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality of the Draft EIS, the segment of the Mississippi River where the proposed diversion river intake structure would be located (subsegment LA070301_00) fully supports its designated uses. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. LDEQ’s water quality assessment indicates that regulated substances are not present in concentrations that would cause a water quality impairment at the location of the intake structure. In response to this concern expressed by commenters, a new subsection has been added to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of nearby industrial facilities on river water routed to the basin during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills from Industrial Sites.</p>
	<p>As described in the EIS, Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design and Operations Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the</p>

proposed MBSD intake structure, the diversion structure would be closed.

Concern ID: 61825

Diversion operations would occur during months with a high flow rate, which coincides with northern regional snow melt. The commenter expressed concern that the cold river water would have adverse impacts in the basin.

Response ID: 16430

The impacts of water temperature from the river into the basin during proposed diversion operations were considered in the Draft EIS. As explained in Section 4.5.5.2 in Surface Water and Sediment Quality of the Draft EIS, the proposed Project would cause minor, intermittent decreases in water temperature during Project operations. As explained in Section 4.10.4.4 in Aquatic Resources, the proposed Project's overall direct and indirect impacts of decreased average temperatures and acute temperature changes on faunal populations at discrete locations and time periods in the Barataria Basin would likely be direct or indirect, minor to moderate, and adverse, and annually recurring and therefore permanent throughout the analysis period.

Concern ID: 62254

Commenters expressed concerns that hazardous substances spilled by industrial facilities upstream from the proposed diversion's intake structure in the Mississippi River could be routed to the Barataria Basin via the diversion during proposed Project operations. One commenter requested that because the Alliance Refinery is described in Chapter 3, Section 3.23 Hazardous, Toxic, and Radioactive Waste Assessment of the Draft EIS as having had past releases of petroleum and hazardous substances, hazardous waste violations under the Resource Conservation and Recovery Act (RCRA), and as having an active industrial landfill site, the Final EIS should assess the potential for the facility to discharge contaminated substances into the Barataria Basin via diversion flows.

Response ID: 16433

The commenters' concerns regarding hazardous spills were considered in the Draft EIS. As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality, the receiving waterbody for industrial facilities along the Mississippi River upstream from the proposed Project's intake structure (LDEQ Mississippi River subsegment LA070301_00), is not listed as impaired by LDEQ. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. LDEQ's water quality assessment for subsegment LA070301_00 indicates that regulated substances are not present at concentrations that would cause a water quality impairment. Industrial facilities, for example the Alliance Refinery, are regulated by LDEQ through permits that include monitoring and reporting requirements. Facilities are required to report any releases of oil or hazardous substances to water to LDEQ.

LDEQ's assessment of this subsegment of the river includes contributions from industrial facilities' regulated discharges to the Mississippi River. In the event of accidental spills of hazardous substances into the river, these facilities would follow their required Spill Prevention, Control, and Countermeasure (SPCC) and Stormwater Pollution Prevention (SWPP) plans to minimize impacts of accidental releases.

As described in Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design and Operations Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed. In response to this concern, the USACE has added a new subsection to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of accidental spills of hazardous substances in the river during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills in the Mississippi River.

Concern ID: 62263

Commenters expressed concern that plastics and microplastics (including but not limited to PFAS) in the Mississippi River would be introduced into the basin through the proposed MBSD diversion, causing adverse impacts on wildlife and humans. Commenters stated that plastics never fully disintegrate, are poorly regulated, and have made their way into every part of the food chain. One commenter witnessed a major spill in the river of plastic pellets called "nurdles" that was never fully cleaned up.

Response ID: 16435

The USACE acknowledges that microplastics and PFAS in surface water are currently not regulated. There are currently no data to determine whether PFAS concentrations in the Mississippi River are significantly different from concentrations in the Barataria Basin. There are no standards to evaluate whether PFAS concentrations are unacceptably elevated in the river or the basin.

The Draft EIS acknowledges that accidents and spills can occur unexpectedly in the river or in the basin. Public and private emergency response teams are available to minimize damage from such accidental releases. As described in Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design and Operations Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed. Also in response to this concern, the USACE has added a new subsection to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of accidental spills of hazardous substances in the river during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills in the Mississippi River.

Concern ID: 62260

The commenter stated support for the Applicant's Preferred Alternative and expressed concern that the Draft EIS overstates adverse impacts of the proposed Project associated with the input of freshwater into the Barataria Basin. The commenter explained that in the last 50 years, the basin has experienced numerous 100-year rainfall events that caused prolonged freshening events.

Response ID: 16436

The commenter's support for the proposed MBSD Project is acknowledged. The commenter's concerns about Project impacts on the salinity of the Barataria Basin waters were considered in the Draft EIS. As projected by Delft3D Basinwide Modeling conducted to assess potential impacts of the proposed Project on resources such as water quality and salinity, the Project area is projected to experience increasing salinity due to sea-level rise and subsidence, in spite of prolonged rainfall events (see Chapter 4, Section 4.5.5.1 in Surface Water and Sediment Quality). As compared to the No Action Alternative, the Applicant's Preferred Alternative would cause permanent, minor (detectable over a small area) to moderate (observable over a large area, readily detectable in local areas) reductions in salinity in the Barataria Basin and permanent, minor increases in salinity in the birdfoot delta during proposed Project operations. These Project impacts on salinity would be beneficial for some wetland types and aquatic species and adverse for others (see Section 4.6 Wetland Resources and Waters of the U.S. and Section 4.10 Aquatic Resources for further details about the proposed Project's salinity impacts on wetlands and aquatic resources, respectively). No related edits have been made to the Final EIS.

EC60500 - Wetland Resources/Waters of the US

Concern ID: 63015

There are misrepresentations in the EIS about how nutrients in the river would spread out far from the sand deposition area to lower plant biomass belowground. Increasing nutrient loads from diversions would weaken soils, not strengthen soils.

The modern Mississippi River has nutrient concentrations that are much higher than when the mostly organic soils were created centuries ago (Turner et al. 2007) and may weaken soils by 30 percent, resulting in less belowground biomass, and change vegetation from being comprised of perennials to annuals (Turner et al. 2011). Increased flooding inundation, which is a consequence of river diversions, also weakens the belowground biomass of wetland plants (Morris et al. 2017) that may erode during high water events or from hurricanes (Kearney et al. 2011, Howes et al. 2010). Individual roots become weaker when

exposed to ambient levels of nutrients found in the river (Hollis and Turner 2019a, b; Hollis and Turner 2021). The soil becomes degraded, accumulates less biomass, and decomposes and erodes faster (Swarzenski et al. 2008, Hebert et al. 2020). The diversion of river water into the nearby marshes would almost certainly weaken soils, making them less resistant to wave energy and hurricanes. A striking example is the net loss of wetlands in the Davis Pond Diversion where increased land loss occurred beginning the year after the diversion opened (Turner et al. 2019). This is an area that has no significant sediment input.

Concern ID: 63016	<p>The Carnarvon Diversion (and other diversions, such as the Naomi Siphon) did not build marsh but rather caused damage to the existing marsh, such as through the introduction of freshwater invasive plant species that clog available waterways, suffocating natural marsh grass, restricting water flow.</p>
Response ID: 16029	<p>A summary of select natural and man-made diversions in southeastern Louisiana, including the Caernarvon Diversion and Naomi Siphon, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and discuss their recorded impacts on the natural environment. This summary, which includes a discussion on changes to marsh extent and the presence of invasive plants, is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.</p>
Concern ID: 63018	<p>The proposed Project would cause land loss further out from the diversion structure and also destroy the brackish/saline marsh grasses, which provide storm surge protection, and replace them with less surge-resistant freshwater plants.</p>
Response ID: 16030	<p>Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the Draft EIS acknowledged that the fresh water transported by</p>

the diversion may result in the loss of some wetlands in the immediate outfall area due to inundation during the initial period following commencement of operations. Further, the Delft3D Basinwide Model projects inundation depths in the critical vegetation parameters to simulate vegetation losses and gains as a result of the diversion, as well as other sources of inundation (such as subsidence and sea-level rise).

However, salt- and brackish marsh vegetation would not be subjected to direct mortality due to the lower salinity of transported water. While saline and brackish species are associated with salinity ranges of greater than 18 ppt and between 18 and 5 ppt, respectively (see Chapter 3, Section 3.6.1.2 in Estuarine Wetlands of the Draft EIS), brackish marsh can fluctuate from fresh to saline conditions depending on tidal movement, and species such as *Spartina alterniflora* are common in both salt and brackish marsh (Conner and Day 1987). Salt is a stressor affecting osmosis and cell structure. Plants occurring in saline and brackish marshes have developed adaptations to either exclude uptake or excrete salt; however even salt marsh species grow better at lower salinities (Mitsch and Gosselink 2000; Teal et al. 2012). However, as described in Chapter 4, Section 4.6.5.1.2.1 Salinity of the Final EIS, in some areas of the Barataria Basin, the seasonal change in salinity due to operation of the diversion above base flow (primarily during spring and early summer) and lower-flow conditions during fall and winter months would be large enough to temporarily change the wetland hydrology from a brackish to fresh or from a saline to brackish system. In the southern basin, where salt marsh predominates, peak salinities would be within the range for salt marsh vegetation under the No Action and Applicant's Preferred Alternatives. Additional analysis regarding the potential impact of hurricanes and saltwater inundation on the extent of wetlands in the Project area during operations has been added to Chapter 4, Section 4.6.5.1.2 Applicant's Preferred Alternative of the Final EIS.

The MAM Plan includes monitoring for inundation related effects on marsh vegetation in the Project area. The MAM Plan provided in the Draft EIS Appendix R was submitted by CPRA and represents a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation,

monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63019

The Draft EIS likely underestimated the benefits of far field effects on marsh soil bulk density and marshes sustained against climate change and rising seas. Related to the total sediment phenomenon, existing models underestimate capture of fines carried in suspension by diverted waters far from the diversion, and modeling underestimates the effect of this capture on renewed marsh vigor and organic soil formation, largely because while the effect is obvious, the specifics are difficult to capture numerically.

Response ID: 16031

As described in Appendix E Delft3D Modeling of the EIS, to account for the complexity of fine-sediment transport patterns, a hysteresis curve has been developed and incorporated into the sediment transport module of the Delft3D Basinwide Model. Therefore, while the model results must be interpreted in light of the uncertainties involved, hysteresis sediment rating curves have been used to project fine-sediment transport in a way that simulates observed transport to the extent practicable in the modeling analysis. Where feasible, uncertainties have been examined through sensitivity tests and model-to-model comparisons and incorporated in the conclusions (see Chapter Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences and Appendix E Delft3D Modeling, Section 8). Because this issue was considered in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 63020

The Draft EIS highly exaggerated the land-building capabilities of the proposed Project, given that the depletion of historic sediment loads of the Mississippi River is well documented (including by

the Expert Panel on Diversion Planning and Implementation [convened by the Water Institute of the Gulf] and USACE's ERDC) and that increased periods of inundation have been found to adversely impact existing vegetation and contribute to land loss. Further, significant uncertainty exists with respect to the response of the existing wetland vegetation to diversion-induced inundation (Brown et al., 2019, p. iii).

Response ID: 16032

The Draft EIS considered the commenter's concerns regarding the rates of land loss and land projected to be built during diversion operations. The Mississippi River is carrying much less sediment than it did in the past. As explained in Chapter 3, Section 3.4.2.5 in Surface Water and Coastal Processes, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The Delft3D Basinwide Modeling accounts for those sediment supply changes as described in Appendix E Delft3D Modeling of the EIS, Sections 5.2.2 and 8.

Further, the Delft3D Basinwide Model incorporates inundation depths in the critical vegetation parameters to simulate vegetation losses and gains as a result of the diversion, as well as other sources of inundation (such as subsidence and sea-level rise). The model results should be interpreted in light of the uncertainties involved. The USACE-ERDC report cited by the comment (Brown et al. 2019), which documents the development and validation of the Adaptive Hydraulics (AdH) model to simulate hydrodynamic, salinity, sedimentation, and morphodynamic processes in the Mississippi River and Delta, was reviewed and used in preparing the navigation analyses in the EIS (see Appendix Q1 Dredging Analysis). The USACE-ERDC report also describes the SEDLIB-VEG model, which is less complex than the vegetation model (LaVegMod) used to project impacts from the proposed Project. While the AdH model was not used in preparing the land-building analyses in the EIS and the SEDLIB-VEG model was not used for the assessment of vegetation impacts from the Project, uncertainties identified in the report for numerical modeling (including uncertainty in the sediment rating curve, subsidence rates, and inundation effects on vegetation) were considered. As discussed in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences and Section 8 of Appendix E Delft3D Modeling, those uncertainties include the parameters used to simulate vegetation growth and mortality. Vegetation ranges were determined by the probability of establishment and mortality of each species used in modeling simulations, based on salinity and inundation depth tolerances.. Where feasible, uncertainties have been examined through sensitivity tests and model-to-model

comparisons and incorporated in the conclusions. However, to further address the concern of exaggerated land building, Chapter 4, Section 4.1.3.3 in Model Limitations and Uncertainty, has been revised in the Final EIS to clarify uncertainty related to currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations.

Concern ID: 63024

The Draft EIS failed to properly capture the state of the science on the effects of nutrient inputs on wetlands. While the views indicating the detrimental effects of nutrient input are included, few opposing views are described, and the science is not settled on this issue.

Response ID: 16034

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS acknowledges uncertainty regarding the effects of nutrient inputs on wetlands. Additional analysis regarding the impact of nutrients that would be transported by the proposed Project on vegetation communities and soil shear strength has been incorporated into Chapter 4, Section 4.6.5.1.2 Applicant's Preferred Alternative of the Final EIS.

Concern ID: 63027

Saltwater grasses and marsh would die when exposed to (or inundated by) fresh water, and would cease protecting the public.

Response ID: 16035

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS acknowledges that the fresh water transported by the diversion may result in the loss of some wetlands in the immediate outfall area due to inundation during the initial period following commencement of operations; those impacts would be offset by later marsh building in the area. While saline and brackish species are associated with salinity ranges of greater than 18 ppt and between 18 and 5 ppt, respectively (see Chapter 3, Section 3.6.1.2 in Estuarine Wetlands of the EIS), brackish marsh can fluctuate from fresh to saline conditions depending on tidal movement, and species such as *Spartina alterniflora* are common in both salt and brackish marsh (Connor and Day 1987). Salt is a stressor affecting osmosis and cell structure. Plants occurring in saline and brackish marshes have developed adaptations to either exclude uptake or excrete salt; however even salt marsh species grow better at lower salinities (Mitsch and Gosselink 2000; Teal et al. 2012). Therefore, salt and brackish marsh vegetation would not be subjected to direct mortality due to the lower salinity of transported water. Chapter 3, Section 3.6.2.1 of the EIS was revised to include additional information regarding the salinity tolerance of brackish and salt marsh vegetation.

Concern ID: 63028

All around the basin there are ghost cypress trees left over from a time when that area was much more fresh, as it naturally should be.

Response ID: 16036	Chapter 3, Section 3.6.2.2 in Wetland Resources and Waters of the U.S. of the EIS describes historic wetland losses in the Barataria Basin, as those losses relate to changes in salinity. Further, Chapter 3, Sections 3.1.4.1 Mississippi River and 3.1.4.2 Barataria Basin of the EIS address the deltaic processes that formed the Barataria Basin and birdfoot delta; however, Sections 3.1.4.2 and 3.2.1.1 Historical Context, have been supplemented in the Final EIS to further discuss historic conditions.
Concern ID: 63029	The commenter states that, upon operation of the proposed MBSD Project, the force of the water would wash out the existing marsh and questions how much marsh would be washed out before the results of land building are seen.
Response ID: 16037	The high water velocities from the diversion structure into the Barataria Basin would contribute to localized wetland losses at the immediate outfall area; those impacts would be offset by later marsh building in the outfall area by 2030 (see Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS). The Final EIS has been updated to provide a discussion of that change in Chapter 4, Section 4.6.5.1.2.4 Land Accretion.
Concern ID: 63037	Two recent (2021) studies should be reviewed and incorporated into the EIS, both of which appear in the journal Water, Volume 13. In the February 27, 2021 issue, the article entitled “A Review of 50 Years of Study of Hydrology, Wetland Dynamics, Aquatic Metabolism, Water Quality and Trophic Status, and Nutrient Biogeochemistry in the Barataria Basin, Mississippi Delta-System Functioning, Human Impacts and Restoration Approaches” by Day et al. In the March 16, 2021 issue, the article (also by Day et al.) entitled “The ‘Problem’ of New Orleans and Diminishing Sustainability of Mississippi River Management - Future Options.”
Response ID: 16044	The EIS discloses the value of wetlands in the Barataria Basin, including as flood control and protection from storm surge, as well as the history of wetland losses in Barataria Basin described in the provided references (see Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S. of the EIS). The Final EIS has been revised to include the recent studies provided by the commenter.
Concern ID: 63038	It would be at least 10 to 50 years before any appreciable amount of marsh may be built.
Response ID: 16045	The commenter correctly notes that the projected benefits of the proposed Project would not be immediate, but would occur over time beginning in the first decade of operations. The wetland acreages presented in Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S., Table 4.6-3 of the Draft EIS represented the total acreage

projected to be present in the Barataria Basin under each action alternative assessed.

Concern ID: 63040

The diversion flow would only capture the top 20 feet of sediment from the river, which does not contain the material necessary to establish land and maintain a sustainable root system. That material lies beneath the top 20 feet and the river depth is too great for the flow to move the land-building material. The first hurricane would destroy this fragile “swamp.”

Response ID: 16047

The issues raised by the commenter were considered in the Draft EIS. The commenter’s description of diversions designed to extract water from the top of the river pertains to existing freshwater diversions (Davis Pond and Caernarvon Diversions). The proposed MBSD Project differs from these because it is not a freshwater diversion; it is a sediment diversion designed to capture larger-sized sediments from a lower portion of the river. As described in Chapter 2, Section 2.1.1 in Introduction of the EIS, the proposed MBSD Project intake structure is designed, and located at a sufficient depth, to capture a higher concentration of coarse-grained sediment transported along the riverbed to allow for a more rapid vertical accumulation of organic material, resulting in quicker emergence of wetlands in the outfall area that are then able to support vegetation that traps available sediment across a range of particle sizes. Although capture of these larger sediments is critical, the proposed MBSD Project would also convey organic material and finer-grained sediments (less than 32 microns) intended to disperse farther into the basin to sustain and nourish existing wetlands. Table 5.2-1 in Appendix E Delft3D Modeling of the EIS lists the sediment classes that the Delft3D Basinwide Model projects would be transported to the basin via the diversion. Additional analysis regarding the potential impact of hurricanes on the extent of wetlands in the proposed Project area during the period of diversion operations, and additional detail regarding the resiliency of marsh created by the proposed Project has been included in Chapter 4, Section 4.6.5.1.2 Applicant’s Preferred Alternative of the Final EIS.

Concern ID: 63041

The Draft EIS statement that “The Barataria Basin lost approximately 25 percent of its total land area between 1932 and 2016 (Couvillion et al., 2017)” is based on flawed data analysis by the USGS and represents a large and biased overestimate of the land area lost in the Barataria Basin, at least since Hurricane Katrina in 2005. As documented and published in the studies by Potter et al. (2020 and 2021) in the Journal of Coastal Research, it must be concluded that the USGS coastal land area change product (cited as Couvillion et al., 2017) has not reported widespread wetland area gains in southern Louisiana and has instead overestimated net marshland losses on most sections of the Gulf Coast since at least 2005. Therefore, the Draft EIS and the

Response ID: 16048	<p>LA TIG's Draft Restoration Plan are based on erroneous land-loss rates and locations within the proposed Mid-Barataria Sediment Diversion impact area.</p> <p>Potter, C. and Amer, R., 2020. Mapping 30 years of change in the marshlands of Breton Sound Basin (southeastern Louisiana, U.S.A.): Coastal land area and vegetation green cover. Journal of Coastal Research, 36(3):437-450.</p> <p>Potter, C. 2021. Remote sensing of wetland area loss and gain in the western Barataria Basin (Louisiana, U.S.A.) since Hurricane Katrina. Journal of Coastal Research (in press).</p>
	<p>The analysis in the EIS is not based on past land-loss rates. The projected changes in wetland extent over the analysis period are based on current baseline conditions (including bathymetry, topography, and hydrologic conditions) and the Delft 3D Modeling analysis (see Appendix E Delft3D Modeling of the EIS) regarding future conditions for the No Action Alternative and the action alternatives (including the Applicant's Preferred Alternative). The Delft 3D model used a variety of inputs to project future conditions and was not based on historical land-loss trends. The difference between USGS data and the land loss cited in the literature would not invalidate the Delft 3D model projections. However, Chapter 3, Section 3.6.2 Wetland Loss of the Final EIS has been revised to include additional detail regarding the historic rate and extent of land loss in the Barataria Basin based on review of the literature cited by the commenter (Potter and Amer 2020 and Potter 2021).</p>
Concern ID: 63042	<p>River sediment is currently wasted offshore when the Barataria Basin needs it to restore and preserve marsh, and the life the marsh supports.</p>
Response ID: 16049	<p>Comment noted. The benefits of diverting river sediments to the Barataria Basin through the proposed Project were discussed throughout Chapter 4 Environmental Consequences of the Draft EIS.</p>
Concern ID: 63043	<p>Sea-level rise, subsidence, and the frequency of hurricanes would not allow for a multiple decade-long positive effect from operation of the proposed Project.</p>
Response ID: 16050	<p>Chapter 4, Sections 4.1.3 in Approach to Evaluation of Environmental Consequences and 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS acknowledge that sea-level rise and subsidence would affect the extent of wetland creation that would occur if the proposed Project were implemented. The projected land gains in the Barataria Basin developed via the Delft3D Basinwide Model take into account estimates of sea-level rise and subsidence. Additional analysis regarding the potential impact of hurricanes on the extent of wetlands in the proposed Project area during the period of diversion operations is</p>

included in Chapter 4, Section 4.6.5.1.2 Applicant's Preferred Alternative of the Final EIS.

Concern ID: 63045	The ongoing loss of Louisiana's coastal wetlands makes local communities increasingly vulnerable to stronger hurricanes and sea-level rise, threatening the health and stability of the entire Barataria Basin.
Response ID: 16051	The Draft EIS discussed the value of wetlands in the Barataria Basin, including as flood control and protection from storm surge (see Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S. of the EIS).
Concern ID: 63046	<p>Coastal land loss is caused by dredged canals through wetlands and associated spoil banks, rather than by Mississippi River levees, resulting in greater than 90 percent of all land loss on this coast (Turner and McClenachan 2018). These features become a significant factor influencing wetland health, resulting in longer individual flooding and drying intervals, pond formation, and sulfide buildup. Large-scale dredging fundamentally changes the movement of water in and out of the wetland, leading to wetland loss; as a result, about 4.6 times more land is lost for every one canal formed. The spatial and temporal distribution of canal permitting is not only coincidental with land loss, but data analysis implies a dominant causal relationship. The result is that the land loss on the coast has stabilized (until sea-level rise reaches a tipping point for wetland survival). There has been a slight gain in land since 2010 (Figure 7 of the attachment).</p> <p>Turner R.E. and G. McClenachan G. 2018. Reversing wetland death from 35,000 cuts: opportunities to restore Louisiana's dredged canals. PLOS ONE 13(12): e0207717. https://doi.org/10.1371/journal.pone.0207717</p>
Response ID: 16052	The influence of canals and spoil banks on wetland losses in Barataria Basin are discussed in Chapter 3, Section 3.6.2.2 Causes of Wetland Loss of the EIS. The literature cited by the commenters (Turner and McClenachan 2018) has been reviewed and additional detail has been added to Chapter 3, Section 3.6.2.2.4 Canals and Spoil Banks of the Final EIS. However, as described in the EIS, risk reduction levees have been shown to reduce the sediment load that enters the Barataria Basin. As the deficit of sediment, combined with increased rates of sea-level rise, contributes to wetland losses, the Mississippi River levees do contribute to coastal land loss.
Concern ID: 63047	The proposed MBSD Project would cause increased loss of wetlands in the birdfoot delta when compared to the No Action Alternative.
Response ID: 16053	As indicated by the comment, the Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S. of the Draft EIS disclosed the

increased wetland losses in the birdfoot delta when compared with the No Action Alternative.

Concern ID: 63048

Models are useful tools but are not as reliable as real-world observations. Given the fact that the Atchafalaya and Wax Lake Deltas in Atchafalaya Bay are the healthiest land-building areas in the state, I think it is fair to compare the observed land building to model projections for the Mid-Barataria Diversion. The Atchafalaya River has been filling in the bay since the 1950s. Its flow is kept at 30 percent of total latitude flow, with the other 70 percent going to the Mississippi, such that the Atchafalaya flow is equal to 43 percent of the Mississippi River flow. The proposed operation of the Mid-Barataria Diversion varies from 5.6 to 7.5 percent of the Mississippi flow only when the river is between 450,000 and 1,000,000 cfs, and is lower otherwise. The proposed Project is expected to discharge more than 5,000 cfs for only 194 days per year (Table 4.1-1). Let us generously assume that the discharge averages 6 percent of river flow for discussion's sake. Thus, the diversion discharge would average about 1/7 of the flow of the Atchafalaya River. The EIS states that the proposed Project would result in 17,300 acres more than the No Action Alternative in 30 years, comparable to the amount of land built in Atchafalaya Bay since the 1950s (Pre-storm acreage was 17,500 [Pers. Comm. Barras 2009]). Several factors complicate the comparison: the Wax Lake Outlet, which receives approximately 1/3 of the Atchafalaya River's flow and delivers it to the Wax Lake Delta, skims from the top of the water column, and the Atchafalaya Delta is compromised by the dredging of the ship channel. Also, some of the Atchafalaya River flow is lost to the marshes south of the Intracoastal. These factors would tend to reduce land building in the bay.

Conversely, the Mississippi River is less sediment-rich than the Atchafalaya River (Blum and Roberts 2009). In addition, sea-level rise is accelerating (Figure 4.1-3), and as a result, future land building would be much slower than when the deltas were forming. The Mid-Barataria Diversion maximum discharge of 75,000 cfs would be reached at 1,000,000 cfs, and would not increase with greater flows, when sediment loads are greater. These factors would tend to limit the rate of land creation/maintenance by the proposed Project compared to the deltas in Atchafalaya Bay. In summary, the EIS states that the Mid-Barataria Diversion would create/maintain about the same amount of land as was built in Atchafalaya Bay with roughly 1/7 the water flow, in about 1/2 the time, and with less sediment-rich water in an environment of accelerating sea-level rise. Even considering the factors that limited land building in Atchafalaya

Bay, the proposed Project is unlikely to create/maintain land at roughly 14 times the rate observed in Atchafalaya Bay. [References provided]

Blum, M.D., Roberts, H.H., 2009. Drowning of the Mississippi delta due to insufficient sediment supply and global sea-level rise. Nature Geoscience 2, 488-491.

Response ID: 16054

While commenters have described real-world examples that by comparison suggest the proposed Project would not produce the land gains projected by the model, observed examples from other basins are not necessarily more reliable than numerical models. Multiple lines of evidence were used in development of the EIS, including professional field experience in coastal Louisiana, reviews of available scientific literature and the results of the Delft3D Basinwide Model, which are based on the site-specific conditions and design parameters of the proposed Project. These approaches have respective strengths and weaknesses such that they can be used in a complementary fashion to develop more reliable results than any one method alone. That complementary use was employed in preparing the EIS. The literature cited by the commenters has been reviewed (specifically, Blum and Roberts 2009) and that reference was considered in development of the EIS. The Delft3D Basinwide Modeling accounts for Mississippi River sediment supply as described in Appendix E Delft3D Modeling of the EIS, Sections 5.2.2 and 8.

Further, the Delft3D Basinwide Model incorporates inundation depths in the critical vegetation parameters to simulate vegetation losses and gains as a result of the diversion, as well as other sources of inundation (such as subsidence and sea-level rise). A summary of select natural and man-made diversions in southeastern Louisiana, including those in Atchafalaya Bay, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes the cited reference, is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

The likelihood of success of the proposed Project and information from other freshwater diversions was considered in the LA TIG's Draft Restoration Plan; therefore, no related edits have been made to the Final Restoration Plan. Chapter 3, Sections 3.2.1.4 (Likelihood of Success - Alternative 1) and 3.2.2.4 (Likelihood of Success - Alternatives 2-6) of the LA TIG's Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The proposed MBSD Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer models

used to analyze Project benefits fully consider the geomorphological features of the Lower Mississippi River, including data and knowledge gained from the referenced project.

Concern ID: 63049

Models are useful tools but are not as reliable as real-world observations. The West Bay Sediment Diversion project was constructed in 2003, originally designed to divert an average discharge of 20,000 cfs. By 2008, the flow had increased substantially, and in 2009 to 2011, measured flows were equal to 8.4 to 9.5 percent of Mississippi River flows (Sharp et al. 2013). Discharges into West Bay at moderate river flows of 551,000 cfs peaked in 2009 at about 42,000 cfs, and declined in the 2009 to 2014 period to about 24,700 cfs (Allison et al. 2017). The operational plan for the proposed Project, as described in the EIS, would result in a flow of about 34,000 cfs at the same moderate Mississippi River flow of 551,000 cfs, or about midway between the high and low West Bay discharges of 2009 to 2014. A report produced by the State of Louisiana CPRA stated that while the West Bay project area gained a total of 557 acres from 2002 to 2014, much of that gain can be attributed to beneficially placed material. Approximately 665 acres of material had been placed within the land/water analysis boundary at the time of the 2014 survey, versus the 557 acres determined via land/water analysis (Plitsch 2017). This lack of land building by the diversion of river water into West Bay for 10 years took place even though Grand Pass is another important source of sediment to the bay (Kolker 2012). Yet the Mid-Barataria EIS projects a land gain of 6,260 acres in the Barataria Basin relative to the No Action Alternative in the first 10 years (Table 4.2-4), with rates of discharge comparable to the West Bay project. Report 13-15, Vicksburg, Mississippi.**http://acwc.sdp.sirsi.net/client/en_US/search/asset/1032362****Response ID: 16055**

USACE notes that commenters have described real-world examples that by comparison suggest the proposed Project would not produce the land gains predicted by the model. USACE disagrees with the assertion that examples from other basins are more reliable than numerical models. Multiple lines of evidence were used in development of the EIS, including professional field experience in coastal Louisiana, reviews of available scientific literature and the results of the Delft3D Basinwide Model. However, the model is based on the site-specific conditions and design parameters of the proposed Project. These approaches have strengths and weaknesses such they can be used in a complementary fashion to develop more reliable results than any one method alone. That complementary use was employed in preparing the EIS. The USACE and the LA TIG have reviewed the literature cited by the commenters, including Allison et al. 2017, Kolker et al. 2012, Plitsch 2017, and Sharp et al. 2013 and those references have been added as applicable. A summary of select natural and man-made diversions in southeastern Louisiana, including the West Bay Sediment Diversion, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes the cited references, is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

The West Bay Sediment Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, "A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that diversions do not lead to appreciable sediment accumulation." (Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, Estuarine, Coastal and Shelf Science, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005>).

The likelihood of success of the proposed Project and information from other freshwater diversions was considered in the LA TIG's Draft Restoration Plan. More specifically, Chapter 3, Sections 3.2.1.4 (Likelihood of Success - Alternative 1) and 3.2.2.4 (Likelihood of Success - Alternatives 2-6) of the LA TIG's Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The proposed MBSD Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer models

used to analyze Project benefits fully consider the current geomorphological features of the Lower Mississippi River, including data and knowledge gained from the referenced project.

Concern ID: 63050

The temperature shock from the discharge of colder river waters would be harmful and likely would damage existing vegetation.

Response ID: 16056

As described in Appendix E Delft3D Modeling, Section 5.4.1 of the EIS, temperature coefficients for growth and for senescence mortality have been incorporated into the vegetation parameters for the Delft3D Basinwide Model. Water temperature is simulated within the model; based on the results of the modeling analysis, and as described in Chapter 4, Section 4.5.5.2 in Surface Water and Sediment Quality of the EIS, temperature trends projected for the proposed Project would follow the same seasonal patterns as the No Action Alternative, though there would be a minor temperature decrease (up to 5°F or 3°C) at assessed locations following operation of the diversion structure above base flow. Because this issue was considered in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 63051

The Draft EIS underestimated the following beneficial impacts of the proposed Project:

- **pioneer species like black willow (which is exploding in the Davis Pond, Caernarvon and Mardi Gras Pass outfall areas);**
- **bald cypress retention and recruitment in areas formerly too saline or submerged; and**
- **survival and recruitment of live oaks and other maritime forest vegetation on natural levees and cheniers where saline soils have inhibited their growth, recruitment, and survival for decades.**

Response ID: 16057

While forested wetlands (including cypress swamps) are present in the northern portions of the Barataria Basin, as depicted in Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S., Figure 3.6-1 of the EIS, land gains associated with the proposed Project would primarily be in the outfall area where marsh vegetation predominates (see Chapter 4, Section 4.2 Geology and Soils, Figures 4.2-2 through 4.2-4 of the EIS). Therefore, the establishment or spread of forest species as a result of the proposed Project is not anticipated. However, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes observed changes in vegetation growth from other

diversions, is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

Concern ID: 63052

Combined with other proposed restoration projects, the proposed MBSD Project would build and preserve more than 17,000 acres of wetlands over the next 30 years to restore critical wetland habitat injured by the DWH oil spill.

Response ID: 16058

The Draft EIS disclosed the projected maximum wetland gains of 17,100 acres associated with the proposed Project at year 2060 before dropping to 12,700 acres at year 2070 in the Barataria Basin; these wetland gains over time are quantified in Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. and are consistent with the commenter's statement. When considered with other reasonably foreseeable future projects, cumulative wetland gains in the Barataria Basin could be greater, as presented in Section 4.25 Cumulative Impacts, Wetland Resources and Waters of the U.S. of the Draft EIS.

Concern ID: 63053

Newly built land is evident from the air on the east bank of the Mississippi River, where there are enough natural breaks in the river levees to allow the natural process of delta building.

Response ID: 16059

The commenter's support for the proposed Project is noted. Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives of the Draft EIS explained how the proposed Project is designed to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin. This is also discussed in Chapter 3, Section 3.2.1.1 in Geology and Soils of the LA TIG's Restoration Plan.

Concern ID: 63054

Clarify whether "sustaining 20 percent of the marsh" means that the proposed Project would sustain 20 percent of the land that is present today or that the proposed Project would add 20 percent to the land's total. Further clarify if those numbers are based on the land that is present today or what would be present in 2050.

Response ID: 16060

The wetland acreages presented in Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S., Table 4.6-3 of the EIS represent the total acreage projected to be present in the Barataria Basin under each action alternative assessed. The percentage of wetland gains and losses presented in Section 4.6, Table 4.6-4 therefore represents the total change in wetland area (including newly created wetlands as well as wetlands that would be lost to subsidence and sea-level rise but for the proposed Project). No edits to the Final EIS are warranted. The comparisons use projected wetland area by decade for all alternatives assessed (that is, the numbers are based on the projected future conditions, and not current wetland area).

The LA TIG's Restoration Plan highlights that, by the end of the analysis period, the proposed Project is projected to be responsible for

creating or maintaining approximately 20 percent of the land that would remain in Barataria Basin at that time (that is, 2070). Specifically, this represents the amount of created or maintained land that remains in 2070 divided by the total amount of land that remains in the Barataria Basin in 2070. See the EIS for more information about projected Project-driven changes in land area over time (Chapter 4, Section 4.2.3.2 Geology and Soils and Section 4.6.5.1 in Wetland Resources and Waters of the U.S.).

Concern ID: 63055

Clarify how the 150,000 cfs Alternative is projected to produce only 9.7 percent more fresh and intermediate marsh and less brackish and saline marsh than the 50,000 cfs Alternative.

Response ID: 16061

The same Project area was used for all alternatives assessed in the EIS, which is the extent of the Barataria Basin and birdfoot delta. Under each action alternative, the proposed Project would create and sustain existing wetlands. The magnitude of impacts would be greater under the 150,000 cfs Alternative when compared with the 50,000 cfs Alternative; however, because the 150,000 cfs Alternative would discharge more fresh water into the Barataria Basin, it would result in greater inundation of the marsh surface in the immediate outfall area, increasing plant stress and mortality. Therefore, the 150,000 cfs Alternative would result in the conversion of a larger area of existing, brackish marsh to freshwater and intermediate marsh in the delta formation area when compared with the other action alternatives. This difference is illustrated in Chapter 4, Section 4.6 Wetland Resources and Waters in the U.S., Figure 4.6-15. Because this issue was considered in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 63056

Louisiana loses an estimated 25 acres of wetlands each day; compare this daily loss to the daily wetland creation projected by the proposed Project.

Response ID: 16062

Reference to the loss of 25 acres of wetlands per day is assumed to be based on the estimate by Couvillon et al. (2017) that, between 1985 and 2010, an estimated 16.6 square miles of wetlands was lost across the state of Louisiana annually. While wetland losses cannot be assessed on a daily basis, this estimate equates to about 29 acres of wetland loss per day.

By comparison, in 2060 (when wetland gains under the Applicant's Preferred Alternative are greatest when compared with the No Action Alternative), the proposed Project would result in a 17,100-acre wetland increase over the No Action Alternative in the Barataria Basin (see Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S., Table 4.6-4). This area equates to about 428 acres (0.7 square mile) if

it is averaged annually over the 40-year period between 2020 and 2060.

By 2070, the proposed Project is anticipated to create 12,700 acres in the Barataria Basin (approximately 19.8 square miles, see Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S., Table 4.6-4). While wetland gains cannot be assessed on a daily basis, this projection would equate to about 254 acres per year or 0.7 acre per day.

Because the projected wetland increase over time was represented in the Draft EIS, no edits to the Final EIS have been made.

Concern ID: 63060

The proposed diversions would build land in the immediate outfall; however, the areas farther away would experience a higher land loss due to changes caused by the lower salinity. The losses in salt marsh flora causes increased erosion and land subsidence in old marshland and would result in a net land loss. The natural land that took nature thousands of years to build cannot be replicated by diversions.

Response ID: 16066

The EIS acknowledges that the fresh water transported by the diversion may result in the loss of some wetlands in the immediate outfall area due to inundation during the initial period following commencement of operations (see Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS).

However, salt- and brackish marsh vegetation would not be subjected to direct mortality due to the lower salinity of transported water. While saline and brackish species are associated with salinity ranges of greater than 18 ppt and between 18 and 5 ppt, respectively (see Chapter 3, Section 3.6.1.2 in Estuarine Wetlands of the EIS), brackish marsh can fluctuate from fresh to saline conditions depending on tidal movement, and species such as *Spartina alterniflora* are common in both salt and brackish marsh (Connor and Day 1987). Salt is a stressor affecting osmosis and cell structure. Plants occurring in saline and brackish marshes have developed adaptations to either exclude uptake or excrete salt; however even salt marsh species grow better at lower salinities (Mitsch and Gosselink 2000; Teal et al. 2012). However, as described in Chapter 4, Section 4.6.5.1.2.1 Salinity of the Final EIS, in some areas of the Barataria Basin, the seasonal change in salinity due to operation of the diversion above base flow (primarily during spring and early summer) and lower-flow conditions during fall and winter months would be large enough to temporarily change the wetland hydrology from a brackish to fresh or saline to brackish system. In the southern basin, where salt marsh predominates, peak salinities would be within the range for salt marsh vegetation under the No Action and Applicant's Preferred Alternatives. While the action alternatives would not counteract all wetland losses across the Barataria Basin over the

analysis period, as shown in Section 4.6 in Wetland Resources and Waters of the U.S., Table 4.6-4, the proposed Project would reduce wetland losses when compared with the No Action Alternative. Because this issue was considered in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 63064

Marsh flora and fauna would die once the proposed Project operation begins and river water fills the estuary. Clarify how long it would take for other species to inhabit the area and how much land would wash away once the saltwater marsh that is currently present dies.

Response ID: 16070

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. indicated that the fresh water transported by the diversion may result in the loss of some wetlands in the immediate outfall area due to inundation during the initial period following commencement of operations; however, those impacts would be offset by marsh building in the delta formation area. However, salt- and brackish marsh vegetation would not be adversely affected by the lower salinity of transported water. Chapter 4, Section 4.6.5.1.2.4 Land Accretion of the Final EIS has been revised to include additional analysis regarding the extent and timing of wetland changes in the immediate outfall area.

As summarized in Chapter 4, Section 4.10.5 in Aquatic Resources of the EIS, the proposed Project would have both adverse and beneficial impacts on the flora and fauna of the Barataria Basin, based on the specific life history and habitat preferences of a given species.

Concern ID: 64195

Vegetation is fragile but is resilient. Seedlings could be introduced in the sediment flow as topsoil crusting occurs, or could be introduced years later at additional cost.

Response ID: 16071

Comment noted. The Project, as proposed, does not include planting of wetland vegetation; rather, the diversion of fresh water and sediments would alter the abiotic conditions in the Barataria Basin to allow for establishment of marsh species via natural recruitment and spread. No related edits to the Final EIS have been made.

Concern ID: 64196

With respect to the Davis Pond and Caernarvon Diversions that overwhelmingly convey finer-grained silts and clays, the critical importance of those sized sediments is graphically apparent. Since those classes of sediments make up at least two-thirds of the sediments that the proposed MBSD Project is expected to transport into the basin (Draft EIS Chapter 2, Section 2.4 Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow, Table 2.4-2), these experiences serve as a telling example of what the proposed MBSD Project would do in terms of strengthening and building up wetlands that can filter and capture the finer-grained sediments that it would

Response ID: 16072	convey. While the Draft EIS presented data about the quantity of these finer-grained sediments, the discussion about the areal distribution and role of these sediments in terms of maintaining and strengthening wetlands that are deteriorating could be improved.
	As described in Chapter 4, Section 4.2.3 in Geology and Soils of the EIS, sand and coarser-grained sediments would be deposited in the immediate outfall area while finer-grained sediment would be deposited farther gulfward in the basin. Land gains associated with the proposed Project would primarily be in the immediate outfall area (see Chapter 4, Figures 4.2-2 through 4.2-4 in Geology and Soils). Chapter 4, Sections 4.2.3.2.2.1 Geology and 4.6.5.1.2.4 Land Accretion have been revised in the Final EIS to further address the importance of fine-grained sediments for marsh building and sustenance.
Concern ID: 63030	The executive summary for Wetland Resources and Waters of the U.S. fails to capture the significance of wetland impacts within the context of the delta cycle (see van Beek and Gagliano 1984; Figs. 1, 2) and fails to discuss the implications of not reconnecting the river to the Barataria Basin.
Response ID: 16038	The implication of not reconnecting the Mississippi River to the Barataria Basin was considered in the Draft EIS. The No Action Alternative, assessed for each resource throughout the EIS, describes the projected future conditions without the proposed Project. Impacts on wetlands under the No Action Alternative are addressed in Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS, and comparisons of the change in wetland area during operations of the proposed Project as compared to conditions under the No Action Alternative are included in the Section ES.4, Wetland Resources and Waters of the U.S. in the Executive Summary. Further, Chapter 3, Sections 3.1.4.1 Mississippi River and 3.1.4.2 Barataria Basin of the EIS address the deltaic processes that formed the proposed Project area; however, Sections 3.1.4.2 and 3.2.1.1 Historical Context, have been supplemented in the Final EIS to further discuss historic conditions and include the referenced study (van Beek and Gagliano 1984).
Concern ID: 63031	The executive summary for Wetland Resources and Waters of the U.S. should indicate that the proposed Project would also benefit brackish marshes.
Response ID: 16039	As shown in Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S., Table 4.6-3 of the EIS, the proposed Project is projected to reduce the total area of brackish marsh in the Barataria Basin when compared with the No Action Alternative over its operational period. As addressed in Section 4.6, some areas of brackish marsh that would be converted to open water under the No Action Alternative may be

sustained by sediments transported by the proposed Project; however, some brackish marsh under the proposed Project would be converted to fresh water in the immediate outfall area. Because this issue was considered in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 63033

The executive summary for Wetland Resources and Waters of the U.S. should reiterate in the 3rd sentence of the first paragraph that the proposed Project would benefit wetlands by providing additional nutrients.

Response ID: 16040

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS includes an analysis of the proposed Project's impacts with respect to increased nutrients transported by the diversion to wetlands in the Barataria Basin and the benefits those nutrients would provide. Because this issue was considered in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 63034

The executive summary for Wetland Resources and Waters of the U.S. should provide additional detail on the impact of various river flow volumes on salinity in the birdfoot delta. The validity of this analysis is questionable because high river flows would overwhelm the birdfoot delta with freshwater regardless of a reduction in flow caused by the diversion, while at low flows, when the diversion is most likely to affect salinity in the birdfoot delta, the diversion still only represents a 10 percent reduction in river flow.

Response ID: 16041

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS provides a detailed analysis of the impacts of reduced sediment and freshwater flow to the birdfoot delta associated with the proposed Project. In addition, Figures 4.5-3 and 4.5-4 in Chapter 4, Section 4.5.5.1 in Surface Water and Sediment Quality, depict the average salinity projected under the proposed Project and No Action Alternatives in the Project area (including the birdfoot delta). Salinity was modeled using a historical representative hydrograph to quantify river flows; the representative hydrograph differs by each decade during Project operations. The results of the analysis find that the proposed Project would cause permanent, minor increases in salinity in the birdfoot delta during Project operations; the maximum increase would be 5 ppt above the No Action Alternative conditions. Finally, Appendix E Delft3D Modeling provides a detailed description of the Delft3D Basinwide Model used to provide quantitative projections of proposed Project impacts. Because these issues were considered in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 63035

The executive summary for Wetland Resources and Waters of the U.S. should reconsider the operating plan for Davis Pond and how

Response ID: 16042	<p>the Davis Pond Diversion would be affected by the proposed Project.</p> <p>Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS provides a detailed analysis of the impacts of operations of the proposed Project on the Davis Pond Freshwater Diversion. Because this issue was considered in the Draft EIS, no related edits have been made to the Final EIS. The operations plan for the Davis Pond Freshwater Diversion is outside the scope of this analysis. Further, there are no plans at this time to change the operating plan for the Davis Pond Freshwater Diversion Project. As discussed in Chapter 5, Section 5.3 Fish and Wildlife Coordination Act Report Recommendations of the Draft EIS, as part of the Fish & Wildlife Coordination Act consultation, USFWS has recommended, and CPRA has agreed to implement, development of a basin-wide operations and basin monitoring data repository to help in the general coordination among diversion operators, within their authorizations.</p> <p>As part of the evaluation of the proposed Project and potential alternatives, the Delft3D model runs and the EIS assumed operations of other diversions consistent with their current or anticipated operational protocols, including the Davis Pond Freshwater Diversion for the hydrodynamic and water quality simulations. The Davis Pond Freshwater Diversion was not included in the Delft 3D morphological modeling simulations.</p> <p>Based on Delft3D Basinwide Modeling results, proposed MBSD Project operations are expected to reduce the frequency with which the Davis Pond Freshwater Diversion would be operated during certain months of the year to meet its current operational guidelines. Refer to Chapter 4, Section 4.5.7 in Surface Water and Sediment Quality of the EIS for further details on the projected number of days for the Davis Pond Freshwater Diversion opening. Potential impacts to the Davis Pond Freshwater Diversion will be further considered as part of the Section 408 permission request process for the proposed MBSD Project.</p>
Concern ID: 63036	<p>The executive summary for Wetland Resources and Waters of the U.S. should clarify whether the stated beneficial impacts on the spread of invasive species would be an adverse impact on the environment, and specify the invasive species considered in this paragraph.</p>
Response ID: 16043	<p>Chapter 4, Section 4.6.5.2 in Wetland Resources and Waters of the U.S. of the EIS analyzes the potential impacts on the spread of invasive species in wetlands in the proposed Project area, including identifying the species considered in the analysis. Chapter 4, Section 4.9.4 in Terrestrial Wildlife and Habitat and Section 4.10.4.6 in Aquatic Resources also analyze the potential for Project impacts on the spread of invasive plants and animals in uplands and aquatic habitats. The</p>

proposed Project could reduce the spread of invasive species in the birdfoot delta, which is considered a beneficial impact to the birdfoot delta. However, operation of the proposed Project could result in the introduction or spread of invasive wetland plant species in the Barataria Basin. The Executive Summary of the Final EIS has been revised to clarify the impact language.

Concern ID: 63059	The freshwater habitat components of Louisiana’s estuaries are under tremendous threat from erosion, saltwater intrusion, and sea-level rise, and are at risk of completely disappearing given physical limitations preventing inland marsh migration (Glick et al. 2013).
Response ID: 16065	The literature cited by the commenter (Glick et al. 2013) was reviewed. Chapter 3, Section 3.6.2.2 in Wetland Resources and Waters of the U.S. of the EIS describes the causes of historic wetland losses in the Barataria Basin and is consistent with those documented by Glick et al. (2013), including sea-level rise. Because this issue was considered in the Draft EIS, no related edits have been made to the Final EIS.
Concern ID: 63061	Identify the amount of water and sediment diverted during the 2019 Bonnet Carré Spillway opening and describe the creation/restoration of wetlands from those diverted sediments.
Response ID: 16067	The Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological response. A summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes additional discussion on the Bonnet Carré Spillway, is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.
Concern ID: 63062	Early model runs used in the Draft EIS predicted accelerated loss of the brackish marsh in the first 10 to 60 days as these delicate plants cannot tolerate voluminous river water inundation.
Response ID: 16068	Chapter 4, Section 4.6.5.1.2.4 Land Accretion of the Final EIS has been revised to include additional analysis regarding the loss of some wetlands in the immediate outfall area due to scouring and inundation during the initial period following commencement of operations.
Concern ID: 63063	Barataria Basin is host to thousands of miles of unused oil canals, whose neglect has altered local hydrology to the detriment of marshes within 2 kilometers of the “spoil banks” constructed of the cast aside materials from canal excavation. The Draft EIS did not consider these hydrologic alterations as significant. However,

Response ID: 16069	in the commenter’s experience, the cumulative impact of small canal projects can be significant.
Concern ID: 63039	The proposed Project would create wetlands, which would in turn provide a myriad of benefits, including helping to protect the coastline from sea-level rise and flooding due to storms.
Response ID: 16046	Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the Draft EIS disclosed the projected wetland gains. Associated benefits, such as building coastal resiliency, from the proposed Project are addressed throughout the Draft EIS. Also see a discussion of the proposed Project’s benefits in Chapter 3, Section 3.2.1.6 Benefits Multiple Resources of the LA TIG’s Final Restoration Plan.

EC60600 - Air Quality

Concern ID: 61925	The Draft EIS belittled the major impacts the proposed Mid-Barataria Sediment Diversion would have on Ironton, and implied that impacts are limited to construction. Ironton already is inundated with pollution from an upriver grain terminal (CHS) and Alliance Refinery and down river coal export terminals. Removing trees from the land removes a critical buffer of air quality protection for Ironton.
Response ID: 16187	Chapter 3, Section 3.7.2 in Air Quality of the EIS describes the existing air quality classification under the Clean Air Act in the proposed Project area. Plaquemines Parish is designated as “unclassifiable/in attainment” for all criteria pollutants, meaning that the air quality in the area meets or is cleaner than national standards. As described in Chapter 4, Section 4.7.3.2 of the EIS in Air Quality, the Action Alternatives would cause minor to moderate adverse impacts on air quality during construction related to the use of combustion-powered equipment and fugitive dust generated by off-road vehicle use, earthwork (such as land clearing and ground excavation), aggregate and material handling (including concrete manufacturing), and wind erosion of exposed piles of dredged and excavated material. As described in Chapter 4, Section 4.7.4.2 in Air Quality of the EIS, the Action Alternatives would cause negligible air quality impacts during operation of the proposed Project due to active maintenance, which

would not be sufficient to cause the proposed Project area to be re-designated as a non-attainment area. Tree cover can improve air quality via uptake of pollutants and the proposed Project would require clearing of some of the forest areas between Ironton and the existing Alliance Refinery. However, as depicted in Chapter 4, Section 4.18 Land Use and Land Cover, Figure 4.18-1, forest vegetation would remain on either side of the diversion structure and would continue to provide some buffer to air emissions from the Alliance Refinery and dust from the grain terminal for the community of Ironton. Chapter 3, Section 3.7.2 of the Final EIS was updated to identify existing sources of emissions in the Project vicinity include operation of the Alliance Refinery, the CHS terminal, and other industrial facilities.

Chapter 4, Section 4.15 Environmental Justice of the Final EIS has been revised to clarify information about potential impacts on the community of Ironton.

Concern ID: 63127

The future without action is a future of increasing oil and gas leaks into the Barataria Basin. The commenters believe that many or most of the ongoing environmental harms to the Barataria Basin are not mentioned in the Draft EIS. The Draft EIS mentioned over 2,600 miles of hazardous liquid pipelines, and over 4,990 “unplugged” (Townsend-Small et al. 2016), inactive wells, 15,979 plugged wells, and 799 active wells. Many of these unplugged, unproductive wells are likely leaking methane into the upper atmosphere.

Response ID: 16188

The EIS acknowledges that oil and gas development has affected the Barataria Basin (see Chapter 3, Section 3.2.3 in Geology and Soils and Section 3.23 Hazardous, Toxic, and Radioactive Waste Assessment of the EIS). In addition, literature provided by the commenter (Townsend-Small et al. 2016), has been reviewed and Chapter 3, Section 3.7.2.1 Climate Change and Greenhouse Gases in the Final EIS has been revised to include a discussion of sources of GHG emissions in Louisiana, including oil and gas production identified in this reference, as well as other ongoing activities.

EC60800 - Terrestrial Wildlife/Habitat

Concern ID: 62889

The Draft EIS ignores or underestimates likely positive impacts to upland wildlife (deer, hogs, furbearers, nutria), wetland wildlife (waterfowl, wading birds, colonial nesting birds), and wildlife with lower salinity tolerances (alligators), as well as foraging habitat (migratory shorebirds and neotropical migrants), nesting habitat (marsh birds) and prey availability for a variety of species.

Response ID: 16189	<p>The Draft EIS evaluated the effects of the proposed Project on terrestrial resources. The impacts of the proposed Project on upland species are discussed in Chapter 4, Section 4.9.4.2 in Terrestrial Wildlife and Habitat of the EIS, but are generally anticipated to be minor and adverse. Conversely, the effects of the proposed Project on wetland wildlife, wildlife with lower salinity tolerances, foraging/nesting habitat, and prey availability in the Barataria Basin are generally anticipated to be beneficial, as discussed throughout Section 4.9 Terrestrial Wildlife and Habitat.</p> <p>In addition, the potential benefits of the proposed Project to multiple resources in the Gulf are described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan.</p>
Concern ID: 62890	<p>The wetlands and coastal habitats of Louisiana are essential to the bird populations (both resident and migratory) and must be protected and restored. The proposed Project is important to maintaining and rebuilding important bird habitat.</p>
Response ID: 16190	<p>Chapter 3, Section 3.9.2.1 in Terrestrial Wildlife and Habitat of the Draft EIS identified the importance of area habitats and resources to migratory, and other, birds in the Barataria Basin. Further, Chapter 4, Section 4.9.4.2 in Terrestrial Wildlife and Habitat of the Draft EIS, discussed the maintenance and creation of marsh, as well as initial land accretion and creation of mudflats, that is projected to occur as part of the proposed Project, and identified that the net addition of these habitats would generally be beneficial to waterfowl and shorebirds.</p> <p>The potential benefits of the proposed Project to resources in the Gulf, including birds, are also described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan.</p>
Concern ID: 62892	<p>The proposed MBSD Project would create wetlands supportive of birds (bald eagles, spring and fall migrants, waterbirds, and marsh birds) and other wildlife that are experiencing a high rate of coastal land (habitat) loss.</p>
Response ID: 16191	<p>Chapter 4, Section 4.9.4.2 in Terrestrial Wildlife and Habitat of the Draft EIS, discussed the maintenance and creation of marsh that is projected to occur as part of the proposed Project, and identified that the net addition of wetlands would generally be beneficial to area birds. As identified in Section 4.12.3.2 in Threatened and Endangered Species of the Draft EIS, the creation and maintenance of wetlands could affect bald eagle aquatic foraging habitat and prey species, but would likely result in negligible effects on the bald eagle itself.</p> <p>The potential benefits of the proposed Project to resources in the Gulf, including birds, are also described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan.</p>

Concern ID: 62893	The proposed MBSD Project would kill wildlife.
Response ID: 16192	As described in Chapter 4, Section 4.9 Terrestrial Wildlife and Habitat of the Draft EIS, wildlife would experience both adverse and beneficial impacts during proposed Project construction and operations, with specific impacts depending on the individual life history and tolerances of a given species.
Concern ID: 62894	Colonial nesting waterbirds are documented within 1 mile of the proposed Project and activities within a certain radius of an active colony are generally prohibited. Nesting colonies can move from year to year and no current information is available on the status of these colonies. If work for the proposed Project would commence during the nesting season, a field visit to the worksite to look for evidence of nesting colonies is required. This field visit should take place no more than 2 weeks before construction begins. If no nesting colonies are found within 1,000 feet (2,000 feet for brown pelicans) of the proposed Project, no further consultation with Louisiana Wildlife Diversity Program (WDP) staff may be necessary. If active nesting colonies are found within the previously stated distances of the proposed Project, further consultation with WDP staff would be required. Colonies should be surveyed by a qualified biologist to document species present and the extent of colonies. Additionally, LDWF should be provided with a survey report. For report requirements and restrictions for minimizing disturbance to colonial nesting birds or if at any time Louisiana Natural Heritage Program-tracked species are encountered within the proposed Project area, please contact our WDP biologists at 225-765-2643.
Response ID: 16193	<p>As noted in Chapter 4, Section 4.9.3.2 in Terrestrial Wildlife and Habitat and Appendix R1 (Mitigation and Stewardship Plan) of the EIS, if a permit is issued, CPRA would conduct pre-construction surveys for colonial waterbirds and would provide the survey results to the LDWF for review. As further noted in Chapter 5, Section 5.3 Fish and Wildlife Coordination Act Report Recommendations of the EIS, if a permit is issued, CPRA has agreed to implement Conservation Recommendation 13 resulting from the Fish and Wildlife Coordination Act consultation with USFWS, which requires inspection and monitoring measures similar to those recommended by the commenter. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.</p> <p>The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for</p>

public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62895

Feral hogs significantly damage levee systems and the increased water levels surrounding marshes would drive them (and other wildlife) further onto the current levee system, exacerbating the damage. Commenter asked how the issue would be addressed.

Response ID: 16166

As noted in Chapter 4, Section 4.9 in Terrestrial Wildlife and Habitat of the Draft EIS, while feral hogs are sometimes found in marsh habitat, they are more common in forested habitat. As described in Section 4.4 Surface Water and Coastal Processes, water level increases from the proposed Project are not expected in northern portions of the basin or within federal levee systems. As shown in Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S., Figure 3.6-1, and Section 3.18.2 Existing Land Use/Land Cover, Figure 3.18-1 forested lands/wetlands are located primarily in these areas. Therefore, increased water levels from the diversion are not expected to appreciably increase feral hog use of and damage to levees in the proposed Project area. Construction of the proposed Project would be expected to destroy and remove approximately 149 acres of forested lands (about 20 acres of which are forested wetlands) from within the Project construction footprint. Feral hogs using those forests would be

displaced during construction and operation and would be expected to move to other areas. See Sections 4.9.3.2 and 4.9.4.2 of the Draft EIS. Section 4.9.4.2.3.2 Terrestrial Invasive Animals was updated for the Final EIS to discuss the potential for feral hogs to damage levees during periods of increased water levels.

Concern ID: 62896

Some wildlife species would have higher survival, but the survival of others would decrease. Commenter expressed concern regarding impacts on wildlife and questioned if there would be more gains than losses.

Response ID: 16194

As described in Chapter 4, Section 4.9 Terrestrial Wildlife and Habitat of the Draft EIS, wildlife would experience both adverse and beneficial impacts during proposed Project construction and operations, with specific impacts depending on the individual life history and tolerances of a given species. The proposed Project is not anticipated to result in the loss of individual species throughout the Barataria Basin, but rather would cause a shift in the species assemblages to account for the modified habitat present in the basin. For example, species with higher-salinity requirements that are currently present would remain during operation of the proposed Project, but would likely move further south to account for changing salinities. These potential impacts of the proposed Project on various species and wildlife groups are analyzed and described in detail in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat, 4.10 Aquatic Resources, 4.11 Marine Mammals, and 4.12 Threatened and Endangered Species in the EIS.

As discussed in Sections 4.16.5.1 and 4.16.5.2 in Recreation and Tourism, the proposed Project would cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts to these species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips. Section 4.16.5.2.3 Recreational Fishing of the Final EIS has been updated to acknowledge that some recreational fishers may need to modify their traditional fishing locations to target specific species that may modify habitat use (either temporarily or permanently) based on changing salinities.

Concern ID: 62898

The 2018 publication “Bird distribution among marsh types on the northern Gulf of Mexico” in the Journal of Coastal Research (vol.

Response ID: 16196	<p>34 (5):1060-1086) presents the results of bird counts at 100 locations in the marsh, tracked for several years starting in 2010.</p> <p>The literature cited by the commenter (Yaukey 2018) has been reviewed and incorporated into Chapter 4, Section 4.9.4.2.2.3 Wetlands (Wet Pasture/Marsh/Bottomland Hardwoods) of the Final EIS.</p>
Concern ID: 62900	<p>The Draft EIS underestimated likely benefits of the proposed Project on wildlife and habitat, as indicated by the receiving areas of the Mississippi and Atchafalaya Rivers, which are vastly more productive and show greater wildlife diversity and abundance than comparable areas of fresh and brackish marsh with no riverine input. A few select instances where this is apparent include:</p> <ul style="list-style-type: none">• waterfowl and wading bird abundance;• foraging habitat for migratory shorebirds and neotropical migrants;• nesting habitat for marsh birds;• prey availability for a wide variety of predators (birds, amphibians, reptiles, fish, and terrestrial and marine mammals);• net benthic and fisheries productivity;• growth rates and density for submerged aquatic vegetation;• the revival of woody vegetation, important for local songbirds, neotropical migrants and wintering birds;• pioneer species like black willow (which is exploding in the Davis Pond, Caernarvon and Mardi Gras Pass outfall areas);• bald cypress retention and recruitment in areas formerly too saline or submerged; and• survival and recruitment of live oaks and other maritime forest vegetation on natural levees and cheniers where saline soils have inhibited their growth, recruitment, and survival for decades.
Response ID: 16198	<p>Chapter 4, Section 4.9.4.2 in Terrestrial Wildlife and Habitat of the EIS, discusses the benefits to waterfowl (and other birds) and general wildlife from the wetlands projected to be built or maintained in the Barataria Basin by the proposed Project. In addition, Sections 4.10.4.1 and 4.10.4.4 in Aquatic Resources indicate major beneficial impacts on SAV and minor to moderate beneficial impacts on fauna (through food</p>

web production), respectively, in the Barataria Basin from operation of the proposed Project.

A summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and to discuss their recorded impacts on the natural environment. This summary, which includes observed changes in wildlife, wildlife habitat, and vegetation growth from other diversions, is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

In addition, the potential benefits of the proposed Project to multiple resources in the Gulf are described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan.

Concern ID: 62905

The wetlands in the birdfoot delta and species better adapted to high-salinity environments would be negatively affected.

Response ID: 16202

Wetlands in the birdfoot delta would be negatively impacted by the proposed Project as discussed in Chapter 4, Section 4.6.5 in Wetland Resources and Waters of the U.S. of the EIS. Brackish and saline marsh, as well as species better adapted to higher salinities, would generally be negatively affected in areas closer to the diversion where salinity decreases are expected to be pronounced (see Chapter 4, Section 4.10 Aquatic Resources of the EIS); however, as noted in Section 4.5.5.1 in Surface Water and Sediment Quality, the salinity in the birdfoot delta is actually anticipated to increase slightly with proposed Project operations. Adverse impacts to wildlife from operation of the proposed Project are also discussed in the EIS, and more information on these impacts can be found in Chapter 4, Section 4.9 Terrestrial and Wildlife Habitat. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62897

Organic plant biomass is being converted to animal biomass as marsh loss occurs, serving as a prey base. But there is a fixed quantity of stored organic biomass and once it is gone, it is gone. Therefore, the No Action Alternative would have dire consequences overall for coastal bird and wildlife populations and the habitats on which they depend, because the system's energy continues to be depleted.

Response ID: 16195

The comment is consistent with the EIS (Chapter 4, Section 4.9.4.1 in Terrestrial Wildlife and Habitat) that identifies continued wetland loss to be a major adverse impact on wetland wildlife due, in part, to a decreasing food source. In addition, as stated in Section 4.10.4.4 in Aquatic Resources, the current Barataria Basin food web is relatively complicated with a high degree of resilience, although detritus plays an important role. In a system that would become predominantly open

water and soft bottom habitat with a low amount of wetlands, the food web would likely become more plankton-based and less detrital-based. This would represent a reduction in net system energy flow, trophic diversity, and faunal diversity compared to the existing system. The system could therefore be less resilient compared to one with multiple trophic pathways and detrital subsidies. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62899

The Draft EIS likely underestimated the value of the riverine reintroduction to wildlife and the estuarine system, as seen at the sites of several new planned and accidental riverine avulsions, such as West Bay, Mardi Gras Pass, Fort St. Philip, delta-wide crevasses in the birdfoot delta, Davis Pond, Caernarvon, and Wax Lake. Biophysically, the introduction of carbon, nitrogen, and phosphorus into declining marshes would automatically trigger concomitant increases in net primary productivity, with beneficial effects amplified up the trophic pyramid (Day et al. 2021, Tupitza and Glaspie 2020, Wissel and Fry 2005).

Response ID: 16197

A summary of select natural and man-made diversions in southeastern Louisiana, including those noted by the commenter, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes the impacts of these other diversions on wildlife and the respective estuarine systems, is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS. In addition, the impacts of nutrient input from the proposed Project on the food web were discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the Draft EIS, which is consistent with the commenter's referenced statement and acknowledges the anticipated increase in primary productivity (and associated benefits to the food web) from nutrient input during Project operations and no changes to the Final EIS were warranted.

Concern ID: 62901

The executive summary for Terrestrial Wildlife and Habitat is confusing and should be put into the context of the delta cycle (that more salt tolerant species are reflective of an abandoned, degrading delta lobe).

Response ID: 16199

The commenter's request regarding the evaluation of impacts on terrestrial wildlife and habitat is acknowledged. To help address these concerns, additional discussions of the delta cycle, and the role that the diversion may play in this cycle, has been added to Chapter 3, Sections 3.1.4.2 Barataria Basin and 3.2.1.1 Historical Context of the Final EIS. Additional discussion related to the Project's impacts on geomorphology and historic deltaic landforms has also been added to

Chapter 4, Section 4.2.3.2.2.3, Geomorphology. However, it is important to note that, as identified in Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative and discussed throughout Chapter 4 Environmental Consequences of the EIS, the No Action Alternative is compared to existing conditions to understand the anticipated changes in the environment that would occur irrespective of the proposed Project. Thereafter, the anticipated environmental consequences of the proposed Project action alternatives are compared to the results of the No Action Alternative analysis. Section ES.1 Introduction and Authority of the Executive Summary has been revised to include this clarification.

Concern ID: 62903

The freshening of systems allows the revival and recolonization of freshwater and brackish species. This is dramatically true in the case of trees and shrubs, few of which tolerate higher salinities. In the outfall areas of existing recent diversions, early successional willows are growing in profusion (for example, see CRMS3169), and succession to longer lived species like bald cypress would very likely follow. Meanwhile, on higher ground, stressed and dying natural levee and chenier vegetation like live oak may be revived, and recruitment of new woody vegetation can begin again.

Response ID: 16200

A summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS. Chapter 4, Section 4.9.4.2.1 Vegetation has also been revised to supplement the analysis of proposed Project's impacts on vegetation.

Concern ID: 63853

Louisiana wetlands provide habitat for 5 million migratory waterfowl during the winter months. Other migratory birds depend on the natural habitats of wetlands, marsh islands, estuary crabs, white/brown shrimp, finfish species, and oysters.

Response ID: 16203

Chapter 3, Section 3.9.2.1 in Terrestrial Wildlife and Habitat of the Draft EIS identified the importance of area habitats and resources to migratory, and other, birds in the Barataria Basin. In addition, Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S. and 4.9 Terrestrial Wildlife and Habitat, discussed the benefits of the additional wetland creation that would be anticipated with the proposed Project, including the benefits of those wetlands on waterfowl. There would be both adverse and beneficial impacts on the food resources listed for migratory birds, including adverse impacts on brown shrimp, oysters, and some finfish, and beneficial impacts on blue crab, white shrimp,

and certain finfish, as discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources.

In addition, the potential benefits of the proposed Project to multiple resources in the Gulf are described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan.

Concern ID: 62904

The loss of any single species would disrupt the local ecology, leading to harsher responses to natural disasters.

Response ID: 16201

As described in Chapter 4, Section 4.9 Terrestrial Wildlife and Habitat of the Draft EIS, wildlife would experience both adverse and beneficial impacts during proposed Project construction and operations, with specific impacts depending on the individual life history and tolerances of a given species. The proposed Project is not anticipated to result in the loss of individual species throughout the Barataria Basin, but rather would cause a shift in the species assemblages to account for the modified habitat present in the basin. For example, species with higher-salinity requirements that are currently present would remain during operation of the proposed Project, but would likely move further south to account for changing salinities. The potential impacts of the proposed Project on various species and wildlife groups are analyzed and described in detail in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat, 4.10 Aquatic Resources, 4.11 Marine Mammals, and 4.12 Threatened and Endangered Species of the EIS. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

EC60900 - Aquatic Resources

Concern ID: 62690

The proposed Project would destroy the ecosystem and its flora and fauna, including oyster, shrimp, crabs, fish, sea turtles, and dolphins.

Response ID: 16073

As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated to those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts on the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. For example, the decrease in salinity that would occur

upon initial operation of the proposed Project would result in major adverse impacts on various species (oysters, brown shrimp, bottlenose dolphins) over a relatively short period of time; however, the accumulating fresh water and sediments would create or maintain wetlands over long-term or permanent basis (that is, extending through the remainder of the 50-year period of analysis) which would benefit other commercially or recreationally important aquatic species such as white shrimp, blue crab, and Gulf menhaden, and would increase storm protection for communities north of the immediate outfall area; the Delft3D Basinwide Model projects these benefits to increase over time and to be greatest in the 2060s (see Chapter 4, Sections 4.6.5.1 in Wetland Resources and Waters of the U.S., 4.10.4.5 in Aquatic Resources, 4.11.5.2 in Marine Mammals, and 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction). As discussed in Section 4.12.2.2 Sea Turtles, the proposed Project would have negligible to minor adverse impacts on hawksbill and leatherback sea turtles, but minor to moderate adverse impacts on Kemp's ridley, green, and loggerhead sea turtles due to the potential for increased interactions between sea turtles and commercial shrimp fishing efforts, if shrimp and shrimp fishers move from mid-basin locations to locations lower in the basin or in nearshore/offshore waters (where more sea turtles would be present). However, NMFS has determined that these impacts would not jeopardize the continued existence of sea turtles (see Appendix O4 NMFS Biological Opinion of the Final EIS).

The USACE and the LA TIG are evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the LA TIG's Restoration Plan). The intended restoration of fresh water flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions in the basin. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin. The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project

(see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. The LA TIG's Restoration Plan indicates that by reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Final Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the NRDA Trustees' Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

The CPRA has revised its Mitigation and Stewardship Plan and Monitoring and Adaptive Management (MAM) Plan in response to public concerns about these impacts. See Appendices R1 and R2 to the Final EIS for more information.

Concern ID: 62692

The proposed Project would introduce or facilitate the spread of invasive species (for example, carp, zebra mollusks, apple snails, Asian clams, water hyacinth, giant salvinia, hydrilla, nutria, northern snakehead) and freshwater pathogens to the basin, which could affect other living resources and impede navigation.

Response ID: 16074

The commenter correctly notes the potential for the proposed Project to introduce or facilitate the spread of invasive species from the Mississippi River into the Barataria Basin and resulting from the alteration of existing habitat characteristics, which is consistent with discussions in the EIS in Chapter 3, Section 3.10.6 and Chapter 4, Section 4.10.4.6 in Aquatic Resources; Sections 3.6.3 and 4.6.5.2 in Wetland Resources and Waters of the U.S.; and Sections 3.9.4 and

4.9.4.2 in Terrestrial Wildlife and Habitat. The sections in Chapter 4 also identify how the introduction or spread of invasive species may negatively impact other living resources. The northern snakehead is not currently known to occur in Louisiana; however, if its presence is later identified in the Mississippi River, its introduction or spread via the proposed Project would result in similar impacts on the environment as those described in Section 4.10.4.6 Aquatic Invasive Species of the EIS. The potential introduction of pathogens (specifically, fecal coliform [not typically pathogenic, but an indicator for other pathogenic bacteria] and Enterocci) is discussed in Section 4.5.5.8 Fecal Coliform; a discussion of fecal coliform has been added to Section 4.10.4.4.2.5 Dissolved Oxygen of the Final EIS. Section 4.10.4.6.2.1 Aquatic Invasive Species has also been supplemented to discuss potential threats to navigation in the Final EIS.

Concern ID: 62696

Oysters are not well adapted to prolonged periods of low salinity and would experience higher mortality and lower reproductive success as a result of the proposed Project.

