These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the

final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)

- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiessky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Brittany Verdin Jimenez

Hello,

I wanted to know why ONLY federally recognized tribes were invited, thus far, and participating in these talks. I understand there is no legal obligation, but state recognized tribes like the United Houma Nation, Pointe Aux Chiene Indians, and the Isle de Jean Charles Band of the Biloxi-Chitimacha-Choctaw-Muskogee Creek Indians are the MOST affected by this sediment diversion so it stands to reason that there is an ethical obligation to invite and collaborate with their council.

Not to mention, these communities listed are already designated as the first climate refugees of the rapidly disappearing Gulf Coast. Projects like these, that do not sell out the voices of the unheard, are what is keeping people from returning to Louisiana post- Katrina. (My family and I.) It would be in this project's best interest, as well as the community's, to collaborate with person's best suited to the task.

Warm regards,

Brittany Verdin Jimenez

**Concern ID: 61932**

**Communities with environmental justice concerns, which include all communities who are vulnerable to racial, ethnic, economic, and ecological violence, should be “meaningfully involved” in “the development, implementation, and enforcement of environmental laws, regulations, and policies” during the proposed MBSD Project.**

**Response ID: 16285**

As discussed in Chapter 1, Section 1.6 Scope of the EIS, and Chapter 4, Section 4.15 Environmental Justice, the EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance to identify the impacts that would likely occur if the proposed Project were to be approved. USACE, the LA TIG, and CPRA have engaged communities with environmental justice concerns in development of the EIS. Examples of public outreach provided by USACE for the EIS include special public notices for the permit application, the scoping process and scoping meetings, and public review of and public meetings regarding the Draft EIS. Material and information related to the Draft EIS were made available through Federal Register notices, press releases, social media, the New Orleans District website, newspapers, mail outs to distribution lists, and provision of hard copies of the Executive Summary and other materials to local libraries and community centers.

USACE and the LA TIG also coordinated with the SELA Voice organizations to understand the needs of the local communities, including communities with environmental justice concerns, regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG’s Draft Restoration Plan and during the public comment period. Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the joint virtual public meetings on the Draft EIS and the LA TIG’s Draft Restoration Plan. Also, the Public Notice to announce the Draft EIS Notice of Availability, the Executive Summary for the Draft EIS, and the Executive Summary for the LA TIG’s Draft Restoration Plan were translated into Spanish and Vietnamese. The consolidated pre-recorded public

---

meeting presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage.

CPRA has engaged in public outreach meetings with the communities projected to be impacted by the MBSD to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts undertaken to better understand and address potential impacts on communities with environmental justice concerns, including low-income and minority populations, such as cultural impacts, are discussed in Chapter 7 of the Final EIS. Refer to the Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Louisiana FinFish Task Force

Acy Cooper III

I am against the Mid Barataria diversion project. This will kill marine mammals. Fresh water will kill our estuaries along with our finfish,shrimp,oyster and crab industries. Plaquemines parish will not be the only parish negatively affected. The future of the state economy is dependent on commercial fisheries. Culture and heritage on our coast will be lost. Jobs will be lost. DREDGE/DONT DIVERT!

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated

---

Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRAs and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62009**

**The negative socioeconomic consequences would devastate southeast Louisiana, destroy people's livelihoods, displace people living near the diversion, and destroy property in the areas impacted by the proposed MBSD Project.**

**Response ID: 16207**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana, including impacts on population, property values, and community cohesion. As noted in these sections, the proposed Project would have both beneficial and adverse socioeconomic impacts on the people and communities within the Project area. Minor to moderate, permanent adverse socioeconomic impacts are expected to occur near the immediate outfall area outside of flood protection. Minor to moderate, permanent, beneficial socioeconomic impacts are expected to occur in the west bank New Orleans area north of the diversion. Moderate to major, beneficial, temporary impacts from job creation and economic activity in the proposed Project area are anticipated. In addition, the Socioeconomics Technical Report in Appendix H1 provides additional details on these projected effects.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in

Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the DWH oil spill.

The commenters' concern regarding the potential impacts of the diversion were considered by CPRA and the LA TIG in developing the Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included mitigation to address and offset some of the projected impacts of the Project on fisheries and surrounding communities outside levee protection including providing structural mitigation and stewardship measures for increased water levels that are projected to result due to the Project, such as raising roads or improving bulkheads. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

In communities south of the Project site outside of federal levee protection where the proposed Project is projected to cause increased water levels, CPRA plans to take one of two approaches. In Myrtle Grove, CPRA is planning to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision. By improving this bulkhead, CPRA would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions without the Project. See Table 1 in the Final Mitigation and Stewardship Plan for more details. CPRA plans to acquire a temporary right-of-way to permit improvement of the bulkhead, voluntarily or through eminent domain if necessary, from the property owners in the Myrtle Grove Marina Estates Subdivision.

In other communities south of the Project site outside of federal levee protection, from Woodpark south to the communities of Grand Bayou and Happy Jack, CPRA plans to elevate the portions of public roads outside of levee protection that provide access to each of these communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits

prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62077**

**The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.**

**Response ID: 16242**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the

---

Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required

as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62777**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).**

**Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures

---

are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures

---

are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 64057**

**The socioeconomic impacts would affect southeast Louisiana and the area impacted by the proposed MBSD Project for generations and ensure the end to the traditions and culture of south Louisiana and its families.**

**Response ID: 16230**

The EIS discusses impacts on the local communities and various quantitative and qualitative impacts from the proposed Project in Chapter 4, Section 4.13 Socioeconomics, including Community Cohesion (Section 4.13.5.6). Consistent with the concern of the commenter, the EIS does find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative.

---

**Correspondence ID:4338**

Albert Johnson

Even though diversions are a good idea, bigger is not always better. This diversion will put an end to most if not all salt water recreational and commercial fishing in the Barataria basin. The communities of Myrtle Grove, Wood Park, Lake Hermitage, and many more will cease to exist. Therefore I must conclude that this project is not in the best interest of the people and the wildlife it will affect for a long time. Perhaps some smaller and less intrusive diversions would be better suited than one large one that changes everything destroys a way of life. ALBERT D JOHNSON

---

**Concern ID: 61971**

**Commenters noted that consideration of multiple smaller and less intrusive diversions would be better suited than one large one that changes everything and destroys a way of life.**

**Response ID: 15973**

The EIS considered multiple small-scale diversions as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.7 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS, including the lack of appropriate range of sediment sizes and increased cost. Additionally alternatives with a single, smaller (50,000 cfs) diversion have been carried forward for detailed evaluation in the EIS; this includes the 50,000 cfs with terraces feature alternative.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

Theodore Mackenroth

I thought that CPRA was suppose to build land and protect the marsh. Don't understand how putting the diversion at Ironton will protect the barrier islands and Plaquemines Parish. How you can divert water that far up will build land along the Gulf. I understand that maybe 50 years from now we have a little land, but what about now. Unless you build land along the gulf you are now protecting anything.

Everyone that lives here, depends on the marsh, and enjoys this area knows that without slowing down the tide your not going to save anything. The oil industry destroyed a lot of land with their pipe lines. The storms have taken away a lot of land. We lost all of our island in the bays. The wind blowing across open water erodes land. We all see how much this area has changed.

Before you go to the expense of a diversion of this size, that you know will destroy more land and seafood, why not narrow the passes from the gulf first. Narrow the passes and move into the bays and build terraces or islands. This would slow the tide water and stop erosion. The islands will stop the wind and waves from eroding land. Start closing off the oil pipelines. Make the tide water go back down the main bayous. Close off all the wash out areas that broke thru the main bayous. There more work that needs to be done before you build this diversion. Starting at the gulf and build land coming in would help more then the diversion. Building land out further will help us in our life time. It would protect us and Plaquemines better.

Common sense should be used in the decision of wetlands rather then politicians goals. The people should come first. The local people and government is trying to tell you that we don't want the diversion. How is it right for the Government to force something on anyone in this country? We don't want this diversion to damage our area and way of life. You can not guarantee that this diversion will not destroy more land then it will build in 50 years. Dredging builds more land in less time without destroying our way of life.

Stop the diversion

---

**Concern ID: 61885**

**Consider the alternative of reducing the size of Bay Long Pass and 4 Bayou Pass to slow the tide water and save land instead of implementing the proposed MBSD Project.**

---

**Response ID: 15981**

This alternative as presented, specifically reducing or narrowing the passes, would not meet the goals and objectives as stated in the purpose and need as described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Other similar restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan, which will be updated in 2023, and by the LA TIG through Natural Resource Damage restoration planning.

---

**Concern ID: 61894**

---

---

**Consider the alternative of tearing down spoil banks and backfilling abandoned canals before, in addition to, or instead of implementing the proposed MBSD Project.**

---

**Response ID: 15987**

This suggested alternative would not meet the goals and objectives as stated in the purpose and need and described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives. It would not re-establish deltaic processes between the Mississippi River and Barataria Basin through the delivery of sediment, fresh water, and nutrients. However, the EIS acknowledges the influence of canals and spoil banks on wetland losses in Barataria Basin (see Chapter 3, Section 3.6.2.2 in Wetland Resources and Waters of the U.S. of the Final EIS), and has updated the analysis to include additional technical references regarding the influence of canals on the existing environment in the Barataria Basin. The EIS does not describe the proposed Project as a solution to fully reverse ongoing land-loss trends. The EIS recognizes that the proposed Project is projected to create and maintain only a portion of the wetlands that would otherwise be lost in the absence of the proposed Project over the next 50 years.

This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Other similar restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan and the LA TIG through Natural Resources Damage restoration planning.

---

**Concern ID: 61970**

**The only alternatives in the EIS are diversions at different flow rates. The EIS has not listed other possible methods on building land in the Barataria Basin. One alternative is to study the creation of barrier islands and compare the result with the diversion alternative. Also consider fortifying the barrier islands with sheet piles, boulders, and rocks, and dam all pipeline canals and washed-out marsh openings with concrete dams.**

**Response ID: 15972**

The Draft EIS considered barrier islands as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.4 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS. While barrier islands play a critical role in reducing land loss, they are not intended or designed to transport sediment, fresh water, or nutrients.

Past investments through a multitude of restoration programs have resulted in the restoration of every major barrier island in the Barataria Basin. CPRA's Coastal Master Plan includes programmatic barrier island restoration to support future maintenance of the restored islands. However, CPRA has stated that fortifying barrier islands with hard structures is not feasible.

---

**Concern ID: 62785**

**This type of freshwater and sediment diversion project is unproven and there are uncertainties with respect to what the diversion would do (that is, if it would work and, if so, to what extent).**

**Response ID: 16367**

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties have been incorporated into the EIS impact conclusions and were briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties.

Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or as predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the projected changes for the No Action Alternative.

In addition to the modeled data, Chapter 4 Environmental Consequences of the EIS includes additional analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in drafting the EIS. In response to public comments, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The LA TIG recognizes and acknowledges that a controlled sediment diversion of this scale has not been constructed in Louisiana previously. However, a sediment diversion at this location has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Chapter 3, Section 3.2.1.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan). The proposed Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management [MAM] Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section

10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62794**

**This poorly planned and executed proposed Project is being pushed forward for the financial gain of politicians and contractors because taxpayer dollars are being used. Private investment dollars would entail more deliberation and a full impact study, including more natural options with less risk and more overall benefits.**

**Response ID: 16375**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance and constitutes a full impact analysis. A variety of alternatives assessed in the EIS are identified in Chapter 2 Alternatives. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

The LA TIG's Restoration Plan evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG has selected Alternative 1 as the LA TIG's Preferred Alternative.

---

**Correspondence ID:4617**

Steve

I am writing to state I am AGAINST the Mid-Barataria Sediment Diversion Project for the following reasons.

Based on the DEIS the environmental impacts outweigh the benefit of the land created. The harm done to the wildlife, livelihoods, and personal property of residents in Plaquemines Parish is unacceptable.

The DEIS did not provide adequate proposals to sediment diversion. All of the alternatives were in regards to various flow rates of the diversion or No Action. I support NO Action. Dredging for one would build more land at a faster rate than sediment diversion. Case in point both Phase 1 and Phase II of the Myrtle Grove Residential Subdivision was built with sand dredging being pumped in from the Mississippi River.

Also, I own property in Myrtle Grove Phase 1 subdivision. This residential neighborhood is composed of homes, Not Camps, many of which are valued in excess of 500K. The increase tidal range would severely negatively impact access, land values, number of times my property would flood, increase clean up cost, and accelerated deterioration of my dock and bulkhead. The DEIS did not provide specific details or guarantees to issues in the event the engineering models are wrong and projected impacts are worse than expected.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality

(CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62013**

**The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.**

**Response ID: 16210**

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood

---

protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or

---

will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating

---

the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to

---

comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Commenter

As an owner of a home in Myrtle Grove, it is evident in reading the draft EIS that the diversion will be, for all practical purposes, a condemnation of the subdivision.

EIS table 4.20-2, page 4-693, shows an increase of 119 days or more of tidal flooding because of the diversion. This is approximately one-third of the year if it stays at 119 days. Later, in Figure 4-20-3, page 4-694, it shows Myrtle Grove flooding two-thirds of the year by 2030 because of the diversion.

Whether one-third or two-thirds of the year, it gets even worse for the owners in Myrtle Grove. Appendix R provides that the diversion may fill Wilkinson Canal with silt and result in the loss of use of the Canal. The loss of the use of Wilkinson Canal will mean the owners in Myrtle Grove will still have waterfront property with boat lifts but will not be able to get out of Myrtle Grove with their boats.

Throughout the draft EIS, it states that the preferred remedy is a flowage easement. A flowage easement gives the Corps of Engineers the right to flood Myrtle Grove in connection with the operation of the diversion. Every flowage easement that I could find on the Corps of Engineers websites expressly prohibits the construction or maintenance of any structure for human habitation. If that is the preferred remedy, it is an express condemnation of Myrtle Grove since no one could continue to maintain their home.

While there is a need to protect and build the Louisiana coast, there must be another alternative to the diversion.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62968**

**If operation of the diversion causes infill of various canals used to access surrounding communities, who will be responsible for dredging to maintain access? For example, if Wilkinson Canal is filled with silt then the canal cannot be used and waterfront property owners with boat lifts in Myrtle Grove will not be able to get out using their boats; the EIS does not require a remedy or provide a funded maintenance plan for this issue (including who would pay for dredging).**

**Response ID: 16642**

The impacts raised by the commenters were considered in the Draft EIS. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the Project area during Project operations.

In acknowledgement of commenters' concerns regarding maintenance of non-federal navigation channels and canals impacted by sedimentation of the proposed diversion, the Mitigation and Stewardship Plan includes measures to mitigate impacts on navigation resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63092**

**Further development of the Mitigation Plan is needed for properties that would be impacted by flooding caused by Project operations. Multiple commenters made specific requests for how their property should be handled (for example, through sales or easements), while others wondered why a more detailed, "real estate plan" for impacted communities was not available.**

**Response ID: 16511**

---

The Draft Mitigation and Stewardship Plan included with the Draft EIS (Appendix R1) included CPRA's initial framework for mitigation and stewardship measures to assist property owners in these communities impacted by increased tidal flooding and to address the Project impacts of Project operations on water levels. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

CPRA states that it is interested in assisting affected communities to remain in place as long as they would like. Mitigation would include a combination of structural measures (for example, raising roads, boat houses, docks and utilities) and non-structural measures. Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

Where the proposed Project would cause increased water levels and/or increased incidence of flooding, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to purchasing a flowage servitude, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property (rather than a servitude) would be made on a case-by-case basis depending on the particular circumstances.