Response ID: 16075

The commenter correctly notes the impacts on oysters from low salinity. As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the Draft EIS, operation of the proposed Project would result in a permanent, major adverse impact on oysters, due in large part to decreases in salinity.

To address Project impacts, CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). Mitigation and stewardship measures aimed at oyster impacts include establishment of new oyster seed grounds in appropriate areas of the basin, enhancing existing public and private seed ground, enhancement of broodstock reefs, and funding to support off-bottom oyster culture.

Although not being implemented to mitigate the effects of the MBSD, the LA TIG also continues to address oil spill related injuries to oysters through various non-Project-related restoration/fishery improvement actions, including: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, and the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS (Appendix R) were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62698

Brown shrimp are not well adapted to prolonged periods of low salinity and would experience higher mortality and lower reproductive success as a result of the proposed Project.

Response ID: 16076

The commenter correctly notes the impacts on brown shrimp from low salinity, as discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources; however, as noted in the Draft EIS, brown shrimp reproduce offshore and, although the number of shrimp surviving to reproduce may change, the reproductive success of surviving shrimp is not anticipated to change. Overall, the Draft EIS anticipated a permanent, major adverse impact on brown shrimp from the proposed Project, due in part to reduced salinity in portions of the Barataria Basin.

Concern ID: 62699

The Draft EIS ignores the beneficial effects of low-salinity waters on low-salinity-tolerant and freshwater species.

Response ID: 16077

The EIS acknowledges the beneficial effects of low-salinity waters on low-salinity-tolerant and freshwater species throughout Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.10 Aquatic

Resources, which identify that the impacts on a given species are related to their salinity tolerance and habitat preferences. For example, the EIS indicates that low-salinity waters would directly benefit alligators, largemouth bass (and other freshwater fishes), and the biomass of SAV. Because this issue was addressed in the Draft EIS, no related edits were made to the Final EIS. These benefits, among others, are also described in Chapter 3, Section 3.2.1.6 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan; because this was described in the Draft Restoration Plan, no related edits were made to the Final Restoration Plan.

Concern ID: 62700

The oysters would move further south and the white shrimp and bass would benefit from the freshwater diversion.

Response ID: 16078

The commenter correctly notes the potential for oysters to use more southern areas of Barataria Bay, and the proposed Project benefits to white shrimp and bass, as described in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the Draft EIS. This benefit, among others, was also described in Chapter 3, Section 3.2.1.6 in OPA Evaluation of the Alternatives of the LA TIG's Draft Restoration Plan.

Concern ID: 62701

The commenter expressed concern regarding impacts on fishing and questions if a net gain or loss of survival would occur if the increased survival of certain fish species due to the freshwater input were compared to the decreased survival of others.

Response ID: 16079

As described throughout Chapter 4, Section 4.10 Aquatic Resources of the EIS, operation of the proposed Project would affect fish species in the Barataria Basin in both beneficial and adverse ways, with the overall impacts to a given species being dependent on that species' habitat preferences and tolerances. The proposed Project is not anticipated to result in the loss of individual species throughout the Barataria Basin, but rather would cause a shift in the species assemblages to account for the modified habitat present in the basin. For example, species with higher-salinity requirements that are currently present (for example, brown shrimp, oysters) would remain during operation of the proposed Project but would likely move further south to account for changing salinities (see Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS).

As discussed in Sections 4.16.5.1 and 4.16.5.2 in Recreation and Tourism, the proposed Project would cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts to these species are

anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips. Section 4.16.5.2.3 Recreational Fishing of the Final EIS has been updated to acknowledge that some recreational fishers may need to modify their traditional fishing locations to target specific species that may modify habitat use (either temporarily or permanently) based on changing salinities.

Concern ID: 62702

The movement from an estuary to a delta-building system would adversely impact commercially-harvested species.

Response ID: 16080

The movement from an estuary to a delta-building system would result in either adverse or beneficial impacts on commercially-harvested species, based on habitat preferences and life histories, as summarized in Chapter 4, Section 4.10 Aquatic Resources, Table 4.10-6 of the Draft EIS. In the LA TIG's Draft Restoration Plan, commercially-harvested species that could experience collateral injury from the proposed Project were also described in Chapter 3, Section 3.2.1.5 in OPA Evaluation of the Alternatives, and species that could benefit from the proposed Project were discussed in Section 3.2.1.6 Benefits Multiple Resources.

Concern ID: 62703

The proposed Project would preclude larval recruitment of shrimp, oyster, crab and essential finfish.

Response ID: 16081

The proposed Project would preclude recruitment of certain larval species in certain areas of the basin (generally the outfall area and into the mid-basin) during certain portions of their transport period, as discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the Draft EIS. For example, operations above base flow would vary year by year, but are generally expected to occur between December/January and June/July and would overlap the majority of the larval transport period for brown shrimp (late January to June), thereby precluding larval recruitment to the outfall area. However, Atlantic croaker larvae are transported into the estuary from October to May (with peaks in November and February), such that larval migration to the outfall area would be precluded only during a portion of its larval transport period.

Concern ID: 62704

The Executive Summary for Aquatic Resources should clarify that wetland habitats are distinct from "open water" habitats.

Response ID: 16082

The Executive Summary for Aquatic Resources in the Draft EIS accurately identified wetlands as a habitat that benefits aquatic fauna due to the presence of vegetation and habitat structure. The Executive Summary in the Final EIS has been updated to distinguish structured habitat (such as wetlands) from open water habitats.

Concern ID: 62705	The Executive Summary for Aquatic Resources should acknowledge that the proposed Project impacts must be considered in the context of the delta cycle.
Response ID: 16083	The commenter's request regarding the evaluation of impacts on aquatic resources is acknowledged. To help address these concerns, additional discussions of the delta cycle, and the role that the diversion may play in this cycle, have been added to Chapter 3, Sections 3.1.4.2 Barataria Basin and 3.2.1.1 Historical Context of the Final EIS. Additional discussion related to the Project's impacts on geomorphology and historic deltaic landforms has also been added to Chapter 4, Section 4.2.3.2.2.3, Geomorphology. However, it is important to note that, as identified in Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative and discussed throughout Chapter 4 Environmental Consequences of the EIS, the No Action Alternative is compared to existing conditions to understand the anticipated changes in the environment that would occur irrespective of the proposed Project. Thereafter, the anticipated environmental consequences of the proposed Project action alternatives are compared to the results of the No Action Alternative analysis. Section ES.1 Introduction and Authority of the Executive Summary has been revised to include this clarification.
Concern ID: 62707	The EIS does not acknowledge, or underestimates, the beneficial impacts of river water on the growth rates and density of SAV in coastal Louisiana.
Response ID: 16085	Chapter 4, Section 4.10.4.1 in Aquatic Resources of the EIS discusses the impacts of the proposed Project on SAV, including the overall beneficial impact of freshwater input on SAV biomass. Because this issue was addressed in the Draft EIS, no related edits were made to the Final EIS.
Concern ID: 62708	The release of polluted river water into the Barataria Basin would create harmful algal blooms and/or large areas of low dissolved oxygen that could negatively affect aquatic fauna including mortality of adults and juveniles that may not be able to escape impacted areas.
Response ID: 16086	As discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS, the input of nutrients from the Mississippi River is generally anticipated to be beneficial to the food web, although there is an acknowledged potential for harmful algal blooms. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and well-mixed by wind and tidal action, such that it is not typically prone to stratification that promotes hypoxic (dissolved oxygen of less than 2 to 3 mg/L) conditions. Further, as discussed in Section 4.10.4.4 in Aquatic Resources, the Delft3D Basinwide Model's dissolved oxygen results do

not suggest that Project implementation would result in oxygen concentrations below 5 mg/L on an average monthly basis; therefore, although sporadic and limited areas of low dissolved oxygen may occur, mainly in the summer months, no large or prolonged periods/layers of low dissolved oxygen are projected by the Delft3D Basinwide Model, nor anticipated based on the Barataria Basin's identification as a largely well-mixed estuary. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to Project implementation has been added to Section 4.5.5.5.2 in Dissolved Oxygen of the Final EIS.

The Monitoring and Adaptive Management (MAM) Plan (Appendix R2), which has been updated for the Final EIS in response to public comments, includes CPRA's plan to implement a monitoring program for phytoplankton species composition, including harmful cyanobacterial/algal bloom species (and associated toxins) (see Sections 3.7.3.10 and 3.7.3.11 of Appendix R2 of the Final EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62709	The 2019 opening of the Bonnet Carré Spillway caused significant impacts to aquatic fauna from the release of river water, and resulted in a declared fisheries disaster of at least \$58 million.
Response ID: 16087	A summary of select natural and man-made diversions in southeastern Louisiana, including the Bonnet Carré Spillway, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment, including area fisheries. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS. However, it is important to note that the Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological purposes. The anticipated impacts of the proposed Project on aquatic fauna from the release of river water is discussed in detail in Chapter 4, Section 4.10 Aquatic Resources.
Concern ID: 62710	The Draft EIS may underestimate likely increases in net primary productivity for aquatic estuarine organisms, which would translate into more biomass in both the proposed Project area and into the northern Gulf of Mexico.
Response ID: 16088	Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS identifies the overall effects of increased nutrients to the Barataria Basin as minor to moderate and beneficial based on benefits to the food web, and Section 4.10.4.5 accounts for these food web benefits in the individual determinations for each key species. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS. The potential for nearshore and offshore ecosystem benefits are also described in Chapter 3, Section 3.2.16 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan.
Concern ID: 62711	Sedimentation from the proposed Project would completely silt over oysters, resulting in 100 percent mortality in areas directly impacted.
Response ID: 16089	As discussed in Chapter 4, Sections 4.10.4.4 and 4.10.4.5 in Aquatic Resources of the Draft EIS, portions of the Little Lake Public Oyster Seed Ground (POSG) would experience substantial sedimentation over time, likely converting hard substrates to soft bottom in those areas over time. However, the Little Lake POSG is not currently a productive oyster reef and the areas with live/productive oyster reef (further south) would experience less sedimentation from the proposed Project, and at rates that the oyster reef/oysters would be expected to survive. To address some projected adverse Project impacts, CPRA would implement a fishery mitigation plan, which has been revised for the

Final EIS in response to public comments (see CPRA's Mitigation and Stewardship Plan in Appendix R1 of the Final EIS). CPRA's mitigation and stewardship measures aimed at oyster impacts include establishment of new oyster seed grounds in appropriate areas of the basin, enhancing existing public and private seed ground, enhancement of broodstock reefs, and funding to support off-bottom oyster culture. Although not being implemented to mitigate the effects of the MBSD, the LA TIG also continues to address oil spill related injuries to oysters through various non-Project-related restoration/fishery improvement actions, including: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, and the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62722

The release of polluted river water through Bonnet Carré, Caernarvon, and Davis Pond resulted in algal blooms, low dissolved oxygen, and lasting adverse effects on local flora and fauna.

Response ID: 16100

Chapter 4, Sections 4.5.5.5 in Surface Water and Sediment Quality and 4.10.4.4 in Aquatic Resources of the EIS analyze the potential impact of Project operations on dissolved oxygen concentrations and the potential for algal blooms. In addition, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

Concern ID: 62723

Various studies can prove that the higher the salinity of the water, the lower the mortality rate of brown and white shrimp, and the higher percentage of reproduction. The introduction of nearly 6.5 billion cubic feet of fresh water per day would significantly decrease the amount of shrimp and other seafood from reproducing, and would increase their mortality rate.

Response ID: 16101

The impacts of the proposed Project's introduction of fresh water on brown and white shrimp were analyzed and are discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS. The impacts on brown shrimp from Project operations are anticipated to be major and adverse, due in part to salinity changes; however, white shrimp are more tolerant of lower salinities and younger life stages are present in the basin later in the year than brown shrimp, resulting in less exposure to higher diversion flows. Therefore, no significant adverse impacts on white shrimp survival are projected. White shrimp would be expected to experience minor to moderate benefits from the increased marsh, SAV, and primary production projected to occur from the proposed Project. The projected benefits of the proposed Project to white shrimp outweigh the negative effects, resulting in an overall negligible to minor benefit on white shrimp from the Project. See Section 4.10.4.5 Key Species of the EIS. Both brown and white shrimp spawn outside of the estuary, where salinity would not be affected by Project operations. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62724

On average, the Mississippi River gets up to 79 degrees Fahrenheit at the height of the reproductive cycle of white shrimp. The Barataria Basin during that same timeframe measures on average 91 degrees Fahrenheit. The temperature differential

would cause adverse reactions to shrimp species including lower growth and survival rates, a decrease in habitat suitability, and relocation of the shrimp to more favorable habitat.

Response ID: 16102

The changes in water temperatures in the Barataria Basin based on the input of cooler river water were analyzed and discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS, which acknowledges that the average monthly temperature under the Applicant's Preferred Alternative would decrease by up to 11.9°F (6.6°C), particularly in cooler months near at the outfall, which may result in changes in bioenergetics and area avoidance by fauna. As discussed in Section 4.10.4.5 in Aquatic Resources, temperature is one of the principal drivers of growth and survival for white and brown shrimp. For white shrimp, post-larvae (the youngest stage occurring in the basin) generally enter the basin from May through November (with peaks in June and September) when temperature differentials would be smaller compared to the No Action Alternative. Further, the HSI model results for juvenile white shrimp, which consider optimum temperature ranges, did not identify significant decreases in habitat suitability. Although individual adverse impacts on white shrimp would occur from the proposed Project, the overall impact of the Project on white shrimp is anticipated to be negligible to minor beneficial. For brown shrimp, post-larvae (the youngest stage occurring in the basin) generally enter the basin from January through June when temperature differentials would be larger compared to the No Action Alternative, particularly in the outfall area. However, although the HSI model results for juvenile brown shrimp did identify significant decreases in habitat suitability, the driver for these impacts primarily related to salinity, rather than temperature, decreases. The overall impact of the Project on brown shrimp is anticipated to be major, permanent, and adverse. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62725

The sheer current of the inflowing water would displace shrimp and other species, pushing them further into the Gulf and precluding them from returning to the basin over time.

Response ID: 16103

The changes in water flows in the Barataria Basin from the proposed Project are discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources, which states that water would continue to follow its general trend of daily movements through the basin passes during Project operations, such that larval advection from marine habitats into the estuary would likely not be affected. The effects on shrimp and other species, from current-related impacts within the basin, are discussed in Section 4.10.4.5 in Aquatic Resources of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62726	The proposed Project would change the habitat of the Barataria Basin in a manner that would decrease key shellfish and finfish, which would subsequently affect higher and lower trophic levels in the food chain.
Response ID: 16104	The commenter is correct that the proposed Project would change the habitat in the Barataria Basin in a manner than would decrease or increase key shellfish and finfish, as noted in Chapter 4, Section 4.10, Table 4.10.6 in Aquatic Resources of the Draft EIS. A discussion of the food web impacts from the proposed Project in the Barataria Basin is included in Section 4.10.4.4 in Aquatic Resources of the Draft EIS.
Concern ID: 62727	Appendix O does not include impacts to the general biological communities of the basin.
Response ID: 16105	Appendix O1 (Biological Assessment) of the EIS is the assessment of impacts to federally listed threatened and endangered species, prepared as part of the Endangered Species Act consultation between USACE and NMFS and USFWS. Impacts on the general biological communities in the Barataria Basin are discussed in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat, 4.10 Aquatic Resources, and 4.11 Marine Mammals of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.
Concern ID: 62728	Additional studies may determine that the fisheries impacts identified in the Draft EIS are incorrect and that all the fisheries in the Barataria Basin would be ruined.
Response ID: 16106	USACE and the LA TIG considered the best information and data available to them in drafting the EIS. No changes to the Final EIS have been made.
Concern ID: 62729	The commenter questioned to what degree the proposed Project would impact the Mississippi Sound and its aquatic life.
Response ID: 16107	The proposed Project is not anticipated to have discernable effects on aquatic life outside of the Project area, which includes the Barataria Basin and the Mississippi River birdfoot delta (particularly for biological resources), as defined in Chapter 3, Section 3.1.1 in Introduction of the EIS; therefore, negligible to no impacts on aquatic life in the Mississippi Sound are anticipated from the construction and operation of the proposed MBSD Project. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.
Concern ID: 62730	Historical information on oyster beds in the Barataria Basin should be included and cited in the EIS.
Response ID: 16108	Historical information on oyster beds in the Barataria Basin is included in Chapter 3, Section 3.10.5.2 (Key Fish and Shellfish Species in the

Barataria Basin) of the EIS. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62731

The acute and significant change in salinity resulting from Project operation would adversely affect commercial species.

Response ID: 16109

The projected change in salinity from the proposed Project is discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS, which indicates that impacts on a particular species (whether commercially important or not) from salinity changes would be dependent on the salinity tolerance of that species, but that species intolerant of the lower salinities in the outfall area would likely shift their habitat usage to areas further south. The adverse impacts of decreased salinity on certain commercially-harvested species are discussed in Section 4.10.4.5 in Aquatic Resources; decreased salinity is noted as a driving factor of adverse impacts on brown shrimp and oysters, and would have a lesser effect on southern flounder. Other commercially important species, such as white shrimp, blue crab, bay anchovy, and Gulf menhaden, would likely experience overall beneficial effects from the Project, despite the projected changes in salinity. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62732

Leveeing of the Mississippi River resulted in a saltier Barataria Basin, causing saltwater species to make a northward shift; without restoration, these changes will continue, resulting in a loss of species that rely on productive freshwater and intermediate wetland habitats.

Response ID: 16110

The commenter correctly notes the impacts from the No Action Alternative, as discussed in Chapter 4, Sections 4.10.4.4 and 4.10.4.5 in Aquatic Resources of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62733

The impacts on oysters and the oyster industry from the over-freshening of Breton Sound should be considered in the development of the proposed MBSD Project.

Response ID: 16111

The impacts on oysters and the oyster industry from fresh water delivered through the proposed MBSD Project are discussed in Chapter 4, Sections 4.10.4.5 in Aquatic Resources and 4.14.4.2 in Commercial Fisheries of the EIS, respectively. As noted in those discussions, the proposed Project is anticipated to have major, permanent adverse impacts on eastern oysters in the Barataria Basin. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

To address Project impacts, CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to

public comments (see the Mitigation and Stewardship Plan in Appendix R1 of the Final EIS). Mitigation and stewardship measures aimed at oyster impacts include establishment of new oyster seed grounds in appropriate areas of the basin, enhancing existing public and private seed ground, enhancement of broodstock reefs, and funding to support off-bottom oyster culture. Although not being implemented to mitigate the effects of the MBSD, the LA TIG also continues to address oil spill related injuries to oysters through various non-Project-related restoration/fishery improvement actions, including: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, and the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62734

Wetlands built by the Mississippi and Atchafalaya Rivers, as well as by wetlands downstream of Mardi Gras Pass, have shown resiliency and a diverse assemblage of freshwater and estuarine species during spring flows and active water diversions.

Response ID: 16112

The commenter's observations are consistent with Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS, which notes that, while some species would be negatively impacted by the freshwater flows from the diversion (including oysters, brown shrimp, spotted seatrout, and southern flounder), a higher number of key fishery species would either be unaffected or be benefitted by the proposed Project (including white shrimp, blue crab, bay anchovy, Gulf menhaden, red drum, Atlantic croaker, and largemouth bass). Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62735

Operation of the proposed Project would allow for the return of productive oyster grounds in the lower basin, which would in turn improve water quality, fisheries habitat, and natural protection for Grand Isle.

Response ID: 16113

As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS, operation of the proposed Project could allow for increased production of oyster grounds in the lower basin; however, this would likely be contingent on the enhancement of existing substrates to make them more suitable. The Final Mitigation and Stewardship Plan (Appendix R1), which has been revised for the Final EIS, describes CPRA's mitigation and stewardship measures, including those measures intended to offset adverse impacts on oysters; these mitigation and stewardship measures have been revised in response to public comment since the release of the Draft EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special

conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62736	The flora and fauna of Louisiana can adapt to seasonal changes in salinity and many of them thrive because of those changes, not in spite of them.
Response ID: 16114	Comment noted. The proposed Project is anticipated to have both beneficial and adverse impacts on the flora and fauna of the Barataria Basin, as discussed throughout Chapter 4, Section 4.10 Aquatic Resources of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.
Concern ID: 62737	The proposed Project would result in the loss of red drum.
Response ID: 16115	As identified in Chapter 4, Section 4.10, Table 4.10-6 in Aquatic Resources of the EIS, the proposed Project is not expected to have an adverse impact on, or resulting loss of, red drum. Rather, changes in the Barataria Basin are anticipated to have an overall beneficial effect on red drum abundance. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.
Concern ID: 62738	The proposed Project would affect salinity in the basin, but there would still be red drum and there would be more bass
Response ID: 16116	As identified in Chapter 4, Section 4.10, Table 4.10-6 in Aquatic Resources of the Draft EIS, the commenter correctly notes that the proposed Project is anticipated to have an overall beneficial effect on red drum and largemouth bass abundance through either direct or indirect effects of the decreasing salinity induced by Project operations.
Concern ID: 62739	The commenter questioned what would happen to bayou living and fishing in the future.
Response ID: 16117	Impacts of the proposed Project on Recreation and Tourism are discussed in Chapter 4, Section 4.16.5.2, impacts on local communities

	are discussed in Section 4.13 Socioeconomics, and impacts on Aquatic Resources are discussed throughout Section 4.10 of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.
Concern ID: 62740	Specific field research indicates that fishes and crustaceans tolerate much lower salinity than those found in scientific literature; this research is available at www.herke-estuarine-fisheries-com and should be cited in the EIS.
Response ID: 16118	Although the noted website does not appear to exist as identified, select references by the comment author have been reviewed. Herke et al. 1987 (Abundance of Young Brown Shrimp in Natural and Semi-Impounded Marsh Nursery Areas: Relation to Temperature and Salinity) was incorporated into Chapter 4, Section 4.10.4.5.2.1 Brown Shrimp of the Final EIS.
Concern ID: 62741	The EIS should present not only the anticipated future conditions of the Barataria Basin, but also the salinity levels and distribution of shellfish, finfish, and other wildlife that were present 80 to 100 years ago. This past description will highlight that the proposed Project would return parts of the basin to more historic conditions and retard the rate wetland loss and saltwater intrusion compared to the No Action Alternative.
Response ID: 16119	Multiple sections within Chapter 3 Affected Environment of the Final EIS have been supplemented to further discuss the past conditions of the Barataria Basin, including Chapter 3, Sections 3.1.4.2 Barataria Basin, 3.2.1.1 in Geology and Soils, 3.9.1 in Terrestrial Wildlife and Habitat, and 3.10.1 in Aquatic Resources.
Concern ID: 62742	The commenter recommends that extensive studies be done on the marine resources and their habitat to evaluate the effect of the polluted Mississippi River that would be redirected into Barataria Bay
Response ID: 16120	Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS includes the results of Delft 3D Basinwide modeling for projected nutrient loading in the Barataria Basin, including nitrogen and phosphorus inputs from the Mississippi River. Individual assessment of potential contaminants, including nitrogen, phosphorus, sulfate, fecal coliform, and atrazine were modeled and discussed in Sections 4.5.5.3, 4.5.5.4, 4.5.5.7, 4.5.5.8, and 4.5.5.9 (respectively) in Surface Water and Sediment Quality. These sections indicate that the proposed Project would result in beneficial decreases in sulfate in the Barataria Basin and would have negligible impacts on atrazine levels and they are therefore not specifically discussed in Section 4.10; however, a discussion of fecal coliform has been added to Section 4.10.4.4.2.5 Dissolved Oxygen of the Final EIS. In addition, CPRA's Mitigation and Stewardship Plan

(Appendix R1 of the EIS) describes CPRA's mitigation and stewardship measures, including the agency's agreement with the USFWS' recommendation to monitor for certain contaminants, (through sampling of fish, shellfish, and potentially bald eagle feces and blood) during diversion operations, if applicable.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62743

An estimated 75 percent of the state commercial and recreational fishing depends on wetlands. As result, when wetlands are lost, so are the habitats that sustain the fishing industry.

Response ID: 16121

The commenter correctly notes the importance of wetlands to fisheries populations (and therefore the fisheries themselves), and the detrimental effect of wetland loss to many of those fisheries, as discussed in Chapter 3, Section 3.10.2 in Aquatic Resources and throughout Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS.

Concern ID: 62750	The commenter opposes any diversion of fresh water that does not conform to the salinity cycles and water parameters needed by oysters in the Mississippi Sound.
Response ID: 16128	Comment noted. The proposed Project is not anticipated to have discernable effects on aquatic life outside of the Project area, which includes the Barataria Basin and the Mississippi River birdfoot delta (particularly for biological resources), as defined in Chapter 3, Section 3.1.1 in Introduction of the EIS; therefore, negligible to no impacts on oysters in the Mississippi Sound are anticipated from the construction and operation of the proposed MBSD Project. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.
Concern ID: 62751	The EIS severely underestimates both the short- and long-term damages to the shrimp fisheries. While it is true that white shrimp production may increase, the reduction of the annual brown shrimp far exceeds any increase in the white shrimp production, as evidenced in production records from the Breton Sound area after inputs from the Caernarvon Freshwater Diversion and Mardi Gras Pass.
Response ID: 16129	As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS, brown shrimp are anticipated to experience a major decrease in abundance from operation of the proposed Project, and white shrimp are anticipated to experience a negligible to minor increase in abundance; therefore, the commenter is correct that the increase in white shrimp abundance would not outweigh the decrease in brown shrimp. As further discussed in EIS Chapter 4, Section 4.14.4.2 in Commercial Fisheries, overall impacts on the commercial shrimp industry would be expected to be moderate to major, permanent, and adverse, with the potential for a substantial loss of income in some months due to the decreased abundance of brown shrimp. Further, a summary of select natural and man-made diversions in southeastern Louisiana, including the Caernarvon Freshwater Diversion and Mardi Gras Pass, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.
Concern ID: 62752	Long-term exposure to excessive fresh water would eventually be detrimental to all shrimp species. Vermilion Bay after years of overexposure to freshwater, has no brown shrimp production and minimal white shrimp production.
Response ID: 16130	The impacts of the proposed Project's introduction of fresh water on brown and white shrimp were analyzed and are discussed in Chapter 4,

Section 4.10.4.5 in Aquatic Resources of the EIS. The impacts on brown shrimp from Project operations are anticipated to be major and adverse, due in part to salinity changes. White shrimp are more tolerant of lower salinities and are anticipated to experience a negligible to minor increase in abundance; for white shrimp, the projected benefits of the proposed Project outweigh the negative effects, resulting in an overall negligible to minor benefit on white shrimp from the Project.

To further address the commenter's concern, a summary of select natural and man-made diversions in southeastern Louisiana, including the Wax Lake Outlet, which has impacted Vermilion Bay, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

Concern ID: 62753

The task force strongly recommends that more consideration be given to real life effects of excessive fresh water on shrimp populations, including the 2019 opening of the Bonne Carré Spillway which caused over \$285 million in damages.

Response ID: 16131

As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS, brown shrimp are anticipated to experience a major decrease in abundance from operation of the proposed Project, and white shrimp are anticipated to experience a negligible to minor increase in abundance; these assessments included review of available literature as well as model projections. The Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological purposes. However, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

Concern ID: 62757

Although tolerant of a wide range of salinities, oysters require several years of favorable salinity conditions for reef areas to develop and populations to become self-sustaining. While there are positive effects of flood pulses, massive freshets can cause elevated levels of oyster mortality, especially when water temperatures are high

Response ID: 16135

Consistent with the commenter's statements, there would be both positive and negative effects on oysters from the salinity changes projected to occur during operation of the proposed Project, with potentially positive benefits on oysters in the lower basin, where salinity is expected to remain high enough to allow growth and survival, but low enough to minimize the potential for predation and disease.

However, the overall impact of freshwater input on oysters anticipated to be major and adverse. The effects of altered temperatures and salinities on oysters during operation of the proposed Project are further discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62758

The operation of the MBSD could also affect reefs through sedimentation and burial.

Response ID: 16136

The commenter correctly notes that existing oyster reefs could be affected through sedimentation and burial during operation of the proposed Project, with the potential for adverse effects related to distance from the outfall and the current productivity of the reef (in other words, if oyster growth can outpace sediment deposition rates). The potential for oyster reef burial from sedimentation during operation of the proposed Project is further discussed in Chapter 4, Sections 4.10.4.4 and 4.10.4.5 in Aquatic Resources of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62759

Nutrient rich waters may contribute to excessive fouling of reef areas, which could impact oysters and other fisheries.

Response ID: 16137

Chapter 4, Sections 4.10.4.4.2.2 Substrates and 4.10.4.5.2.11 Eastern Oysters in the Final EIS has been revised to discuss the potential for nutrient loading from the proposed Project to increase fouling of oyster reefs and oysters, respectively.

Concern ID: 62760

Sedimentation in EFH would have substantial impacts in the short-term.

Response ID: 16138

The impacts of sedimentation from the proposed Project on EFH are discussed in Chapter 4, Section 4.10.4.3 in Aquatic Resources and Appendix N2 Essential Fish Habitat Assessment (Section 6.6 [Project Effects to EFH]) of the EIS. Generally, the proposed Project would convert one type of EFH to another type. Over time, Project-related sedimentation would result in increased emergent marsh, and could affect sand/shell substrates and oyster reefs that are located higher in the basin by converting them to soft bottom EFH habitats. Both beneficial and adverse impacts from sedimentation would occur over time, with sediment building faster in the immediate outfall area. However, the effects of sediment deposition related to wetland creation and burial of structured habitat (for example shell or vegetation, which provide refugia for fauna) are not likely to be substantial in the short-term (generally defined as a 3-year period). Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62761	Shrimp require years of undisturbed bottom habitat to be able bury themselves in the sediments to evade depredation and to survive to spawn.
Response ID: 16139	Chapter 4, Sections 4.10.4.5.2.1 (Brown Shrimp) and 4.10.4.5.2.2 (White Shrimp) of the Final EIS have been supplemented to discuss predator avoidance through burial, and how the proposed Project could affect that potential.
Concern ID: 62762	The continuous input of colder river water would drastically alter the dynamics of EFH that is critically dependent on stable warm temperatures for the optimal growth of marine species.
Response ID: 16140	The impacts of decreased water temperatures from the proposed Project on EFH and managed species are discussed in Appendix N2 Essential Fish Habitat Assessment (Section 6.5.6 [Project Effects on Water Temperature]) of the EIS, which indicates the potential for faunal stress and mortality during opening of the diversion each year, as well as in areas near the outfall during winter. Similarly, Chapter 4, Sections 4.10.4.4 and 4.10.4.5 in Aquatic Resources discuss the potential impacts of water temperature on the water column (decreases of up to 11.9°F in certain months at mid-basin stations) and how changes in water temperature may affect aquatic fauna in general, and select managed species, respectively. However, Section 4.10.4.1.2 in Submerged Aquatic Vegetation of the Final EIS has been updated to discuss impacts on SAV from the lower temperatures associated with Mississippi River water input.
Concern ID: 62771	The estuary provides a food source and nursing grounds for many species of fish (including migratory species), invertebrates, aquatic insects, which are threatened by this proposed Project.
Response ID: 16149	The impacts to the Barataria Basin from the proposed Project were discussed throughout Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS, which included both adverse and beneficial impacts on area flora and fauna, based on the specific life histories and habitat preferences.
Concern ID: 62772	The diversion would end the brown shrimp fishery in the upper/mid-basin.
Response ID: 16150	As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources and Section 4.14.4 in Commercial Fisheries of the EIS, habitat suitability for brown shrimp in the Barataria Basin would decrease, particularly in the mid- to lower basin (see Figure 4.10-16). Brown shrimp, and particularly earlier life stages of brown shrimp, may be precluded from the immediate outfall area in periods of high flow, instead being transported into areas west and south of the outfall, where water flow would be generally unaffected by diversion operation. Larger juvenile and sub-adult brown shrimp would remain in the southern basin, where

salinities would generally be below optimal, but still relatively suitable. Salinity in the Lower Barataria Basin may decrease below optimal levels for large juveniles and sub-adults in the spring and summer, but these life stages can tolerate low-salinity conditions and would remain in these lower basin habitats. The species is anticipated to have decreased abundance over time; however, the viability of the population is not anticipated to be affected, such that brown shrimp would remain in the Barataria Basin. As identified in Section 4.14.4.2 in Commercial Fisheries, impacts on the brown shrimp fishery are also anticipated to be major, permanent, and adverse associated with adverse impacts on brown shrimp abundance over time as compared to No Action Alternative. Adverse impacts to the fishery may be partially offset by changes in fisher behavior, especially given that the greatest impacts may be occurring later in the analysis period, but these adjustments could increase operating costs. Impacts could further encourage fishers to exit from the industry. Potential new entrants may adapt more easily by investing in more flexible vessels/gear than they would have otherwise, or they may pursue alternative employment. Communities reliant on employment and expenditures associated with this industry would be adversely affected. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)

- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62773

The decreased salinity and increased turbidity in the proposed Project area would decrease the commercial and recreational productivity of important finfish and shellfish species, including crab, oyster, white and brown shrimp, red drum, black drum, speckled trout, and flounder.

Response ID: 16151

Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS discusses the effects of decreased salinity and increased turbidity on select commercially and recreationally important species, where applicable. In light of the number of species present, these key species were chosen to use as representative species for impact analyses. These species were selected to cover a range of different feeding guilds, habitat usage, and life histories, and to describe how the individual effects of the proposed Project, as described in Section 4.10.4.4, could combine to cumulatively affect a given species. As summarized in Table 4.10-6, the proposed Project would be expected to decrease the abundance of oysters, brown shrimp, spotted trout, and southern flounder, but could result in increased abundance of blue crab, white shrimp, and red drum. Although black drum was not selected as a key species for evaluation in the EIS, its life history has similarities to that of the red drum and Atlantic croaker, and it is likely to experience a similar range of impacts (negligible impacts to moderate benefits) from operation of the proposed Project. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)

- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62774

The commenter questioned how the proposed diversion would affect fisheries productivity in the Project area and indicated that the analysis should include an assessment of the data from the Davis Pond.

Response ID: 16152

Impacts of the diversion on aquatic species would vary by species and are discussed in Chapter 4, Sections 4.10.4.5 and 4.10.5.5 in Aquatic Resources and 4.14.4 in Commercial Fisheries of the EIS. The Delft 3D Basinwide Model includes Davis Pond operations and the results capture how the Project operations are projected to affect Davis Pond operations. A summary of select natural and man-made diversions in southeastern Louisiana (including Davis Pond) has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and to describe their recorded impacts on the natural environment. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

Concern ID: 63152

There are many fish species of conservation concern in the northern Gulf of Mexico including the dusky shark, sand tiger shark, Warsaw grouper, speckled hind (grouper), Alabama shad, key silverside, opossum pipefish, and mangrove rivulus. (NOAA 2012).

Response ID: 16154

The lists of special status species discussed in the Essential Fish Habitat Assessment (Appendix N2 of the EIS) and Chapter 4, Section 4.12 Threatened and Endangered Species were developed in consultation with NMFS and include those species anticipated to incur potential impact from construction or operation of the proposed Project. As these species were not identified as species of concern for the Project during the EFH and ESA consultations, they are not discussed in the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 63154

Oysters are the cornerstone of everything in Louisiana (tourism and industry) and oysters need salinities of between 10 and 20 ppm. The oyster fields in the greater New Orleans area and Mississippi Sound are the largest oyster fields in the world at the moment, despite hanging on for dear life.

Response ID: 16155

The salinity requirements of oysters are discussed in Chapter 3, Section 3.10.5.2 in Aquatic Resources and impacts on oysters from salinity changes due to the proposed Project are discussed in Chapter 4, Section 4.10.5.5 in Aquatic Resources of the EIS. The importance of oysters to the commercial fishery is discussed in Chapter 3, Section 3.14.3 in Commercial Fisheries and impacts on these

industries/activities are discussed in Chapter 4, Section 4.14.4.2 in Commercial Fisheries.

Overall, the eastern oyster fishery in the Project area is expected to experience major, permanent, adverse impacts under the Applicant's Preferred Alternative relative to the No Action Alternative, although it is possible that areas near the barrier islands could be used as seed grounds and growing areas for adults when salinities are too low throughout the rest of the Barataria Basin. This determination considers expected impacts on oyster abundance as well as the anticipated response from commercial fishers.

As indicated in Table 4.16-2 of the EIS, recreational oyster harvest accounts for a very small portion of overall recreational fishing effort in the Barataria Basin; therefore, impacts to recreation and tourism associated with changes to recreational harvest of oysters are expected to be negligible.

While availability of shrimp and oysters from the basin would decrease due to the Project relative to the No Action Alternative, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional imports would likely also occur. Under the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp, though the impact would likely occur sooner and be more significant under the Applicant's Preferred Alternative.

The proposed Project is not anticipated to have discernable effects on aquatic life outside of the Project area, which includes the Barataria Basin and the Mississippi River birdfoot delta (particularly for biological resources), as defined in Chapter 3, Section 3.1.1 in Introduction of the EIS; therefore, negligible to no impacts on aquatic life in the Mississippi Sound are anticipated from the construction and operation of the proposed MBSD Project. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62706

The proposed Project would not be likely to create hard bottom habitat, but would likely affect oyster reefs in both a positive and negative manner.

Response ID: 16084

The Executive Summary for Aquatic Resources has been revised in the Final EIS to indicate that no hard bottom would be created by the proposed Project. Oysters and oyster reefs would experience both beneficial and adverse effects, with overall effects expected to be adverse, as described in Chapter 4, Sections 4.10.4.4 and 4.10.4.5 in Aquatic Resources of the EIS.

Concern ID: 62712	Aquatic fauna do not respond directly to nutrient concentrations and the Mississippi River Delta is not oligotrophic.
Response ID: 16090	The commenter correctly notes that aquatic fauna do not respond directly to nutrient concentrations. As discussed in Chapter 4, Section 4.10.4.4.2.4 in Aquatic Resources of the EIS, increased nutrient levels may result in increased primary productivity in the Barataria Basin, such that the increased nutrient loads would indirectly lead to benefits for aquatic fauna. Although the basin is not oligotrophic, Section 4.5 Surface Water and Sediment Quality indicates that certain nutrients, such as total nitrogen and total phosphorus concentrations in the basin, would be elevated compared to the No Action Alternative, allowing for the increased primary productivity. Section 4.10.4.4.2.4 Nutrient Loading of the Final EIS has been revised to clarify this point. The EIS further acknowledges in Section 4.10.4.4.2.4, that increased nutrient loads also have the potential to cause adverse impacts on fauna through decreases in DO and harmful algal blooms that can be caused from increased phytoplankton biomass.
Concern ID: 62713	It is unclear whether the first complete paragraph on page ES-12 is intended to refer to both animals and plants. If it is unintended to focus on animals, clarify why there is such a focus on SAV.
Response ID: 16091	The first paragraph of the Executive Summary for Aquatic Resources identifies aquatic fauna as the focus, but also identifies SAV as a habitat type that aquatic fauna benefit from. As such, Chapter 4, Section 4.10.4.1 in Aquatic Resources has an SAV-specific assessment in the EIS. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.
Concern ID: 62715	The Executive Summary for Aquatic Resources should indicate that high diversion flows adversely affect the larval recruitment of estuarine fauna, but not of freshwater fauna.
Response ID: 16093	Consistent with Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS, it is estuarine species for which the high diversion flows are a potential recruitment concern, not freshwater species. Therefore, the Executive Summary for Aquatic Resources has been revised in the Final EIS to clarify that the potential for high diversion flows to adversely affect recruitment is specific to estuarine species.
Concern ID: 62716	Commenters asked for clarification of why estuarine species are the focus of the EIS in the context of an abandoned, degrading delta lobe.
Response ID: 16094	The commenter's concern regarding the evaluation of impacts on aquatic resources is acknowledged. To help address these concerns, additional discussions of the delta cycle, and the role that the diversion may play in this cycle, has been added to Chapter 3, Sections 3.1.4.2 Barataria Basin and 3.2.1.1 Historical Context of the Final EIS.

Additional discussion related to the proposed Project's impacts on geomorphology and historic deltaic landforms has also been added to Chapter 4, Section 4.2.3.2.2.3, Geomorphology. However, it is important to note that, as identified in Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative and discussed throughout Chapter 4 Environmental Consequences of the EIS, the No Action Alternative is compared to existing conditions to understand the anticipated changes in the environment that would occur irrespective of the proposed Project. Thereafter, the anticipated environmental consequences of the proposed Project action alternatives are compared to the results of the No Action Alternative analysis. Section ES.1 Introduction and Authority of the Executive Summary has been revised to include this clarification. Therefore, although the EIS acknowledges that conditions have changed over time, anticipated Project impacts are compared to future conditions without the Project in the Barataria Basin, which is currently an estuarine ecosystem. Thus, the EIS has selected species representative of an estuarine system in assessing the proposed Project's potential impacts.

Concern ID: 62717

Discuss how the diversion would affect phytoplankton standing stocks and productivity, and how any such effects would impact oysters.

Response ID: 16095

Nutrient loading and its projected effects on the food web are discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. As described, nutrient increases would stimulate primary productivity, which would contribute to increases in low trophic level species, such as shrimp, crabs, small planktivorous fish. As filter feeders, the increase in primary producers would also benefit oysters; Sections 4.10.4.4.2.4 Nutrient Loading and 4.10.4.5.2.11 Eastern Oysters of the Final EIS have been revised to acknowledge this benefit.

Concern ID: 62718

Fecal coliform concentrations adversely affect the people who eat contaminated oysters and the economics of the oyster fishery, not the oysters themselves.

Response ID: 16096

Anticipated changes in fecal coliform levels in the Barataria Basin from riverine inputs are discussed in Chapter 4, Section 4.5.5.8.2 in Fecal Coliform of the EIS. Section 4.14.4.2.3 Eastern Oyster Fishery in the Final EIS has been revised to discuss the potential impacts of increased fecal coliform levels on oyster propagation and harvest. Reference to fecal coliform as an impact driver for oysters in the Executive Summary for Aquatic Resources has been removed in the Final EIS.

Additionally, Appendix R2 in the Final EIS includes CPRA's Monitoring and Adaptive Management (MAM) Plan, which includes monthly fecal

coliform monitoring (Section 3.7.5.1) starting prior to construction and continuing during Project operations.

At the time of publication of the Draft EIS for public review, the Mitigation and Stewardship Plan and the MAM Plan (Appendix R) contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62719	The EIS should evaluate the potential impacts to white shrimp.
Response ID: 16097	Impacts on white shrimp from the proposed Project are discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.
Concern ID: 62720	The EIS overestimates the likely impact of low dissolved oxygen because the Barataria Bay is shallow and well-mixed, likely allowing for low dissolved oxygen to occur only in the deeper areas/holes created by humans.
Response ID: 16098	Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS indicates the potential impact of low DO to be adverse, but negligible to minor based on the Barataria Basin's depth and identification as a well-mixed estuary, which would likely only allow for pockets of low DO in deeper

areas. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62721	Dredging to obtain sediment for marsh creation has led to large holes in coastal Louisiana which almost certainly contain pockets of low dissolved oxygen; however, these pockets of low dissolved oxygen are not identified in the assessment of other projects.
Response ID: 16099	Comment noted. No changes to the EIS are warranted as the comment is directed to DO analyses for other projects. Including or excluding data from environmental analyses for coastal restoration not related to the proposed Project is outside the scope of this EIS.
Concern ID: 62754	The proposed Project, once operating, would create a river-fed deltaic estuary with an abundance of life.
Response ID: 16132	The proposed Project would have both beneficial and adverse effects on aquatic life during operations, as discussed throughout Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS. The benefits of the proposed Project are also discussed in detail in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Final Restoration Plan.
Concern ID: 62755	The diversion of nutrient delivery from the mouth of the Mississippi River to the mid-basin may ameliorate some of the imbalances which often lead to hypoxic conditions in the open Gulf, and would certainly lead to increases in many estuarine organisms.
Response ID: 16133	As discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS, nutrient levels in water diverted from the Mississippi River may result in increased primary productivity in the Barataria Basin, which would lead to benefits for aquatic fauna. The birdfoot delta is projected to have negligible changes in nutrient loads. Further, Section 4.25.5 in Cumulative Impacts, Surface Water and Sediment Quality of the Final EIS has been revised to discuss the Gulf Hypoxia Action Plan, which highlights the important role that river diversions could play in reducing nutrient loads. In addition, substantial nutrient load reduction could be achieved through the measures being implemented by the other states and entities involved with the Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. These combined efforts could lessen the potential impacts of excess nutrient loads to Barataria Basin and the northern Gulf of Mexico.
Concern ID: 62763	While there are positive effects of flood pulses associated with hurricanes that help flush the bays and estuaries of oyster diseases, massive freshets, such as those from high amounts of rain water (including tropical storms) or the proposed Project, can cause elevated levels of oyster mortality.

Response ID: 16141

Consistent with the commenter's statements, there would be both positive and negative effects on oysters from the salinity changes projected to occur during operation of the proposed Project, with the overall impact of freshwater input on oysters anticipated to be major and adverse. The effects of altered salinities, including prolonged decreases in salinity, on oysters are further discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62764

The diversion is intended to restore and rebuild marsh, but would affect the existing flora/fauna in the basin during operations, which the designers say could adapt and survive in the modified environment.

Response ID: 16142

As described throughout Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS, operation of the proposed Project would affect the existing flora and fauna of the Barataria Basin in both beneficial and adverse ways, with the overall impacts to a given species being dependent on that species habitat preferences and tolerances.

Concern ID: 62765

Without the oyster reefs, which would die in the fresh water, the commenter questioned how the ecosystem would be filtered.

Response ID: 16143

As described in Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S. of the Draft EIS, wetlands improve water quality by removing organic and inorganic toxic materials, suspended sediments, and nutrients via plant uptake and sedimentation. Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. identifies a projected maximum wetland gain of 17,100 acres associated with the proposed Project at year 2060 before dropping to 12,700 acres at year 2070 in the Barataria Basin. The increase in wetlands, when compared to the No Action Alternative, would continue to filter the ecosystem. In addition, Section 4.10.4.2.2 in Benthic Resources of the Final EIS has been supplemented to describe the increase in freshwater filter feeders that would also work to partially offset the water filtration capacity lost due to the decrease in oyster abundance.

Concern ID: 62766

A community model for oysters can be used to quantify the ecological benefits of an oyster reef in an ecosystem restoration project. This technical note describes additional benefits to consider during restoration planning: <https://erdc-library.erdc.dren.mil/jspui/bitstream/11681/4023/1/TN-EMRRP-ER-01.pdf>.

Response ID: 16144

The benefits of oyster reefs are qualitatively discussed in Chapter 3, Section 3.10.5.2.11 Eastern Oysters. This section has been supplemented in the Final EIS with the identified reference to further clarify the benefits of oyster reefs. However, the stated intent of the

referenced study is to provide information to planners on the economic benefits provided by oyster reef restoration, so that the full range of benefits can be considered when planning and evaluating oyster restoration projects. Restoration processes beyond assessment of the proposed delta restoration are outside the scope of this EIS.

Concern ID: 62767

Reefs provide both ecological and economic benefits. Ecological benefits result from the water quality, erosion prevention and stabilization, and habitat services provided by reefs (Wilber 2002).

Response ID: 16145

The benefits of oyster reefs are qualitatively discussed in Chapter 3, Section 3.10.5.2.11 Eastern Oysters; however, this section has been supplemented in the Final EIS with the identified reference (Wilber 2002) to further clarify the benefits of oyster reefs.

Concern ID: 62768

USACE needs to conduct a spatial analysis of future suitable areas for oyster reef creation and restoration, which should include additional data, not investigated in this MBSD study, such as temperatures, bottom conditions, water mixing, and diversion modeling.

Response ID: 16146

As discussed in Chapter 1, Section 1.6 Scope of the EIS, the EIS was developed to assess the environmental and socioeconomic impacts of the proposed Project. The Mitigation and Stewardship Plan (Appendix R1), which has been revised for the Final EIS in response to public comments, describes CPRA's mitigation and stewardship measures, including those measures proposed to partially offset some of the anticipated adverse impacts on oysters. Those mitigation and stewardship measures rely upon further sampling once the diversion begins operations (if permits are issued) to understand the most suitable locations for restoring oyster reef areas. Implementation of mitigation and stewardship measures would be led by CPRA. USACE would not participate in oyster mitigation and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special

conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62769

River water contains industrial and biological pollutants which could degrade water quality within the estuary and would adversely affect all marine life.

Response ID: 16147

Chapter 4, Sections 4.5.5.3 through 4.5.5.9 in Surface Water and Sediment Quality of the EIS discuss anticipated changes in chemical concentrations in the Barataria Basin due to the proposed Project. The general impacts of certain chemical compounds/nutrients on aquatic resources are discussed in Section 4.10.4.4 in Aquatic Resources. Other potential contaminants, including sulfate, atrazine, and fecal coliform were also modeled and discussed in Sections 4.5.5.7 and 4.5.5.9. The Draft EIS concludes that the proposed Project would result in beneficial decreases in sulfate and would have negligible impacts on atrazine levels. Sulfate and atrazine are therefore not specifically discussed in Section 4.10 Aquatic Resources; however, a discussion of fecal coliform has been added to Section 4.10.4.4.2.5 Dissolved Oxygen of the Final EIS.

Additionally, Appendix R2 in the Final EIS includes CPRA's Monitoring and Adaptive Management (MAM) Plan, which includes monthly fecal coliform monitoring (Section 3.7.5.1) and periodic sampling for Contaminants of Concern in fish, shellfish, and wildlife (Section 3.7.3.23).

At the time of publication of the Draft EIS for public review, the MAM Plan (Appendix R) contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures

except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62770

The commenters' concerns regarding this proposed diversion are rooted in other similar experiences. The PDARP/PEIS indicated "collateral injuries" to estuarine organisms such as oysters and brown shrimp, Mardi Gras Pass decimated oyster reefs, and high-volume diversions (natural or man-made) have obliterated marsh grass and the natural ecology in impacted areas.

Response ID: 16148

As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS, the impact of the proposed Project on brown shrimp and oysters is anticipated to be major and adverse, due in part to salinity changes. Conversely, the proposed Project is anticipated to have a major beneficial impact on wetlands in the Barataria Basin from the diversion of sediment and fresh water. A summary of select natural and man-made diversions in southeastern Louisiana, including Mardi Gras Pass, has been developed to compare the purpose and/or characteristics of these diversions and their recorded impacts on the natural environment, including estuarine organisms and marsh grasses to the proposed MBSD Project. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

The LA TIG's Final Restoration Plan recognizes the potential collateral injuries that could result from the proposed Project. In selecting the LA TIG's Preferred Alternative, the LA TIG evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance

in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 (Identification of a Preferred Alternative), 3.2.1.5 (Avoids Collateral Injury), and 3.2.2.5 (Avoids Collateral Injury) of the LA TIG's Final Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project under OPA and this is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems and which necessarily entails re-introducing freshwater flows that had historically characterized the Barataria Basin before construction of levees.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the LA TIG's Preferred Alternative.

The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which includes providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the spill.

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)

- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

At the time of publication of the Draft EIS for public review, the Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan (Appendix R) contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 64217	The EIS needs to provide supporting evidence of the assertion that the proposed Project would cause increased occurrence of invasive plant species.
Response ID: 16156	Chapter 4, Section 4.10.4.6 in Aquatic Resources of the EIS identifies literature reviewed, and the evaluation and impact conclusions reflect the best professional judgment based on sound science and expertise of the USACE and cooperating agencies, to determine the potential for increased occurrence of invasive plants due to the proposed Project. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.
Concern ID: 62714	The Executive Summary for Aquatic Resources indicates a negative effect on SAV followed by a later positive effect. Mississippi River water greatly stimulates SAV growth in the delta. There are no seagrasses here, so there is no reason to be concerned with effects of river water on SAV.
Response ID: 16092	Chapter 3, Section 3.10.2.1 and Chapter 4, Section 4.10.4.1 in Aquatic Resources of the EIS discuss the SAV species likely present in the proposed Project area and the impacts to them from the proposed Project. Overall, the proposed Project would likely initially result in adverse impact on SAV in the basin from a relatively quick change in salinity, which may result in die-offs of species intolerant of the new salinity regime early in the Project life. However, the initial adverse impacts on SAV would be temporary, with permanent beneficial impacts to overall coverage and biomass of SAV once the salinity regime stabilizes. Consistent with the commenter's statement and the noted sections of the EIS, there are no seagrasses in the proposed Project area; however, there are multiple other species of SAV that may occur in the proposed Project area, such as hydrilla and wild celery. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.
Concern ID: 67232	The opening of the Davis Pond and Caernarvon diversions to combat effects of the DWH oil spill has had significant impacts on the fish and mega-invertebrate community associated with reduced salinity and lower water turbidity.
Response ID: 16952	The impacts that the DWH oil spill had on fish and mega-invertebrates in the Barataria Basin, and the drivers of those impacts, were considered in the Draft EIS. These impacts are discussed throughout Chapter 3 Affected Environment, including time series representations of LDWF fisheries independent data for key species that cover the period of the DWH oil spill. As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the Project is to restore for injuries caused by the DWH oil spill by implementing a large-scale sediment diversion in the Barataria

Basin that would reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts. This EIS serves as the environmental review required by NEPA to inform the LA TIG's OPA decision regarding funding the construction of the proposed MBSD Project using damages paid by BP following the DWH oil spill (see Section 1.6.1 The OPA and DWH NRDA Decisions of the EIS).

EC61000 - Marine Mammals

Concern ID: 62986

The Project would drive decreases in salinity that would reduce the overall health, survival, and reproduction of bottlenose dolphins that reside in the Barataria Basin, a species that was negatively affected by the Deepwater Horizon oil spill (NMFS, 2013). Some commenters felt that because of this, the Project should either not move forward or its operation should be altered.

National Marine Fisheries Service (NMFS). 2013. Roy Crabtree (NMFS) to Elizabeth Davoli (CPRA). <https://s3.documentcloud.org/documents/726710/national-marine-fisheries-service-comments-on.pdf>

Response ID: 16701

The concerns raised by the commenters about the projected decreases in salinity and resulting effects on Barataria Bay dolphins were considered in the Draft EIS. More specifically, Chapter 4, Section 4.11.5.2 in Marine Mammals of the EIS acknowledges that the proposed Project would likely have significant, adverse impacts to Barataria Basin dolphins, a species that suffered significant impacts from the DWH oil spill. This section also discusses the physiological changes caused by exposure to low-salinity water, the duration of those changes that leads to mortality, and the anticipated mortality of a large portion of the dolphin population in the Barataria Basin within the first decade. These sections of the EIS provide a more in-depth analysis of potential impacts to dolphins than the letter cited by the commenter.

The concerns raised by the commenters were also considered in the LA TIG's Draft Restoration Plan (see Section 3.2.1.5 [Collateral Injury]); the Final Restoration Plan has been edited consistent with changes made to the Final EIS and see below regarding new, related content included in Appendix R.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to

natural resources, like dolphins, that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of

response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible (if it is possible), the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins in Louisiana (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63066

It is not clear why the negative impacts to bottlenose dolphins are expected from the proposed Project when dolphin injuries and mortality have not been associated with other freshwater releases or diversion projects such as Wax Lake Delta. Dolphins may simply reduce their use of less saline environments as conditions change.

Response ID: 16589

The potential for dolphins to simply reduce their use of damaging, less saline environments by moving to higher saline environments was considered in the Draft EIS. More specifically, Chapter 4, Section 4.11 (Marine Mammals) of the EIS describes the impacts on bottlenose dolphins from freshwater exposure; these impacts are well documented and include observations and data collected in Louisiana associated with the release of fresh water. Most recently, a freshening event in 2019 resulted in the declaration of a bottlenose dolphin unusual mortality event (UME) in the northern Gulf of Mexico. The Bonnet Carré Spillway, Pearl River, and Lower Mississippi River distributaries contributed to low salinity in the region, resulting in increased mortality and strandings of bottlenose dolphins. Existing data on low-salinity exposure were used to develop a dose-response model that forms the basis for the evaluation of impacts in the EIS (Booth et al., 2020). Existing populations of bottlenose dolphins in Louisiana are largely reflective of the predominant conditions in a given area. Within Barataria Bay, dolphins demonstrate site fidelity to small areas of the basin which, as described in the EIS, has led to the identification of distinct strata (for example, Takeshita et al., 2020). Some of the dolphins tolerate lower salinity waters within Upper Barataria Bay, but are not expected to survive the amount and duration of fresh water released from the diversion. The Barataria Bay bottlenose dolphin stocks' extreme site fidelity and estuarine nature also suggests the dolphins would not move to areas with higher salinity, such as near the barrier islands or Gulf of Mexico.

Concern ID: 63067

The majority of the bottlenose dolphin population of this area will be destroyed... not just killed but sentenced to a horrific death. Freshwater releases at Bonnet Carré Spillway in 2019 resulted in an unusual mortality event (UME), demonstrating the harm that freshwater releases can cause to dolphins. A study by the Galveston Bay Dolphin Research Program also found that dolphins in upper Galveston Bay developed skin lesions after

flooding from Hurricane Harvey. Additional studies further support the harm that the diversion could cause by demonstrating negative impacts to dolphins from exposure to low-salinity conditions (Deming and Garrison, 2021; Duignan et al., 2020; McClain et al., 2020).

Deming, A., and L. Garrison. 2021. 2019 Northern Gulf of Mexico bottlenose dolphin unusual mortality event. Marine Mammal Commission meeting/webinar on “Effects of Low Salinity Exposure on Bottlenose Dolphins,” 23 March 2021. Oral presentation. <https://www.mmc.gov/events-meetings-and-workshops/other-events/effects-of-low-salinity-exposure-on-bottlenose-dolphins-webinar/>

Duignan, P.J., N.S. Stephens, and K. Robb. 2020. Fresh water skin disease in dolphins: a case definition based on pathology and environmental factors in Australia. Scientific Reports 10:21979.

McClain, A.M., R. Daniels, F.M. Gomez, S.H. Ridgway, R. Takeshita, E.D. Jensen, and C.R. Smith. 2020. Physiological effects of low-salinity exposure on bottlenose dolphins (*Tursiops truncatus*). Journal of Zoological and Botanical Gardens 1:61-75.

Response ID: 16590

The Draft EIS included an analysis based on extensive literature and soon-to-be published data (now published) demonstrating the impacts of low-salinity conditions on dolphins. These data were considered as part of an Expert Elicitation (a garnering of expert opinions to determine or quantify an unknown) that resulted in dose-response curves (Booth et al. 2020) and summarized in Chapter 4, Section 4.11.3 (Marine Mammals - Overview of Impact Analysis Approach) of the EIS. While Deming and Garrison (2021) was presented after the release of the Draft EIS, the presentation was based on data that were fully considered in the Draft EIS, including as part of the Expert Elicitation. Along with other relevant data (for example, BBES tagging studies), the analysis contained in the Draft EIS determined that there would be a significant, adverse, permanent impact on the BBES Stock. Further, the analysis in the Draft EIS concluded that if the 75,000 cfs Alternative were implemented, impacts would be immediate and only a remnant population would be likely to exist near the barrier islands after 50 years of operation.

After release of the Draft EIS, at the request of the Marine Mammal Commission, the National Marine Mammal Foundation and University of St. Andrews released a population impact projection based on the information presented in the Draft EIS (including annual survival rates from Garrison et al. 2020) coupled with an updated population model for BBES dolphins (Schwacke et al.2022, Thomas et al. 2021). This new, additional analysis has been incorporated into the Final EIS in Chapter 4, Sections 4.11.5.2 Barataria Bay Estuarine Stock and

supports the original determination in the Draft EIS of major, permanent, adverse impacts on the BBES dolphin population. The research presented in the McClain et al. (2020) study cited by commenters was considered in the Draft EIS [cited at the time as McClain et al. (in prep)]; the research presented by Duignan et al. (2020) is consistent with the established literature and does not change the conclusions of the Draft EIS, but this study has been incorporated in Chapter 4, Section 4.11.5.2.2.1 General Effects on Dolphin Health of the Final EIS. Similarly, the information included in the Deming and Garrison presentation was considered in the Draft EIS, is consistent with the conclusions of the Draft EIS, and the presentation has now been cited in Section 4.11.5.2.2.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include specific marine mammal response triggers that may affect Project operation mitigation efforts; see Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without

implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63069

The Draft EIS did not include detailed information about the potential impacts of the proposed Project on bottlenose dolphins.

Response ID: 16592

The Draft EIS included an analysis of the impacts to marine mammals, including bottlenose dolphins, in Chapter 4, Section 4.11 (Marine Mammals). The EIS quantifies the impact on dolphin survival rates (the percentage of existing dolphins that would survive from one year to the next year) for different populations of dolphins (Table 4.11-5) from the most pronounced stressor, salinity, but also includes a qualitative assessment on other impacts such as wetland shifts, prey species impacts, HABs, water temperature, and other impacts. The Final EIS includes the incorporation of additional population impact analysis that was completed by Thomas et al. (2021) after the Draft EIS was released for public comment.

Concern ID: 63070

A recent study suggests that the proposed Project would not only prevent the recovery of the BBES Stock, but it would result in the functional extinction of dolphins in the West, Central, and Southeast strata of the stock area (Thomas et al., 2021). The only dolphins remaining in the basin would live adjacent to the barrier islands, and even this group would become severely reduced over the 50-year planning horizon of the proposed Project. Additionally, an expert elicitation (Booth and Thomas, 2021) building on previous studies (Garrison et al., 2020; Schwacke et al., 2017; Thomas et al., 2021) suggests that while dolphins can endure some periods of exposure to low salinity, the period of

tolerable exposure shortens for dolphins exposed to acute changes in salinity, and the median time to death is 22 days with continuous exposure to water with salinity levels below 5 ppt.

Schwacke, L.H., L. Thomas, R.S. Wells, W.E. McFee, A.A. Hohn, K.D. Mullin, E.S. Zolman, B.M. Quigley, T.K. Rowles, and J.H. Schwacke. 2017. Quantifying injury to common bottlenose dolphins from the Deepwater Horizon oil spill using an age-, sex- and class-structured population model. *Endangered Species Research* 33:265-279.

Thomas, L., Marques, T., Booth, C., Takeshita, R., and L. Schwacke. 2021. Predicted population consequences of low salinity associated with the proposed Mid-Barataria Sediment Diversion Project on bottlenose dolphins in the Barataria Bay Estuarine System Stock.

Response ID: 16593

The Draft EIS included an analysis of the impacts to marine mammals, including BBES dolphins in Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock. This analysis incorporated the Booth and Thomas (2021), Garrison et al. (2020), and Schwacke et al. (2017) studies, and the Final EIS includes additional analyses that were completed by Thomas et al. (2021) after the Draft EIS was released for public comment. The impact conclusions in the Draft EIS were based in large part on Garrison et al. (2020), which predicts that only a remnant population of dolphins would continue to exist in Barataria Basin after diversion operations commenced. The conclusion of major, permanent, adverse impact to bottlenose dolphins is also supported by Thomas et al. (2021), which built on these earlier studies and concludes that, after 1 year of operation of the Applicant's Preferred Alternative, there would be 61 percent fewer dolphins in the Central stratum than under the No Action Alternative, 35 percent fewer in the West stratum, 12 percent fewer in the Southeast stratum, and 2 percent fewer in the Island stratum, with 25 percent fewer overall. Thomas, et al. further concluded that after 10 years of operation, there would be 100 percent reduction in the populations of dolphins in the Central and West strata, an 82 percent reduction in the population of the Southeast stratum dolphins, and a 34 percent reduction in the population of the Island stratum dolphins as compared against the No Action Alternative, with

an overall difference in population of 78 percent. (Note that Thomas, et al. 2022 slightly refined some of these projections.) After 50 years of operation, in three out of the four strata, dolphins are predicted to be functionally extinct (defined as less than or equal to dolphin in Thomas, et al. 2022) under the Applicant's Preferred Alternative, with the remaining Island stratum being 85 percent lower [95 percent CI -28 -- -99] under the Applicant's Preferred Alternative than under the No Action Alternative. Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the Applicant's Preferred Alternative is projected to be 143 dolphins (95 percent CI 11-706) compared to a predicted 3,363 dolphins (95 percent CI 2,831-4,289) predicted to inhabit the Barataria Bay under the No Action Alternative. In other words, the BBES dolphin stock is projected to be 96 percent smaller (95 percent CI -80 -- -100) under the Applicant's Preferred Alternative than then No Action Alternative. Chapter 4, Section 4.11 Marine Mammals of the Final EIS has been updated to reflect the results of Thomas et al. (2021).

Booth and Thomas (2021) evaluated multiple scenarios with different salinity changes, and in one of those scenarios' where bottlenose dolphins experience a change in salinity within 0 to 5 days from typical salinity environment (that is, mean 15 to 25 ppt) down to an atypical environment with salinity below 5 ppt for an extended period, the median time to death would be 22 days.

Concern ID: 63071

The dire forecasts about the near-term effects on dolphin populations in parts of Barataria Bay depend upon a number of unproven and improbable assumptions about dolphin adaptability and tolerance for living in the delta (Garrison et al., 2020). Conversely, the continued collapse of the marsh platform in the Barataria Basin will eventually reach a tipping point at which the prey base of dolphins in the bay would shrink and could eventually collapse. The long-term health of dolphins in the northern Gulf of Mexico depends on reconnecting the river to the delta and reestablishing the deltaic cycle.

Garrison, L.P, Litz, J. and Sinclair, C. 2020. Predicting the effects of low salinity associated with the MBSD Project on resident common bottlenose dolphins (*Tursiops truncatus*) in Barataria Bay, LA. NOAA Technical Memorandum NOAA NMFS-SEFSC-748: 97 p.

Response ID: 16594

The Draft EIS recognized that the loss of wetlands under the No Action Alternative would result in a gradually increasing, from negligible to moderate, adverse impact on dolphins (see Chapter 4, Section 4.11.5.1 [Operational Impacts]). The impacts on bottlenose dolphins from freshwater exposure have been well documented, including observations and data collected in association with the release of fresh

water in Louisiana (see Chapter 4, Section 4.11 [Marine Mammals] of the EIS for more details). Most recently, a freshening event in 2019 resulted in the declaration of an unusual mortality event (UME) in the northern Gulf of Mexico. Existing data on low-salinity exposure were used to develop a dose-response model that formed the basis for the evaluation of impacts in the Draft EIS (see Chapter 4, Section 4.11.3 [Overview of Impact Analysis Approach]). The dose-response model was coupled with an updated population model to evaluate potential changes in survival rates with in BBES. These potential decreases in survival rates caused by the diversion were compared to future conditions without the diversion (the No Action Alternative). The analysis contained in the Draft EIS determined that there would be a major, adverse, long-term impact on the BBES Stock. That conclusion is also supported by Thomas et al. (2021), which built on earlier studies and concludes that, after 1 year of operation of the Applicant's Preferred Alternative, there would be 61 percent fewer dolphins in the Central stratum than under the No Action Alternative, 35 percent fewer in the West stratum, 12 percent fewer in the Southeast stratum, and 2 percent fewer in the Island stratum, with 25 percent fewer overall. Thomas, et al. 2021 further concluded that after 10 the planned 50 years of operation, there would be 100 percent reduction in the populations of dolphins in the Central and West strata, an 82 percent reduction in the population of the Southeast stratum dolphins, and a 34 percent reduction in the population of the Island stratum dolphins as compared against the No Action Alternative, with an overall difference in population of 78 percent. (Note that Thomas, et al. 2022 slightly refined some of these projections.) After 50 years of operation, in three out of the four strata, dolphins are predicted to be functionally extinct under the Applicant's Preferred Alternative, with the remaining Island stratum being severely reduced relative to the No Action Alternative (that is, the median predicted population size of the Island stratum would be 85 percent lower [95 percent CI 28-99] under the Applicant's Preferred Alternative than under the No Action Alternative). Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the Applicant's Preferred Alternative is 143 dolphins (95 percent CI 11-706) compared to a predicted 3,363 (95 percent CI 2,831-4,289) predicted to inhabit the Barataria Bay under the No Action Alternative. In other words, the BBES dolphin stock would be 96 percent smaller (95 percent CI 80-100) under the Applicant's Preferred Alternative than then No Action Alternative. Chapter 4, Section 4.11 Marine Mammals of the Final EIS has been updated to reflect the results of Thomas et al (2021). The impacts of Project-induced wetland changes on dolphins is discussed in Chapter 4, Section 4.11.5 Operational Impacts of the EIS.

Concern ID: 63072	The EIS should include an analysis of the potential impacts of the proposed Project on bottlenose dolphins in the Mississippi Sound.
Response ID: 16595	While Figure 3.11-1 of the Draft EIS showed the distribution of bottlenose dolphin stocks in southeast Louisiana, including the Mississippi Sound Stock, it was not meant to imply that all depicted stocks would be affected by the Project. The figure has been updated to clarify this point in the Final EIS. The Project would divert fresh water, sediment, and nutrients into the Barataria Basin on the western side of the Mississippi River. The Barataria Basin has no hydrological connection to Mississippi Sound, and the Mississippi Sound Stock does not extend into the Barataria Basin, or any other area that would be affected by the Project. Therefore, the Mississippi Sound Stock is not included in the analysis of the impacts of the Project.
Concern ID: 63075	The estimates of bottlenose dolphin survival rates provided in the Draft EIS may be inaccurate due to key modeling assumptions and limitations, which were acknowledged in the Draft EIS and associated studies (Garrison et al., 2020). For example, because the models used by the Draft EIS did not look at the cumulative effect of multiple stressors and exposure to low-salinity waters over many years, the Draft EIS likely underestimates the impact of the proposed Project on bottlenose dolphins.
Response ID: 16596	Garrison, L.P, Litz, J. and Sinclair, C. 2020. Predicting the effects of low salinity associated with the MBSD Project on resident common bottlenose dolphins (<i>Tursiops truncatus</i>) in Barataria Bay, LA. NOAA Technical Memorandum NOAA NMFS-SEFSC-748: 97 p. USACE and the LA TIG acknowledge the assumptions and limitations of the modeling, and the resulting uncertainties (including potential underestimation of adverse impacts) noted by the commenter. In addition to the Delft3D modeling, published, peer-reviewed studies (and in some cases, pre-published data available only to the NMFS EIS authors) were reviewed in conjunction with development of the EIS's evaluation of projected impacts to bottlenose dolphin populations in the Project area. The Final EIS includes additional analyses that were completed by Thomas et al. (2021) after the Draft EIS was released for public comment. The EIS considers multiple sources of stress for bottlenose dolphins including salinity and temperature; sedimentation and land loss; contaminant and nutrients; food web and ecological interactions; and dolphin prey. While quantitative analysis regarding the combined effects of multiple stressors and prolonged salinity exposure are not currently available, the qualitative analysis supports the permanent, major, adverse impact on BBES dolphins found in the EIS (the most significant adverse impact category of the EIS).

Concern ID: 63076

Another operational alternative that should be considered is management of the timing of freshwater influxes to minimize impacts on dolphin reproductive success. Commenters provided multiple references for further information on dolphin reproduction and health.

Response ID: 16705

Impacts on dolphin reproduction were considered in the Draft EIS. More specifically, Chapter 4, Sections 4.11.5.1 and 4.11.5.2 in Marine Mammals included an analysis of the potential impacts of harmful algal blooms, spring flows, and multiple stressors on reproductive health. Section 4.11.5.2 also considered the potential impacts of reduced reproductive health on the recovery trajectory of BBES Stock population. Some citations mentioned by the commenter (Bejarano et al., 2107; Miller et al., 2013; and Urian et al., 1996) were included in the Draft EIS. The other citations mentioned by the commenter (Mattson et

al., 2006; Miller et al., 2010; Rowe et al., 2010, and Wells et al., 1987) were reviewed and would not change the findings of the EIS, but they have been added to Section 4.11.

As discussed in Chapter 2, Section 2.4.2 Evaluation of Operational Trigger, in developing the proposed Project, CPRA considered different operational triggers for the diversion, including using pulsing operational regimes, to determine whether various operational alternatives would meet the purpose and need of the Project and which would best meet those purposes. CPRA concluded that a simple on/off operational trigger with no pulsing provides the greatest total volume of sediment.

Section 4.11.5.2 of the Draft EIS finds that the timing of the proposed Project operations would result in the lowest salinity levels in the BBES Stock area at the peak of dolphin calving and that this would represent a serious threat to dolphin reproductive success.

With respect to approaches that CPRA could use to mitigate potential impacts to dolphins, the LA TIG and CPRA have developed three documents that address the issue.

First is CPRA's Mitigation and Stewardship Plan, which includes support for a state-wide stranding program, a program to reduce non-diversion related stressors to dolphins, and additional stranding surge capacity in response to unusual marine mammal mortality (see Section 3.2.1.1.5 [Associated Stewardship Measures – Alternative 1] of the Final Restoration Plan).

Second is the MAM Plan, which CPRA expanded in response to public comments to include more details regarding the process through which operational data would be used to evaluate potential modifications to those strategies and protocols (see Appendix R2 to the Final EIS). As stated in the MAM Plan, adaptive management strategies, such as timing of freshwater influxes, are largely reliant upon data that would only be available once operations commence but may also be informed by new information gained during the preoperational period. At that time, these data would be used to evaluate potential operational actions, including timing and magnitude of freshwater influxes, that may further minimize impacts to marine mammals and dolphin reproductive success while achieving Project goals.

Third is the Marine Mammal Intervention Plan, which outlines a spectrum of response actions for dolphins affected by the operation of the diversion, ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable

habitat where any health impacts would be minimized. For more information, see Appendix R5 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63077

The Draft EIS underestimates the harm to bottlenose dolphins that would be caused during the construction of the proposed Project. More specifically, increased exposure to underwater noise due to increased vessel traffic in Barataria Bay during the construction period will in all likelihood exacerbate the dolphins' stress and health problems. There also will be a greater risk of vessel strikes during construction.