A complete listing of the mitigation and stewardship measures that CPRA would implement if the proposed Project is approved and funded is included in CPRA's Mitigation and Stewardship Plan included in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the

Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63102**

**Commenters expressed concern that they will not be able to use their property if the Project proceeds. Commenters believe that the amount of funds proposed for mitigation is insufficient.**

**Response ID: 16640**

The commenters' concern regarding the adequacy of the funding for mitigation measures was considered by CPRA and the LA TIG in developing CPRA's Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included proposals to address and partially offset some of the projected impacts of the Project on surrounding communities outside levee protection, including potential mitigation measures to address increased water levels due to the Project. In response to comments, CPRA further expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The mitigation and stewardship measures would vary by community. In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the Project. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and the utilities of those communities. Also in these communities, CPRA plans to acquire Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Raymond Strohmeyer

I am writing to give you my opinion on the diversion project.

I am a homeowner in Myrtle Grove Marina Estates and have been for approximately 11 years. I attended the meeting last night at Belle Chase Middle School and some great points were brought up by the residents. However, I didn't hear many good responses to their concerns.

I believe all of us want to preserve our marsh lands and our increasable outdoor resources. However, I don't know if building the largest diversion ever by man is the way to go about solving this issue. Why not multiple smaller diversions that would more accurately mimic the natural flow of water and nutrients as it was before The Corps tried to tame the Great Mississippi River?

As residents of MGM, we are never all going to agree on what is the best solution for everyone, but our government has to come up with a solution that will make everyone whole. I have over a million dollars invested in my property, and it has been a place that me and my family have enjoyed and made many unforgettable memories! We built our place in accordance with all applicable codes at that time.

This project is going to lead to adverse effects for all residents and will be detrimental to the value of our properties.

I would love to come to some amicable agreement that will help benefit all residents of Plaquemines and the State! We need to do this in a way that doesn't leave us without the value we have worked so hard to create.

I had hoped that one day my kids and grandkids would enjoy our place for generations to come, but at this point, it seems that will not come to fruition.

---

**Concern ID: 63096**

**Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).**

**Response ID: 16699**

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the

---

Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances. Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions,

would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61971**

**Commenters noted that consideration of multiple smaller and less intrusive diversions would be better suited than one large one that changes everything and destroys a way of life.**

**Response ID: 15973**

The EIS considered multiple small-scale diversions as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.7 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS, including the lack of appropriate range of sediment sizes and increased cost. Additionally alternatives with a single, smaller (50,000 cfs) diversion have been carried forward for detailed evaluation in the EIS; this includes the 50,000 cfs with terraces feature alternative.

---

**Concern ID: 62009**

**The negative socioeconomic consequences would devastate southeast Louisiana, destroy people's livelihoods, displace people living near the diversion, and destroy property in the areas impacted by the proposed MBSD Project.**

**Response ID: 16207**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana, including impacts on population, property values, and community cohesion. As noted in these sections, the proposed Project would have both beneficial and adverse socioeconomic impacts on the people and communities within the Project area. Minor to moderate, permanent adverse socioeconomic impacts are expected to occur near the immediate outfall area outside of flood protection. Minor to moderate, permanent, beneficial socioeconomic impacts are expected to occur in the west bank New Orleans area north of the diversion. Moderate to major, beneficial, temporary impacts from job creation and economic activity in the proposed Project area are anticipated. In addition, the Socioeconomics Technical Report in Appendix H1 provides additional details on these projected effects.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the

---

interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the DWH oil spill.

The commenters' concern regarding the potential impacts of the diversion were considered by CPRA and the LA TIG in developing the Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included mitigation to address and offset some of the projected impacts of the Project on fisheries and surrounding communities outside levee protection including providing structural mitigation and stewardship measures for increased water levels that are projected to result due to the Project, such as raising roads or improving bulkheads. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

In communities south of the Project site outside of federal levee protection where the proposed Project is projected to cause increased water levels, CPRA plans to take one of two approaches. In Myrtle Grove, CPRA is planning to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision. By improving this bulkhead, CPRA would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions without the Project. See Table 1 in the Final Mitigation and Stewardship Plan for more details. CPRA plans to acquire a temporary right-of-way to permit improvement of the bulkhead, voluntarily or through eminent domain if necessary, from the property owners in the Myrtle Grove Marina Estates Subdivision.

In other communities south of the Project site outside of federal levee protection, from Woodpark south to the communities of Grand Bayou and Happy Jack, CPRA plans to elevate the portions of public roads outside of levee protection that provide access to each of these communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA

permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62013**

**The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.**

**Response ID: 16210**

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to

---

moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations.

The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable

---

alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62805**

**Great questions have been raised at the public meetings; however not many good responses were provided.**

**Response ID: 16379**

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. The USACE and LA TIG undertook a coordinated and concurrent public review process for the Draft EIS and the LA TIG's Draft Restoration Plan. Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration Plan and the Draft EIS in its decision-making process. All public questions and comments received during the comment period are addressed in this Response to Comment Appendix. Revisions have been made to the Final EIS based on public comments received on the Draft EIS, input from the cooperating agencies, and continued Project evaluation. Changes between the Draft and Final EIS are identified through markings along the margins on the applicable pages, as described in Chapter 1, Section 1.7 Public Involvement Summary of the Final EIS. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

For a summary of public outreach efforts related to the Draft EIS refer to Chapter 7 Public Involvement of the Final EIS and for restoration planning see Section 1.8 of the LA TIG's Final Restoration Plan.

Independent of the joint Draft EIS and Draft Restoration Plan public meetings, CPRA held additional meetings with communities potentially affected to receive their input on how best to mitigate Project effects on water levels. Based in part on that feedback, CPRA updated the Mitigation and Stewardship Plan (Appendix R1, revised for the Final EIS) to specify the measures that would be implemented to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This mitigation includes a combination of structural measures (for example, raising roads, boat houses, docks and utilities) and non-structural measures (for example, Project servitudes). The mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if the permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Dear U.S. Army Corps of Engineers, New Orleans District,

This Earth Day, please coordinate a management program for the wetlands along The Gulf Coast. The mass deaths of manatees this year is concerning.

Thank you for considering as history will show your foresight.

Sincerely,

Chris Branciere

Jacksonville, FL 32224

---

**Concern ID: 62333**

**Please support the restoration of vital wildlife habitat along the Gulf Coast.**

**Response ID: 15842**

The commenter's desire for habitat restoration is acknowledged.

---

**Concern ID: 63119**

**The mass deaths of manatees this year is concerning to the commenter.**

**Response ID: 16268**

The 2020-2021 unusual mortality event (UME) was issued for manatees along Florida's east coast. The UME is being investigated to determine the cause, but preliminary information indicates that it is related to a reduction of food availability in portions of Indian River Lagoon (USFWS 2021). Although manatees transiting through the proposed Project area would likely be Florida residents, the UME is unrelated to the proposed Project and the proposed Project is not anticipated to result in injury or mortality of a manatee.

Jay Powers

What I don't see as an alternative is a pumped system to place over dredging in the marsh. This would seem a more effective way to place soil with less fresh water. The goal would be salt water tolerant plants that would stay viable in tidal surges. I understand that past diversions have failed because fresh water plants failed in salt water surges.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

---

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

Louisiana Department of Environmental Quality

Linda Piper

The Department of Environmental Quality (LDEQ), Business and Community Outreach Division has received your request for comments on the above referenced project.

After reviewing your request, the Department has no objections based on the information provided in your submittal. However, for your information, the following general comments have been included. Please be advised that if you should encounter a problem during the implementation of this project, you should immediately notify LDEQ's Single-Point-of-contact (SPOC) at (225) 219-3640.

- Please take any necessary steps to obtain and/or update all necessary approvals and environmental permits regarding this proposed project.
- If your project results in a discharge to waters of the state, submittal of a Louisiana Pollutant Discharge Elimination System (LPDES) application may be necessary.
- If the project results in a discharge of wastewater to an existing wastewater treatment system, that wastewater treatment system may need to modify its LPDES permit before accepting the additional wastewater.
- All precautions should be observed to control nonpoint source pollution from construction activities. LDEQ has stormwater general permits for construction areas equal to or greater than one acre. It is recommended that you contact the LDEQ Water Permits Division at (225) 219-9371 to determine if your proposed project requires a permit.
- If your project will include a sanitary wastewater treatment facility, a Sewage Sludge and Biosolids Use or Disposal Permit is required. An application or Notice of Intent will be required if the sludge management practice includes preparing biosolids for land application or preparing sewage sludge to be hauled to a landfill. Additional information may be obtained on the LDEQ website at <http://www.deq.louisiana.gov/portal/tabid/2296/Default.aspx> or by contacting the LDEQ Water Permits Division at (225) 219- 9371.
- If any of the proposed work is located in wetlands or other areas subject to the jurisdiction of the U.S. Army Corps of Engineers, you should contact the Corps directly regarding permitting issues. If a Corps permit is required, part of the application process may involve a water quality certification from LDEQ.
- All precautions should be observed to protect the groundwater of the region.
- Please be advised that water softeners generate wastewaters that may require special limitations depending on local water quality considerations. Therefore if your water system improvements include water softeners, you are advised to contact the LDEQ Water Permits to determine if special water quality-based limitations will be necessary.
- Any renovation or remodeling must comply with LAC 33:III.Chapter 28, Lead-Based Paint Activities; LAC 33:III.Chapter 27, Asbestos-Containing Materials in Schools and State Buildings (includes all training and accreditation); and LAC 33:III.5151, Emission Standard for Asbestos for any renovations or demolitions.
- If any solid or hazardous wastes, or soils and/or groundwater contaminated with hazardous constituents are encountered during the project, notification to LDEQ's Single-

Point-of-Contact (SPOC) at (225) 219-3640 is required. Additionally, precautions should be taken to protect workers from these hazardous constituents.

- The two unregistered free flowing water wells that were discovered in the pasture land during the site investigation and the corroded steel oil well pipe that was observed protruding from the water near the center of the West Access Canal need to be properly plugged and abandoned. The plugging and abandonment of these wells must be completed by a Louisiana Department of Natural Resources (LDNR) Licensed Water Well Driller, and be done in accordance with LAC Title 56 Regulatory Requirements.
- If any docks or pilings involve any treated wood elements, the treated timber must be reused, recycled, or properly disposed of at permitted facilities.
- If the project will involve the removal or disturbance of any soils which may have contaminant concentrations that exceed the Limiting Screening Option Standards established by the LDEQ Risk Evaluation/Corrective Action Program (RECAP) Regulation, these materials may be considered a waste and disposed of at a permitted facility, or might be managed as part of a Solid Waste Beneficial Use or Soil Reuse Plan in accordance with LAC 33:VII.Chapter 11. Alternately, a site-specific RECAP Evaluation might be conducted and submitted to the LDEQ.

Currently, Plaquemines Parish is classified as attainment with the National Ambient Air Quality Standards and has no general conformity determination obligations.

Please send all future requests to my attention. If you have any questions, please feel free to contact me at [REDACTED]

Sincerely,

Linda (Brown) Piper

Environmental Scientist Manager

Louisiana Dept. of Environmental Quality

Office of the Secretary

**Concern ID: 62958**

**The Department of Environmental Quality (LDEQ), Business and Community Outreach Division has received your request for comments on the proposed MBSD Project.**

**After reviewing your request, the Department has no objections based on the information provided in your submittal. However, for your information, the following general comments have been included. Please be advised that if you should encounter a problem during the implementation of this proposed Project, you should immediately notify LDEQ's Single-Point-of-contact (SPOC) at (225) 219-3640.**

**Response ID: 15888**

Thank you for your comments. USACE solicited review according to 40 CFR Part 1503.1. If a permit is issued, CPRA would be required to obtain all applicable federal, state, and local permits before starting construction of the proposed MBSD Project.

**Correspondence ID:5300**

Joe Chedotal

The problem is there is way too much water intrusion from the Gulf of Mexico. Until the Gulf is slowed considerable the mid=barataria diversion will be a boondoggle just to spend money. There are so many issues with this project I can.t begin to list them all. I will name a few The diversion will kill shrimp, crabs, oyster, dolphin, etc. will raise the water table in myrtle grove, wookpark making property unusable during high river months. will impact a lot of peoples lives. will put most of lower placquemines out of business.

The money would be better spend building the barrier islands and fortifying them with sheet piles, bolders and rocks. No opening between barrier islands must be no more than 200 feet. Once this is completed, restore the inland islands like st mary, saturday island and grand isle point to name a few. Use dreggers in the river and gulf to pump silt and sand inland. Dam all pipeline canals, washed out marsh openings with concrete dams

Now that the barrier islands are restored and canals dammed pumping silt and sand will be beneficial to marsh growth.

---

**Concern ID: 61970**

**The only alternatives in the EIS are diversions at different flow rates. The EIS has not listed other possible methods on building land in the Barataria Basin. One alternative is to study the creation of barrier islands and compare the result with the diversion alternative. Also consider fortifying the barrier islands with sheet piles, boulders, and rocks, and dam all pipeline canals and washed-out marsh openings with concrete dams.**

**Response ID: 15972**

The Draft EIS considered barrier islands as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.4 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS. While barrier islands play a critical role in reducing land loss, they are not intended or designed to transport sediment, fresh water, or nutrients.

Past investments through a multitude of restoration programs have resulted in the restoration of every major barrier island in the Barataria Basin. CPRA's Coastal Master Plan includes programmatic barrier island restoration to support future maintenance of the restored islands. However, CPRA has stated that fortifying barrier islands with hard structures is not feasible.

---

**Concern ID: 62777**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).**

**Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants

and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62778**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term

---

adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:5463**

Wilson Hildebrand

Dear sir

Please do not proceed with the mid-barataria sediment diversion project. Instead construct a plan that will use dredge material from the Mississippi River or the Gulf of Mexico to build Marsh instantly.

The proposed project will have too many negative effects on the fishing industry the marsh structure and also raising the sea level surrounding the project. Also this type of diversion is unproven so no one knows if it will actually work and build Marsh. At best we are looking at 10 to 50 years before any appreciable amount of Marsh may be built.

Dredged material from the Mississippi River or the Gulf of Mexico has been proven to immediately rebuild our coastline and our marshes. This is the way to go. Take the moneys from this project and put it towards dredged material reclamation and you will have something to show for your efforts immediately.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the

Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused

on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62785**

**This type of freshwater and sediment diversion project is unproven and there are uncertainties with respect to what the diversion would do (that is, if it would work and, if so, to what extent).**

**Response ID: 16367**

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties have been incorporated into the EIS impact conclusions and were briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties.

Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or as predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the projected changes for the No Action Alternative.

In addition to the modeled data, Chapter 4 Environmental Consequences of the EIS includes additional analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in drafting the EIS. In response to public comments, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The LA TIG recognizes and acknowledges that a controlled sediment

diversion of this scale has not been constructed in Louisiana previously. However, a sediment diversion at this location has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Chapter 3, Section 3.2.1.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan). The proposed Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management [MAM] Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63038**

**It would be at least 10 to 50 years before any appreciable amount of marsh may be built.**

**Response ID: 16045**

The commenter correctly notes that the projected benefits of the proposed Project would not be immediate, but would occur over time beginning in the first decade of operations. The wetland acreages presented in Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S., Table 4.6-3 of the Draft EIS represented the total acreage projected to be present in the Barataria Basin under each action alternative assessed.

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:7353**

Thomas Cassidy

Dear U.S. Army Corps of Engineers, New Orleans District,

As we learn more, sometimes at great cost, of the complex interactions constantly in process throughout the natural world of which we are small parts, we often find many of our past well-intended engineering projects, prompted in many instances by natural and economic dysfunctions/ disasters, have had unintended negative consequences which could be overlooked when the underlying infrastructure had excess capacity and resiliency but are now becoming recognized as obstacles to our continued well being and adaptation to our evolving world.

Particularly with respect to wetlands and waterways a better understanding of how they work unimpeded and how this would integrate more and better resources for the improvement and expansion of species, agriculture, among many other activities, at lower cost and greater returns has been developed and demonstrated in a credible manner. It is also likely the broader application of this natural infrastructure integration and regeneration approach would go far to perhaps shortstop and mitigate consequences of natural and other disasters, potentially more likely as climate and the natural world changes before our eyes.

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend.

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

\*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

\*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

As the project advances, I urge federal and state decision-makers to consider the following:

\*Commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders.

\*Work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

Thank you for considering my comments.

Sincerely,

Thomas Cassidy

Clovis, CA 93611

---

**Concern ID: 62663**

Decades of study demonstrate the MBSD is the optimal way to restore the sustainable functionality to the ecosystem injured by the DWH oil spill, including providing benefits to the northern Gulf of Mexico ecosystem injured by the spill. The Project would rebuild and restore coastal wetland habitat, which is vital to the health of the Gulf of Mexico ecosystem and the species that reside within it. It would address a multitude of concerns on an ecosystem-wide and economic scale, would work synergistically with ecosystem restoration projects in the basin, and would create jobs. The Draft Restoration Plan demonstrates the likely benefits of the Project, and the Project would likely help mitigate consequences of future natural disasters and climate change. Not implementing the Project would not only prevent the area from recovering, but would accelerate its degradation over time.

**Response ID: 16622**

The LA TIG acknowledges the comment and agrees that the Project would deliver fresh water, sediment, and nutrients to the Barataria Basin; reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin (for example, sediment retention and accumulation, new delta formation); and create, restore, and sustain wetlands and other deltaic habitats and associated ecosystem services.

---

**Concern ID: 62890**

**The wetlands and coastal habitats of Louisiana are essential to the bird populations (both resident and migratory) and must be protected and restored. The proposed Project is important to maintaining and rebuilding important bird habitat.**

**Response ID: 16190**

Chapter 3, Section 3.9.2.1 in Terrestrial Wildlife and Habitat of the Draft EIS identified the importance of area habitats and resources to migratory, and other, birds in the Barataria Basin. Further, Chapter 4, Section 4.9.4.2 in Terrestrial Wildlife and Habitat of the Draft EIS, discussed the maintenance and creation of marsh, as well as initial land accretion and creation of mudflats, that is projected to occur as part of the proposed Project, and identified that the net addition of these habitats would generally be beneficial to waterfowl and shorebirds.

The potential benefits of the proposed Project to resources in the Gulf, including birds, are also described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan.

---

**Concern ID: 63337**

Diane Kastel

Dear U.S. Army Corps of Engineers, New Orleans District,

Eleven years ago today, the "Deepwater Horizon" exploded, killing 11 people, and, eventually, spilling millions of gallons of oil into the Gulf of Mexico. It became the largest environmental disaster in U.S. history that resulted in the deaths of as many as one million birds.

The oil spill exacerbated a, dire, land-loss crisis. Since the 1930's, the "Barataria Basin", an estuary in southeastern Louisiana, near New Orleans, has lost, nearly, 295,000 acres of land, displacing communities, threatening critical infrastructure and, jobs, and, devastating habitat for birds, and, other wildlife. Forty percent of North America's migratory bird species depend on this, disappearing, habitat.

"Barataria Basin" was, also, ground zero for the oil spill, causing wetlands to disappear three times faster than the rest of the state. We, now, have an opportunity to restore some of the damaged habitat.

We are submitting a comment in support of the "Mid-Barataria Sediment Diversion", the single-largest ecosystem restoration project in the history of the U.S.

This week also marks "Earth Day", which we celebrate this year with the theme "Restore Our Earth." Wildlife, fisheries, and, beautiful, natural places are at risk of, complete, collapse without large-scale, natural, infrastructure restoration projects like the "Mid-Barataria Sediment Diversion". Natural infrastructure is engineering with nature-restoring, and, mimicking, natural landscapes like wetlands to provide bird habitat, buffer coastal communities against flooding, and, to absorb carbon pollution-a win-win-win for birds and, people.

This project will build more wetlands than any other, individual, restoration project in the world. By reconnecting the Mississippi River with its marshes, the sediment diversion will mimic the natural spring floods that, once, replenished the marshes, benefiting birds, wildlife, and, fisheries.

This innovative, project is a, crucial, first step in turning the tide on the state's land loss crisis, and, protecting, vulnerable, communities from hurricanes, and, sea-level rise, while also ensuring the, long-term, health of the ecosystem in the face of a changing climate, and, coast.

To celebrate "Earth Day", we are demonstrating, overwhelming, public support for this project. We are telling the "U.S. Army Corps of Engineers" that we support restoration of Louisiana's "Barataria Basin".

Thank you for considering our, very, relevant comments.

Sincerely,

DIANE KASTEL

Wheaton, IL 60189

**Concern ID: 61733**

**Barataria Basin land loss plus the BP oil spill has had and continues to have devastating impacts on communities, birds, and wildlife habitat.**

**Response ID: 16159**

The impacts that land loss and the DWH oil spill have had and continue to have on communities, birds, and wildlife habitat in the Barataria Basin were considered in the Draft EIS. These impacts are discussed throughout Chapter 3 Affected Environment. As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the Project is to restore for injuries caused by the DWH oil spill by implementing a large-scale sediment diversion in the Barataria Basin that would reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts. This EIS serves as the environmental review required by NEPA to inform the LA TIG's OPA decision regarding funding the construction of the proposed MBSD Project using damages paid by BP following the DWH oil spill (see Section 1.6.1 The OPA and DWH NRDA Decisions of the EIS).

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

**Correspondence ID:7743**

Pamela Weinstein

Dear U.S. Army Corps of Engineers, New Orleans District,

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend.

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

\*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

\*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

As the project advances, I urge federal and state decision-makers to consider the following:

\*Commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders.

\*Work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

You are not naive enough to believe that the use of fossil fuels are not directly or indirectly ruining the habitat of our precious wildlife. It is shameful that people have to write letters like this, when you have it in your power to protect, what cannot be replaced. The old adage "People have to support their families" is just an excuse to cover up for the promises that you have made to big Oil, to get their huge donations. There are plenty of jobs rebuilding a world, not dependent on Oil for energy and deforestation for farmland or even more building. You are destroying our planet and justifying it, with weak excuses. You are short-sighted and you may not care about animals or the poor( who always bear the brunt of greed) but you will have grandchildren who will ask you why you allowed people to destroy their wild places. Laws must put on place or kept to protect what little wilderness there is. This beautiful, unique planet will not survive without lawmakers doing what they know is right and stop making excuses. Excuses don't cut it, in a desperate situation, and our wildlife is in danger of extinction.

Thank you for considering my comments.

Sincerely,

PAMELA WEINSTEIN

Port St Lucie, FL 34986

**Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40 percent of all migratory birds in North America spend a part of their life in coastal Louisiana.**

**Response ID: 16162**

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment. The use of Louisiana's coastal habitats by a large diversity of birds is discussed in Chapter 3, Section 3.9.3 in Terrestrial Wildlife of the EIS. The benefits that the Project would provide to birds are discussed in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.12 Threatened and Endangered Species of the EIS.

---

**Concern ID: 61756**

**The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.**

**Response ID: 15891**

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management

---

governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts

---

a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63360**

**The USACE is not naive enough to believe that the use of fossil fuels is not directly or indirectly ruining the habitat of local wildlife and notes that USACE has it in its power to protect what cannot be replaced.**

**Response ID: 16322**

The commenter's input is noted. Chapter 3, Section 3.6.2.2 in Wetland Resources and Waters of the U.S. of the Draft EIS discussed the direct and indirect causes of wetland loss in the Barataria Basin, including wetland loss related to exploration, production and use of fossil fuels.

Greg Cahill

Dear U.S. Army Corps of Engineers, New Orleans District,

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group: please consider what you will all tell your children and grandchildren about your personal role in restoring or destroying their environment.

Thank you for considering my comments.

Sincerely,

Greg Cahill

Culver City, CA 90232

**Concern ID: 61756**

**The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.**

**Response ID: 15891**

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for

---

public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

C. Men

Dear U.S. Army Corps of Engineers, New Orleans District,

The coastline of Louisiana has been decimated over the years because many departments and agencies have allowed businesses, real estate developers and fishing of the area run rampant without the needed regulations based on research of habitats and loss of native grasses and plants that help protect the shore. So it is up to the army corps of engineers to do something NOW TO REGULATE AND SAVE THIS AREA FROM RAPE AND PILLAGE BY GREEDY CORPORATIONS!!!! So do something for future generations for gods sake.

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend.

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

\*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

\*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

As the project advances, I urge federal and state decision-makers to consider the following:

\*Commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders.

\*Work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

Thank you for considering my comments.

Sincerely,

C. Men

Columbus, OH 43214

**Correspondence ID:9710**

Form Letter 9

Mid-Barataria Diversion

Pro and Cons

Cons;

1. Only lower storm surge .5-1 in thirty years north of Diversion
2. Create only 17,300 acres of land at a cost of \$114,000 per acre while destroying the salt water marsh and decreasing Hurricane Protection
3. Kill more bottlenose dolphins and endanger sea turtles then the BP Oil spill did with BP monies
4. Destroy brown shrimp, oysters, crab, saltwater sports fishing industry
5. Create the largest (red tide) dead zone in our history with polluted waters and fertilizer run off from the Mississippi River
6. Destroy the communities, of Happy Jack, Grand Bayou, Lake Hermitage, Suzzie Bayou, Deer Range, Woodpark and Myrtle Grove.
7. Cemeteries of Deer Range and Lake Hermitage will be under water
8. No plan to compensate affected communities or raise affected communities to protect them from rising waters of 2 to 5 about normal tides
9. Zero Hurricane Protection
10. Reduce tax collects for the Plaquemines Parish, School Board, Sheriff Office and our Local Parish Government by reducing values of properties in affected areas
11. Change our culture for ever
12. No land gain in the first 20 years
13. Kill the two most productive estuaries in America that provide 25% of the entire countrys domestic seafood production and drive Louisianas seafood-based tourism/hospitality eco
14. Actually cause land loss further out from the structure and also destroy the brackish/saline marsh grasses which provide storm surge protection and replace them with less surge-resistant freshwater plants
15. Kill the immense dolphin stock that lives in these estuaries and has already suffered immeasurably from effects of the BP oil spill (the projects have already had to obtain a sneaky Congressional waiver to environmental reviews that would prevent them from receiving a permit);
16. Cause immense toxic algal blooms and dead zones directly in the estuaries
17. Cause 100s of millions of dollars in economic loss annually to no less than 3 other Gulf Coast states (TX and its shrimping industry, MS and its tourism/fisheries, and AL and its seafood processing/distribution industry)

Pros;

1. None
2. This is what CPRA has to offer

3. CPRA uses slick soundbites and marketing to push these projects forward to convince the Louisiana public and Legislature to allow them to dole out contracts for over \$2 billion in precious and limited coastal restoration dollars on these projects.

---

**Concern ID: 61719**

**It would take 20 years for the Project to create land.**

**Response ID: 16168**

The commenter's concern regarding the timeline required for land building was considered in the Draft EIS in Chapter 4, Section 4.2 Geology and Soils. A discussion has been added to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS. In short, the diversion is projected to create 6,260 acres of land in Barataria Basin in its first 10 years of operation and 12,800 acres by 20 years of operation.

---

**Concern ID: 61812**

**Commenters expressed concern that the proposed Project would have adverse water quality impacts in the Barataria Basin due to the introduction of nitrate and phosphate from the Mississippi River. Several commenters questioned whether the proposed Project would create harmful algal blooms and hypoxia in the Barataria Basin similar to the hypoxic "dead zone" in the Gulf of Mexico that exists due to nutrients in Mississippi River waters. One commenter expressed concern that the EIS does not adequately assess the potential for the proposed Project to create algal blooms and hypoxia in the basin, other than acknowledging it.**

**Response ID: 16425**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA's Mississippi River/Gulf of Mexico Hypoxia Task Force "Hypoxia 101" webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone "water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen" (<https://www.epa.gov/ms-htf/northern-gulf-mexico-hypoxic->

[zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.\)](#)

Dissolved oxygen concentrations associated with the Applicant's Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.5.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section is included in Section 4.5.5.3 in Surface Water and Sediment Quality and has been added to Section 4.5.5.4.2 Applicant's Preferred Alternative of the Final EIS. Finally, the EIS acknowledges the potential for major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) if warranted, in the Barataria Basin during Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the

proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61852**

**The cost per acre of marsh creation by the diversion is far higher than a corresponding alternative of marsh creation through the use of dredged material. Marsh creation through a diversion takes 50 years unlike marsh creation through dredging. In addition, brackish/salt marshes (which would be created by dredging) are more resilient than freshwater marshes, and thus marsh created through dredging would be a more sound investment of restoration funding than a sediment diversion.**

**Response ID: 16617**

The timing of marsh benefits created by the proposed diversion was considered in the Draft EIS in Chapter 4, Section 4.6.5 Wetland Resources, Operational Impacts. In response to these comments, additional detail has been added regarding the resiliency of fresh marsh compared to brackish marsh in the Final EIS, Sections 4.6.5.1.2.3 Soil Shear Strength and 4.6.5.1.2.4 Land Accretion. Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

While the commenters suggest that marsh creation through dredging would cost less than the proposed Project, the LA TIG does not believe that comparing the costs of a sediment diversion to marsh creation projects using dredged material is relevant for several reasons. Most importantly, as explained in the LA TIG's Restoration Plan, the goal of the Project is to create a long-term sustainable ecosystem through the reestablishment of deltaic process. Marsh creation through the use of dredged material would not bring fresh water or nutrients to the basin on an ongoing basis. The benefits of marsh created with dredged material would diminish over time without maintenance in the form of additional pumping events due to subsidence and sea-level rise; thus, the temporal nature of Project benefits in the absence of periodic maintenance would also be very different. The costs and benefits of the Project were fully considered by the LA TIG and are discussed in the Draft Restoration Plan in Section 3.2.1.2 Cost to Carry Out the Alternative.

---

**Concern ID: 61908**

**Commenters suggested that there will be detrimental impacts on the tourism economy and on restaurants, which are partly dependent on fisheries in the Barataria Basin. Commenters express concerns about adverse effects on Louisiana’s attractiveness as a fishing area and place for swamp tours and authentic seafood.**

**Response ID: 16238**

EIS Chapter 4, Section 4.16.5.2 in Recreation and Tourism describes how the MBSD Project would impact the tourism economy that is dependent on fisheries. Relative to the No Action Alternative, the proposed Project would cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts on these species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips. As described in the EIS, these changes would not substantially impact the broad tourism economy, which includes more than fisheries.

While availability of shrimp and oysters from the basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant’s Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant’s Preferred Alternative than under the No Action Alternative.

This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

---

**Concern ID: 61927**

**The environmental justice aspects of the Project need further review because of the increase in flood conditions that would have disproportionate impacts on low-income or minority communities, including an American Indian village, outside of federal levee protection. These disproportionate impacts include devastating impacts on community culture.**

**Response ID: 16276**

The issues raised by the commenters were considered in the Draft EIS. The EIS Chapter 4, Section 4.15 Environmental Justice discusses potential impacts of the proposed Project on low-income and minority populations.