Response ID: 16597

The impacts to dolphins of increased vessel traffic in Barataria Basin were acknowledged and discussed in Chapter 4, Section 4.11.4.2 (Marine Mammals - Construction Impacts) of the Draft EIS. That

discussion concluded by noting that, while vessel traffic in the Barataria Basin would increase with construction activities, that “noise-producing construction activities [like vessel traffic] have minimal overlap with the BBES Stock range and thus are anticipated to have negligible to minor, temporary, indirect, and adverse impacts on bottlenose dolphins.” The Draft EIS also states that impacts on marine mammals from construction would be predominantly due to risks of strikes from transiting construction vessels. Because this was previously addressed in the Draft EIS, no related edits were made in the Final EIS.

Concern ID: 63078

The impact of increased freshwater inputs from the Mississippi River into coastal areas of Louisiana in 2019 caused a die-off leading to an unusual mortality event (UME). The Louisiana Department of Wildlife and Fisheries (LDWF) was winding down its involvement in the marine mammal stranding network during that time. While a group called Audubon Coastal Wildlife Network attempted to fill the void left by the LDWF, critical data were missed. It is estimated that only 33 percent of stranded animals were reported for Louisiana during the whole of the 2019 UME.

Response ID: 16598

Chapter 4, Section 4.11.5.2.2.1 General Effects on Dolphin Health of the Final EIS has been revised to acknowledge the limitations of data collection by the LDWF during the 2019 UME. Analysis in the Final EIS is based on additional expert opinion regarding effects on dolphins from freshwater exposure compiled for Booth & Thomas (2021) and new data reported in Thomas, et al. (2021). This additional information supported the impact conclusions in the Draft EIS. NOAA has assumed coordination of the Louisiana Marine Mammal Stranding Network. Independent of this Project, the LA TIG has funded a project to support stranding network enhancements. Further, through the Project, the LA TIG would support an additional 20 years of funding for the Louisiana Marine Mammal Stranding Network.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project,

such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63080

The Corps and the TIG have circumvented a legal process intended to conserve marine mammals and protect ecosystems by obtaining a Congressionally-mandated MMPA waiver for the proposed Project. The waiver does not establish a quota for how many dolphins can be taken by the proposed Project, and it is clear that the level of take for this stock will be grossly unsustainable, in clear violation of the MMPA (absent BBA-18). The legislative waiver, quite simply, provided Congressional permission to break the law. It is critical for the protection of marine mammals that such a legislative waiver be a one-off occurrence.

Response ID: 16599

The U.S. Army Corps had no role in seeking a Marine Mammal Protection Act waiver for this Project from Congress, nor did any federal agencies on the LA TIG. CPRA sought the waiver.

Title II, section 20201 of the Bipartisan Budget Act of 2018 provides: "(a) In recognition of the consistency of the Mid-Barataria Sediment Diversion, Mid-Breton Sound Sediment Diversion, and Calcasieu Ship Channel Salinity Control Measures projects, as selected by the 2017 Louisiana Comprehensive Master Plan for a Sustainable Coast, with the findings and policy declarations in section 2(6) of the Marine Mammal Protection Act (16 U.S. C. 1361 et seq., as amended) regarding maintaining the health and stability of the marine ecosystem, within 120 days of the enactment of this section, the Secretary of Commerce shall issue a waiver pursuant to section 101(a)(3)(A) and this section to Section 101(a) and Section 102(a) of the Act, for such projects that will remain in effect for the duration of the construction, operations and maintenance of the projects. No rulemaking, permit,

determination, or other condition or limitation shall be required when issuing a waiver pursuant to this section. (b) Upon issuance of a waiver pursuant to this section, the State of Louisiana shall, in consultation with the Secretary of Commerce: (1) To the extent practicable and consistent with the purposes of the projects, minimize impacts on marine mammal species and population stocks; and (2) Monitor and evaluate the impacts of the projects on such species and population stocks.”

The National Marine Fisheries Service issued the waiver in March 2018. Since that waiver in 2018, CPRA has not requested any additional waivers for coastal restoration projects. More information on the waiver can be found at <https://www.fisheries.noaa.gov/action/marine-mammal-protection-act-waiver-select-louisiana-coastal-master-plan-projects>.

Concern ID: 63626

The success of the Project is uncertain, but the Project would cause dolphin deaths regardless of its success or failure.

Response ID: 16600

Chapter 4, Section 4.11.5.2 (Barataria Bay Estuarine Stock) of the Draft EIS acknowledged that the MBSD would result in mortality and severely compromised health of a significant number of individuals belonging to the Barataria Bay estuarine stock (BBES) of bottlenose dolphins. This section has been updated to incorporate research by Thomas, et al. (2021) that was completed after release of the Draft EIS. According to data published by Thomas, et al. (2021) most of the approximately 2,300 dolphins within the Barataria Basin would perish within the first 10 years of start of operations of the proposed Project (comparing the anticipated Barataria Basin 2027 dolphin population (2,307 dolphins) to the projected 2038 population under the Preferred Alternative (644 dolphins) indicates that approximately 72 percent of the dolphins would perish). These additional data built on earlier studies analyzed, and support the impact conclusions, in the Draft EIS.

The commenter’s concern that Project success is uncertain is acknowledged. The value of fresh water, sediment, and nutrients in the ecological productivity and sustainability of the Barataria Basin is discussed throughout Chapter 4 (Environmental Consequences) of the EIS. Each of the Alternatives analyzed in the EIS, except for the No Action Alternative, are expected to meet the purpose and need of the Project, and uncertainties in the overall impacts of the Project, both beneficial and adverse, are incorporated into the analyses included in Chapter 4 Environmental Consequences of the EIS. More specifically, salinity impacts of the Project are assessed using the Delft3D Basinwide Model, and this model’s projections of future conditions include uncertainties. Uncertainties are incorporated into the EIS impact conclusions and are briefly summarized in the EIS in Chapter 4, Section 4.1.3.3 (Model Limitations and Uncertainty), and in detail in

Appendix E (Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties). Uncertainties related to the Marine Mammals impact analysis are summarized in detail in Chapter 4, 4.11.3.1 (Marine Mammals, General Caveats to Impact Analysis Approach).

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include specific marine mammal response triggers that may affect Project operation mitigation efforts; see Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not

be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

With respect to the LA TIG's Restoration Plan, the LA TIG's conclusion that the Project is likely to succeed in providing the predicted Project benefits is detailed discussed in Section 3.2.1.4 (Likelihood of Success) of the Final Restoration Plan.

Concern ID: 63627

A commenter expressed opposition to the diversion because more studies are needed on dolphins and other marine life.

Response ID: 16601

The Draft EIS included an analysis of the impacts to marine mammals, including bottlenose dolphins in Chapter 4, Section 4.11 Marine Mammals. That analysis included a review of the extensive studies of the BBES dolphin stock since the DWH oil spill as well as a comprehensive literature review of studies of the impact of low-salinity waters on dolphins that was incorporated into the Expert Elicitation described in Chapter 4, Section 4.11.3 Overview of Impact Analysis Approach. The Final EIS also incorporates additional analysis by Thomas et al. (2021), which was published after the Draft EIS was released for public comment. Based on these sources, the EIS projects that the proposed Project would have major, adverse, permanent impacts to BBES dolphins, resulting in their functional extinction except for a small number that may survive around Grand Isle.

The LA TIG notes, however, that the MAM Plan, included in Appendix R2 to the EIS, includes extensive monitoring before and during Project operations, which would help address key uncertainties, such as the optimal balance between sediment and freshwater input needed to achieve the Project purpose, and could provide information critical to informing potential operational modifications over time that could reduce negative impacts to dolphins.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for

public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63628

A commenter expressed confusion as to why NOAA would allow a diversion that would kill dolphins.

Response ID: 16602

Chapter 3, Section 3.11.1 Marine Mammals in the Northern Gulf of Mexico of the Final EIS has been revised to discuss the Marine Mammal Protection Act waiver.

The concerns raised by the commenters regarding the impacts to dolphins were considered in the LA TIG's Draft Restoration Plan. The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there

would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The DWH oil spill resulted in the oiling of more than 1,100 kilometers of wetlands, nearly all of which were located in coastal Louisiana (see Section 2.0 [Restoration Planning Process] of the Restoration Plan). The heaviest oiling occurred in the Barataria Basin, resulting in substantial injuries to natural resources in the basin. Recognizing that the resulting loss of marsh productivity affected resources throughout the northern Gulf of Mexico ecosystem, the State of Louisiana and the federal Trustees that negotiated the DWH Natural Resource Damages settlement allocated \$4 billion, almost half of the total settlement amount, to restoring Louisiana's wetland, coastal, and nearshore habitats (see Section 1.1 [Background and Summary of the Settlement] in the Restoration Plan).

The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

With regard to the Marine Mammal Protection Act (MMPA), the Bipartisan Budget Act of 2018, Public Law 115-123 included a requirement that the Secretary of Commerce, as delegated to the Assistant Administrator of the NMFS, issue a waiver of the MMPA moratorium and prohibition for three projects, including the proposed MBSD Project. Accordingly, NMFS issued the waiver on March 15, 2018.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include specific marine mammal response triggers that may affect Project operation mitigation efforts; see Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section

10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63629

Operation of the MBSD will adversely affect dolphin prey species, such as spotted sea trout, as well as other important marine resources, such as submerged aquatic vegetation, benthic algae and other benthic fauna, brown shrimp, southern flounder, and eastern oyster.

Response ID: 16603

The impact of the Project on dolphin prey species was discussed and considered in detail in Chapter 4, Section 4.11.5.1 (Marine Mammals - General Impacts on Habitat and the Environment) of the Draft EIS, which notes:

Certain marine mammal prey species are more tolerant of lower salinity waters than others. Of the 10 key species analyzed in Section 4.10 Aquatic Resources that are known BBES dolphin prey (representing 75 percent of the stomach prey content), the Applicant's Preferred Alternative would result in overall minor beneficial impacts on six species (red drum, Gulf menhaden, bay anchovy, blue crab, white shrimp, and bass) and a major adverse impact on brown shrimp, minimal adverse impact of spotted seatrout, negligible to minimal adverse impact on southern flounder, and neutral impacts on Atlantic croaker. Oysters are not known to be a prey item for BBES dolphins.

Further, as discussed in Section 4.11.5.1 (General Impacts on Habitat and the Environment in Marine Mammals), initial adverse impacts on SAV would be temporary, with permanent beneficial impacts to overall coverage and biomass of SAV once the salinity regime stabilizes. Although the specific timing of these changes cannot be predicted, Section 4.10.4.1.2 in Submerged Aquatic Vegetation has been updated in the Final EIS to indicate that SAV colonized mudflats relatively quickly (within 2 years), once conditions were suitable, at Mardi Gras Pass (on the east side of the Mississippi River). The resulting increase in SAV biomass would result in increased primary productivity,

increased nursery habitat for aquatic species, and shifts in the food web would play a role in the impacts on dolphin prey species. Impacts on benthic algae would be adverse or beneficial, depending on the salinity tolerance of a given species (see Section 4.10.4.2 [Benthic Resources]).

Concern ID: 63631

A commenter questions whether the freshwater releases at Bonnet Carré Spillway led to an unusual mortality event (UME) that occurred in 2019.

Response ID: 16604

Chapter 4, Section 4.11.5.2 (Barataria Bay Estuarine Stock) of the EIS summarizes the dolphin deaths, stranding numbers, and body conditions that led to the UME declaration in 2019. After analyzing various potential causes for the increase in dolphin mortality, scientists determined that the most likely cause of this UME was exposure to low-salinity waters in 2019 from the above average freshwater discharge into the Northern Gulf of Mexico. Prolonged exposure to low-salinity water (for example, less than 10ppt) has been documented to have harmful health impacts on bottlenose dolphins, ranging from skin lesions and serum electrolyte abnormalities to death.

Concern ID: 63632

While modeling has been done to estimate the impact of changing salinities on dolphins, there are large gaps in knowledge that may result in over- or under-estimating Project impacts. The pre-construction dolphin monitoring outlined in the Draft EIS may help address these gaps and should be leveraged to explore modifications to Project operation that could reduce negative impacts to dolphins.

Response ID: 16605

The Draft EIS recognized the uncertainty inherent in the model projections used to assess impacts of the Project on various elements of the environment, including dolphins (see Chapter 4, Section 4.11 [Marine Mammals] of the Draft EIS). The LA TIG agrees that the monitoring commitments included in the MAM Plan, which include extensive pre- and post-Project operation monitoring, would help address these uncertainties and would provide information critical to potential operational modifications that could reduce negative impacts to dolphins.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement.

Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63068

It is not clear why the Draft EIS suggests that the proposed Project would result in wetland loss that would harm dolphin health and reproduction. More specifically, observations suggest that the Project is actually projected to increase wetland habitat. It is not clear how wetland creation and a decrease in wetland loss rates affect residual health and reproduction effects from the DWH spill to dolphins.

Response ID: 16591

To clarify, although the diversion is expected to increase wetland habitat, the freshwater influx that would result from diversion operations is anticipated to be the primary driver of dolphin mortality and morbidity. The projected impacts of wetland changes and freshwater flows caused by the Project on dolphins were discussed in detail in Chapter 4, Section 4.11.5 (Marine Mammals - Operational Impacts) of the Draft EIS.

Concern ID: 63630

The Project will lead to long-term benefits for marine mammals and dolphin populations by restoring the marine ecosystem and by carrying out monitoring and mitigation of the near-term impacts described by the Draft EIS and associated studies (Garrison et al., 2020).

Response ID: 16706

The Draft EIS included an analysis of the impacts to marine mammals, including BBES dolphins in Chapter 4, Section 4.11 Marine Mammals. While the analyses in the EIS suggest that some prey resources upon

which dolphins rely may benefit from the proposed Project, the analyses overall suggest that the impact of the proposed Project on dolphins would be immediate, significant, and adverse. These analyses incorporated studies from Booth and Thomas (2021), Garrison et al. (2020), and Schwacke et al. (2017) and the Final EIS includes additional analyses that were complete by Thomas et al. (2021) after the Draft EIS was released for public comment.

The impact conclusion in the Draft EIS was based in large part on Garrison et al. (2020), which predicts that only a “remnant population” of dolphins would continue to exist in Barataria Basin after diversion operations commenced. That conclusion is confirmed by Thomas et al. (2021), which concludes that, after 1 year of operation of the Applicant’s Preferred Alternative, there would be 61 percent fewer dolphins in the Central stratum than under the No Action Alternative, 35 percent fewer in the West stratum, 12 percent fewer in the Southeast stratum and 2 percent fewer in the Island stratum, with 25 percent fewer overall. Thomas, et al. further concluded that after 10 years of operation, there would be 100 percent reduction in the populations of dolphins in the Central and West strata, an 82 percent reduction in the population of the Southeast stratum dolphins and a 34 percent reduction in the population of the Island stratum dolphins as compared against the No Action Alternative with an overall difference in population of 78 percent. After the planned 50 years of operation, dolphins in three out of the four strata are predicted to be extinct under the Applicant’s Preferred Alternative, with the remaining Island stratum population being 85 percent lower [95 percent CI 28-99] under the Applicant’s Preferred Alternative than under the No Action Alternative). Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the Applicant’s Preferred Alternative is projected to be 143 dolphins (95 percent CI 11-706) compared to a predicted 3,363 dolphins (95 percent CI 2831-4289) predicted to inhabit Barataria Bay under the No Action Alternative. In other words, the BBES dolphin stock is predicted to be 96 percent smaller (95 percent CI 80-100) under the Applicant’s Preferred Alternative than then No Action Alternative. Section 4.11 Marine Mammals of the Final EIS has been updated to reflect the results of Thomas et al (2021).

To respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals, the LA TIG has developed a new Marine Mammal Intervention Plan to further (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is

possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

EC61100 - Threatened & Endangered Species

Concern ID: 63106

The proposed Project would kill more sea turtles than did the DWH oil spill with BP monies.

Response ID: 16204

Chapter 4, Section 4.12.2.2 Sea Turtles of the EIS, determined that the proposed Project would have negligible to minor adverse impacts on hawksbill and leatherback sea turtles, but minor to moderate adverse impacts on Kemp's ridley, green, and loggerhead sea turtles due to the potential for increased interactions between sea turtles and commercial shrimp fishing efforts.

In compliance with the Endangered Species Act of 1973, as amended (16 U.S.C. §§ 1531 et. seq.), the NMFS' Biological Opinion on the proposed Project (included in the Final EIS as Appendix O4) concludes the proposed Project is not likely to jeopardize the continued existence of sea turtles and authorizes "take" for the Project, which is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or attempt to engage in any such conduct. In its Biological Opinion, the NMFS authorizes the incidental take of 783 sea turtles per year, including 370 Kemp's ridley sea turtles (including up to 38 mortalities), 319 loggerhead sea turtles (including up to 10 mortalities), and 94 green sea turtles (including up to 9 mortalities). Over the 50-year Project life, this could equate to a take of 39,150 sea turtles (including up to 2,850 sea turtles mortalities). This can be compared to the lower-end estimate of 4,900 large juvenile/adult, 56,000 juvenile, and 35,000 hatchling sea turtles killed by the DWH oil spill (NMFS 2020).

Concern ID: 63107

The proposed Project would kill sea turtles, which commenters indicated should stop the proposed Project.

Response ID: 16205

Chapter 4, Section 4.12.2.2 Sea Turtles of the EIS, determined that the proposed Project would have negligible to minor adverse impacts on hawksbill and leatherback sea turtles, but minor to moderate adverse impacts on Kemp's ridley, green, and loggerhead sea turtles due to the potential for increased interactions between sea turtles and commercial shrimp fishing efforts.

In compliance with the Endangered Species Act of 1973, as amended (16 U.S.C. §§ 1531 et. seq.), the NMFS' Biological Opinion on the proposed Project (included in the Final EIS as Appendix O4) concludes the proposed Project is not likely to jeopardize the continued existence

of sea turtles and authorizes a “take” for the Project, which is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or attempt to engage in any such conduct. In its Biological Opinion, the NMFS authorizes the incidental take of 783 sea turtles per year, including 370 Kemp’s ridley sea turtles (including up to 38 mortalities), 319 loggerhead sea turtles (including up to 10 mortalities), and 94 green sea turtles (including up to 9 mortalities). Over the 50-year Project life, this could equate to a take of 39,150 sea turtles (including up to 2,850 sea turtles mortalities). This can be compared to the lower-end estimate of 4,900 large juvenile/adult, 56,000 juvenile, and 35,000 hatchling sea turtles killed by the DWH oil spill (NMFS 2020). Under the Endangered Species Act, NMFS can authorize the incidental take of sea turtles, but it cannot authorize a project that jeopardizes the continued existence of sea turtles in the proposed Project area.

Concern ID: 63108**Commenters questioned how many sea turtles would be killed by the proposed Project.****Response ID: 16409**

In compliance with the Endangered Species Act of 1973, as amended (16 U.S.C. §§ 1531 et. seq.), the NMFS’ Biological Opinion on the proposed Project (included in the Final EIS as Appendix O4) concludes the proposed Project is not likely to jeopardize the continued existence of sea turtles and authorizes a “take” for the Project, which is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or attempt to engage in any such conduct. In its Biological Opinion, the NMFS authorizes the incidental take of 783 sea turtles per year, including 370 Kemp’s ridley sea turtles (including up to 38 mortalities), 319 loggerhead sea turtles (including up to 10 mortalities), and 94 green sea turtles (including up to 9 mortalities). Over the 50-year Project life, this could equate to a take of 39,150 sea turtles (including up to 2,850 sea turtles mortalities).

Concern ID: 63109**Additional studies should be conducted to determine the impacts of the proposed Project on biota (including sea turtles).****Response ID: 16206**

In compliance with the Endangered Species Act of 1973, as amended (16 U.S.C. §§ 1531 et. seq.), the NMFS prepared a Biological Opinion on the proposed Project (Appendix O4 of the Final EIS), which authorizes the incidental take of 783 sea turtles per year, including 370 Kemp’s ridley sea turtles (including up to 38 mortalities), 319 loggerhead sea turtles (including up to 10 mortalities), and 94 green sea turtles (including up to 9 mortalities). Over the 50-year Project life, this could equate to a take of 39,150 sea turtles (including up to 2,850 sea turtles mortalities).

In addition, Section 8.3 of the NMFS’ Biological Opinion requires that the federal action agencies ensure that the Project proponent monitor brown shrimp fishing effort in the action area; fund, implement, and

annually report on a salinity monitoring program in Barataria Bay; and funds and implements a monitoring plan targeting the distribution, health, and habitat use of sea turtles in the Barataria Basin.

Concern ID: 63110

The commenters are concerned with the impacts that this proposed Project would have on threatened and endangered species in the area and indicated that there are likely to be minor to moderate adverse effects for the Kemp's ridley, loggerhead and green sea turtles, and the pallid sturgeon in the area.

Response ID: 16253

The adverse effects on these species from the proposed Project were further evaluated by the USFWS (pallid sturgeon) and the NMFS (sea turtles in Barataria Basin waters) in their Biological Opinions; the respective Biological Opinions have been included in Appendices O3 and O4 of the Final EIS. Both agencies have determined that the construction and operation of the proposed Project would not be likely to jeopardize the continued existence of these species. NMFS has authorized a take of up to 783 Kemp's ridley, loggerhead, and green sea turtles (total) per year (including up to 57 mortalities per year). The USFWS has authorized the loss (by death or serious injury) of 48 pallid sturgeon per year.

Concern ID: 63111

The EIS indicates that there are likely to be major indirect adverse effects on bald eagles, which may be exposed to contamination as a result of this proposed Project.

Response ID: 16255

No major impact is anticipated for bald eagles due to the proposed Project. As identified in Chapter 4, Section 4.12.3.2 in Threatened and Endangered Species of the Draft EIS, the proposed Project is anticipated to have a negligible to moderate, permanent, indirect, and adverse impact on bald eagles, with the potential for moderate adverse impacts if contaminants are present in the diverted water, the prey become contaminated, and bald eagles consume the contaminated prey; no related edits have been made in the Final EIS.

Appendix R1 (Mitigation and Stewardship Plan) of the EIS describes CPRA's proposed monitoring measures, including CPRA's agreement to monitor for contaminants, at the request of the USFWS. As discussed in Chapter 5, Section 5.3 Fish and Wildlife Coordination Act Report Recommendations of the EIS, CPRA has agreed to a conservation recommendation proposed by USFWS that requires CPRA implement an adaptive sampling plan to detect potential contamination that could impact bald eagles.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for

public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63119

The mass deaths of manatees this year is concerning to the commenter.

Response ID: 16268

The 2020-2021 unusual mortality event (UME) was issued for manatees along Florida's east coast. The UME is being investigated to determine the cause, but preliminary information indicates that it is related to a reduction of food availability in portions of Indian River Lagoon (USFWS 2021). Although manatees transiting through the proposed Project area would likely be Florida residents, the UME is unrelated to the proposed Project and the proposed Project is not anticipated to result in injury or mortality of a manatee.

Concern ID: 63121

The negative repercussions from the diversion are influenced by a salinity differential in the source and receiving waters, impacting threatened and endangered species by its suddenness and magnitude.

Response ID: 16272

Chapter 4, Section 4.12 Threatened and Endangered Species of the Final EIS has been revised to discuss the potential impact of an acute change in salinity on special status species, as applicable. However, because the impacts on special status species discussed in the

Biological Opinions are within the range of impact identified in the Draft EIS, no changes were warranted to the determinations provided in the Draft EIS.

Concern ID: 63122

There are five species of sea turtle that are listed as threatened or endangered in the Gulf of Mexico.

Response ID: 16273

The commenter correctly notes that five federally listed sea turtles occur in the northern Gulf of Mexico, as identified in Chapter 4, Section 4.12 Threatened and Endangered Species, Table 4.12-1 of the EIS; therefore, no related edits have been made to the Final EIS.

Concern ID: 63123

The Gulf sturgeon would be at high risk due to their diadromous spawning in the Pearl River and Pascagoula river basins.

Response ID: 16274

The proposed Project is not anticipated to have discernable effects on aquatic life outside of the Project area, which includes the Barataria Basin and the Mississippi River birdfoot delta (particularly for biological resources), as defined in Chapter 3, Section 3.1.1 in Introduction of the EIS. As noted in Section 3.12.1 in Threatened and Endangered Species and Figure 3.12-1 of the EIS, the Gulf sturgeon's range is outside the proposed Project area, and the species is therefore not carried forward for an evaluation of impacts from the proposed Project in Chapter 4 Environmental Consequences. Because the issue raised by the commenter was addressed in the Draft EIS, no related edits have been made in the Final EIS.

Concern ID: 63112

The EIS should exclude any conclusions regarding pallid sturgeon risk until their presence near the proposed Project is confirmed.

Response ID: 16256

As discussed in Chapter 4, Section 4.12.2.3 in Threatened and Endangered Species and Appendix O1 (Biological Assessment) of the Draft EIS, the EIS analysis recognizes that pallid sturgeon density in the Lower Mississippi River is believed to be extremely low. In accordance with NEPA and the ESA, the EIS appropriately includes an analysis and determination of impacts on the pallid sturgeon from the proposed Project, based on a range of possible local population sizes. The adverse effects on pallid sturgeon from the proposed Project were further evaluated by the USFWS in its Biological Opinion, which has been included as Appendix O3 of the Final EIS. The USFWS determined that the construction and operation of the proposed Project would not be likely to jeopardize the continued existence of the pallid sturgeon and authorized the loss (by death or serious injury) of 48 pallid sturgeon per year.

Concern ID: 63113

The Executive Summary for Threatened and Endangered Species should be supplemented to explain how the proposed Project may "increase commercial shrimping interactions" with sea turtles given the expected decline in shrimp populations in the estuary.

Response ID: 16257	The detailed assessment of impacts on sea turtles, including the potential for increased commercial shrimping interactions, was included in Chapter 4, Section 4.12.2.2 in Threatened and Endangered Species of the Draft EIS; therefore, no related edits have been made to the Final EIS. As stated in Section 4.12.2.2, changes in local shrimp populations (including a decrease in the brown shrimp population and a negligible to minor increase in the white shrimp population) may result in changes to the shrimp fishery in the proposed Project area. If these changes result in shrimp fishers focusing on locations lower in the basin or in nearshore/offshore waters (where more sea turtles would be present), it may increase the potential for interactions between fishers and sea turtles, which is a primary threat to sea turtles. Increased interactions could increase the rate of injury and mortality to sea turtles present in the proposed Project area.
Concern ID: 63114	Explain the statement in the Executive Summary for Threatened and Endangered Species that indicates the “presence of core use habitat in the Barataria Basin (Kemp’s ridley).”
Response ID: 16259	The detailed assessment of impacts on sea turtles, including a discussion of the Kemp’s ridley’s core use habitat in the Barataria Basin, was included in Chapter 4, Section 4.12.2.2 in Threatened and Endangered Species and Appendix O1 (Biological Assessment) of the Draft EIS. However, Chapter 3, Section 3.12.1.1.2.3 Kemp’s Ridley Sea Turtle of the Final EIS has been revised to clarify that “core use” habitat is a general term used to represent important foraging and migratory areas that have been identified for juvenile and post-nesting Kemp’s ridley sea turtles.
Concern ID: 63115	The Executive Summary for Threatened and Endangered Species ignores the likely positive effects of the proposed Project on Kemp’s ridley sea turtle, due to the Project’s likely positive impacts on its preferred prey, blue crabs.
Response ID: 16261	The detailed assessment of impacts on sea turtles, including the likely positive effects of increased blue crabs on Kemp’s ridley sea turtles, was included in Chapter 4, Section 4.12.2.2 in Threatened and Endangered Species in the Draft EIS; therefore, no related edits have been made to the Final EIS.
Concern ID: 63116	Commenter disagrees with the adverse conclusion for the piping plover, red knot, and black rail. The proposed Project would greatly increase mudflat and sand flat habitat in the outfall area, which would be used by these species.
Response ID: 16262	Comment noted. The EIS concludes in Chapter 4, Section 4.12.2.4 in Threatened and Endangered Species that the proposed Project is not likely to adversely affect piping plover and red knot, as any impact to those two birds or their prey would be negligible to minor adverse. As

identified in this section, sediment input would create mudflats prior to the establishment of wetland vegetation; however, this is considered a negligible benefit to the piping plover and red knot as they typically use the barrier islands for foraging. With regard to eastern black rail, which are generally believed to inhabit vegetated areas, Section 4.12.2.5 in Threatened and Endangered Species of the EIS concludes that the proposed Project would have both individually adverse and beneficial impacts on the species from changing habitats, including adverse, temporary to short-term impacts from salinity changes that may alter the presence of infaunal prey species, and positive, long-term effects from marsh creation and preservation. However, due to the low species density likely in the proposed Project area, the overall impact on the species would be negligible. The proposed Project is not anticipated to increase sandflat habitat. Because use of mudflats was discussed in the Draft EIS, no related edits have been made in the Final EIS.

Concern ID: 63117

The Executive Summary for Threatened and Endangered species should provide detailed support for the statement that bald eagles may be adversely impacted from potential contaminant uptake given the assertions elsewhere that the proposed Project would not load additional contaminants into the receiving area. There is likely some risk of localized PAH loading, but there is a lot of uncertainty. Monitoring is needed. The USEPA assessed this question for the Maurepas Diversion and determined that there was no impact on bald eagles due to contaminants.

Response ID: 16264

See Chapter 5, Section 5.3 Fish and Wildlife Coordination Act Report Recommendations of the EIS. CPRA has agreed to a Fish and Wildlife Coordination Act conservation recommendation identified by USFWS that CPRA implement an adaptive monitoring/sampling plan for fish and shellfish in the diversion outfall area and in the Mississippi River to detect potential contamination that could impact bald eagles. Because the issues raised by the commenter were addressed in the Draft EIS, no related edits have been made in the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management

measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63120

The Draft EIS and the LA TIG's Draft Restoration Plan (Section 3.2.1.6.2) should be reconciled with respect to determinations for the saltmarsh topminnow, with the Draft EIS indicating minor to moderate benefits and the Draft Feasibility Report indicating both beneficial and adverse impact.

Response ID: 16269

The Draft EIS Chapter 4, Section 4.12.3.1 in Threatened and Endangered Species and the LA TIG's Draft Restoration Plan (Section 3.2.1.6.2 [Benefits to Water Column Resources]) consistently noted a combination of adverse and beneficial impacts on the saltmarsh topminnow, with an overall minor to moderate benefit anticipated from construction and operation of the proposed Project; therefore, no related edits have been made to the Final EIS or the LA TIG's Final Restoration Plan.

Concern ID: 63118

Commenter strongly disagrees with the adverse impact noted for the manatee as manatees like fresh water and SAV and suggests that an independent manatee expert should review the conclusion.

Response ID: 16266

Chapter 4, Section 4.12.2.1 in Threatened and Endangered Species of the Draft EIS acknowledged the potential benefits of decreased salinity and increased SAV; however, the Draft EIS also identified a potential for adverse impact from increased vessel movement and noise associated with construction and operation of the proposed Project, resulting in a negligible to minor adverse impact/not likely to adversely affect determination. Further, as noted in Appendix O3 USFWS Biological Opinion of the Final EIS, the USFWS considered the effects

of the proposed Project on the West Indian manatee and concurred with the determination in the EIS for this species.

Concern ID: 67233

It is imperative that the operational plan includes continual adaptive mitigation of unavoidable impacts to critical habitat in the Breton and Mississippi Sound areas.

Response ID: 16953

As discussed in Sections 3.12 and 4.12 (Threatened and Endangered Species) of the EIS and Appendices O3 and O4, ESA designated critical habitat for the loggerhead sea turtle and piping plover is within the Project area, as is proposed critical habitat for the red knot. However, the Project would have no effect on these designated or proposed areas of critical habitat.

EC61200 – Socioeconomics

Concern ID: 62009

The negative socioeconomic consequences would devastate southeast Louisiana, destroy people’s livelihoods, displace people living near the diversion, and destroy property in the areas impacted by the proposed MBSD Project.

Response ID: 16207

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana, including impacts on population, property values, and community cohesion. As noted in these sections, the proposed Project would have both beneficial and adverse socioeconomic impacts on the people and communities within the Project area. Minor to moderate, permanent adverse socioeconomic impacts are expected to occur near the immediate outfall area outside of flood protection. Minor to moderate, permanent, beneficial socioeconomic impacts are expected to occur in the west bank New Orleans area north of the diversion. Moderate to major, beneficial, temporary impacts from job creation and economic activity in the proposed Project area are anticipated. In addition, the Socioeconomics Technical Report in Appendix H1 provides additional details on these projected effects.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG

believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the DWH oil spill.

The commenters' concern regarding the potential impacts of the diversion were considered by CPRA and the LA TIG in developing the Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included mitigation to address and offset some of the projected impacts of the Project on fisheries and surrounding communities outside levee protection including providing structural mitigation and stewardship measures for increased water levels that are projected to result due to the Project, such as raising roads or improving bulkheads. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

In communities south of the Project site outside of federal levee protection where the proposed Project is projected to cause increased water levels, CPRA plans to take one of two approaches. In Myrtle Grove, CPRA is planning to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision. By improving this bulkhead, CPRA would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions without the Project. See Table 1 in the Final Mitigation and Stewardship Plan for more details. CPRA plans to acquire a temporary right-of-way to permit improvement of the bulkhead, voluntarily or through eminent domain if necessary, from the property owners in the Myrtle Grove Marina Estates Subdivision.

In other communities south of the Project site outside of federal levee protection, from Woodpark south to the communities of Grand Bayou and Happy Jack, CPRA plans to elevate the portions of public roads outside of levee protection that provide access to each of these communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative

to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship

Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62010

Sediment transported by the diversion into the basin would cause the main waterways to have increased shoaling, become too shallow to pass through, and would require dredging in order to access personal properties. This plan should address the potential loss of access for homes, camps, and businesses due to the increased shoaling.

Response ID: 16208

The impacts raised by the commenters were considered in the Draft EIS; therefore, no related edits have been made to the Final EIS. The EIS describes impacts on marine transportation and maintenance dredging in Chapter 4, 4.21 Navigation. This section also describes potential impacts on access due to delays when dredging. In addition, refer to Section 4.13 Socioeconomics for a discussion of socioeconomic impacts due to potential sedimentation in Barataria Basin navigation channels and canals. The proposed Project would have moderate, intermittent but permanent, adverse impacts on marine traffic efficiency and safety for shallow-draft vessels. The proposed Project would also cause minor to moderate, permanent, adverse impacts in dredging requirements for portions of the Mississippi River Navigation Channel and the birdfoot delta due to Project-induced changes to typical shoaling patterns and locations. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the proposed Project area during Project operations. In acknowledgement of commenters' concerns regarding sediment and shoaling impacting navigation, the Mitigation and Stewardship Plan in Appendix R1 in the Final EIS includes measures to mitigate impacts on navigation in the basin resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent

anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62011

Commenters are concerned about the impacts of the proposed MBSD Project operations on the coastal communities including Jean Lafitte, lower Lafitte, Barataria, Crown Point, and the island of Grand Isle.

Response ID: 16209

The impacts raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics considers impacts on community populations, housing and property values, community infrastructure, as well as community cohesion and other potential socioeconomic impacts on affected communities in the proposed Project area. As described, communities near the immediate outfall area (within 10 miles north and 20 miles south) outside of flood protection are anticipated to experience increased tidal flooding and storm surge that may increase ongoing trends in outmigration and cause minor to moderate, permanent, adverse impacts on community cohesion in these areas. Long-term benefits of the proposed Project are also anticipated in communities in the west bank New Orleans area north of the diversion, where decreases in storm damages are anticipated over time due to the Project. The communities of Lafitte and Des Allemands are located in areas anticipated to experience permanent, minor to moderate beneficial impacts associated with storm hazards. The proposed Project is projected to increase surge heights by only up to 0.1 foot in the community of Grand Isle. Chapter 4, Sections 4.13 Socioeconomics, 4.14 Commercial Fisheries, and 4.15 Environmental Justice provide detailed analyses of impacts from the

proposed Project. The Socioeconomics Technical Report in Appendix H1 provides additional details.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Concern ID: 62013

The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.

Response ID: 16210

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in

Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation and stewardship measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes

from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62014	The proposed MBSD Project would reduce tax revenue for the parishes located in the impacted area and the funds to support vital services in these areas.
Response ID: 16211	The EIS considers and describes impacts on tax revenue in Chapter 4, Section 4.13.4 and 4.13.5 in Socioeconomics. There is also a discussion of Public Services and Utilities in this chapter (Section 4.13 Socioeconomics). As described, the proposed Project construction would have minor to moderate short-term benefits on sales and use taxes in local jurisdictions and the state associated with construction spending. Negligible to minor permanent adverse impacts on tax revenues from sales and use taxes, including associated with impacts on commercial fishing activities, as well as property tax collections associated with reduced property values are anticipated in Plaquemines Parish due to operation of the proposed Project. Potential adverse effects on utilities associated with reduced property taxes are also anticipated during the operations phase of the proposed Project.
Concern ID: 62015	Commenter supports implementation of the proposed MBSD Project to restore the wetlands. The Barataria Basin needs its infrastructure to return which would have a substantial economic impact, support birds and other wildlife, and also bring back jobs to this area.
Response ID: 16212	The commenters' support of the proposed Project is acknowledged. The EIS evaluates economic impacts of the proposed Project in Chapter 4.13 Socioeconomics, and Appendix H1, Socioeconomics Technical Report, including potential employment impacts. In addition, Chapter 4, Section 4.16.5.2 in Recreation and Tourism describes how the proposed Project would impact recreational and sport fishing in the Barataria Basin.
Concern ID: 62016	Commenter inquired as to why CPRA is not required to adjust operations, conduct maintenance dredging, or provide alternative boat access for Myrtle Grove if Wilkinson Canal is impacted.
Response ID: 16213	The impacts on channel and canal navigation raised by the commenters were considered in the Draft EIS. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the proposed Project area during Project operations. In acknowledgement of the commenters' concerns regarding maintenance of non-federal navigation channels and canals impacted by sedimentation of the proposed diversion, CPRA has supplemented the Final Mitigation and Stewardship Plan with measures to mitigate impacts on navigation in the basin resulting from operation of the Project, including monitoring and dredging or other measures for certain federal and non-federal navigation channels including the

Barataria Waterway and Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62017

Commenter requests a supplemental EIS due to the lack of specificity concerning this proposal to the residence, parish, and fishing communities.

Response ID: 16220

The issues raised by the commenters were considered in the Draft EIS; therefore, no related edits have been made to the Final EIS and a supplemental EIS is not warranted. The EIS includes analysis of socioeconomic impacts, including increased flooding impacts, on affected communities. Sections 4.13 Socioeconomics, 4.14 Commercial Fisheries, 4.15 Environmental Justice, and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction provide detailed analyses of impacts from the proposed MBSD Project.

Projected increased flooding in the communities surrounding the diversion is discussed in Section 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction. The Socioeconomics section evaluates impacts on economy, employment and business activity, population, housing, taxes, public services, community cohesion and protection of children in light of the best data available to USACE and the LA TIG to evaluate the impacts over the 50-year analysis period. The EIS also contains separate analysis of impacts on commercial fisheries and on minority and low-income populations, including a table (Table 4.15-1) that summarizes individual communities and the potential impacts. In addition, the Socioeconomics Technical Report in Appendix H provides additional details. Appendix P Flood and Storm Hazards Evaluation provides additional details on the flood modeling and impacts.

Concern ID: 62018

Commenters noted inconsistencies in the property values presented in the EIS and Appendices. Specifically, comments highlighted a need to reconcile the property value of \$52 Million for Myrtle Grove in Appendix H Socioeconomics Technical Report compared to the value of \$5.9 Million for Myrtle Grove and all the other affected communities in Chapter 4, Section 4.13.5.3 in Socioeconomics of the main body of the EIS.

Response ID: 16214

The commenter's concern with the consistency of property valuation in the EIS is acknowledged. The issues raised by the commenters were considered in the Draft EIS. Appendix H1 Socioeconomics Technical Report and Chapter 4, Section 4.13.5.3 Housing and Property Values in Socioeconomics present different statistics about housing values. Specifically, Table 2-6 in Appendix H1 Socioeconomics Technical Report presents total property values based on estimated online fair market estimates in Myrtle Grove. Section 4.13.5.3 Housing and Property Values in Socioeconomics presents the assessed value of properties as reported by the Plaquemines Parish Assessor. Per the Plaquemines Parish Assessor, the assessed value is calculated as 15 percent of the fair market value for all commercial improvements, and 10 percent of the fair market value for all residential improvements and all land. For clarity, edits have been made to Section 4.13.5.3 and Appendix H1 Socioeconomics Technical Report of the Final EIS.

Concern ID: 62019

The Draft EIS fails to address extended economic and community impacts of this proposed Project. The proposed MBSD Project would not only affect localized Louisiana concerns, but would impact no less than three other Gulf Coast states including Texas, Mississippi, and Alabama.

Response ID: 16215

EIS Chapter 3, Section 3.1.1 Project Area identifies the area of analysis for the EIS which includes the Barataria Basin and portions of Mississippi River birdfoot delta. For socioeconomic impacts, the EIS

identifies the area of potential impacts as the 10-parish Project area due to indirect socioeconomic impacts. Most impacts would likely be concentrated in Plaquemines, Lafourche, and Jefferson Parishes, Louisiana. For commercial fisheries, the proposed Project area includes two basins (the Barataria Basin and a portion of the Mississippi River Basin birdfoot delta). The proposed Project is not anticipated to have discernable effects on aquatic resources outside of the Project area. Commercial fishermen that travel to Barataria Basin to fish for species that would be adversely affected, particularly shrimp and oysters, could also be adversely affected by the proposed Project. Chapter 4, Section 4.14.4 Operational Impacts in Commercial Fisheries in the Final EIS has been revised to acknowledge this.

In response to one commenter's request for supplemental environmental review to consider potential impacts of the Project on the Texas shrimp fishery, the NOAA Technical Memorandum cited in support of that request has been reviewed. The technical memo does not confirm the comment that shrimp from the Barataria Basin migrate to Texas. While that memo does report that tagged brown shrimp released in Louisiana were recovered in Texas, those recovered shrimp were released in offshore waters south of Calcasieu Lake. Tagged shrimp that were released in the Caillou Lake estuary, which is in the Terrebonne Basin (on the western side of the Barataria Basin) were not recovered in Texas.

Concern ID: 62020

The EIS is lacking in detail and particularly vague when it comes to addressing the impacts on the communities that are within a 2-mile radius of the Mid-Barataria Sediment Diversion: Ironton, Myrtle Grove, and Wood Park. An assessment should be made on how the construction of this proposed Project might impact the property value of homes in the surrounding area and that those landowners/homeowners be made aware of the impact. Efforts should be made to reduce, as much as possible, the potential negative impacts that the construction of this proposed Project would have on surrounding communities including Ironton, Myrtle Grove, and Wood Park.

Response ID: 16216

The impacts raised by the commenters were considered in the Draft EIS. The EIS includes analysis of socioeconomic impacts on affected communities. Section 4.13 Socioeconomics, 4.14 Commercial Fisheries, and 4.15 Environmental Justice provide detailed analyses of impacts from the proposed Project. In addition, the Socioeconomics Technical Report in Appendix H of the EIS provides additional details. In Chapter 4, Section 4.15.5 Environmental Justice of the Final EIS, a section has been added that provides a summary of impacts on the community of Ironton to assist understanding impacts of the proposed Project on that community.

CPRA has engaged in public outreach meetings with the communities and groups impacted by the proposed MBSD Project to solicit input on mitigation strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities and groups. A summary of these public outreach meetings can be found in Chapter 7 Public Involvement of the Final EIS. The Mitigation and Stewardship Plan in Appendix R1 of the EIS provides additional details about mitigation proposed by CPRA for the proposed Project, including mitigation and stewardship measures for the communities projected to be impacted.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62021

The ecological pressures created by the Mississippi River Levee System on coastal lands make properties more vulnerable to hurricane damage, as well as potentially decreasing property

Response ID: 16217	<p>values. The coastal communities and housing market is put at risk if bold action is not taken to restore the coast.</p> <p>The proposed MBSD Project is expected to reduce loss of coastal wetlands in Louisiana relative to the No Action Alternative. The EIS finds in Chapter 4, Section 4.13 Socioeconomics that the proposed Project would have minor, permanent, beneficial impacts on housing and property values as the land gained as a result of the proposed Project would decrease the risks of storm hazards, particularly in areas north of the diversion and in the west bank New Orleans area.</p>
Concern ID: 62022	<p>The Draft EIS lays out how many jobs would be created through construction and the proposed Project would also bring desperately needed jobs and economic growth. Plaquemines Parish, where the proposed Project would be constructed, and the surrounding region - including Orleans and Jefferson Parishes - would expect to see a significant economic boost.</p>
Response ID: 16218	<p>The EIS describes the jobs impact from the construction of the diversion in Chapter 4, Section 4.13.4.2 in Socioeconomics. The EIS finds that moderate to major, temporary economic benefits are anticipated from proposed Project construction.</p>
Concern ID: 62024	<p>Electricity system resilience has become an increasingly important aspect of planning, which is recognized by the Regional Transmission Organization that Louisiana is situated in. A restored coast would help provide energy security through the protection it provides by creating a buffer for extreme weather events, and lowering storm surge. A more protected power grid also means reduced costs, which should translate to lower rates for consumers.</p>
Response ID: 16219	<p>The EIS considers impacts on Public Services and Utilities in Chapter 4, Section 4.13 Socioeconomics. As described, most public services and utilities infrastructure are located inside flood protection, though a few facilities are not. Beneficial impacts on public service infrastructure and utilities are expected in areas distant from the diversion and to the north associated with decreases in storm hazards with the proposed Project as compared to the No Action Alternative.</p> <p>Additionally, the LA TIG finds that restoration of the coastal environment is intended to build resiliency, including security for infrastructure such as power providers.</p>
Concern ID: 62025	<p>Appendix H of the Draft EIS titled “Socioeconomics Technical Report” provides information relevant to the analysis of potential impacts to socioeconomic resources resulting from the proposed Project. Appendix D to Appendix H, titled “Economic Impact of the Design and Construction of the Mid-Barataria Sediment Diversion Project” includes a breakdown of the cost estimates for</p>

the design and construction of the proposed Project. This appendix does not clearly set forth the cost/value of the borrow material that CPRA will excavate from Midway's property and use for the proposed Project. Without this information, the Draft EIS does not accurately analyze the impacts of the proposed Project on socioeconomics.

Response ID: 16221

The commenter's concern regarding ensuring appropriate compensation for any property owner whose property is acquired or taken as part of the proposed Project is acknowledged. As part of any property acquisition to implement the proposed Project, CPRA would compensate landowners for property used for the Project in accord with Louisiana and Federal law, including the Louisiana Constitution and the Fifth Amendment of the U.S. Constitution.

Concern ID: 62026

The proposed Project would destroy wetlands in certain areas in the beginning phases and over time proposes to create wetlands in the outfall area. The Applicant has not publicly addressed the issue of the Public Trust Doctrine and future land and mineral rights. The commenter inquires as to who would own land and mineral rights in the outfall area where land may be built and if the public would be allowed to fish, hunt, and navigate through the outfall areas which are important socioeconomic questions for local stakeholders.

Response ID: 16222

According to CPRA, due to concerns about safety of the public and security for the proposed Project facilities, there is not a plan to make the diversion structure or immediate outfall area accessible for public use. CPRA is, however, planning to provide signage and other public space near the proposed Project to educate the public regarding the purpose and functioning on the Project. CPRA also states that ownership of any lands created by operation of the proposed Project would be determined in accord with current state law, including mineral rights, pursuant to La. R.S. 31:149 and La. R.S. 49:214.5.5(E) and that pursuant to La. R.S. 49:214.5.5(B), the proposed Project would not create any rights to the public in or on private property.

Concern ID: 62027

The Draft EIS cites Oxfam America's Social Vulnerability Index from 2009, but the Water Institute of the Gulf and the Louisiana Coastal Protection and Restoration Authority have developed some work in this area through their 2017 Coastal Master Plan process. This more current application could be useful in analyzing this proposed Project.

Response ID: 16223

Chapter 3, Section 3.15 Environmental Justice of the EIS cites community social vulnerability data from NOAA from 2019. While the Coastal Master Plan is a valuable and detailed document, the NOAA data used in the EIS represents the best data available to the USACE and LA TIG since it is more recent and provides community-specific

metrics for many areas near the proposed Project. The commenter is correct that the Socioeconomics Technical Report in Appendix H1 cites the older Oxfam report. For the Final EIS, Appendix H1 Socioeconomics Technical Report has been updated to be consistent with the main body of the EIS and utilize the NOAA data.

Concern ID: 62029

The EIS describes immediate, major, and permanent adverse impacts on several critical species in the Barataria Basin, including shrimp and oysters. The health of commercial fisheries and the socioeconomic well-being of coastal communities are closely intertwined. Such impacts would inflict economic harm on businesses, families, and individuals.

Response ID: 16225

The issues raised by the commenters were considered in the Draft EIS. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted. The EIS also acknowledges the importance of commercial fisheries to the Louisiana economy and communities, as described by commenters. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana and Section 4.14 Commercial Fisheries describes impacts to commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts to shrimp and oyster fisheries in the proposed Project area are anticipated under the Applicant's Preferred Alternative. Changes in abundance may exacerbate trends of aging fishers leaving the industry and would have adverse impacts on the overall fishery. Adverse impacts may be partially offset by changes in fisher behavior. Additional details on the regional and community level economic impacts on commercial fisheries due to the proposed MBSD Project can be found in Section 4.14 Commercial Fisheries.

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)

- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62030

Louisiana plays a vital role in the economic infrastructure of the USA. Ports carry 20 percent of waterborne commerce and provide 26 percent of the commercial fishery landings measured by weight

Response ID: 16226	<p>and 18 percent of our nation’s oil. If the proposed Project should fail, our nation’s energy economic security would be devastated.</p> <p>The EIS considers impacts on Public Services and Utilities in Chapter 4, Section 4.13 Socioeconomics. Chapter 3 also provides background information on the importance of regional mineral resources and fisheries. As described, most public services and utilities infrastructure are located inside flood protection, though a few facilities are not. Beneficial impacts on public service infrastructure and utilities are expected in areas distant from the diversion and to the north associated with decreases in storm hazards with the proposed Project as compared to the No Action Alternative. Additionally, the LA TIG finds that restoration of the coastal environment is intended to build resiliency, including security for infrastructure.</p>
Concern ID: 62034	<p>Louisiana is a valuable landscape to millions of citizens, making it a working coast for both sportsmen and the commercial fisheries industry. This Coastal Master Plan must be able to show that it will improve the reduction of economic losses from storm surge, provide sustainable coastlines for residential, public, industry and commercial fisheries.</p>
Response ID: 16228	<p>While the proposed MBSD Project is part of the Louisiana Master Plan, the focus of this EIS is the proposed Project and the not the entire Master Plan. The purpose of the proposed MBSD Project is to reconnect the Barataria Basin and the Mississippi River through the delivery of sediment, fresh water and nutrients to support the long-term viability of existing and planned coastal restoration efforts. This is necessary to help restore habitat and ecosystem services injured as a result of the DWH oil spill. CPRA is considering various coastal restoration strategies in its Coastal Master Plan.</p>
Concern ID: 64119	<p>Commenters note that building a single acre of marshland serves no direct or positive economic purpose as opposed to the historically prolific fisheries of coastal Louisiana which generate an estimated \$2.4 billion in economic benefits for the State of Louisiana and the people of south Louisiana.</p>
Response ID: 16233	<p>The EIS recognizes the value of commercial as well as recreational fisheries in Chapter 3, Section 3.14 Commercial Fisheries and Section 3.16 Recreation and Tourism and considers adverse impacts that may occur due to the proposed Project on these activities in Chapter 4, Section 4.14 Commercial Fisheries and Section 4.16 Recreation and Tourism. Wetlands also serve important functions, including attenuation of wave and storm surges (in particular, refer to Chapter 3, Section 3.6 and Chapter 4, Section 4.6, which discuss Wetland Resources and Waters of the U.S. and Chapter 3, Section 3.14 and Chapter 4, Section 4.14 which discuss Commercial Fisheries). Wetland building itself does not conflict with commercial fishing uses of the</p>

basin, as wetlands provide a diverse set of functions, which include providing habitat for finfish, shellfish, as well as other aquatic organisms.

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE's involvement with the proposed Project is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under the CWA Section 404 and RHA Sections 10 and 14 (33 USC Section 408). USACE is neither a proponent nor an opponent of the proposed MBSD Project, and USACE was not involved in the Restoration Plan. As explained in the Restoration Plan, the LA TIG is the group responsible for restoring natural resources and services within the Louisiana Restoration Area that were injured by the DWH oil spill; therefore, response content pertaining to the LA TIG's restoration planning has been addressed solely by the LA TIG, not USACE.

As part of the LA TIG's restoration planning efforts, the LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the DWH oil spill.

Concern ID: 64057

The socioeconomic impacts would affect southeast Louisiana and the area impacted by the proposed MBSD Project for generations and ensure the end to the traditions and culture of south Louisiana and its families.

Response ID: 16230

The EIS discusses impacts on the local communities and various quantitative and qualitative impacts from the proposed Project in Chapter 4, Section 4.13 Socioeconomics, including Community Cohesion (Section 4.13.5.6). Consistent with the concern of the commenter, the EIS does find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative.

Concern ID: 64060

The proposed MBSD Project would result in a financial impact on the surrounding communities that support the coastal community. More work needs to be produced to address the economic impacts for Louisiana as a whole and the locally impacted parishes from the proposed Project. This should include all of the state-wide economic issues that would result from the loss of natural resources which are heavily marketed as a basis for the

industries of tourism, hospitality, restaurants, etc. Any failure to consider the complete economic impact of the destruction of seafood is inadequate given the nature of this proposed Project and the natural resource results actually delineated in the Draft EIS.

Response ID: 16231

The Draft EIS considered the potential socioeconomic impacts of the Project; thus, no related changes have been made to the Final EIS. More specifically, the EIS acknowledges in Chapter 3, Section 3.14.7 in Commercial Fisheries that the seafood industry represents a major source of jobs and income in Louisiana, which includes commercial harvesters, seafood processors and dealers, seafood wholesalers and distributors, restaurants, tourism, and retail sales. Chapter 4, Section 4.14 Commercial Fisheries considers regional economic impacts and community impacts projected to result from the proposed Project on the shrimp, oyster, crab, and finfish fisheries, noting that communities with a high reliance on these landings may be most heavily impacted, and that indirect effects may include impacts to fish license holders, crew, dealers, suppliers, and seafood processors. While availability of shrimp and oysters from the Basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, though potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's Preferred Alternative than under the No Action Alternative. This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

Concern ID: 64089

Commenters asked that the jobs that are created by construction of the proposed Project spur inclusive and equitable economic development. The Louisiana State and local economic development authorities should focus efforts through communication, recruitment, and training activities, into creating jobs for local residents, including minority residents. The same type of focused workforce development effort is likely necessary in order for these local jobs to translate into longer term economic benefits for affected communities. Work with the community to identify future needs of this workforce, including: providing adequate emergency and routine medical care for workers, facilitating the start and growth of small business to provide services to this workforce, and educating skilled workers who can later pivot to other jobs along our coast long after construction is complete.

Response ID: 16234

With respect to the award of contracts, CPRA is required to follow the provisions of the Louisiana Public Bid Law, including those contained in Title 39, Chapter 17 (the Louisiana Procurement Code) and in Title 38, Chapter 10 (Public Contracts). CPRA has sought and regularly seeks engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS.

Concern ID: 64090

Commenters request assurance that their community resources like sewage, water, broadband etc. can handle construction impacts in both the short and long term.

Response ID: 16232

The EIS considers impacts to local public services and utilities within the 10-parish Project area in Chapter 4, Section 4.13.5.5 Public Services and Utilities in Socioeconomics. As described, construction of the proposed Project would not affect electric power plants or water supply or treatment facilities, as none are located in the Project construction footprint. Beneficial impacts on public service infrastructure and utilities are expected in areas distant from the diversion and to the north associated with decreases in storm hazards with the proposed Project as compared to the No Action Alternative. Additionally, the LA TIG finds in its Restoration Plan that restoration of the coastal environment is intended to build resiliency including security for infrastructure.

Concern ID: 62028

Commenters suggest integrating more current data and information before the release of the Final EIS, including and especially the 2020 Census data. This data would show important population shifts to communities in Jefferson, Lafourche, and Plaquemines Parish, as well as the major metropolitan area of greater New Orleans. However, the use of census data may not accurately identify the individuals and businesses economically reliant on the Barataria Basin resources and does not reflect long-term or more recent income levels of those directly involved in businesses or jobs related to the resources.

Response ID: 16224

The EIS uses a variety of data sources to best describe the regional economy and populations, including relatively recently released statistics from the U.S. Census Bureau American Community Survey (ACS), data from 2010 Decennial Census, as well as a variety of state and local sources. Initial data from the 2020 Decennial Census was released in fall 2021 for Congressional redistricting purposes, with the bulk of the remaining 2020 Decennial Census data projected to be released over the next few years. The Final EIS has been revised to update the 2010 Decennial Census data to 2020 Census data. This update provides the most recent population and demographic data available for the some of the very small communities described in the EIS. Data for particular industries that may be affected by the Project, such as commercial fishing, are presented using state sources or other local data as available.

Concern ID: 62031

The Draft EIS acknowledges that measuring economic and socioeconomic impacts over an extended period is an inexact science and particularly difficult to anticipate over long-time horizons. Yet, that is exactly what CPRA has done and what is captured and presented to the public in the Draft EIS. It also fails to build confidence in a project that claims to be based in such detailed and exact science.

Response ID: 16227

Pursuant to NEPA, the EIS has been prepared to evaluate the anticipated impacts on the human environment from the proposed Project and reasonable alternatives to it, including No Action. Accurate, high-quality data and scientific analysis was used in the EIS, including input from agencies' own experts. The EIS makes this information available to the public and to decision makers. Although its forecasts of economic and socioeconomic impacts are not certain, the agencies have endeavored to prepare an EIS containing full disclosure of anticipated impacts, as well as all information necessary for the decision makers to understand the environmental consequences of their decisions. Where information is unavailable or incomplete, those data gaps are disclosed in the document.

Appendix R2 in the Final EIS includes CPRA's Monitoring and Adaptive Management (MAM) Plan, which was jointly developed by CPRA and its federal partners in the LA TIG. The MAM Plan provides flexible, science-based approaches to monitor and assess Project success as well as potential adaptive management actions to minimize impacts of the proposed Project and decision points that could lead to changes in management.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of

publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62035

Important assets like historical oyster reefs should be protected. Louisiana's coastal communities depend on the health of the estuaries for economic sustenance.

Response ID: 16229

The EIS discusses impacts on the local communities and impacts on local fisheries from the proposed Project in Section 4.14 Commercial Fisheries, Section 4.15 Environmental Justice, and Section 4.13 Socioeconomics, including Community Cohesion (Section 4.13.5.6). Consistent with the concern of the commenter, the EIS does find potential major, permanent, adverse impacts on subsistence fishing for communities from the proposed Project compared to the No Action Alternative (Section 4.15.4.2). Additional details on oysters and designated oyster grounds in the Project area can be found in Section 4.10.4.5, Key Species in Aquatic Resources. The proposed Project is expected to have major, direct, permanent, adverse impacts on oysters. CPRA has developed mitigation and stewardship measures which include increased funding for creation of broodstock reefs, funding for creation of new oyster seed grounds, funding for enhancing public and private oyster reefs and increased funding to further develop alternative

oyster culture methods, including off-bottom oyster culture. These are detailed in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

EC61300 – Commercial Fisheries

Concern ID: 62071

The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy,

Response ID: 16241**abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of

these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62077

The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would

displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.

Response ID: 16242

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62078

The proposed MBSD Project would cause the loss of Louisiana shrimp, oyster, crab and finfish production which would impact the seafood based supply chain of southern Louisiana, including

corresponding impacts on restaurants in New Orleans and southern Louisiana.**Response ID: 16243**

The impacts raised by the commenters were considered in the Draft EIS. The EIS acknowledges in Chapter 3, Section 3.14.7 in Commercial Fisheries that the seafood industry represents a major source of jobs and income in Louisiana, which includes commercial harvesters, seafood processors and dealers, seafood wholesalers and distributors, and retail sales. Chapter 4, Section 4.14 Commercial Fisheries discusses regional economic impacts and community impacts on the shrimp, oyster, crab, and finfish fisheries, noting that communities with a high reliance on these landings may be most heavily impacted, and that indirect effects may include impacts to fish license holders, crew, dealers, suppliers, and seafood processors. While availability of shrimp and oysters from the basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's Preferred Alternative than under the No Action Alternative. This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)

- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62079

Commenters are concerned that impacts similar to those caused by the fresh water from Bonnet Carré Spillway openings would affect fisheries in the Barataria Basin with the proposed MBSD Project.

Response ID: 16244

The Project area for the MBSD EIS includes the Barataria Basin and the Mississippi River birdfoot delta. Existing operations and influences of rivers and diversions, including but not limited to the Bonnet Carré Spillway, were incorporated into the baseline conditions of the No Action Alternative and action alternatives assessed in the Draft EIS, Chapter 4 Environmental Consequences, Sections 4.2 through 4.24. Reasonably foreseeable future (but not existing) diversions, such as the Mid-Breton Diversion, were analyzed for impacts in combination with existing diversions and the proposed MBSD diversion in Chapter 4, Section 4.25 Cumulative Impacts.

A summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and to discuss their recorded impacts on the natural environment. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS. Note that the Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological purposes.

Concern ID: 62083

Commenters suggested that shrimping, fishing, and oysters would disappear in the Barataria Basin because of the fresh water diluting the salinity to a level that cannot sustain breeding of these species.

Response ID: 16247

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS described impacts of the proposed Project on finfish and shrimp and oyster species. As described, impacts may include those associated with changes in salinity. As summarized in EIS Section 4.14.5 in Commercial Fisheries, as compared to the No Action Alternative moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative sometime after 2050. While abundance of shrimp and oysters would decline under the Applicant's Preferred Alternative (as compared to the No Action Alternative), the EIS impact analysis does not anticipate shrimp and oysters would disappear from the basin. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement.

Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project. Impacts related to subsistence activities are discussed in Section 4.15 Environmental Justice.

Concern ID: 62084

Commenters believe that the proposed MBSD Project would cause economic loss annually to other Gulf Coast states. The Mississippi Gulf Coast seafood and fishing industry would be devastated.

Response ID: 16248

Chapter 3, Section 3.1.1 Project Area of the Draft EIS identifies the analysis area for the EIS. This is the area in which the Project is anticipated to have discernable effects. For socioeconomic impacts, the EIS identifies the area of potential impacts as the 10-parish Project area due to indirect socioeconomic impacts. Most impacts would likely be concentrated in Plaquemines, Lafourche and Jefferson Parishes, Louisiana. For Commercial Fisheries, the Project area includes two basins (the Barataria Basin and a portion of the Mississippi River Basin). The proposed Project is not anticipated to have discernable effects on aquatic resources outside of the Project area. Commercial fishermen that travel to Barataria Basin to fish for species that would be adversely affected, particularly shrimp and oysters, could also be adversely affected by the proposed Project. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Final EIS has been revised to acknowledge this. Those commercial fishermen would be eligible to

participate in the fishery mitigation programs discussed in the Mitigation and Stewardship Plan (Appendix R1 to the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project. Impacts related to subsistence activities are discussed in Section 4.15 Environmental Justice.

Concern ID: 62085

Concerns were raised that the proposed MBSD Project would affect fishermen with smaller vessels. Fishermen would have to travel farther towards the Gulf in their boats to catch some species such as speckled trout, and brown and white shrimp. Most inshore fishing vessels are not large enough or equipped to go any further outside the basin.

Response ID: 16249

The impacts raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discusses impacts of the proposed MBSD Project on commercial

fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts on brown shrimp and oyster fisheries in the Project area are anticipated. Section 4.14.4.2 Applicant's Preferred Alternative discusses the potential adaptive responses of fishermen to changes in species abundance, including the potential for substitution of species and need for gear upgrades, as well as increasing the length of fishing trips. CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation,

stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62089

The Barataria Estuary would be more productive as a result of the increased input of carbon and the vital building blocks of life, which would mean opportunities for increased seafood harvest. The proposed MBSD Project is of critical importance for this transformation to one of our nation's most productive fisheries.

Response ID: 16250

The commenter's support of the proposed Project is acknowledged. Chapter 4, Section 4.10 Aquatic Resources in the Draft EIS describes anticipated impacts from the proposed Project on aquatic species. As described, impacts would range from adverse to beneficial, depending on the species.

Concern ID: 62091

Commenters requested that detailed information on the full cost/benefit analysis regarding commercial fisheries be provided.

Response ID: 16251

NEPA does not require that the EIS contain a cost-benefit analysis unless it is relevant to the agency's decision. USACE generally assumes that a permit applicant has done its own economic evaluation of a proposed project. The EIS evaluates potential adverse as well as

potential beneficial impacts to commercial fisheries in Chapter 4, Section 4.14 Commercial Fisheries.

Consistent with OPA regulations, in the LA TIG's Final Restoration Plan the LA TIG has evaluated a range of alternatives based on multiple criteria including the cost to carry out each alternative, the likelihood of success, the extent to which future injury would be prevented and avoid collateral injury, the extent of benefits to more than one natural resource, and the effect on public safety. This analysis can be found in Section 3 of the Restoration Plan.

Concern ID: 62098

Commenter expresses concern that the Draft EIS is biased against the Project, over emphasizing and/or over-reporting the potential negative impacts to certain fisheries (particularly brown shrimp) and understating the Project benefits and the likely outcomes if the Project is not implemented.

Response ID: 16252

The issues raised by the commenters were considered in the Draft EIS. The EIS follows NEPA guidance and presents the adverse as well as the beneficial impacts of the Project in an unbiased manner. The EIS was developed considering the best information and data available to USACE and the LA TIG at the time of writing.

In addition, the benefits of the Project are described in Section 3.2.1.6 Benefits Multiple Resources of the LA TIG's Restoration Plan.

Concern ID: 62102

Commenter suggested that USACE consider a recent study by LDWF regarding the principal commercial fisheries in Barataria Bay (An Assessment of the Principal Commercial Fisheries in Barataria Bay and Its Environs in April 2021) as part of its analysis of the Project.

Response ID: 16254

The LDWF study was not available at the time that the Draft EIS was being developed; however, LDWF provided the agencies with the preliminary data that was included in the referenced report. The data was used in development of the Draft EIS discussion of commercial fisheries. The reference to the LDWF Barataria Bay fisheries data has been revised in the Final EIS to acknowledge its relationship to the published study.

Concern ID: 62103

The Draft EIS does not fully address the anticipated destruction of multiple components of the commercial oyster fishery, including oyster habitat, off-bottom oyster farms, and the oyster hatchery at Grand Isle resulting from impacts to water quality and changes in salinity.

Response ID: 16258

Impacts of the proposed Project on eastern oysters are discussed in the Aquatic Resources section of the EIS in Chapter 4, Section 4.10.4.5, Key Species. The section identifies that most adverse impacts on oysters are anticipated at mid-basin locations, while some

beneficial impacts may occur in the lower basin, including the Grand Isle area. The off-bottom and hatchery components of the oyster fishery would not be affected by the Project, or may benefit from it. Specifically, the only significant off-bottom oyster fisheries in Barataria Basin occurs in the lower basin. As indicated in Chapter 3, Section 3.14.6, Aquaculture, the Mike Voisin Oyster Hatchery in Grand Isle is the only commercially available source of oyster larvae and seed. These areas could benefit from the Project. Final EIS Chapter 4, Section 4.14 Commercial Fishing has been revised to discuss these effects.

CPRA's Mitigation and Stewardship Plan includes measures to increase funding for the development of broodstock reefs, enhancing public and private oyster areas, creating a new public oyster seed ground and to further develop alternative oyster culture methods, including off-bottom oyster culture. See the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 64171

Comments were received suggesting that the MBSD would have negative impacts on the fishing industry due to further accelerations in exits from the industry especially for older members of the workforce for whom job retraining may not be as easily undertaken and the fact that there are less young fisherman coming into the fishing industry to replace the aging fisherman. The invaluable traditional ecological knowledge that has been passed down from generations could be lost.

Response ID: 16267

Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discusses impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts to shrimp and oyster fisheries in the Project area are anticipated. Section 4.14.4.2 Applicant's Preferred Alternative discusses the potential behavioral responses of fishermen to changes in species abundance, including the potential for substitution of species and need for gear upgrades, increasing the length of fishing trips, as well as exiting the industry.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)

- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 64297

Commenters noted that Project-induced sedimentation affecting some Barataria Basin navigation channels and marine

infrastructure would result in permanent, moderate, adverse impacts on commercial fishing vessels using the affected channels and marinas if no mitigation efforts are taken to maintain channel depths.

Response ID: 16270

The impacts raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS recognizes that Project-induced sedimentation affecting some Barataria Basin navigation channels and marine infrastructure would result in permanent, moderate, adverse impacts on commercial fishing vessels using the affected channels and marinas if no mitigation efforts are taken to maintain channel depths. Acknowledging concerns regarding maintenance of non-federal navigation channels and canals that could be impacted by sedimentation of the proposed diversion, CPRA's Mitigation and Stewardship Plan includes measures to mitigate impacts on navigation resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components

of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62081

Commenters suggested that the "catch" would move elsewhere to a place they can still be harvested.

Response ID: 16245

Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS described anticipated impacts on aquatic species from the proposed Project. As described, there would be major adverse impacts on brown shrimp populations, while impacts to white shrimp and blue crab would be negligible to minor beneficial, and impacts on finfish would range from adverse to beneficial, depending on the species. Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed potential responses of the commercial fishing industry to changes in fish abundance and catch within the basin as well as the potential for fishers to partially offset some adverse impacts by changing their fishing locations, while noting that these adjustments would likely be accompanied by increased costs.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). CPRA's Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)

- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62107

Commenters suggested that while it is understandable that residents who rely upon the current Barataria Basin fisheries have

fear and concern regarding a conversion to more freshwater oriented species in the basin, these fears of collapse would prove groundless. The commenters suggest that the government should facilitate fishers' shift into the new fisheries that evolve from the shifting species and location.

Response ID: 16263

The issues raised by the commenters were considered in the Draft EIS. EIS Chapter 4, Section 4.14 Commercial Fisheries discusses the potential impacts on commercial fishing activities, which includes a discussion of potential behavioral changes that fishers may make in response to changes in species availability, including substitution of fish species, taking longer trips, and upgrading gear in Section 4.14.4.2 Applicant's Preferred Alternative in Commercial Fisheries. While substitution of species may occur, such changes have costs that the fishers must incur.

CPRA has developed a plan to mitigate some potential adverse Project impacts. CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined its Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies.

A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 64168

Commenter questions the viability of workplace substitutions to other fishery species or industries and notes that these types of substitutions are not likely to fully offset the adverse impacts.

Response ID: 16265

The impacts raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14 Commercial Fisheries of the Draft EIS discussed the potential impacts on commercial fishing activities, which includes a discussion of potential behavioral changes that fishers may

make in response to changes in species availability, including substitution of fish species, taking longer trips, and upgrading gear. While substitution of species may occur, such changes have costs that the fishers would incur.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62082

Commenters noted that the proposed MBSD Project would have multiple impacts to fisheries that commercial harvesters are dependent upon and that have not been fully evaluated or have been grossly underestimated thus far. These impacts include (A) continual sediment displacement that would smother essential oyster and shrimp habitat; (B) severe changes in water temperature that would directly affect the normal growth of a variety of juvenile marine species; (C) substantial increases in the frequency and duration of hypoxic events that would contribute to an increase in mortality of aquatic resources; and (D) the displacement of a variety of commercially important marine resources along with the fishermen whom harvest them. Overall, this proposed Project would have a devastating impact to both the culturally important marine resources and the fishing communities whom depend upon them.

Response ID: 16246

The impacts raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.10.4.5 Key Species in Aquatic Resources in the Draft EIS described impacts of the proposed Project on finfish and

shrimp and oyster species. As described, impacts may result from various factors, for example, increased sedimentation, changes in salinity, increased nutrients, changes in water temperature and dissolved oxygen (hypoxia) is discussed in Section 4.10.4.4 General Impacts on Habitat and the Environment in Aquatic Resources. These impacts on species and habitat conditions inform Section 4.14 Commercial Fisheries, which discussed the impacts of the proposed Project on commercial fishing activities in detail. As described, the proposed Project is anticipated to have adverse impacts on commercial shrimp and oyster fisheries, negligible to minor beneficial effects on the blue crab fishery, and a range of impacts on finfish fisheries, depending on the species. Impacts related to subsistence activities are discussed in Section 4.15 Environmental Justice.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined its Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA

plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded. Fishers who utilize the Barataria Basin would be eligible to participate in CPRA's MBSD fisheries mitigation program regardless of state residency. Eligibility requirements for this program would include use within the Project area and may include information from trip tickets and vessel licenses.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62105

Commenters expressed concerns over the health and reproductive capacity of Louisiana's marsh estuary systems that are extremely important to commercial fisheries should the proposed MBSD Project become fully implemented. The proposed MBSD Project impact area is a primary estuary for these economically important resources such as shrimp, oysters, crabs,

and fish. Estuarine systems throughout the marsh serve as critical habitat for a variety of natural resources such as shrimp, oysters, crabs, and fish. Commercial fishermen, seafood business and seafood consumers are greatly dependent on these resources being healthy, abundant, and consistently available.

Response ID: 16260

The EIS recognizes the value of estuarine habitats as well as the value of fisheries, and evaluated proposed Project impacts on estuarine habitats that would be adverse as well as beneficial (in particular, refer to Chapter 3, Section 3.6 and Chapter 4, Section 4.6, which discuss Wetland Resources, and Chapter 3, Section 3.14 and Chapter 4, Section 4.14, which discuss Commercial Fisheries). Beneficial impacts would include increases in primary productivity and available food sources, which could benefit or adversely affect fauna, depending on the organism's place in the food chain. However, increases in nutrient loading could also produce phytoplankton blooms, including HAB's, and die-offs of these blooms could in turn lead to decreases in dissolved oxygen. In addition, refer to the Essential Fish Habitat (EFH) Assessment in Appendix N Aquatic Resources including Essential Fish Habitat Assessment of the EIS for more details on the EFH in the Project area. Wetlands provide a diverse set of functions, which include providing habitat for finfish, shellfish, as well as other organisms. As such, wetland creation and commercial fishing are not mutually exclusive. The proposed Project is anticipated to have adverse effects on commercial fishing for some species (shrimp, oyster, southern flounder, spotted seatrout), primarily related to changes in salinity in the basin, the impacts of which are discussed in Chapter 4, Section 4.14 Commercial Fishing.

EC61400 – Environmental Justice

Concern ID: 61926

Commenter inquires if there will there be any kind of history done on the African American community that may have existed there prior to the proposed Project, or if there are any impacts on the African American community.

Response ID: 16271

The Draft EIS (Chapter 2 of Appendix H1, Socioeconomics Technical Report) included information about the history of communities in the affected area, with attention to the Black and African American populations of those communities. The Draft EIS Chapter 4, Section 4.15 Environmental Justice also described potential impacts on low-income and minority populations from construction and operation of the proposed Project. In the Final EIS, Section 4.15.5.1 in Environmental Justice has been added to provide a summary of impacts on the majority-Black community of Ironton, which is the closest community to

the diversion, to assist understanding the projected impacts of the proposed Project on that community.

Concern ID: 61927

The environmental justice aspects of the Project need further review because of the increase in flood conditions that would have disproportionate impacts on low-income or minority communities, including an American Indian village, outside of federal levee protection. These disproportionate impacts include devastating impacts on community culture.

Response ID: 16276

The issues raised by the commenters were considered in the Draft EIS. The EIS Chapter 4, Section 4.15 Environmental Justice discusses potential impacts of the proposed Project on low-income and minority populations.

In addition, since the release of the Draft EIS, CPRA has engaged the public through outreach meetings with the communities projected to be impacted by the MBSD, including Grand Bayou, to solicit input on mitigation strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts undertaken to better understand and address potential impacts on low-income and minority populations, including cultural impacts, are discussed in Chapter 7 of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE

currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61928

In the case of environmental justice, the No Action Alternative as presented in the Draft EIS results in the affected communities eventually being subject to the same major adverse effects from climate change as if the Project was carried out.

Response ID: 16278

As explained in Chapter 4, Section 4.15 Environmental Justice of the Draft EIS, this is correct for low-income and minority populations south of the diversion outside of flood protection. For other low-income and minority populations (for example, those residing in communities in the West Bank of New Orleans) and other resources (for example, commercial and subsistence fishing), Project impacts are projected to range from beneficial to adverse as compared to the No Action Alternative. Further details can be found in Section 4.15 Environmental Justice.

Concern ID: 61929

Commenters expressed that southeast Louisiana's fisheries-dependent residents have endured more overlapping disasters in one generation than anyone can reasonably expect of a community. They have suffered the levee breaches of Hurricane Katrina, the DWH oil spill's ongoing impacts on fish stock, the historic flood events of 2019, and COVID-19. Many of these same fishers have also survived forced refugee flight from Southeast Asia. Fishing is not just their livelihoods-it's their lives. One commenter suggested that at a very general level the Applicant's Preferred Alternative should be implemented when low-income, vulnerable fishing communities see a rebound in their profitability to a point where they can financially prepare for the proposed MBSD Project.

Response ID: 16280

As noted in the purpose and need, the proposed Project is intended to support coastal restoration projects. Such projects may reduce the impacts of tropical events such as hurricanes and associated flooding. Without the Project, adverse impacts on commercial shrimp, oyster, crab, and certain finfish fisheries are anticipated due to reduced marsh habitat and increased salinity over the long term (that is, 50 years), but more rapidly after 2050 for shrimp and oyster, as discussed in Chapter 4, Section 4.14 Commercial Fisheries. It is anticipated that as the

coastal areas, including wetlands in the Barataria Basin, continue to erode, communities would be increasingly vulnerable to environmental disasters and the economic effects of declining fisheries. While the proposed Project would not stop subsidence and sea-level rise and associated impacts in the Barataria Basin, by 2070, the proposed Project is projected to create approximately 13,400 acres of land in the Barataria Basin and result in the loss of 3,000 acres of land in the birdfoot delta as compared to the No Action Alternative.

CPRA has expanded and refined its Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 67234

Part of the purpose of the diversion is to spend money on the problem of the sinking coast and to line the pockets of politicians.

Response ID: 16954

The purpose of the proposed Project is discussed in Chapter 1, Section 1.4 Purpose and Need of the EIS. As stated in Chapter 4, Section 4.13 Socioeconomics, total construction expenditures (spending) during construction of the proposed Project were estimated in the Draft EIS to be \$1.309 billion under the Applicant's Preferred Alternative, of which 17 percent would be spent during the design phase, and 83 percent would be spent during the construction phase (2020 dollars) and would take approximately 5 years. These costs are subject to adjustment prior to the start of construction if the Project is permitted and funded. The spending that construction would generate is anticipated to benefit the region and the area. Assuming design and construction occur over a 10-year period, the proposed Project, including indirect and induced impacts, would support employment that would be equivalent to 29 percent of the workforce in Plaquemines Parish. However, although a portion of expenditures and employment would occur in the parish, much of the spending and employment supported by the proposed Project is anticipated to be distributed throughout the Project area. Regardless, the employment and expenditures on the proposed Project would be substantial and represent a major benefit.

Concern ID: 61930

The proposed MBSD Project is an inequitable use of public funds because its negative impacts fall most directly on marginalized ethnic groups, including African American, Native American, Latin American, Asian American, Canary Islander American (Islenos), and Croatian American and unjustly places the burden on Louisiana's coastal fishers. Risks often fall disproportionately on low-income or minority communities due to ongoing institutional injustices. These low-income and minority communities, including homes, cultures, and livelihoods of Indigenous people and other people of color are often sacrificed for the benefit of the "greater good", particularly for the larger tax bases upstream of the proposed MBSD Project. For example, when the levee breached at Mardi Gras Pass, nothing was done to re-protect the mostly African American oyster farmers and fishers whose oyster farms in Breton Sound were destroyed by the fresh water from Mardi Gras Pass. But a levee breach anywhere else along the Mississippi River would be quickly rebuilt and the impacted people would be indemnified. Also, the most effective flood risk reduction solutions, like home buyouts, are not offered to low-income populations in areas south of New Orleans. Both the Draft EIS and the LA TIG's Draft Restoration Plan would benefit from

additional reflections on the natural and human history of the Project geography that resulted in such fundamental changes to the landscape and set us on the course of the land-loss crisis that Louisiana faces today. The EIS should describe historic, systemic inequities affecting communities with environmental justice concerns in the Project area to provide authentic and more complete context for the discussions.

Response ID: 16281

The Draft EIS (including Section 4.15 Environmental Justice and Appendix H, Socioeconomics Technical Report at Chapter 2) included a discussion of communities with low-income and minority populations, including information about factors that have contributed to historic and systemic inequities in southeast Louisiana. As discussed in the EIS, the Project may have disproportionately high and adverse, long-term impacts on some low-income and minority populations in communities engaged in commercial and subsistence fishing and dependent on adversely impacted fisheries, as well as communities located near the immediate outfall area (within approximately 10 miles north and 20 miles south) and outside of federal levee protection. In addition, negligible to minor, adverse impacts related to increased risk of levee overtopping during certain 1 percent storm events south of the immediate outfall area may occur, which may impact the community of Ironton. Commenters also raised concerns about Mardi Gras Pass; however, the closure of Mardi Gras Pass is outside of the scope of the EIS.

CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the

Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61931

Commenters noted that the proposed MBSD Project will provide critical storm surge protection to vulnerable communities such as Gretna, Harvey, Marrero, and Estelle. According to the CPRA Master Plan viewer social vulnerability map, which includes non-English speaking and natural resources dependent populations, there are a multitude of areas that are medium to high risk socially. These communities need to be protected where retreat is not always an option, and by building the Mid-Barataria Sediment Diversion, it can work towards those communities' long-term protection.

Response ID: 16284

The commenter's support of the Project is acknowledged. The EIS Chapter 4, Section 4.15 Environmental Justice acknowledges that low-income and minority populations in communities north of the proposed diversion and inside of federal flood protection would experience some beneficial impacts related to additional protection from storm hazards as land building reduces storm surge and wave heights. Chapter 4, Section 4.20 Public Health and Safety provides additional information about storm hazard reduction afforded by creation and maintenance of wetland habitat within the diversion outfall area.

Concern ID: 61932

Communities with environmental justice concerns, which include all communities who are vulnerable to racial, ethnic, economic, and ecological violence, should be "meaningfully involved" in "the development, implementation, and enforcement of environmental laws, regulations, and policies" during the proposed MBSD Project.

Response ID: 16285

As discussed in Chapter 1, Section 1.6 Scope of the EIS, and Chapter 4, Section 4.15 Environmental Justice, the EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and

guidance to identify the impacts that would likely occur if the proposed Project were to be approved. USACE, the LA TIG, and CPRA have engaged communities with environmental justice concerns in development of the EIS. Examples of public outreach provided by USACE for the EIS include special public notices for the permit application, the scoping process and scoping meetings, and public review of and public meetings regarding the Draft EIS. Material and information related to the Draft EIS were made available through Federal Register notices, press releases, social media, the New Orleans District website, newspapers, email/mail outs to distribution lists, and provision of hard copies of the Executive Summary and other materials to local libraries and community centers.

USACE and the LA TIG also coordinated with the SELA Voice organizations to understand the needs of the local communities, including communities with environmental justice concerns, regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan and during the public comment period. Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the joint virtual public meetings on the Draft EIS and the LA TIG's Draft Restoration Plan. Also, the Public Notice to announce the Draft EIS Notice of Availability, the Executive Summary for the Draft EIS, and the Executive Summary for the LA TIG's Draft Restoration Plan were translated into Spanish and Vietnamese. The consolidated pre-recorded public meeting presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage.

CPRA has engaged in public outreach meetings with the communities projected to be impacted by the MBSD to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts undertaken to better understand and address potential impacts on communities with environmental justice concerns, including low-income and minority populations, such as cultural impacts, are discussed in Chapter 7 of the Final EIS. Refer to the Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and

specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61933

Commenters expressed concern that the MBSD Project is going to cause a lot of problems for the community of Ironton and the neighboring communities. There is an alarming lack of detail and lack of analysis about how the MBSD Project would affect Ironton. Some specific concerns regarding Ironton include whether the MBSD Project would result in impacts on air quality, noise, traffic, emergency services, flood risks, and community cohesion.

Response ID: 16286

The Draft EIS Chapter 4, Sections 4.7 Air Quality, 4.8 Noise; 4.13 Socioeconomics; 4.15 Environmental Justice; and 4.22 Land-Based Transportation identified potential air quality, noise, transportation, and flooding impacts specifically concerning the community of Ironton. In addition, Chapter 2 of Appendix H1 (Socioeconomics Technical Report) provides contextual information about the community. Section 4.15 Environmental Justice, has been revised to highlight information about potential impacts on the community of Ironton in the Final EIS. Also, in the Final EIS, Section 4.15.5.1 Environmental Justice has been added to provide a summary of impacts on the majority-Black community of Ironton, which is the closest community to the diversion, to assist understanding the projected impacts of the proposed Project on that community.

CPRA has engaged in public outreach meetings with the communities that would be impacted by the MBSD to solicit input on mitigation strategies, including reaching out to local non-profits to assist with and facilitate meetings with the communities projected to be impacted. Outreach efforts to better understand community concerns regarding impacts, including cultural impacts, and mitigation and stewardship measures are discussed in Chapter 7 of the Final EIS. Refer to the Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61936

Environmental Justice Executive Order 12898 (1994) addresses environmental justice in minority and low-income populations. The order acknowledges the disproportionate adverse impacts that federal actions have historically had on certain communities.

It also commits the federal government to promoting nondiscrimination in future federal actions that may impact environmental quality. As most of the funds that are suggested for this Project would come from the federal funding streams this issue should be addressed. The Draft EIS cites federal policies mandating that issues of environmental justice be given full consideration, in particular the long standing Executive Order (12898) on Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations and comparable Department of Defense directives. Attention must be paid to communities such as the Native Americans in Grand Bayou, Vietnamese fishermen, and low-income resident fishers of Plaquemines, Jefferson, and Lafourche who may be negatively impacted by this Project. In the parishes closest to the Project site, Plaquemines and Jefferson, minority populations respectively constitute 36 and 60 percent of the overall population.

Response ID: 16293

The EIS Chapter 4, Section 4.15 Environmental Justice acknowledges that disproportionately high and adverse impacts on low-income and minority populations could occur in some communities where reductions in abundance of oysters, brown shrimp, and certain fish species are anticipated as a result of the proposed Project. These impacts would depend in part on the extent to which affected populations engage in or are heavily reliant on commercial and subsistence fishing for these species. The EIS Chapter 4, Section 4.15, Environmental Justice recognizes the presence of low-income and minority populations in communities that depend on shrimp and oyster fishing in Barataria Bay, including Grand Isle, Galliano, the Lafitte area, Barataria, Belle Chasse, Live Oak, West Pointe à la Hache, Ironton, Grand Bayou, and Port Sulphur. However, as discussed in the EIS, there are insufficient data to correlate fisheries harvests with specific low-income and minority populations. Consequently, the precise extent to which impacts on shrimp and oyster fisheries would affect specific low-income and minority populations cannot be determined.

CPRA has expanded and refined its Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. CPRA's mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61938

The EIS identifies and acknowledges that there are low-income and minority communities that might experience disproportionately high and adverse economic impacts as a result of the proposed Project, particularly as such impacts relate to commercial and subsistence fishing.

Response ID: 16296

The EIS Chapter 4, Section 4.15 Environmental Justice acknowledges that disproportionately high and adverse impacts on low-income and minority populations could occur in some communities where reductions in abundance of oysters, brown shrimp, and certain fish species are anticipated as a result of the proposed Project. These impacts would depend in part on the extent to which affected populations engage in or are heavily reliant on commercial and subsistence fishing for these species. The EIS Chapter 4, Section 4.15 Environmental Justice recognizes the presence of low-income and minority populations in communities that depend on shrimp and oyster fishing in Barataria Bay, including Grand Isle, Galliano, the Lafitte area, Barataria, Belle Chasse, Live Oak, West Pointe à la Hache, Ironton, Grand Bayou, and Port Sulphur. However, as discussed in the EIS,

there are insufficient data to correlate fisheries harvests with specific low-income and minority populations. Consequently, the precise extent to which impacts on shrimp and oyster fisheries would affect specific low-income and minority populations cannot be determined.

CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since issuance of the Draft EIS and LA TIG's Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61940

Commenters found it unclear whether the Draft EIS discussion of impacted fishermen, including low-income and persons of color, is limited to those living in the Barataria Basin. For example, there

may be Vietnamese fishermen or other fishers who reside outside the Barataria Basin but travel to the Barataria Basin to fish. Clearly these fishermen would be impacted by the Project. The State must clarify the inclusion of fishermen residing within and outside the Project boundary in both its impacts analysis and its discussion of potential mitigation for impacts to fisheries.

Response ID: 16299

Fishermen who travel to Barataria Basin to fish for species that would be adversely affected, particularly shrimp and oysters, could also be adversely affected by the proposed Project. Chapter 4, Section 4.14.4 Operational Impacts in Commercial Fisheries of the Final EIS has been revised to acknowledge this.

The Mitigation and Stewardship Plan (Appendix R1 to the EIS) provides a suite of mitigation and stewardship measures applicable to fishers that may be impacted by the Project. Those measures would be available to any impacted fisher who relies on fisheries in the Barataria Basin, regardless of whether or not they reside in the basin.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for

funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 64130

Commenters suggested the Draft EIS is insufficient in terms of its definition and analysis of affected communities, particularly low-income and communities of color. The analysis would be improved by a discussion of historical context and systemic inequities to describe the existing barriers (that is, economic hardships, educational background, language barriers) these communities, particularly Ironton, must deal with.

Response ID: 16301

The issues raised by the commenters were considered in the Draft EIS. The EIS Chapter 3, Section 3.15 Environmental Justice and Chapter 2 of Appendix H1 Socioeconomics Technical Report discusses existing barriers faced by populations in the Project area affected by the proposed Project, including economic hardships, and describes specific communities with low-income and minority populations. Chapter 2 of Appendix H1 Socioeconomics Technical Report, also provides information regarding historical context and systemic inequities affecting these communities. Chapter 4, Section 4.15 in Environmental Justice describes potential impacts on low-income and minority populations from construction and operation of the proposed Project. In the Final EIS, Chapter 4 Section 4.15.5.1 Environmental Justice, a summary of impacts to the Ironton community has been added to facilitate access to that information. Information concerning additional outreach to communities with environmental justice concerns has also been added.

Concern ID: 61934

Commenters asked that the EIS provide details about the in-person meetings that CPRA held in the low-income and minority communities potentially impacted by the Project.

Response ID: 16287

CPRA has engaged in public outreach meetings with the communities projected to be impacted by the MBSD to solicit input on mitigation strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts were undertaken to better understand and address potential impacts on communities impacted by the MBSD, including those with environmental justice concerns, such as low-income and minority populations, that may be disproportionately impacted by the Project; these are discussed in Chapter 7 of the Final EIS. CPRA has expanded and refined its Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and the LA TIG Draft Restoration Plan based on community and resource agency input. The updated mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-

income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61935

Commenters noted that the MBSD Project would have positive environmental justice outcomes, as the Project goes forward, over time. The proposed MBSD Project is actually part of the larger suite of projects outlined in the Coastal Master Plan. In concert, these projects will provide very significant long-term storm surge and sustainability benefits for communities in Plaquemines and Jefferson parishes, whether within or without structural storm risk reduction systems. Each of these benefits would be particularly helpful over time to those who depend on subsistence fishing and those who live in particularly flood prone areas that, because of

Response ID: 16290**historic discriminatory settlement patterns, is made up of disproportionately poor members of minority groups.**

The EIS evaluated anticipated impacts of the action alternatives and a No Action Alternative over a 50-year analysis period. The Delft3D model production runs also projected conditions over a 50-year period. Anticipated impacts beyond that timeframe were not evaluated in the EIS.

As discussed in Chapter 4, Section 4.15 Environmental Justice, the EIS acknowledges that low-income and minority populations in areas north of the diversion and inside of federal risk reduction levees would experience some beneficial impacts related to additional protection from storm hazards due to reduced storm surge and wave heights as a result of the Project's land building. Low-income and minority populations within 10 miles to the north and 20 miles to the south of the diversion outside federal risk reduction levees would experience increased tidal flooding relative to the No Action Alternative, particularly in the first 2 decades of operations. Low-income and minority populations south of the diversion and outside federal risk reduction levees would experience increased risk of storm surge. In addition, negligible to minor, adverse impacts related to increased risk of levee overtopping during certain 1 percent storm events south of the immediate outfall area may occur, which may impact the community of Ironton.

Low-income and minority populations that depend on subsistence fishing activities may experience both beneficial and adverse impacts depending on the specific resources and areas where subsistence activities are practiced, as discussed in Chapter 4, Section 4.15.4.2. With regards to other restoration and flood risk reduction projects, Chapter 4, Section 4.25 Cumulative Impacts discusses other restoration and flood risk reduction projects in concert with the proposed Project. The operations of those reasonably foreseeable projects combined with the MBSD Project have the potential to result in minor to moderate, adverse and minor, long-term or permanent, beneficial impacts on low-income and minority communities in the Barataria Basin.

Concern ID: 61939

The EIS meets the minimum requirements of Executive Order No. 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations by identifying disproportionately high and adverse human health or environmental impacts of the proposed Mid-Barataria Sediment Diversion on minority, low-income, and Tribal populations in the relevant Project area.

Response ID: 16308

Acknowledged.

Concern ID: 64152 **The conclusion that the proposed Project would adversely affect subsistence fisheries fails to acknowledge that there are subsistence fisheries based on freshwater fish and shellfish, which would benefit from the proposed MBSD Project. Therefore, these conclusions are erroneous, or exaggerated.**

Response ID: 16303 The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.15 Environmental Justice. For clarity, Section 4.15.4.2.5 Subsistence Fishing and Hunting in the Final EIS has been revised to acknowledge that subsistence fisheries based on certain freshwater fish and shellfish may benefit from the proposed Project.

EC61500 – Recreation/Tourism

Concern ID: 61905 **Commenters expressed that residents’ way of life including living off of and recreating in the water would be impacted by an influx of fresh water due to the MBSD Project.**

Response ID: 16235 The issues raised by the commenters were considered in the Draft EIS. As described in the Existing Conditions in Chapter 3, Section 3.16 Recreation and Tourism, as well as Appendix H1 Socioeconomics Technical Report, the Draft EIS acknowledges the importance of recreational use in the region, describing many types of outdoor recreational activities, including fishing, hunting, boating, wildlife viewing, and general shoreline use, among others. The EIS further acknowledges that extensive estuarine and freshwater wetlands provide habitat for many kinds of fish, birds, reptiles, and mammals that are an integral component of recreation in the region. The evaluation of environmental changes in the basin under the No Action Alternative shows that the abundance of target recreational species, including spotted seatrout and red drum, would decline over time. Access to recreational boating sites would also increase from negligible impacts in the early decades to major, adverse impacts in the later decades, leading to decreases in recreational use in the southern portions of the basin even without the Project. Chapter 4, Sections 4.16.4.2 and 4.16.5.2 in Recreation and Tourism describe how changes in the amount of fresh water due to the MBSD Project would impact recreation and tourism. As noted, there would be adverse impacts on-site accessibility, recreational boating, and boat-based recreational fishing due to tidal flooding, sedimentation, and invasive plants. There would be adverse impacts on recreational fishing for spotted seatrout and beneficial impacts on recreational fishing for red drum.

CPRA has developed a suite of mitigation and stewardship measures to help address and offset Project impacts (see the Draft Mitigation and Stewardship Plan in Appendix R1 to the Draft EIS). In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA

permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61906

The MBSD Project would cause loss and detrimental impacts on the recreational and sport fishing industry in the Barataria Basin.

Response ID: 16236

The issues raised by the commenters were considered in the Draft EIS. EIS Chapter 4, Section 4.16.5.2 in Recreation and Tourism acknowledges that the proposed Project would impact recreational and sport fishing in the Barataria Basin. Relative to the No Action Alternative, the proposed Project would cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts on these species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips.

Concern ID: 61907

Commenters suggested that recreational activities would need to be limited to protect the area as it is recovering. In addition, water activities can cause changes to the outflow of sediments.

Response ID: 16237

The issues raised by the commenters were considered in the Draft EIS. EIS Chapter 4, Section 4.16.5.2 in Recreation and Tourism describes how the proposed Project would impact recreational and sport fishing in the Barataria Basin, including the potential for the Project to affect site accessibility due to sedimentation in some navigation channels. Permanent, moderate, adverse impacts on boat-based recreation may occur where sedimentation from proposed Project operations accumulates to the extent that water depths decrease and restrict access to deeper draft vessels.

Concern ID: 61908

Commenters suggested that there will be detrimental impacts on the tourism economy and on restaurants, which are partly

dependent on fisheries in the Barataria Basin. Commenters express concerns about adverse effects on Louisiana's attractiveness as a fishing area and place for swamp tours and authentic seafood.

Response ID: 16238

EIS Chapter 4, Section 4.16.5.2 in Recreation and Tourism describes how the MBSD Project would impact the tourism economy that is dependent on fisheries. Relative to the No Action Alternative, the proposed Project would cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts on these species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips. As described in the EIS, these changes would not substantially impact the broad tourism economy, which includes more than fisheries.

While availability of shrimp and oysters from the basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's Preferred Alternative than under the No Action Alternative.

This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

Concern ID: 61909

The MBSD diversion structure and any newly built land should be open to the public for access and enjoyment.

Response ID: 16239

According to CPRA, due to concerns about safety of the public and security for the Project facilities, there is not a plan to make the diversion structure or immediate outfall area accessible for public use. CPRA is, however, planning to provide signage and other public space near the Project to educate the public regarding the purpose and functioning of the Project. CPRA also states that ownership of any lands created by operation of the Project will be determined in accord with current state law, including mineral rights pursuant to La. R.S. 31:149 and La. R.S. 49:214.5.5(E) and that pursuant to La. R.S.

49:214.5.5(B), the Project will not create any rights to the public in or on private property.

Chapter 4, Section 4.16.5.2 in the EIS describes how an increase in wetland habitat from the MBSD relative to the No Action Alternative may result in increased opportunities for bird nesting and bird watching in some areas of the Barataria Basin. However, the MBSD Project would accelerate wetland loss in other areas such as the birdfoot delta.

Concern ID: 61910

The MBSD Project would help wildlife, fisherman, recreationalists, and hunters who depend on a healthy coast in the long term.

Response ID: 16240

EIS Chapter 4, Sections 4.16.4.2 and 4.16.5.2 in Recreation and Tourism describe anticipated effects of the MBSD Project on wildlife viewing, recreational fishing, hunting, and other recreational activities that utilize the Project area. As compared to the No Action Alternative, long term minor to moderate adverse impacts on-site accessibility, recreational boating, and boat-based recreational fishing due to increased tidal flooding at access points at Lafitte, Myrtle Grove, and Grand Bayou, as well as introduction and spread of invasive species, are anticipated. The proposed Project would also cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum throughout the basin. Beneficial impacts on hunting and wildlife watching due to an increase in wetland habitat in some areas of the Barataria Basin are also anticipated.

CPRA has developed a suite of mitigation and stewardship measures to help address and offset Project impacts, including those related to recreation (see the Draft Mitigation and Stewardship Plan in Appendix R1 to the Draft EIS). In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the

Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

EC61600 – Public Lands

Concern ID: 62269	The commenter stated that the Public Lands section of the Draft EIS Executive Summary did not provide details on how public lands in the proposed Project area would be impacted by the proposed Project.
Response ID: 16441	Chapter 4, Section 4.17 Public Lands in the EIS provides a detailed discussion of potential impacts on public lands in the Project area.
Concern ID: 62267	The commenter expressed concern that the proposed MBSD Project's adverse impacts on wetland loss in the birdfoot delta would cause a loss of public lands in the Delta National Wildlife Refuge (NWR) and in the Pass A Loutre Wildlife Management Area (WMA). The commenter recommended that these adverse impacts on public lands be mitigated by creating state and federal public lands in the Project outfall area.
Response ID: 16439	The commenter's concern that the proposed Project would cause a loss of wetlands in the Delta NWR and in the Pass A Loutre WMA, both of which are located in the birdfoot delta, was addressed in the Draft EIS in Chapter 4, Section 4.17.4 Operational Impacts in Public Lands. As part of its responsibilities under the Fish and Wildlife Coordination Act and as operator of the Delta NWR, the USFWS recommended the creation of crevasses to build land in the birdfoot delta to offset MBSD Project-induced wetland losses of 926 acres in the Delta NWR and 37 acres in the Pass A Loutre WMA (see Appendix T, USFWS Coordination Act Report (CAR), of the Final EIS). In response to

USFWS' CAR Recommendation, CPRA agreed that, "Within 5 years of the commencement of Project operations, CPRA or the LA TIG will provide \$10,000,000 of additional funding for wetland preservation and restoration work in the Delta NWR and the [Pass A Loutre] PAL WMA to offset modeled acres of indirect wetland losses in those areas. That funding may be accomplished through additional funding through the CWPPRA program, through additional restoration work sponsored by the LA TIG (for example, construction of the Engineering and Design work discussed in the DWH LA TIG's Restoration Plan and Environmental Assessment #7), or through a direct contribution for additional work. The funding will be proportioned between the Delta NWR and the PAL WMA based on the magnitude of the predicted wetland loss in each area" (Final EIS, Appendix R1 Mitigation and Stewardship Plan, Section 4.6 Fish and Wildlife Coordination Act).

This information was updated in the Final EIS, Chapter 4, Section 4.27.1 in Mitigation Summary and in the Final EIS, Section 4.17.4.2.2 Birdfoot Delta in Public Lands.

Concern ID: 62268

The Barataria Basin is home to the Delta National Wildlife Refuge and the Pass A Loutre Wildlife Management Area. The proposed MBSD Project is expected to result in the loss of 2,000 to 3,000 acres of wetlands by 2070 in these areas. The EIS should discuss the expected land loss in these wildlife areas and the effects on the wildlife that rely upon this natural habitat.

Response ID: 16440

The projected loss of wetlands in the Delta NWR and the Pass A Loutre WMA is discussed in Chapter 4, Section 4.17.4 Operational Impacts in Public Lands. Information about the effects of this loss on wildlife that rely on the wetland habitat in these public lands has been added to Section 4.17.4.2 in Public Lands in response to this comment. As part of its responsibilities under the Fish and Wildlife Coordination Act and as operator of the Delta NWR, the USFWS recommended the creation of crevasses to build land in the birdfoot delta to offset MBSD Project-induced wetland losses of 926 acres in the Delta NWR and 37 acres in the Pass A Loutre WMA (see Appendix T USFWS Coordination Act Report (CAR) of the Final EIS). In response to USFWS' CAR Recommendation, CPRA agreed that "Within 5 years of the commencement of Project operations, CPRA or the LA TIG will provide \$10,000,000 of additional funding for wetland preservation and restoration work in the Delta NWR and the [Pass A Loutre] PAL WMA to offset modeled acres of indirect wetland losses in those areas. That funding may be accomplished through additional funding through the CWPPRA program, through additional restoration work sponsored by the LA TIG (for example, construction of the Engineering and Design work discussed in the DWH LA TIG's Restoration Plan and Environmental Assessment #7), or through a direct contribution for additional work. The funding will be proportioned between the Delta

NWR and the PAL WMA based on the magnitude of the predicted wetland loss in each area” (Final EIS, Appendix R1 Mitigation and Stewardship Plan, Section 4.6 Fish and Wildlife Coordination Act).

This information was updated in the Final EIS, Chapter 4, Section 4.27.1 in Mitigation Summary and in the Final EIS, Section 4.17.4.2.2 Birdfoot Delta in Public Lands.

Concern ID: 62271

The proposed Project would have permanent and detrimental impacts on Plaquemines Parish as a whole because it would starve the birdfoot delta, including the Delta NWR and Pass A Loutre WMA, of needed sediment.

Response ID: 16442

The commenter’s concern that the proposed Project would cause a loss of wetlands in the Delta NWR and in the Pass A Loutre WMA, both of which are located in the birdfoot delta, was addressed in the Draft EIS in Chapter 4, Section 4.17.4 Operational Impacts in Public Lands. As part of its responsibilities under the Fish and Wildlife Coordination Act and as operator of the Delta NWR, the USFWS recommended the creation of crevasses to build land in the birdfoot delta to offset MBSD Project-induced wetland losses of 926 acres in the Delta NWR and 37 acres in the Pass A Loutre WMA (see Appendix T USFWS Coordination Act Report (CAR) of the Final EIS). In response to USFWS’ CAR Recommendation, CPRA agreed that “Within 5 years of the commencement of Project operations, CPRA or the LA TIG will provide \$10,000,000 of additional funding for wetland preservation and restoration work in the Delta NWR and the [Pass A Loutre] PAL WMA to offset modeled acres of indirect wetland losses in those areas. That funding may be accomplished through additional funding through the CWPPRA program, through additional restoration work sponsored by the LA TIG (for example, construction of the Engineering and Design work discussed in the DWH LA TIG’s Restoration Plan and Environmental Assessment #7), or through a direct contribution for additional work. The funding will be proportioned between the Delta NWR and the PAL WMA based on the magnitude of the predicted wetland loss in each area” (Final EIS, Appendix R1 Mitigation and Stewardship Plan, Section 4.6 Fish and Wildlife Coordination Act).

This information was updated in the Final EIS, Chapter 4, Section 4.27.1 in Mitigation Summary and in the Final EIS, Section 4.17.4.2.2 Birdfoot Delta in Public Lands.

EC61700 - Land Use/Cover

Concern ID: 63129

The proposed Project would have no land gain in the first 20 years.

Response ID: 16277

Land gains and losses are discussed in Chapter 4, Section 4.2.3 in Geology and Soils of the EIS. As reported in this section, the proposed Project would introduce significant volumes of sediment into the Barataria Basin, most of which is expected to be retained. Further, as discussed, the Delft3D Basinwide Model suggests that an expected net addition of 53 mcy of sediment would be retained in the proposed Project area (Barataria Basin and birdfoot delta) by 2030 and 310 mcy by 2070, which would result in the net creation of 4,980 acres (7.8 square miles) of land by 2030, and 17,300 acres (27.0 square miles) by 2050. The Executive Summary and Section 4.2.3.2.2.1 Geology of the Final EIS have been revised to clarify ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed Project operations.

Concern ID: 63130

Commenters noted that the Draft EIS classified Midway’s property as a mix of “barren” and “pasture/hay” (see Figure 4.18-1). They believe that this classification is incorrect as Midway is currently operating a borrow site on approximately 250 acres of the property. For the remaining acreage, Midway has an application pending with the Louisiana Department of Natural Resources, Office of Coastal Management for a coastal use permit to operate this acreage as a borrow site. However, elsewhere in the Draft EIS (see Chapter 4, Section 4.2.4.1 in Geology and Soils), the Midway borrow site is referenced by name. Thus, Midway’s property should be classified and assessed as “developed” in Section 4.18 Land Use and Land Cover.

Response ID: 16279

As discussed in Chapter 3, Section 3.18.2 in Land Use and Land Cover and referenced in Chapter 4, Section 4.18 Land Use and Land Cover, Figure 4.18-1 of the EIS, the existing land use types within the construction footprint are based on the 2016 National Land Cover Dataset (NLCD) (Multi-Resolution Land Characteristics Consortium 2016). The construction footprint shown in Figure 4.18-1 includes the proposed site of the diversion structure. None of the permitted or developed borrow pits owned by Midway Cattle are located in the construction footprint of the diversion structure and therefore they are not included in the land use acreages shown in Table 4.18-1 or land use types shown in Figure 4.18-1. Note, the NLCD is based on land cover including water, vegetation, or tree canopy; therefore, it may not reflect current use of land. The Myrtle Grove USACE-approved borrow site referred to in Section 3.2.3.1 Non-Fuel Mineral Resources and in Section 4.2.3.4 in Mineral Resources of the Draft EIS is located near the proposed construction footprint. For clarity, its name has been revised to the Midway Cattle Ranch borrow pit in the Final EIS.

Concern ID: 63128

The impacts on land use and land cover should be discussed with reference to the delta cycle.

Response ID: 16275

The commenter's request regarding the evaluation of impacts on land use and land cover is acknowledged. To help address these concerns, additional discussions of the delta cycle, and the role that the diversion may play in this cycle, has been added to the Final EIS in Chapter 3, Sections 3.1.4.2 Barataria Basin and 3.2.1.1 Historic Context, and Chapter 4, Section 4.2.3.2.2.3 Geomorphology. However, it is important to note that, as identified in Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative and discussed throughout Chapter 4 Environmental Consequences of the EIS, the No Action Alternative is compared to existing conditions to understand the anticipated changes in the environment that would occur irrespective of the proposed Project. Thereafter, the anticipated environmental consequences of the proposed Project action alternatives are compared to the results of the No Action Alternative analysis. Section ES.1 Introduction and Authority of the Executive Summary has been revised in the Final EIS to include this clarification.

EC61800 - Aesthetic and Visual Resources

Concern ID: 63125

The commenter's home is on a bayou off of the Bay of St. Louis on the beautiful Mississippi Gulf Coast. According to the commenter, in 2019 when the Bonnet Carré Spillway was opened, it caused swarms of flies, algae, and disgusting odors in the beautiful community that took months to return to normal. The flies that swarmed homes, cars, and boats permanently stained anything they sat on.

Response ID: 16283

The proposed Project is not anticipated to have discernable effects on aquatic life outside of the Project area, which is limited to Louisiana, and particularly the Barataria Basin and the Mississippi River birdfoot delta, as defined in Chapter 3, Section 3.1.1 in Introduction of the EIS; therefore, negligible to no impacts on the Mississippi Sound are anticipated from the construction and operation of the proposed MBSD Project. It is important to note that the Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological purposes. However, a summary of select natural and man-made diversions in southeastern Louisiana, including the Bonnet Carré Spillway, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS and discusses

conditions that might have led to stagnant waters and/or odors after the Bonnet Carré Spillway openings.

EC61900 – Public Health & Safety/Storm Hazard Risk Reduction

Concern ID: 62220

The Project would inundate access roads and properties, some of which are newly built infrastructure projects.

Response ID: 15755

Draft EIS Chapter 4, Section 4.13.5.1 (Socioeconomics, Economy, Employment, Business, and Industrial Activity, Flooding and Storm Hazards) and 4.20.4.2 Public Health and Safety, Operational Impacts, Floodplains and Tidal Flooding discussed the increased flooding impacts outside of federal levee systems, including road inundation and infrastructure damage, potentially caused by the operation of the diversion. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and/or other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. The USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62221

The Project would not provide substantial protection from hurricanes or storm surge, nor would storm surge protection be provided in a timely manner. The area most likely to experience some increase in protection would be subject to increased water levels from diversion operations. The current diversion Project needs to be reengineered to create meaningful storm surge protection. The Project is a misuse of funds based on what the diversion would do versus what it purports to do, in part due to the Mississippi River not having enough sediment to build substantial land.

Response ID: 15756

While the proposed Project would impact storm surge, the purpose and need of the Project is not storm surge protection. As described in the Draft EIS in Chapter 1, Section 1.4 Purpose and Need, the purpose of the Project is to restore injuries caused by the DWH oil spill and help restore habitat and ecosystem services injured by the spill by reestablishing deltaic processes. However, as described in the Draft EIS in Chapter 4, Section 4.20.4 Public Health and Safety, the Project

would have the ancillary benefit of storm damage risk reduction on communities north of the diversion due to the creation and maintenance of wetland habitat within the delta formation area; the increase in topography and land acreage would induce greater hydraulic friction and resistance, reducing the inland extent of storm surge and limiting wave heights in some communities north of the diversion, as compared to the No Action Alternative. The EIS acknowledges that storm surge and wave height reduction benefits for some communities north of the diversion would not be instantaneous, but that these benefits would increase over time as more land is created and maintained within the delta formation area. The EIS also acknowledges that some of the same communities that would experience storm surge reduction benefits, such as Lafitte, would experience an increase in non-storm inundation frequency due to increased water levels from diversion operations. At the same time, operation of the Project would have permanent, minor to moderate, adverse impacts on storm hazards in communities south of the diversion, with anticipated increases in storm surge of up to 1.7 feet near Myrtle Grove (as compared to the No Action Alternative). Section 4.20.4.2.2.2 in Public Health and Safety of the Final EIS has been revised to include additional information and figures further explaining the impacts of the Project on storm surge and wave height.

The EIS recognizes the role of sediment load in land building. The river still carries a massive sediment load, but not as massive as it historically carried. As explained in Chapter 3, Section 3.4.2.5 in Surface Water and Coastal Processes, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes as described in Section 3.4.2.5 Sediment Transport. The Delft3D Basinwide Model used Mississippi River sediment loads when computing the sediment load that would be delivered to the Barataria Basin. This is described in detail in the EIS, Appendix E Delft3D Modeling, Section 5.2.2.

Concern ID: 62223

The alteration of Mississippi River flows and/or MRL could cause erosion or collapse of the MRL and result in catastrophic flooding.

Response ID: 15749

Section 14 of the Rivers and Harbors Act of 1899 (33 USC 408), referred to as Section 408, authorizes the Secretary of the Army, through the Chief of Engineers, to grant permission for the alteration, occupation, or use of a USACE Civil Works project if the Secretary determines that the activity will not be injurious to the public interest and will not impair the usefulness of the project. Because the proposed

Project has the potential to directly and/or indirectly impact the Mississippi River Levee, New Orleans to Venice Levee, and the Mississippi River Navigation Channel, which are USACE Civil Works projects, CPRA has requested Section 408 permission to construct and operate the Project. The USACE 408 Review process includes a review of the technical adequacy of the Project design, including all appropriate technical analyses, including geotechnical, structural, hydraulic and hydrologic, construction, safety and operations and maintenance requirements. A Section 408 permission would not be granted unless the proposed modifications to the civil works projects would not limit the ability of the USACE Project to function as authorized and would not compromise or change any authorized Project conditions or purposes. The USACE Section 408 review is ongoing and the findings of this review will be disclosed in the Record of Decision.

Concern ID: 62224

Communities like Happy Jack, Lake Hermitage and Myrtle Grove, some of which have homes that are not above the new base flood elevation, already experience some degree of flooding which would be made worse by the diversion. This would affect the ability of residents to access and enjoy their homes and communities.

Response ID: 15757

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discuss the anticipated increased flooding impacts outside of federal levee systems to be caused by the operation of the diversion. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes, which would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA

and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62225

Plaquemines Parish could experience flooding from the diversion similar to flooding due to the Mississippi River Gulf Outlet. Commenter asked if the diversion would be closed if it causes such flooding.

Response ID: 15758

As described in Draft EIS Chapter 2, Section 2.8 Action Alternatives Carried Forward for Detailed Analysis, the proposed Project design includes earthen guide levees that would be constructed along both sides of the diversion conveyance channel. The portion of the guide levees on the protected side of the New Orleans to Venice Levee system (NOV-NF-W-05a.1) would be designed and built as hurricane and storm damage risk reduction levees against storm surges that may enter the diversion channel. A gated control structure would also be built on the Mississippi River side of the conveyance channel, and the gate would be closed prior to and during storm events. Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discusses the increased flooding impacts potentially caused by the operation of the diversion.

CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property

owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components

of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62226

The diversion would destroy the property in which commenters have made substantial investment.

Response ID: 15750

Draft EIS Chapter 4 Section 4.13.5.3 in Socioeconomics discussed impacts of the proposed Project on property values. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitude. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62227

The diversion would flood access roads, damage vehicles, cause siltation/sludge, cause cancellation of flood insurance, inundate cemeteries, stress levees, impact provision of emergency services, and increase the cost to raise homes, slabs and wharves.

Response ID: 15820

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discusses the increased flooding impacts outside of federal levee systems, including road inundation and infrastructure damage, anticipated to be caused by the operation of the diversion. Sections 4.13.5.1.2.1 and 4.13.5.3.2.1 in Socioeconomics of the Final EIS has been updated to include potential impacts such as vehicle damage, accumulation of siltation and sludge, cemetery inundation and interruption of emergency services. Recognizing the potential for these impacts, CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will

possess the requisite property interest to undertake the activity proposed in the application.

The Final EIS concludes that the proposed Project would not have impact on the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62228

The commenter feels that the hydrology study is outdated, and the proposed diversion would have a more significant impact on the

commenter's property than projected, due to current environmental conditions.**Response ID: 15796**

The Delft3D Basinwide Model represents the best tool currently available to inform impact analysis for the EIS. Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the No Action Alternative. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures such as raising roads or improving bulkheads in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62229

The storm surge could back up into the diversion and cause flooding in Plaquemines Parish.

Response ID: 15751

As described in the Draft EIS Chapter 2, Section 2.8 Action Alternatives Carried Forward for Detailed Analysis, the proposed Project design includes earthen guide levees that would be constructed along both sides of the diversion conveyance channel. The portion of the guide levees on the protected side of the New Orleans to Venice Levee system (NOV-NF-W-05a.1) would be designed and built as hurricane and storm damage risk reduction levee to reduce risk against storm surges that may enter the diversion channel. A gated control structure would also be built on the Mississippi River side of the conveyance channel, and the gate would be closed prior to and during storm events.

Concern ID: 62230

Commenter states that the EIS incorrectly characterizes an increase in water surface elevation as an increase in tidal flooding. Commenter notes that, in any case, increases in flooding are not due solely to the diversion, but instead are due to many factors.

Response ID: 15753

In the context of this EIS, the term “tidal flooding” is used to distinguish non-storm related coastal flooding from coastal flooding caused by storm surge and/or waves. The Draft EIS acknowledged that changes in water levels within the Barataria Basin are influenced by a number of factors, including winds, tides, sea-level rise, and subsidence. The Draft EIS also noted that floodplains within the Project area would continue to be subject to hydrological changes associated with relative sea-level rise, leading to increased water levels throughout the basin, regardless of the implementation of the proposed Project (see Section 4.20.4.2 Operational Impacts, Floodplains and Tidal Flooding). As described in the introduction of Chapter 4 Environmental Consequences the potential impacts of the proposed Project are projected by comparing the anticipated environmental consequences of the proposed Project to the anticipated consequences of No Action in order to isolate the potential impacts of the proposed Project. Therefore, the EIS acknowledges the role of other factors in increased water levels in the basin while recognizing the proposed Project as one of these factors.

Concern ID: 62232

Flooding risk due to operation of the diversion should be estimated based on an assumption that predictable flooding risk would result in closing of the structure temporarily, reducing such risk attributable to operation of the diversion.

Response ID: 15759

For the purposes of the impact assessment in the Draft EIS, it was assumed that the proposed Project would be operated according to CPRA’s Preliminary Operations Plan, Draft EIS Appendix F MBSD Design and Operations Information. This Plan indicates that the diversion gates would be opened fully (above base flow) when flow in the Mississippi River at Belle Chasse exceeds the “trigger” of 450,000 cfs. The Plan includes criteria for modifying or ceasing operations, including damage to the diversion structure, spills of other hazardous discharges, severe impediments to navigation, tropical storm activity, or threats to public safety. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally,

impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62233

Restoration of coastal habitat and the delta would provide protection from storm damage.

Response ID: 15752

While the intent of the proposed Project is to reestablish deltaic processes to restore resources injured by the DWH oil spill, the Draft EIS Chapter 4, Section 4.20.4.2 Public Health and Safety described the ancillary benefit of storm damage risk reduction on communities north of the proposed diversion due to the creation and maintenance of wetland habitat and increases in topography and land acreage within the delta formation area. At the same time, operation of the Project would have permanent, minor to moderate, adverse impacts on storm hazards in communities south of the diversion, with anticipated increases in storm surge of up to 1.7 feet near Myrtle Grove (as compared to the No Action Alternative). Section 4.20.4.2.2.2 in Public Health and Safety of the Final EIS has been revised to include additional information and figures further explaining the impacts of the Project on storm surge and wave height

Concern ID: 62234

There was not a hydrology report in the Draft EIS showing the impact upon the water levels.

Response ID: 15760

The EIS does not include a separate, stand-alone hydrology report; however, hydrology is one of the outputs provided by the Delft3D Basinwide Model. The results of this modeling are included in Appendix E, Delft3D Modeling. Based on these results, several sections of the Draft EIS discussed the projected impacts on water

levels throughout the basin for all Project alternatives, including in the vicinity of Myrtle Grove. These sections include Section 4.4 Surface Water and Coastal Processes and Section 4.20 Public Health and Safety. These sections are supplemented by additional information in Appendix P Flood & Storm Hazards Evaluation.

Concern ID: 62236

The commenter asserts that information provided in several sections of the Draft EIS and in presentations are inconsistent and would like to know what the actual impact to Myrtle Grove would be.

Response ID: 15822

The USACE acknowledges the commenters' concerns regarding the consistency and accuracy of the reported projections. USACE is the lead agency for development of this EIS, which contains the results from the Delft3D Basinwide Model regarding the projected effects of the Project on water levels in Barataria Basin, including areas close to the diversion outfall (within a 20-mile radius). The estimated flooding impacts in Myrtle Grove are described in Chapter 4, Sections 4.20.4.2.1.2 and 4.20.4.2.2.2 in Public Health and Safety. USACE is not familiar with other numbers that may have been reported by CPRA. Readers of the EIS should not consider the model outputs as absolute values or predictions of actual future conditions. Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future conditions. Uncertainties are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 (Model Limitations and Uncertainty), and in detail in Appendix E Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties.

Concern ID: 62282

Diversion impacts, including land loss in the birdfoot delta, would make lower Plaquemines more vulnerable to storms.

Response ID: 15805

Draft EIS Chapter 4, Section 4.6.5 in Wetlands and Waters of the U.S. described the projected acceleration of wetland loss in the birdfoot delta caused by the proposed Project and Section 4.20.4.2 in Public Health and Safety acknowledged lower Plaquemines' increased vulnerability to storm hazards that would result from operation of the proposed Project. While the Draft EIS acknowledged the role that land loss plays in increased storm hazards, it did not explicitly acknowledge the role this accelerated land loss in the birdfoot delta could play in increased storm hazards. Section 4.20.4.2.2.2 in Public Health and Safety has been edited in the Final EIS to include acknowledgement that this

accelerated loss of wetlands in the birdfoot could increase storm hazard vulnerability depending on the storm path and intensity.

In the LA TIG's Draft Restoration Plan, the LA TIG recognized the potential collateral injuries associated with the Project, including potential land loss in the birdfoot delta. In selecting the Applicant's Preferred Alternative, the LA TIG evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide what it believed to be the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7, 3.2.1.5, and 3.2.2.5 of the Final Restoration Plan for more information about the LA TIG's selection of the Applicant's Preferred Alternative.

Concern ID: 62284

Projections for increased water levels seem lower than what would be expected because the river water levels quoted are much lower than the river has averaged in recent years, and showing the "average" water level increases means that there would be higher peak water levels that are most damaging.

Response ID: 15812

The Delft3D Basinwide Model represents the best tool currently available to inform the impact analysis for the EIS. Draft EIS Chapter 4, Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the No Action Alternative.

While Draft EIS Section 4.4.4.2 in Surface Water and Coastal Processes referenced average water levels to generally illustrate impacts to water levels for each alternative, Section 4.20.4.2 in Public Health and Safety used daily projected peak water surface elevations to estimate potential tidal (non-storm) flooding in communities outside federal levee systems. This analysis of daily peak water surface elevations utilized model outputs that were based on the 2011 Mississippi River Hydrograph, which was a "high flow" year when the diversion was projected to be operating at or near maximum capacity for several months.

Concern ID: 62287

Individuals who chose to invest money outside of the levee protection did so accepting responsibility for impacts from storms, but not man-made damage.

Response ID: 15809

The USACE acknowledges the commenter's concern regarding increased flooding from the proposed Project. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures such as raising roads or improving bulkheads in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature

on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62289

Hurricanes could potentially delay the timeline of the Project.

Response ID: 15799

It is not clear whether the commenter is referring to a delay in the timeline for construction of the Project or in the rate of land building over 50 years, so this response addresses both. As for construction, there are contingencies built into the Project schedule to account for weather delays. In regard to the rate of land building over 50 years, the Delft3D Basinwide Model projections do not account for wetland erosion from hurricanes. However, it should be noted that if one or more hurricanes were to cause wetland loss during the 50-year

analysis period, land building from the proposed Project would still result in a greater acreage of remaining wetlands than under the No Action Alternative. Additional analysis regarding the potential impact of hurricanes and saltwater inundation on the extent of wetlands in the Project area has been added to Chapter 4, Section 4.6.5.1 Wetland Types and Extent of the Final EIS.

Concern ID: 62291

A commenter expressed concern that the amount of land building would be inefficient given increased water level and flood risk.

Response ID: 15807

One objective of the Project is the delivery of fresh water, nutrients and sediment beyond the outfall area. The ability of a large-scale diversion to deliver sufficient amounts of sediment and nutrients to sustain existing and created marsh was a factor that led to its selection as the Applicant's Preferred Alternative. The EIS's evaluation of alternatives, which includes the potential impact of sea-level rise, is discussed in Chapter 2. As part of its decision, USACE will conduct a public interest review, which weighs the probable harms that would be caused by a project against its prospective benefits.

See Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5, of the LA TIG's Restoration Plan for a discussion regarding the LA TIG's evaluation of the range of alternatives and identification of the LA TIG's Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54 and strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the Preferred Alternative.

Concern ID: 62292

Ironton will be at risk from storm surge which would be made worse by the diversion.

Response ID: 15810

As described in the Draft EIS Chapter 2, Section 2.8 Action Alternatives Carried Forward for Detailed Analysis, the proposed Project design includes earthen guide levees that would be constructed along both sides of the diversion conveyance channel. The portion of the guide levees on the protected side of the New Orleans to Venice Levee system (NOV-NF-W-05a.1) would be designed and built as hurricane and storm damage risk reduction against storm surges that may enter the diversion channel. A gated control structure would also be built on the Mississippi River side of the conveyance channel, and the gate would be closed prior to and during storm events.

Draft EIS Chapter 4, Section 4.20.4.2 in Public Health and Safety provided projected changes in storm surge elevation due to the proposed Project, including increased storm surge elevation in the vicinity of the portion of the NOV-NFL Levee system which provides risk reduction to Ironton. Depending upon the strength and path of a given storm, storm surge could overtop the NOV-NFL Levee, both with or without the proposed Project; however, as described in Section 4.20.4.2, the proposed Project would increase the risk and volume of potential overtopping.

Concern ID: 62297

The Draft EIS does not specifically quantify the storm surge increase in the Midway Cattle Ranch area and therefore does not adequately address the impacts of storm surge on Midway's property. However, it is clear that such impacts would be significant.

Response ID: 15804

While the EIS does not describe storm surge impacts at the parcel level, it does provide an analysis of impacts to storm surge elevations and wave heights in comparison to the levee heights which provide storm risk reduction to such parcels. For example, Figure 4.20-24 in Chapter 4, Section 4.20.4.2 Public Health and Safety of the Draft EIS showed projected storm surge and wave height in comparison to levee heights in the vicinity of Midway's property. As shown in the figure and described elsewhere in Section 4.20.4.2, the proposed Project would decrease storm surge elevation north of the diversion, decreasing the risk associated with overtopping of the levee in the vicinity of Midway's property. However, it should be noted that, as described in Section 4.20.4.2, some storms are projected to overtop this reach of the NOV-NFL Levee, both with or without the proposed Project.

Concern ID: 62299

The commenter asserts that they do not intend to grant a flowage easement to allow USACE to flood their property and deny them access to their property at USACE's discretion.

Response ID: 15801

The proposed Project would be a CPRA project, not a USACE project; therefore, CPRA would seek any flowage easements not USACE. Additional detail on the CPRA's proposed flowage easements, referred to as Project servitudes, can be found in Final EIS Appendix R1, Mitigation and Stewardship Plan.

CPRA plans to acquire Project servitudes in the communities south of the diversion outside of levee projection beginning at Woodpark and continuing south to Grand Bayou and Happy Jack. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project

servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. The USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62300

The diversion would cause harmful algal blooms which have unforeseen risks to human health, including Amnesic Shellfish Poisoning (ASP), Neurotoxic Shellfish Poisoning (NSP), Paralytic Shellfish Poisoning (PSP), Diarrhetic Shellfish Poisoning (DSP) and Ciguatera Fish Poisoning (CFP).

Response ID: 15813

The impacts raised by the commenters have been considered in the Draft EIS. As discussed in the EIS, Chapter 4, Sections 4.5.5.3 and 4.5.5.4 in Surface Water and Sediment Quality, increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations. Vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin than in the river and reaching the Gulf through Barataria Bay.

Section 4.10.4.4 in Aquatic Resources notes that an increased potential and frequency of phytoplankton blooms would be likely within the Project area, but whether or not these blooms would become harmful algal blooms cannot be definitely determined. A reference to Section 4.10 is included in Section 4.5.5.3 in Surface Water and Sediment Quality of the Draft EIS. A reference to Section 4.10 Aquatic Resources has been added to Section 4.5.5.4 (Phosphorus) of the Final EIS. Clarifying language has been added to Sections 4.5.5.3, 4.5.5.4, and 4.25.5.4 in Cumulative Impacts.

Section 4.14 Commercial Fisheries has been updated in the Final EIS to discuss the National Shellfish Sanitation Program and the Louisiana Department of Health's oversight of shellfish harvesting in order to prevent harvest of oysters that may contain unsuitable levels of fecal coliform or toxins harmful to human health. Additionally, Appendix R2 in the Final EIS includes a Monitoring and Adaptive Management (MAM) Plan that describes monthly fecal coliform monitoring (Section 3.7.5.1) and periodic sampling for Contaminants of Concern in fish, shellfish, and wildlife (Section 3.7.3.23).

Additionally, as described in Appendix R2 CPRA's MAM Plan of the EIS, Section 3.7.3.11, CPRA is proposing to monitor for Harmful Cyanobacterial/Algal Bloom Toxins in Barataria Surface Waters. Samples will be collected monthly and additional discrete sampling will be done as needed in response to observations of presence of cyanobacterial and/or eukaryotic algal species associated with harmful algal bloom. Filter feeding fish may also be analyzed for toxins in fish tissue.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62308

The Draft EIS mentions a reduction in storm surge of 0.5 to one foot north of the Project but could say more about the consequence and benefits of that decrease.

Response ID: 15803

Additional information on the consequence and benefits of decreased storm surge north of the delta formation area was provided in Draft EIS Chapter 4, Section 4.13 Socioeconomics, 4.13.5 Operational Impacts. These benefits include reduced pressure of outmigration from affected coastal communities and beneficial impacts on housing, property values, and property tax revenue.

Concern ID: 62309

Operation of the MBSD has the capacity to reduce MR flood stage, reduce the tendency of the Lower MR to re-meander through bank caving, with attendant benefits for the structural integrity of the

Response ID: 15816	<p>levee system and the navigation channel. The EIS could be improved by providing quantitative estimates of these stage reductions and attendant benefits in terms of preventing damage to the navigation and flood control levees.</p> <p>Section 4.4 Surface Water and Coastal Processes of the Final EIS has been updated to include additional information regarding the effects of the proposed Project on river stage. The average predicted water level drop at Belle Chasse, caused by operation of proposed Project, is approximately 0.7 foot, when the river was flowing at 1.00 million cfs.</p>
Concern ID: 62310	<p>The 150k Alternative would roughly double the wetland creation benefits without doubling adverse impacts such as induced flooding.</p>
Response ID: 15818	<p>CPRA submitted a joint Section 10/404 permit application and Section 408 permission request to USACE for the construction, operation, and maintenance of a 75,000 cfs sediment diversion (LA TIG's Preferred Alternative). The EIS evaluates the Applicant's Preferred Alternative and five additional action alternatives as well as the No Action Alternative in order to inform USACE's permit and permission decisions and the LA TIG's NRDA decision in compliance with the statutes, orders, and policies outlined in EIS Chapter 5 Consultation and Coordination.</p> <p>Although the 150,000 cfs Alternative would result in the greatest degree of benefits (including the most land building), it also would result in the greatest degree of adverse impacts, particularly to dolphins (see Draft EIS Chapter 4, Section 4.11.5, Operational Impacts), shrimp and oysters (see Draft EIS Section 4.10.4.5, Key Species), and public health and safety (through tidal flooding in areas closer to the immediate outfall, see Draft EIS Section 4.20.4.2, Operational Impacts).</p> <p>See Sections 3.2.4.7, 3.2.1.5, and 3.2.2.5 of the LA TIG's Restoration Plan for a discussion regarding the LA TIG's evaluation of the range of alternatives and identification of the LA TIG's Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54 and it strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety.</p>
Concern ID: 62311	<p>Weather is a major factor in how the diversion impacts communities, and the weather cannot be predicted.</p>
Response ID: 15817	<p>The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties were incorporated into the EIS impact conclusions and are briefly summarized in the Draft EIS in Chapter 4,</p>

Section 4.1.3.3 Model Limitations and Uncertainty, and in detail in Appendix E Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties.

Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or as predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the model outputs projecting the changes that would occur for the No Action Alternative.

Concern ID: 62312	Investment in this type of resilient storm and flood protection infrastructure is critical.
Response ID: 15798	Draft EIS Chapter 4, Section 4.20.4.2 Public Health and Safety described the potential storm and flood protection benefits to some communities in the Project area and the adverse impacts and increased risks to other communities from the proposed Project.
Concern ID: 62313	The wetlands to the south of Morgan City/Berwick are an example of where sediment contributes to storm surge protection as the Atchafalaya and Wax Lake Delta are accreting sediment.
Response ID: 15806	Wetlands south of Morgan City/Berwick are outside of the scope of this EIS, which includes the Barataria Basin and the Mississippi River birdfoot delta. However, a summary of select diversions and diversion-like features in southeastern Louisiana was developed in response to public comments regarding how various diversions and diversion-like constructed or natural features have affected their receiving environments and their recorded impacts on the natural environment. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.
Concern ID: 62984	Man-made decisions and actions have caused climate changes, which has increased both frequency and destruction [of storms]. The loss of wetlands has greatly reduced the coast and allowed for more intense storm surges reaching further into the state.
Response ID: 15797	Draft EIS Section 3.6 Wetland Resources and Waters of the U.S. acknowledged the role that wetlands play in attenuating waves and storm surge, noting that communities sheltered by wetlands may sustain less damage from storm surge. This section also acknowledged that threats to wetland habitat include increased storm

frequency and intensity associated with climate change. Draft EIS Chapter 4, Section 4.20.4.2 Public Health and Safety acknowledged that coastal wetland loss can lead to increased storm surge.

Concern ID: 63008	The commenter states that all the communities living close to that region are suffering from loss, and the communities are dissolving into the Gulf as they are battered by hurricanes and sea-level rise.
Response ID: 15762	Draft EIS Section 3.20 Public Health and Safety recognized ongoing flooding impacts caused by the combination of multiple forces, including land loss, hurricanes, and sea-level rise, within the Project area.
Concern ID: 62294	The EIS needs to include explicit detail on the status of levees and analysis of impacts to nearby residents' home insurance and flood insurance costs.
Response ID: 15800	EIS Chapter 3, Section 3.20.3.1 Federal Risk Reduction Levees, provides information on the level of risk reduction or elevation to which each levee system was designed. EIS Chapter 4, Section 4.20.4.2 Public Health and Safety, provides an analysis of projected water levels through the 50-year analysis period as compared to the levee design heights throughout the Project area. Section 4.20.4.2 also explains that all permanent Project features such as guide levees that would be subject to storm surge and waves would be designed and built to provide a 50-year level of hurricane and storm damage risk reduction. Section 4.13.5.3 Housing and Property Values in Socioeconomics has been revised in the Final EIS to provide additional discussion of flood insurance due to MBSD impacts.
Concern ID: 62301	The commenter asked what the impacts to the base flood elevations would be for Plaquemines Parish West Bank residents. The commenter also asked how such changes would impact flood insurance rates, home elevation programs, and existing homes elevated in the past 10 years.
Response ID: 15814	Because both the existing level of drainage and federal flood risk reduction would be maintained, there would be no anticipated change to the FEMA FIRM designation or base flood elevations due to the construction of the diversion. Chapter 4, Section 4.13.5.3 Housing and Property Values in Socioeconomics has been revised in the Final EIS to provide additional discussion of the provision of flood insurance and other programs due to MBSD impacts.
Concern ID: 62302	The diversion would cause land loss, then create freshwater marshes which are more susceptible to saltwater impacts of storm surge and increasing future storm surge impacts.
Response ID: 15815	Additional analysis regarding the potential impacts of conversion from saline marsh and brackish marsh to fresh and intermediate marsh and on susceptibility to hurricanes and saltwater inundation in the Project

area during operations has been added to Chapter 4, Section 4.6.5.1 Wetland Types and Extent of the Final EIS.

Concern ID: 62303

The commenter asked what the impacts to the Plaquemines Parish’s forced drainage pump stations on the West Bank of the Mississippi River would be.

Response ID: 15819

As described in Draft EIS Section 4.4.5 Stormwater Management and Drainage, impacts on stormwater management and drainage between the MR&T- Levee and NOV-NFL Levee would be negligible. The proposed conveyance channel would bisect the existing drainage area served by the Wilkinson Canal Pump Station. To address this, the proposed Project would connect the bisected area by a siphon routed beneath the proposed conveyance channel. To maintain siphon flow, water levels within drainage canals within this drainage area south of the proposed diversion, including Timber Canal, would need to be lowered through operation of the Wilkinson Canal Pump Station.

USACE will consider whether this alteration of the Wilkinson Canal Pump Station operations meet 33 U.S.C. Section 408 standards as part of its Section 408 evaluation.

Concern ID: 62304

Computer modeling from various studies looking at predicted increases in water levels caused by diversion operations have shown wildly varying results.

Response ID: 15802

USACE and the LA TIG acknowledge that various modeling efforts may produce different water level projections in the Barataria Basin depending on the model boundary conditions (for example, diversion discharge, tide and sea level) and geometric data (bathymetry/topography and boundaries); however, we are not aware of any unexplainable large differences in water level predictions among the other various models used. Production-level models, such the Delft3D used for the Draft EIS, produce very similar projections when using the same boundary conditions and geometric data.

Concern ID: 62305

The threat of community flooding obviously increases with diversion discharge and proximity to the area of outfall. Additionally, some models suggest that outfall areas would be more prone to flooding in the early years of operations, and would need time for channels to evolve in order to expand capacity.

Response ID: 15824

Water level impacts in the basin were projected by the Delft3D Basinwide Model, as explained in Chapter 4, Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis and Section 4.4.4.2 Surface Water and Coastal Processes, Operational Impacts, Water Levels of the Draft EIS. Draft EIS Sections 4.4.4.2 Surface Water and Coastal Processes and Section 4.20.4.2 Public Health and Safety, Operational Impacts, Floodplains and Tidal Flooding both acknowledged that higher water levels and the risk of community

flooding increase with proximity to the diversion outfall. As stated in Section 4.4.4.2, maximum monthly average water levels nearest to the diversion outfall are projected to be highest in the first three modeled decades as compared to the No Action Alternative in the first three modeled decades. Additionally, in Section 4.2.3.2 Geomorphology in Geology and Soils, the Draft EIS discussed previous studies and modeling which indicate development of channel networks early (within 5 to 10 years) have occurred for other diversions in south Louisiana. These other diversions have both similarities and differences with the proposed MBSD Project but help inform potential impacts of the Project on geomorphology. MBSD Project diversion operations may result in a different land building and morphologic evolution than these examples.

Concern ID: 62307

Operating the diversion in the spring could cause increased water levels in the Terrebonne Basin through the GIWW, directly conflicting with flood fight efforts in Terrebonne. Real-time monitoring would be necessary.

Response ID: 15808

The Terrebonne Basin was not included in the Project area because no impacts are anticipated in that basin from the Project operations. As a result, Delft3D Basinwide Model water level projections were not modeled for this area. However, as shown in Figure 4.4-11 in Section 4.4 Surface Water and Coastal Processes of the Draft EIS, water levels were projected to increase less than one foot in the GIWW during spring operation of the proposed Project. As part of CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Final EIS), the existing USGS water level gage near Larose would be used for monitoring of water levels during diversion operation. However, the MAM Plan explains that this monitoring data would be used to inform Project partners as to whether, and to what extent, Project operations result in marsh inundation patterns that could potentially cause inundation stress on wetland vegetation. The MAM Plan does not include real-time monitoring for water levels within the GIWW for the purpose of diversion operational adjustments.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such

measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. The USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63002

The commenter states that residents of southeast Louisiana had 40 years between Hurricane Betsy in 1965 and Hurricane Katrina in 2005 to learn how to live with nature on a disappearing coast, and have squandered those 40 years, increasing the area's vulnerability and the number of people exposed to danger by expanding the footprint of development and doubling down on levees and pumps, paying the price as storm after storm devastates community after community.

Response ID: 15754

Comment noted. EIS Section 3.20 (Public Health and Safety, Including Flood and Storm Hazard Risk Reduction) provides the historical context of storm surge impacts.

Concern ID: 63006

The commenter suggests that southerly winds begin in spring and often last through fall, causing higher water levels and coastal flooding issues regardless of river stage. The commenter asserts that it will be difficult, from both a physical standpoint of high basin-side water levels as well as a sociopolitical standpoint of the perception of flood risk, to operate large-scale diversions during these months, noting that real-time monitoring will be a necessity.

Response ID: 15763

The Delft3D Basinwide Model simulations, which were used in the Draft EIS to project flood risk, included wind as one input as described in the EIS Appendix E Delft3D Modeling, Section 3.2.2 Atmospheric Forcing and summarized in Chapter 4, Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis. Meteorological data recorded throughout 2014, including windspeed and direction recorded at 6-hour intervals in the basin over the course of the year, was used in the

model. That data reflects the seasonal variation in wind speed and direction that occurred in the basin in 2014 and was factored into model outputs with respect to water levels. Appendix E Delft3D Modeling, Section 3.2.2 Atmospheric Forcing has been edited in the Final EIS to clarify this. Further, as part of CPRA's proposed Monitoring and Adaptive Management (MAM) Plan, Appendix R2 to the Final EIS, real-time monitoring of water levels during diversion operation would be collected at stations in the Mississippi River and Barataria Basin. However, the MAM Plan explains that this monitoring data would be used to inform Project partners as to whether, and to what extent, Project operations result in marsh inundation patterns that could potentially cause inundation stress on wetland vegetation. The MAM Plan does not include real-time monitoring for water levels for the purpose of diversion operational adjustments. CPRA's operation of the diversion based on Mississippi River flows is described in Chapter 2, Section 2.8.1.4 Project Operations of the EIS.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. The USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for

funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 64508

The proposed Project would introduce contamination that could potentially make fish and shellfish more harmful for public consumption.

Response ID: 15825

Chapter 4, Sections 4.5.5.3 through 4.5.5.9 of the EIS discuss anticipated changes in chemical concentrations in the Barataria Basin due to the proposed Project. The general impacts of these chemical compounds/nutrients on aquatic resources are discussed in Section 4.10.4.4 General Impacts on Habitat and the Environment. Potential contaminants, including sulfate, atrazine, and fecal coliform were also modeled and discussed in Sections 4.5.5.7 Sulfate and 4.5.5.9 Atrazine. The Delft3D Basinwide Model projects that the proposed Project would result in beneficial decreases in sulfate and would have negligible impacts on atrazine levels and they are therefore not specifically discussed in Section 4.10. A discussion of fecal coliform has been added to Section 4.10.4.4.2.5 Dissolved Oxygen of the Final EIS; however, it is not harmful to fish and shellfish themselves. Chapter 4, Section 4.10.4.4 General Impacts on Habitat and the Environment has also been supplemented in the Final EIS to discuss the potential for bioaccumulation of river water contaminants in biota of the Barataria Basin.

Section 4.14.4.2.3 in Commercial Fisheries has been updated in the Final EIS to discuss the National Shellfish Sanitation Program and the Louisiana Department of Health's oversight of shellfish harvesting in order to prevent harvest of oysters that may contain unsuitable levels of fecal coliform or toxins harmful to human health. Additionally, Appendix R2 in the Final EIS includes CPRA's Monitoring and Adaptive Management (MAM) Plan that describes monthly fecal coliform monitoring (Section 3.7.5.1) and periodic sampling for Contaminants of Concern in fish, shellfish, and wildlife (Section 3.7.3.23).

Concern ID: 64507

The assertion that the proposed Project impacts "tidal flooding" is an improper use of the term. Additionally, effects of increased surface water elevation can be minimized by proper operation of the diversion, such as by closing the structure when tropical storms are predicted, or when wind speeds and directions conducive to higher water surface elevations are predicted.

Response ID: 15827

In the context of this EIS, the term "tidal flooding" is used to distinguish non-storm related coastal flooding from coastal flooding caused by storm surge and/or waves. For the purposes of the impact assessment in the Draft EIS, it was assumed that the proposed Project would be operated according to CPRA's Preliminary Operations (Water Control) Plan (see Draft EIS Appendix F MBSD Design and Operations

Information). This Plan indicates that the diversion gates would be opened fully (above base flow) when flow in the Mississippi River at Belle Chasse exceeds the “trigger” of 450,000 cfs. The Plan includes criteria for modifying or ceasing diversion operations, including threats to public safety. The Plan also requires closure of the diversion gates and cessation of all diversion flows when tropical depressions or named storms are forecasted to impact the Barataria and Mississippi River Basins.

Concern ID: 62298

Flood management decisions throughout the basin are piecemeal by varied agencies.

Response ID: 15811

Draft EIS Section 3.20 Public Health and Safety acknowledged the varied entities responsible for federal and non-federal storm and flood risk reduction infrastructure, as well as state and local government roles in emergency response and evacuations, and local land use decisions (such as zoning) that affect flooding risks faced by homeowners and businesses.

EC62000 – Navigation

Concern ID: 61765

Keep the Port of New Orleans open and navigable.

Response ID: 16443

The issue raised by the commenter was considered in the development of the Draft EIS. The construction and operation of the proposed Project would have negligible impacts on the Port of New Orleans, including, but not limited to, negligible impacts on dredging and operations at the Port. Chapter 4, Section 4.21.4.1.2.1 Maintenance Dredging has been updated in the Final EIS to include a discussion of negligible impacts on the Port of New Orleans as a result of construction and operation of the proposed Project. Impacts to navigation are also discussed in that section.