In addition, since the release of the Draft EIS, CPRA has engaged the public through outreach meetings with the communities projected to be impacted by the MBSD, including Grand Bayou, to solicit input on mitigation strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts undertaken to better understand and address potential impacts on low-income and minority populations, including cultural impacts, are discussed in Chapter 7 of the Final EIS. Refer to

---

the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62014**

**The proposed MBSD Project would reduce tax revenue for the parishes located in the impacted area and the funds to support vital services in these areas.**

**Response ID: 16211**

The EIS considers and describes impacts on tax revenue in Chapter 4, Section 4.13.4 and 4.13.5 in Socioeconomics. There is also a discussion of Public Services and Utilities in this chapter (Section 4.13 Socioeconomics). As described, the proposed Project construction would have minor to moderate short-term benefits on sales and use taxes in local jurisdictions and the state associated with construction spending. Negligible to minor permanent adverse impacts on tax revenues from sales and use taxes, including associated with impacts on commercial fishing activities, as well as property tax collections associated with reduced property values are anticipated in Plaquemines Parish due to operation of the proposed Project. Potential adverse effects on utilities associated with reduced property taxes are also anticipated during the operations phase of the proposed Project.

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the**

---

**favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review,

---

Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62078**

**The proposed MBSD Project would cause the loss of Louisiana shrimp, oyster, crab and finfish production which would impact the seafood based supply chain of southern Louisiana, including corresponding impacts on restaurants in New Orleans and southern Louisiana.**

**Response ID: 16243**

The impacts raised by the commenters were considered in the Draft EIS. The EIS acknowledges in Chapter 3, Section 3.14.7 in Commercial Fisheries that the seafood industry represents a major source of jobs and income in Louisiana, which includes commercial harvesters, seafood processors and dealers, seafood wholesalers and distributors, and retail sales. Chapter 4, Section 4.14 Commercial Fisheries discusses regional economic impacts and community impacts on the shrimp, oyster, crab, and finfish fisheries, noting that communities with a high reliance on these landings may be most heavily impacted, and that indirect effects may include impacts to fish license holders, crew, dealers, suppliers, and seafood processors. While availability of shrimp and oysters from the basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's Preferred Alternative than under the No Action Alternative. This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

---

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62084**

**Commenters believe that the proposed MBSD Project would cause economic loss annually to other Gulf Coast states. The Mississippi Gulf Coast seafood and fishing industry would be devastated.**

**Response ID: 16248**

Chapter 3, Section 3.1.1 Project Area of the Draft EIS identifies the analysis area for the EIS. This is the area in which the Project is anticipated to have discernable effects. For socioeconomic impacts, the EIS identifies the area of potential impacts as the 10-parish Project area due to indirect socioeconomic impacts. Most impacts would likely be concentrated in Plaquemines, Lafourche and Jefferson Parishes, Louisiana. For Commercial Fisheries, the Project area includes two basins (the Barataria Basin and a portion of the Mississippi River Basin). The proposed Project is not anticipated to have discernable effects on aquatic resources outside of the Project area. Commercial fishermen that travel to Barataria Basin to fish for species that would be adversely affected, particularly shrimp and oysters, could also be adversely affected by the proposed Project. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Final EIS has been revised to acknowledge this. Those commercial fishermen would be eligible to participate in the fishery mitigation programs discussed in the Mitigation and Stewardship Plan (Appendix R1 to the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

---

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project. Impacts related to subsistence activities are discussed in Section 4.15 Environmental Justice.

---

**Concern ID: 62221**

**The Project would not provide substantial protection from hurricanes or storm surge, nor would storm surge protection be provided in a timely manner. The area most likely to experience some increase in protection would be subject to increased water levels from diversion operations. The current diversion Project needs to be reengineered to create meaningful storm surge protection. The Project is a misuse of funds based on what the diversion would do versus what it purports to do, in part due to the Mississippi River not having enough sediment to build substantial land.**

**Response ID: 15756**

While the proposed Project would impact storm surge, the purpose and need of the Project is not storm surge protection. As described in the Draft EIS in Chapter 1, Section 1.4 Purpose and Need, the purpose of the Project is to restore injuries caused by the DWH oil spill and help restore habitat and ecosystem services injured by the spill by reestablishing deltaic processes. However, as described in the Draft EIS in Chapter 4, Section 4.20.4 Public Health and Safety, the Project would have the ancillary benefit of storm damage risk reduction on communities north of the diversion due to the creation and maintenance of wetland habitat within the delta formation area; the increase in topography and land acreage would induce greater hydraulic friction and resistance, reducing the inland extent of storm surge and limiting wave heights in some communities north of the diversion, as compared to the No Action Alternative. The EIS acknowledges that storm surge and wave height reduction benefits for some communities north of the diversion would not be instantaneous, but that these benefits would increase over time as more land is created and maintained within the delta formation area. The EIS also acknowledges that some of the same communities that would experience storm surge reduction benefits, such as Lafitte, would experience an increase in non-storm inundation frequency due to increased water levels from diversion operations. At the same time, operation of the Project would have permanent, minor to moderate, adverse impacts on storm hazards in communities south of the diversion, with anticipated increases in storm surge of up to 1.7 feet near Myrtle Grove (as compared to the No Action Alternative). Section 4.20.4.2.2.2 in Public Health and Safety of the Final EIS has been revised to include additional information and figures further explaining the impacts of the Project on storm surge and wave height.

The EIS recognizes the role of sediment load in land building. The river still carries a massive sediment load, but not as massive as it historically carried. As explained in Chapter 3, Section 3.4.2.5 in Surface Water and Coastal Processes, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes as described in Section 3.4.2.5 Sediment Transport. The Delft3D Basinwide Model used

Mississippi River sediment loads when computing the sediment load that would be delivered to the Barataria Basin. This is described in detail in the EIS, Appendix E Delft3D Modeling, Section 5.2.2.

---

**Concern ID: 62493**

**The proposed Project operations will flood two cemeteries in the towns of Lake Hermitage and Deer Range, Louisiana.**

**Response ID: 16451**

The potential flooding impacts raised by the commenters were considered in the Draft EIS. According to the Louisiana State Historic Preservation Office (LA SHPO) database, the Lake Hermitage cemetery is identified as the Bieber Cemetery and the Deer Range Cemetery in Suzy Bayou is identified as the Deer Range Cemetery. As compared to the No Action Alternative, operation of the proposed Project would increase tidal flooding and storm surge in communities outside of federal levees within 20 miles of the outfall area, including the towns of Lake Hermitage and Suzie Bayou South (Deer Range) in which these cemeteries are located. Such events may result in sediment deposition (burial) and/or erosion of soils at each of these cemeteries. Chapter 4, Section 4.4.4 in Surface Water and Coastal Processes and Section 4.13.3.1 in Socioeconomics detail these impacts.

---

**Concern ID: 62777**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).**

**Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the

final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62792**

**CPRA is using soundbites and marketing to convince the Louisiana public and legislature to allow them to dole out contracts for over \$2 billion in limited coastal restoration dollars on these projects. In reality, Barataria Bay is already connected to the river with existing diversions at Davis Pond, West Pointe à la Hache, and Naomi.**

**Response ID: 16373**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, the Draft EIS assesses the environmental and socioeconomic impacts of the proposed Project. To the extent construction spending would serve as an economic driver, those anticipated impacts are discussed in Chapter 4, Section 4.13.4.2 Economy, Employment, Business, and Industrial Activity. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Delft3D Basinwide Model, which was used in developing the proposed MBSD Project EIS, accounts for the existing diversions at Davis Pond, West Pointe a la Hache, and Naomi (see Appendix E [Delft3D Modeling], Section 5.1.1 of the EIS).

The USACE is neither a proponent nor an opponent of the proposed Project. It will make its decisions regarding the proposed Project based on the evaluations in the EIS and considering public comments and its determinations with respect to the public interest review, compliance with the CWA Section 404(b)(1) guidelines, compliance with other laws and Executive Orders, whether the Project would affect the ability of Corps projects to meet their authorized purposes and whether the project is injurious to the public interest. USACE's decisions will

---

not be based in any respect on CPRA's public communications regarding the proposed Project.

---

**Concern ID: 62986**

**The Project would drive decreases in salinity that would reduce the overall health, survival, and reproduction of bottlenose dolphins that reside in the Barataria Basin, a species that was negatively affected by the Deepwater Horizon oil spill (NMFS, 2013). Some commenters felt that because of this, the Project should either not move forward or its operation should be altered.**

**National Marine Fisheries Service (NMFS). 2013. Roy Crabtree (NMFS) to Elizabeth Davoli (CPRA). <https://s3.documentcloud.org/documents/726710/national-marine-fisheries-service-comments-on.pdf>**

**Response ID: 16701**

The concerns raised by the commenters about the projected decreases in salinity and resulting effects on Barataria Bay dolphins were considered in the Draft EIS. More specifically, Chapter 4, Section 4.11.5.2 in Marine Mammals of the EIS acknowledges that the proposed Project would likely have significant, adverse impacts to Barataria Basin dolphins, a species that suffered significant impacts from the DWH oil spill. This section also discusses the physiological changes caused by exposure to low-salinity water, the duration of those changes that leads to mortality, and the anticipated mortality of a large portion of the dolphin population in the Barataria Basin within the first decade. These sections of the EIS provide a more in-depth analysis of potential impacts to dolphins than the letter cited by the commenter.

The concerns raised by the commenters were also considered in the LA TIG's Draft Restoration Plan (see Section 3.2.1.5 [Collateral Injury]); the Final Restoration Plan has been edited consistent with changes made to the Final EIS and see below regarding new, related content included in Appendix R.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources, like dolphins, that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit

many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible (if it is possible), the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins in Louisiana (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of

its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63018**

**The proposed Project would cause land loss further out from the diversion structure and also destroy the brackish/saline marsh grasses, which provide storm surge protection, and replace them with less surge-resistant freshwater plants.**

**Response ID: 16030**

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the Draft EIS acknowledged that the fresh water transported by the diversion may result in the loss of some wetlands in the immediate outfall area due to inundation during the initial period following commencement of operations. Further, the Delft3D Basinwide Model projects inundation depths in the critical vegetation parameters to simulate vegetation losses and gains as a result of the diversion, as well as other sources of inundation (such as subsidence and sea-level rise).

However, salt- and brackish marsh vegetation would not be subjected to direct mortality due to the lower salinity of transported water. While saline and brackish species are associated with salinity ranges of greater than 18 ppt and between 18 and 5 ppt, respectively (see Chapter 3, Section 3.6.1.2 in Estuarine Wetlands of the Draft EIS), brackish marsh can fluctuate from fresh to saline conditions depending on tidal movement, and species such as *Spartina alterniflora* are common in both salt and brackish marsh (Conner and Day 1987). Salt is a stressor affecting osmosis and cell structure. Plants occurring in saline and brackish marshes have developed adaptations to either exclude uptake or excrete salt; however even salt marsh species grow better at lower salinities (Mitsch and Gosselink 2000; Teal et al. 2012). However, as described in Chapter 4, Section 4.6.5.1.2.1 Salinity of the Final EIS, in some areas of the Barataria Basin, the seasonal change in salinity due to operation of the diversion above base flow (primarily during spring and early summer) and lower-flow conditions during fall and winter months would be large enough to temporarily change the wetland hydrology from a brackish to fresh or from a saline to brackish system. In the southern basin, where salt marsh predominates, peak salinities would be within the range for salt marsh vegetation under the No Action and Applicant's Preferred Alternatives. Additional analysis regarding the potential impact of hurricanes and saltwater inundation on the extent of

---

wetlands in the Project area during operations has been added to Chapter 4, Section 4.6.5.1.2 Applicant's Preferred Alternative of the Final EIS.

The MAM Plan includes monitoring for inundation related effects on marsh vegetation in the Project area. The MAM Plan provided in the Draft EIS Appendix R was submitted by CPRA and represents a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63080**

**The Corps and the TIG have circumvented a legal process intended to conserve marine mammals and protect ecosystems by obtaining a Congressionally-mandated MMPA waiver for the proposed Project. The waiver does not establish a quota for how many dolphins can be taken by the proposed Project, and it is clear that the level of take for this stock will be grossly unsustainable, in clear violation of the MMPA (absent BBA-18). The legislative waiver, quite simply, provided Congressional permission to break the law. It is critical for the protection of marine mammals that such a legislative waiver be a one-off occurrence.**

**Response ID: 16599**

The U.S. Army Corps had no role in seeking a Marine Mammal Protection Act waiver for this Project from Congress, nor did any federal agencies on the LA TIG. CPRA sought the waiver. Title II, section 20201 of the Bipartisan Budget Act of 2018 provides: "(a) In recognition of the consistency of the Mid-Barataria Sediment Diversion, Mid-Breton Sound Sediment Diversion, and Calcasieu Ship Channel Salinity Control Measures projects, as selected by the 2017 Louisiana Comprehensive Master Plan for a Sustainable Coast, with the findings and policy declarations in section 2(6) of the Marine Mammal Protection Act (16 U.S. C. 1361 et seq., as

amended) regarding maintaining the health and stability of the marine ecosystem, within 120 days of the enactment of this section, the Secretary of Commerce shall issue a waiver pursuant to section 101(a)(3)(A) and this section to Section 101(a) and Section 102( a) of the Act, for such projects that will remain in effect for the duration of the construction, operations and maintenance of the projects. No rulemaking, permit, determination, or other condition or limitation shall be required when issuing a waiver pursuant to this section. (b) Upon issuance of a waiver pursuant to this section, the State of Louisiana shall, in consultation with the Secretary of Commerce: (1) To the extent practicable and consistent with the purposes of the projects, minimize impacts on marine mammal species and population stocks; and (2) Monitor and evaluate the impacts of the projects on such species and population stocks.”

The National Marine Fisheries Service issued the waiver in March 2018. Since that waiver in 2018, CPRA has not requested any additional waivers for coastal restoration projects. More information on the waiver can be found at <https://www.fisheries.noaa.gov/action/marine-mammal-protection-act-waiver-select-louisiana-coastal-master-plan-projects>.

---

**Concern ID: 63096**

**Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).**

**Response ID: 16699**

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA’s plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners’ properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner’s property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and

---

the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:9763**

Dan Scheiman

Dear U.S. Army Corps of Engineers, New Orleans District,

Get on the right side of environmental history. Think of all the amazing natural habitats that exist today because they were protected by citizens and conservation organizations who stopped your plans to drain and ditch. The Corps' focus should change to conservation and restoration.

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

\*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

\*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

As the project advances, I urge federal and state decision-makers to consider the following:

\*Commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders.

\*Work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

Thank you for considering my comments.

Sincerely,

Dan Scheiman

Little Rock, AR 72205

---

**Concern ID: 61741**

**Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40 percent of all migratory birds in North America spend a part of their life in coastal Louisiana.**

**Response ID: 16162**

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment. The use of Louisiana's coastal habitats by a large diversity of birds is discussed in Chapter 3, Section 3.9.3 in Terrestrial Wildlife of the EIS. The benefits that the Project would provide to birds are discussed in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.12 Threatened and Endangered Species of the EIS.

---

**Concern ID: 61756**

---

**The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.**

**Response ID: 15891**

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

---

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

---

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63356**

**All the amazing natural habitats that exist today are because they were protected by citizens and conservation organizations who stopped the USACE's plans to drain and ditch. The USACE should change its focus to conservation and restoration.**

**Response ID: 16318**

The commenter's input is noted. The mission of the USACE is outside the scope of this EIS.