Concern ID: 61766

The commenter expressed concern that a lack of a strong consistent flow in the Mississippi River has made the river more treacherous due to silting. Diverting more water from the river via the proposed MBSD diversion during low-water periods would further reduce the flow/velocity despite what the Draft EIS states, thereby eventually making the river too shallow to pass.

Response ID: 16444

The commenter’s concern about the proposed Project’s impacts on the safety and efficiency of vessel traffic was addressed in the Draft EIS. Operation of the proposed Project above 5,000 cfs would be limited to periods of higher flows in the river, as stated in Draft EIS Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis, when water depth and vessel clearance is less of an issue. However, the EIS recognizes that changes to sedimentation rates might

persist into the low-water season, as the commenter correctly notes. The several modeling efforts described in the EIS Chapter 4, Section 4.4 Surface Water and Coastal Processes and 4.21 Navigation, as well as in Appendix E Delft3D Modeling and in Appendix Q Navigation/Dredging Analysis, include projections of channel sedimentation impacts resulting from operation of the proposed diversion. The conclusion stated in those sections is that operation of the Applicant's Preferred Alternative is projected to cause "moderate, permanent, adverse impacts on dredging operations from Venice to the Gulf of Mexico."

Concern ID: 62283

The commenter questioned who would be responsible for maintaining/dredging the navigation channels in the areas impacted by proposed diversion operations.

Response ID: 16445

As stated in the Draft EIS in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the Project area during Project operations. Other non-federal channels and facilities (for example, marinas, anchorages) near these channels would be expected to also experience increased sedimentation (see Section 4.21.5.2 in Navigation).

CPRA plans to mitigate the effects of the Project on boat access from Myrtle Grove and Woodpark to the basin as explained in Appendix R1 Mitigation & Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA

permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62286

The commenter requested that the sediment delivery function of the Mississippi River be separated from the navigation function of the Mississippi River and requested that the USACE review the article:

Harley S. Winer, 2007. A New Paradigm for Managing the Lower Mississippi River, Coastal Engineering 2006, World Scientific Publishing Co., Inc. Hackensack, NJ. pp. 2000-2011.

Response ID: 16446

The USACE has reviewed the Winer (2007) article and agrees that reengineering the Mississippi River's water and sediment delivery system to allow more land and marsh building in Atchafalaya Bay is an innovative concept. However, the proposed Project would not have more than negligible impacts on the Atchafalaya Bay, and the EIS analysis is centered on the Project area (where more than negligible impacts of the Project would occur), particularly on the Barataria Basin and the birdfoot delta, as described in Chapter 1, Purpose and Need of the EIS. Therefore, the recommendation in the article is outside the scope of the MBSD Project. No related edits have been made to the Final EIS.

Concern ID: 62290

The commenter expressed concern that if multiple diversions are to be operated simultaneously, or if the river experiences a period of very low stages, sufficient draft for shipping could be threatened. The Port of Baton Rouge, Port of New Orleans, and the Port of South Louisiana are three of the ten largest shipping ports in the nation. These shipping and associated transportation industries could be impacted unless careful planning assures that critical water volumes and navigation channels are maintained.

Response ID: 16447

The Draft EIS considered the commenter's concern about the importance of the safety and efficiency of vessel traffic. Operation of the proposed diversion above 5,000 cfs would be limited to periods of higher flows in the river, as stated in Draft EIS Chapter 2, Section 2.8.1.4 Project Operations, when water levels, water depth, and vessel clearance are less of an issue. However, the EIS recognizes that

changes to sedimentation rates might persist into the low-water season, as the commenter correctly notes. The several modeling efforts described in the EIS Chapter 4, Section 4.4 Surface Water and Coastal Processes and 4.21 Navigation, as well as in Appendix E Delft3D Modeling and Appendix Q Navigation/Dredging Analysis, include projections of water levels, adequate navigation draft, and channel sedimentation impacts resulting from operation of the proposed diversion. The models showed no navigation draft impacts from Venice to New Orleans and above, including at the Port of Baton Rouge, the Port of South Louisiana, and the Port of New Orleans. The conclusion stated in those sections is that operation of the Applicant's Preferred Alternative is projected to cause "moderate, permanent, adverse impacts on dredging operations from Venice to the Gulf of Mexico."

Potential future projects, including the Mid-Breton Sediment Diversion and other diversions, considered for Cumulative Impacts, were modeled and are listed in the Draft EIS Table 4.25.1-1. Cumulative effects on navigation are discussed in Section 4.25.21 Cumulative Impacts - Navigation. The conclusion is that there will be no navigation draft impacts from Venice to New Orleans and above, but "The combined cumulative impacts on dredging ... in the Mississippi River from Venice to the Gulf will be moderate to major, adverse and permanent."

Concern ID: 62293

The commenter noted that the vessel simulation model in the Draft EIS Appendix Q Navigation/Dredging Analysis includes pilot cards that are inconsistent with vessel drafts listed for the vessel simulations.

Response ID: 16448

Suezmax, Panamax, and VLCC vessels were used in the navigation simulations as described in the Draft EIS, Appendix Q2 Navigation Study Reports were correctly identified in the text. "Suezmax" and "Panamax" are dimension classifications and "VLCC" is a tonnage classification. The ship simulator operator, Maritime Institute of Technology & Graduate Studies (MITAGS) indicated that what was listed as a "pilot card" was actually a filename for the model simulation, which was meant for internal use. To avoid confusion, the USACE has added the following note to page 25 of Appendix A of Appendix Q2 Navigation Study Reports of the Final EIS: "NOTE: The 'Ship Name' on the following Pilot Cards is an internal file name to the ship simulation computer and does not necessarily correspond to the vessel nomenclature used in the descriptive text. In all cases, the main body text description of vessel characteristics is correct."

Concern ID: 63407

The MBSD Project would cause sediment deposition in the ship channel and, unlike the West Bay Diversion, it is not in an area where the USACE performs channel maintenance dredging. Therefore, any shoaling in the channel and within the Wills Point

Anchorage should be removed by the Applicant (the Coastal Protection and Restoration Authority). Commenter requests that the USACE lead an effort to properly model the impact of the hydrology changes and shoaling in the vicinity of the proposed diversion structure before approving the permit application. According to recent surveys of the Pilottown Anchorage done by the USACE and CPRA, there are over 60 million cubic yards of material within the Pilottown Anchorage.

Response ID: 16450

The issue raised by the commenter was considered in the Draft EIS in Chapter 4, Section 4.4.3 Hydrology and in Appendix Q1 Dredging Analysis, Section 5.1. With regard to the Wills Point Anchorage Area, about 6 miles above the proposed diversion, it is in the area of which paragraph 5.1 of the Draft EIS Appendix Q1 Dredging Analysis says, "... the models agree ... may experience negligible net erosion." Therefore, the USACE believes no deposition would occur and no further detailed modeling of that area is required. While increased deposition below the diversion is anticipated, HEC-6T modeling predicts that accumulation would primarily occur in the lateral bars. Because the navigation channel (above Venice) is naturally much deeper than navigation depth, any increased deposition within the channel would not threaten the authorized navigation depth and no dredging would be needed to maintain the navigation channel.

With regard to the channel below Venice, including the Pilottown Anchorage, paragraph 5.4 of the Draft EIS Appendix Q1 Dredging Analysis notes that the HEC-6T model, considered the most reliable of those applied to the Mississippi River above Head of Passes, showed a small decrease in channel dredging between Venice and Head of Passes for the first 44 years of the proposed Project with a small increase possible after that time. The AdH model showed that the presence of multiple upstream sediment diversions resulted in a net reduction in sediment deposition, and an upstream shift in the location of deposition in the vicinity of Head of Passes (similar to the No Action Alternative). The modeling indicated a risk of some additional deposition at or upstream of Venice, but did not indicate such a risk for the Pilottown Anchorage. These results are consistent with the 1D HEC-6T model results. The USACE considers these results for the channel to be applicable to the adjacent anchorages and channels. No additional modeling for this issue has been conducted for the Final EIS.

USACE acknowledges that the West Bay Diversion increased the amount of shoaling that was occurring in the Pilottown Anchorage. However, the applicability of the West Bay Diversion to the MBSD Project is limited since the West Bay Diversion was essentially adjacent to the dredged area instead of approximately 60 miles upstream.

Concern ID: 63408

Additional ship modeling should be required because the ship simulation in the Draft EIS, Appendix Q Navigation/Dredging Analysis was based on 15-percent design. The details and information should also be peer reviewed with navigation industry representatives and the USACE.

Response ID: 16449

The USACE's independent team of reviewers reviewed the ship simulation in Appendix Q Navigation/Dredging Analysis and determined it is sufficient for USACE's evaluation of impacts for the EIS. CPRA's 60 percent designs for the proposed Project have decreased the extent to which the Project's intake structure (including the temporary construction cofferdam and the permanent protection cells) would extend into the Mississippi River. Therefore, although the simulation was based on 15 percent designs, those designs represent a worse-case scenario of potential impacts on vessels transiting past the diversion when it is in operation. . No related revisions were made to the Final EIS.

EC62100 – Land-based Transportation

Concern ID: 65169

The commenter expressed concern that construction of the proposed Project would impact the construction of the Belle Chasse Bridge. Commenter questioned whether and how the proposed MBSD Project would impact transportation systems, for example traffic counts, tolling, etc.

Response ID: 16493

The impacts on area traffic from the proposed Project were considered in the Draft EIS. During the 5-year construction period of the Project, CPRA estimates that construction truck deliveries would generate up to 100,100 roundtrips to the diversion complex via LA 23 during the construction period, with the majority of truck deliveries (approximately 94,000) occurring during the first 42 months (3.5 years) of proposed Project construction. This equates to an estimated 515 truck deliveries per week over this duration, or about 103 roundtrips each day based on a 5-day workweek. This would represent less than a 2 percent increase in the existing daily traffic of 9,300 vehicles. Much of the truck traffic may travel across the Belle Chasse Bridge en route to the proposed MBSD Project site on LA 23. Because proposed MBSD Project-induced increased traffic would only increase LA 23 traffic by 2 percent above existing traffic levels on LA 23, the proposed Project is not expected to cause more than a minor increase in traffic on the bridge, and therefore is not expected to impact the construction timeframe or future tolling system of the Belle Chasse Bridge. Chapter 4, Section 4.22 (Land-Based Transportation) and Section 4.25.22 Cumulative Impacts, Land-Based Transportation provide more details

on traffic studies and traffic impact analyses conducted for the proposed MBSD Project.

EC62200 – Cultural Resources

Concern ID: 62493

The proposed Project operations will flood two cemeteries in the towns of Lake Hermitage and Deer Range, Louisiana.

Response ID: 16451

The potential flooding impacts raised by the commenters were considered in the Draft EIS. According to the Louisiana State Historic Preservation Office (LA SHPO) database, the Lake Hermitage cemetery is identified as the Bieber Cemetery and the Deer Range Cemetery in Suzy Bayou is identified as the Deer Range Cemetery. As compared to the No Action Alternative, operation of the proposed Project would increase tidal flooding and storm surge in communities outside of federal levees within 20 miles of the outfall area, including the towns of Lake Hermitage and Suzie Bayou South (Deer Range) in which these cemeteries are located. Such events may result in sediment deposition (burial) and/or erosion of soils at each of these cemeteries. Chapter 4, Section 4.4.4 in Surface Water and Coastal Processes and Section 4.13.3.1 in Socioeconomics detail these impacts.

Concern ID: 62494

The commenter expressed concern that the undetermined National Register of Historic Places (NRHP) eligibility of some sites in the Project area is being equated with ineligibility. For example, 21 of the 31 sites, or 2/3, are presumed to be inundated or destroyed and are consequently ineligible.

Response ID: 16452

As indicated in Chapter 4, Section 4.24 Cultural Resources of the Draft EIS, the National Register eligibility of all identified historic properties within the Operational Area of Potential Effects (APE) was considered by the USACE with comments from the LA SHPO. The USACE determined that the intensity and duration of potential Project-induced impacts on submerged archaeological sites in the Operational Impacts APE cannot be separated from ongoing sea-level rise, subsidence, and other processes not caused by the proposed Project. The USACE, LA SHPO, ACHP, CPRA, and other consulting parties have developed a Programmatic Agreement (PA) for the long-term monitoring and management of cultural resources in the Operational Impacts APE. The PA is available in Appendix K Cultural Resources Information of the Draft EIS.

Concern ID: 62495

The commenter expressed concern that the lack of archaeological integrity makes individual sites ineligible, but overlooks the fact that sites regarded as ineligible together might contribute

information from a regional programmatic approach. The piecemeal approach used is not the right way to approach a regional-scale project.

Response ID: 16453

As indicated in Section 4.24 Cultural Resources of the Draft EIS, all archival research regarding potential sites containing historic properties and completed field surveys were reviewed by the Section 106 Consulting Parties. To address the potential for adverse effects of the proposed Project on cultural resources, including archaeological sites, within the Operational Impacts APE, the USACE, LA SHPO, and other consulting parties developed an alternative mitigation plan for the proposed Project that includes an ethnohistoric overview regarding Tribal Nations in the Barataria Basin and larger Mississippi River Delta region.

In addition, unrelated to the proposed Project, the National Park Service's Mississippi River Delta Archaeological Mitigation Project (MRDAM) is collecting data from archaeological sites in the Mississippi River Delta region, including the Barataria Basin and birdfoot delta, to develop a database of sites under threat from sea-level rise and subsidence in Louisiana's coastal zone.

Concern ID: 62496

The commenters requested that state and federal officials work with residents of Ironton for Project impacts on the St. Rosalie cemeteries. These are sacred sites to the people of Ironton because the graves of their ancestors are buried there. The Final EIS should include a discussion about the fact that the proposed MBSD Project would impact community visitation to these sacred sites at St. Rosalie by creating a large physical separation between the community of Ironton and the St. Rosalie sites.

Response ID: 16454

As indicated in Chapter 4, Section 4.24 Cultural Resources of the Draft EIS, with input from the Section 106 consulting parties, the USACE and LA SHPO have determined that the St. Rosalie Plantation Cemetery (identified as Site 16PL280) and Ironton Cemetery would not be impacted by construction or operation of the proposed MBSD Project. The cemeteries are currently and would continue to be on private property. Residents of Ironton currently have access to the cemeteries via LA 23 and would continue to have access to the St. Rosalie cemeteries via LA 23 during and after the proposed Project is constructed. During the 5-year construction phase of the proposed Project, two-way traffic on LA 23 would be maintained. Northbound traffic would utilize the two existing southbound lanes, maintaining the existing two-lane capacity. Southbound traffic would utilize the shoulder, reducing southbound roadway capacity from two lanes to one. This reduction in capacity may cause delays for southbound traffic over a 1.5-year period during the duration of construction (see the Draft EIS, Chapter 4, Section 4.22.3.1 Construction Impacts).

To clarify potential impacts on Ironton, Section 4.15 Environmental Justice has been revised to highlight information about potential impacts on the community of Ironton in the Final EIS. For a summary of public outreach efforts related to the EIS refer to Chapter 7 of the Final EIS and for restoration planning see Section 1.8 of the LA TIG's Draft Restoration Plan.

CPRA held a public meeting in the community of Ironton. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. A summary of these public engagement meetings can be found in Chapter 7 of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a Section 10/404 permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62498

The commenter owns waterfront property near Port Sulphur and has a family cemetery that is an historic landmark. The commenter has owned and enjoyed this property for many generations and planned to have future generations enjoy this as well. The commenter wants to know what impacts the Project would have on the family cemetery that is an historic landmark.

Response ID: 16456

The potential impacts raised by the commenter were considered in the Draft EIS. According to the LA SHPO database of historic sites, the Lake Hermitage cemetery located near the address provided by the commenter is identified as the Bieber Cemetery. As compared to the No Action Alternative, operation of the proposed Project would increase tidal flooding and storm surge in communities outside of federal levees within 20 miles of the outfall area, including the town of Lake Hermitage in which this cemetery is located. Such events may result in impacts from sediment deposition (burial) and/or erosion. Chapter 4, Section 4.4.4 in Surface Water and Coastal Processes and Section 4.13.3.1 in Socioeconomics detail these impacts.

Concern ID: 62499

Several Indigenous Peoples of the State of Louisiana are already experiencing losses of important cultural sites and historic territories due to erosion. They should have been consulted. The commenter understands there is no legal obligation, but state-recognized Tribal Nations like the United Houma Nation, Pointe Aux Chien Indians, and the Isle de Jean Charles Band of the Biloxi-Chitimacha-Choctaw-Muskogee Creek Indians would be MOST affected by this sediment diversion; so it stands to reason that there is an ethical obligation to invite and collaborate with their council. The fact that the state has recognized many of these Native Nations even if the federal government does not implies an obligation to consult with all Indigenous Peoples in an area that would be impacted by a state-sponsored project.

Response ID: 16457

The USACE acknowledges the commenter's concern about ensuring that all potentially affected Tribal Nations be invited to participate in the Section 106 consultation process. As indicated in Chapter 4, Section 4.24 Cultural Resources of the Draft EIS, cultural resources consultations have been conducted in accordance with Section 106 of the NHPA. Appendix K Cultural Resources Information of the EIS includes the PA negotiated between the Section 106 consulting parties regarding the proposed Project. The PA explains the outreach conducted by the USACE to Tribal communities, identifies the Tribal Nations that decided to participate in the Section 106 Process, and explains that the USACE has and would continue to consult with any interested Tribal Nation who may have not yet requested to consult.

Concern ID: 62497

The commenters request that state and federal officials work with the residents of Ironton to respect the rights of these people to make decisions about what happens to sacred places (like St. Rosalie cemeteries) and how to best preserve and protect this local black community that is an important part of black history.

Response ID: 16455

Information regarding the effects of the Project on the St. Rosalie cemetery has been added to the Executive Summary and to Chapter 4, Section 4.24.2.2 Applicant's Preferred Alternative in Cultural Resources of the Final EIS. To clarify potential impacts on Ironton, Section 4.15 Environmental Justice has been revised to highlight information about potential impacts on the community of Ironton in the Final EIS. For a summary of public outreach efforts related to the EIS and the Draft Restoration Plan, including outreach to Ironton residents, refer to Chapter 7 of the Final EIS. Similar information specific to the restoration planning is included in Section 1.8 of the LA TIG's Draft Restoration Plan.

CPRA held a public meeting in the community of Ironton. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. A summary of these public engagement meetings can be found in Chapter 7 of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA

permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

EC62300 – HTRW Assessment

Concern ID: 61864	USACE and the Project sponsors have a responsibility to do a formal, limited Phase I Assessment of the Hazardous, Toxic, and Radioactive Waste risk. Firm conclusions must only be provided when a formal, appropriately detailed assessment stand behind them.
Response ID: 15931	The issues raised by the commenters were considered in the Draft EIS; therefore, no related edits have been made to the Final EIS. As indicated in EIS Chapter 3, Section 3.23 Hazardous, Toxic, and Radioactive Waste, a Phase I Environmental Site Assessment was conducted in January 2020 to identify any potential recognized environmental conditions (RECs) located in or adjacent to the Project area that have, or may have in the past, adversely impacted environmental conditions. The conclusions in Chapter 4 of the EIS are based on this assessment.
Concern ID: 62953	Many or most of the ongoing environmental harms to the Barataria Basin are not mentioned in the Draft EIS. Pipelines and wells present a significant present risk to the natural resources of Barataria Basin. Ongoing releases do indeed impact the health of the natural resources of the Barataria Basin, including marine mammals, fisheries, and endangered species. The Draft EIS discusses these releases in the context of its discussion of the potential impact of the continuing releases on the affected environment or in terms of their potential impact on the proposed MBSD Project.
Response ID: 15930	The issues raised by the commenters were considered in the Draft EIS; therefore, no related edits have been made to the Final EIS. The EIS notes in Chapter 3, Sections 3.2 Geology and Soils and 3.23 Hazardous, Toxic, and Radioactive Waste and Chapter 4, Sections 4.2

and 4.23, the existing presence of oil and gas pipelines and wells within the Project area. The EIS determined that increased water flow and sedimentation due to operation of the proposed Project could potentially create exposure to existing contaminated sites and inadvertent releases of contaminants resulting in minor to major, short to long term, adverse impacts over time. However, as noted in Section 4.2 Geology and Soils, burial of pipelines due to sedimentation from the proposed Project may be beneficial in that it would reduce the exposure of these pipelines to wave energy or collision damage and resulting risk of petroleum spills.

ES70000 – Cumulative Impacts

Concern ID: 61846

The commenter requested that the Final EIS, Chapter 4, Section 4.25 Cumulative Impacts be updated to include recent information about IGP Methanol, LLC, Venture Global/Gator Express, Pointe LNG, Castleton Commodities Incorporated, and Formosa Plastics moving forward with construction in the proposed Project area.

Response ID: 16460

Each of these projects was considered in the cumulative impacts analysis of the Draft EIS (Chapter 4, Section 4.25) with the exception of the Formosa Plastics project, which was not included in the cumulative impacts analysis because that project would be located in St. James Parish, far north of the Mid-Barataria Sediment Diversion Project impact area. In Section 4.25 Cumulative Impacts, the Castleton Commodities Inc. project is called “Braithwaite Methanol Plant/CCI Port Nickel LLC.”

Reasonably foreseeable projects and information about them was based on the stage of development that the actions and facilities had reached at the time the Draft EIS was being prepared. The cumulative impacts analysis in the Draft EIS was based on the status of projects in May 2020. No related edits have been made for the Final EIS for these facilities.

In May 2022 after publication of the Draft EIS, the USACE conducted a search to identify any new/additional reasonably foreseeable projects that, cumulatively with the proposed MBSD Project, have the potential to significantly alter the environmental landscape from what was assessed in the Draft EIS. After identifying new, reasonably foreseeable projects, USACE evaluated those projects for their potential to significantly affect the environmental landscape that was presented in the Draft EIS and concluded that none would significantly change the MBSD cumulative impacts as described in the Draft EIS. Nevertheless, USACE determined that five newly-identified projects would have more than negligible cumulative impacts. To provide a

complete picture of MBSD cumulative effects to the decision maker(s) and the public, these five projects have been added to the Final EIS in Chapter 4, Section 4.25.25 Cumulative Impacts Analysis 2022 Update.

Concern ID: 61847

The commenter requested that the Draft EIS include analyses of several river diversions that are included in CPRA’s Master Plan that would have impacts on proposed Project-area resources associated with reduced salinity and lower water turbidity, including the Lower Breton Diversion (50,000 cfs), Central Wetlands Diversion (5,000 cfs), East Maurepas Diversion (2,000 cfs), Manchac Landbridge Diversion (2,000 cfs), Union Freshwater Diversion (25,000 cfs), Mid-Breton Sound Diversion (35,000 cfs), and Mid-Barataria Diversion (75,000 cfs).

Response ID: 16461

Although the Lower Breton Diversion (50,000 cfs), Central Wetlands Diversion (5,000 cfs), Manchac Landbridge Diversion (2,000 cfs), and Union Freshwater Diversion (25,000 cfs) are included in CPRA’s 2017 Master Plan, they are not included in the cumulative impacts analysis of the EIS because they do not meet the definition of reasonably foreseeable as defined and agreed to by the consulting agencies in Section 4.25.1 Methodology for Assessing Cumulative Impacts. This section states, “Projects that would require a Department of the Army permit application, including but not limited to projects proposed for the Project area in CPRA’s 2017 Coastal Master Plan, were considered reasonably foreseeable if a permit application had been submitted to the USACE by May 2020.” Additionally, as further stated in that section, the cumulative impacts analysis was restricted to projects and actions that would contribute impacts on resources within the same geographic area as the Mid-Barataria Sediment Diversion Project. That geographic area is illustrated in Chapter 3, Section 3.1.1 Project Area.

The proposed Maurepas Diversion is being studied by USACE and a Draft EIS for that project will be published in 2022. Due to its small scale (2,000 cfs) and its location outside of the Mid-Barataria Sediment Diversion Project area of impact, anticipated cumulative effects with that diversion in place would be negligible.

Concern ID: 61848

Commenters expressed the opinion that the Mid-Barataria Sediment Diversion Project would help support and enhance the lifespan of other coastal restoration and protection projects.

Response ID: 16462

The commenters correctly note that, as discussed in Chapter 4, Section 4.25.6 Cumulative Impacts, Wetland Resources and Waters of the U.S., “Cumulative impacts on wetland accretion from operation of the reasonably foreseeable future projects combined with operation of the MBSD Project action alternatives would likely result in fewer losses in wetlands in both the Barataria Basin and birdfoot delta, but most notably in the Barataria Basin, where implementation of the MBSD

Project action alternatives would prevent the loss of an additional 26,000 acres.”

Concern ID: 61849

The commenter questioned to what degree the proposed MBSD Project would adversely impact Mississippi Sound aquatic life and commercial fisheries. The commenter expressed concern that these resources are already adversely impacted by Bonnet Carré Spillway openings.

Response ID: 16463

The commenter’s concerns about freshwater impacts on Mississippi Sound aquatic life and fisheries are acknowledged. However, the proposed Project is not anticipated to have more than negligible impacts on aquatic life outside of the proposed Project area, particularly in the Barataria Basin and the Mississippi River birdfoot delta, as defined in Chapter 3, Section 3.1.1 (Project Area) of the EIS; therefore, negligible to no impacts on aquatic life in the Mississippi Sound are anticipated from the construction and operation of the proposed MBSD Project.

Concern ID: 61850

Commenters expressed concern that reasonably foreseeable industrial facilities like the Plaquemines Liquids Terminal and pipelines that may be built near the proposed MBSD Project structure or in the Barataria Basin would cause adverse impacts on the marsh ecosystem restored by the MBSD Project operations. One commenter expressed the opinion that industrial facilities that may be constructed near the proposed MBSD Project should be denied permit because they would be inconsistent with the objectives of the proposed MBSD Project.

Response ID: 16464

The commenters’ concern about the potential impact of future industrial development and activity on the habitat that would be created by the proposed Project was considered in Chapter 4, Sections 4.25.4 and 4.25.6 in the Cumulative Impacts section of the Draft EIS. These sections explain that reasonably foreseeable industrial facilities and infrastructure that may be constructed in the proposed MBSD Project area are expected to have negligible impacts on proposed Project-area resources because the facilities would be required to adhere to permit conditions imposed by regulating agencies such as wetland mitigation, SWPPP, and SPCC plans in order to be constructed and operated.

Furthermore, CPRA entered into a Memorandum of Understanding with the Plaquemines Port Harbor & Terminal District (PPHTD) and the Plaquemines Liquid Terminal, LLC (PLT) requiring PPHTD and PLT to perform sediment transport modeling and a navigation study to determine the impact, if any, that the PLT Project may have on the proposed MBSD Project, and to agree to certain terms and conditions, as needed, to ensure that the PLT, once constructed and operated, does not have unreasonable adverse impacts on the design, construction, or operation of the proposed MBSD Project. These steps

would help ensure that the PLT Project remains consistent with the Louisiana Coastal Master Plan.

Since publication of the Draft EIS, the Tallgrass/PLT facility's sponsors PPHTD/PLT have withdrawn their Joint Permit application (Louisiana Department of Natural Resources Coastal Use Permit [CUP] number P20180379 and DA Permit number MVN-2012-0123-EPP), and terminated the Memorandum of Understanding (MOU) (originally dated April 24, 2019) between CPRA and PPHTD/PLT pertaining to the facility. A footnote has been added in Section 4.25.1.3.2 Reasonably Foreseeable Future Projects of the Final EIS to reflect the withdrawal of the PLT Project.

Concern ID: 62437

Commenters expressed concerns about potential increases in carbon dioxide emissions of the reasonably foreseeable industrial facilities that may be constructed and operated in the Project area of the proposed MBSD Project. One commenter requested that the Final EIS include an analysis of the scale of carbon dioxide emissions of reasonably foreseeable petrochemical facilities and their associated infrastructure in the proposed Project area.

Response ID: 16465

The commenters' concerns about the air quality impacts of reasonably foreseeable petrochemical facilities in the Project area were considered in the air quality cumulative impacts analysis (see Section 4.25.7 Cumulative Impacts, Air quality).

Chapter 4, Section 4.25.7 Cumulative Impacts, Air Quality of the EIS addresses the air quality impacts of reasonably foreseeable future petrochemical facilities in the Project area. As noted in Section 4.25.1.1 Cumulative Impacts, air quality would only be negligibly impacted by operation of the MBSD Project action alternatives and therefore none would measurably contribute to cumulative air quality effects. While petrochemical and industrial facilities in the Project area may result in more than negligible individual or cumulative impacts on air quality during their operations, the Project alternatives would not contribute measurable impacts. Further, other petrochemical and industrial facilities in the Project area would be required to comply with applicable regulations and permitting requirements pertaining to air quality. Finally, the Project would result in permanent, indirect, minor, beneficial impacts on carbon sequestration and atmospheric GHG concentrations due to wetland creation and restoration within the Barataria Basin (see Chapter 4, Section 4.7.4.2 in Air Quality of the EIS).

Concern ID: 62440

The commenter expressed concern that in the Draft EIS, Chapter 4, Section 4.25.5.4 Cumulative Impacts - Surface Water and Sediment Quality, the PLT facility is among three reasonably foreseeable industrial projects (along with NOLA Oil Terminal and Plaquemines LNG/Gator Express Pipeline) with potential impacts

that were not considered in the Delft3D Basinwide Modeling for the EIS. However, this EIS section acknowledges that the PLT facility would have the potential for oil spills that could enter the MBSD intake and be conveyed into Barataria Basin sediments, waters, and wetlands.

Response ID: 16466

The commenter's concern about oil spills potentially contaminating water diverted into the basin by the proposed Project was considered in the Draft EIS in Chapter 2, Section 2.8.1.4 (Project Operations) and Appendix F (MBSD Design and Operations Information). This section and appendix explain that in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed. Information regarding closing the diversion structure in the event of hazardous spills has been added to the Cumulative Impacts section, Chapter 4, Section 4.25.5.4 in the Final EIS.

Since publication of the Draft EIS, the Tallgrass/PLT facility's sponsors PPHTD/PLT have withdrawn their Joint Permit application (Louisiana Department of Natural Resources Coastal Use Permit [CUP] number P20180379 and DA Permit number MVN-2012-0123-EPP), and terminated the Memorandum of Understanding (MOU) (originally dated April 24, 2019) between CPRA and PPHTD/PLT pertaining to the facility. A footnote has been added in Section 4.25.1.3.2 Reasonably Foreseeable Future Projects of the Final EIS to reflect the withdrawal of the PLT Project.

Concern ID: 62442

Commenters requested that additional information about the reasonably foreseeable Plaquemines Liquids Terminal be added to the Final EIS, Chapter 4, Section 4.25 (Cumulative Impacts), such as the potential for the project to affect sediment transport capabilities of the proposed MBSD Project.

Response ID: 16467

Furthermore, CPRA entered into a Memorandum of Understanding with the Plaquemines Port Harbor & Terminal District (PPHTD) and the Plaquemines Liquid Terminal, LLC (PLT) requiring PPHTD and PLT to perform sediment transport modeling and a navigation study to determine the impact, if any, that the PLT Project may have on the proposed MBSD Project, and to agree to certain terms and conditions, as needed, to ensure that the PLT, once constructed and operated, does not have unreasonable adverse impacts on the design, construction, or operation of the proposed MBSD Project. These steps would help ensure that the PLT Project remains consistent with the Louisiana Coastal Master Plan.

Since publication of the Draft EIS, the Tallgrass/PLT facility's sponsors PPHTD/PLT have withdrawn their Joint Permit application (Louisiana Department of Natural Resources Coastal Use Permit [CUP] number P20180379 and DA Permit number MVN-2012-0123-EPP), and

terminated the Memorandum of Understanding (MOU) (originally dated April 24, 2019) between CPRA and PPHTD/PLT pertaining to the facility. A footnote has been added in Section 4.25.1.3.2 Reasonably Foreseeable Future Projects of the Final EIS to reflect the withdrawal of the PLT Project.

Concern ID: 62449

The commenter expressed concern that the Draft EIS Section 4.25.4.4 Cumulative Impacts - Surface Water and Coastal Processes, does not disclose the potential impacts of projected flooding in the “Polder B” area on Midway’s property, which is a developed borrow site.

Response ID: 16468

The potential impacts of flooding in “Polder B” were considered in the Draft EIS in Chapter 4, Section 4.25.4.4 Cumulative Impacts - Surface Water and Coastal Processes. In response to this comment, Section 4.25.13.4 Cumulative Impacts - Socioeconomics of the Final EIS has been revised to include a statement about the potential socioeconomic impact on the Polder B area and the Midway property due to the flooding associated with the reasonably foreseeable NOV-NF-W-05a.1 Project.

Concern ID: 62450

The commenter expressed concern about potential combined adverse impacts from both the raising of the proposed NOV-NFL Federal levee near the Myrtle Grove Marina Estates and construction and operation of the proposed MBSD Project.

Response ID: 16469

The commenter’s concern about the combined impacts of the reasonably foreseeable NOV-NFL Levee project near Myrtle Grove and the proposed MBSD Project was considered in the Draft EIS in Chapter 4, Section 4.25.4.4 Cumulative Impacts - Stormwater Management and Drainage.

CPRA has developed a Mitigation and Stewardship Plan with measures to minimize and/or offset some impacts of the proposed MBSD Project on the communities outside of flood protection. This plan, which was included in the Draft EIS Appendix R (Mitigation and Stewardship Plan and the Monitoring and Adaptive Management [MAM] Plan), has been revised in the Final EIS in response to public input. For Myrtle Grove, the Final Mitigation and Stewardship Plan includes improvements to the bulkhead around the Myrtle Grove Marina Estates Subdivision, docks, and boat houses, as well as other infrastructure improvements (sewer system). See Appendix R1 of the Final EIS for details regarding this plan.

Structural measures such as raising roads or improving bulkheads in the Mitigation and Stewardship Plan were not included in CPRA’s MBSD DA permit application and are not part of the currently-proposed MBSD Project. Many of these structural measures would require USACE and other permits prior to installation. Such permits are not

guaranteed and would take time for USACE and other regulating agencies to process.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62460

The commenter expressed concern that with the possible storage of 20 million barrels on the reasonably foreseeable Plaquemines Liquids Terminal and the transfer of that oil through pipelines regularly connected and disconnected from large, river-borne vessels would cause frequent oil spillage into the proposed MBSD diversion, as well as potentially catastrophic impacts resulting from accidents or hurricanes. Any of those could have serious impacts on the operation of the proposed MBSD Project.

Response ID: 16470

Potential impacts of the reasonably foreseeable Plaquemines Liquids Terminal were considered in the Draft EIS in the Sediment Transport

subsection of Chapter 4, Section 4.25.4.4 Cumulative Impacts. Since publication of the Draft EIS, the Tallgrass/PLT facility's sponsors PPHTD/PLT have withdrawn their Joint Permit application (Louisiana Department of Natural Resources Coastal Use Permit [CUP] number P20180379 and DA Permit number MVN-2012-0123-EPP), and terminated the Memorandum of Understanding (MOU) (originally dated April 24, 2019) between CPRA and PPHTD/PLT pertaining to the facility. A footnote has been added in Section 4.25.1.3.2 Reasonably Foreseeable Future Projects of the Final EIS to reflect the withdrawal of the PLT Project.

Potential oil spills from the terminal were also assessed in the Permitted Discharges Section of 4.25.5.4 Cumulative Impacts of the Draft EIS. As described in the Draft EIS in Chapter 2, Section 2.8.1.4 Project Operations and in Appendix F MBSD Design and Operations Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed. Information regarding closing the structure in the event of hazardous spills has been added to the Cumulative Impacts section, Section 4.25.5.4 of the Final EIS.

Concern ID: 62461

The commenter identified a number of facilities applying for new or renewed LPDES permits in Louisiana during the years 2020 to 2021.

Response ID: 16471

The potential impacts of the proposed projects noted by the commenter were considered in the Draft EIS in Chapter 4, Section 4.25 Cumulative Impacts with the exception of those projects the commenter listed that are outside of the proposed MBSD Project impact area as described in the Draft EIS Chapter 4, Section 4.25.1.3 Cumulative Impacts, Step 3: Identify the Projects and Actions to be Considered. Reasonably foreseeable projects and information about them was based on the stage of development that the actions and facilities had reached at the time the Draft EIS was being prepared. To be considered a "reasonably foreseeable project" to be included in the evaluation of cumulative effects in the EIS, a proposed project needed to be sufficiently advanced in the planning process that it was no longer speculative. In this case, proposed projects that had been submitted to relevant agencies for permitting (including USACE) by May 2020 were considered reasonably foreseeable and were included in the cumulative impacts analysis. No related edits have been made for the Final EIS.

In May 2022 after publication of the Draft EIS, the USACE conducted a search to identify any new/additional reasonably foreseeable projects that, cumulatively with the proposed MBSD Project, have the potential to significantly alter the environmental landscape from what was assessed in the Draft EIS. After identifying new, reasonably

foreseeable projects, USACE evaluated those projects for their potential to significantly affect the environmental landscape that was presented in the Draft EIS and concluded that none would significantly change the MBSD cumulative impacts as described in the Draft EIS. Nevertheless, USACE determined that five newly-identified projects would have more than negligible cumulative impacts. To provide a complete picture of MBSD cumulative effects to the decision maker(s) and the public, these five projects have been added to the Final EIS in Chapter 4, Section 4.25.25 Cumulative Impacts Analysis 2022 Update.

Concern ID: 62463

The commenter stated concern that because Ironton is the closest community to the MBSD Project site and to the proposed Plaquemines Port Harbor & Terminal District/Plaquemines Liquids Terminal (PPHTD/PLT) site and the existing Alliance Refinery, Ironton would be particularly vulnerable to impacts from all three in terms of potential flood and/or health effects.

Response ID: 16472

The concerns raised by the commenters were considered in the Draft EIS in Chapter 3, Section 3.7.2 Air Quality, Existing Conditions; and Chapter 4, Sections 4.8 Noise, 4.13 Socioeconomics, 4.15 Environmental Justice, 4.22 Land-Based Transportation and 4.25 Cumulative Impacts. Chapter 3, Section 3.7.2 Air Quality - Existing Conditions identifies the existing air quality in the proposed Project area and provides that Plaquemines Parish is designated as "unclassifiable/in attainment" for all criteria pollutants. The resource sections in Chapter 4 address potential air quality, noise, transportation, and flooding impacts specifically concerning the community of Ironton. In addition, Chapter 2 of Appendix H1 Socioeconomics Technical Report to the EIS provides contextual information about the Ironton community. As stated in the EIS in Chapter 4, Section 4.15 Environmental Justice, populations in Ironton would experience minor to moderate, temporary adverse, impacts due to increased noise levels, dust, and transportation delays during the approximately 5-year construction period. However, as previously described in the Land-Based Transportation section of Section 4.25.22 Cumulative Impacts of the Draft EIS, cumulative impacts on traffic from construction of the reasonably foreseeable future actions combined with construction of the proposed MBSD Project action alternatives would likely be major, adverse, and temporary and could cause substantial traffic delays on LA 23. Ironton would experience these major, adverse impacts because of its proximity to LA 23 and the proposed MBSD Project. To make this clearer, Section 4.25.22.3 in Cumulative Impacts of the Final EIS has been revised to state that Ironton would experience major, adverse impacts during the 5-year construction period of the proposed Project due to cumulative impacts of the proposed MBSD Project and reasonably foreseeable projects on LA 23 traffic volumes and congestion.

Beyond the near-term impacts of construction, operation of the Applicant's Preferred Alternative may have impacts on Ironton. Because it is within the New Orleans to Venice (NOV) Non-Federal Levee (NFL) W-05a.1 (La Reussite to Myrtle Grove levee reach) levee system, Ironton is not expected to be impacted by increases in frequency and duration of tidal flooding due to Project operations (see Section 4.15.4.2.2 Storm Hazards and 4.20.4.2 Public Health and Safety). However, negligible to minor increases in risk of overtopping of the NOV-NFL Levee south of the immediate outfall area following the delta formation in the outfall area that may affect storm surge during certain 1 percent storms may impact low-income and minority populations within Ironton.

Also, in the Final EIS, Section 4.15.5.1 Environmental Justice has been added to provide a summary of impacts on the majority-Black community of Ironton, which is the closest community to the diversion, to assist understanding the projected impacts of the proposed Project on that community.

Concern ID: 62469

The commenter stated concern that the assessment in the Draft EIS of potential impacts of the reasonably foreseeable project Plaquemines Port Harbor & Terminal District/Plaquemines Liquids Terminal (PPHTD/PLT) on the proposed MBSD Project operations cannot be accurate without including results of the previously conducted assessment of PPHTD/PLT's potential impact on sediment capture of the proposed MBSD Project intake structure.

Response ID: 16474

The Sediment Transport section in Chapter 4, Section 4.25.4.4 Cumulative Impacts in the Draft EIS acknowledged that, based on a sediment transport study conducted by AECOM (2019), the reasonably foreseeable PPHTD/PLT facility may have moderate, adverse, permanent impacts on the sediment transport capability of the proposed MBSD Project. Since publication of the Draft EIS, the Tallgrass/PLT facility's sponsors PPHTD/PLT have withdrawn their Joint Permit application (Louisiana Department of Natural Resources Coastal Use Permit [CUP] number P20180379 and DA Permit number MVN-2012-0123-EPP), and terminated the Memorandum of Understanding (MOU) (originally dated April 24, 2019) between CPRA and PPHTD/PLT pertaining to the facility. A footnote has been added in Section 4.25.1.3.2 Reasonably Foreseeable Future Projects of the Final EIS to reflect the withdrawal of the PLT Project.

Concern ID: 63241

The commenter questioned what other projects are in place to help retain land created by the proposed MBSD Project.

Response ID: 16475

Other reasonably foreseeable projects that would retain the land created by the proposed MBSD Project include, but would not be limited to, the Large-Scale Marsh Creation and Component E- Planning Project, the Grand Bayou Ridge and Marsh Restoration Project, the

Bayou L'Ours Marsh Terracing Project, and others. These projects were considered in the Draft EIS in Chapter 4, Sections 4.25.2 and 4.25.6 in Cumulative Impacts, which discusses the beneficial and adverse impacts of other projects in the proposed MBSD Project area on sustaining wetlands and retaining land created by the proposed MBSD Project. While the restoration projects described in these sections are not specifically designed to retain the land created by the proposed MBSD Project, these restoration projects would contribute to land retention.

Concern ID: 62464

The commenter expressed concern that models have not yet examined the cumulative impacts on flooding from multiple proposed diversions operating simultaneously.

Response ID: 16473

The Draft EIS considered the potential flooding impacts of multiple proposed diversions operating simultaneously. Potential flooding impacts of the proposed MBSD Project combined with impacts of *existing* Mississippi River diversions on the west bank including the Davis Pond Freshwater Diversion, and the West Pointe A La Hache Siphon and on the east bank (Bonnet Carré Spillway, Caernarvon Freshwater Diversion, and Mardi Gras Pass) were projected by the Delft3D Basinwide Model baseline conditions and 50-year projections for the MBSD No Action and action alternatives for hydrology, flooding, hydrodynamics, water quality, vegetation/wetlands, and other resources in the Project area. The added impacts of the MBSD Project action alternatives in combination with these existing freshwater influences are discussed by resource topic in Chapter 4, Sections 4.2 through 4.24.

The added flooding impacts of the proposed MBSD Project action alternatives on existing diversion operations were qualitatively or quantitatively analyzed and discussed in the Draft EIS in Chapter 4, Section 4.4.3 in Surface Water and Coastal Processes, Section 4.13 Socioeconomics, and Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction. The Draft EIS Section 4.20.4 Storm Surge and Flooding concluded that in conjunction with the operation of existing diversions, the proposed Project would have negligible impacts on flooding in Project area communities within federal levee systems and minor to major, adverse, long-term impacts on flooding in Barataria Basin communities not protected by federal levees (for example, Lafitte, Myrtle Grove, and Grand Bayou).

Operational impacts, including risk for increased flooding, of reasonably foreseeable future projects including diversions such as the Mid-Breton Sediment Diversion combined with proposed MBSD Project operations were assessed by the Delft3D Basinwide Model and discussed in Section 4.25.1 Methodology for Assessing Cumulative Impacts and in Section 4.25.20 Cumulative Impacts - Public Health and Safety, Including Flood and Storm Hazard Risk Reduction. As described in

Section 4.25.20, Delft 3D Basinwide modeling projected that the reasonable foreseeable projects modeled would have a negligible impact on water levels during non-storm conditions in the birdfoot delta and Barataria Basin. Also see EIS, Appendix E Delft3D Modeling for information on the setup of the Delft 3D Basinwide Modeling for the impact analysis of the EIS alternatives. No related edits have been made to the Final EIS.

ES81000 – Delft3D Modeling

Concern ID: 61829

The Delft3D Basinwide Modeling conducted for the Draft EIS is flawed because its validation process was based on the West Bay Sediment Diversion, which is not a valid comparison because the footprint of that project received several lifts via sediment dredged and pumped from the Mississippi River, which would not occur for the proposed MBSD Project.

Response ID: 16476

Validating the Delft3D Basinwide Model to a large sediment diversion in the Barataria Basin would have been ideal; however, there are no other large-scale sediment diversions on the landscape at this time. Because the other existing diversions (Davis Pond and Caernarvon Diversions) are freshwater diversions designed to extract water from the top of the river and discharge primarily water, not sediment, they are not applicable for validating the Delft3D Model for the MBSD Project. The West Bay Sediment Diversion, in contrast, is useful for validating the physical processes of erosion and deposition of sediment because although some dredging occurs for that project, it, like the proposed MBSD Project, is a sediment diversion that extracts sediment from deeper in the river. The modelers used standard professional practice by validating the Delft3D Basinwide Model (a well-proved, public-domain, physics-based model) with the West Bay Sediment Diversion to properly reproduce the primary physical processes of sediment erosion and deposition. In that manner, the modelers were able to examine how diversion flows would affect the process of sediment erosion and deposition separate from dredged material disposal.

As part of developing the Draft EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

Concern ID: 61830

The commenter stated that information regarding how the proposed Project would impact the velocity of the Mississippi River upstream of the proposed diversion is not clear in Appendix E (Delft3D Modeling) and Appendix F (MBSD Design and Operations Information).

Response ID: 16477

The Project's impacts on the velocity of the Mississippi River upstream of the diversion intake was considered in the Draft EIS in Appendix E Delft3D Modeling, Attachment B (Velocity Contour Maps and Velocity Direction Figures), Figures VEL 1 - VEL 6 (No Action Alternative) and Figures VEL 25 - VEL 30 (Applicant's Preferred Alternative). These figures display no discernable differences in velocity contours in the Mississippi River upstream of the proposed diversion structure. In Chapter 4 of the Draft EIS, Section 4.4 (Surface Water and Coastal Processes), Figure 4.4-37 shows that cross-channel velocities immediately adjacent to the diversion structure would increase by up to 0.3 m/sec (1 foot per second) and by less than 0.03 m/sec (0.1 foot per second) a short distance away. Although these model data are not high-resolution, the USACE concludes that river velocities upstream of the diversion would change by less than 1 foot per second. For greater clarity, a sentence summarizing this has been added to the Final EIS in Section 4.4.4.2.3.2 Applicant's Preferred Alternative in Surface Water and Coastal Processes and in Appendix E Delft 3D Modeling, Section 7.2 Water Velocity Outputs.

Concern ID: 61831

The commenter questioned the level of certainty of land-loss estimates under the No Action Alternative over the 50-year period of analysis. Commenter further questioned how that level of certainty compares to the level of certainty of some of the adverse impacts that are projected to occur from the proposed Project.

Response ID: 16478

It is correct that the Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties were incorporated into the Draft EIS impact conclusions and are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in (Model Limitations and Uncertainty), and in detail in Appendix E (Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties). Hurricanes were not modeled as part of the Delft3D Basinwide Model; they were, however, modeled as part of the ADCIRC modeling conducted for the Draft EIS, Chapter 4, Section 4.20 Public Health and Safety, Including Storm and Flooding Risk Reduction. The rationale for that omission and explanation of how it was accounted for are provided in Appendix E Delft3D Modeling, Section 8.1. The land-change uncertainty bounds were not included in the summary in Section 4.1.3.3. In response to this comment, a summary of land-change uncertainty has been added to that section in the Final EIS. The USACE and LA TIG agree that the model uncertainties should be clearly stated in the EIS with respect to the Model's quantitative results. A footnote has been added to the

Executive Summary and to Table 4.2-6 in Section 4.2 Geology and Soils of the Final EIS providing the uncertainty bounds for land-change projections. Uncertainties related to the Marine Mammals impact analysis are summarized in detail in Chapter 4, 4.11.3.1 (Marine Mammals, General Caveats to Impact Analysis Approach).

As part of developing the EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

Concern ID: 61832

Commenters expressed concern that the uncertainties of the model were not quantified or identified in the model results. For example, with respect to the projections of land change, the ranges of potential acres to be created/lost along with a confidence level that each range is accurate were not provided. Commenters noted that the model predicted a net land gain of only 2 - 4 percent of the total land area within the Project area over the 50-year analysis period and questioned whether the model is sensitive enough and accurate enough to predict such a slight change.

Response ID: 16479

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties. The land-change uncertainty bounds were not included in the summary in Section 4.1.3.3. In response to this comment, the USACE has added a summary of land-change uncertainty to that section in the Final EIS. Where the model's quantitative results are presented, the EIS identified the model uncertainties. A footnote has been added to the Executive Summary and to Table 4.2-6 in Section 4.2 Geology and Soils of the Final EIS providing the uncertainty bounds for land-change projections.

As part of developing the EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

Concern ID: 61842

Commenter is concerned about the accuracy of the sea-level rise projections used in the Delft3D Basinwide Model to predict land changes. In particular, the commenter suggests that if updated

sea-level rise rates (as provided in Sweet et al. 2017 and Church et al. 2014) were applied, the modeling would project no land-gain benefits from the diversion.

Response ID: 16480

Large variability in projected relative sea-level rise does introduce corresponding uncertainty into land-loss and land-gain projections. The literature provided by the commenters has been reviewed. Measured and projected relative sea-level rise rates vary substantially by location, and using projections at a station in Florida, such as Cedar Key, are not useful for projections in the central Gulf Coast. Citing the USACE and NOAA sea-level projection tool (USACE 2019d), the MBSD Project Modeling Work Group chose a sea-level rise scenario based on the 2017 Coastal Master Plan “moderate” scenario, which is slightly higher than the USACE’s “Intermediate” rate for the Barataria Basin water level station at Grand Isle, LA, as shown in Chapter 4, Figure 4.1.3 of the Draft EIS. The USACE rate reflects sea-level rise data collected at Grand Isle over the period 1947 to 2007. The MBSD Project Modeling Work Group determined that the use of that 2017 Coastal Master Plan Intermediate Sea-Level Rise curve was an appropriate choice at the time the modeling was conducted in 2019.

The sea-level rise value used in the Delft3D Basinwide Model simulation for the Draft EIS considered “intermediate” at the time of the modeling, is close to the low projection (0.3 m Global Mean Sea Level) given by Sweet et al. (2017) for Grande Isle. The commenter’s suggestion of the Church et al. 2014 reference, which provides useful information, has been added as a reference in the Final EIS in Chapter 4, Section 4.1.3.2 Sea-Level Rise. Use of a different sea-level rise rate would affect the impact projections of all the alternatives considered in the EIS, including the No Action Alternative. If the relative sea-level rise rate used in the model is an underestimate, the effect on model results was mitigated, but not eliminated, by the use of a “No Action Alternative compared to Action Alternatives” comparison method. (In other words, if sea-level rise was underestimated, it was underestimated for all alternatives, including No Action Alternative. The impacts of the proposed Project presented in the Draft EIS are the net difference in impact magnitude between the No Action Alternative and the proposed Action Alternatives). Chapter 4, Section 4.1.3.2 Sea-level Rise states that higher sea-level rise rates would reduce anticipated land creation. However, in light of the commenters’ concern, the USACE has amended the last sentence of the next to last paragraph of that section in the Final EIS to say, “If actual sea-level rise is higher (as is predicted by Sweet et al. 2017) than the value used in the Delft3D Basinwide Model, water levels would be higher and loss rates and land gains would be different than what the Delft3D Basinwide Model projects.”

Concern ID: 61843

The Delft3D Basinwide Model results are flawed because the model was not calibrated to data from the Fort St. Philip, Davis Pond, and Caernarvon Diversions. Instead the model was calibrated to the unsuccessful West Bay Diversion, which has not produced any land in 20 years of operation (other than that created by the deposit of dredged material). Calibration to West Bay is not appropriate because the West Bay Diversion outfall area is comprised of deeper water and mineral soils, while the outfall area of the proposed MBSD Project diversion is comprised of shallow water covered with emergent vegetation inhabiting organic soils.

Response ID: 16481

The Delft3D Basinwide Model was not calibrated to Fort St. Philip because it is a naturally-occurring crevasse rather than an engineered diversion. The Davis Pond and Caernarvon Diversions are freshwater diversions intended to reduce salinity through the introduction of fresh water and were not designed to channel sediments from deep in the river.

The West Bay Sediment Diversion is a large, uncontrolled diversion with a discharge of 20,000 to 50,000 cfs. Constructed in 2003, the goals for the project included: 1) increase land:water ratio; 2) increase mean elevation in the wetland; and 3) promote marsh habitat. To date, the restoration actions have successfully restored a portion of the land and habitat previously present in West Bay. (McQueen et al., 2020). Because the modelers considered the West Bay Sediment Diversion to be a reasonable analog to the proposed Project and in accordance with professional standards, they validated the Delft3D Basinwide Model to the West Bay Sediment Diversion. The accretion rate of inorganic sediment was also validated using data from the Big Mar Lake adjacent to the Caernarvon Diversion. The Delft3D Basinwide Model is a public-domain, physics-based model in which water depth and consolidation of underlying soils are accounted for by appropriate equations. The consolidation feature of the model is described in the below reference, which was included in Chapter 10 (References) and cited in Chapter 2 (Alternatives) of the Draft EIS. Therefore, differences in water depth and underlying soils are accounted for in the model's physics-based calculations.

Uncertainties associated with the validation using West Bay were assessed using sensitivity tests and were considered in the analysis by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in Appendix E (Delft3D Modeling) and incorporated into the Draft EIS conclusions throughout Chapter 4 Environmental Consequences.

CPRA. 2011. Myrtle Grove Delta Building Diversion Modeling Effort in Support of the LCA Medium Diversion at Myrtle Grove with Dedicated

Dredging Project: Data Collection, Preliminary Design, and Modeling Initiative. Available online at:
<https://www.lacoast.gov/reports/project/4900753~1.pdf>.

As part of developing the EIS, the USACE, together with the members of the LA TIG (including cooperating agencies and CPRA), reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

Concern ID: 61844

The Delft3D Basinwide Modeling used for the EIS is flawed because it was not calibrated against empirical results from three diversions that, like the proposed MBSD Project diversion, include an outfall area comprised of shallow water with organic soils: Fort St. Philip natural crevasse, Davis Pond Diversion, Caernarvon Diversion (see Zedler 2017, Suir 2012, and Turner 2017). Further, there is no evidence of a net land gain or conservation within those sites after the diversions began. There was sometimes a dramatic land loss after diversion implementation/start that has not reversed (Couvillion 2017, USACE 2004, Suir et al. 2014, Kearney et al. 2011, Underwood 1994).

Response ID: 16482

The Delft3D Basinwide Model was not calibrated to Fort St. Philip because that is a naturally-occurring crevasse rather than an engineered diversion. The Davis Pond and Caernarvon Diversions were designed to primarily divert fresh water in order to lower salinities in the receiving basins. Unlike the MBSD, they were not designed to divert sand-sized sediment, which is needed to build land.

The West Bay Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, "A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that diversions do not lead to appreciable sediment accumulation." (Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, Estuarine, Coastal and Shelf Science, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005>).

The Zedler (2017) reference cited by the commenter is useful. Zedler wrote approvingly of the application of integrated habitat and hydrodynamic models in an adaptive management framework for restoration of coastal Louisiana. That is the same approach described in the Draft EIS in Chapter 4, Section 4.27 Mitigation Summary.

The Turner (2017) reference about using a correct mineral sediment supply baseline for coastal restoration is also useful. The Delft3D Basinwide Model results used in the EIS confirm the conclusion in Turner (2017) that Mississippi River diversions upstream of the birdfoot delta increase deterioration of the birdfoot delta, as noted in Chapter 4, Section 4.2.3.3 in Geology and Soils of the Draft EIS.

The references provided by the commenter were considered and incorporated into the EIS. Couvillion et al. 2017 is included in Chapter 3, Section 3.2 Geology and Soils and Section 3.6 Wetlands and Waters of the U.S., Kearney et al. 2011 is cited in Chapter 2, Section 2.4.1.3.3 Lower Barataria Basin, and Underwood 1994 is cited in Appendix R2 Monitoring and Adaptive Management Plan of the EIS Suir et al. 2014 was added to Chapter 2 Alternatives, Table 2.3-1of the Final EIS.

Couvillion, B.R., H. Beck, D. Schoolmaster, and M. Fischer. 2017. Land area change in coastal Louisiana 1932 to 2016: U.S. Geological Survey Scientific Investigations Map 3381, 16 p. pamphlet. Available online at: <https://doi.org/10.3133/sim3381>.

Underwood, AJ. 1994. On beyond BACI: sampling designs that might readily detect environmental disturbances. Ecological Applications 4: 3–15.

As part of developing the EIS, the USACE, together with the members of the LA TIG (including cooperating agencies and CPRA), reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives. No related edits have been made to the Final EIS.

Concern ID: 61845

The Delft3D Basinwide Modeling for the EIS projects positive results when existing evidence from nearby sites in Louisiana show the opposite results. Commenter stated that the model does not incorporate important biological drivers such as the effects of

flooding, nutrients, and resistance to erosion, and consequently questioned the accuracy of the model.**Response ID: 16483**

Comparing observed effects of various diversions has limited value, since diversions and receiving environments often exhibit unique attributes or behaviors that correlations do not account for. For that reason, the Delft3D Basinwide Model, even with its limitations and uncertainties, is a better predictor than anecdotal comparison to Fort St. Phillip or other sites where diversions were designed to divert primarily water, not land-building sediment.

The Delft3D modeling did incorporate flooding, nutrients, and resistance to erosion in its results. Flooding, nutrients, and resistance to erosion are described in Appendix E Delft3D Modeling. See generally Figure 5-1 regarding model module interaction, Section 5.2 Morphodynamics Module and 5.4 Vegetation Module in Appendix E Delft3D Modeling for additional information.

Uncertainties associated with the validation using West Bay were assessed using sensitivity tests and were considered in the analysis by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in Appendix E Delft3D Modeling and incorporated into the Draft EIS conclusions throughout Chapter 4 Environmental Consequences.

The references provided by the commenter were considered and incorporated into the EIS. Couvillion et al. 2017 is included in Chapter 3, Section 3.2 Geology and Soils and Section 3.6 Wetlands and Waters of the U.S., Kearney et al. 2011 is cited in Chapter 2, Section 2.4.1.3.3 Lower Barataria Basin, and Underwood 1994 is cited in Appendix R2 Monitoring and Adaptive Management Plan of the EIS Suir et al. 2014 was added to Chapter 2 Alternatives, Table 2.3-1 of the Final EIS.

Couvillion, B.R., H. Beck, D. Schoolmaster, and M. Fischer. 2017. Land area change in coastal Louisiana 1932 to 2016: U.S. Geological Survey Scientific Investigations Map 3381, 16 p. pamphlet. Available online at: <https://doi.org/10.3133/sim3381>.

Underwood, AJ. 1994. On beyond BACI: sampling designs that might readily detect environmental disturbances. *Ecological Applications* 4: 3–15

As part of developing the EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

Concern ID: 62277

Many of the impacts of the proposed Project are more dramatic in the first decade of the proposed Project operations; after 2030, the discussion of benefits and impacts in the Draft EIS is based largely on a few model years. However, those model years do not acknowledge the increasing rainfall and river flooding of the past few years that can be expected to increase due to climate change. For example, it is foreseeable that a flood year like 2019 could become more normal over the next decade.

Response ID: 16484

Climate change has altered rainfall and river flow patterns and may further do so in the future. Uncertainties regarding future conditions were summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E (Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties). Uncertainties regarding climate change were considered and incorporated into the Draft EIS conclusions throughout Chapter 4 Environmental Consequences. No related edits have been made to the Final EIS.

The USACE, together with the members of the LA TIG (including cooperating agencies and CPRA), reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

Concern ID: 62278

Models have not taken into account the influence of wind, which is a significant driver of water levels in the estuary. In winter, storm fronts generally move north to south and water levels in the basins are typically lower, providing an opportunity for seasonal diversion operations. This is particularly true in the Barataria Basin, where backwater flooding from a high river has not been a significant concern.

Response ID: 16485

Wind is an important factor in the estuary. The Delft3D Basinwide Model simulations included wind as described in the Draft EIS

Appendix E (Delft3D Modeling, Section 3.2.2 Atmospheric Forcing) and summarized in Chapter 4, Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis. Meteorological data recorded throughout 2014, including wind speed and direction recorded at 6-hour intervals in the basin over the course of the year, was used in the model. That data reflects the seasonal variation in wind speed and direction that occurred in the basin in 2014 and was factored into model outputs with respect to water levels. Appendix E Delft3D Modeling, Section 3.2.2 Atmospheric Forcing has been edited in the Final EIS to clarify this.

As part of developing the EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

Concern ID: 62280

The Draft EIS outlines uncertainties in the modeling that tend to underestimate salinity by 1ppt, water level by 0.1 m, and temperature by 1.5°C. The level of uncertainty reported in the Draft EIS varies spatially throughout the basin. Section 8.0 (Model Limitations and Uncertainties) of Appendix E (Delft3D Modeling) mentions that the dilution factor is uncertain as well as the effect of barrier islands on tidal exchange over time. The Draft EIS also describes uncertainty around other restoration efforts. For instance, the model assumes that the barrier islands are drowned by relative sea-level rise. However, the State of Louisiana has been committed to maintaining these important features, and that commitment is likely to continue, therefore reducing salinity increases. The Mississippi River birdfoot delta passes, however, are likely to deepen, enlarge, and increase salinity influences. Taken all together, these factors may underestimate salinity enough that the biological impacts forecasted may be a worst-case scenario for saltwater species, such as oysters and dolphins.

Response ID: 16486

The Delft3D Basinwide Model results should be interpreted in light of the uncertainties discussed in the EIS. As discussed in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties, those uncertainties were examined through sensitivity tests and by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method and incorporated into the Draft EIS conclusions throughout Chapter 4 (Environmental Consequences). No related edits have been made to the Final EIS.

As part of developing the EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

ES82000 – ADCIRC Modeling

Concern ID: 62181	The commenter believes the units on the storm hydrographs in Draft EIS Appendix P are incorrect.
Response ID: 15764	Figures 3-24 through 3-39 and 3-62 through 3-77 in Draft EIS Appendix P1 Surge and Wave Conditions Report (ADCIRC Model) are correctly plotted in feet. No changes were made to the Final EIS.

GEN1000 - General Support for Project/RP

Concern ID: 63332	A large number of commenters expressed general support for the proposed Project.
Response ID: 16288	The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.
Concern ID: 63333	Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.
Response ID: 16289	The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA

evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 63334

The proposed MBSD Project would maintain and restore coastal lands and should move forward.

Response ID: 16291

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 63336

This proposed Project is absolutely crucial for the future of our coast and the safety and livelihoods of our coastal communities.

Response ID: 16292

The commenter's support for the proposed Project is noted. The proposed Project, by reestablishing deltaic processes, is intended to build coastal resiliency and protection for the coastal communities behind Barataria Basin. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries. See Sections 3.2.1.6 (Benefits Multiple Resources) and 3.2.1.7 (Public Health and Safety) of the LA TIG's Restoration Plan for a detailed discussion of the proposed Project's potential benefits and public health and safety impacts, respectively.

Concern ID: 63337

A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.

Response ID: 16294

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of

the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 63338	The proposed Project would bring back vital habitat along the Gulf Coast, including wetlands that would support a huge variety of birds and other wildlife.
Response ID: 16295	The commenter's support for the proposed Project is noted. Chapter 4, Section 4.9 Terrestrial Wildlife and Habitat of the Draft EIS explained the beneficial (and adverse) impacts of the proposed Project on various avian and terrestrial species. As also explained in the LA TIG's Restoration Plan in Section 3.2.1.6, the proposed Project is intended to improve habitat for birds and other coastal and living marine resources.
Concern ID: 63339	The Mid-Barataria Sediment Diversion is the largest individual ecosystem restoration project in our country's history, which is fitting since the Barataria Basin is experiencing one of the highest rates of land loss on the planet. Large-scale projects like the Mid-Barataria Sediment Diversion are just the kind of bold actions that are needed if there is to be any hope of a truly sustainable coast.
Response ID: 16297	The commenters' support for the proposed Project is noted. Land and wetland loss along coastal Louisiana is described in EIS Chapter 3, Sections 3.1.4.1 and 3.1.4.2 in Introduction.
Concern ID: 63340	The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.
Response ID: 16298	The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

Concern ID: 63340a	Coastal preservation and restoration activities are essential in order to continue providing habitat for fish and wildlife, to protect communities, and to provide a source of recreation to residents and visitors.
Response ID: 16298a	The commenter's support for coastal restoration is noted. As discussed in Chapter 1, Section 1.4 Purpose and Need, the purpose of the proposed Project is to implement a large-scale diversion that would provide and support the long-term viability of existing and planned coastal restoration efforts. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need. The impacts (both beneficial and adverse) of the proposed Project on the extent of wetlands (including as fish and wildlife habitat), protection from storm events, and the economy, depending on the wetland area, community, and industry are considered in the EIS; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.9 Terrestrial Wildlife and Habitat, 4.10 Aquatic Resources, 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.
Concern ID: 63341	The coastal wetland system creates multiple lines of natural defense from hurricanes and storm surge, and the ongoing wetland loss resulting from the lack of riverine input into the basin has resulted in increased storm risks to local communities (including decreases in property values and impacts to the electrical grid).
Response ID: 16300	The commenter's support for the proposed Project is noted. The commenter correctly notes that coastal wetlands are natural defense against hurricanes and storm surge, and the damage they cause to local communities and infrastructure, as discussed in Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S. of the Draft EIS. The causes of wetland loss in the proposed Project area were discussed in Section 3.6.2 of the Draft EIS, and included subsidence, levees, storms, canals/spoil banks, herbivory, and the DWH oil spill. Chapter 4, Sections 4.6 Wetland Waters and Resources of the U.S. and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS explained how the proposed Project would create and maintain wetlands in the Barataria Basin, and discuss the corresponding impacts on storm surge and flooding.
Concern ID: 63342	Other natural or man-made diversions have successfully built land, such that the proposed MBSD Project would also be expected to build land.
Response ID: 16302	The commenter's support for the proposed Project is noted. Consistent with the comment, Chapter 4, Section 4.2.3.2 in Geology and Soils

indicates that the proposed Project is anticipated to build land in the Barataria Basin (with smaller amounts of land loss projected in the birdfoot delta). To facilitate comparisons between the proposed Project and other natural or man-made diversions, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

Concern ID: 63343

The diversion would result in a return to a more natural state in which a delta existed in the Barataria Basin and the saltier waters required by many important fishery species were naturally further south.

Response ID: 16304

The concerns raised by the commenter related to the proposed Project's role in connecting the Barataria Basin to the Mississippi River were considered in the Draft EIS. As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources, the proposed Project would impact salinity in the Barataria Basin, with salinity impacts benefiting some fishery species, such as bass and Gulf menhaden, and adversely impacting others, such as oysters and brown shrimp. Section 4.2 in Geology and Soils of the Draft EIS discussed the proposed Project's impacts on creating a delta in the basin. As identified in Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative and discussed throughout Chapter 4 Environmental Consequences of the EIS, the No Action Alternative is compared to existing conditions to understand the anticipated changes in the environment that would occur irrespective of the proposed Project. Thereafter, the anticipated environmental consequences of the proposed Project action alternatives are compared to the results of the No Action Alternative analysis. Section ES.1 Introduction and Authority of the Executive Summary has been revised to include this clarification. In addition, Chapter 3, Sections 3.1.4.2 and 3.2.1.1 Historical Content, have been supplemented in the Final EIS to further discuss historic conditions and the role that the diversion may play in the Mississippi River Delta cycle.

Concern ID: 63345

Local communities are being afforded the opportunity to capitalize on well over \$1 billion in economic impact through the construction of the proposed Project, adding hundreds of higher wage jobs to their communities. These jobs also would allow these communities to build a workforce pipeline of talent to continue to perform civil construction, earthworks, environmental restoration, and surveying work in complex and challenging environments, each of which would provide stable, lucrative incomes for workers and their families and that benefit would flow

Response ID: 16306	to the vibrant communities and add a stable tax base for local governments.
	The commenter's support for the proposed Project is noted. The comment is consistent with the content of Chapter 4, Section 4.13.4.2 in Socioeconomics of the Draft EIS, which identified up to major economic benefits within the proposed Project area during construction of the proposed Project.
Concern ID: 63346	Through a long history of coastal restoration, it has become clear that funding sources will deplete, and dredged sediments pumped and shaped into land subside often within a few decades; however, the river will continue to flow for generations and the sediments, nutrients, and fresh water will continue to build land as long as it is allowed it to flow.
Response ID: 16307	The commenter's support for the proposed Project is noted. Consistent with the comment, Chapter 4, Section 4.2.3.2 in Geology and Soils of the Draft EIS discussed the long-term and sustained source of sediment that would be provided by the proposed Project for the replenishment and restoration of lands (including wetlands) within the outfall area.
Concern ID: 63347	The commenter strongly urges that the proposed Project be approved without delay, and that CPRA continue to work in collaboration with communities, residents, and impacted commercial and charter fishermen to develop additional granularity around mitigation and stewardship measures proposed.
Response ID: 16309	<p>The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.</p> <p>CPRA engaged the fishing community potentially impacted by the Project through public meetings to solicit input on mitigation and stewardship strategies and engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures from affected fishers. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. In response to comments, CPRA</p>

has expanded and refined the Final Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated proposed Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63348

The proposed MBSD Project is not a panacea for all of Louisiana's land loss, but it is a first step in using the full suite of tools on hand, including the most important tool, the Mississippi River, which actually built this landscape.

Response ID: 16310

The commenter's support for the proposed Project is noted. Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives of the Draft EIS explained how the proposed Project is designed to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin. This is also

discussed in Chapter 3, Section 3.2.1.1 in Geology and Soils of the LA TIG's Restoration Plan.

Concern ID: 63349

Commenters noted that it is clear that only nature can build a delta, and that nature should be allowed to begin to replace the one that was allowed to die. In order for that to happen without massive dislocation of human communities, some combination of a diversion the approximate size of the Wax Lake Outlet, combined with some level of control at the point of outflow, would be necessary.

Response ID: 16311

The commenter's support for the proposed Project is noted. Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives of the Draft EIS explained how the proposed Project is designed to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin. Although the proposed Project is not designed to divert the maximum capacity of water diverted by the Wax Lake Outlet (about 440,000 cfs), its operation is projected to build maximum of 17,300 acres of land in the Barataria Basin by 2050, as discussed in Chapter 4, Section 4.2.3.2 in Geology and Soils. The capacity and operational triggers considered for the proposed Project are discussed in Chapter 2, Section 2.4 Step 2: Evaluation of Operational Alternatives - Location, Operational Triggers, Capacity, and Base Flow. The purpose of the proposed Project is also discussed in Chapter 3, Section 3.2.1.1 (Alternative 1 Description) of the LA TIG's Restoration Plan.

Concern ID: 63351

Before the river was engineered in response to the 1927 flood, Louisiana used to grow every spring and New Orleans enjoyed an immense buffer protecting it from storms. Restoring this wetland buffer is key to the city's survival. Southeast Louisiana is already an engineered space, but one that is not working for us. Let us engineer it for longevity. Please approve this diversion.

Response ID: 16313

The commenter's support for the proposed Project is noted. Chapter 2, Section 2.2.1 Define Project Objectives of the Draft EIS explained that the proposed Project is intended to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin. This is also discussed in Chapter 3, Section 3.2.1.1 (Alternative 1 Description) of the LA TIG's Restoration Plan.

Concern ID: 63352

The Mid-Barataria Sediment Diversion is the cornerstone of Louisiana's Coastal Master Plan and would help support and enhance the lifespan of other coastal restoration and protection projects. Combined with other proposed restoration projects, the Mid-Barataria Sediment Diversion would build and preserve more than 17,000 acres of wetlands over the next 30 years to restore critical wetland habitat injured by the DWH oil spill.

Response ID: 16314 The commenter's support for the proposed Project is noted. The cumulative impacts of the proposed Project and other restoration projects were discussed in Chapter 4, Section 4.25.6.4 in Cumulative Impacts of the Draft EIS. This section identified that, although sea-level rise and saltwater intrusion would generally offset the wetland gains of individual projects by 2070, there would be substantial interim benefits of these other past, present, and reasonably foreseeable restoration projects in the Barataria Basin, including benefits related to fisheries production and storm surge risk.

Concern ID: 63353 **The commenter strongly supports the Applicant's Preferred Alternative, but would prefer something larger. The commenter further notes that south Louisiana cannot afford to wait longer or accept lesser solutions because the coastline is sinking and local fisheries and wildlife habitat is washing into the Gulf. Fortunately, the Mississippi River offers a chance at salvation if the river is used correctly.**

Response ID: 16315 The commenter's support for the proposed Project is noted. The relative impacts, both beneficial and adverse, for the various capacity alternatives is explained throughout Chapter 4 Environmental Consequences of the EIS. Although the 150,000 cfs Alternative would result in the greatest degree of benefits (including the most land building), it also would result in the greatest degree of adverse impacts, particularly to marine mammals (see Section 4.11.5 in Marine Mammals), shrimp and oysters (see Section 4.10.4.5 in Aquatic Resources), and public health and safety (through increased water levels and inundation in areas closer to the immediate outfall, see Section 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction). The USACE has supplemented Section 4.10.4.5.3 in the Final EIS to further discuss the impacts of the 150,000 cfs Alternative to brown shrimp and oysters. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

The LA TIG's Restoration Plan evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54 and strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. While 150,000 cfs diversion would be expected to deliver more ecological benefits in terms of land creation and marsh building than the LA TIG's Preferred Alternative, it would also incur more collateral injuries and pose a greater risk to human health and safety; thus, it was not selected as the LA TIG's Preferred Alternative. See Section 3.2.4 (Overall OPA Evaluation Conclusions) of the Final Restoration Plan for a discussion

of how the LA TIG came to its decision. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 63354

The proposed MBSD Project is the most cost-effective way to address the current problems in a sustainable way.

Response ID: 16316

The USACE and LA TIG acknowledge the commenter's support for the proposed Project. The LA TIG further notes that it strove to identify a preferred alternative that meets OPA's cost criteria and achieves the LA TIG's goals of comprehensive, integrated ecosystem restoration, through the creation of deltaic processes that supports an ecosystem that would be sustained over decades even in the face of rising sea levels and coastal erosion.

Concern ID: 63355

The proposed Project needs to be built, but in the meantime, there is also a need to dredge and pump river sediment to build marsh, then put rocks around to maintain those results.

Response ID: 16317

The commenter's support for the proposed Project is noted. The action being considered in the EIS is described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Sections 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives and 2.8 Action Alternatives Carried Forward for Detailed Analysis. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS. Other coastal restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan and the LA TIG through NRDA restoration planning.

Concern ID: 63357

The commenter indicates that the proposed Project would represent a major economic development project for the region and urges that this Project be approved and constructed with all urgency given the land-loss emergency along the Louisiana coast.

Response ID: 16319

The commenter's support for the proposed Project is noted. Consistent with the comment, Chapter 4, Section 4.13 Socioeconomics of the Draft EIS indicated that construction of the proposed Project would result in a major economic benefit within the Project area. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 63358	The commenter supports constructing the Mid-Barataria Sediment Diversion before more Louisiana heritage is lost, and references a recent notice about native Indians who are being relocated by the government because their land is going to be under water.
Response ID: 16320	<p>The commenter's support for the proposed Project is noted. Chapter 4, Sections 4.2 Geology and Soils and 4.6 Wetland Resources and Waters of the U.S. of the Draft EIS discussed the land building/marsh creation projected to result from the proposed Project, and Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discussed the projected impacts of the Project on flooding and storm hazards in Barataria Basin. Any ongoing actions regarding the relocation of Tribal Nations in coastal Louisiana is not associated with the proposed MBSD Project.</p> <p>As indicated in Chapter 4, Section 4.24 Cultural Resources of the Draft EIS, historic resources consultations have been conducted in accordance with Section 106 of the NHPA. Appendix K Cultural Resources Information of the Final EIS includes the PA negotiated between the NHPA Section 106 consulting parties regarding the proposed Project. The PA explains the outreach conducted by the CEMVN to Tribal communities, identifies the Tribal Nations that decided to participate in the Section 106 Process, and explains that the CEMVN has and would continue to consult with any interested Tribal Nation who may have not yet requested to consult.</p>
Concern ID: 63359	More diversions (size notwithstanding) are needed up and down the Mississippi River to build more marsh.
Response ID: 16321	<p>The commenter's support for the proposed Project is noted. Chapter 2, Section 2.3.7 in Step 1: Evaluation of Functional Alternatives of the EIS includes an analysis of multiple, smaller (5,000-10,000 cfs) diversions up and down the Mississippi River; this discussion indicated that the smaller-scale diversions would not reestablish sustainable deltaic processes because the appropriate volume and range of sediment needed to meet Project objectives would not be captured and/or transported into the basin. Further, assessment of locational alternatives for the larger-sized project indicated that locations in the upper and lower basins would not meet the purpose and need of the proposed Project, and that other locations in the middle basin would not be as effective in meeting the purpose and need (see Section 2.4.1 in Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow). However, the Louisiana Coastal Master Plan contemplates additional sediment diversions to help restore the marsh and estuaries; those diversions that are reasonably foreseeable are discussed in Chapter 4, Section 4.25 Cumulative Impacts of the EIS. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS. Other projects</p>

outside Barataria Basin or that are not yet reasonably foreseeable (as defined in Section 4.25.1.3 in Cumulative Impacts) are beyond the scope of this EIS.

Concern ID: 63360	The USACE is not naive enough to believe that the use of fossil fuels is not directly or indirectly ruining the habitat of local wildlife and notes that USACE has it in its power to protect what cannot be replaced.
Response ID: 16322	The commenter's input is noted. Chapter 3, Section 3.6.2.2 in Wetland Resources and Waters of the U.S. of the Draft EIS discussed the direct and indirect causes of wetland loss in the Barataria Basin, including wetland loss related to exploration, production and use of fossil fuels.
Concern ID: 63362	This is a necessary step toward correcting environmental damage done to Louisiana by artificially directing water down the Mississippi River. Information about the necessity of healthy coastal marsh systems wasn't available when those decisions were made. It is especially necessary that the coastline is restored in preparation for climate change, which would hit Louisiana harder than most states.
Response ID: 16324	The commenter's support for the proposed Project is noted. The impacts of climate change and sea-level rise in Louisiana were discussed in Chapter 3, Sections 3.1.3 in Introduction and 3.4.1.1 in Surface Water and Coastal Processes of the Draft EIS and were factored into the Delft3D Basinwide model results discussed throughout Chapter 4 Environmental Consequences. Impacts to marsh and to flood risk for various communities are discussed for both the No Action Alternative and the Applicant's Preferred Alternative.
Concern ID: 63363	The commenter expressed support for the thorough analysis in the EIS, with the acknowledgement that modifications would be present in the Final EIS to account for ongoing communications about the proposed Project.
Response ID: 16325	The commenter's support for the proposed Project is noted. Revisions have been made to the Final EIS based on public comments received on the Draft EIS, input from cooperating agencies, and continued Project evaluation. Changes between Draft and Final EIS are identified through markings along the margins on the applicable pages, as described in Chapter 1, Section 1.7 Public Involvement Summary.
Concern ID: 63365	The proposed Project is necessary to stop land loss and mitigate storm impacts; however, impacts on the local populations should be mitigated.
Response ID: 16327	The commenter's support for the proposed Project is noted. CPRA expanded and refined its Mitigation and Stewardship Plan (Appendix R1) for the Final EIS in response to community and resource agency

input. If the proposed Project is approved and funded, CPRA states that it would implement the mitigation and stewardship measures as set forth in Appendix R1. CPRA's coordination with the affected communities and industries is described in Chapter 7 Public Involvement and Appendix R1, both of which have been revised for the Final EIS, in response to public comments.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63366

The commenter supports centering community needs in planned mitigation and stewardship efforts.

Response ID: 16328

CPRA has conducted meetings in communities that would be affected by the proposed Project. CPRA's coordination with the affected communities and industries is described in Chapter 7 Public Involvement and Appendix R1 (Mitigation and Stewardship Plan) of the

EIS, which have been revised in response to public comments in the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63367

Commenters noted that there is criticism from impacted communities and industries; however, the proposed Project proponent addresses these criticisms and has mechanisms to mitigate the impacts.

Response ID: 16329

CPRA's coordination with the affected communities and industries is described in Chapter 7 Public Involvement and Appendix R1 (Mitigation and Stewardship Plan) of the EIS, which have been revised in response to public comments in the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were

submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63368

CPRA has used the best available information and data to plan and design the proposed Project, and has committed to careful adaptive management and funding for mitigation to aide in the transition for the most impacted stakeholders.

Response ID: 16330

The commenter's support for the proposed Project is noted, including support for the analysis that has been undertaken to understand the potential impacts of the Project. Appendix R1 (Mitigation and Stewardship Plan) of the EIS describes CPRA's mitigation and stewardship measures and Appendix R2 (Monitoring and Adaptive Management [MAM] Plan), describes CPRA's proposed monitoring metrics to adaptively manage operations to meet Project objectives; both of these documents have been revised for the Final EIS in response to public comments.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63369

The commenter indicates that the Mid-Barataria Sediment Diversion presents the best chance to combat the impacts of climate change on Louisiana's communities and culture, with the best possible information and data backing it. However, the commenter notes that there is no such thing as a perfect model and even in the easiest to measure hydrological systems, models are the first point of failure and mistakes get made. Therefore, the commenter urges that the planning process involve the communities who have the deepest levels of experience, including the people who live close to the diversion, directly in the design, measuring, monitoring, evaluation, and stewardship of the proposed Project.

Response ID: 16332

The commenter's support for the proposed Project is noted, including the substantial analysis that has been undertaken regarding the Project. CPRA's coordination with the affected communities and industries is described in Chapter 7 Public Involvement and Appendix R1 (Mitigation and Stewardship Plan), which have been revised for the Final EIS in response to public comments.

The Delft3D Basinwide Model projections of future conditions include uncertainties, as detailed in Appendix E Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties of the Draft EIS. As part of developing the EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan of the Final EIS includes details regarding operational and adaptive management governance for the proposed Project. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations

discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63370

The commenter indicated that, with or without the diversion, the coastal situation is not encouraging, and action must be taken.

Response ID: 16333

The commenter's input is noted. The impacts of both the action alternatives and the No Action Alternative were discussed throughout Chapter 4 Environmental Consequences of the Draft EIS.

Concern ID: 63371

Some of the proposed Project impacts (in particular to oysters) could be minimized with proper management of the diversion. It is a sediment diversion and therefore should only be operated when sediment content is high in the river and in the water column, which just happens to be in the springtime when the water temperatures are low and oysters can handle the increase in the fresh water.

Response ID: 16334

As discussed in Chapter 2, Sections 2.2.1 Define Project Objectives and 2.4.3.2 Application of Additional Considerations to Capacity Alternatives of the EIS, the intake channel was modeled and designed to divert a relatively high sediment-to-water ratio (SWR) (greater than 1.0 on average) to be as efficient as possible in transporting sediment to reestablish deltaic processes; an SWR greater than 1.0 indicates that the proposed Project would divert more sediment per unit volume of diverted fresh water than concentrations in the Mississippi River. As identified in Chapter 4, Table 4.1-3, intermediate to maximum flows through the diversion structure are projected to occur predominantly in winter, spring, and early summer months. However, as discussed in

Chapter 4, Section 4.10.4.5 in Aquatic Species of the EIS, operation of the proposed Project would result in a permanent, major adverse impact on oysters, due in large part to decreases in salinity.

CPRA plans to operate the proposed MBSD Project in accordance with the Operations Plan which can be found in Appendix F (MBSD Design and Operations Information) of the EIS. CPRA would adaptively manage the diversion for performance (see Monitoring and Adaptive Management [MAM] Plan in EIS, Appendix R2), if the Project is approved and funded. The MAM Plan does not currently include a requirement to adjust operations based on SWR; however, it does include the parameters that will be monitored to evaluate Project objectives, including SWR, observations that will trigger consideration of adaptive management, and examples of potential adaptive management actions related to SWR (see Section 4.1.1 and Table 4.1-1). Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for

funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63372

New Orleans and Louisiana are high in the list of at-risk cities/states for sea-level rise and hurricanes, and New Orleans has already seen too much devastation. The commenter urged for quick action to protect the country and its citizens.

Response ID: 16335

The commenter's support for the proposed Project is noted. The impacts of climate change and sea-level rise in Louisiana were discussed in Chapter 3, Sections 3.1.3 in Introduction and 3.4.1.1 in Surface Water and Coastal Processes of the Draft EIS.

Concern ID: 63373

The commenter supports one of the alternative action plans of the Mid-Barataria Sediment Diversion proposal and the use of DWH settlement/ restoration monies for implementing the plan.

Response ID: 16336

The USACE and LA TIG acknowledge the commenter's support for the proposed Project. The LA TIG further acknowledges the commenter's support for using DWH restoration dollars to fund construction of the Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement and determined by the LA TIG. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 63374

Construction of the Mid-Barataria Sediment Diversion Project would have a massive positive economic impact, bringing thousands of jobs and billions of dollars in regional economic sales.

Response ID: 16337

The commenter's support for the proposed Project is noted. Chapter 4, Section 4.13.4.2 in Socioeconomics of the Draft EIS discussed major economic benefits projected to occur within the Project area during construction of the proposed Project from increased jobs and regional sales.

Concern ID: 63376

The State of Louisiana does not have the funding to implement its Coastal Master Plan in full. The State must utilize its best natural asset (the Mississippi River) to protect its communities, infrastructure, and natural resources, to compete for federal restoration funds in the future.

Response ID: 16339 The commenter's input is noted. Implementation of Louisiana's Coastal Master Plan in full is outside of the scope of this EIS and the LA TIG's Restoration Plan.

Concern ID: 63378 **The diversion would result in a return to a more natural state in which a delta existed in the Barataria Basin and the saltier waters required by many important fishery species were naturally further south.**

Response ID: 16304 The concerns raised by the commenter related to the proposed Project's role in connecting the Barataria Basin to the Mississippi River were considered in the Draft EIS. As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources, the proposed Project would impact salinity in the Barataria Basin, with salinity impacts benefiting some fishery species, such as bass and Gulf menhaden, and adversely impacting others, such as oysters and brown shrimp. Section 4.2 in Geology and Soils of the Draft EIS discussed the proposed Project's impacts on creating a delta in the basin. As identified in Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative and discussed throughout Chapter 4 Environmental Consequences of the EIS, the No Action Alternative is compared to existing conditions to understand the anticipated changes in the environment that would occur irrespective of the proposed Project. Thereafter, the anticipated environmental consequences of the proposed Project action alternatives are compared to the results of the No Action Alternative analysis. Section ES.1 Introduction and Authority of the Executive Summary has been revised to include this clarification. In addition, Chapter 3, Sections 3.1.4.2 Barataria Basin and 3.2.1.1 Historical Content have been supplemented in the Final EIS to further discuss historic conditions and the role that the diversion may play in the Mississippi River Delta cycle.

Concern ID: 63379 **After many years of study, with great investment of resources, it is time to implement the Mid-Barataria Sediment Diversion. Comments from opponents, primarily in St. Bernard and Plaquemines Parishes, are worthy of consideration but insufficient to delay further action on this keystone project of the Coastal Master Plan.**

Response ID: 16341 The commenter's statement of support is noted. The evaluation of the impacts of the Project in the EIS was developed using the best information and data available to USACE and the LA TIG. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. Revisions have been made to the Final EIS based on public comments received on the Draft EIS, input from cooperating agencies, and continued Project communications. Changes between the Draft and Final EIS are

identified through markings along the margins on the applicable pages, as described in Chapter 1, Section 1.7 Public Involvement Summary. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 63380

Though there might be a less hard, more green diversion channel one could design, the time has already been expended and the permit has almost been granted, such that now is time to move forward with the Mid-Barataria Sediment Diversion.

Response ID: 16342

The commenter's support for the proposed Project is noted. USACE is neither a proponent nor an opponent of the proposed Project and has not made any decision with respect to the proposed Project.

Several design alternatives were considered as discussed in Chapter 2, Section 2.4.4 in Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow of the Draft EIS. The proposed design, with the hardened, open diversion channel, was designed as the most effective structure to meet the purpose and need of the action. As noted in Chapter 7, Section 7.6 Record of Decision of the EIS, the Final EIS is not a decision document. The USACE will issue its Record of Decision for the proposed Project after the close of the Final EIS public review period. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 63381

The proposed Project would have fewer detrimental effects than those opposed to it understandably believe it would.

Response ID: 16343

The commenter's input is noted. The beneficial and adverse impacts of the proposed Project were explained throughout Chapter 4 Environmental Consequences of the Draft EIS. The LA TIG's Restoration Plan evaluated the proposed Project against a variety of factors, including those outlined in 15 CFR §990.54, and strove to identify an alternative that would provide what the LA TIG believes is the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. See Section 3.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan for a discussion of how the LA TIG came to its decision on the proposed Project.

Concern ID: 63382

The Mid-Barataria Sediment Diversion is a linchpin project from the plan that is critical to building a more climate resilient future for Louisiana. For decades, scientists and engineers have considered all the tools available and overwhelmingly agree that this proposed Project, and projects like it, are the best long-term

solution and necessary to match the challenges faced from land loss due to sea-level rise and other climate change impacts. The proposed Project would build and maintain thousands of acres of vital wetlands to protect people from flooding from more intense hurricanes and sea-level rise. Without action, some communities would see increased vulnerability to floods, continued loss of wetlands, and a collapse of key fisheries. Finally, the proposed Project would work in concert with nearby marsh creation projects and would extend the lifespan of the millions of dollars that have been invested in nearby marsh creation projects.

Response ID: 16344

The commenter's support for the proposed Project is noted. The No Action and proposed Project alternatives' impacts on flooding potentials, wetland extent, and key fisheries were discussed in Chapter 4, Sections 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk, 4.6 Wetland Resources and Waters of the U.S., and 4.10 Aquatic Resources of the Draft EIS, respectively. Similarly, the cumulative impacts of the proposed Project and other restoration projects were discussed in Section 4.25 Cumulative Impacts of the Draft EIS, as applicable.

Concern ID: 63383

The commenter is a firm believer in the power of adaptive management and looks forward to seeing the development and implementation of a robust and inclusive adaptive management plan. Done well, the commenter notes that a plan of this nature would build trust and gain knowledge to share this innovative technology with deltas all over the world.

Response ID: 16345

The commenter's input is noted. Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) of the EIS reflects CPRA's proposed adaptive management strategies, which were refined for the Final EIS based on public input received during the Draft EIS comment period.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would

be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63384

Orleans Parish is on the frontlines of climate change and has a vested interest in the implementation of large-scale coastal restoration projects such as the proposed MBSD Project, and particularly those that mimic or restore the Mississippi River's natural processes. The City of New Orleans supports the "multiple lines of defense" approach to risk reduction across coastal Louisiana. While projects like dredging for marsh creation and barrier island creation are vital components of that approach, they do not possess the land-building power that the proposed MBSD Project does and are unable to keep pace with sea-level rise.

Response ID: 16346

The commenter's support for the proposed Project is noted. The commenter correctly notes that the proposed Project is intended to reestablish the Mississippi River's natural deltaic processes, and that many alternatives considered in Chapter 2 Alternatives of the Draft EIS (such as marsh or barrier island creation) would not reestablish those processes. If approved, the proposed Project, in conjunction with the range of restoration projects across the Louisiana coastline, would reflect a multiple lines of defense approach to protecting Louisiana's resources, including New Orleans and Orleans Parish. Also, Chapter 4, Section 4.25 Cumulative Impacts considers other past, present and reasonably foreseeable projects together with the action alternatives, including the proposed Project.

Concern ID: 63385

A commenter noted that some opposed to the proposed Project compare it to freshwater diversions, like the Caernarvon Diversion, which introduce fresh water to combat rising salinity levels due to saltwater intrusion. The proposed MBSD Project is a sediment diversion, which is designed to shunt sediment from the

Response ID: 16347	river into a desired area, much like the river is designed to do by nature.
	The commenter is correct that a sediment diversion would have different goals and impacts from freshwater diversion projects that have been previously implemented. A summary of select natural and man-made diversions in southeastern Louisiana, including the Caernarvon Diversion, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.
Concern ID: 63386	LA Highway 1 (LA 1) is the only roadway supporting Port Fourchon and the significant industry that it supports, and is the sole evacuation route for area residents. The highway also provides access to seafood production areas, eco-tourism destinations, coastal marshes for restoration and protection projects, and a critical route for oil spill response. The proposed Project would help deliver the sediment and fresh water to protect our basin, furthering the protection of LA 1, and those who travel on it, from storms.
Response ID: 16348	The commenter's support for the proposed Project is noted. The effects of the proposed Project on weather and storm surge events, including the areas in which the impacts of storm events are projected to decrease, were discussed in Chapter 4, Section 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS. As discussed, storm surge in the western and middle basin would increase up to 0.2 feet by 2040 under the Applicant's Preferred Alternative. Although the wetlands projected to be created or maintained by the proposed Project would not directly benefit LA 1, the cumulative impacts of the proposed Project and other restoration projects, as discussed in Chapter 4, Section 4.25.6.4 in Cumulative Impacts, would allow for substantial interim (before 2070) benefits of these other past, present, and reasonably foreseeable restoration projects in the Barataria Basin, including those related to storm surge risk.
Concern ID: 63387	The central purpose of the proposed MBSD Project based on its Natural Resource Damage funding source is to offset damage caused to the Barataria Basin as a result of the DWH oil spill in 2010. However, the Draft EIS also noted that an associated purpose is building and protecting wetlands with a view to restoration of parts of the basin. A central goal of the CWA, the Section 404 regulations, and NEPA is the restoration and maintenance of the chemical, physical, and biological integrity of the nation's waters, including the Barataria Basin. The MMPA

states as a key policy that the primary objective of the management of marine mammal species should be to maintain the health and stability of the marine ecosystem. The proposed MBSD Project is designed to further these goals.

Response ID: 16349

The commenter's support for the proposed Project is noted. The burden to comply with NEPA is on the federal decision-making agencies, not on the project itself. USACE will evaluate the proposed Project for its compliance with the CWA Section 404(b)(1) guidelines; that evaluation is underway and is not complete. The LA TIG also intends to rely on the Draft EIS to inform its decision under OPA and to fulfill the requirements of the federal Trustees under NEPA. A discussion of the MMPA can be found in Chapter 3, Section 3.11.1 Marine Mammals in the Northern Gulf of Mexico of the Final EIS.

As described in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the proposed MBSD Project is to restore for injuries caused by the DWH oil spill and to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

Concern ID: 63388

Commenters noted that the time for planning and studying has run out and the river must be put to work. The Mid-Barataria Sediment Diversion would do just that. It would work in concert with nearby marsh creation projects to extend their longevity, which optimizes our investments. In addition, there would be a massive economic boon coming from the construction and sales related to the development of the proposed Project.

Response ID: 16350

The commenter's support for the proposed Project is noted. The cumulative impacts of the proposed Project and other restoration projects were discussed in Chapter 4, Section 4.25 Cumulative Impacts of the Draft EIS, as applicable. Further, the comment is consistent with Chapter 4, Section 4.13.4.2 in Socioeconomics of the Draft EIS, which identified major economic benefits within the Project area during construction of the proposed Project.

Concern ID: 63390

The proposed Project would be beneficial as long it is run as designed and is not altered by special interests, and would help maintain wetlands that would minimize flood risks to the commenter's generational home, outside the levee system.

Response ID: 16352

The commenter's support for the proposed Project is noted. Chapter 4, Section 4.6 Wetlands and Waters of the U.S. of the EIS discusses the extent of wetland maintenance and restoration that would be expected from the proposed Project, although Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction

acknowledges the increased potential for flooding impacts outside of federal levee systems. Recognizing the potential for these impacts, CPRA has developed a number of mitigation and stewardship measures for infrastructure impacts, such as elevating public roadways. These measures, which have been revised in response to public comments since the release of the Draft EIS, are described in Appendix R1 (Mitigation and Stewardship Plan) of the Final EIS.

Structural measures such as raising roads or improving bulkheads in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if the permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the D EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. The USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 (Mitigation Summary) of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63392

The proposed Project would also enhance and extend the life span of other nearby restoration projects, maximizing our coastal restoration efforts and limited funding.

Response ID: 16354

The commenter's input is noted. The cumulative impacts of the proposed Project and other restoration projects were discussed in Chapter 4, Section 4.25 Cumulative Impacts of the Draft EIS, as applicable.

Concern ID: 63394

The Mid-Barataria Sediment Diversion would rebuild wetlands, protect the coast, and help reduce the Gulf of Mexico Dead Zone through diversion of nutrients into the Barataria Basin to increase area productivity.

Response ID: 16356

The commenter correctly notes that the proposed Project would build and maintain wetlands within the Barataria Basin that would provide some storm surge reduction to some portions of the basin, as discussed in Chapter 4, Sections 4.6.5.1 in Wetland Resources and Waters of the U.S. and 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the EIS. As discussed in Section 4.10.4.4 in Aquatic Resources, nutrient load would increase in the Barataria Basin from the input of water from the Mississippi River; however, the birdfoot delta is projected to have negligible changes in nutrient loads. Section 4.25.5.4.4 and 4.25.5.4.5 in Cumulative Impacts, Surface Water and Sediment Quality of the Final EIS has been revised to discuss the Gulf Hypoxia Action Plan, which highlights the important role that river diversions could play in reducing nutrient loads; however, the Gulf hypoxic zone is not expected to be impacted by operation of the proposed Project.

Concern ID: 63396

There is an opportunity in Louisiana to invest in restoration to build a more climate resilient future for Louisiana's coast. With annual inputs of sediment and fresh water, river deltas can continue to provide valuable habitats and other benefits in the face of environmental changes. However, human activity has altered many deltas around the world and the Mississippi River Delta is no exception as levees and canals have caused a series of other direct and indirect impacts. The idea of a river diversion at Myrtle Grove is not new and has undergone extensive study since it was first explored more than 35 years ago in a 1984 feasibility study by the USACE. With the diversion there would be changes in

the basin; changes in water levels, sediment accumulation, and the distribution of salinity and some species of fish and wildlife. Efforts to mitigate for these changes should be as transparent and inclusive as possible. But without the diversion, major changes are also expected to occur and the ecosystem would continue to degrade with continued sea-level rise and wetland loss.

Response ID: 16358

The commenter's support for the proposed Project is noted. The analyses in the EIS were developed using the best information and data available to USACE and the LA TIG at the time of writing. The impacts of both the proposed Project and the No Action Alternative are discussed throughout Chapter 4 Environmental Consequences. Appendix R of the Final EIS reflects CPRA's mitigation and stewardship strategies, which were refined based on public input received during the Draft EIS comment period.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63350

The Mid-Barataria Sediment Diversion is the first project-level attempt at systemic ecosystem restoration to one of the world's treasures, the Mississippi River Delta. The future of the Gulf Coast depends on the modeling and permitting decisions in projects like the proposed Project.

Response ID: 16312

The commenter's support for the proposed Project is noted. Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives of the Draft EIS explained how the proposed Project is designed to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

The purpose of the proposed Project is also discussed in Chapter 3, Section 3.2.1.1 (Alternative 1 Description) of the LA TIG's Restoration Plan. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 63356

All the amazing natural habitats that exist today are because they were protected by citizens and conservation organizations who stopped the USACE's plans to drain and ditch. The USACE should change its focus to conservation and restoration.

Response ID: 16318

The commenter's input is noted. The mission of the USACE is outside the scope of this EIS.

Concern ID: 63344

The proposed Project must be moved forward to naturally reverse the impacts of levees and oil and gas activities, as well as to combat sea-level rise and climate change.

Response ID: 16305

The commenter's support for the proposed Project is noted. The comment is consistent with Chapter 4, Section 4.2.3.2 in Geology and Soils of the Draft EIS, which identified the projected land gains over time from operation of the proposed Project; these land gains take into account anticipated sea-level rise.

Concern ID: 63361

Move this proposed Project forward and prohibit the oil companies from endangering the local people and their way of life.

Response ID: 16323

The commenter's support for the proposed Project is noted. The regulation of oil companies and their activities is outside the scope of the EIS, as described in Chapter 1, Section 1.6 of the EIS; however, past, present, and reasonably foreseeable activities in the Project area

(including oil and gas activities) are included in the Cumulative Impacts assessment (Chapter 4, Section 4.25 Cumulative Impacts of the EIS), where their contribution to impacts on resources within the proposed Project area are considered. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

GEN2000 - General Critique of Project/RP

Concern ID: 62777

Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).

Response ID: 16359

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent

anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62778

Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.

Response ID: 16360

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is

projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62779

Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.

Response ID: 16361

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and

specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62780

Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.

Response ID: 16362

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation,

stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62781

Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.

Response ID: 16363

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS,

consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 62782

A large number of commenters expressed general opposition to the proposed Project.

Response ID: 16364

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 62783

Commenters noted that the cost of designing and building the proposed MBSD Project is too high for the small amount of land anticipated to be built.

Response ID: 16365

The commenter's opposition to the cost of the proposed Project is noted. Under NEPA, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that the permit applicant has conducted its own economic evaluation of a proposed project. Consequently, a cost-benefit analysis is not relevant to USACE's permitting decisions. As part of evaluating the proposed Project, the LA TIG considered the costs associated with developing, constructing, and managing the Applicant's Preferred Alternative consistent with the Restoration Plan alternatives evaluation criteria in 15 CFR §990.54. This discussion is in Chapter 3, Section 3.2.1.2 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan.

Concern ID: 62784

Prior or proposed diversions and diversion-like projects (including the Caernarvon Diversion, MRGO, Mardi Gras Pass, Maurepas Bonnet Carré Spillway openings) did not work or caused adverse impacts on area resources.

Response ID: 16366

The commenter's concern regarding the effectiveness and adverse impacts of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the Caernarvon Diversion, MRGO, Mardi Gras Pass, and Bonnet Carré Spillway, is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS. The Maurepas

Diversion is subject to an ongoing NEPA analysis, which is anticipated to be finalized in 2022.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The referenced projects all had unique goals, and, where goals existed, each of those projects have achieved their goals. Those achievements increase confidence in the ability of the LA TIG to set goals and select approaches appropriate for achieving those goals. The proposed Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the current geomorphological features of the Lower Mississippi River, as well as data and knowledge gained from the referenced projects.

Concern ID: 62785

This type of freshwater and sediment diversion project is unproven and there are uncertainties with respect to what the diversion would do (that is, if it would work and, if so, to what extent).

Response ID: 16367

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties have been incorporated into the EIS impact conclusions and were briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties.

Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or as predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the projected changes for the No Action Alternative.

In addition to the modeled data, Chapter 4 Environmental Consequences of the EIS includes additional analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in drafting the EIS. In response to public comments, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these

diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The LA TIG recognizes and acknowledges that a controlled sediment diversion of this scale has not been constructed in Louisiana previously. However, a sediment diversion at this location has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Chapter 3, Section 3.2.1.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan). The proposed Project would be monitored and adaptively managed to meet its objectives (see the Monitoring and Adaptive Management [MAM] Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62786

Multiple commenters expressed concern with the impacts of diverted waters on the economy and natural environment of the State of Mississippi.

Response ID: 16368

The proposed Project is not anticipated to have discernable effects on resources outside of the Project area, which is limited to Louisiana, and particularly the Barataria Basin and the Mississippi River birdfoot delta (as defined in Chapter 3, Section 3.1.1 in Introduction and the subsections entitled Area of Potential Effects for each resource heading in Chapter 4 Environmental Consequences). Because these resource-specific areas of potential effects were determined based on the anticipated limits of discernable impacts, negligible to no impacts on the natural or human environment are anticipated in the State of Mississippi from the construction and operation of the proposed MBSD Project.

Concern ID: 62788

The proposed Project would result in quick or immediate adverse impacts on resources in order to produce potential benefits in the future.

Response ID: 16369

As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would cause both beneficial and adverse impacts on the assessed resources upon commencement of operation, as well as both beneficial and adverse impacts on the assessed resources in the future. For example, the decrease in salinity that would occur upon initial operation of the proposed Project would result in major adverse impacts on various species (oysters, brown shrimp, bottlenose dolphins) over a relatively short period of time; however, the accumulating fresh water and sediments would create or maintain wetlands over long term or permanent basis, (that is, extending through the remainder of the 50-year period of analysis) which would benefit other commercially or recreationally important aquatic species, such as white shrimp, blue crab, and Gulf menhaden, and would increase storm protection for communities north of the immediate outfall area the Delft3D Basinwide Model projects these benefits to increase over time and to be greatest in the 2060s (see Chapter 4, Sections 4.6.5.1 in Wetland Resources and Waters of the U.S., 4.10.4.5 in Aquatic Resources, 4.11.5.2 in Marine Mammals, and 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54,

consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 62789

The cost of designing and building the proposed MBSD Project is too high for a project that has undependable results.

Response ID: 16370

The commenter's opposition to the proposed Project is noted. With respect to the dependability of the future benefits of the proposed Project, the Draft EIS acknowledged that the Delft3D Basinwide Model projections of future conditions includes uncertainties, which are incorporated into the EIS impact conclusions. These uncertainties are briefly summarized in the EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties. However, in addition to the modeled data, Chapter 4 - Environmental Consequences -includes analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in preparing the EIS. As part of developing the EIS, the USACE, together with the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the EIS impacts analysis of the alternatives.

Consistent with OPA regulations (15 CFR §990.54), the LA TIG's Restoration Plan evaluated multiple alternatives based on a number of criteria, including the cost of the alternative. For more information see Section 3 of the LA TIG's Final Restoration Plan. The costs associated with developing, constructing, and managing the Applicant's Preferred Alternative are discussed in Chapter 3, Section 3.2.1.2 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan.

Concern ID: 62790

Diversion of polluted and nutrient-laden waters into the Barataria Basin would result in harmful algal blooms (HABs) and expansion of the dead zone.

Response ID: 16371

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA's Mississippi River/Gulf of Mexico Hypoxia Task Force "Hypoxia 101" webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a

variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone “water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen” (<https://www.epa.gov/ms-hf/northern-gulf-mexico-hypoxic-zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.>)

Dissolved oxygen concentrations associated with the Applicant's Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.5.2 in Dissolved Oxygen of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section has been added to Sections 4.5.5.3.2 and 4.5.5.4.2 of the Final EIS. Finally, the EIS acknowledges the potential for up to major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) in the Barataria Basin during Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62791	Thus far, CPRA has not done anything to lower storm surge or slow the rate of wetland loss.
Response ID: 16372	CPRA was formed in 2005 to address Louisiana’s coastal crisis by implementing projects for a sustainable coast and reducing hurricane surge risks for its residents. Since 2007, CPRA has partnered on the implementation of hundreds of miles of levees to protect residents, visitors, and property; created tens of thousands of acres of marshes; and rebuilt Louisiana’s barrier island system. Louisiana’s Coastal Master Plan for a Sustainable Coast provides the roadmap for coastal restoration and every year the public can review the CPRA Annual Plan to understand the progress. Several of these past and current projects were considered as part of the cumulative impact analysis in Chapter 4, Section 4.25 Cumulative Impacts of the Draft EIS. CPRA’s actions to address storm surge and wetland loss outside of the proposed Project area (defined in Chapter 3 Affected Environment to include the Barataria Basin and the Mississippi River birdfoot delta), are outside the scope of this EIS.
Concern ID: 62792	CPRA is using soundbites and marketing to convince the Louisiana public and legislature to allow them to dole out contracts for over \$2 billion in limited coastal restoration dollars on these projects. In reality, Barataria Bay is already connected to the river with existing diversions at Davis Pond, West Pointe á la Hache, and Naomi.
Response ID: 16373	<p>The commenter’s opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, the Draft EIS assesses the environmental and socioeconomic impacts of the proposed Project. To the extent construction spending would serve as an economic driver, those anticipated impacts are discussed in Chapter 4, Section 4.13.4.2 Economy, Employment, Business, and Industrial Activity. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.</p> <p>The Delft3D Basinwide Model, which was used in developing the proposed MBSD Project EIS, accounts for the existing diversions at Davis Pond, West Pointe a la Hache, and Naomi (see Appendix E [Delft3D Modeling], Section 5.1.1 of the EIS).</p> <p>The USACE is neither a proponent nor an opponent of the proposed Project. It will make its decisions regarding the proposed Project based</p>

on the evaluations in the EIS and considering public comments and its determinations with respect to the public interest review, compliance with the CWA Section 404(b)(1) guidelines, compliance with other laws and Executive Orders, whether the Project would affect the ability of Corps projects to meet their authorized purposes and whether the project is injurious to the public interest. USACE's decisions will not be based in any respect on CPRA's public communications regarding the proposed Project.

Concern ID: 62793

The proposed Project is only being built to save New Orleans from being waterfront property.

Response ID: 16374

The commenter's opposition to the proposed Project is noted. As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the proposed Project is to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts. As discussed throughout Chapter 4 Environmental Consequences of the EIS, operation of the proposed Project would have various beneficial (and adverse) impacts throughout the Barataria Basin that would not be restricted to those experienced by the greater New Orleans area. Fifty years after the start of operations, the proposed Project is projected to have built or maintained 20.9 square miles of land in the vicinity of Myrtle Grove and Ironton. Communities to the north of that area are projected to benefit from reduced hurricane and storm surge. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62794

This poorly planned and executed proposed Project is being pushed forward for the financial gain of politicians and contractors because taxpayer dollars are being used. Private investment dollars would entail more deliberation and a full impact study, including more natural options with less risk and more overall benefits.

Response ID: 16375

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance and constitutes a full impact analysis. A variety of alternatives assessed in the EIS are identified in Chapter 2 Alternatives. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as

described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

The LA TIG's Restoration Plan evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG has selected Alternative 1 as the LA TIG's Preferred Alternative.

Concern ID: 62803

The proposed Project provides essentially zero benefit to anything in the Barataria Basin south of Lafitte.

Response ID: 16377

There would be both adverse and beneficial impacts on the wider Barataria Basin, including beneficial impacts on areas south of Lafitte, Louisiana. These adverse and beneficial impacts are discussed throughout Chapter 4 Environmental Consequences. Although the EIS recognizes the specific adverse impacts in the Lafitte area from increased tidal flooding (see Section 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction), the benefits south of Lafitte include (but are not limited to) regional economic benefits from the job creation and expenditures associated with construction of the diversion (see Section 4.13.4 in Socioeconomics), as well as the maintenance or restoration of wetlands in the immediate outfall area (see Figures 4.6-9 through 4.6-14 in Wetland Resources and Waters of the U.S.), which would result in benefits to various aquatic species in the Barataria Basin (such as white shrimp, blue crab, and red drum; see Table 4.10-6 in Aquatic Resources). Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62805

Great questions have been raised at the public meetings; however not many good responses were provided.

Response ID: 16379

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. The USACE and LA TIG undertook a coordinated and concurrent public review process for the Draft EIS and the LA TIG's Draft Restoration Plan. Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration

Plan and the Draft EIS in its decision-making process. All public questions and comments received during the comment period are addressed in this Response to Comment Appendix. Revisions have been made to the Final EIS based on public comments received on the Draft EIS, input from the cooperating agencies, and continued Project evaluation. Changes between the Draft and Final EIS are identified through markings along the margins on the applicable pages, as described in Chapter 1, Section 1.7 Public Involvement Summary of the Final EIS. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

For a summary of public outreach efforts related to the Draft EIS refer to Chapter 7 Public Involvement of the Final EIS and for restoration planning see Section 1.8 of the LA TIG's Final Restoration Plan.

Independent of the joint Draft EIS and Draft Restoration Plan public meetings, CPRA held additional meetings with communities potentially affected to receive their input on how best to mitigate Project effects on water levels. Based in part on that feedback, CPRA updated the Mitigation and Stewardship Plan (Appendix R1, revised for the Final EIS) to specify the measures that would be implemented to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This mitigation includes a combination of structural measures (for example, raising roads, boat houses, docks and utilities) and non-structural measures (for example, Project servitudes). The mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if the permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation,

stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62806

Some commenters suggested that the data used for the proposed Project are flawed.

Response ID: 16380

The EIS was developed considering the best information and data available to USACE and the LA TIG at the time of writing. Where commenters have identified specific data used in the EIS as being potentially flawed, those concerns have been assessed and responded to. In addition, additional data and publications recommended for review by the public during the Draft EIS comment period have been reviewed and incorporated into the Final EIS where appropriate.

Concern ID: 62807

The local population is not being kept up-to-date on the mitigation that would be done for their communities.

Response ID: 16381

CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area over the past several years. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the

proposed MBSD Project to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures, which were informed by CPRA's public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62809

If CPRA were truly interested in preserving the integrity of the land and water, it would employ some of the real science applied by Viktor Schauberger to revolutionize the field of hydrodynamics, reduce coastal erosion, and increase the efficiency of vessel transport.

Response ID: 16382

Although the ideas of Viktor Schauberger (and the books later developed from his ideas) were not reviewed during the development of

the EIS, the EIS analysis was developed using the best information and data available to USACE and the LA TIG at the time of writing and the EIS considers the beneficial and adverse impacts of the proposed Project. As noted in Chapter 2, Section 2.2 Steps Taken to Identify and Evaluate Reasonable Alternatives of the EIS, the proposed Project was identified in the 2017 Coastal Master Plan.

According to CPRA, the Coastal Master Plan used best information, data, and engineering available to it to work to achieve long-term sustainability of Louisiana's coast and ecosystem, relying where possible on natural processes and cycles. The projects identified in the Coastal Master Plan were the result of extensive public input, review, and vetting. The EIS and Coastal Master Plan generally incorporated more recent studies and publications than those ideas developed Viktor Schauburger during his life (1885-1958); therefore, no related edits to the Final EIS have been made.

Concern ID: 62810

The Draft EIS exhibited bias by listing negative impacts in a scientifically sound manner, then softening the negative information through use of semantics or alternative information that is always highlighted by the Applicant in its public statements and meetings about the proposed Project. This is totally unacceptable and would require extreme diligence on the part of the reviewing lead agency.

Response ID: 16383

The analyses in the Draft EIS acknowledged the potential impacts of the proposed Project and indicated the anticipated overall results based on a given analysis. The USACE has developed the EIS, together with the members of the LA TIG (including cooperating agencies and CPRA), considering the best information and data available to them and based on best professional judgment with respect to the potential impacts of the proposed Project. Additionally, the third-party contractor supporting preparation of the EIS was required to execute an Organizational Conflict of Interest Certification specifying that the contractor does not have financial or other interest in the outcome of the permit application process.

With specific regard to the concerns regarding former CPRA Board Chairman Johnny Bradberry, who is now President of Gulf Engineers and Consultants ("GEC"), the third-party contractor supporting preparation of the EIS, the Louisiana Board of Ethics, in an opinion dated February 18, 2019, Docket No. 2019-136, recognized the Conflict Mitigation Plan GEC has in place to avoid any conflict of interests, including prohibiting Mr. Bradberry from any involvement in the preparation of this EIS or in deriving any compensation from the preparation of the EIS. The prohibitions in that Conflict Mitigation Plan have been adhered to by GEC throughout this process.

Concern ID: 62811

CPRA is sacrificing the economic and environmental welfare of Plaquemines Parish citizens and resources for the implementation of the proposed Project. The commenter suggests that trucking in sediment to build up land, while expensive, is an option. The commenter questions at what cost the government would be responsible for the damage caused to the region.

Response ID: 16384

As discussed in Chapter 1, Section 1.4 Purpose and Need of the EIS, the proposed Project is intended to reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the input of sediment, fresh water, and nutrients, which would create wetlands, sustain existing wetlands, and support the long-term viability of existing and planned coastal restoration efforts, including dredging projects being built now and in the future. One such project is the Large-scale Marsh Creation and Component E Planning discussed in Chapter 4, Section 4.25 Cumulative Impacts of the EIS. This is all with the goal to provide for the long-term sustainability of the Barataria Basin (including Plaquemines Parish), not at its expense. However, the potential socioeconomic impacts of the proposed Project are described in 4.13 Socioeconomics of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

The Mitigation and Stewardship Plan (Appendix R1), revised for the Final EIS in response to public comment, includes mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project, including impacts on fisheries and on water levels in the communities south of the outfall outside of levee protection. For fisheries related impacts, the Plan includes job training, vessel and dock improvements, fisheries innovation support (for example, alternative oyster culture), and marketing support. For increased water levels and tidal flooding in communities south of the diversion outside federal levee protection, the Plan includes structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures. See Appendix R1 to the Final EIS for more details.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if the permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will

possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62812

The permit application notes the proposed Project would destroy or alter 7,530 acres of essential fish habitat. The commenter expressed concern that this acreage excludes oyster habitat, as well as crab, shrimp, and sport fishing habitats which, in total, is several times larger than 7,530 acres.

Response ID: 16385

As discussed in Appendix N2 Essential Fish Habitat Assessment of the EIS, operation of the proposed Project is projected to convert EFH from one EFH habitat type to another, rather than result in habitat loss of EFH. The habitat conversion generally would result in a conversion of the more ubiquitous soft bottom habitats (19,545 acres) to more structured habitats (see the Executive Summary, Table ES-1). The

adverse (and beneficial, as applicable) impacts on the habitats for specific species, including blue crab, brown and white shrimp, oysters, and select sport fish, are discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62816

BTNEP has long supported the idea of sediment diversion, but the scale of the diversions continues to grow and correspondingly, the scale of adverse impacts grows with it; it must be acknowledged that besides the benefit this diversion may bring, there are numerous potentially important adverse impacts that must be considered throughout the planning and evaluation process.

Response ID: 16389

The commenter's input is noted. As discussed throughout Chapter 4 Environmental Consequences, there are both beneficial and adverse effects of each of the alternatives carried forward, which include 50,000, 75,000, and 150,000 cfs alternatives (with and without terraces). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 62817

One commenter requested an individual discussion.

Response ID: 16390

USACE NEPA practice is to respond to public comments in writing. However, the USACE was able to discuss the commenter's concern, which was based on impacts of the MRGO rock closure on salinity in Lake Pontchartrain, and pass those concerns on to the appropriate USACE staff. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the MRGO is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

Concern ID: 62818

The people of Plaquemines Parish, Lafitte, and Grand Isle will certainly be opposing the diversions and will be requesting more and immediate storm surge protection for their families, which could be provided by dredging projects.

Response ID: 16391

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 2 Alternatives of the EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed

action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. As discussed in Chapter 2, Section 2.3.5 Large-Scale Marsh Creation, without periodic maintenance, dredging to create large-scale marsh in the Barataria Basin would not be expected to have long-lasting results. After 50 years without nourishment through additional dredge events, approximately half of the dredged material placed for one of these projects in the basin would be lost by the end of a 50-year Project life. The EIS does evaluate reasonably foreseeable large-scale marsh creation projects working in tandem with the sediment diversion alternatives in the cumulative impacts section of the EIS (see Chapter 4, Section 4.25 Cumulative Impacts). Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62819

A commenter expressed that the State of Louisiana collected money for every dead dolphin and pelican but now has a "so-called waiver from the laws of the land (NEPA and the MMPA) to kill three times as many Barataria Bay dolphins that would cause their functional extinction". The State of Louisiana would far surpass the rate of dead wildlife by another unproven type of project.

Response ID: 16392

Chapter 3, Section 3.11.1 Marine Mammals in the Northern Gulf of Mexico of the Final EIS has been revised to discuss the Marine Mammal Protection Act waiver.

The MMPA waiver does not alter USACE's or the LA TIG's NEPA responsibility to evaluate anticipated impacts of the proposed Project on marine mammals. The EIS analyzes and discloses the environmental and economic impacts of the proposed Project, including anticipated effects on marine mammals. (See Chapter 4, Section 4.11 Marine Mammals).

Section 2020(1)(b) of the Bipartisan Budget Act of 2018 also requires the State of Louisiana, in consultation with the Secretary of Commerce (delegated to NMFS), to the extent practicable and consistent with the purposes of the proposed Project, to minimize impacts on marine mammal species and population stocks, and monitor and evaluate the impacts of the proposed Project on such species and population stocks.

Concern ID: 62823

The commenter notes that the State got a waiver from the MMPA, which normally prohibits an operation that will kill marine mammals.

Response ID: 16393

Chapter 3, Section 3.11.1 Marine Mammals in the Northern Gulf of Mexico of the Final EIS has been revised to discuss the Marine Mammal Protection Act waiver that was issued for the proposed Project.

Concern ID: 62850

The commenter questions how the government can pick and choose which communities they decide no longer need to exist and indicates that is what the government would be doing to the citizens of Myrtle Grove Estates, as well as other communities, if the proposed Project were approved.

Response ID: 16396

The commenter's concern regarding the projected effect of the proposed Project on several communities near the diversion outfall outside of flood protection is noted. The EIS analysis considers the beneficial and adverse impacts of the proposed Project. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Independent of the joint Draft EIS and Draft Restoration Plan public meetings, CPRA held meetings with communities potentially affected to receive their input on how best to mitigate Project effects on water levels. Based in part on that feedback, the revised Mitigation and Stewardship Plan (Appendix R1 of the Final EIS) includes mitigation to partially offset some of the the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This mitigation includes a combination of structural measures (for example, raising roads, boat houses, docks and utilities) and non-structural measures (for example, Project servitudes). The mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if the permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62851

Destroying an ecosystem or place in order to sustain another is not only unfair and unjust but morally wrong.

Response ID: 16397

Comment noted. Chapter 4 Environmental Consequences of the Draft EIS acknowledged the range of potential adverse and beneficial impacts on the assessed resources, including transition of portions of the ecosystem to different salinity regimes (see Chapter 4, Section 4.10 Aquatic Resources) and changes in the potential for tidal flooding in certain areas (see Chapter 4, Section 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction).

Concern ID: 64183

The stated purpose and need for the proposed Project is to restore for injuries caused by the DWH oil spill; however, if the damages this proposed Project would cause, as outlined by the Draft EIS and stakeholders scoping comments opposing the

Project, are compared to the damages caused by the DWH oil spill, the impacts are utterly alike, to include the devastation of shrimp, oysters, and dolphins and the destruction of the brackish/saline habitat that is naturally occurring in the Barataria Basin.

Response ID: 16400

As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the proposed Project is to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts. As described throughout Chapter 4, Section 4.10 Aquatic Resources of the EIS, operation of the proposed Project would affect the existing flora and fauna of the Barataria Basin in both beneficial and adverse ways, with the overall impacts to a given species being dependent on that species habitat preferences and tolerances. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

The LA TIG's Restoration Plan discusses how the DWH oil spill resulted in the oiling of more than 1,100 kilometers of wetlands, nearly all of which were located in coastal Louisiana (DWH NRDA Trustees 2016). The heaviest oiling occurred in the Barataria Basin, resulting in substantial injuries to natural resources in the basin (DWH NRDA Trustees 2016). Recognizing that the resulting loss of marsh productivity affected resources throughout the northern Gulf of Mexico ecosystem, the State of Louisiana and the federal Trustees that negotiated the DWH Natural Resource Damages settlement allocated \$4 billion, almost half of the total settlement amount, to restoring Louisiana's wetland, coastal, and nearshore habitats.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources injured by the spill. See Executive Summary and Chapter 3, Section 3.2.1.5 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan. The intended restoration of fresh water flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin. The proposed Project will not stop all of that marsh loss; however, it is projected to create and maintain approximately

9,800 acres more than the No Action Alternative at year 2070 (see Table 4.6-4 of the EIS).

For its Restoration Plan decision, the LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Chapter 3, Section 3.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG has found that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem. The LA TIG selected the proposed Project because the LA TIG has found it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

In its Strategic Restoration Plan for Barataria Basin (March 2018), the LA TIG evaluated the potential and extent of collateral injury for a range of restoration techniques. Unfortunately, almost all large-scale restoration comes with potential for collateral injury. The LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54. In the LA TIG's Final Restoration Plan, the LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. Again, see Chapter 3, Section 3.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan for a discussion of how the LA TIG came to its decision.

In recognition of the potential for collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA would implement a suite of stewardship measures

in recognition of the collateral injury that is anticipated to result from the implementation of the proposed Project. See Section 3.2.1.1.5 (Associated Stewardship Measures) of the LA TIG's Restoration Plan, and Appendix R1 (Mitigation and Stewardship Plan) of the Final EIS. The LA TIG is also committed to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 64184

Commenter is concerned with the planning and construction of another big diversion on the east bank of the Mississippi River before there is proof that the proposed MBSD Project would work.

Response ID: 16401

The concern regarding the future success of the proposed Project is noted. The likelihood of success of the proposed Project was

discussed in the LA TIG's Draft Restoration Plan. While recognizing the innovative nature of the proposed Project, the LA TIG's Restoration Plan discusses in detail the factors that would contribute to the Project's success. More specifically, Sections 3.2.1.4 (Likelihood of Success - Alternative 1) and 3.2.2.4 (Likelihood of Success - Alternatives 2-6) address the likelihood of success of the proposed Project and other action alternatives considered by the LA TIG in its Restoration Plan. In addition, such a sediment diversion has been extensively studied over several decades with the objective of designing and operating a diversion in the vicinity of the proposed Project to provide a combination of land building and ecosystem benefits (see Section 3.2.1.4 [Likelihood of Success - Alternative 1] of the LA TIG's Restoration Plan). The proposed Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management [MAM] Plan, Appendix R2 of the EIS). The Mid-Breton Sediment Diversion Project is not the focus of this EIS; however, the potential cumulative impacts of the two diversions are addressed in Chapter 4, Section 4.25 Cumulative Impacts of the EIS and no related edits to the Final EIS have been made.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62804

Restoration funds are often misused by state and federal entities in a manner that does not protect or restore the environment.

Response ID: 16378

The restoration effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences of the Draft EIS. USACE does not oversee how NDRA restoration funds are expended.

The LA TIG assessed the reasonableness of costs associated with the proposed Project, as discussed in Chapter 3, Section 3.2.1.2 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan. The LA TIG established Standard Operating Procedures that apply to both restoration planning and project costs to ensure that funds are spent appropriately on restoration. This includes regular reporting on spending, as well as audit requirements. For more information on these procedures see

<https://www.gulfspillrestoration.noaa.gov/sites/default/files/wp-content/uploads/DWH-SOPs.pdf>.

Concern ID: 62813

The waters of the Barataria Basin would be so full of contamination that no one would be able to live there.

Response ID: 16386

As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality of the EIS, the Mississippi River water quality subsegment LA070301_00 at the diversion intake structure location fully supports its designated uses. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. The LDEQ's water quality assessment indicates that regulated substances are not present in concentrations that would cause a water quality impairment at the Mississippi River location of the intake structure. Language has been added to Chapter 4, Section 4.5.5.11 Hazardous Spills in the Mississippi River in Surface Water and Sediment Quality of the Final EIS to clarify this.

Concern ID: 62814

Strongly held concerns regarding the proposed Project are well documented by scientific studies including the USACE's own body of work such as Pictorial Account and Landscape Evolution of the Crevasses near Fort St. Philip Louisiana and USACE Perspective on Mississippi River Sediment Diversions. The USACE and other scientific studies by Howes and others, which are based on empirical data and not conjecture, show that this

proposed Project would most likely negatively impact the environment and residents who depend on it.**Response ID: 16387**

The EIS evaluates both beneficial and adverse impacts of the proposed Project and includes a full and fair discussion of significant environmental impacts. In preparing the EIS, USACE utilized both its own high-quality information and information from other sources and ensured the professional and scientific integrity of the analyses. Of the references identified by the commenter, no specific study for Howes was provided for consideration. In addition, the “USACE Perspective on Mississippi River Sediment Diversions” was a presentation developed by the USACE during early Project planning. While the presentation was not used as a specific reference for the Draft EIS, multiple references used to create the presentation were. While the report discussing the Fort St. Philip crevasses (Suir et al., 2014) was not referenced in the Draft EIS, it has been reviewed and incorporated into the Final EIS, as part of the new Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana, described below.

A summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and to discuss their recorded impacts on the natural environment. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS and includes an assessment of the crevasses near Fort St. Philip.

Concern ID: 62815

Some commenters believe that CPRA has not listened to the experienced oyster community regarding the adverse impacts of the proposed Project and have presented very limited Project options to the people of Louisiana and to the USACE.

Response ID: 16388

The Project’s impacts on oysters and oyster habitat are evaluated in the Draft EIS in Chapter 4, Section 4.10.4.5 Key Species. The Project’s impacts on oyster fishing are evaluated in Section 4.14.4.2 in Commercial Fisheries. Alternatives to the proposed Project are discussed in Chapter 2 Alternatives.

According to the LA TIG, CPRA and LDWF worked together with numerous oyster fishers as part of Louisiana Sea Grant’s Seafood Futures Initiative to develop mitigation and stewardship measures aimed at maintaining a sustainable oyster fishery. In addition, CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings to solicit input on mitigation and stewardship strategies and engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures from affected fishers. A summary of these public engagement meetings and other outreach efforts is in Chapter 7

Public Involvement of the Final EIS. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62824

A commenter asked for an explanation of why the State of Louisiana encouraged Congress to exempt the proposed MBSD Project and the Mid-Breton Diversion from the MMPA. Further, the commenter was not sure how the proposed Project could be funded by the DWH restoration settlement if those funds are to be allocated to address damage inflicted on Louisiana's fisheries and resources (including dolphins).

Response ID: 16394

Chapter 3, Section 3.11.1 Marine Mammals in the Northern Gulf of Mexico of the Final EIS has been revised to discuss the Marine

Mammal Protection Act waiver that was issued for the proposed Project.

USACE does not have information on the reasons for the State of Louisiana's support for legislation related to the MMPA waiver. As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is neither a proponent nor an opponent of the proposed Project. USACE's involvement with the proposed Project is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under the CWA Section 404 and RHA Sections 10 and 14 (33 USC Section 408). USACE is not a member of the LA TIG and is not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG's Draft Restoration Plan, or NRDA processes have been addressed solely by the LA TIG and represents the views only of the LA TIG, not USACE.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources injured by the spill. See Executive Summary and Chapter 3, Section 3.2.1.5 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan. The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin." The proposed Project will not stop all of that marsh loss; however, it is projected to create and maintain approximately 9,800 acres more than the No Action Alternative at year 2070 (see Table 4.6-4 of the EIS).

For its Restoration Plan decision, the LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Chapter 3, Section 3.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG has found that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as

red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem. The LA TIG selected the proposed Project because the LA TIG has found it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

In its Strategic Restoration Plan for Barataria Basin (March 2018), the LA TIG evaluated the potential and extent of collateral injury for a range of restoration techniques. Unfortunately, almost all large-scale restoration comes with potential for collateral injury. The LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR, §990.54. In the LA TIG's Final Restoration Plan, the LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. Again, see Chapter 3, Section 3.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan for a discussion of how the LA TIG came to its decision.

In recognition of the potential for collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA would implement a suite of stewardship measures in recognition of the collateral injury that is anticipated to result from the implementation of the proposed Project. See Section 3.2.1.1.5 (Associated Stewardship Measures) of the LA TIG's Restoration Plan, and Appendix R1 (Mitigation and Stewardship Plan) of the Final EIS. The LA TIG is also committed to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to

implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62852

CPRA's mitigation proposal is inadequate and the commenters implore the USACE to consider the complete cost of the negative impacts as part of the total cost of the proposed Project before allowing this plan to advance.

Response ID: 16398

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. NEPA does not require that a cost-benefit analysis be included in the EIS unless it is relevant to an agency's decision. USACE generally assumes that a permit applicant has performed its own economic evaluation of the proposed project and therefore does not consider a financial justification analysis for its permit decisions. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

CPRA expanded and refined its Final Mitigation and Stewardship Plan (Appendix R1 of the Final EIS) in response to community and resource agency input. Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship

Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 64180

The Draft EIS treated likely damage from implementation and operation of this massive freshwater flood project as “collateral” and just another cost of doing business, well worth the proposed Project’s \$2 billion price tag.

Response ID: 16399

As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance to identify the direct and indirect impacts that would likely occur if the proposed Project were to be approved. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is neither a proponent nor an opponent of the proposed Project. USACE's involvement with the proposed Project is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under the CWA Section 404 and RHA Sections 10 and 14 (33 USC Section 408). USACE is not a member of the LA TIG and is not evaluating the proposed Project for compliance with OPA and is not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG's Draft Restoration Plan, OPA, or NRDA processes have been addressed solely by the LA TIG and reflect only the views of the LA TIG, not USACE.

With respect to the Restoration Plan, the LA TIG evaluated a reasonable range of alternatives under the factors outlined in 15 CFR, §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5, and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems, and necessarily entails re-introducing freshwater flows that had historically characterized the Barataria Basin before the construction of levees.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the LA TIG's Preferred Alternative.

GEN3000 – Misc. Topics – General Comments

Concern ID: 62316	Growers in the Midwest need solutions to their crop fertility needs that do not require as much nitrogen and phosphorus fertilizer.
Response ID: 15770	Comment noted, but is outside the scope of this EIS. This EIS is focused on CPRA's proposed Mid-Barataria Sediment Diversion Project. The scope of this EIS is limited to areas in which the Project is expected to have more than negligible effects on the environment, particularly the Barataria Basin and the Mississippi River birdfoot delta in Louisiana.
Concern ID: 62317	Commenter was unable to access online document
Response ID: 15771	Commenter was contacted and notified that online link to the appendix requested was corrected.
Concern ID: 62318	CPRA, with assistance of Attorney General and federal agencies, should hold E&P companies accountable for failure to maintain coastal zone structures that has led to coastal marsh loss. Louisiana should hold profit making companies accountable for the damages they cause.
Response ID: 15772	The Draft EIS recognized causes and impacts of coastal land loss (see EIS Chapter 3, Section 3.6.2 Wetland Loss). The suggestions regarding accountability are outside the scope of this EIS.
Concern ID: 62319	The Mid-Barataria Bay Sediment Diversion is an ambitious Project to divert sediment and fresh water from the Lower Mississippi River main stem into the surrounding marshlands, and Project duration is 50 years.
Response ID: 15773	Comment noted. The commenter is correct regarding the intent of the proposed Project, as was described in the Draft EIS Chapter 1 Introduction and Purpose and Need. The period of analysis for analyzing impacts of the proposed Project is 50 years. If implemented, Project operation is anticipated to extend beyond 50 years.
Concern ID: 62320	The commenter is opposed to Mid-Breton Sediment Diversion
Response ID: 15774	The focus of this EIS is the proposed Mid-Barataria Sediment Diversion. The impacts of the proposed Mid-Breton Sediment Diversion are considered in this EIS as part of the cumulative impacts analysis,

which analyzes the incremental impacts of the proposed Project when added to other past, present, and reasonably foreseeable future actions (see Chapter 4, Section 4.25 Cumulative Impacts). Additionally, there would be an opportunity for the public to provide comments on the proposed Mid-Breton Sediment Diversion when the USACE releases the Draft EIS for that proposed project.

Concern ID: 62322

Commenter asserts that more land needs to be built, but the Project may do more harm than good.

Response ID: 15775

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The purpose and need of the proposed Project is to restore injuries caused by the DWH oil spill by reestablishing deltaic processes, to ultimately restore habitat and ecosystem services injured by the DWH oil spill. The EIS recognizes that in fulfilling this purpose and need, the proposed Project would have both beneficial and adverse impacts on several resources. See Section 2.9 in Chapter 2 for a summary of the projected effects of the Project.

Title 15 CFR §990.54 of the NRDA regulations outlines the criteria against which reasonable alternatives are evaluated to select the LA TIG's Preferred Alternative. Recognizing that almost all restoration comes with some potential for collateral injury, one factor for evaluation is the extent to which each alternative would prevent future injury and avoid collateral injury. The potential for collateral injury does not preclude an alternative from selection, rather the LA TIG must evaluate each alternative under multiple factors, and select a Preferred Alternative to meet the outlined restoration objectives.

The LA TIG, in identifying the Preferred Alternative in the Restoration Plan, evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 Identification of a Preferred Alternative, 3.2.1.5 Alternative 1 - Avoids Collateral Injury, and 3.2.2.5 Alternatives 2-6 - Avoids Collateral Injury of the LA TIG's Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystem that was altered when Mississippi River flows were cut off by construction of levees. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is

anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

Concern ID: 62323

There has to be a different way to do it that does not have negative environmental impacts, at a fraction of the cost and time.

Response ID: 15956

The EIS recognizes that the proposed Project would have both beneficial and adverse impacts on several resources. See Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative for a summary of the projected effects of the proposed Project. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

The alternatives evaluated in the EIS were based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2, an alternatives screening process was conducted where screening criteria were identified and a wide range of alternatives were evaluated including other available coastal restoration tools and methods. The screening criteria included key concepts from the purpose and need including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan.

The Project-specific purpose and need built on analyses in the LA TIG's SRP/EA #3, including its initial screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin.

After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2 Alternatives, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the

EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018, page 3-32) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in this Restoration Plan. Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

Concern ID: 62324

Commenter appreciated the opportunity to provide input on this issue and looks forward to getting more information regarding the Project and its impact to the homeowners of Martin Lane, Port Sulphur, LA.

Response ID: 15776

The Draft EIS provides information regarding potential impacts to communities such as Port Sulphur, particularly in Section 4.13 Socioeconomics and Section 4.20 Public Health and Safety. Since issuance of the Draft EIS for public comment, CPRA has further developed its Mitigation and Stewardship Plan, which describes planned mitigation and stewardship measures for homeowners impacted by the proposed Project. Final EIS Appendix R1 contains the revised Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency

input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. The USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62325	There are many water issues including oil extraction, sonar booms, dams and corporate profit.
Response ID: 15777	Comments noted. The scope of this EIS is limited to areas in which the Project is expected to have more than negligible effects on the environment, which is limited to Louisiana, particularly the Barataria Basin and the Mississippi River birdfoot delta.
Concern ID: 62327	The Commenter supports the proposed action, but states that there are flaws in the Draft EIS that should be corrected.
Response ID: 15779	As described in Chapter 1, Section 1.7 Public Involvement Summary of the Final EIS, changes between the Draft and Final EIS are identified through markings along the margins on the applicable pages. Table 1.7-1 lists the section numbers where substantial changes were made (see Chapter 1, Section 1.7).
Concern ID: 62328	The USEPA found that the Maurepas Diversion would have no impact on bald eagles due to contaminants, which is opposite of what this EIS says. This Maurepas document is no longer online.
Response ID: 15780	The USACE cannot speak to USEPA's findings on the Maurepas Diversion's impact on bald eagles. Details regarding the basis of the finding the commenter notes regarding potential effects of the MBSD on

bald eagles due to contaminants were provided in Draft EIS Chapter 4, Section 4.12.3.2.2.2 in Threatened and Endangered Species.

A new monitoring parameter, periodic sampling for Contaminants of Concern in fish, shellfish, and wildlife (Section 3.7.3.23), has been added to the Monitoring and Adaptive Management (MAM) Plan, Appendix R2 in the Final EIS.

Concern ID: 62329	The EIS should discuss how the Mississippi River Levees are the root cause of land loss that cannot be corrected by a single diversion project.
Response ID: 15781	The EIS recognizes the role that the Mississippi River Levee has played in coastal land loss in the Barataria Basin, and does not describe the proposed Project as a solution to fully reverse ongoing land-loss trends. The Draft EIS recognized that the proposed Project is projected to create and maintain only a portion of the wetlands that would otherwise be lost in the absence of the proposed Project over the next 50 years. See EIS Chapter 4, Section 4.6 Wetlands and Waters of the U.S. for the discussion of projected future land loss under the proposed Project as compared to the No Action Alternative.
Concern ID: 62331	The EIS is comprehensive and well-prepared, and used the best available information and data.
Response ID: 15782	Acknowledged.
Concern ID: 62332	The commenter provided a general critique of failures to tackle climate change, to embrace renewable energy and to halt environmental degradation.
Response ID: 15783	Comment noted. The comment does not appear to include any comments regarding the analysis of the Project contained in either the EIS or Restoration Plan.
Concern ID: 62333	Please support the restoration of vital wildlife habitat along the Gulf Coast.
Response ID: 15842	The commenter's desire for habitat restoration is acknowledged.
Concern ID: 62337	There should be better inspection of oil rigs/pipelines and prosecution in incidents that harm nature. Our taxes pay to clean up environmental damage caused by negligence.
Response ID: 15784	While the proposed Project is intended to restore habitat and ecosystem services injured by the DWH oil spill, the commenters are raising issues associated with the wider oil and gas industry that are outside the scope of this EIS.
Concern ID: 62338	The commenter gives two examples of corporations releasing contaminants in Louisiana, and believes that Louisiana coastal

	protection and restoration projects are hindered by oil and gas interests.
Response ID: 15785	While the proposed Project is intended to restore habitat and ecosystem services injured by the DWH oil spill, the commenters are raising issues associated with the wider oil and gas industry that are outside the scope of this EIS.
Concern ID: 62341	The people of Louisiana should be prioritized over the coast because the coast is fine.
Response ID: 15845	The commenter's views are acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.
Concern ID: 62343	The commenter requests that agencies use DWH oil spill funds for research and restoration of bird species in the area.
Response ID: 15789	<p>As was described in Draft EIS Chapter 4, Section 4.9 Terrestrial Wildlife and Habitats, the proposed Project would be beneficial to those bird species that use both terrestrial and emergent wetland habitats. Additionally, CPRA's Monitoring and Adaptive Management Plan includes monitoring of green-winged teal, mottled duck, gadwall, and brown pelican, as described in EIS Appendix R2.</p> <p>The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would</p>

be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62346	Restoring and protecting these wetlands into the future would provide significant positive impacts for birds (in terms of nesting and feeding sites), and humans (in terms of tourism dollars and mental well-being). Projects like these are critical for wildlife and serve as a means to bring people together.
Response ID: 15791	The Draft EIS acknowledged the benefits of the proposed Project to wetlands and birds. See EIS Chapter 4, Section 4.6 Wetlands and Waters of the U.S. and 4.9 Terrestrial Wildlife and Habitat for a description of those benefits. The proposed Project's anticipated effects on communities are discussed in EIS Chapter 4, Section 4.13 Socioeconomics and 4.16, Recreation and Tourism.
Concern ID: 62348	Commenters note that humans should be good stewards of our environment as it supports life on earth, and note some of the benefits of ecosystem restoration.
Response ID: 15792	Comment noted. The Draft EIS considered the various effects of the Project on the natural and human environment.
Concern ID: 62350	The commenter asked whether they could submit formal comments on the Draft EIS in writing or if they must send them using the NPS online comment form.
Response ID: 15793	Comments on the Draft EIS were accepted via email, USPS, phone, as well as the PEPC online comment form.
Concern ID: 62351	The commenter asked what the reference for the statistics in the EIS is if the Project is unparalleled and innovative.
Response ID: 15846	The impacts and projections discussed in the Draft EIS were based on USACE's and the LA TIG's consideration of the best information and data available to them, including peer-reviewed literature, subject matter expertise, and computer modeling which simulates future conditions. That data and USACE's evaluation of that data, done in coordination with the LA TIG, are included in the EIS to inform the public and the decision maker.

Concern ID: 62352	CPRA has issued statutory rights of entry for the diversion projects, which deter from the credibility of the agency having the best interest of Louisiana taxpayers in mind.
Response ID: 15892	Comment noted.
Concern ID: 62354	The commenter asserts that elected officials push for the Project even though they know it would increase water levels in some communities.
Response ID: 15794	USACE is evaluating CPRA's proposed Project through the EIS and will make its decision in compliance with the statutes, orders, and policies outlined in Chapter 5 of the EIS.
Concern ID: 62355	There are better ways to build land and the Corps knows how. Our elected officials should put people and communities first instead of the pockets of a selected few people.
Response ID: 15955	The range of reasonable alternatives evaluated in the EIS were based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS and consistent with CEQ NEPA regulations. As described in Chapter 2, an alternatives screening process was conducted where screening criteria were identified and a wide range of alternatives were evaluated including other available coastal restoration tools and methods. The screening criteria included key concepts from the purpose and need including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. The Project-specific purpose and need built on analyses in the LA TIG's SRP/EA #3, including its initial screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. Based on a review of the various alternatives against these criteria developed from the purpose and need only large-scale sediment diversions with varying capacities were brought forward as alternatives to the LA TIG's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the

EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

See Sections 3.2.4.7, 3.2.1.5, and 3.2.2.5 of the LA TIG's Restoration Plan for a discussion regarding the LA TIG's evaluation of the range of alternatives and identification of the LA TIG's Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54 and it strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG 2018, page 3-32) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in this Restoration Plan. It is also worth noting that the LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

Concern ID: 62356

CPRA has a history of mis-operation of existing diversions, as well as neglect in maintaining previous salinity control structures.

Response ID: 15875

CPRA's history regarding its operation of other diversions and salinity structures was not evaluated as a factor contributing to the projected impacts of the proposed Project in the EIS and LA TIG's Restoration Plan.

Concern ID: 62359

Commenter requests assistance with the local effort to re-wild the Blitzen and other rivers in and near Malheur to protect birds.

Response ID: 15849

Comment noted. The scope of this EIS is limited to areas in which the Project is expected to have more than negligible effects on the environment, particularly the Barataria Basin and the Mississippi River birdfoot delta in Louisiana.

Concern ID: 62360	A lot of money was wasted on researching and solving this problem.
Response ID: 15850	Comment noted.
Concern ID: 62362	The residents of the impacted communities see what helps and what hurts because they live it every day.
Response ID: 15882	All public comments on the EIS will be considered by the USACE and by the LA TIG. All public comments on the Restoration Plan will be considered by the LA TIG. A summary of public engagement meetings and other outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS.
Concern ID: 62363	USACE should identify the river management problems their projects have caused and correct those, not adding more patches to the system it broke.
Response ID: 15876	The proposed Project is not a USACE project. The State of Louisiana through CPRA is the permit Applicant and would construct and operate the diversion. The combined effects of USACE's past, present and reasonably foreseeable projects, in combination with the MBSD Project, were considered in Chapter 4, Section 4.25 Cumulative Impacts of the Draft EIS.
Concern ID: 62364	The commenter asked whether there will be any internships for college students later in the Project.
Response ID: 15851	The USACE recommends reaching out to CPRA directly regarding internship opportunities.
Concern ID: 62366	Commenter asked what companies would be associated with this Project.
Response ID: 15853	The USACE recommends reaching out directly to CPRA regarding companies involved in the Project.
Concern ID: 62367	The Mid-Breton Sediment Diversion would have devastating impacts to the Mississippi Gulf Coast, similar to the opening of the Bonnet Carré Spillway.
Response ID: 15898	The focus of this EIS is the proposed Mid-Barataria Sediment Diversion. The impacts of the proposed Mid-Breton Sediment Diversion are considered in this EIS as part of the cumulative impacts analysis, which analyzes the incremental impacts of the proposed Project when added to other past, present, and reasonably foreseeable future actions (see Chapter 4, Section 4.25 Cumulative Impacts). However, there would be an opportunity for the public to provide comments on the proposed Mid-Breton Sediment Diversion at such time the USACE releases the Draft EIS for that proposed project.