**Correspondence ID:9831**

Ellen Skarin

Dear U.S. Army Corps of Engineers, New Orleans District,

I live in Washington state now, but I grew up in the Ohio Valley. I have been disappointed for many years as more wetlands were lost every year. I currently live on a bluff above a small estuary, and I see almost every winter when storms erode unprotected beaches and bluffs on the Hood Canal. Ten landowners here have protected this small area against future construction - so much more could be done with the Mississippi delta!

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend.

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

\*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

\*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

As the project advances, I urge federal and state decision-makers to consider the following:

\*Commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders.

\*Work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

Thank you for considering my comments.

Sincerely,

Ellen Skarin

Hansville, WA 98340

**Concern ID: 61741**

**Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40 percent of all migratory birds in North America spend a part of their life in coastal Louisiana.**

**Response ID: 16162**

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment. The use of Louisiana's coastal habitats by a large diversity of birds is

---

discussed in Chapter 3, Section 3.9.3 in Terrestrial Wildlife of the EIS. The benefits that the Project would provide to birds are discussed in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.12 Threatened and Endangered Species of the EIS.

---

**Concern ID: 61756**

**The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.**

**Response ID: 15891**

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council

websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public

---

through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62428**

**Commenter gave example of local landowner efforts to protect local estuary in Washington state, noting that so much more could be done with the Mississippi Delta.**

**Response ID: 15872**

Comment noted. The scope of this EIS is limited to Louisiana, particularly the Barataria Basin and Mississippi River birdfoot delta.

Lynne Glaeske

Dear U.S. Army Corps of Engineers, New Orleans District,

More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend.

Given the environmental damage that Louisiana has sustained in recent years, and the damage expected in the near future from climate change, I would think that both the citizens of Louisiana, and the US Army Corps of Engineers should be focused on protecting human communities and wildlife habitat.

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

\*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

\*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

As the project advances, I urge federal and state decision-makers to consider the following:

\*Commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders.

\*Work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

Thank you for considering my comments.

Sincerely,

Lynne Glaeske

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62427**

**Given the environmental damage that Louisiana has sustained in recent years, and the damage expected in the near future from climate change, the commenter thinks that both the citizens of Louisiana and the US Army Corps of Engineers should be focused on protecting human communities and wildlife habitat.**

**Response ID: 15964**

The EIS analyses utilized the best information and data available to USACE and the LA TIG at the time of writing. USACE is neither a proponent nor an opponent of the proposed Project. USACE's role is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under Section 404 of the CWA and Sections 10 and 14 of the RHA of 1899.

As explained in its Restoration Plan, the LA TIG's support for the proposed Project stems from its obligations under OPA to restore for the natural resource injuries incurred by the DWH oil spill. As an oil pollution incident, the DWH oil spill is subject to the provisions of OPA, 33 United States Code (USC) § 2701 et seq. A primary goal of OPA is to make the environment and public whole for injuries to natural resources, and services resulting from incidents involving an oil discharge or substantial threat of an oil discharge. The DWH Trustee Council and its Trustee Implementation Groups were established under the authority of OPA. The NRDA regulations under OPA (15 CFR § 990) establish a process for restoration planning, including the development and evaluation of restoration alternatives and the development of Restoration Plans. These OPA NRDA regulations establish criteria for identifying and evaluating restoration alternatives (see Section 3.1). Restoration activities under OPA are intended to return injured natural resources and services to their baseline condition (that is, primary restoration), and to compensate the public for interim losses from the time of the incident until the time resources services recover to baseline conditions (that is, compensatory restoration). To meet these goals, the restoration activities need to produce benefits that are related to or have a nexus (that is, connection) to the natural resource injuries and service losses resulting from the spill.

Form Letter 10

Dear U.S. Army Corps of Engineers, New Orleans District,

The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which birds depend.

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

I ask that the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

\*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

\*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

Thank you for considering my comments.

Sincerely,

Susan Grant

Eden Prairie, MN 55346

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

**Correspondence ID:12162**

Charli Lau

Dear U.S. Army Corps of Engineers, New Orleans District,

The Deepwater Horizon oil spill, along with a variety of other human activities, has caused the wildlife and habitats of Louisiana, specifically the Barataria Basin, significant distress. Many species of plants and animals are in a perilous situation- but just as careless human activity has caused this, certain thoughtful and diligent human activities can help alleviate much of this.

As a citizen of this nation, and a neighbor to Louisiana, it is my sincere hope that the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

\*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

\*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

Thank you for considering my comments.

Sincerely,

Charli Lau

Guthrie, OK 73044

---

**Concern ID: 62675**

**Commenters noted that the impacts of the DWH oil spill on wetlands, wildlife, birds, communities, and land loss are still felt by this region and in particular, Barataria Basin where 95 percent of the oiling occurred. These impacts are exacerbated by decades of saltwater intrusion, sea-level rise, and subsidence.**

**Response ID: 16497**

The impacts of the DWH oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss of the EIS notes the ongoing impact of the DWH oil spill on wetlands, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species of the EIS provides an overview of the adverse impacts of the oil spill on key aquatic species within the Barataria Basin.

The LA TIG agrees with the commenters that the impacts of the DWH oil spill are significant in this region and thus the LA TIG is committed to continuing to plan and implement significant restoration projects like the LA TIG's Preferred Alternative in the Restoration Plan. The LA TIG's Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin. These habitats are critical components of the broader northern Gulf of Mexico ecosystem and suffered the greatest degree of oiling in Louisiana due to the DWH oil spill.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

S. Eisert

Dear U.S. Army Corps of Engineers, New Orleans District,

Please do all you can to restore and preserve the Brataria Basin, a place critical to the balance of nature - and thus us.

The major oil spill 11 years ago is still impacting the people of the area as well as threatening nearly half of our migratory birds. They are simply the tip of the iceberg we can see – but eventually won't be able to see if serious steps aren't taken. Once this natural balance is broken, the fallout from indifference now will cost us even more in the years ahead – in actual dollars.

There are so many things in this country that we now need to restore and repair – from infrastructure to support for struggling and marginalized citizens to crises in mental health issues, which often connect to larger personal tragedies like addiction, gun issues and suicide and to immigration issues and more. We have thought there was little cost to mild indifference to these matters. So now we are at a real tipping point in this country on many issues. The bill has come due in many arenas. And I understand that the list of priorities is long. But we have no choice but to deeper, work harder, sacrifice more – or it all and we too will be gone.

The Mid-Baratari Sediment Diversion is just one of those must-dos. The ecosystem and the people who live there are still struggling from the massive oil spill.

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and, as I mentioned earlier, there is a massive impacet on all migratory birds in North America which spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential to rebuild vital environments these birds depend. But more than birds that depend on what's done in this area where there has been costal loss, displaced communities and other impacted wildlife.

So please support the preferred alternative in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

>>> Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

>>> Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

As the project proceeds, federal and state decision makers need to do the following:

>>> Commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders.

>>> Work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

Our planet is now very fragile and growing more so by the day, so these are critical issues. And everything is connected— wildlife, people, even oxygen, whether we can see and understand those connections at this moment or not.

This is a system that has taken hundreds of thousands of years to balance. If we don't actively restore, some day soon we risk unknowingly pulling out the final lynchpin that holds it together.

I hope you will deeply consider these points as you proceed.

Sincerely,

S. Eisert

Redmond, WA 98052

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and

---

Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

**Correspondence ID:12900**

Michael Wiseman

My opinion is that natural gas exploration started the problem with coastal erosion so therefore, more money from the oil and gas industries needs to be allocated for continued restoration efforts. There are chemicals in the water that may also be contributing to eroding coastlines and of course damage to the ecosystem. Diverting freshwater is not going to help solve those problems. Marine life will forever be harmed because of that, so fishermen are going to need continued, monetary support for years to come because the industry as a whole has been severely impacted because of man-made accidents.

---

**Concern ID: 61727**

**One major cause for the loss of wetlands over the last 50 or 60 years is mining and drilling operations that were not required by regulatory agencies to replace the marsh loss they caused. So money from the oil and gas industries should be allocated for continued restoration efforts.**

**Response ID: 16027**

The impacts of the oil and gas industry on wetland loss in the Barataria Basin were described in the Draft EIS. This EIS serves as the environmental review required by NEPA to inform USACE's decisions on the Section 10/404 permit and Section 408 permission and the LA TIG's OPA decision regarding funding the construction of the proposed MBSD Project via damages paid by BP following the DWH oil spill (see Section 1.6.1 The OPA and DWH NRDA Decisions of the EIS). USACE requires compensatory mitigation in the form of replacement habitat for its Section 10/404 permits (including those involving oil and gas exploration and production) that will result in wetland losses.

---

**Concern ID: 61819**

**Commenters expressed concern that the proposed Project would have adverse impacts on Barataria Basin's water quality, wetlands, fisheries, recreational uses, and eroding coastlines due to chemicals, oil and hazardous waste, and/or pollutants in the Mississippi River that would be routed to the Barataria Basin via the proposed diversion.**

**Response ID: 16429**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality of the Draft EIS, the segment of the Mississippi River where the proposed diversion river intake structure would be located (subsegment LA070301\_00) fully supports its designated uses. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. LDEQ's water quality assessment indicates that regulated substances are not present in concentrations that would cause a water quality impairment at the location of the intake structure. In response to this concern expressed by commenters, a new subsection has been added to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of nearby industrial facilities on river water routed to the basin during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills from Industrial Sites. As described in the EIS, Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design Information, in the event of oil spills and

other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed.

---

**Concern ID: 62777**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).**

**Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

---

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take

advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. **Correspondence ID:12948**

Floyd Robin

I have been a commercial fisherman for most of my 80 years of age. I have looked over the proposed mitigation measures and I would be interested in the gear improvements grant program. Even though I'm 80 years old, I feel good and I'm not yet ready to retire, but I would need to improve the equipment on my boat to withstand stronger waters should I need to go out further and chase shrimp. I'd also need financial assistance thereafter to maintain the new equipment until I can make a decent profit to sustain myself.

**Correspondence ID:13876**

Form Letter 11

CRAB FISHERMEN ARE BEING LEFT OUT!!! The proposed mitigation measures mention nothing about crabbers and how we'll be impacted by this diversion. We would need new, bigger boats to stay in business too. And why doesn't CPRA and these other agencies dredge instead of implementing this diversion project? Dredging builds land too and doesn't hurt us fishermen. PLEASE HELP THE CRABBERS.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

---

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 63136**

**Commenters were concerned that proposed mitigation does not include measures for crab fishermen.**

**Response ID: 16520**

As noted in Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS, impacts on blue crab from the Project are anticipated to be neutral to beneficial. In addition, as stated in Section 4.14 Commercial Fisheries impacts on the blue crab fishery are anticipated to be negligible to minor beneficial. This determination considers potential impacts on blue crab abundance as well as the anticipated response from the commercial fishing industry. In response to public comments, CPRA has included \$1 million in funding for a crab marketing and outreach program and improvements to crab fishing gear as part of the Final Mitigation and Stewardship Plan (see Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA)

---

Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:15267**

Sandy Sanders

Dear U.S. Army Corps of Engineers, New Orleans District,

The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which 40%-400 species-of migratory birds depend.

I urge the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group to take the following significant steps, both immediate and ongoing, toward addressing this crucially important ecological crisis:

- 1) Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.
- 2) Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.
- 3) Develop a robust adaptive management program incorporating knowledge gained from monitoring the project over time and taking into consideration input from key stakeholders.
- 4) Work with potentially impacted communities to develop ideas and proposals for adaptation and mitigation.
- 5) Be as detailed and transparent as possible throughout the mitigation planning process.

Thank you for considering my concerns and request on behalf of both birds and humans, who are an integral, interdependent part of the web of life, whether we believe it or not. Whatever hurts other species in the web, hurts us. Even if mainly for the sake of self-preservation, this vital habitat must be restored. Morally and ethically, its also the right thing to do.

Sincerely,

Sandy Sanders

Lawrence, KS 66044

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public

---

through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement**

---

**fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Dear U.S. Army Corps of Engineers, New Orleans District,

PLEASE support the restoration of the Mid-Barataria Sediment Diversion - it is essential to rebuild vital habitats on which these birds depend.

PLEASE:

\*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

\*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

Thank you for doing everything within your power to restore this habitat that helps HUMANS as well as wildlife.

Thank you.

Sincerely,

Julie Wagner

Branford, CT 06405

Marta Bechtel

Dear U.S. Army Corps of Engineers, New Orleans District,

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend.

I support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group to work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

Thank you for considering my comments.

Sincerely,

Marta Bechtel

Harrisonburg, VA 22801

Leda Beth Gray

Dear U.S. Army Corps of Engineers, New Orleans District,

I'm writing to ask you to please select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion, and to fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan. This will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend. Birds are a part of the natural heritage of all Americans!

In addition I am asking the following- -

that the Army Corps of Engineers commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders; and to

work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the whole mitigation planning process.

Thank you for considering my comments.

Sincerely,

Leda Beth Gray

Blue Hill, ME 04614

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision**

---

**making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:16950**

Kaitlyn Wright

Dear U.S. Army Corps of Engineers, New Orleans District,

The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which migratory birds depend. Bird populations are more vulnerable than ever with continued loss of habitat from human developments and climate change combined.

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

\*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

\*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

As the project advances, I urge federal and state decision-makers to consider the following:

\*Commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders. Monitoring is an essential part of ecological restoration because it gives information about the quality of the habitat and the longevity of the impacts both positive and negative.

\*Work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process. Communicating with people from diverse backgrounds will bring new solutions to practical issues.

Thank you for considering my comments.

Sincerely,

Kaitlyn Wright

**Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40 percent of all migratory birds in North America spend a part of their life in coastal Louisiana.**

**Response ID: 16162**

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment. The use of Louisiana's coastal habitats by a large diversity of birds is discussed in Chapter 3, Section 3.9.3 in Terrestrial Wildlife of the EIS. The benefits that the Project would provide to birds are discussed in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.12 Threatened and Endangered Species of the EIS.

---

**Concern ID: 61756**

**The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.**

**Response ID: 15891**

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

---

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62827**

**Monitoring is an essential part of ecological restoration because it gives information about the quality of the habitat and the longevity of positive and negative Project impacts.**

**Response ID: 16659**

CPRA and the LA TIG acknowledge that monitoring is critical for understanding the positive and negative impacts of the Project over the long term. Accordingly, the importance of monitoring was considered as part of the LA TIG's Restoration Plan and in the MAM Plan included with the Draft EIS (Appendix R2). CPRA and its LA TIG partners have further revised and refined this MAM Plan prior to issuance of the Final EIS partially in response to public comments. As part of the Project implementation, CPRA would undertake substantial monitoring as explained in the MAM Plan (see Appendix R2 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61758**

**Commenter recommended communicating with people from diverse backgrounds to bring new solutions to practical issues.**

**Response ID: 15894**

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan.

As part of the Draft EIS process, USACE coordinated with the SELA Voice organizations to understand the needs of the local communities regarding the best ways to reach out to these communities prior to the release of the Draft EIS and during the public comment period. Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the virtual public meetings. The Public Notice to announce the Draft EIS Notice of Availability, the Executive Summary for the Draft EIS, and the Executive Summary for the LA TIG's Draft Restoration Plan were translated into Spanish and Vietnamese. The consolidated pre-recorded public meeting presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage.

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in coastal restoration. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area, in an effort to reach out to individuals and communities to gather information and feedback related to the proposed MBSD Project. In addition, since the release of the Draft EIS CPRA has held numerous in public meetings with the communities impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS.

Paula Narbutovskih

Dear U.S. Army Corps of Engineers, New Orleans District,

Our wildlife is disappearing at an alarming rate. When they become extinct, they are not coming back. We humans must do everything in our power to protect the wild creatures. Do your part and rebuild the wetlands so vital to the survival of the birds who depend upon it.

Sincerely,

Paula Narbutovskih

Abiquiu, NM 87510

---

**Concern ID: 62892**

**The proposed MBSD Project would create wetlands supportive of birds (bald eagles, spring and fall migrants, waterbirds, and marsh birds) and other wildlife that are experiencing a high rate of coastal land (habitat) loss.**

**Response ID: 16191**

Chapter 4, Section 4.9.4.2 in Terrestrial Wildlife and Habitat of the Draft EIS, discussed the maintenance and creation of marsh that is projected to occur as part of the proposed Project, and identified that the net addition of wetlands would generally be beneficial to area birds. As identified in Section 4.12.3.2 in Threatened and Endangered Species of the Draft EIS, the creation and maintenance of wetlands could affect bald eagle aquatic foraging habitat and prey species, but would likely result in negligible effects on the bald eagle itself.

The potential benefits of the proposed Project to resources in the Gulf, including birds, are also described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan.

---

**Correspondence ID:18136**

Margie Parker

Dear U.S. Army Corps of Engineers, New Orleans District,

More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend.

I support the preferred alternative as outlined in the draft EIS for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

I ask the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group to choose the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

This will make a huge, positive difference for migrating birds and the local coastal communities.

Sincerely,

Margie Parker

Coupeville, WA 98239

**Concern ID: 61741**

**Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40 percent of all migratory birds in North America spend a part of their life in coastal Louisiana.**

**Response ID: 16162**

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment. The use of Louisiana's coastal habitats by a large diversity of birds is discussed in Chapter 3, Section 3.9.3 in Terrestrial Wildlife of the EIS. The benefits that the Project would provide to birds are discussed in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.12 Threatened and Endangered Species of the EIS.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed

Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:18707**

Ellea Concha-Leafequus

Dear U.S. Army Corps of Engineers, New Orleans District,

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana.

The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which many birds, resident and migratory, depend. Let's restore most of the bird habitat ruined by the Deepwater horizon spill. This includes vital fisheries and forested wetland ecotones.

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the vital ecosystem that was nearly destroyed by the US's largest oil spill. Ecosystem restoration is the difficult priority of my and the ACE efforts.

With that in mind, I ask the following of you, the U.S. Army Corps of Engineers and the Louisiana Trustee Implementation Group:

\*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

\*Fund the project sufficiently and completely (if no other funds can be added) from Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

\*Commit to developing a robust adaptive ecosystem management program that incorporates knowledge gained from monitoring biodiversity changes over time.

\* Consider inputs from key stakeholders. Eg:

\*Work proactively and collaboratively with impacted communities to develop their proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout these processes.

\*Incorporate Research results from the last 11 years and prior, to attempt as close to pre-spill Biodiversity Restoration as is possible as an end goal of habitat restoration.

\*Adaptive ecosystem management not only monitors water and nutrient cycles but adapts restoration and utilization by stakeholders to the changing climate, biodiversity, and utilization by Migrators and other stakeholders.

Thank you for considering my comments. Please keep me informed on the progress of this restoration and mitigation.

Sincerely,

Ellea Concha-Leafequus

Richmond, CA 94804

---

**Concern ID: 61741**

**Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40 percent of all migratory birds in North America spend a part of their life in coastal Louisiana.**

**Response ID: 16162**

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment. The use of Louisiana's coastal habitats by a large diversity of birds is discussed in Chapter 3, Section 3.9.3 in Terrestrial Wildlife of the EIS. The benefits that the Project would provide to birds are discussed in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.12 Threatened and Endangered Species of the EIS.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62833**

**CPRA should incorporate research results from the last 11 years and earlier to ensure that restored ecosystems attain close to pre-spill conditions.**

**Response ID: 16660**

The LA TIG's strategy for restoring the ecosystem impacted by the DWH oil spill to pre-spill conditions is the subject of the Deepwater Horizon Oil Spill Programmatic Damage Assessment and Restoration Plan and Programmatic Environmental Impact Statement (PDARP/PEIS). The PDARP/PEIS describes the Deepwater Horizon Oil Spill Natural Resource Damages Trustees', including CPRA's, ecosystem approach to restoration. The PDARP/PEIS also includes a robust Monitoring and Adaptive Management Framework for ensuring that the collective suite of restoration activities undertaken pursuant to the PDARP/PEIS meets the Trustees' restoration goals of fully restoring for injuries from the oil spill. That Monitoring and Adaptive Framework, which is described in Section 5.5.15 and in Appendix 5.E of the PDARP/PEIS, incorporates research undertaken both before and after the oil spill. Additionally, in September 2021, the LA TIG released a Monitoring and Adaptive Management Strategy that describes the LA TIG's objectives, processes, and priorities to support restoration planning, implementation, and evaluation through monitoring and adaptive management activities applicable to all LA TIG activities. That Strategy improves the LA TIG's ability to achieve effective and efficient restoration of natural resources injured by the DWH oil spill in the Louisiana Restoration Area—with more than \$200 million from the DWH monitoring and adaptive management funding allocation dedicated to that effort.

---

**Concern ID: 62834**

**Adaptive management should adapt restoration actions to incorporate human utilization response to climate and biodiversity changes.**

**Response ID: 16661**

The Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS) considered the adaptive management issues raised by the commenters. The MAM Plan calls for monitoring of the socioeconomic parameters set forth in the State's System Wide Assessment and Monitoring Program (see Section 3.7.3.24 [Socio-economic Data] of the MAM Plan in Appendix R2 to the Final EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances

where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation and stewardship strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project

alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:18890**

Kenneth Smith

As a home owner I get flooded 12 to 15 times a year and some times 5 to 6 days at a time. When that happens I do not get mail or garbage pickup, and not able to leave my home. So with this said every thing I have is here. Please do not impose more water on me, I do not have the money to move. I am not for the plan. Pump in the sand from the river. The tide never brings land in but when it goes out it takes land with it. Fix the beach first to slow down the tide, that's the fix.

---

**Concern ID: 61970**

**The only alternatives in the EIS are diversions at different flow rates. The EIS has not listed other possible methods on building land in the Barataria Basin. One alternative is to study the creation of barrier islands and compare the result with the diversion alternative. Also consider fortifying the barrier islands with sheet piles, boulders, and rocks, and dam all pipeline canals and washed-out marsh openings with concrete dams.**

**Response ID: 15972**

The Draft EIS considered barrier islands as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.4 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS. While barrier islands play a critical role in reducing land loss, they are not intended or designed to transport sediment, fresh water, or nutrients.

Past investments through a multitude of restoration programs have resulted in the restoration of every major barrier island in the Barataria Basin. CPRA's Coastal Master Plan includes programmatic barrier island restoration to support future maintenance of the restored islands. However, CPRA has stated that fortifying barrier islands with hard structures is not feasible.

---

**Concern ID: 62224**

**Communities like Happy Jack, Lake Hermitage and Myrtle Grove, some of which have homes that are not above the new base flood elevation, already experience some degree of flooding which would be made worse by the diversion. This would affect the ability of residents to access and enjoy their homes and communities.**

**Response ID: 15757**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discuss the anticipated increased flooding impacts outside of federal levee systems to be caused by the operation of the diversion. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4)

---

providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes, which would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Donald Rice

Dear U.S. Army Corps of Engineers, New Orleans District,

The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which local economies and wildlife like fish and birds depend.

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group to please select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and fund the project using Deepwater Horizon settlement monies as outlined in the Restoration Plan.

This project has the potential to preserve the Louisiana bayou for future generations while supporting wildlife critical to the local economy and providing a buffer for flooding of high population areas and the funding is available. This sort of opportunity is rare and can not be missed.

Thank you for considering my comments.

Sincerely,

Donald Rice

Barrington, RI 02806

Henry McAnespy

I live in Myrtle Grove and my home and businesses will be directly impacted by this diversion project. I am an oysterman and shrimper and my businesses have suffered enough. I'm at the point where I'm too old to start over, so the start-up assistance for AOC is not an option for me. Additionally, the mitigation measures for shrimpers aren't applicable to me necessarily because 1. I don't want a bigger boat outfitted with a chill cool system; 2. I'm close to retirement and 3. what's the point of even continuing to fish when all of the oysters and brown shrimp will be KILLED BY THE INFLUX OF FRESH WATER? What would help me is a COMPLETE BUYOUT of my property at the FAIR MARKET VALUE. I never thought I'd have to sell my property and businesses when I decided to settle here, but with this diversion I will have to. And when I say a complete buyout, I mean my businesses too and all of the expenses that come with that. And there needs to be complete equity and transparency when compensating commercial fishermen; there shouldn't be millions spent on studies. Lastly, since this project looks like it'll get approved, USACE, CPRA and other stakeholders NEED TO HIRE LOCAL LOUISIANANAS FOR THIS WORK. Just because we don't have degrees from Harvard doesn't mean that we're not capable of doing the work. HIRE LOCAL!

---

**Concern ID: 63096**

**Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).**

**Response ID: 16699**

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that

are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take

advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 64089**

**Commenters asked that the jobs that are created by construction of the proposed Project spur inclusive and equitable economic development. The Louisiana State and local economic development authorities should focus efforts through communication, recruitment, and training activities, into creating jobs for local residents, including minority residents. The same type of focused workforce development effort is likely necessary in order for these local jobs to translate into longer term economic benefits for affected communities. Work with the community to identify future needs of this workforce, including: providing adequate emergency and routine medical care for workers, facilitating the start and growth of small business to provide services to this workforce, and educating skilled workers who can later pivot to other jobs along our coast long after construction is complete.**

**Response ID: 16234**

With respect to the award of contracts, CPRA is required to follow the provisions of the Louisiana Public Bid Law, including those contained in Title 39, Chapter 17 (the Louisiana Procurement Code) and in Title 38, Chapter 10 (Public Contracts). CPRA has sought and regularly seeks engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS.

---

**Correspondence ID:19589**

Darlene McGarry

I follow-up to discussions at a recent meeting in Port Sulphur for Happy Jack residents, I have the following comments regarding the Draft EIS and am in opposition to the diversion project.

1) The structure itself does not have any flood gate on the backside to stop tidal flooding during hurricanes. The levees along the structure are not at a level to stop that tidal flow from flooding areas along Hwy. 23. Use MRGO as an example. The 25' depth of the structure is far deeper than the water in Barataria Bay. The flow will create a deep hole for water to wash away current marsh. The diversion will create an open area for further threat from hurricane tidal surges.

2)The increase in water levels will impact Happy Jack roads, lift stations, residences, docks, boat houses and bulkheads. There is no option in the mitigation to have property values assessed prior to approval of projects with a guaranteed buy out option as well as a plan with budgets to cover all areas/properties affected by the project. The Draft EIS mentions \$305million in the mitigation budget...a drop in the bucket.

3)The Marine Mammal Protection Act forbids projects such as this from harming or killing dolphins. The exemption that was approved without input from the community, requires five years of dolphin monitoring after the diversion is completed. The Draft EIS estimated that the project would kill an estimated 34% of the dolphin population, but have seen others estimate killing up to 75% of the bottlenose dolphin population in the area.

4)The substantial loss and permanent damage to the commercial and recreational fisheries.....eliminating all oysters and shrimp, and affecting the trout and other species in the area of the diversion, does not support any positives that this diversion would net. The draft EIS estimates the creation of 13,500 acres (21 square miles) of marsh after 50-years of the operation of the diversion. According to the U.S. Geological Survey in 2019, Louisiana loses 16.5 square miles (10,500 acres) a year or 1 football field of coast every hour. in 50 years, Louisiana will have lost an estimated 825 square miles of marsh and this \$1.4Billion project will have created 21 square miles.

This projects economic consequences, the consequences on the environment and ecosystem, the projected damage to properties, and permanent impact on the pure enjoyment of this sportsman's paradise far outweigh the positive impacts of the diversion.

---

**Concern ID: 61853**

**The amount of acres of habitat that would be restored through the preferred alternative would not justify its high cost. Given Louisiana's annual coastal habitat loss rate, investing in a nearly \$2 billion Project that would provide relatively little benefit compared to this annual loss is not justifiable.**

**Response ID: 16618**

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless it is relevant to the agency's decision. USACE generally assumes that a permit applicant has conducted its own economic evaluation of the costs of a proposed Project. USACE will conduct a public interest review as part of its permit decision-making process, which weighs the anticipated harms of a project against its anticipated benefits.

---

As part of the OPA analysis, LA TIG considered the cost to carry out the Project consistent with the Restoration Plan alternatives evaluation criteria, 15 CFR §990.54. The cost to carry out the Project was evaluated in Section 3.2.1.2 Cost to Carry Out the Alternative of the LA TIG's Draft Restoration Plan. The Project would reestablish deltaic processes that deliver sediment, fresh water, and nutrients; improve the function of existing habitats; and successfully develop deltaic habitats that connect nearshore and offshore ecosystems. Wetlands are one component of a restored ecosystem to be achieved. The LA TIG expects that the Project would result in the creation of a maximum of 17,300 acres of land in the Barataria Basin by year 30 of operations; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 [Alternative 1 Description] of the Restoration Plan). The creation of marsh habitat would provide substantial benefits to nearshore marine ecosystems, water column resources (including fish and invertebrates), birds, terrestrial wildlife, and offshore marine ecosystems (see Section 3.2.1.6 [Benefits Multiple Resources] of the Restoration Plan). Given the high rates of erosion and land loss, the land created by the Project would become even more important to the coastal ecosystem over time.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the

---

final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would

---

be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62986**

**The Project would drive decreases in salinity that would reduce the overall health, survival, and reproduction of bottlenose dolphins that reside in the Barataria Basin, a species that was negatively affected by the Deepwater Horizon oil spill (NMFS, 2013). Some commenters felt that because of this, the Project should either not move forward or its operation should be altered.**

**National Marine Fisheries Service (NMFS). 2013. Roy Crabtree (NMFS) to Elizabeth Davoli (CPRA). <https://s3.documentcloud.org/documents/726710/national-marine-fisheries-service-comments-on.pdf>**

**Response ID: 16701**

The concerns raised by the commenters about the projected decreases in salinity and resulting effects on Barataria Bay dolphins were considered in the Draft EIS. More specifically, Chapter 4, Section 4.11.5.2 in Marine Mammals of the EIS acknowledges that the proposed Project would likely have significant, adverse impacts to Barataria Basin dolphins, a species that suffered significant impacts from the DWH oil spill. This section also discusses the physiological changes caused by exposure to low-salinity water, the duration of those changes that leads to mortality, and the anticipated mortality of a large portion of the dolphin population in the Barataria Basin within the first decade. These sections of the EIS provide a more in-depth analysis of potential impacts to dolphins than the letter cited by the commenter.