The proposed Project is not anticipated to have measurable impacts on ecological resources within the State of Mississippi, including distributaries of the Mississippi River.

Concern ID: 62368

The commenter asked whether the proposed Project would help McCall Creek. This creek was used to ship cotton and lumber to the Mississippi River in the late 1800's.

Response ID: 15901

McCall Creek is outside the area of influence, and thus the area of analysis, for the proposed Project. The Project is not intended to benefit McCall Creek. The scope of this EIS is limited to areas in which the Project is expected to have more than negligible effects on the environment, particularly the Barataria Basin and the Mississippi River birdfoot delta. The proposed Project is not anticipated to have measurable impacts on ecological resources within the State of Mississippi, including tributaries of the Mississippi River.

Concern ID: 62369

The commenter stated that they need more information on the Project to know what areas would be impacted.

Response ID: 15877

Information on the proposed Project, including the Draft EIS and Draft Restoration Plan, has been made available through several venues, including Project websites (<http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>; <https://www.gulfspillrestoration.noaa.gov/restoration-areas/louisiana>), media stories, and public libraries. For a summary of public outreach efforts related to the Draft EIS refer to Chapter 7 Public Involvement of the EIS and for restoration planning see Section 1.8 of the LA TIG's Restoration Plan. See Chapter 2 of the EIS for a description of the proposed Project and the Project footprint to better understand the areas that would be directly impacted by the Project's construction.

Concern ID: 62370

The commenter asserted that the MRGO was a shipping channel and a diversion, and asked how much land it built and why it was closed if it built land.

Response ID: 15878

The MRGO was not a diversion; it was a navigation channel for shipping. The MRGO did not directly connect to the Mississippi River; instead it connected to the Gulf Intracoastal Waterway, which goes through the Inner Harbor Navigation Canal and the IHNC Lock before reaching the river. The lock is not designed to carry water or sediment from the Mississippi River into the MRGO. The MRGO is not a useful comparison to the proposed Project for the purpose of impact analysis in this EIS.

Concern ID: 62373

Commenter stated that they do not want tax dollars going toward a project that would harm Louisiana's commercial fishing industry.

Response ID: 15880 If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

As explained in the Restoration Plan, the LA TIG is the group responsible for restoring natural resources and services within Louisiana that were injured by the DWH oil spill. The LA TIG is comprised of state and federal Trustees of natural resources, and the LA TIG's decision to fund this Project would be based on the Project's ability to restore for injuries to natural resources from the DWH oil spill, including aquatic resources.

Concern ID: 62374 **Commenter is opposed to MBSD because it doesn't build land fast enough.**

Response ID: 15949 The commenter's opposition to the proposed Project is noted. The commenter is correct that the proposed Project would take approximately 30 years to create its maximum projected acreage of 17,300 acres; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 [Alternative 1 Description] of the Restoration Plan).

The commenter's concern regarding the timeline required for land building was considered in the Draft EIS in Chapter 4, Section 4.2 Geology and Soils. A discussion has been added to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Geology and Soils section of the Executive Summary and to Chapter 4, Section 4.2.3.2 Operational Impacts in Geology and Soils of the Final EIS.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018, page 3-32) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in this Restoration Plan. It is also worth noting that the LA TIG has funded other marsh creation restoration efforts that provide ecosystem

services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

Concern ID: 62375	This Project would have made sense 50 years ago because there would have been more marsh to save at that time.
Response ID: 15881	Commenter's input is noted.
Concern ID: 62376	A cost-benefit analysis should be performed since there may never be \$2 billion available again for saving the coast.
Response ID: 15948	<p>NEPA does not require that an EIS contain a cost-benefit analysis unless it is relevant to the agency's decision. USACE typically assumes that a permit applicant has done its own economic evaluation of a proposed project. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.</p> <p>Consistent with OPA regulations (15 CFR §990.54), the LA TIG's Restoration Plan evaluates multiple alternatives based on a number of criteria, including the cost of the alternative. For more information see Section 3 of the LA TIG's Final Restoration Plan.</p>
Concern ID: 62377	Commenter asserts that the proposed Project is the best hope for undoing the extensive damage that the levee systems caused, and that land building is essential.
Response ID: 15911	The commenter's statement of support, which correctly notes that the purpose of the proposed Project is to reestablish and maintain deltaic processes in support of coastal Louisiana resources, is acknowledged. The EIS recognizes the role that Mississippi River levees have played as one factor in coastal land loss in the Barataria Basin. The EIS does not describe the proposed Project as a solution to fully reverse ongoing land-loss trends. The Draft EIS recognized that the proposed Project is projected to create and maintain only a portion of the wetlands that would otherwise be lost in the absence of the proposed Project over the next 50 years. See EIS Chapter 4, Section 4.2.3. Geology, Topography, and Geomorphology for the discussion of projected future land loss under the proposed Project as compared to the No Action Alternative.
Concern ID: 62378	Commenter notes that their future plans depends on New Orleans existing into the future.
Response ID: 15912	Comment noted.

Concern ID: 62379	A few more years of income production do not justify the looming collapse of not only the natural resource but the possibility of inhabiting the coast.
Response ID: 15913	Comment noted.
Concern ID: 62380	Commenter asks how the proposed Project will affect current and future generations.
Response ID: 15916	The Draft EIS discussed impacts of the proposed Project on human and natural resources projected over 50 years of Project operation.
Concern ID: 62382	The State of Louisiana has done very little to assist the Hypoxia Action Plan or promote its implementation, despite having that opportunity during the past 20 years that they were planning and promoting diversions under the Coastal Master Plan.
Response ID: 15929	USACE cannot speak to the state's assistance or promotion of the Hypoxia Action Plan. However, the USACE agrees that the Gulf Hypoxia Action Plan is relevant to the Project area. Therefore, the USACE has added a discussion about the Gulf Hypoxia Action Plan to Chapter 4, Section 4.25.5 Cumulative Impacts, Surface Water and Sediment Quality of the Final EIS.
Concern ID: 62383	The Louisiana Nutrient Reduction and Management Strategy, which included diversions as the main feature, is not mentioned in the Draft EIS.
Response ID: 15934	A discussion of the Louisiana Nutrient Reduction and Management Strategy has been included in the discussion of Gulf Hypoxia Action Plan which has been added to Chapter 4, Section 4.25.5 Cumulative Impacts, Surface Water and Sediment Quality of the Final EIS.
Concern ID: 62384	Our state government, elected officials, the Coastal Protection and Restoration Authority and other state agencies, and local jurisdictions must pivot to centering community expertise as they carry out the MBSD.
Response ID: 15961	<p>According to CPRA, it has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the MBSD Project area over the past several years. In addition, since the release of the Draft EIS CPRA has engaged the public through meetings with the communities projected to be impacted by the MBSD to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings can be found in Chapter 7 of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts</p> <p>The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were</p>

submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62385

Commenters noted that commercial fishermen and coastal residents are not against restoration. The tension between fishers and coastal projects has always arisen not because of the Projects' intended goals, but given the processes used to develop and implement coastal restoration projects.

Response ID: 15957

CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the MBSD Project area over the past several years. In addition, since the release of the Draft EIS CPRA has engaged the public through meetings with the communities projected to be impacted by the MBSD to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings can be found in Chapter 7 of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be

implemented by CPRA as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62386

The construction, implementation, and operation of the first large-scale river sediment diversion must meaningfully include and honor the generational and place-based knowledge of coast-dependent residents. The mitigation, adaptation, and MBSD-adjacent governmental support strategies suggested by CCC emerge directly from their clients' own comments and the expertise they have shared with CCC for over a decade.

Response ID: 15958

CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area over the past several years. In addition,

since the release of the Draft EIS CPRA has engaged the public through meetings with the communities projected to be impacted by the MBSD to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings can be found in Chapter 7 of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented by CPRA as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62387

Do the best

Response ID: 15865

Comment noted.

Concern ID: 62388

The internet is rigged.

Response ID: 15855	Comment noted, but is outside the scope of this EIS.
Concern ID: 62390	Commenter supports the selection of the 75,000 cfs sediment diversion, but also encourages the continued exploration of increased capacity and the acceleration of other sediment diversions that are identified in Louisiana’s Coastal Master Plan to maximize use of the natural resources of the river.
Response ID: 15918	<p>The commenter’s support for the Project is noted. The relative impacts, both beneficial and adverse, for the various capacity alternatives are explained throughout Chapter 4 of the EIS. Although the 150,000 cfs Alternative would result in the greatest degree of benefits (including the most land building), it also would result in the greatest degree of adverse impacts, particularly to marine mammals (see Section 4.11.5 Operational Impacts), shrimp and oysters (see Section 4.10.4.5 Key Species), and public health and safety (through increased water levels and inundation in areas closer to the immediate outfall, see Section 4.20.4.2 Operational Impacts). Sections 4.10.4.5 Key Species and 4.11.5 Operational Impacts in the Final EIS have been revised to further discuss the impacts of the 150,000 cfs Alternative to brown shrimp, oysters, and dolphins.</p> <p>The LA TIG’s Restoration Plan evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54 and strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. While a 150,000 cfs diversion would be expected to deliver more ecological benefits in terms of land creation and marsh building than the Preferred Alternative, it would also incur more collateral injuries and pose a greater risk to human health and safety; thus it was not selected as the LA TIG’s Preferred Alternative in the Final Restoration Plan. See Section 3.2.4 Overall OPA Evaluation Conclusions of the Final Restoration Plan for a discussion of how the LA TIG came to its decision.</p>
Concern ID: 62391	Commenter expressed disappointment in the opinions issued by the Lieutenant Governor, St. Bernard Parish Council and Plaquemines Parish Council which benefit few oyster fishermen rather than the Louisiana coast.
Response ID: 15919	Comment noted. USACE has considered all public comments, including those favorable and unfavorable to the Project, received during the scoping period and Draft EIS public comment period, and will consider any comment received during the Final EIS public review period before making its decisions for the proposed Project.
Concern ID: 62392	Commenter offered free air time on Paradise Louisiana TV for anyone wishing to debate the subject of diversions.

Response ID: 15864	Comment noted.
Concern ID: 62394	When the Morganza Spillway was built, it diverted the natural flow of water from the Louisiana marsh and the sediment the marsh needs to maintain itself. The commenter asks why the Morganza Spillway is not being opened to allow the natural flow of water so it can deposit sediment.
Response ID: 15856	Comment noted. The operation of the Morganza Spillway is outside the Project area and the scope of this EIS. The scope of this EIS is limited to areas in which the Project is expected to have more than negligible effects on the environment, particularly the Barataria Basin and the Mississippi River birdfoot delta in Louisiana.
Concern ID: 62395	The state's restoration plans are inadequate to meet the challenges of coastal restoration and the climate crisis.
Response ID: 15920	The intent of the Project is to restore injuries caused by the DWH oil spill and help restore habitat and ecosystem services injured by the spill. Other complementary coastal restoration strategies are being considered for implementation by CPRA in their Coastal Master Plan and the LA TIG in their restoration planning process.
Concern ID: 62397	Though this diversion project will restore some crucial land, more attention should be paid to the political economy of coastal restoration, which serves corporate interests in the navigation and fossil fuel industries
Response ID: 15921	Comment noted. The Project was included in CPRA's 2017 Coastal Master Plan and will complement other restoration projects being implemented in the area.
Concern ID: 62398	The ability of corporate interests to tilt the agency's decision by flooding it with supportive public comments undermines the fairness, transparency, and ultimate success of this Project. The Army Corps and NPS should be aware of the impacts of corporate-funded advocacy campaigns in support of this diversion.
Response ID: 15922	Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.
Concern ID: 62399	Commenter asserts that short-term profit in the form of commercial fisheries that thrive off the collapsing ecosystem as saltwater moves north should not detract from long-term

Response ID: 15923

economic growth which will come from the improved health of our wetlands.

As part of its decision-making process for the DA Section 10/404 permits, the USACE will conduct a public interest review in which the probable harms of the proposed Project will be weighed against its prospective benefits. Also as part of that process, USACE will consider public comments on the Draft EIS.

With respect to its Restoration Plan, the LA TIG acknowledges the commenter's concern that potential impacts to commercial fisheries not override the benefits that would be provided by the Project. In selecting their Preferred Alternative, the LA TIG evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54 of the NRDA regulations. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7, 3.2.1.5, 3.2.2.5 of the LA TIG's Final Restoration Plan. As suggested by the commenter, the LA TIG has found that a project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems and necessarily entails Mississippi River flows that were cut off by construction of levees. The LA TIG recognize that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the Preferred Alternative in the Final Restoration Plan.

Concern ID: 62400

North of Covington and Baton Rouge most folks actually entertain the idea of the river running wild and beefing up the delta like back in the 1700's and are inconsiderate of the couple hundred thousand people that inhabit the land below New Orleans. Areas south of New Orleans have their own culture and ways of life that must be protected. Dredging works but people are pretending that's not the answer.

Response ID: 15924

The EIS analyzes impacts throughout the Project area, including south of New Orleans.

Dredging was considered under the category of "marsh creation." Marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5, Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine

sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

USACE will consider all public comments received and will also conduct a public interest review, which considers various factors relevant to the proposed Project and weighs the projected harms of a proposed project against its projected benefits, before deciding whether to grant the permit and permission request.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://www.gulfspillrestoration.noaa.gov/restoration-areas/louisiana>).

Concern ID: 62401

Decades of world-class science is overwhelmingly conclusive that sediment diversions are crucial to a sustainable Mississippi River Delta. Politics or a few very loud individuals should not jeopardize putting the power of the river to work and save our coast.

Response ID: 15925

The USACE developed a comprehensive EIS that evaluates the beneficial and adverse impacts of the proposed Project. Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan.

All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

Concern ID: 62402

The U.S. Army Corp of Engineers (USACE) is thrust into this river diversion debate and looked upon like an arbiter or referee. And that would be fine except for the fact that the USACE is just not an innocent bystander in its long history of navigational and flood protection projects that have greatly affected Louisiana's coast.

Response ID: 15926	USACE is neither a proponent for nor an opponent to the proposed Project. As part of its Section 10/404 permitting decision-making process, USACE conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.
Concern ID: 62403	MBSD and Mid-Breton Sediment Diversion are advocated by several powerful NGOs called Changing Course which advocates building new river deltas in Barataria Bay and Breton Sound, giving up on sustaining communities in lower Plaquemines Parish, and allowing the birdfoot delta to collapse.
Response ID: 15927	<p>The “Changing Course” proposal is not being evaluated as part of this EIS.</p> <p>All public comments received on the EIS and Restoration Plan, including those in support of and critical of the Project, were reviewed and considered in developing the Final EIS and Final Restoration Plan.</p> <p>With respect to the impact of the proposed Project on lower Plaquemines Parish and the birdfoot delta, the diversion would be expected to accelerate land loss as compared to the No Action Alternative. See Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology for further discussion. The impacts of the proposed Mid-Breton Sediment Diversion were considered in the Draft EIS as part of the cumulative impacts analysis, which analyzes the incremental impacts of the proposed Project when added to other past, present, and reasonably foreseeable future actions (see Chapter 4, Section 4.25 Cumulative Impacts). Additionally, there will be an opportunity for the public to provide comments on the proposed Mid-Breton Sediment Diversion when USACE releases the Draft EIS for that proposed project.</p>
Concern ID: 62404	Appendix A contains more detailed recommendations related to the draft Monitoring and Adaptive Management Plan; Appendix B contains a series of recent op-eds and other statements of support for the Project from various stakeholders. We request that the materials in Appendix B be considered as part of the Army Corps’ public interest review and by the LA TIG as evidencing consistency with the OPA criteria.
Response ID: 15928	The USACE and LA TIG have reviewed Appendices A and B. Revisions were made to the Monitoring and Adaptive Management Plan to respond to “Improvement #1: Define a clear adaptive management process” and “Improvement #2: Clarify the problem definition” in Appendix A of the commenter’s comment letter.
Concern ID: 62405	Commenter suggested that the Final EIS should include targeted economic incentive plans for contractors associated with Project design or construction to prioritize economic opportunities for all

	interested residents in the Project footprint/outfall area wherever relevant.
Response ID: 15940	Provision of economic incentives for contractors would be the responsibility of CPRA and therefore has not been added to the Final EIS. CPRA is required to follow the provisions of the Louisiana Public Bid Law, including those contained in Title 39, Chapter 17 (the Louisiana Procurement Code) and in Title 38, Chapter 10 Public Contracts. The comment has been provided to CPRA.
Concern ID: 62406	The actions of oil companies are a major contributor to land loss in Louisiana. Perhaps, instead of accepting a pittance of what the oil lobby makes off the destruction of the state (and deaths of its people in Cancer Alley) as a donation to wetland restoration, Louisiana and Federal legislators/regulators alike should require oil companies to pay back in full this debt for land and life and demand that better methods be devised to prevent any further damage.
Response ID: 15857	Comment noted. The Draft EIS recognizes causes and impacts of coastal land loss (see EIS Chapter 3, Section 3.6.2 Wetland Loss)
Concern ID: 62407	CPRA should prepare materials on the skills needed to obtain these construction jobs, as well as the average annual salaries. It will take time to create the labor line to get workers trained, and the State should be working with our trade schools, community colleges and universities early and often to prepare a local workforce.
Response ID: 15858	Comment noted.
Concern ID: 62408	It is the responsibility of the Governor, through his executive assistant for coastal affairs, to exercise this authority to stop the PLT Project as it is inconsistent with the MBSD Project and Coastal Master Plan.
Response ID: 15859	While EIS Chapter 4, Section 4.25 Cumulative Impacts considers past, present, and reasonably foreseeable future structures or actions in the Project area which could affect the same resources as the proposed Project, such as the PLT, State approval of other structures or actions is outside the scope of this EIS.
Concern ID: 62424	Commenter states that they do not oppose the proposed Project.
Response ID: 15869	Comment noted.
Concern ID: 62426	Several commenters submitted test messages, well wishes and miscellaneous text.
Response ID: 15871	Acknowledged.

Concern ID: 62428	Commenter gave example of local landowner efforts to protect local estuary in Washington state, noting that so much more could be done with the Mississippi Delta.
Response ID: 15872	Comment noted. The scope of this EIS is limited to Louisiana, particularly the Barataria Basin and Mississippi River birdfoot delta.
Concern ID: 62432	The Buckeye Marrero Terminal, LLC permit includes the statements that no discharge should occur within one mile upstream of any drinking water intake, and the permittee is responsible for determining the existence and location of the nearest drinking water intake. The listed intakes downstream of the MBSD Project site are at Point a la Hache (River Mile 49.2E), Port Sulphur (River Mile 49W), and Venice (River Mile 18.6W).
Response ID: 15962	The Buckeye Marrero Terminal LPDES Permit conditions are outside the scope of this EIS. However, CPRA would be required to comply with any LPDES permit conditions if such a permit is required by LDEQ for the proposed MBSD Project.
Concern ID: 62433	Commenter noted that a resolution was passed unanimously by the Plaquemines Parish District 9 Council against the diversion.
Response ID: 15946	The commenter's input is acknowledged. The resolution is included in the Project record.
Concern ID: 62435	This comment has been replaced and superseded by correspondence 39875 at commenter's request.
Response ID: 15965	Acknowledged.
Concern ID: 63013	The commenter asked that the Project proceed with caution, recognizing that these situations are not as straightforward as they may always seem. Modifying terrestrial ecosystems for the sake of a marine ecosystem can ultimately damage both. The commenter notes that their comments should not be considered as condoning the Project, but rather as a request that further thought be given to certain areas to ensure that the Project results in a fair and environmentally secure decision for all involved.
Response ID: 15960	The USACE and the LA TIG considered the best information and data available to them in the preparation of the EIS, which will be used by the USACE and the LA TIG in their respective decisions on the Section 10/404 permit application, the Section 408 permission request, and the LA TIG funding request. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. Appendix R2: Monitoring and Adaptive Management Plan provides details about the monitoring and adaptive management plans for the proposed Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63014

The commenter asserts that USACE should close Mardi Gras Pass. South Pass has silted in to where 20-foot boats are scared to traverse. All navigable channels should remain navigable.

Response ID: 15795

Comment noted. Any proposed closure of Mardi Gras Pass is outside the scope of this EIS, which evaluates the potential impacts of CPRA's proposed Project.

Concern ID: 62372

A commenter noted that it has been said that a new governor could shut down this Project at any point, which cannot happen.

Response ID: 15854

The commenter's input is noted. Consideration of potential future actions of undetermined governors is outside the scope of the EIS. The EIS evaluates the environmental impacts of the proposed Project and a reasonable range of alternatives, including No Action, to inform the

USACE's decision regarding the requested Section 404/10 permit and Section 408 permission, as well as the NRDA decision of the LA TIG.

Concern ID: 62409

The commenter commends CPRA for making great strides to save our coast and for being in constant communication and have provided aid to increase the Town of Jean Lafitte's flood protection. They have handled this entire process with open ears and have adapted along the way.

Response ID: 15874

Comment noted.

Concern ID: 62410

Commenter asserts that if the deltaic system is fully restored, the results would be astonishing and that the new delta could be allowed to flourish that is more productive than the physical delta we measure our losses from 90 years ago.

Response ID: 15943

Comment noted. Although the EIS recognizes that current conditions have changed over time, Chapter 4 Environmental Consequences of the EIS discusses how the proposed Project alternatives would affect the currently-existing natural environment, to which the human and animal populations have acclimated. Chapter 3 Affected Environment summarizes the historic context for each resource assessed in the EIS. Further, Sections 3.1.4.1 Mississippi River and 3.1.4.2 Barataria Basin of the EIS address the deltaic processes that formed the proposed Project area; these sections have been supplemented in the Final EIS to further discuss historic conditions.

Concern ID: 62411

All of these organisms are highly adaptable, as they must be to thrive in a deltaic environment where conditions can change in a geological instant—a saline embayment can freshen overnight and begin to fill with sediment after an avulsion on the river, or a freshwater wetland can be cut off from the river due to a course change. Nothing lives here that has not adapted to those conditions.

Response ID: 15947

As described throughout Chapter 4, Section 4.10 Aquatic Resources of the EIS, operation of the proposed Project would affect the existing flora and fauna of the Barataria Basin in both beneficial and adverse ways, with the overall impacts to a given species being dependent on that species' habitat preferences and tolerances.

Concern ID: 62412

If public funds are spent to acquire rights to private property in the receiving basin, then the right to free and unfettered public access must be acquired as well. Private landowners that succeed in requiring the purchase of rights such as flowage easements in order to allow a project that would prevent their land from disappearing should not be allowed to profit from this massive beneficial investment beyond sale of their property to the people in fee simple at fair market value.

Response ID: 15952	Ownership of any lands created or acquired related to construction or operation of the Project would be determined in accord with current state law, including ownership of mineral rights pursuant to La. R.S. 31:149 and La. R.S. 49:214.5.5(E). Pursuant to La. R.S. 49:214.5.5(B), the Project would not create any rights of access to the public in or on private property.
Concern ID: 62413	The MBSD diversion structure, outfall channel, and outfall area would constitute the world's single largest engineered restoration project. The LA TIG and CPRA should include a recreation and education area near the diversion with a viewing platform, trails, bike paths, along with a boat launch into the diversion outfall area.
Response ID: 15951	Due to concerns about safety of the public and security for the Project facilities, there is not a plan to make the diversion structure or immediate outfall area accessible for public use. CPRA is, however, planning to provide signage and other public space near the Project to educate the public regarding the purpose and functioning on the Project. Ownership of any lands created by operation of the Project would be determined in accord with current state law, including ownership of mineral rights pursuant to La. R.S. 31:149 and La. R.S. 49:214.5.5(E). Pursuant to La. R.S. 49:214.5.5(B), the Project would not create any rights of access to the public in or on private property.
Concern ID: 62415	Commenter requested USACE and LA TIG review more detailed comments on the Draft Environmental Impact Statement and Draft Restoration Plan in the comments of the Restore the Mississippi River Delta campaign.
Response ID: 15866	The comments of the Restore the Mississippi River Delta have been considered.
Concern ID: 62421	A well-funded propaganda machine is touting a highly-experimental project using a narrative that conveniently ignores what is easily the biggest source of the local communities' woes: extraction; these communities are left to seek funding on their own to repair the damage from these industries such as spoil banks and open canals.
Response ID: 15953	Comment noted; however, this comment raises concerns that are outside the scope of this EIS.
Concern ID: 62422	All spending for the promotion of the MBSD must be reported to the public in extensive detail. This includes spending from federal and state agencies, foundations, non-profits, and businesses.
Response ID: 15862	The commenter's recommendation is noted, but is outside the scope of this EIS. Financial reporting regarding the LA TIG agencies' budgets and amounts expended is available through the Deepwater Horizon DIVER database. https://www.diver.orr.noaa.gov/web/guest/diver-

[explorer?siteid=9&subtitle=DWH%20Natural%20Resource%20Damage%20Assessment%20Data](#). USACE does not have information regarding expenditures by agencies and/or organizations to promote the proposed MBSD Project.

Concern ID: 62423

Any studies completed by institutions funded by extractive industries should be redone by a neutral party.

Response ID: 15954

The authors and agencies involved in the EIS analysis utilized the best information and data available to them to develop a comprehensive document that considers the beneficial and adverse impacts of the proposed Project. USACE is neither a proponent for nor an opponent of the proposed Project. Studies utilized in the EIS were reviewed and considered by USACE's independent third-party contractor, GEC, and its experts for technical acceptability. GEC executed an Organizational Conflict of Interest statement attesting that it does not have an interest in the outcome of the permitting process. USACE independently evaluated and verified the EIS for its accuracy, scope, and contents.

Concern ID: 62431

Commenter asserts that diversion projects give Mississippi Delta communities a chance to survive, but they do not guarantee anything. Community members must overcome distrust and listen to authentic voices, from both communities and objective scientists, engineers, economists, social scientists and planners, who have no financial stake in the outcome.

Response ID: 15873

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan.

Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration Plan and the Draft EIS in its decision-making process. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project. For a summary of public outreach efforts related to the Draft EIS refer to Chapter 7 Public Involvement of the EIS and for restoration planning see Section 1.8 of the LA TIG's Restoration Plan.

Concern ID: 62326

Once the permafrost thaws past a certain point then the temperature of the Ocean will rise such that the methane hydrate frozen at the bottom of the continental shelves and Ocean will be

	released then there will be an oxygen-poor atmosphere above sea level.
Response ID: 15778	Ongoing impacts and future threats of climate change on wildlife habitat and wetlands were discussed throughout Draft EIS Chapter 3, including Section 3.6 Wetlands and Waters of the U.S., Section 3.7 Air Quality and Section 3.9 Terrestrial Wildlife and Habitat. Draft EIS Section 4.1.3.2 Sea-level Rise in Section 4.1 Overview of Delft3D Basinwide Model for Impact Analysis described how modeling used for the EIS impact analysis factors in sea-level rise.
Concern ID: 62334	The USACE has the skilled staff, needed knowledge, equipment and resources to save the coastline and protect people and wildlife.
Response ID:	The USACE acknowledges the commenter's endorsement. However, the Project is proposed by CPRA; for the proposed Project, the USACE is responsible for evaluation of CPRA's Section 404/10 permit application and Section 408 permission request.
Concern ID: 62339	What we do locally can affect the entire nation.
Response ID: 15786	Comment noted.
Concern ID: 62340	Staff and volunteers who worked to save birds and other wildlife from DWH effects are stakeholders in this decision.
Response ID:	The USACE and LA TIG appreciate the efforts of volunteers to save birds and other wildlife after the DWH oil spill, and recognize such volunteers among the many stakeholders in the decision whether to approve and fund the proposed Project.
Concern ID: 62342	National parks, monuments, lakes, streams, oceans and other picturesque areas should be left in their natural state.
Response ID: 15788	Comment noted. The purpose and need of the proposed Project is to restore injuries caused by the DWH oil spill by reestablishing deltaic processes to ultimately restore habitat and ecosystem services injured by the DWH oil spill.
Concern ID: 62344	Humans have no right to inhumanely kill animals, and humans depend on animals to live.
Response ID: 15790	Comment noted. The Draft EIS considered the effects of the Project on terrestrial and aquatic, and marine mammal species in Chapter 4, Section 4.10 Aquatic Resources, Section 4.9 Terrestrial Wildlife and Habitat, and Section 4.11 Marine Mammals, respectively.
Concern ID: 62357	Southern Louisiana has been losing habitat for many years.
Response ID: 15896	Comment noted. Chapter 3, Section 3.6.2.2 Causes of Wetland Loss of the Draft EIS described historic wetland losses in the Barataria Basin. Further, Sections 3.1.4.1 Mississippi River and 3.1.4.2 Barataria Basin of the Draft EIS addressed the deltaic processes that formed the

proposed Project area; these sections have been supplemented in the Final EIS to further discuss historic conditions.

Concern ID: 62358

Commenter notes that racism has caused social distancing for years.

Response ID: [15848](#)

Comment noted. Draft EIS Chapter 4, Section 4.15 Environmental Justice considered the impact of the proposed Project on minority and low-income populations.

Concern ID: 62389

The Draft EIS both overestimates adverse effects and underestimates positive effects. All of these complex benefits are difficult to quantify and model, but they are apparent at each outlet of the Mississippi and Atchafalaya rivers.

Response ID: 15917

In preparing the EIS, USACE, together with members of the LA TIG (including cooperating agencies and CPRA), utilized high-quality information, ensured the professional and scientific integrity and accuracy of its analyses, and identified its methodologies and sources. Where information is unavailable or incomplete, those data gaps are disclosed in the document.

The Delft3D Basinwide Model represents the best tool currently available to USACE and the LA TIG to inform impact analyses for the EIS. Chapter 4, Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the EIS acknowledges that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Model outputs are not predictions of actual future conditions (see EIS Chapter 4, Section 4.1.3.3 Model Limitations and Uncertainty and Section 8 of Appendix E Delft3D Modeling). The outputs are instead used to compare the degree of difference between the impacts projected for each alternative and as compared to the No Action Alternative.

Concern ID: 62427

Given the environmental damage that Louisiana has sustained in recent years, and the damage expected in the near future from climate change, the commenter thinks that both the citizens of Louisiana and the US Army Corps of Engineers should be focused on protecting human communities and wildlife habitat.

Response ID: 15964

The EIS analyses utilized the best information and data available to USACE and the LA TIG at the time of writing. USACE is neither a proponent nor an opponent of the proposed Project. USACE's role is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under Section 404 of the CWA and Sections 10 and 14 of the RHA of 1899.

As explained in its Restoration Plan, the LA TIG's support for the proposed Project stems from its obligations under OPA to restore for the natural resource injuries incurred by the DWH oil spill. As an oil pollution incident, the DWH oil spill is subject to the provisions of OPA, 33 United States Code (USC) § 2701 et seq. A primary goal of OPA is to make the environment and public whole for injuries to natural resources, and services resulting from incidents involving an oil discharge or substantial threat of an oil discharge. The DWH Trustee Council and its Trustee Implementation Groups were established under the authority of OPA. The NRDA regulations under OPA (15 CFR § 990) establish a process for restoration planning, including the development and evaluation of restoration alternatives and the development of Restoration Plans. These OPA NRDA regulations establish criteria for identifying and evaluating restoration alternatives (see Section 3.1). Restoration activities under OPA are intended to return injured natural resources and services to their baseline condition (that is, primary restoration), and to compensate the public for interim losses from the time of the incident until the time resources services recover to baseline conditions (that is, compensatory restoration). To meet these goals, the restoration activities need to produce benefits that are related to or have a nexus (that is, connection) to the natural resource injuries and service losses resulting from the spill.

Concern ID: 66931

Please either post the entire Draft EIS to the USACE website as one PDF or remove the PDF security restrictions. It is difficult to conduct searches for particular text/topics in multiple PDFs. If the restrictions are removed, the PDFs can be downloaded and combined into one PDF, making it much easier to search.

Response ID: 16858

The USACE applied security settings on the Draft EIS for document control so that chapters/sections would not be edited.

Concern ID: 66932

The Draft EIS link does not work.

Response ID: 16859

The USACE webpage may have temporarily been down at some point during the Draft EIS comment period. If so, it was only a temporary outage.

Concern ID: 66933

The Project would save less land than the city of Gretna.

Response ID: 16860

The commenter's concern about the amount of land created or sustained by the Project was considered in the Draft EIS. As explained in Chapter 4, Section 4.2.3.2 Geology and Soils, Operational Impacts, the Project would increase the amount of land in the Barataria Basin by approximately 13,400 acres in 2070, but result in 3,000 less acres of land in the birdfoot delta in 2070 (see Chapter 4, Section 4.2.3.2.2.1 Geology, Table 4.2-4).

Concern ID: 62434	It is up to USACE to do something now to regulate and save this area from decimation by greedy corporations.
Response ID: 15959	Comment noted, but is outside the scope of this EIS. This EIS is focused on evaluating and disclosing the potential environmental impacts associated with the proposed Mid-Barataria Sediment Diversion Project.
Concern ID: 62353	The corrupting influence of money in our political system is undermining our democratic traditions.
Response ID: 15847	Comment noted, but is outside the scope of this EIS. This EIS is focused on evaluating and disclosing the potential environmental impacts associated with the proposed Mid-Barataria Sediment Diversion Project.
Concern ID: 62414	The government can prevent widespread economic or environmental losses by imposing higher restrictions on state and federal permits issued to companies asking for permission for dredging of canals, diverting construction projects, or the oil/gas expedition drilling within the state and federal waters. With all the new restrictions, nothing stopped the biggest man-made disastrous oil spill from the BP explosion on April 20, 2010.
Response ID: 15860	Comment noted, but is outside the scope of this EIS. This EIS is focused on evaluating and disclosing the potential environmental impacts associated with the proposed Mid-Barataria Sediment Diversion Project.
Concern ID: 62430	Almost the entire Upper Mississippi River watershed has also been developed to enhance agricultural productivity including extensive use of a drainage system used to load water off landscapes as quickly as possible. This development exacerbates flood damages by preventing the landscape from naturally retaining and slowing the release of rainfall and impacts the river's ability to filter pollution, such as nitrogen and phosphorus.
Response ID: 15863	Comment noted, but is outside the scope of this EIS. The scope of this EIS is limited to areas in which the Project is expected to have more than negligible effects on the environment, particularly the Barataria Basin and the Mississippi River birdfoot delta in Louisiana.
Concern ID: 62416	Louisiana's oystermen and women have been champions of protecting and restoring our damaged coastal environment for decades, investing their own funds and resources through building cultch and coastal water bottoms which demonstrates their commitment to a common goal they can share with CPRA and others.
Response ID: 15867	Commenter's input is noted.

Concern ID: 62418

Louisiana's oystermen and women have long been among the most active advocates for saving and restoring our coast. And, while they support broader efforts to restore the wetlands and to provide for coastal flood protection, those who live and work in our coastal communities and depend on the natural fisheries and wildlife resources of Louisiana's estuaries, and whose culture is intertwined with those resources, deserve to have the guarantee that all efforts would be taken to preserve these natural renewable resources for generations to come.

Response ID: 15950

The Draft EIS evaluates how the proposed Project would impact commercial, recreational, and subsistence fishers as compared to No Action conditions in Chapter 4, Sections 4.10 (Aquatic Resources), 4.14 (Commercial Fisheries), 4.15 (Environmental Justice) and 4.16 (Recreation and Tourism).

In response to public comments and resource agency input about the proposed mitigation efforts, CPRA has expanded and refined the oyster mitigation and stewardship measures. CPRA's mitigation and stewardship strategies and associated expenditures would focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to oyster fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for oysters in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to oyster fisheries in the early years of the Project's operational life. The revised mitigation and stewardship measures include allocating \$4 million to establish new public seed grounds, \$15 million to enhance public and private oyster grounds, \$4 million to enhance broodstock reefs and \$8 million for alternative oyster culture.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in

instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62419

The pursuit of Multiple Lines of Defense strategy and coastal protection at all costs has had negative impacts on the State's commercial fishing, shrimping and oystering communities, doing far more damage to the state's economy and coastal employment than any lasting good to our coastal infrastructure.

Response ID: 15861

Comment noted. Chapter 4, Section 4.14.4.2 of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative, primarily by accelerating by decades the decline of species abundance that would also be anticipated under the No Action Alternative. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally,

impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62420

Commenter requested that all who share their concerns about the detrimental, unintended but very real consequences of the proposed Project make their voices heard by commenting at CEMVN- Midbarataria@usace.army.mil.

Response ID: 15868

Comment noted.

GEN4000 – Executive Summary

Concern ID: 61861

The description of the nature of impacts is fundamentally flawed. Clarify who decides whether an impact is adverse or beneficial and what the criteria for these decisions are.

Response ID: 15932

Early in the EIS process, USACE in coordination with the LA TIG and CPRA decided on an approach to evaluation of the environmental impacts for the EIS. As stated in Chapter 4, Section 4.1, Approach to Evaluation of Environmental Consequences, under NEPA, federal agencies must consider the potential environmental impacts, both beneficial and adverse, of the proposed Project and its reasonable alternatives, including direct, indirect, and cumulative impacts. During development of the EIS, it was considered whether the proposed Project would cause a significant adverse or beneficial impact on the human environment (defined as the natural and physical environment and the relationship of people with that environment [40 CFR 1508.14]).

The CEQ regulations require consideration of both context and intensity when determining whether an effect is significant. Chapter 4, Sections 4.1.1 (Context) and 4.1.2 (Intensity) of the EIS set forth the criteria for context and intensity for determining impacts in the EIS. Resource-specific indicators for impacts are included for each resource in their corresponding sections within Chapter 4, Environmental Consequences of the EIS.

Concern ID: 61862

The estimates of land gain in the Executive Summary do not match what is stated in Chapter 4, Environmental Consequences.

Response ID: 15935

The estimates of land gain were reviewed for discrepancies in both the Executive Summary and Chapter 4, Environmental Consequences of the Draft EIS and have been determined to be accurate in both instances. However, to help address these concerns, the EIS has been revised to add a discussion to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Geology and Soils section of the Executive Summary and to Chapter 4, Section 4.2.3.2.2.1 Geology, of the Final EIS.

Concern ID: 61863

Based on the Executive Summary, the proposed MBSD Project is not a sediment diversion.

Response ID: 15933

Section ES.3 of the Executive Summary describes the proposed Project: "The proposed Project evaluated in this EIS is a controlled sediment and freshwater intake diversion structure in Plaquemines Parish on the right descending bank of the Mississippi River at river mile (RM) 60.7, with a conveyance system that would discharge sediment, fresh water, and nutrients from the Mississippi River into an outfall area within the mid-Barataria Basin in Plaquemines and Jefferson Parishes." The MBSD Project is fully described and discussed in the body of the EIS, particularly Chapter 2, Section 2.8 Action Alternatives Carried Forward for Detailed Analysis where the Project components are described in detail.

MA10000 – MAM Plan – General Comments

Concern ID: 62833

CPRA should incorporate research results from the last 11 years and earlier to ensure that restored ecosystems attain close to pre-spill conditions.

Response ID: 16660

The LA TIG's strategy for restoring the ecosystem impacted by the DWH oil spill to pre-spill conditions is the subject of the Deepwater Horizon Oil Spill Programmatic Damage Assessment and Restoration

Plan and Programmatic Environmental Impact Statement (PDARP/PEIS). The PDARP/PEIS describes the Deepwater Horizon Oil Spill Natural Resource Damages Trustees', including CPRA's, ecosystem approach to restoration. The PDARP/PEIS also includes a robust Monitoring and Adaptive Management Framework for ensuring that the collective suite of restoration activities undertaken pursuant to the PDARP/PEIS meets the Trustees' restoration goals of fully restoring for injuries from the oil spill. That Monitoring and Adaptive Framework, which is described in Section 5.5.15 and in Appendix 5.E of the PDARP/PEIS, incorporates research undertaken both before and after the oil spill. Additionally, in September 2021, the LA TIG released a Monitoring and Adaptive Management Strategy that describes the LA TIG's objectives, processes, and priorities to support restoration planning, implementation, and evaluation through monitoring and adaptive management activities applicable to all LA TIG activities. That Strategy improves the LA TIG's ability to achieve effective and efficient restoration of natural resources injured by the DWH oil spill in the Louisiana Restoration Area—with more than \$200 million from the DWH monitoring and adaptive management funding allocation dedicated to that effort.

Concern ID: 62834

Adaptive management should adapt restoration actions to incorporate human utilization response to climate and biodiversity changes.

Response ID: 16661

The Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS) considered the adaptive management issues raised by the commenters. The MAM Plan calls for monitoring of the socioeconomic parameters set forth in the State's System Wide Assessment and Monitoring Program (see Section 3.7.3.24 [Socio-economic Data] of the MAM Plan in Appendix R2 to the Final EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued.

Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62835

Federal and state decision makers and the Trustees should work proactively, transparently, and collaboratively with communities with environmental justice concerns and stakeholders to develop ideas and proposals for adaptation and mitigation as environmental conditions change.

Response ID: 16662

CPRA undertook substantial community outreach, particularly aimed at soliciting input from low-income and minority populations, during the period between the Draft and Final EIS and LA TIG's Draft and Final Restoration Plan. CPRA engaged the communities potentially impacted by the Project, including low-income and minority community members, through public meetings to solicit input on mitigation and stewardship strategies. Further, CPRA engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. CPRA also used a survey tool to gather feedback from low-income and minority community members regarding Project impacts and on mitigation concepts. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. If the Project is implemented, CPRA plans to continue outreach to the communities and stakeholders with environmental justice concerns through Project construction and operations.

Concern ID: 62836

What are the conditions for closure of the diversion? For example, would the diversion be shut down if there is community flooding or a large amount of wetland loss in the first 5 years? CPRA's stated commitment to adaptive management may eventually result in the agency making substantial adjustments to the operational regime of the proposed Project without providing recourse for affected stakeholder groups.

Response ID: 16663

Information regarding Project operations, including the plan for when the diversion would be shut down for emergencies and storm events, is

set forth in CPRA's Operations (Water Control) Plan issued with the Draft EIS (Appendix F2 Preliminary Operations Plan).

With regard to community flooding, the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) details mitigation strategies that would address increased water levels in impacted communities. With regard to ensuring Project performance, in accordance with the Monitoring and Adaptive Management (MAM) Plan, CPRA would monitor Project performance over the life of the Project and adaptively manage the Project to ensure Project success (for examples of potential adaptive management actions, see Tables 4.1-1 through 4.1-3 in the MAM Plan in Appendix R2 to the Final EIS). If the Project is implemented, CPRA would continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62837

Encouraging the comprehensive and holistic restoration of the Lower Mississippi River would benefit all restoration projects in the region. Coordinating the operation of the proposed Project to work well with other restoration and water management efforts would benefit birds, wildlife, and people.

Response ID: 16664

The Project is part of several comprehensive, coordinated strategies for restoration of Barataria Basin and the surrounding region. First, the Project is contemplated in the PDARP/PEIS, which establishes a comprehensive framework for restoring the northern Gulf of Mexico from impacts from the DWH oil spill. Second, the Project is part of the LA TIG's Strategic Restoration Plan for Barataria Basin, which articulates a comprehensive Restoration Plan for restoring the Barataria Basin. The Project is also a cornerstone project of Louisiana's Coastal Master Plan, the 50 year, \$50 billion scientifically based strategy for restoring coastal Louisiana. Louisiana's Coastal Master Plan projects are selected with an eye toward complementing other restoration efforts, such as the Gulf of Mexico Hypoxia Task Force and the Lowermost Mississippi River Management Program.

The Draft EIS considered coordinating the Project with other restoration and management efforts—specifically CPRA's agreement to implement Conservation Recommendation 3 from the Fish and Wildlife Coordination Report to establish a basin-wide operation and monitoring data repository to ensure operators of other projects can coordinate in an effort to maximize restoration efforts in the basin (see Chapter 5, Section 5.3 [Fish and Wildlife Coordination Act Report Recommendations] of the EIS and Section 6.3 [Data Storage and Accessibility] of the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 to the EIS). These collaboration methods are also included in the Final EIS.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued.

Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62846

Adaptively managing the Project to support oyster culture would be infeasible, as doing so would require maintaining current salinity patterns.

Response ID: 16666

CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS) outlines a monitoring process for salinities in the basin after Project operations commence. As explained in the MAM Plan, information from salinity monitoring would be used to inform potential relocation of seed grounds to more environmentally suitable areas within the basin or the establishment of broodstock reefs to address larval supply.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented.

Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62861

Outfall management techniques should be fully evaluated to help redirect diverted waters away from oyster production areas, or other sensitive areas, where feasible. These techniques could be utilized as part of a comprehensive adaptive management plan that may reduce impacts, including the introduction of invasive species, on seafood species.

Response ID: 16670

Based on analyses included in the Coastal Master Plan, the size and scope of ridges necessary to isolate areas in the basin from fresh water would make this solution infeasible. No related edits have been made to the Final EIS.

CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the EIS) outlines a monitoring process for salinities in the basin that CPRA would implement after operations commence. The salinity information would inform potential relocation of seed grounds to more environmentally suitable areas within the basin or the establishment of broodstock reefs in environmentally suitable areas to address larval supply. The Mitigation and Stewardship Plan (Appendix R1 to the EIS) includes oyster mitigation and stewardship measures totaling \$32 million. Table 4.27-2 in Section 4.27 (Mitigation Summary) identifies which of these oyster mitigation and stewardship measures are specific to the proposed Project and which are augmentation of existing or proposed programs.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation,

monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62863

Combining the LA TIG Restoration Plan review with the Draft EIS, Mitigation and Stewardship Plan and MAM Plan review has created confusion. For example, having two versions of the Mitigation and Stewardship Plan and MAM Plan with different appendix numbers makes it difficult to cite the appropriate documents.

Response ID: 16672

Commenters' concern that the combined public review for the USACE Draft EIS and the LA TIG Restoration Plan may have caused confusion for some readers is noted.

The LA TIG wanted to ensure that the Restoration Plan contained all information relevant to Trustee decision-making and thus included two documents in the LA TIG's Restoration Plan that were also appended to the EIS. All comments on the Monitoring and Adaptive Management (MAM) Plan and Mitigation and Stewardship Plan have been reviewed by both USACE and the LA TIG and have been responded to, whether commenters referred to Appendices in the Draft EIS or Draft Restoration Plan.

Concern ID: 62864

There is significant confusion about funds available for mitigation versus monitoring and adaptive management. The EIS should clarify how much funding will be available for each.

Response ID: 16673

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under

development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62865

Such a transformative project will require a robust program of monitoring, which will not only support the proposed Project, but also will support the evaluation of future diversions that are anticipated in the Coastal Master Plan.

Response ID: 16674

The robust monitoring raised by the commenters was considered by CPRA and the LA TIG in the Monitoring and Adaptive Management (MAM) Plan included in the Draft EIS (Appendix R2). CPRA's MAM Plan included with the Final EIS (Appendix R2) provides additional detail on the substantial monitoring CPRA would undertake as part of Project implementation. The MAM Plan identifies monitoring needs and the key performance measures associated with each objective that would be used to evaluate progress toward meeting the Project's restoration objectives and to inform CPRA's adaptive management decisions.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62867

The Final EIS should not be published unless there are commitments to monitor the following parameters at the diversion site or in Barataria Bay: Project operations, the flow and quality of the water flowing through the diversion, wetland type coverage over time, water surface elevation, water quality in the basin,

salinity, contaminant concentrations in diverted sediments, fish and shellfish abundance, oyster reef parameters, benthic community composition and abundance, SAV coverage, finfish and oyster contaminant concentrations, and shellfish harvest restrictions. These same data should also be collected in two reference basins.

Response ID: 16676

Basin-side monitoring of water surface elevation, water quality in the basin, salinity, fish and shellfish abundance, and benthic community composition and abundance to evaluate how the Project is meeting Project objectives were included in the Monitoring and Adaptive Management (MAM) Plan of the Draft EIS (Appendix R2). Riverside monitoring parameters include river discharge, suspended sediment concentrations, nutrient concentrations in water conveyed to the Barataria Basin, sedimentology of the Alliance South sand bar, and Mississippi River sediment load were also included in the MAM Plan of the Draft EIS. Additionally, in the Fish and Wildlife Coordination Act Report (CAR) section of Chapter 5 (Consultation and Coordination) of the Draft EIS, CPRA accepted USFWS' recommendation on pre- and post-construction periodic sampling of Contaminants of Concern in fish, shellfish, and wildlife from the outfall area and the Mississippi River (see Section 3.7.3.23 of the MAM Plan [Appendix R2 to the EIS]). Therefore, no changes were made in the Final EIS on these issues. The Louisiana Department of Health will continue to monitor shellfish harvest restrictions. Additionally, the majority of the parameters above are collected via the State's System Wide Assessment and Monitoring Program that will allow comparison of the Project variables within and among other estuarine basins across the Louisiana coast.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not

be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62870

Although the EIS references studies that support high site fidelity in the Barataria Stock of bottlenose dolphins, no comprehensive or comparable studies on-site fidelity have been conducted with adjacent stocks including Mississippi River Delta and Mississippi Sound (MSS) stocks. The proposed Project should include routine, standardized, line transect, capture-mark-recapture surveys of bottlenose dolphins, as well as genetic sampling and tagging efforts, in Lake Borgne, Bay Boudreau and Bay Saint Louis regions. In addition, MSS stocks could experience additional pressure due to displacement or change in prey or movement of bottlenose dolphins from the proposed Project. Therefore, the MSS stock needs to be monitored before and after the Project, with a particular focus on Lake Borgne and Bay Boudreau Region dolphins.

Response ID: 16678

The Draft EIS considered the issue raised by commenters in Chapter 4, Section 4.11.5.3 (Operational Impacts - Other Dolphin Stocks Considered), finding it is unlikely the Mississippi River Delta (MRD) stock would be impacted by the proposed Project, either directly from low salinity or other environmental effects (for example, temperature). Hence, the Project would not be expected to impact dolphins or their prey inhabiting those waters. It is not anticipated that dolphins in the Barataria Basin would relocate to the MRD stock area or beyond; therefore, no impact on other Louisiana stocks is anticipated. Therefore, no changes were made to the Final EIS on MRD stock monitoring.

Studies such as the ones suggested by the commenter, including aerial line transect surveys designed to better understand the population structure (for example, abundance, distribution, and density) of the Mississippi Sound, Lake Borgne, and Bay Boudreau dolphin stocks east of the Mississippi River, are being integrated into the permitting and environmental analysis efforts associated with CPRA's proposed

Mid-Breton Sediment Diversion Project, currently under USACE permit review through a separate EIS process.

Concern ID: 62874

CPRA should monitor sediment flow through the diversion annually, particularly in the first, more critical decade of operation. This will help determine whether the goals of the Project can be achieved with more efficient use of water flow in following years.

Response ID: 16681

The sediment monitoring issues raised by the commenter were considered in Table 4.1-1 of the Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS); therefore, no changes were made to the Final EIS on sediment monitoring. This included monitoring the sediment-to-water ratio in the flows conveyed into Barataria Basin as well as the sediment volume conveyed into Barataria Basin. As noted in the MAM Plan, these parameters would be monitored each year for the life of the Project, including the first decade of Project operation. The sediment-to-water ratio would be evaluated biweekly during operational events and quarterly during base flows. For more information, refer to of the MAM Plan (Appendix R2 to the EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for

funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62875

CPRA should ensure systematic monitoring of algal blooms and their impacts in the basin, both before and after Project operation.

Response ID: 16682

Sections 3.7.3.9-3.7.3.11 (Chlorophyll A, Phytoplankton Species Composition [including Harmful Cyanobacterial/Algal Bloom Species], and Harmful Cyanobacterial/Algal Bloom Toxins, respectively) in the Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS) have been revised. Proposed monitoring includes both pre-construction and post-construction monitoring for the potential development of phytoplankton blooms raised by the commenter. Chlorophyll A would be monitored hourly at in situ gages and daily through remote sensing. Additionally, all three parameters will be monitored monthly, with additional discrete sampling events dependent on observations, systematically using in situ sondes and/or remote sensing, with results determining when phytoplankton sampling would occur and, in turn, when sampling for harmful algal bloom toxins should occur.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship

Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63311**No amount of adaptive management will ensure the continued support of oyster culture in the Barataria Basin.****Response ID: 16684**

The Draft EIS discussed anticipated impacts to oyster fisheries in Section 4.14.4.2 (Operational Impacts, Applicant's Preferred Alternative, Eastern Oyster Fishery) in Commercial Fisheries and found that the proposed Project would have major, permanent, adverse impacts on Eastern oyster fisheries in the Project area.

The concerns expressed by the commenter were considered by CPRA and the LA TIG in preparing the Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS). LA TIG acknowledges that operation of the Project would likely reduce oyster abundance in the Barataria Basin (see Section 4.14.4.2 [Commercial Fisheries - Operational Impacts] of the Final EIS). However, specific MAM and mitigation activities have been proposed to understand and mitigate impacts to oyster production. As described in the MAM Plan (Appendix R2 to the Final EIS), if the data collected through MAM activities suggests that sustaining oyster populations in the basin is no longer viable, the CPRA would implement some of the actions outlined in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), such as the relocation of seed grounds to more environmentally suitable areas or the establishment of broodstock reefs to address larval supply, in areas outside of Barataria Basin. The Mitigation and Stewardship Plan (Appendix R1 to the EIS) includes additional oyster mitigation and stewardship measures totaling \$32 million. Table 4.27-2 in Section 4.27 (Mitigation Summary) shows which of these oyster mitigation and stewardship measures are new and which are augmentation of existing or proposed programs.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation,

monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63775

The MAM Plan should develop an information dashboard or clearinghouse where the basin-wide data can be kept and accessed, would be useful to the public as well as diversion operators, state agencies, researchers, and other stakeholders.

Response ID: 16686

In response to public comments, CPRA would develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

This dashboard has been added to the Monitoring and Adaptive Management (MAM) Plan included in the Final EIS (Appendix R2).

Concern ID: 63777

CPRA should coordinate with not only USFWS, NMFS, and other resource agencies, but also other science, policy-based and community stakeholders, to ensure a broader discussion of management impacts and options.

Response ID: 16687

CPRA and the LA TIG considered the commenters concern in developing the Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the EIS). The MAM Plan includes input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]). The MAM Plan included in the Final EIS (Appendix R2) has been revised in response to public comments. In addition, in response to public comments, CPRA would develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard

would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

With specific regard to the inclusion of scientific expertise, in addition to the expertise within CPRA, the governance provisions of the MAM Plan call for establishing a Technical Focus Group/Peer Review Group with subject matter expertise to provide technical support on long-term Project planning, assist in the evaluation and interpretation of monitoring data and evaluate the state of the science concerning adaptive management. See Section 2.2.2.3 (Technical Focus Group(s)/Peer Review) of the MAM Plan (Appendix R2 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63834

The Mitigation Plan should include sufficient resources to address invasive aquatic plants in the area of influence.

Response ID: 16691

The invasive aquatic plant issue raised by the commenter was considered in CPRA's Monitoring and Adaptive Management (MAM) Plan included with the Draft EIS (Appendix R2), which included monitoring for flora and fauna including potential increases in invasive species. Observed increases would then be addressed through the adaptive management structure within the MAM Plan. No related changes were made to the MAM Plan included in the Final EIS (see Appendix R2).

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62801

State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project

operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62838

Near-term, long term, and real-time monitoring in the Barataria Basin will be essential to the operation of the diversion as well as to public communication about the performance, over space and time, of the diversion and its area of influence. Governance and decision making for the Project should be a science-based, inclusive, and transparent process with genuine engagement and input from external experts and community stakeholders.

Response ID: 16665

According to the LA TIG, the monitoring issues raised by the commenter were considered in CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS), which was jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan included input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]). In response to public comments, CPRA would develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

With specific regard to the inclusion of scientific expertise, in addition to the expertise within CPRA, the governance provisions of the MAM Plan call for establishing a Technical Focus Group/Peer Review Group with subject matter expertise to provide technical support on long-term Project planning, assist in the evaluation and interpretation of monitoring data, and evaluate the state of the science concerning adaptive management. See Section 2.2.2.3 (Technical Focus Group(s)/Peer Review) of the MAM Plan (Appendix R2 to the Final EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE

as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62857

The complexity of the proposed Project, and the multitude of uncertainties that have been identified while estimating its benefits and impacts, demonstrates the importance for real-time monitoring protocols in the adaptive management program to reduce uncertainties over time.

Response ID: 16667

According to the LA TIG, the monitoring measures raised by the commenters were considered in CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS). Monitoring, including collection of real-time data, is essential for increasing the likelihood of achieving desired Project outcomes given the uncertainties inherent to predicting the Project's effects. For example, post-construction, hydrographic station readings in the Mississippi River would be posted in real time and accessible from remote networks to enable forecasting water and sediment arrival. Along the gradient from the Mississippi River through the diversion and into the basin, CPRA is planning for the use of real-time data for key hydrographic variables (turbidity, stage, velocity, and water quality). As CPRA's plan to perform real-time monitoring was included in the Draft EIS, no changes have been made in the Final EIS in response to this comment. See CPRA's MAM Plan (Appendix R2 to the EIS) for additional details regarding the monitoring efforts planned in anticipation of and during Project operations.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained

draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62862

Taking advantage of operational changes authorized in WRDA 2007, Davis Pond should be used as an adaptive management tool to achieve a gradual transition to lower estuarine salinities in the Barataria Basin. During the transition, the response of estuarine organisms, including brown shrimp, oysters and bottlenose dolphins could be monitored.

Response ID: 16671

The Draft EIS did not consider using Davis Pond as an adaptive management tool. Based on the comparative size and location of the Davis Pond Freshwater Diversion relative to the Project, operational limitations on Davis Pond during low river flows and existing limitations on the flexibility of Davis Pond's operational regime, Davis Pond cannot effectively be used to ease the transition to a fresher estuary. In addition, increasing flows from Davis Pond in advance of commencement of Project operations could reduce the pre-construction time period available for fishers to continue their fishing activities while beginning to adapt to changes that occur once Project operations commence. Accordingly, no changes have been made to the Final EIS.

Concern ID: 62866

A commenter recommends that, if the MBSD Project goes forward, the LA TIG and CPRA work with NMFS to initiate the pre-

operations sampling program for marine mammals in Barataria Bay by the end of 2021 to ensure a minimum five years of baseline information is collected on bottlenose dolphins and their prey species and habitat, prior to the implementation of the MBSD, as outlined in the MAM Plan.

Response ID: 16675

The dolphin monitoring measures raised by commenters were considered in Section 6.3.6 (Public Interest Mitigation - Marine Mammals) of CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) and Section 3.7.3.19 (Atlantic Bottlenose Dolphins [*Tursiops truncatus*]) of the Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS). The revised MAM Plan included in Appendix R2 of the Final EIS describes proposed dolphin monitoring during the 5 years prior to operations. The LA TIG coordinated with NMFS in the development of these measures.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62876

Commenter supports the pre-operations sampling plan outlined for marine mammals in the Draft EIS Appendices R1 and R2 (Mitigation and Stewardship Plan, and MAM Plan), which include enhanced stranding response and investigations, capture-mark-recapture surveys, visual assessment surveys, health assessments, tagging, remote biopsy sampling, prey assessment, and collection of habitat data.

Response ID: 16683

Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) and Appendix R1 (Mitigation and Stewardship Plan) to the Draft EIS contained the information on marine mammal monitoring noted by the commenter. In addition, since the publication of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention (MMI) Plan to be implemented by CPRA to further respond to and recognize expressed public concerns about the potential impacts of the Project on marine mammals (see new Appendix R5 to the Final EIS). The MMI Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404

permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63805

Water quality must be monitored throughout construction, implementation, and beyond in as near to real-time as possible.

Response ID: 16689

The pre- and post-operations water quality monitoring noted by the commenter was considered in CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS). CPRA would collect water quality data in real time from existing Coastwide Reference Monitoring System (CRMS), Louisiana Department of Environmental Quality (LDEQ), and United States Geological Survey (USGS) stations in the Barataria Basin (see Figures 3.7-5 and 3.7-6 in the MAM Plan for water quality sampling locations). The MAM Plan states that collected data will inform future Project management decisions aimed at improving Project effectiveness and limiting ecological and/or human impacts when possible. Therefore, no changes were made in the Final EIS on water quality monitoring.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA

Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63843**Nutrients in diverted water should be monitored and removed before reaching Barataria Basin.****Response ID: 16692**

The issue raised by the commenter on monitoring nutrients in diverted water was considered in the Monitoring and Adaptive Management (MAM) Plan included with the Draft EIS (Appendix R2); no changes were made in the MAM Plan in response to this comment. CPRA has proposed to measure Mississippi River nutrient concentrations on a biweekly basis during operational events (above baseflow), and quarterly during base flow conditions. This information will be used to calculate, in conjunction with measurement of the water volume conveyed into the Barataria Basin, the nutrient loads conveyed into the Barataria Basin. CPRA also proposes to measure nutrient levels in Barataria surface waters on a monthly basis.

Chapter 4, Section 4.6 (Wetland Resources and Waters of the U.S.) of the Draft EIS also discussed how wetlands created by the Project would likely absorb the additional nutrients diverted to the basin, thereby reducing the potential negative impacts of nutrients in Mississippi River water. In response to commenters' concerns, a discussion of the Gulf Hypoxia Action Plan has been added to Chapter 4, Section 4.25.5 (Cumulative Impacts - Surface Water and Sediment Quality) of the Final EIS.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required

as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63844

The MAM Plan should address increased nutrient levels and the potential for increased eutrophication in coastal bays.

Response ID: 16693

Monitoring nutrients in diverted water was considered in CPRA's Monitoring and Adaptive Management (MAM) Plan included with the Draft EIS (Appendix R2).

Chapter 4, Sections 4.5.5.3 Nitrogen and 4.5.5.4 Phosphorus in Section 4.5 Surface Water and Sediment Quality of the Draft EIS discussed how wetlands created by the Project could absorb the additional nutrients diverted to the basin, thereby reducing the potential negative impacts within the Barataria Basin from nutrients introduced into the basin from Mississippi River water. Section 4.10.4.4 General Impacts on Habitat and the Environment, Applicant's Preferred Alternative, Nutrient Loading and Dissolved Oxygen of the Draft EIS discussed the potential for algal blooms and resulting dissolved oxygen levels due to nutrient loading in Barataria Basin waters and bays.

In response to commenters' concerns, a discussion of the Gulf Hypoxia Action Plan has been added to Chapter 4, Section 4.25.5 (Cumulative Impacts - Surface Water and Sediment Quality) of the Final EIS. This discussion includes the Nutrient Reduction Strategies developed by the 12 member states of the Hypoxia Task Force. Louisiana's Nutrient Reduction and Management Strategy has highlighted the important role that river diversions could play in reducing nutrient loads. The wetlands created by the diversion would take up nutrients, thus assisting in the reduction of impacts in the Gulf of Mexico from excess nutrients introduced through the Mississippi River water.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range

of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63970

A commenter, when commenting on the MAM Plan, expressed concern that just as the State of Louisiana is about to embark on a series of sediment diversions that will result in significant dolphins deaths, the State of Louisiana has pulled itself out of the stranding response business. While the commenter recognized that increased stranding response funding would be available through the Project, it is not clear to them to whom this funding will be given and thus how effectively the funding will be utilized. They are worried that most stranded dolphins in Barataria Bay would already be dead.

Response ID: 16694

The LA TIG, in recognition of the need to improve stranding response in Louisiana, finalized Restoration Plan #5 in August of 2020, which included the use of non-MBSD Deepwater Horizon Natural Resource Damages funding for enhancement of the Louisiana Marine Mammal Stranding Network. NOAA is the lead implementing Trustee on this enhancement project and has assumed the stranding network coordination role in Louisiana. These enhancements would be

extended through stranding network investments noted in the MBSD Mitigation and Stewardship Plan (Appendix R1 to the EIS). NOAA would lead implementation of stewardship measures for marine mammals including the continued enhancement of the stranding network. CPRA would lead any Project operational mitigation actions considered as part of the Monitoring and Adaptive Management (MAM) Plan, in consultation with NOAA.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63809

The Trustees must continue to invest in monitoring and research to measure the Project's success and better understand the changing environment, the diversion impacts to people, and to inform the robust adaptive management program that will inform decisions related to Project operations. An independent and multi-disciplinary science and technical advisory group - including physical scientists, ecologists, sociologists and other experts -

should be established and engaged frequently to advise operation managers.

Response ID: 16690

USACE is not a Trustee.

The LA TIG acknowledges the comment, and notes that, the robust monitoring and adaptive management measures raised by commenters were considered in the Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS). In particular, the MAM Plan establishes a technical advisory group (see Section 2.2.2.3 [Technical Focus Group(s)/Peer Review] of the MAM Plan). As a result, no changes have been made to the MAM Plan included with the Final EIS in response to this comment. If the LA TIG funds the Project, the LA TIG would also fund the MAM Plan.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62868

Sediment should be monitored for a broad suite of contaminants, including PAHs and mercury, near sites of active deposition.

Response ID: 16677

The sediment monitoring recommendation raised by commenters was considered in Chapter 5, Section 5.3 (Fish and Wildlife Coordination Act Report Recommendations) of the Draft EIS, where CPRA agreed to the USFWS' recommendation to undertake pre- and post-construction periodic sampling of Contaminants of Concern in fish, shellfish, and wildlife from the outfall area and the Mississippi River (see also Section 3.7.3.23 of CPRA's Monitoring and Adaptive Management (MAM) Plan [Appendix R2 to the Draft EIS]). Because sediment sampling is likely to be highly variable spatially and temporally, the recommendation from the USFWS and CPRA's commitment to sample fish and shellfish would give a more integrated picture of any contaminant concerns.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63768

CPRA should work with local community and four-year colleges to prepare local graduates in project monitoring techniques. They should primarily use local contractors to carry out the monitoring work.

Response ID: 16685

According to CPRA, it encourages the use of local contractors within the limitations allowed by law. CPRA uses several assistance programs to help ensure contractors have skilled local candidates available for employment. One example of such a program is the Coastal Science Assistantship Program (CSAP), which provides a stipend to local students to assist in CPRA's various coastal activities. These programs are not specific to the proposed Project and are not affiliated with the Project Monitoring and Adaptive Management (MAM) Plan.

Concern ID: 62859

The Final EIS and supporting record should include additional information about possible operational minimization measures that may be considered through the adaptive management process, based on monitoring and new information. For example, evaluation of the construction of landscape features that might provide higher-salinity refuge areas within the basin might be an option.

Response ID: 16668

The Draft EIS considered measures for adaptively managing the Project as part of the Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS). Since issuance of the Draft EIS, CPRA modified the MAM Plan to include additional information regarding strategies for minimizing impacts through monitoring and adaptive management (see Section 3.7.1.1.7 [Topography/bathymetry of the Project Influence Area] of the MAM Plan in Appendix R2 to the Final EIS).

The EIS considered potential features in the outfall area such as canals, bayous, impoundments, weirs, and chenier-like ridges to manipulate the flow of water and sediment for water quality and sediment retention benefits, to create barriers for storm surge and wind, and to redirect waters away from oyster production and sensitive areas. However, flow-directing outfall features within the initial delta formation area were eliminated from consideration because of the potential for such features to impede the development of the delta formation. See Chapter 2, Section 2.5 Step 3: Evaluation of Sediment Diversion Outfall Features for evaluation of these alternative outfall features as part of the alternatives screening process. Because these features were previously eliminated, they will not be considered as part of future adaptive management.

As described in the MAM Plan (Appendix R2 to the Final EIS), CPRA would monitor salinities in the basin after Project operations commence to help inform potential relocation of seed grounds to more

environmentally suitable areas within the basin or the establishment of broodstock reefs to address larval supply. The Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) includes a full suite of oyster mitigation and stewardship measures totaling \$32 million.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62871

This Project can proceed carefully and with full attention to the ways in which impacts to bottlenose dolphins can be lessened. Supporting a rigorous pre- and post- construction monitoring program can reduce key uncertainties about the populations of bottlenose dolphins and can help measure Project effects.

Response ID: 16679

The marine mammal related monitoring issue raised by the commenters was considered in CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS). The MAM Plan describes pre- and post-construction monitoring to document baseline and changes to the abundance, distribution, population

demography, density, survival, health, and reproduction of the Barataria Bay Estuarine System (BBES) stock of bottlenose dolphins, their prey, and their habitat, including effects that may result from the operation of the Project and resulting low salinity. For more information, refer to Section 3.7.3.19 (Atlantic Bottlenose Dolphins [*Tursiops truncatus*]) of the MAM Plan (Appendix R2 to the EIS). As these marine mammal monitoring measures were already considered in the Draft EIS, no changes were made in the Final EIS in response to this comment.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62827

Monitoring is an essential part of ecological restoration because it gives information about the quality of the habitat and the longevity of positive and negative Project impacts.

Response ID: 16659

CPRA and the LA TIG acknowledge that monitoring is critical for understanding the positive and negative impacts of the Project over the long term. Accordingly, the importance of monitoring was considered as part of the LA TIG's Restoration Plan and in the MAM Plan included with the Draft EIS (Appendix R2). CPRA and its LA TIG partners have further revised and refined this MAM Plan prior to issuance of the Final EIS partially in response to public comments. As part of the Project implementation, CPRA would undertake substantial monitoring as explained in the MAM Plan (see Appendix R2 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62860

The Draft EIS Monitoring and Adaptive Management (MAM) Plan in Appendix R2 includes several steps and elements that would

be considered appropriate for adaptive management and allow for full benefits of such measures.

Response ID: 16669

The MAM Plan steps and elements noted and supported by the commenters were included in Appendix R2 to the Draft EIS. These measures have been further refined in CPRA's MAM Plan issued with the Final EIS (Appendix R2).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

MA14000 – MAM Data Management & Reporting

Concern ID: 63094	There should be a website that shows if the diversion is running and at what capacity.
Response ID: 16646	<p>In response to public and agency comments, CPRA would develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.</p> <p>This dashboard has been added to the Monitoring and Adaptive Management (MAM) Plan included in the Final EIS (Appendix R2). The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.</p> <p>The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.</p>
Concern ID: 63095	CPRA should communicate relevant thresholds and triggers for monitoring to the public on a regular basis.

Response ID: 16648

As explained in the Monitoring and Adaptive Management (MAM) Plan, CPRA would develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. The dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operations.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

MT20000 – Compensatory Wetland Mitigation

Concern ID: 62189

Jesuit Bend Mitigation Bank would provide an offset for Project impacts, particularly if wet pasture impacts are offset with fresh to intermediate marsh as it has been for previous USACE projects.

Response ID: 16402	The direct wetland impacts associated with the proposed Project are discussed in the EIS at Chapter 4, Section 4.6.4.1 Wetland Resources and Waters of the U.S., Construction Impacts, Wetland Types and Extent. USACE will evaluate impacts and consider any necessary compensatory mitigation consistent with 33 CFR §320.4(r), 33 CFR Part 332 and applicable USACE guidance in its permitting decision. If compensatory mitigation were required, options consistent with Part 332 would be considered, including banks within the appropriate watershed with available credits. Any potential compensatory mitigation requirements would be discussed in the ROD.
Concern ID: 62191	The mitigation proposed by CPRA (“self-mitigation”) is inconsistent with federal law and fails to consider and give priority to credits from mitigation banks; USACE should consider CPRA’s mitigation plan and determine that compensatory mitigation is required for construction footprint impact through the purchase of released in-kind and in-basin mitigation bank credits, which are available from Jesuit Bend Mitigation Bank
Response ID: 16403	<p>The direct wetland impacts associated with the proposed Project are disclosed in the EIS and will be evaluated by USACE in accordance with 33 CFR §320.4(r) in its permitting decision. If compensatory mitigation were required, options consistent with 33 CFR Part 332, including banks within the appropriate watershed with available credits, would be considered. If a permit is issued, any potential compensatory mitigation requirements would be provided in the ROD.</p> <p>The term “self-mitigating” was used in Chapter 4, Section 4.27.2.1 Compensatory Mitigation, Jurisdictional Wetlands and Waters of the U.S. to indicate that CPRA believes the marsh creation benefits of the Project would offset the wetland impacts. However, since publication of the Draft EIS, CPRA has committed to constructing wetlands within the designated beneficial use area with excavated material that, according to Wetland Value Assessment (WVA) modeling, would at minimum be equivalent to the identified Average Annual Habitat Units (AAHUs) lost from Project construction. Edits have been made to Final EIS Chapter 2, Section 2.8.1.1 Project Design Features to reflect this Project feature. Final EIS Section 4.6.5.3 Wetland Resources and Waters of the U.S., Wetland Value Assessment has been updated with the Interagency Habitat Evaluation Team’s WVA calculation of the AAHUs that would be created in these beneficial use areas, and Section 4.27.2.1 Compensatory Mitigation, Jurisdictional Wetlands and Waters of the U.S. has been edited to summarize the wetland impacts and describe the projected benefits that would be provided by these beneficial use marsh creation sites and other wetland benefits of the Project.</p>

Concern ID: 66934

It appears that CPRA is considering using some of the excavated material for construction of the MBSD for beneficial use placement and upland reuse (for example, filling existing borrow pits). However, this material would first be used for construction of the Project components and only be used for beneficial reuse “if suitable” and “to the extent practicable.” CPRA acknowledges that “[b]ecause the amount of dredge material suitable for placement in the beneficial use sites is currently unknown, the benefits cannot be calculated or considered as a mitigation offset.”