The concerns raised by the commenters were also considered in the LA TIG's Draft Restoration Plan (see Section 3.2.1.5 [Collateral Injury]); the Final Restoration Plan has been edited consistent with changes made to the Final EIS and see below regarding new, related content included in Appendix R.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources, like dolphins, that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be

adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible (if it is possible), the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins in Louisiana (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63080**

**The Corps and the TIG have circumvented a legal process intended to conserve marine mammals and protect ecosystems by obtaining a Congressionally-mandated MMPA waiver for the proposed Project. The waiver does not establish a quota for how many dolphins can be taken by the proposed Project, and it is clear that the level of take for this stock will be grossly unsustainable, in clear violation of the MMPA (absent BBA-18). The legislative waiver, quite simply, provided Congressional permission to break the law. It is critical for the protection of marine mammals that such a legislative waiver be a one-off occurrence.**

**Response ID: 16599**

The U.S. Army Corps had no role in seeking a Marine Mammal Protection Act waiver for this Project from Congress, nor did any federal agencies on the LA TIG. CPRA sought the waiver. Title II, section 20201 of the Bipartisan Budget Act of 2018 provides: "(a) In recognition of the consistency of the Mid-Barataria Sediment Diversion, Mid-Breton Sound Sediment Diversion, and Calcasieu Ship Channel Salinity Control Measures projects, as selected by the 2017 Louisiana Comprehensive Master Plan for a Sustainable Coast, with the findings and policy declarations in section 2(6) of the Marine Mammal Protection Act (16 U.S. C. 1361 et seq., as amended) regarding maintaining the health and stability of the marine ecosystem, within 120 days of the enactment of this section, the Secretary of Commerce shall issue a waiver

---

pursuant to section 101(a)(3)(A) and this section to Section 101(a) and Section 102( a) of the Act, for such projects that will remain in effect for the duration of the construction, operations and maintenance of the projects. No rulemaking, permit, determination, or other condition or limitation shall be required when issuing a waiver pursuant to this section. (b) Upon issuance of a waiver pursuant to this section, the State of Louisiana shall, in consultation with the Secretary of Commerce: (1) To the extent practicable and consistent with the purposes of the projects, minimize impacts on marine mammal species and population stocks; and (2) Monitor and evaluate the impacts of the projects on such species and population stocks.”

The National Marine Fisheries Service issued the waiver in March 2018. Since that waiver in 2018, CPRA has not requested any additional waivers for coastal restoration projects. More information on the waiver can be found at <https://www.fisheries.noaa.gov/action/marine-mammal-protection-act-waiver-select-louisiana-coastal-master-plan-projects>.

Steven

I believe the diversions are a great idea and a great testimony to the creative ideas and solutions that engineers come up with to reverse the years of our degrading marsh land. I approve as a Plaquemines Parish resident!

---

**Concern ID: 63334**

**The proposed MBSD Project would maintain and restore coastal lands and should move forward.**

**Response ID: 16291**

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:19853**

Rod Lincoln

I grew up in the Nairn community below Port Sulphur and my family continues to own property there. I recognize what this initiative is designed to do, it has many advantages, but I have a real concern about the motives this group has and the incredible environmental damage they will do.

Historically the people of New Orleans and Louisiana have always put their wants over the needs of the people in Plaquemines. This was particularly apparent during the 1927 floods when the parish was lied to by public officials and then had their levees on both sides of the river destroyed supposedly to protect New Orleans. Very few got reparations despite the public promises. I believe this is a similar event.

In addition to the damage identified in this document, which is substantial, it will virtually destroy lower Plaquemines Parish. Land below the Chevron refinery will become worthless as the river silts in, the land sinks more and the state and federal government decide it does not want to maintain the highway and infrastructure below the diversion. Access to the lower part of the parish will be restricted and many families will be displaced because of loss of property and jobs.

Back in the late 1800s Captain James Eads built his jetties to increase the velocity of the water to keep the jetties (and river) clear. People were told it was necessary to closed off nearly all outlets from the river to have enough water to keep the river clear. Over the past century the amount of land build-up along the river has been minimal. During high water no problem, but a lack of a strong consistent flow has made the river more treacherous due to silting. By diverting more water from the river during low water periods, this will further reduce the flow/velocity...despite what your experts say, thereby eventually making the river too shallow to pass. Just like the St Bernard delta, the Plaquemines deltas will die. The new diversion will establish the new seashore. This will also make lower Plaquemines far more vulnerable to hurricanes. Like the Chandelier Islands, lower Plaquemines will just disappear into the Gulf with this plan. The upper parish will be too small to be a justified parish and would have to be merged with either Orleans or Jefferson for survival. What may be good for New Orleans is not good for its neighbors or Louisiana.

---

**Concern ID: 61754**

**Commenter expressed the view that decision makers prioritize the proposed Project benefits for New Orleans and disregard how the Project would impact Plaquemines Parish residents.**

**Response ID: 15890**

As discussed throughout Chapter 4 Environmental Consequences of the EIS, operation of the proposed Project would have various beneficial (and adverse) impacts throughout the Barataria Basin that would not be restricted to those experienced by the greater New Orleans area. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. Further, based on the evaluation in the EIS and its OPA evaluation, the LA TIG considers the impacts of the proposed Project, both beneficial and negative to both the environment and the community, including Plaquemines Parish.

---

**Concern ID: 61766**

**The commenter expressed concern that a lack of a strong consistent flow in the Mississippi River has made the river more treacherous due to silting. Diverting more water from the river via the proposed MBSD diversion during low-water periods would further reduce the flow/velocity despite what the Draft EIS states, thereby eventually making the river too shallow to pass.**

**Response ID: 16444**

The commenter's concern about the proposed Project's impacts on the safety and efficiency of vessel traffic was addressed in the Draft EIS. Operation of the proposed Project above 5,000 cfs would be limited to periods of higher flows in the river, as stated in Draft EIS Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis, when water depth and vessel clearance is less of an issue. However, the EIS recognizes that changes to sedimentation rates might persist into the low-water season, as the commenter correctly notes. The several modeling efforts described in the EIS Chapter 4, Section 4.4 Surface Water and Coastal Processes and 4.21 Navigation, as well as in Appendix E Delft3D Basinwide Modeling and in Appendix Q Navigation/Dredging analysis, include projections of channel sedimentation impacts resulting from operation of the proposed diversion. The conclusion stated in those sections is that operation of the Applicant's Preferred Alternative is projected to cause "moderate, permanent, adverse impacts on dredging operations from Venice to the Gulf of Mexico."

---

**Concern ID: 61780**

**The commenter expressed concern that the proposed Project would cause detrimental land loss in the birdfoot delta that would cause the birdfoot delta and lower Plaquemines Parish to disappear. All that would be left would be upper Plaquemines Parish, which would be so small that decision makers would merge the parish with Orleans Parish.**

**Response ID: 16177**

The commenter's concerns regarding projected land change in the birdfoot delta and the Barataria Basin (both located in lower Plaquemines Parish) due to diversion operations were considered in the Draft EIS. As explained in Chapter 4, Section 4.2.3.2 Geology and Soils, Operational Impacts, the Project would increase the amount of land in the Barataria Basin, but land in the birdfoot delta would decrease. Under the No Action Alternative, land area in the birdfoot delta would be reduced from 62,800 acres in 2020 to 6,640 acres in 2070 due to sea-level rise and subsidence (see the Final EIS, Chapter 4, Section 4.2.3.2.1 No Action Alternative, Table 4.2-3 Model-projected Total Land Area under the No Action Alternative). By diverting sediment and water upriver, the proposed Project would result in an increased rate of loss in the birdfoot delta, as illustrated in Figure 4.2-7 (Model-projected Change in Land Area). The Project specifically is projected to result in a loss of 3,000 acres in the birdfoot delta by 2070 as compared to the No Action Alternative. Examples of reasonably foreseeable restoration projects aimed to retain sediment in the birdfoot delta are provided in Chapter 4, Section 4.25.2 (Geology and Soils section of Cumulative Impacts). To address concerns related to descriptions of land-change impacts of the proposed Project, a discussion has been added to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This

---

discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

In the Draft Restoration Plan, the LA TIG recognized the potential collateral injuries associated with the Project, including potential land loss in the birdfoot delta. In selecting the preferred alternative, the LA TIG evaluated a reasonable range of alternatives under the factors outlined in the OPA evaluation criteria in 15 CFR §990.54. Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process. See Sections 3.2.4.7, 3.2.1.5, and 3.2.2.5 of the LA TIG's Final Restoration Plan for more information about the LA TIG's selection of the Preferred Alternative.

Other restoration efforts in the Barataria Basin that are not part of the proposed MBSD Project may benefit land creation in the Barataria Basin. These are discussed in the EIS, Chapter 4, Section 4.25 Cumulative Impacts.

---

**Concern ID: 62009**

**The negative socioeconomic consequences would devastate southeast Louisiana, destroy people's livelihoods, displace people living near the diversion, and destroy property in the areas impacted by the proposed MBSD Project.**

**Response ID: 16207**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana, including impacts on population, property values, and community cohesion. As noted in these sections, the proposed Project would have both beneficial and adverse socioeconomic impacts on the people and communities within the Project area. Minor to moderate, permanent adverse socioeconomic impacts are expected to occur near the immediate outfall area outside of flood protection. Minor to moderate, permanent, beneficial socioeconomic impacts are expected to occur in the west bank New Orleans area north of the diversion. Moderate to major, beneficial, temporary impacts from job creation and economic activity in the proposed Project area are anticipated. In addition, the Socioeconomics Technical Report in Appendix H1 provides additional details on these projected effects.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the DWH oil spill.

The commenters' concern regarding the potential impacts of the diversion were considered by CPRA and the LA TIG in developing the Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included mitigation to address and offset some of the projected impacts of the Project on fisheries and surrounding communities outside levee protection including providing structural mitigation and stewardship measures for increased water levels that are projected to result due to the Project, such as raising roads or improving bulkheads. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

In communities south of the Project site outside of federal levee protection where the proposed Project is projected to cause increased water levels, CPRA plans to take one of two approaches. In Myrtle Grove, CPRA is planning to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision. By improving this bulkhead, CPRA would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions without the Project. See Table 1 in the Final Mitigation and Stewardship Plan for more details. CPRA plans to acquire a temporary right-of-way to permit improvement of the bulkhead, voluntarily or through eminent domain if necessary, from the property owners in the Myrtle Grove Marina Estates Subdivision.

In other communities south of the Project site outside of federal levee protection, from Woodpark south to the communities of Grand Bayou and Happy Jack, CPRA plans to elevate the portions of public roads outside of levee protection that provide access to each of these communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or

will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62282**

**Diversion impacts, including land loss in the birdfoot delta, would make lower Plaquemines more vulnerable to storms.**

**Response ID: 15805**

Draft EIS Chapter 4, Section 4.6.5 in Wetlands and Waters of the U.S. described the projected acceleration of wetland loss in the birdfoot delta caused by the proposed Project and Section 4.20.4.2 in Public Health and Safety acknowledged lower Plaquemines' increased vulnerability to storm hazards that would result from operation of the proposed Project. While the Draft EIS acknowledged the role that land loss plays in increased storm hazards, it did not explicitly acknowledge the role this accelerated land loss in the birdfoot delta could play in increased storm hazards. Section 4.20.4.2.2.2 in Public Health and Safety has been edited in the Final EIS to include acknowledgement that this accelerated loss of wetlands in the birdfoot could increase storm hazard vulnerability depending on the storm path and intensity.

In the LA TIG's Draft Restoration Plan, the LA TIG recognized the potential collateral injuries associated with the Project, including potential land loss in the birdfoot delta. In selecting the Applicant's Preferred Alternative, the LA TIG evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative

---

that would provide what it believed to be the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7, 3.2.1.5, and 3.2.2.5 of the Final Restoration Plan for more information about the LA TIG's selection of the Applicant's Preferred Alternative.

---

**Correspondence ID:20089**

William Hamilton

I strongly support this measure. Action needs to be taken ASAP to save our coastline. MBSD needs to be replicated on a massive scale in many other locations.

Thank you!

---

**Concern ID: 63332**

**A large number of commenters expressed general support for the proposed Project.**

**Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:20163**

CCA

William Fabre

Please follow through with the current diversion plans. Freshwater feeds our marsh and sediment builds our land back. Without action on this we will continue to sink and erode until a storm destroys what little healthy habitat we have left.

---

**Concern ID: 63341**

**The coastal wetland system creates multiple lines of natural defense from hurricanes and storm surge, and the ongoing wetland loss resulting from the lack of riverine input into the basin has resulted in increased storm risks to local communities (including decreases in property values and impacts to the electrical grid).**

**Response ID: 16300**

The commenter's support for the proposed Project is noted. The commenter correctly notes that coastal wetlands are natural defense against hurricanes and storm surge, and the damage they cause to local communities and infrastructure, as discussed in Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S. of the Draft EIS. The causes of wetland loss in the proposed Project area were discussed in Section 3.6.2 of the Draft EIS, and included subsidence, levees, storms, canals/spoil banks, herbivory, and the DWH oil spill. Chapter 4, Sections 4.6 Wetland Waters and Resources of the U.S. and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS explained how the proposed Project would create and maintain wetlands in the Barataria Basin, and discuss the corresponding impacts on storm surge and flooding.

Coast Builders Coalition

Scott Kirkpatrick

I am writing on behalf of the Coast Builders Coalition, a non-profit trade association with the mission of advancing coastal restoration and hurricane protection efforts along the Gulf Coast. As an industry association, our membership consists of those companies doing restoration or protection work in the gulf states.

Coast Builders Coalition (CBC) supports the Mid-Barataria Basin Sediment Diversion. Our members are involved in the variety of the projects being undertaken to protect and restore the Louisiana coast. We understand the importance river diversions play as a tool in the toolbox to restore the coast. It is critical we use these diversion tools as part of our overall plan to protect and restore the coast.

Many of our members have been involved with restoration plans in Louisiana for several decades. They understand the extensive research and deliberations that have gone into this diversion project. This project has been through extensive vetting and represents an excellent output of the scientists, engineers, consultants and contractors who have been involved over the decades.

While this is a large project, the draft EIS takes a very detailed look into all aspects of the project and does a good job of accounting for various impacts. The mitigation measures outlined in the draft environmental impact statement are very robust and fairly apportioned.

Our members and their thousands of employees stand ready to support this important project in any manner possible. We expect thousands of people in southeast Louisiana will be needed to work on this project. It will represent a major economic development project for the region. We urge this project be approved and constructed with all urgency given the land loss emergency we have along the Louisiana coast.

Sincerely,

Scott Kirkpatrick

Executive Director

Coast Builders Coalition

---

**Concern ID: 63357**

**The commenter indicates that the proposed Project would represent a major economic development project for the region and urges that this Project be approved and constructed with all urgency given the land-loss emergency along the Louisiana coast.**

**Response ID: 16319**

The commenter's support for the proposed Project is noted. Consistent with the comment, Chapter 4, Section 4.13 Socioeconomics of the Draft EIS indicated that construction of the proposed Project would result in a major economic benefit within the Project area. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider

---

public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:20309**

Michael Schramm

Today I am writing to support strong protection, restoration, and stewardship of bird habitat sites in the Mid-Barataria region. We must be loyal to ancestors, and to our future generations by passing along the gifts of nature we have been blessed to receive. We should regard the pollution and destruction of these sites as disgusting, and a tragedy to address.

Restoring, and crucially supporting/stewarding, these wetlands into the future will provide significant positive impacts for birds (in terms of nesting and feeding sites), and humans (in terms of tourism dollars, and mental well-being).

Now, more than ever, this projects are critical to support birds and other important species, many of which are dwindling. We know stewarded sites can support bird population growth of 2-34x more than un-stewarded, or unprotected sites.

At a time of national political division, this also serves as a means to bring people together, put people to work supporting their local communities, and create mutual goodwill for something we all love: the stunning landscapes and wildlife we are blessed with in the US.

---

**Concern ID: 62346**

**Restoring and protecting these wetlands into the future would provide significant positive impacts for birds (in terms of nesting and feeding sites), and humans (in terms of tourism dollars and mental well-being). Projects like these are critical for wildlife and serve as a means to bring people together.**

**Response ID: 15791**

The Draft EIS acknowledged the benefits of the proposed Project to wetlands and birds. See EIS Chapter 4, Section 4.6 Wetlands and Waters of the U.S. and 4.9 Terrestrial Wildlife and Habitat for a description of those benefits. The proposed Project's anticipated effects on communities are discussed in EIS Chapter 4, Section 4.13 Socioeconomics and 4.16, Recreation and Tourism.