Response ID: 16861

Since publication of the Draft EIS, CPRA has determined that it would construct a beneficial use component to the proposed Project and has submitted information concerning the design and location of the beneficial use sites such that the benefits in terms of acreage and Average Annual Habitat Units (AAHUs) can now be calculated. These beneficial use areas would be located near the proposed outfall transition feature. According to Wetland Value Assessment (WVA) modeling, these constructed wetlands would at minimum be equivalent to the identified AAHUs lost from Project construction. Edits have been made to Final EIS Chapter 2, Section 2.8.1.1. Project Design Feature) to reflect this Project feature. Final EIS Chapter 4, Section 4.6.5.3 Wetland Resources and Waters of the U.S., Wetland Value Assessment has been updated with the Interagency Habitat Evaluation Team’s WVA calculation of the AAHUs that would be created in these beneficial use areas, and Section 4.27.2.1 Compensatory Mitigation, Jurisdictional Wetlands and Waters of the U.S. has been edited to summarize the anticipated wetland impacts and anticipated benefits of the proposed Project that include these marsh creation sites and other wetland benefits of the Project.

Concern ID: 66935

CPRA claims that there will be “no net loss” of wetlands because wetland losses during construction would be offset by the anticipated creation of wetlands during operation of the MBSD. The uncertainty and timing of these environmental benefits cannot justify disregarding the requirement that unavoidable impacts be minimized and mitigated. Based on the uncertainty and timing, these benefits cannot be reasonably expected to offset the significant losses of jurisdictional wetlands and their functions within the construction footprint.

Response ID: 16862

CPRA has determined that it will construct wetlands within the designated beneficial use area with excavated material, which, according to Wetland Value Assessment (WVA) modeling, would at minimum provide equivalent Average Annual Habitat Units (AAHUs) to the identified AAHUs anticipated to be lost due to direct impacts from Project construction. The proposed Project beneficial use wetland

creation feature would be constructed concurrently with overall construction of the proposed Project.

CPRA is not relying on diversion marsh creation performance to replace the permanent loss of wetlands that would result from Project construction. Because the beneficial use marsh creation Project feature would be constructed using typical marsh creation construction methods, uncertainty regarding the success and environmental benefits of this Project feature would be minimized. Edits have been made to Final EIS Section 2.8.1.1. Project Design Features to reflect this Project feature. Final EIS Section 4.6.5.3 Wetland Resources and Waters of the U.S., Wetland Value Assessment has been updated with the Interagency Habitat Evaluation Team's WVA calculation of the AAHUs that will be created in these beneficial use areas, and Section 4.27.2.1 Compensatory Mitigation, Jurisdictional Wetlands and Waters of the U.S. has been edited to summarize the anticipated wetland impacts and benefits of the proposed Project to include these beneficial use marsh creation sites and other wetland benefits of the Project.

Concern ID: 66936

CPRA claims that sometime in the next 50 years (potentially 2040 or later) fresh and intermediate marsh is anticipated to be established, and this will mitigate the known, immediate, permanent loss of 182.9 acres of jurisdictional wetlands. CPRA does not dispute that there will be a significant temporal loss of aquatic function. This temporal lag in the creation of wetlands (even assuming that the MBSD works as projected, which is highly uncertain) cannot justify deviating from compensatory mitigation requirements. As required by the 2008 Final Rule, this temporal loss must be addressed, quantified and mitigated through the purchase of available in-kind and in-basin mitigation bank credits or other well-established mechanisms.

Response ID: 16863

CPRA is not relying on diversion marsh creation success to replace the anticipated permanent loss of 193.1 acres of wetlands resulting from Project construction. The permanent loss of 1193.1 acres of jurisdictional wetlands would be replaced through construction of at least 402 acres of marsh through beneficial use of excavated material concurrent with construction of the proposed Project.

Concern ID: 66937

As acknowledged by CPRA, CPRA's proposed self-mitigation involves a high degree of uncertainty. To account for uncertainty, CPRA relies on an adaptive management plan. Thus, not only will the "self-mitigation" not occur before or concurrent to the impacts, it is uncertain to happen at all.

Response ID: 16864

CPRA is not relying on diversion marsh creation success to replace the anticipated permanent loss of 193.1 acres of wetlands resulting from Project construction. The permanent loss of 193.1 acres of

jurisdictional wetlands would be replaced through construction of at least 402 acres of marsh through beneficial use of excavated material concurrent with construction of the proposed Project.

Because the beneficial use marsh creation Project feature would be constructed using typical marsh creation construction methods, uncertainty regarding the success and environmental benefits of this Project feature would be minimized. Therefore, the uncertainty regarding whether the proposed Project would produce projected land building and marsh creation benefits through operation of the diversion, as projected by the Delft3D Basinwide Model, is not relevant to the calculation of anticipated wetland creation benefits associated with the beneficial use component of the proposed Project.

Concern ID: 66938

The purchase of mitigation bank credits (or mitigation through some other well-established mechanism) is feasible, appropriate and practicable. The purchase of in-kind and in-basin mitigation bank credits will offset the values and functions of the impacted jurisdictional wetlands.

Response ID: 16865

Should compensatory mitigation be required, the purchase of mitigation bank credits and potentially other mitigation options would be considered in accordance with 33 CFR Part 332.

Concern ID: 66939

It is inappropriate to compare the MBSD to “typical” marsh creation projects. Although under certain circumstances the Corps has the limited discretion to not require compensatory mitigation when a proposed discharge is reasonably expected to result in environmental benefits, the anticipated benefits of the MBSD cannot justify the Corps exercising this discretion.

Response ID: 16866

CPRA has determined it would construct wetlands within the designated beneficial use area with excavated material that, according to WVA modeling, would at minimum produce sufficient AAHUs to replace the anticipated AAHUs that would be lost due to Project construction. USACE’s determination in its permitting decision whether to require compensatory mitigation would be made in accordance with 33 CFR §320.4(r), 33 CFR Part 332 and applicable USACE guidance, including the 1990 USEPA & USACE MOA Concerning the Determination of Mitigation.

Concern ID: 66940

The Corps is mandated to require “additional” mitigation when temporal losses to aquatic function will result.

Response ID: 16867

CPRA has determined that it would construct a beneficial use marsh creation component concurrent with Project construction. The WVA model considers the temporal losses to aquatic function in its calculations regarding Project impacts and marsh creation construction benefits.

Concern ID: 66941	Despite the requirements of the 2008 Final Rule, CPRA and the Corps do not address whether a single acre of this land will be provided long-term protection. Not only is there no guarantee that the Project will successfully result in the creation of these acres, even if the Project is successful, there is nothing in place to prevent the conservation objectives of the Project being compromised by incompatible uses. As a result, the proposed mitigation for the MBSD is not in compliance with the 2008 Final Rule requirements and is unlawful.
Response ID: 16868	Benefits to be derived from marsh reestablishment have been evaluated through the WVA model which considers temporal losses to and gains in aquatic function. The beneficial use of excavated material to create marsh is a component of the Project and would be constructed concurrently with proposed Project. USACE's determination in its permitting decision whether to require compensatory mitigation would be made in accordance with 33 CFR §320.4(r), 33 CFR Part 332 and applicable USACE guidance. If compensatory mitigation were required, banks within the appropriate watershed with available credits would be considered.
Concern ID: 66943	If the Project is considered permittee-responsible mitigation, CPRA's "self-mitigation" is also inconsistent with CEMVN's Permittee-Responsible Mitigation Plan Template.
Response ID: 16869	The beneficial use component of the proposed Project is not considered permittee-responsible mitigation; it is a Project feature. USACE would not require that the marsh creation component to use the Permittee-Responsible Mitigation Plan Template. USACE's determination in its permitting decision whether to require compensatory mitigation would be made in accordance with 33 CFR §320.4(r), 33 CFR Part 332 and applicable USACE guidance, including the 1990 USEPA & USACE MOA Concerning the Determination of Mitigation.
Concern ID: 66945	"Self-Mitigation" for the MBSD is not environmentally preferable. Not only does CPRA's proposed "self-mitigation" not meet the requirements of the 2008 Final Rule or CEMVN's requirements for permittee-responsible mitigation, it is not environmentally preferable. Mitigation bank credits are the preferred option under the 2008 Final Rule. There is no basis for the Corps to override the preference for compensatory mitigation through available in-kind and in-basin mitigation bank credits.
Response ID: 16870	The beneficial use component of the proposed Project is not considered permittee-responsible mitigation. USACE's determination in its permitting decision whether to require compensatory mitigation would be made in accordance with 33 CFR §320.4(r), 33 CFR Part 332 and applicable USACE guidance. If compensatory mitigation

were required, banks within the appropriate watershed with available credits would be considered.

Concern ID: 66946

The USFWS recognizes that the anticipated marsh to be created by the Project would not “self-mitigate” for the indirect impacts the proposed Project would cause in the birdfoot delta and therefore has recommended that CPRA provide additional mitigation in the form of wetland creation through crevasse construction in the birdfoot delta. The Project’s direct impacts to 182.9 acres of jurisdictional wetlands should similarly be offset through wetland creation.

Response ID: 16871

The anticipated direct impacts to 182.9 acres of jurisdictional wetlands due to Project construction would be replaced through construction of at least 400 acres of marsh through beneficial use of excavated material concurrent with construction of the proposed Project. Because the beneficial use marsh creation Project feature would be constructed using typical marsh creation construction methods, uncertainty regarding the success and environmental benefits of this Project feature would be minimized. CPRA has also agreed to the conservation recommendations of the USFWS, including the construction of crevasse projects that may include terracing to offset the indirect losses on the Delta NWR and the Pass A Loutre (PAL) WMA. Within 5 years of the commencement of Project operations, CPRA or the LA TIG will provide \$10 million of additional funding for wetland preservation and restoration work in the Delta NWR and the PAL WMA to offset modeled acres of indirect wetland losses in those areas. That funding may be accomplished through additional restoration work sponsored by the LA TIG (for example, construction of the E&D work discussed in the DWH LA TIG’s Restoration Plan and Environmental Assessment #7), or through a direct contribution for additional work. The funding will be proportioned between the Delta NWR and the PAL WMA based on the magnitude of the predicted wetland loss in each area.

Concern ID: 66497

For the purpose of determining in-kind mitigation for degraded wetlands, one needs to determine the wetland habitat that existed prior to the degradation. The majority of emergent wetlands habitat that existed prior to degradation of wetlands within the Project’s construction footprint was fresh/intermediate marsh. Emergent wetlands delineated within the Project footprint include soils associated with historic marsh, specifically Lafitte and Westwego soil series.

Response ID: 16872

The comment is acknowledged. USACE’s determination in its permitting decision whether to require compensatory mitigation would be made in accordance with 33 CFR §320.4(r), 33 CFR Part 332 and applicable USACE guidance. If compensatory mitigation were

required, banks within the appropriate watershed with available credits would be considered.

MT21100 – Impacts to Navigation Mitigation

Concern ID: 62968

If operation of the diversion causes infill of various canals used to access surrounding communities, who will be responsible for dredging to maintain access? For example, if Wilkinson Canal is filled with silt then the canal cannot be used and waterfront property owners with boat lifts in Myrtle Grove will not be able to get out using their boats; the EIS does not require a remedy or provide a funded maintenance plan for this issue (including who would pay for dredging).

Response ID: 16642

The impacts raised by the commenters were considered in the Draft EIS. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the Project area during Project operations.

In acknowledgement of commenters' concerns regarding maintenance of non-federal navigation channels and canals impacted by sedimentation of the proposed diversion, the Mitigation and Stewardship Plan includes measures to mitigate impacts on navigation resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project,

such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63791

CPRA should monitor canals and dredge them as they begin to silt from the diversion.

Response ID: 16645

The commenter's concerns regarding siltation and infill of Wilkinson Canal and other navigation channels in the Barataria Basin were considered in the Draft EIS in Chapter 4, Section 4.16.5.2 Recreation and Tourism - Operational Impacts and Section 4.21.5.2 in Navigation.

Siltation and infill of Wilkinson Canal was considered in the Draft Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. Since issuance of the Draft EIS, CPRA has revised its plan to address infill of Wilkinson Canal caused by Project operations. See Section 6.3.1 (Impacts to Navigation) of the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) for CPRA's final plan with regard to the siltation of Wilkinson Canal.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in

the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62969

To ensure commerce is not disrupted and navigation safety is prioritized, the CPRA and Louisiana should engage and communicate with the navigation industry concerning Project impacts to the Mississippi River Ship Channel, birdfoot delta, and Southwest Pass.

Response ID: 16643

The EIS Appendix Q2 Navigation Study Reports included CPRA's coordination with Mississippi River pilots to evaluate impacts on navigation safety during proposed Project construction and operations. Appendix Q2 Navigation Study Reports has been updated with additional details of CPRA's efforts.

USACE agrees that maintaining safe and efficient navigation is a top priority. USACE has engaged the navigation industry in meetings on August 2, 2018, September 5, 2018, and February 3, 2022 and will continue to coordinate with the navigation industry regarding the industry's concerns about the proposed Project. .

CPRA's Operational Plan for the proposed Project states, "In the event diversion operations cause an unintended and severe impediment to navigation, as determined by the U.S. Coast Guard in consultation with CPRA, CPRA will coordinate with the U.S. Coast Guard and CEMVN and determine what, if any, changes in diversion operations are warranted to address the impediment" (see the Draft EIS, Appendix F2 Preliminary Operations Plan).

CPRA has proposed the following measures in its Final Mitigation and Stewardship Plan (Appendix R1) to address concerns about navigation

impacts in the Mississippi River during Project construction. These measures have been forwarded to the U.S. Coast Guard for their review and input.

- CPRA would coordinate the location of Mississippi River Aids to Navigation (ATONS) associated with the MBSD structure with the USCG. The ATONS would be visually inspected each day and the operability recorded in the Daily Report and would be maintained for the duration of the Project.
- Whenever flow through the structure is started or stopped, on-site personnel shall notify the USCG via a Navigation Bulletin so that traffic is informed of the Project's operating condition.
- Before raising or lowering any gate at the entrance to the diversion channel, the operator should check the vicinity of the inflow, conveyance and outflow channels for boats, fishermen and swimmers and alert them to clear the area. Methods for these alerts may include horns, lights and/or audio messages.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship

Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63032

The requirement to maintain a sufficient picket boat during the construction and operation of the diversion structure to protect maritime commerce, transiting vessels and the diversion structure(s) must be included.

Response ID: 16644

The commenter's concerns regarding the impacts of the Project on navigation safety in the Mississippi River were considered and addressed in the Draft EIS navigation section in Chapter 4, Section 4.21.4 Mississippi River. This section explains that during construction, the Project would have moderate, temporary, adverse impacts on the safety and efficiency of shallow-draft vessels transiting past the proposed Project site in the Mississippi River and intermittent but permanent, moderate, adverse, impacts on navigation safety and efficiency during operations. Since issuance of the Draft EIS, CPRA's 60-percent designs for the proposed Project have decreased the extent to which the Project's intake structure (including the temporary construction cofferdam) would extend into the Mississippi River during construction. The Final EIS has been updated to reflect this reduced impact on navigation safety and efficiency during construction. Therefore, the impact determination on navigation safety and efficiency during construction has been revised to "minor, temporary, and adverse impacts" in Chapter 4, Section 4.21.4.1.2.2 Traffic in the Navigation section of the Final EIS. Prior to any issuance of a permit for the Project by USACE, the USACE would coordinate with the U.S. Coast Guard to establish special permit conditions to address vessel safety in the Mississippi River during construction and operation of the proposed Project.

CPRA's Operational Plan for the proposed project states, "In the event diversion operations cause an unintended and severe impediment to navigation, as determined by the U.S. Coast Guard in consultation with CPRA, CPRA will coordinate with the U.S. Coast Guard and CEMVN and determine what, if any, changes in diversion operations are warranted to address the impediment" (see the EIS, Appendix F2 Preliminary Operations Plan).

Further, CPRA has proposed the following measures in its Final Mitigation and Stewardship Plan (Appendix R1) to address concerns about navigation impacts in the Mississippi River during Project construction. These measures have been forwarded to the U.S. Coast Guard for their review and input.

- CPRA would coordinate the location of Mississippi River Aids to Navigation (ATONS) associated with the MBSD structure with the USCG.
- Whenever flow through the structure is started or stopped, on-site personnel shall notify the USCG via a Navigation Bulletin so that traffic is informed of the Project's operating condition.
- Before raising or lowering any gate at the entrance to the diversion channel, the operator should check the vicinity of the inflow, conveyance and outflow channels for boats, fishermen and swimmers and alert them to clear the area. Methods for these alerts may include horns, lights and/or audio messages.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

MT21200 – Property Impacts Mitigation

Concern ID: 63096	Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).
Response ID: 16699	<p>Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.</p> <p>CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.</p> <p>The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.</p>

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship

Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63097

Commenter requested information regarding how high to install a new bulkhead on their lot in the Myrtle Grove Marina Subdivision.

Response ID: 16636

Projected increases in water levels and corresponding tidal inundation in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS. See Table 4.20-2 of the Final EIS for the projected number of days that inundation would be experienced (based on fixed thresholds) at these communities including Myrtle Grove.

CPRA's Final Mitigation and Stewardship Plan includes structural measures that CPRA plans to implement to reduce some impacts of the proposed Project. In particular, CPRA has proposed, as part of the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to improve the bulkhead along the lots in the Myrtle Grove Marina Estates Subdivision to an elevation of 4.0 feet NAVD88 or greater.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent

anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63098

Commenter asserted that the compensation evaluation for Midway should consider public market and value of borrow material.

Response ID: 16637

As part of any property rights acquisition from Midway to implement the Project, CPRA would compensate landowners for the value of any property interest acquired in accordance with applicable law. Determining the appropriate amount that CPRA would pay for property it acquires for the Project is outside of the scope of the USACE EIS process and the LA TIG's OPA Restoration Plan.

Concern ID: 63099

Commenter expressed concern that they will not be able to access their property due to flood waters caused by operation of the Project and the that the Project will kill fish, shrimp, and crab that they enjoy from their property.

Response ID: 16709

The commenter's concern regarding the impacts of the proposed Project on access to certain properties due to increased water levels was considered in Chapter 4, Section 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS, and the impacts of the proposed Project on aquatic species and recreational and subsistence fishing were considered in Sections 4.10.4.5 Key Species in Aquatic Resources, 4.13.5.6 Community Cohesion and 4.16.5.2 Applicant's Preferred Alternative in Recreation and Tourism.

Recognizing these potential impacts, CPRA engaged the communities potentially impacted by the proposed Project through public meetings to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. The Final EIS Mitigation and Stewardship Plan (Appendix R1) was expanded and refined since the Draft EIS based on this community input. CPRA's Final Mitigation and Stewardship Plan includes structural measures that CPRA plans to implement to address and offset some impacts of the proposed Project. For example, CPRA plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce incidence of tidal flooding in Myrtle Grove compared to future conditions without the Project. CPRA is also planning to provide property owners from Woodpark south to Grand Bayou and Happy Jack with funds to elevate docks and boat houses, and to mitigate the effects of the proposed Project on boat access from Myrtle Grove and Woodpark to the basin. See the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) for additional details.

Structural measures such as raising roads or improving bulkheads in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Draft EIS also addressed how changes in the proposed Project area both with and without implementation of the proposed Project would potentially impact aquatic species Chapter 4, Section 4.10 Aquatic Species and recreational fishing Chapter 4, Section 4.6 Recreation and Tourism. In response to public comments and resource agency input, CPRA has expanded and refined the fisheries mitigation and stewardship measures since the release of the Draft EIS. CPRA's mitigation and stewardship strategies and expenditures focus on establishing sustainable fisheries. The final fishery mitigation plan can be found in the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were

submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63100

Commenters request additional information on how homestead exemption will be considered in compensation for acquisition.

Response ID: 16638

The reference to homestead exemption in the Draft EIS was for informational purposes, and not intended to determine how compensation or mitigation would be provided. As part of any property acquisition to implement the Project, CPRA intends to compensate landowners for the value of any property interest acquired in accordance with applicable law..

Concern ID: 63101

Commenter requests information on whether property will be transferrable after receiving mitigation and whether insurance will continue to be available.

Response ID: 16639

Details regarding CPRA's planned mitigation and stewardship measures are explained in CPRA's Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS. Any property that is subject to a Project servitude would remain transferrable, however, subsequent

transfers of that property would remain subject to the terms of the servitude. Similarly, if CPRA were to implement structural mitigation and stewardship measures on a landowner's property (such as improving the bulkhead), the property would remain transferrable, however, subsequent transfers of the property would remain subject to the terms of any servitude or other agreement granted to CPRA.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

CPRA and the LA TIG would not place any restrictions on the ability to obtain or receive insurance as a condition to implementation of any mitigation and stewardship measures.

Concern ID: 63102

Commenters expressed concern that they will not be able to use their property if the Project proceeds. Commenters believe that the amount of funds proposed for mitigation is insufficient.

Response ID: 16640

The commenters' concern regarding the adequacy of the funding for mitigation and stewardship measures was considered by CPRA and the LA TIG in developing CPRA's Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included proposals to address and partially offset some of the projected impacts of the Project on surrounding communities outside levee protection, including potential mitigation and stewardship measures to address increased water levels due to the Project. In response to comments, CPRA further expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The mitigation and stewardship measures would vary by community. In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the Project. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and the utilities of those communities. Also in these communities, CPRA plans to acquire Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner

were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and

specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63103

Commenter suggests that a floodgate across the canal would be a better solution and would not harm property.

Response ID: 16641

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) outlined the mitigation and stewardship measures proposed by CPRA to address and offset the projected impacts of Project operations on surrounding communities, including providing mitigation for increased water levels due to the Project. In response to comments, CPRA has expanded and refined the Final Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

As part of developing the Final Mitigation and Stewardship Plan, CPRA considered the possibility of installing a flood gate for the Myrtle Grove Marina Estates Subdivision. CPRA decided not to pursue this option for several reasons. While some property owners in Myrtle Grove have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the Barataria Basin. CPRA has proposed instead other structural mitigation and stewardship measures to address the

projected impacts of the Project on water levels and boat accessibility in the Mitigation and Stewardship Plan.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

MT21300 – Flooding Impacts Mitigation

Concern ID: 62951

CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.

Response ID: 16711

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the

proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62952

Commenter expressed concern about the efficacy of certain mitigation and stewardship measures such as floodwalls, floodgates and flood easements.

Response ID: 16710

Since issuance of the Draft EIS, CPRA has expanded and refined the Mitigation and Stewardship Plan (Appendix R1) based on community and resource agency input. Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

If the LA TIG decides to fund the proposed Project, that funding authorization would also include funding for the mitigation and stewardship measures set forth in the Mitigation and Stewardship Plan.

With implementation of the structural mitigation included in the Final Mitigation and Stewardship Plan, access to the properties within the communities south of the outfall (beginning at Myrtle Grove and continuing south to Grand Bayou and Happy Jack) would be improved over future conditions without the proposed Project. In particular, roadways would either be protected from flooding by increasing the height of the community's bulkhead (Myrtle Grove) or elevating the access roadways (Woodpark south to Happy Jack). The result would be that property owners, tenants and guests, as well as emergency service workers, would have improved access to the potentially flooded properties. See the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) for additional details.

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove Marina Estates Subdivision. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again,

community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Mitigation and Stewardship Plan.

In addition, changes in water levels due to Project operations would not be expected to change the Flood Insurance Rate Maps (FIRMs). See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change. Also, the proposed Project servitudes, which would permit CPRA to increase the water levels on the properties during Project operations in exchange for monetary compensation, would not restrict the provision of emergency services.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components

of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62954

Compensation should not be provided for impacts to vacation homes, rental homes, or planned homes.

Response ID: 16612

The comment that compensation should not be provided for impacts to vacation homes, rental homes, or planned homes, is acknowledged. CPRA's mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) do not differentiate between primary residences and second, vacation or rental homes in terms of the mitigation planned as part of the Project or offered to any property owner. In cases where CPRA acquires property interests as part of implementing the mitigation and stewardship measures, CPRA will compensate the landowner for that property interest.

Concern ID: 62956

It is imperative that oyster productivity be rebuilt because it would provide natural flood protection.

Response ID: 16613

The oyster mitigation concern raised by the commenters was considered in the Draft EIS as part of the Draft Mitigation and Stewardship Plan (Appendix R1). Additional details on oyster mitigation have been added to this appendix in the Final EIS. CPRA agrees that maintaining a sustainable oyster population is imperative and has designated \$32 million in mitigation strategies associated with the Project toward that objective. Most of these funds would go towards new public seed grounds, enhanced public/private grounds, Alternative Oyster Culture, and broodstock reefs. Additional funding would go towards assisting the oyster industry in marketing and outreach. Details regarding the oyster mitigation and stewardship measures are set forth in the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in

instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62957

Commenter expressed support for implementation and recognizes the cross benefit of mitigation and stewardship measures to address increased localized flooding. The commenter noted that once in place those measures would result in protection to the communities from both localized flooding associated with the Project as well as from increased flooding associated with subsidence and sea-level rise.

Response ID: 16614

The LA TIG acknowledges the commenter's support of the Project and agrees that the mitigation and stewardship measures would address some Project impacts, as well as flooding from sea-level rise and subsidence.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any

mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63291

The Project should consider the use of muscle walls to protect homes, businesses, and municipalities from flooding.

Response ID: 16615

The Draft EIS did not consider the use of muscle walls as a potential flooding mitigation measure. While CPRA has updated the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA has not made final decisions regarding the materials that would be used for the structural mitigation and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan,

but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63915

Grand Bayou would be negatively impacted by water level, and yet is not likely to receive land-building benefits. CPRA should consider mitigation activities that enhances compliance for oil companies to reduce the impacts of oil and gas activities in the area.

Response ID: 16616

The impacts on Grand Bayou raised by the commenter were considered in Chapter 4, Sections 4.15.4 Operational Impacts in Environmental Justice and 4.20.4.2 Operational Impacts in Public Health and Safety of the Draft EIS and in CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS). In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes funding for improvements and other mitigation and stewardship measures in the Grand Bayou community, many of which are targeted at improvements requested by community residents. This includes funding for raising homes and roads, boardwalks, and floating gardens. In addition, CPRA would purchase Project servitudes from landowners in the Grand Bayou community whose property is projected to be impacted by increased water levels caused by during Project operations. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Details regarding these mitigation and stewardship measures are set forth in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation,

stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

The Draft EIS recognizes causes and impacts of coastal land loss, including oil and gas activities (see EIS Chapter 3, Section 3.6.2 Wetland Loss). Enforcement related to other spills is not within the scope of the EIS or Restoration Plan. As explained in Section 4.2.4.2 (Mineral Resources - Operational Impacts) and depicted in Figure 4.2-5 of the Final EIS, operation of the Project is projected to infill canals within the basin near the Project outfall that were constructed as part of oil and gas production.

MT21400 - Aquatic/Fisheries Impacts (other than commercial) SMM

Concern ID: 62975

Those who experience a taking from this and future diversions must be reasonably compensated for their losses; however, having to fish in a new location does not warrant compensation.

Response ID: 16611 Statements about what types of losses might constitute compensable takings are beyond the scope of the EIS. The Mitigation and Stewardship Plan (Appendix R1 to the EIS) focuses on maintaining a sustainable fishery into the future, rather than compensating individual fishers for alleged losses.

MT21500 - ESA-Listed Species SMM

Concern ID: 62943 **The EIS should address mitigation and stewardship measures for threatened, endangered (T&E) and special status species and their habitat, including adding a section to the Mitigation Plan that specifies the measures that will be taken to minimize impacts to T&E species.**

Response ID: 16610 Impacts to Threatened and Endangered Species (T&E species) were addressed in Chapter 4, Section 4.12 (Threatened and Endangered Species) of the Draft EIS. Those impacts are also subject to the ongoing consultation with the U.S. Fish & Wildlife Service and the National Marine Fisheries Service (collectively, the “Services”) under the Endangered Species Act (ESA). Appendix O Biological Assessment & Biological Opinion of the EIS contains a Biological Assessment (BA) for T&E species. This BA discusses impacts to T&E species, as well as measures that would be taken to minimize impacts to T&E species.

For the species that the Project is “likely to adversely affect” (for example, pallid sturgeon), a request, along with the BA, was sent to the Services to initiate formal consultation regarding those species. The formal consultation resulted in Biological Opinions (BO) for those T&E species that includes specific measures to minimize the amount of take for the specified T&E species.

The USFWS BO on the proposed Project (included as Appendix O3 USFWS Biological Opinion of the Final EIS) concludes the proposed Project would not be likely to jeopardize the continued existence of the pallid sturgeon and authorized the loss (by death or serious injury) of 48 pallid sturgeon per year. Section 5.2 of the USFWS’ BO requires that the diversion gate be opened or closed over a several hour period to allow fish sufficient time to migrate back to the river or away from the structure, that CPRA and the USACE coordinate with the USFWS to develop a Fish Monitoring and Removal Plan for pallid sturgeon, and conduct any cutterhead or suction dredging in the Mississippi River (if determined to be warranted at a later date) using operational parameters coordinated with the USFWS.

The NMFS' BO on the proposed Project (included in the Final EIS as Appendix O4 NMFS Biological Opinion) concludes the proposed Project is not likely to jeopardize the continued existence of sea turtles and authorizes the incidental take of 783 sea turtles per year, including 370 Kemp's ridley sea turtles (including up to 38 mortalities), 319 loggerhead sea turtles (including up to 10 mortalities), and 94 green sea turtles (including up to 9 mortalities). Section 8.3 of the NMFS' BO requires that the federal action agencies ensure that the Project proponent monitor brown shrimp fishing effort in the action area; fund, implement, and annually report on a salinity monitoring program in Barataria Bay; and funds and implements a monitoring plan targeting the distribution, health, and habitat use of sea turtles in the Barataria Basin.

ESA consultation seeks to minimize impacts to T&E species. CPRA has updated its Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include a reference to Appendix O Biological Assessment & Biological Opinion for T&E species. For State-listed and/or Special Status Species, potential impacts are identified in Chapter 4, Section 4.12.3 State-listed Threatened and Endangered Species of the Final EIS and conservation measures are discussed in the FWCAR (see Appendix T USFWS Coordination Act Report (CAR) to the Final EIS).

MT21800 – Cultural Resources SMM

Concern ID: 62935

The cultural resources mitigation plan in the Draft Programmatic Agreement (Appendix K Cultural Resources Information of the Draft EIS) includes a public education component (website or other materials). The commenter suggested that the public education component should include information about individual cultural resource sites as well as regional information. Also, the commenter suggested that the following entities should be consulted in developing the public education component: public university archeology programs that have an interest, the Louisiana Archeological Society, and the Louisiana Archaeological Survey and Antiquities Commission. Additionally, the public education component should include support for public archeology instruction in kindergarten through high school and for Louisiana's universities that teach archeology and support for the Louisiana Archeology Month, which is the Louisiana Department of Culture, Recreation and Tourism's means of educating the public about Louisiana's heritage.

Response ID: 16654

The public education component of the Alternative Mitigation Plan appended to the Programmatic Agreement in Appendix K Cultural

Resources Information of the EIS is intended to inform the public about the regional history of Native Americans between 1500 and 1900 AD in Southeastern Louisiana. As stated in the Alternative Mitigation Plan, to achieve this objective, the plan proposes to examine the archaeological record and cultural history of the region. While information gleaned from individual sites is invaluable, they often provide limited information at a local level and do not generally provide much information about the larger geographic region. In addition to incorporating ethnographic interviews, the parties participating in the National Historic Preservation Act (NHPA) Section 106 consultation have agreed on the minimum types of source materials that would be reviewed to develop the public education component of the plan, all of which may be derived from a variety of community programs and organizations, likely including those recommended by the commenter. A qualified professional consultant would complete the public education component. As stated in Part VI.B.2 of the Programmatic Agreement in the EIS Appendix K Cultural Resources Information, draft versions of all products would be provided to the NHPA Section 106 Consulting Parties for a 60-day review period to ensure that the final product is suitable for public education and includes a robust collection of the available materials from a diverse group of sources.

Concern ID: 63899

The commenter expressed concern that the ethnohistoric overview component of the cultural resources alternative mitigation plan should draw on archeology, which could include a regional analysis, as well as oral and archival sources. The commenter expressed concern that the alternative mitigation plan would merely be a summary of existing literature.

Response ID: 16656

The issue raised by the commenter was addressed in the Programmatic Agreement developed concurrent with the Draft EIS, which sets forth the alternative mitigation to be implemented by CPRA as part of implementing the Project (see the Programmatic Agreement in Appendix K Cultural Resources Information of the EIS). The Alternative Mitigation Plan, developed by the Section 106 Consulting Parties, including federally recognized Tribes, includes a regional ethnohistory of Native American settlement in the southeastern coastal Louisiana region (Barataria Basin, Breton Sound Basin, and Pontchartrain Basin). The analysis conducted as part of the Alternative Mitigation Plan would include an examination of the archaeological record at the regional level as well as oral and archival sources. The Consulting Parties have agreed that the region is considered understudied and that the general public is currently without a synthesis of the extant archaeological and historical literature, particularly one augmented with regionally relevant Native American oral accounts. The products that the study proposes to provide are not merely a summary of the existing literature. Rather, the plan would: (1) mitigate

for the lack of cohesion among the archaeological record, scholarly literature on Native American history, and the available vital/archival records; and (2) make the existing literature and Tribal knowledge available to the public online and in the classroom.

Concern ID: 63900

The cultural resources Alternative Mitigation Plan should compile information about the history of Tribes and specific cultural sites for use in consultations.

Response ID: 16657

The issue raised by the commenter was addressed in the Programmatic Agreement developed for the Draft EIS, which sets forth the Alternative Mitigation Plan to be implemented by CPRA as part of implementing the Project (see the Programmatic Agreement In Appendix K of the EIS). The Alternative Mitigation Plan, developed by the NHPA Section 106 Consulting Parties, including federally recognized Tribes, includes a regional ethnohistory of Native American settlement in the southeastern coastal Louisiana region (Barataria Basin, Breton Sound Basin, and Pontchartrain Basin). The Alternative Mitigation Plan does not include the investigation of archaeological sites. Instead, the objective of the Alternative Mitigation Plan is to develop a comprehensive ethnohistoric overview of Native American history in southeastern coastal Louisiana (Barataria Basin, Breton Sound Basin, and Pontchartrain Basin). One of the proposed products to be developed through the Alternative Mitigation Plan is information, documents, and/or maps to improve NHPA Section 106 consultation with federal agencies by clarifying for each participating Tribe which projects they wish to consult on.

Concern ID: 62938

CPRA should work with residents of Ironton and Tribes to protect cultural resources and maintain access to cultural sites, including those separated from Ironton by the diversion channel. Commenters suggest that the Project mitigate for any loss of access to cultural sites, using the Lagniappe for the Working Coast project as an example.

Response ID: 16655

As indicated in Chapter 4, Section 4.24 (Cultural Resources) of the EIS, cultural resources consultations have been conducted in accordance with Section 106 of the National Historic Preservation Act (NHPA). The Section 106 Consulting Parties are comprised of the USACE (the lead federal agency), the State Historic Preservation Office, the Advisory Council on Historic Preservation, CPRA (the Applicant), federal agency members of the LA TIG, and federally recognized Tribal Nations who expressed historic ties to the Barataria Basin and who choose to participate. This consultation resulted in the development of a Programmatic Agreement that is included in Appendix K Cultural Resources Information of the EIS. The Alternative Mitigation Plan (see the Programmatic Agreement and its attachments in Appendix K), was developed to mitigate for the Project's adverse effects on historic

properties in the Barataria Basin caused by the proposed Project. The Programmatic Agreement identifies the Tribal Nations that decided to participate in the consultation, and explains that the USACE would continue to consult with any interested federally recognized Tribal Nation who has not yet requested to consult.

As indicated in Chapter 4, Section 4.24.2.2 of the Cultural Resources section of the Draft EIS, the NHPA Section 106 Consulting Parties have developed Stipulations in the Programmatic Agreement that contain prescriptive steps and potential mitigation measures should any portions of the known historic properties (that is, archeological remains of St. Rosalie Plantation) within the Construction APE be identified as NRHP eligible by ongoing Phase II analysis. This section has been updated in the Final EIS to clarify that neither the St. Rosalie Cemetery, the Ironton Cemetery or visitation access to them would be impacted by construction or operation of the proposed MBSD Project. The cemeteries are currently and would continue to be on private property. Residents of Ironton currently have access to the St. Rosalie and Ironton cemeteries via LA 23 and would continue to have access to the cemeteries via LA 23 after the proposed Project is constructed. To clarify potential impacts on Ironton, Section 4.15 Environmental Justice has been revised to highlight information about potential impacts on the community of Ironton in the Final EIS.

Lagniappe for the Working Coast is a grant awarded by the National Estuary Program to a partnership between the Lowlander Center and state-recognized Tribes to mitigate erosion to areas, including archaeological sites, sacred to Louisiana's coastal Tribes through the backfilling of unused or abandoned canals excavated in coastal marshes. More information on National Estuary Program grants is available at <https://estuaries.org/initiatives/watershedgrants/>.

SMM10000 – Other/General SMM

Concern ID: 63151

Some commenters stated general support and appreciation for the mitigation plan.

Response ID: 16555

Comments offering general support and appreciation for the Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) are acknowledged. CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were

submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63179

Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.

Response ID: 16556

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage

of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

Concern ID: 63180

Mitigation plan should have been presented with the Draft EIS.

Response ID: 16557

The Draft Mitigation and Stewardship Plan for the Project was included as Appendix R1 to the Draft EIS, for which a NOA was published in the Federal Register on March 5, 2021 (86 FR 12942). The LA TIG presented an overview of the Mitigation Plan during the April Draft EIS Public Meetings. The Mitigation and Stewardship Plan included in the Draft EIS was a draft plan, with specific issues that required further development before the plan was finalized. The Final Mitigation and Stewardship Plan is published as Appendix R1 to the Final EIS. CPRA expanded and refined the Final Mitigation and Stewardship Plan (Appendix R1) in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63181

CPRA has no real mitigation plan.

Response ID: 16558

The Draft EIS contained CPRA's Mitigation and Stewardship Plan in Appendix R1.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63182

Proposed mitigation is insufficient and not guaranteed, and the amount of funding for mitigation is not clearly stated.

Response ID: 16559

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the LA TIG's Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final

Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63183

Commenter supports the Project but believes that there needs to be protection for cultural resources in the area. Commenters noted specific sites such as those in Bayou des Oies and a need for safeguards that respect the culture and history of the Lafitte Barataria-Crown Point community in a way that promotes the continued sustainability of that community.

Response ID: 16560

The commenter's support for the Project is acknowledged. The EIS discusses impacts to the local communities and various quantitative and qualitative impacts from the proposed Project in Chapter 4, Section 4.13 Socioeconomics, including Community Cohesion (Section

4.13.5.6). Consistent with the concern of the commenter, the EIS does find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative.

CPRA's Final Mitigation and Stewardship Plan includes various mitigation and stewardship measures to address projected adverse impacts of the proposed Project, including mitigation and stewardship measures for increased flooding in some communities and for adverse impacts to fisheries. For example, CPRA's Final Mitigation and Stewardship Plan includes measures intended to help preserve community cohesion in Grand Bayou and Ironton. For a complete listing of measures that would be taken, see the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS. If implemented, these measures could help to preserve affected communities and their histories/cultures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63184

Commenter concerned about public land loss at birdfoot delta and recommends creating state and federal public lands in the diversion outfall area.

Response ID: 16561

The Draft EIS considered impacts to public lands in Chapter 4, Section 4.17.4 (Public Lands - Operational Impacts). Ownership of newly created land from Project operations would be determined in accordance with state law. Pursuant to La. R.S. 49:214.5.5(B), the Project would not create any rights to the public in or on private property. It is expected that land loss in the birdfoot delta within the National Wildlife Refuge (NWR) and Wildlife Management Area WMAWMA would be offset by creation of land built in the area in water bottoms owned by the State of Louisiana. At the recommendation of USFWS, within 5 years of the commencement of Project operations, CPRA or the LA TIG will provide \$10,000,000 of additional funding for wetland preservation and restoration work in the Delta NWR and the Pass A Loutre (PAL) WMA to offset modeled acres of indirect wetland losses in those areas (See Appendix R1 Mitigation Plan, Section 4.6 Fish and Wildlife Coordination Act).

Concern ID: 63185

Additional development of mitigation plans and accountability for mitigation commitments is needed.

Response ID: 16562

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would

be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63188

One comment noted, in reference to the adequacy of the mitigation funds, that the initial amounts committed are 10 times the annual budget of Plaquemines Parish.

Response ID: 16563

The Draft EIS contained a Mitigation and Stewardship Plan in Appendix R1. The Final Mitigation and Stewardship Plan is published as Appendix R1 to the Final EIS. CPRA expanded and refined the Final Mitigation and Stewardship Plan (Appendix R1) in response to community and resource agency input.

According to CPRA, its budget for mitigation and stewardship measures, to be potentially funded by the LA TIG, reflects the needs that were identified through the environmental review and many public meetings. See the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) for additional information on mitigation funding allocations. The Plaquemines Parish budget was not considered by CPRA in determining the budget for the stewardship and mitigation and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is

issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63192

The Proposed Project should include investment in economic development, such as tourism.

Response ID: 16565

The Draft EIS considered the effects of the Project on economic development, including the effects on tourism (see Chapter 4, Section 4.13.5 [Socioeconomics - Operational Impacts] and Section 4.16.5 [Recreation and Tourism - Operational Impacts] of the EIS), concluding that the Project would have both beneficial and adverse impacts on the regional economy associated with recreational expenditures. While the EIS concludes that the Project would have a beneficial impact on hunting and wildlife watching due to an increase in wetland habitat in some areas of Barataria Basin, it also found minor to moderate, permanent, adverse impacts to recreational boating in the delta formation area due to a number of factors.

Commenters' desire for additional economic development associated with the Project is noted. The estuarine and freshwater wetlands are an integral component of recreation in the region and the Project would increase the area and sustainability of wetland habitats (see Section 3.2.1.1.1 [Alternative 1] in the LA TIG's Restoration Plan and Section 4.6 [Wetland Resources and Waters of the U.S.] of the EIS for more information).

The Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitat in the Barataria Basin. Injured resources, including lost recreational use, not addressed in the Final Restoration Plan have been addressed by previous restoration plans and are intended to be the focus of future restoration plans. For example, the LA TIG has addressed restoration of lost recreational use within Louisiana in RP/EA #2 (LA TIG, 2018a) and RP/EA #4 (LA TIG, 2018b).

Additionally, CPRA's Mitigation and Stewardship Plan (Appendix R1 to the EIS) includes measures focused on establishing a sustainable

fishing industry in the long term, including providing financial and technical assistance for alternate business ventures, job training, boats and/or boat improvements, and other measures that will provide economic benefits to the industry.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

In light of the public interest expressed in other projects of this scale and nature, the LA TIG anticipates that members of the public may want to visit the Project site. Due to concerns about safety of the public and security for the Project facilities, there is not a plan to make the diversion structure or immediate outfall area accessible for public use. CPRA would, however, provide signage and other public space near the Project to educate the public regarding the purpose and functioning on the Project.

Concern ID: 63194

The Draft EIS and Draft Restoration Plan seem to indicate CPRA and other entities will only begin performing mitigation when they have proof of impact. Instead, they should help communities begin to adapt throughout construction so adaptations will be in process as the MBSD operation begins.

Response ID: 16566

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) contained information on steps that would be taken before Project construction to protect fisheries. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS, including specifying mitigation and stewardship measures that would be undertaken before Project construction (see Appendix R1 to the Final EIS for additional details). For example, the Final Mitigation and Stewardship Plan outlines the structural mitigation and stewardship measures that CPRA plans to implement in the communities south of the diversion outside of levee protection (Myrtle Grove to Happy Jack/Grand Bayou) prior to beginning Project operations.

Structural measures such as raising roads or improving bulkheads in the Mitigation and Stewardship Plan were not included in CPRA's MBSD DA permit application and are not part of the currently-proposed MBSD Project. Many of these structural measures would require USACE and other permits prior to installation. No applications have been filed with USACE. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any

particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63202**There needs to be a plan to protect the basin from pollution introduced from the Mississippi River into the Barataria Basin.****Response ID: 16570**

Chapter 3, Section 3.5.1.1 Water Quality Standards and Dedicated Uses - Mississippi River of the Draft EIS considered the commenter's concern regarding the potential for the Project to introduce pollution from the Mississippi River into the basin and explains that the Mississippi River fully supports designated uses for the river established by the Environmental Protection Agency and the Louisiana Department of Environmental Quality. However, the designated uses for the Mississippi River may be different from the designated uses for other waterbodies in the Barataria Basin. The Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Final EIS) includes monitoring of a variety of water quality related parameters, which would start prior to construction and continue throughout the Project's implementation.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section

10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63210

Concern was expressed about whether residents will be notified before the diversion is turned on.

Response ID: 16577

The Draft EIS did not address whether or how residents would be notified regarding Project operations. In response to public comments, CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 in the Final EIS) states that it would develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA

Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63726

Some commenters felt that the amounts allocated for mitigation were insufficient, while others felt that no amount of mitigation would suffice, for example for the more senior fishers who won't be in a good position to adapt to the changing environment.

Response ID: 16702

The Draft EIS considered how changes in the commercial fisheries, both with and without implementation of the proposed Project, would impact more senior fishers in Chapter 4, Section 4.14.4 in Commercial Fisheries. In response to public comments and resource agency input about the proposed mitigation efforts, CPRA has expanded and refined its fisheries mitigation and stewardship measures. CPRA's mitigation and stewardship strategies and associated expenditures would focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for fisheries in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to fisheries in the early years of the Project's operational life. The provisions of the fishery mitigation and stewardship plan, valued at approximately \$54 million, would help to achieve that goal and to mitigate the impacts of the proposed Project on oyster fishers. While not mitigation for the Project impacts, examples of other restoration/fishery improvement actions include: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, CPRA's allocation of \$2 million in adaptive management funding to support off-bottom oyster culture, the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery and the LA TIG's allocation of \$38 million in recreational use funds to support subsistence and recreational

fisheries. The Final Mitigation and Stewardship Plan is included in Appendix R1 to the Final EIS.

The comments of more senior fishers who expressed concern about their ability to adapt to changing fishery conditions are acknowledged. If permitted by USACE and funded by the LA TIG, it would take CPRA approximately 5 years to complete construction of the proposed Project and to begin operations. This relatively long period provides those affected with the time and opportunity to decide how they want to go forward, ranging from taking advantage of the adaptation opportunities offered through the Mitigation and Stewardship Plan (Appendix R1 to the EIS) to transitioning out of the fishing industry or retiring.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63886

A commenter expressed that they believe in living with water, and that mitigation is important and they are concerned about it.

Response ID: 16578

The Draft EIS considered how communities in the Project area have “lived with water” and adapted to evolving conditions due to sea-level rise, subsidence and storm events in Chapter 3, Section 3.20 (Public Health and Safety) and Chapter 4, Section 4.20 (Public Health and Safety). Further, CPRA’s Mitigation and Stewardship Plan (Appendix R1) included with the Draft EIS included potential measures to address the projected impacts of Project operations on water levels and inundation in the communities near the Project outfall outside levee protection. Since publication of the Draft EIS and LA TIG’s Draft Restoration Plan, CPRA has expanded and refined the Mitigation and Stewardship Plan based on community and resource agency input to include additional detail regarding the measures planned to address increases in water levels. The Final Mitigation and Stewardship Plan is included in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for

funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63930

Public comments asked to ensure mitigation dollars are set aside to help the most marginalized communities and provide an equitable allocation of resources.

Response ID: 16579

CPRA's Draft Mitigation and Stewardship Plan included in the Draft EIS (Appendix R1) set forth numerous measures that CPRA could undertake to mitigate Project impacts. CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The Final Mitigation and Stewardship Plan contains additional details on the various mitigation and stewardship measures specifically designed and targeted to assist low-income and minority individuals and communities including reserving a portion of some mitigation and stewardship programs for individuals from identified communities with environmental justice concerns that may be disproportionately impacted by the Project and engaging an outreach coordinator to assist community members with available programs and resources. A summary of the public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as

conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63933

Commenters asked if there will be mitigation efforts done prior to the implementation of the diversion and when those measures will occur.

Response ID: 16580

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) contained information on mitigation, including mitigation that would be undertaken before the Project becomes operational. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS, including providing additional detail on several mitigation efforts that would be undertaken before the Project becomes operational, including funding for public and private oyster seed ground enhancement, marketing, shrimp vessel and facility improvements, workforce and business training, and subsistence fishing access (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any

particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63934

Implementing agencies should be adaptive and transparent in how they mitigate impacts to communities. CPRA has done a great job in outreach and the same level of outreach and engagement should continue through construction and Project operation.

Response ID: 16581

CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. Further, CPRA engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA would continue outreach to help ensure that impacted communities become aware and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded. The MAM Plan also includes particular measures including engagement with stakeholder groups. See Section 2.2.2.2 (Stakeholder Review Panel) of the MAM Plan (Appendix R2 to the Final EIS).

Concern ID: 63935

State and Federal agencies should collaborate with CPRA to help with mitigation efforts related to workforce development, housing, education and training programs, mental health, fisheries subsidies and access to capital for people to go into business for themselves.

Response ID: 16582

According to CPRA, it is collaborating with the LA TIG federal agencies (NOAA, DOI, USEPA, USDA) through the LA TIG framework as well as other venues, in the development and implementation of the Mitigation and Stewardship Plan. CPRA anticipates working with other State agencies, such as Louisiana Economic Development, on the workforce development, education and training programs included in the Mitigation and Stewardship Plan (Appendix R1 to the EIS). Finally, the State of Louisiana has been working with, and will continue to work with, Louisiana Sea Grant on the Seafood Futures initiative, focused on ensuring a long term, sustainable fishing industry in spite of coastal changes. Louisiana Sea Grant, based at Louisiana State University, is

part of the National Sea Grant Program, a network made up of 34 programs located in each of the coastal and Great Lakes states and Puerto Rico. Sea Grant Programs work individually and in partnership to address major marine and coastal challenges.

Concern ID: 63946

Public comments asked to create a fund specifically for those impacted as a result of the diversion and develop a screening process where people can qualify each year to receive mitigation funds.

Response ID: 16586

The Draft EIS evaluates how the Project would impact commercial, recreational, and subsistence fishers as compared to the No Action alternative in Chapter 4, Sections 4.10 (Aquatic Resources), 4.14 (Commercial Fisheries), 4.15 (Environmental Justice) and 4.16 (Recreation and Tourism).

In response to public comments and agency input about the proposed mitigation efforts, CPRA has expanded and refined the mitigation and stewardship measures. However, CPRA's mitigation and stewardship strategies do not include direct payments to fishers. Rather, CPRA's mitigation and stewardship strategies and expenditures focus on establishing sustainable fisheries rather than on compensating individual fishers for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for fisheries in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to fisheries in the early years of the Project's operational life.

The updated fishery mitigation plan, valued at approximately \$54 million, along with other restoration actions and programs being funded by the LA TIG and by the State through LDWF, address the impacts of the Project. The fishery mitigation plan can be found in the Mitigation and Stewardship Plan (Appendix R1 to the EIS). These measures utilize programs and techniques familiar to members of the fishing industry. CPRA and LDWF would develop eligibility criteria as part of finalizing the programs which focus on fishers of Barataria Basin.

These programs would also benefit businesses other than commercial fishers that are directly or indirectly dependent on a successful commercial fishery.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63965

The Trustees should begin mitigation and adaptation during construction before impact as opposed to waiting after impacts occur to initiate the process.

Response ID: 16588

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) contained information on mitigation and stewardship measures, including measures that would be undertaken by CPRA before Project construction. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS, which now provides additional detail on several efforts that CPRA would undertake before Project construction, including funding for public and private oyster seed ground enhancement, marketing, shrimp vessel and facility improvements, workforce and business training, and subsistence fishing access (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

CPRA would be responsible for implementation of any mitigation actions and for monitoring and adaptive management associated with the proposed Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63190

Commenters recommend Hypoxia Action Plan be seen as a mitigation effort already in place and/or that its recommended actions be considered as part of the mitigation for Project.

Response ID: 16564

The commenters accurately noted that the Gulf Hypoxia Action Plan is relevant to the Project area. In response to these comments, a discussion of the Gulf Hypoxia Action Plan has been added to Chapter 4, Section 4.25.5 (Cumulative Impacts - Surface Water and Sediment Quality) of the Final EIS. Similar text has been added to the LA TIG's Final Restoration Plan. The proposed Project is anticipated to reduce

the amount of nitrogen and phosphorus that reaches the Gulf of Mexico through nutrient uptake in the marshes that would be created and/or sustained by the proposed diversion. Because the proposed Project is already anticipated to reduce the nutrients that contribute to the Gulf Hypoxia Zone (GHZ), further mitigation actions with respect to the GHZ for the proposed Project are not considered necessary. However, CPRA has committed to implement water quality monitoring for nitrogen and phosphorus (and other parameters) in the outfall area and to make the results of that monitoring available online to the public and interested parties in real time. Consequently, while the Hypoxia Action Plan would not be considered as mitigation for impacts associated with the Project, the anticipated reduction in nutrients reaching the Gulf through wetlands restoration and the water quality monitoring/access to water quality monitoring data would be consistent with the Hypoxia Action Plan.

Concern ID: 63203

Proposed Project will have a potential negligible to minor impact on levee systems and CPRA should request Corps credits for proposed Project.

Response ID: 16571

The Project would have a negligible to minor beneficial impact on the NOV-NFL and WBV levee systems by reducing surge elevation and wave height to the north of created and maintained wetlands. The proposed Project would have a negligible to minor adverse impact on the NOV-NFL Levee system by increasing surge elevation to the south of the outfall. CPRA notified USACE in writing that work in-kind credit is not being pursued for MBSD; however, CPRA reserves the right to pursue work in-kind credit in the future. CPRA is not eligible for credit under Engineer Regulation 1165-2-208 and the existing NOV-NFL Project Partnership Agreement.

Concern ID: 63208

Additional information is needed on who will pay for the increased costs for flooding and levee protection that will be needed due to the Project.

Response ID: 16576

The Draft EIS summarizes whether and the degree to which construction and operation of the Project would cause increases in water levels and corresponding inundation in Table 4.20-15 in Chapter 4, Section 4.20 Public Health and Safety. Further, a draft of CPRA's Mitigation and Stewardship Plan was issued with the Draft EIS (Appendix R1) and explained CPRA's mitigation and stewardship measures to address increases in water levels and inundation projected to result from Project operations. Between completion of the Draft EIS and publication of the Final EIS, CPRA expanded and refined those mitigation and stewardship measures based on input received on the Draft EIS and during direct community outreach (see Chapter 7 [Public Involvement] of the Final EIS). As explained in CPRA's Final Mitigation and Stewardship Plan issued with the Final EIS (Appendix R1), CPRA

would allocate funding to address and avoid some adverse effects due to the projected increases in inundation, including construction of structural mitigation and stewardship measures such as improving bulkheads, elevating roads, and raising homes. Increases in tidal flooding are not projected to exceed existing levee protection, therefore, CPRA does not intend to raise levees or to construct new levees. CPRA also would use Project funds to acquire Project servitudes over certain properties projected to be affected by Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. For additional details regarding CPRA's mitigation and stewardship measures, see the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

If the LA TIG decides to fund the Project, that funding authorization would also include funding for mitigation and stewardship measures.

Structural measures contained in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under this DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulatory agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA)

Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63196

Mitigation will be about the same regardless of the diversion capacity.

Response ID: 16567

The purpose of CPRA's Mitigation and Stewardship Plan (see Appendix R1 to the EIS) is to demonstrate how some adverse impacts of the Project (75,000 cfs capacity) would be avoided, minimized, or mitigated. The mitigation and stewardship measures are focused on the construction and operation of the diversion with a capacity of 75,000 cfs. If a different diversion capacity were selected for implementation, the Mitigation and Stewardship Plan would be reviewed and adjusted, as appropriate, to reflect the revised Project impacts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan,

but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63201

Mitigation should be transparent; changes to ecosystem would occur even without the proposed Project due to continued sea-level rise and wetland loss.

Response ID: 16569

The Draft EIS evaluated anticipated changes to wetland and other resources due to sea-level rise and wetland loss if the proposed Project is not implemented in its evaluation of the No Action Alternative. Any mitigation and stewardship measures that would be required by USACE would be special conditions of the DA permit, if one is issued. If a permit is issued, it would be made available to the public via the USACE website.

As described in Section 1.6 (No Action Alternative) of the LA TIG's Final Restoration Plan (as well as in greater detail in the SRP/EA #3), the loss of deltaic processes in this estuarine ecosystem has resulted in a steady decline in the health of natural resources in the Barataria Basin, which is indicated by metrics such as decreased plant health, high rates of erosion, and higher salinities farther north in the basin. Without the proposed MBSD Project, deterioration of injured resources within and beyond the Barataria Basin would continue (see the No Action Alternative Analyses in Chapter 4, Sections 4.2 [Geology and Soils] and 4.6 [Wetland Resources and Waters of the U.S.] of the EIS).

The measures set forth in CPRA's Mitigation and Stewardship Plan for the Project address changes directly attributable to the proposed MBSD Project, such as changes in salinity affecting fisheries. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for

public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63944

Some commenters were concerned about potential hardships that would be caused by the diversion and made personal requests for direct financial assistance, job training, boat repairs, or boat upgrades to allow them to fish in more distant fishing grounds.

Response ID: 16584

The Draft EIS evaluates how the Project would impact commercial, recreational, and subsistence fishers and how it would affect disadvantaged, minority and low-income communities as compared to No Action conditions in Chapter 4, Sections 4.10.4.5 Aquatic Resources, Key Species, 4.14.4 Commercial Fisheries, Operational Impacts, 4.15.4 Environmental Justice, Operational Impacts, Commercial Fishing and Subsistence Fishing and Hunting, and Recreational Fishing and Hunting and 4.16.5 Recreation and Tourism, Operational Impacts, Recreational Fishing. Without the Project, adverse impacts to fisheries would be expected during the 50-year period evaluated in the EIS. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for some fisheries in a large portion of the currently suitable habitat. By contrast, with

implementation of the diversion, the Project would cause significant adverse impacts to some commercial fisheries in the early years of the Project's operational life.

To address some of the adverse impacts to fishers and fisheries projected to be caused by the proposed diversion, CPRA has prepared a Mitigation and Stewardship Plan (see CPRA's Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). CPRA's mitigation and stewardship strategies and expenditures focus on establishing sustainable fisheries rather than on compensating individual fishers for their particularized economic losses. In response to public comments and agency input about proposed mitigation and stewardship efforts, CPRA has expanded and refined its mitigation and stewardship measures.

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. CPRA's Mitigation and Stewardship Plan includes many of the programs suggested by the commenters, including:

- \$15 million for vessel and facility improvements
- \$2 million in workforce and business training

See Appendix R1 to the Final EIS for more details.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any

particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63945

The seafood industry mitigation plan does not provide mitigation and stewardship measures to stakeholders in Mississippi who are licensed in Louisiana.

Response ID: 16585

CPRA's Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) provides a suite of mitigation strategies applicable to fishers that may be impacted by the Project regardless of state of residence. CPRA has expanded and refined its Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The focus of those measures remains providing assistance to impacted users. Those mitigation programs will be equally available to any impacted fisher who relies on fisheries in the Barataria Basin, regardless of whether or not they reside in the Basin.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by

USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63948

Public comment asked for provision of affordable broadband internet access for all residents impacted by the MBSD.

Response ID: 16587

Under USACE regulations, compensatory mitigation is intended to address significant resource losses that are specifically identifiable, reasonably likely to occur and of importance to the human or aquatic environment. Mitigation must be directly related to the impacts of the proposal, appropriate to the scope and degree of those impacts and reasonably enforceable. Because the proposed Project is not anticipated to adversely impact cable, internet or communication access, or infrastructure, the suggested provision of broadband internet access would not relate to resource losses caused by the proposed Project and would not be required by USACE.

CPRA has proposed mitigation and stewardship measures to address and partially offset some of the projected impacts of the Project, including providing mitigation for impacts to fisheries and increased water surface elevations caused by the Project (see Appendix R1 [Mitigation and Stewardship Plan] to the EIS). These measures have been designed to target specific impacts, and while broadband would likely benefit some of the impacted communities, CPRA and the LA TIG have chosen a targeted approach to mitigation based on the projected impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact

determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued.

Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63204

CPRA and State should work with willing landowners and users on closure of canals to increase proposed Project benefits.

Response ID: 16572

CPRA and other LA TIG Trustees have a long record of implementing a variety of restoration projects, including closures of canals where appropriate and cost-effective for coastal restoration. These projects are consistent with the Coastal Master Plan, and CPRA anticipates that they will continue to be implemented in the future. Canal closures are not a feature of the proposed Project and were not evaluated in the Draft EIS. In response to comments from the community, however, CPRA's Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) evaluated canal closures as a possible mitigation measure and as a result the Final Mitigation and Stewardship Plan includes a funding allocation for canal closures in Grand Bayou.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies

which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63207

Water pollution, especially nitrogen and phosphorus, may negatively impact the Project. The Mitigation Plan should 1) Fund LA's Nutrient Management and Reduction Strategy; 2) Fund ground activities upstream to reduce pollution in the river; and 3) identify projects in other states to reduce pollution loading.

Response ID: 16575

The Draft EIS considered the impacts that water pollution within the Mississippi River, including nitrogen and phosphorus, may cause in Chapter 4, Section 4.5.5 Operational Impacts in Surface Water and Sediment Quality. In response to comments, a discussion of the Gulf Hypoxia Action Plan has been added to Chapter 4, Section 4.25.5 Cumulative Impacts - Surface Water and Sediment Quality of the Final EIS. The Hypoxia Action Plan highlights the important role that sediment diversions can play in reducing nutrient loading into the Gulf of Mexico.

While the LA TIG's Final Restoration Plan is focused on wetland creation in Barataria Basin and not upland nutrient removal, Louisiana's Nutrient Reduction and Management Strategy highlights the important role that river diversions could play in reducing nutrient loads. See <https://deg.louisiana.gov/page/nutrient-management-strategy>. As stated in Section 4.25.5.2, the combined impact of several Mississippi River diversions operating simultaneously may reduce nutrient flow

from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

While not part of this Project, the LA TIG is funding other restoration efforts on the ground to reduce nutrient pollution in the Mississippi River. Each of the 12 member states in the Gulf of Mexico Watershed Nutrient Task Force (Hypoxia Task Force) have nutrient reduction strategies that identify programs and projects to reduce nutrient loads to the Mississippi River and the Gulf of Mexico. These state strategies can be found at <https://www.epa.gov/ms-htf/hypoxia-task-force-nutrient-reduction-strategies>.

Federal agencies also provide financial and technical support and conduct scientific studies that support improvements in local water quality throughout the Mississippi River Basin and reduce nutrient loads to the Gulf of Mexico. Separate from this Project, other funding is available for nutrient reduction projects in other states.

Concern ID: 63206

Commenter expressed appreciation for CPRA’s indication that it would move away from the USACE’s handful of dredging contractors, and recommendations were made to explore expanding other fields of expertise such as engineering or construction firms, as well as focusing on the use of locals to benefit the economy.

Response ID: 16574

The EIS does not address how CPRA would select contractors for the Project if the Project is approved and funded; topics such as contracting are beyond the scope of the NEPA review. CPRA is required to follow, and does follow, the provisions of the Louisiana Public Bid Law, including those contained in Title 39, Chapter 17 (the Louisiana Procurement Code) and in Title 38, Chapter 10 (Public Contracts). CPRA also conducts its procurement in accordance with the provisions governing the Hudson and Veteran’s initiatives and the Louisiana First Hiring Act. CPRA has no authority to procure outside of these procurement statutes.

In furtherance of its work and mission, CPRA contracts for a variety of professional services (such as engineering services), consulting services, and construction work, all of which are procured in strict accordance with Louisiana law. As provided by law, CPRA makes all solicitations for work available to the public through the posting of public notices and advertisements for work, which are open to the public for competition.

Concern ID: 63205

Potential basin impacts are understated; the proposed Project could support proactive efforts to create a cleaner Mississippi River and a cleaner Barataria Basin.

Response ID: 16573

In response to comments, a discussion of the Gulf Hypoxia Action Plan has been added to Chapter 4, Section 4.25.5 (Cumulative Impacts -

Surface Water and Sediment Quality) of the Final EIS. The Hypoxia Action Plan highlights the important role that sediment diversions can play in reducing nutrient loading into the Gulf of Mexico.

Concern ID: 63197

While recognizing that their recommendations may be outside the scope of the EIS, commenters suggested continuing to work with fishers and to examine fishing laws and policies.

Response ID: 16568

The LA TIG acknowledges the desire of the commenters for ongoing engagement with fishers regarding the fishing laws and policies. Existing task forces within the State, such as the Joint Fisheries Task Force Working Group within the Louisiana Department of Wildlife and Fisheries (LDWF), would be an appropriate forum to suggest the examination of fishing laws and policies, given the many factors resulting in changed conditions in the State.

Concern ID: 63942

Commenters requested mitigation actions be taken to minimize air, water and noise impacts near the construction site.

Response ID: 16583

If the Project is permitted, approved, and funded, CPRA has stated that it would implement certain BMPs during Project construction to avoid and minimize construction impacts listed in Chapter 4, Section 4.27.1 (Mitigation Summary - Avoidance and Minimization) and Appendix R1 (Mitigation and Stewardship Plan) of the Draft EIS. In response to comments, CPRA expanded and refined the BMPs and EPMs between the Draft and Final EIS in the Mitigation Summary Table (Appendix R3 to the Final EIS).

SMM11000 - Marine Mammals SMM

Concern ID: 62917

Public comment suggested that there should be increased monitoring for the dolphin population.

Response ID: 16541

The Monitoring and Adaptive Management (MAM) Plan included in the Draft EIS (Appendix R2) contained draft plans for monitoring marine mammals in Barataria Bay before and during Project operations. The LA TIG recognizes that pre-operation Project monitoring would be essential to understand the impacts of the Project on marine mammals and to inform adaptive management approaches to both monitoring and operational modifications that allow for the minimization of impacts, where practicable. The MAM Plan included in the Draft EIS identified a core marine mammal monitoring team that would be established to conduct year-round marine mammal monitoring. This core team would also provide stranding surveillance and response capacity. The monitoring plans included in the MAM Plan included in the Final EIS (Appendix R2) have been enhanced to allow for critical data collection capabilities. The MAM Plan in the Final EIS (Appendix R2) has also

been updated to provide the marine mammal team important environmental data necessary to understand where monitoring should be focused and to inform operational adaptive management.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62918

A suggestion was submitted that Barataria Basin dolphins will thrive in the Grand Isle area and request for the USACE to consider transporting Mid-Barataria dolphins to Grand Isle.

Response ID: 16704

The dolphins within the Barataria Basin, including those that inhabit the waters near Grand Isle, are all bottlenose dolphins (*Tursiops truncatus*) and are part of a single population stock, however studies indicate that many of these dolphins live and feed over much more localized areas within the bay. This population (including the dolphins around Grand

Isle) was severely compromised by the DWH oil spill and, as described in Chapter 3, Section 3.11.3.2 in Marine Mammals of the EIS, continue to demonstrate health impacts (for example, reproductive failure, lung and heart disease, etc.) as a result of the spill and have not yet started a population trajectory to recovery. As noted in Chapter 4, Section 4.11 Marine Mammals of the Draft EIS, once diversion operations begin, the dolphin survival rate (that is, the number of dolphins that survives from year to year) will decline. After the planned 50 years of operation, dolphins in three of the four strata (as described in Thomas et al., 2021) are predicted to be functionally extinct under the Applicant's Preferred Alternative, with the dolphins in the remaining Island stratum (which includes the Grand Isle area) being severely reduced relative to the No Action Alternative (the median predicted abundance in the Island stratum is 85 percent lower [95 percent CI: 28-99 percent] under the Applicant's Preferred Alternative than under the No Action Alternative). Section 4.11 of the Final EIS has been updated to reflect the results of Thomas et al. (2021).

In recognition of the potential collateral injury to bottlenose dolphins and in response to public comments on this issue, the LA TIG has developed a Marine Mammal Intervention Plan since the release of the Draft EIS (see Appendix R5 to the Final EIS). The Plan indicates that any animals impacted by the diversion that are captured and/or rehabilitated would be released in locations suitable for health and survival, which may include, but is not limited to, the areas near Grand Isle. However, it would be logistically impossible to translocate all dolphins compromised by the proposed Project to the waters around Grand Isle. In addition, given that BBES dolphins demonstrate high site fidelity within Barataria Basin and are not anticipated to leave unsuitable habitats resulting from Project operations, as described in Chapter 4, Section 4.11.5.1 in Marine Mammals of the EIS, it is unknown if dolphins that are relocated to waters near Grand Isle would stay near Grand Isle. Moreover, to compress the entire population (currently estimated at approximately 2,000 dolphins) to the waters of Grand Isle would likely result in increased competition and reduced prey resources, and the population would not be sustainable.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the

additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62919

Commenters suggested that the proposed Project should include additional details and measures to minimize adverse impacts on dolphins, including additional adaptive management measures, such as operational minimization measures (and other measures to minimize short-term impacts from lower salinity levels) as well as additional details about human interaction/anthropogenic stressor reduction stewardship measures, and about how the goals of those measures will be achieved. One commenter noted that while the alternatives evaluated in the Draft EIS, including those rejected for further review, are adequate for purposes of a Final EIS and Record of Decision, more information on minimization measures that may be considered to address impacts to dolphins through the adaptive management process is needed

Response ID: 16707

In recognition of the potential collateral injury to bottlenose dolphins and in response to public comments on this issue, the CPRA has revised the Monitoring and Adaptive Management (MAM) Plan included in the Draft EIS (see Appendix R2 [Monitoring and Adaptive Management Plan] to the Final EIS) to include more specific details regarding strategies and protocols to be used to minimize impacts on dolphins at the onset of operations and the process through which operational data would be used to evaluate potential modifications to those strategies

and protocols. As stated in the MAM Plan, adaptive management strategies are largely reliant upon data that would only be available once operations commence, but may also be informed by new information gained during the preoperational period. At that time, such data would be used to evaluate modifications to operations that may further minimize impacts to marine mammals while achieving Project goals. In the updated MAM Plan, the CPRA has included a framework by which recommendations on operational management actions designed to minimize impacts on marine mammals would be made and CPRA's final determination on whether they would implement those measures.

The LA TIG has also developed a Marine Mammal Intervention Plan (see Appendix R5 to the Final EIS), which outlines a spectrum of response actions for dolphins affected by the operation of the diversion, ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. With respect to achieving the goals of the stewardship measures that are incorporated in the Mitigation and Stewardship Plan addressing other anthropogenic stressors, the NMFS' Southeast Regional Office and Southeast Fisheries Science Center will lead those efforts. The Final Mitigation and Stewardship Plan has been updated to include additional information regarding this topic (see Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of

specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62921

Commenters suggested that the State of Louisiana must comply with the MMPA waiver and minimize impacts to marine mammal population stocks in ways that are practicable and consistent with the purposes of the Project. This includes considering alternative actions and modifications to Project operations to reduce or mitigate impacts to BBES dolphins while still meeting the Project purpose. The Mitigation Plan incorrectly suggests that actions to reduce impacts to dolphins is not necessary because it would negatively impact Project performance. The Trustees should research all possible mitigation actions to reduce impacts to BBES and invest in the restoration projects that effectively reduce this impact. These may include alternative construction designs or operational strategies, such as reduced diversion flow or salinity thresholds, that would reduce impacts to bottlenose dolphins.

Response ID: 16703

CPRA prepared a Mitigation and Stewardship Plan and a Monitoring and Adaptive Management (MAM) Plan. Chapter 3, Section 3.11.1 Marine Mammals in the Northern Gulf of Mexico of the Final EIS has been revised to discuss the Marine Mammal Protection Act waiver that was issued for the proposed Project.

There is no requirement in the Bipartisan Budget Act that CPRA evaluate alternatives other than the Project. The Bipartisan Budget Act of 2018, Section 20201 requires the State of Louisiana, in consultation with the Secretary of Commerce (delegated to NMFS), to the extent practicable and consistent with the purposes of the proposed Project to minimize impacts on marine mammal species and population stocks, and monitor and evaluate the impacts of the proposed Project on such species and population stocks.

CPRA's updated MAM Plan (Appendix R2 of the Final EIS) includes measures and frameworks for minimizing and monitoring impacts of the proposed Project on marine mammals. In addition, the LA TIG has

developed a Marine Mammal Intervention Plan. As described in the Federal Register notice announcing issuance of the MMPA waiver, the State's consultation with NMFS will be ongoing to appropriately address the evolving Project planning and design for the construction, operation, and maintenance phases. This ongoing consultation is described in the MAM Plan as well as the Marine Mammal Intervention Plan (see below and Appendices R2 and R5 to the Final EIS for more details).