---

**Correspondence ID:20734**

John Berlinghoff

I am writing in support of the Mid-Barataria Sediment Diversion. There was a recent notice about native Indians who are being relocated by the government because their land is going under water. We need the Diversion project before more of the heritage of Louisiana is lost.

The Coastal Master Plan will help support and enhance the lifespan of other coastal restoration and protection projects.

---

**Concern ID: 63358**

**The commenter supports constructing the Mid-Barataria Sediment Diversion before more Louisiana heritage is lost, and references a recent notice about native Indians who are being relocated by the government because their land is going to be under water.**

**Response ID: 16320**

The commenter's support for the proposed Project is noted. Chapter 4, Sections 4.2 Geology and Soils and 4.6 Wetland Resources and Waters of the U.S. of the Draft EIS discussed the land building/marsh creation projected to result from the proposed Project, and Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discussed the projected impacts of the Project on flooding and storm hazards in Barataria Basin. Any ongoing actions regarding the relocation of Tribal Nations in coastal Louisiana is not associated with the proposed MBSD Project.

As indicated in Chapter 4, Section 4.24 Cultural Resources of the Draft EIS, historic resources consultations have been conducted in accordance with Section 106 of the NHPA. Appendix K Cultural Resources Information of the Final EIS includes the PA negotiated between the NHPA Section 106 consulting parties regarding the proposed Project. The PA explains the outreach conducted by the CEMVN to Tribal communities, identifies the Tribal Nations that decided to participate in the Section 106 Process, and explains that the CEMVN has and would continue to consult with any interested Tribal Nation who may have not yet requested to consult.

---

**Correspondence ID:21817**

Welldone LLC Museums, Culture, Nature designers

Gordon Linge

The Mid-Barataria Diversion Project is critically important to restoring the natural environmental T with impacts both locally and globally.

It is totally self-centered ignorance to object. This is the river's nature. Levees are not. Leaves and wood chips barged in after storm debris clean up could be deposited in shallow waters and let wave action push these organic materials into the diversion sediment to expedite land building. Today's river does not have the amount of driftwood and organic materials as it did 150 years ago.

---

**Concern ID: 61890**

**Consider suggestions such as barging in wood chips and placing in shallow waters, and using old sunken ships and barges to build land.**

**Response ID: 15984**

Suggestions such as barging in wood chips and other organic material to the sediment deposited by the diversion or building upon old sunken ships and barges would not meet the scope and the scale of the proposed Project or its purpose and need, and therefore, would not be practicable. While alternative materials such as these may fill in small-scale areas, fill material such as these would not address the proposed Project's purpose of restoring deltaic processes to the Barataria Basin. Therefore, they were eliminated from further consideration. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

**Correspondence ID:21896**

Don Saucier

This project will not succeed because of the following :

The "land" produced by this diversion project will not be sufficient to maintain a sustainable root system .Top sediment produces swamp land. This diversion flow only captures the top 20 ft. of sediment which does not contain the material necessary to establish land . That material lies beneath the top 20 ft. and the river depth is too great for the flow at this point to carry this sediment to the top 20 ft.The first hurricane will destroy this fragile " swamp " .

Instead , pump dredge material into key areas and in patterns designed to accrete sediment during high water due to storms .

Although pumping bottom material may to more costly initially , the results will be more sustainable .

When one considers the net costs of of both approaches , pumping bottom sludge will last and not necessitate in subsidizing a fishing industry so vital to the economy and culture of Louisiana.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale

sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process. CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63040**

**The diversion flow would only capture the top 20 feet of sediment from the river, which does not contain the material necessary to establish land and maintain a sustainable root system. That material lies beneath the top 20 feet and the river depth is too great for the flow to move the land-building material. The first hurricane would destroy this fragile "swamp."**

**Response ID: 16047**

The issues raised by the commenter were considered in the Draft EIS. The commenter's description of diversions designed to extract water from the top of the river pertains to existing freshwater diversions (Davis Pond and Caernarvon Diversions). The proposed MBSD Project differs from these because it is not a freshwater diversion; it is a sediment diversion designed to capture larger-sized sediments from a lower portion of the river. As described in Chapter 2, Section 2.1.1 in Introduction of the EIS, the proposed MBSD Project intake structure is designed, and located at a sufficient depth, to capture a higher concentration of coarse-grained sediment transported along the riverbed to allow for a more rapid vertical accumulation of organic material, resulting in quicker emergence of wetlands in the outfall area that are then able to support vegetation that traps available sediment across a range of particle sizes. Although capture of these larger sediments is critical, the proposed MBSD Project would also convey organic material and finer-grained sediments (less than 32 microns) intended to disperse farther into the basin to sustain and nourish existing wetlands. Table 5.2-1 in Appendix E Delft 3D Modeling of the EIS lists the sediment classes that the Delft3D Basinwide Model projects would be transported to the basin via the diversion. Additional analysis regarding the potential impact of hurricanes on the extent of wetlands in the proposed Project area during the period of diversion operations, and additional detail regarding the resiliency of marsh created by the proposed Project has been included in Chapter 4, Section 4.6.5.1.2 Applicant's Preferred Alternative of the Final EIS.

**Correspondence ID:21944**

Commenter

Over the years conservationists have been fighting to make changes to better our fisheries. From size and creel limits on fish to even closing or shortening seasons on reef fish. We in South Louisiana, especially in Happy Jack, have been making changes sour kids and grandkids can enjoy what we have today.

I fully understand and agree with the rebuilding the marsh and most importantly the coast islands of South Louisiana. With this being said, there must be a different and better way to accomplish the task. With the resources and technology of today it should not take 50 years to accomplish these projects. Why not use dredges and pumps to pump sand from the Gulf of Mexico inland to rebuild the marshes. Some of the coastal islands have been rebuilt with this process and look much better and hopefully more of the coastal islands can be rebuilt as well.

With the diversion yes, we will build some land over a 50-year period but definitely not enough for the impact to the fisheries as well as raising the water levels up to a foot. I was under the assumption the rebuilding of the marshes was to help with the sinking and lose of marsh land. Seem like this project is going to make us lose more than we gain.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to

---

define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Form Letter 12

Dear U.S. Army Corps of Engineers,

The ongoing loss of its coastal wetlands, which has already claimed an area equal in size to the state of Delaware, makes communities increasingly vulnerable to stronger hurricanes and sea level rise. In the face of these challenges, we have an opportunity to harness the natural land-building power of the Mississippi River to maintain vital wetlands and restore the health and vitality of the entire ecosystem.

I support the Mid-Barataria Sediment Diversion, which is the cornerstone of Louisiana's Coastal Master Plan and will enhance the lifespan of other coastal restoration and protection projects. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

This project will have many positive, long-term benefits for coastal communities, including increased storm surge protection from restored wetlands, job creation, and regional economic impact during construction. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. Decision makers must work with potentially impacted communities to develop and implement ideas and proposals for adaptation and mitigation.

Finally, to ensure the project meets its restoration goals in response to changing environmental conditions, state and federal decision makers must develop and implement a robust adaptive management program.

A future without the Mid-Barataria Sediment Diversion is a future we cannot afford.

Sincerely,

Aloysius Cunningham

---

**Concern ID: 61716**

**The ongoing loss of Louisiana's coastal wetlands makes communities increasingly vulnerable to stronger hurricanes and sea-level rise and threatens the health and stability of the entire Barataria Basin upon which a number of communities, wildlife, fish nurseries, sportsman culture, economy, and vital resources depend.**

**Response ID: 16026**

The importance of maintaining wetlands for the protection of coastlines, coastal communities, wildlife resources, and recreation was considered in the Draft EIS in Sections 3.6 Wetland Resources and Waters of the U.S., 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, and 3.16 Recreation and Tourism.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision**

---

**making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the

---

Project through public meetings to solicit input on mitigation and stewardship strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Joseph Owens

Each time I have gone fishing, I have personally witnessed the slow decay of the march in Barataria and other areas around the coast. Over the last 50 years land has slowly eroded away during most of my lifetime.

I have read Project 2050 over thirty years ago, and I am personally disgusted that it has taken this long to get another fresh water diversion built. I am extremely happy that common sense is starting to make it way into decision makers in this state. They need more of these up and down the river, building march. They need to construct more of these every couple miles up and down the river. Let the Mississippi do what nature intended it to do in the first place. these diversions do not need to be big, just functional.

No get off your asses and get it built!

---

**Concern ID: 61737**

**The construction of levees along the Mississippi River precluded land-building sediments from entering Louisiana estuaries, which has caused a loss of Louisiana's coastal wetlands and other problems, such as making properties more vulnerable to hurricane damage and decreasing property values.**

**Response ID: 16024**

The impacts raised by the commenters were considered in the Draft EIS. Information about historic causes of land loss can be found in Chapter 3, Section 3.1.4 Overview and History of the Project Area and Section 3.6.2 in Wetland Resources and Waters of the U.S. The importance of maintaining wetlands for the protection of coastlines, coastal communities, and wildlife resources is discussed in Sections 3.6 Wetland Resources and Waters of the U.S. and 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the EIS. As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the Applicant's Preferred Alternative is to implement a large-scale sediment diversion in the Barataria Basin that would reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

---

**Concern ID: 63359**

**More diversions (size notwithstanding) are needed up and down the Mississippi River to build more marsh.**

**Response ID: 16321**

The commenter's support for the proposed Project is noted. Chapter 2, Section 2.3.7 in Step 1: Evaluation of Functional Alternatives of the EIS includes an analysis of multiple, smaller (5,000-10,000 cfs) diversions up and down the Mississippi River; this discussion indicated that the smaller-scale diversions would not reestablish sustainable deltaic processes because the appropriate volume and range of sediment needed to meet Project objectives would not be captured and/or transported into the basin. Further, assessment of locational alternatives for the larger-sized project indicated that locations in the upper and lower basins would not meet the purpose and need of the proposed Project, and that other locations in the middle basin would not be as effective in meeting the purpose and need (see Section 2.4.1 in Step 2:

Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow). However, the Louisiana Coastal Master Plan contemplates additional sediment diversions to help restore the marsh and estuaries; those diversions that are reasonably foreseeable are discussed in Chapter 4, Section 4.25 Cumulative Impacts of the EIS. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS. Other projects outside Barataria Basin or that are not yet reasonably foreseeable (as defined in Section 4.25.1.3 in Cumulative Impacts) are beyond the scope of this EIS.

I am commercial Fishermen I need help if there any programs available.

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take

advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based

organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Allen Sreiy

I want to know is there any program that can help commercial Fishermen?

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

Mark Comeaux

..we live at the above address Its our permanent address that we have owned since 2000.

..right now we incur occasional flooding over our dock and in our backyard from strong south winds or storms

..the Project will cause increased rising waters we will be forced to change the elevation of our property

...the Project will cause restricted access and usage of our property

..our Property value will decrease and our quality of life

...we will have to travel farther towards the gulf in our boats to catch speckled trout, and brown and white shrimp

...our family won't be able to swim or ski in our lakes due to the dirty Mississippi River water introduced by the Project

...access from our property through navigable waterways will require dredging in order to continue to utilize our property for the intent for which it was purchased.

...with the Project causing higher water, the parish owned roadways will require increased elevation, as well as the roads off the main road leading to our homes

...this Project has the potential for us to incur unexpected and unaffordable expenses such as::::

- -- --raise our bulkhead
- -- --raise our dock
- -- --raise our roof over the dock
- -- --raise our boat shed
- -- --raise the slab under our house
- -- --raise the elevation of our yard
- -- --raise the elevation of our road crossing our property

As far as us moving, with the project forthcoming, our property value is unstable and decreasing in value , as well as unattractive to any buyers who would be willing to pay what we have invested,we would be hard pressed to find something comparable and affordable..

**Concern ID: 63096**

**Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).**

**Response ID: 16699**

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of

the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61819**

**Commenters expressed concern that the proposed Project would have adverse impacts on Barataria Basin's water quality, wetlands, fisheries, recreational uses, and eroding coastlines due to chemicals, oil and hazardous waste, and/or pollutants in the Mississippi River that would be routed to the Barataria Basin via the proposed diversion.**

**Response ID: 16429**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality of the Draft EIS, the segment of the Mississippi River where the proposed diversion river intake structure would be located (subsegment LA070301\_00) fully supports its designated uses. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. LDEQ's water quality assessment indicates that regulated substances are not present in concentrations that would cause a water quality impairment at the location of the intake structure. In response to this concern expressed by commenters, a new subsection has been added to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of nearby industrial facilities on river water routed to the basin during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills from Industrial Sites. As described in the EIS, Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed.

---

**Concern ID: 62010**

**Sediment transported by the diversion into the basin would cause the main waterways to have increased shoaling, become too shallow to pass through, and would require dredging in order to access personal properties. This plan should address the potential loss of access for homes, camps, and businesses due to the increased shoaling.**

**Response ID: 16208**

The impacts raised by the commenters were considered in the Draft EIS; therefore, no related edits have been made to the Final EIS. The EIS describes impacts on marine transportation and maintenance dredging in Chapter 4, 4.21 Navigation. This section also describes potential impacts on access due to delays when dredging. In addition, refer to Section 4.13 Socioeconomics for a discussion of socioeconomic impacts due to potential sedimentation in Barataria Basin navigation channels and canals. The proposed Project would have moderate, intermittent but permanent, adverse impacts on marine traffic efficiency and safety for shallow-draft vessels. The proposed Project would also cause minor to moderate, permanent, adverse impacts in dredging requirements for portions of the Mississippi River Navigation Channel and the birdfoot delta due to Project-induced changes to typical shoaling patterns and locations. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the proposed Project area during Project operations. In acknowledgement of commenters' concerns regarding sediment and shoaling impacting navigation, the Mitigation and Stewardship Plan in Appendix R1 in the Final EIS includes measures to mitigate impacts on navigation in the basin resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

---

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62013**

**The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.**

**Response ID: 16210**

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm

---

hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be

required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62085**

**Concerns were raised that the proposed MBSD Project would affect fishermen with smaller vessels. Fishermen would have to travel farther towards the Gulf in their boats to catch some species such as speckled trout, and brown and white shrimp. Most inshore fishing vessels are not large enough or equipped to go any further outside the basin.**

**Response ID: 16249**

The impacts raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discusses impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts on brown shrimp and oyster fisheries in the Project area are anticipated. Section 4.14.4.2 Applicant's Preferred Alternative discusses the potential adaptive responses of fishermen to changes in species abundance, including the potential for substitution of species and need for gear upgrades, as well as increasing the length of fishing trips. CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62224**

**Communities like Happy Jack, Lake Hermitage and Myrtle Grove, some of which have homes that are not above the new base flood elevation, already experience some degree of flooding which would be made worse by the diversion. This would affect the ability of residents to access and enjoy their homes and communities.**

**Response ID: 15757**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discuss the anticipated increased flooding impacts outside of federal levee systems to be caused by the operation of the diversion. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project.

---

CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes, which would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62227**

**The diversion would flood access roads, damage vehicles, cause siltation/sludge, cause cancellation of flood insurance, inundate cemeteries, stress levees, impact provision of emergency services, and increase the cost to raise homes, slabs and wharves.**

**Response ID: 15820**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discusses the increased flooding impacts outside of federal levee systems, including road inundation and infrastructure damage, anticipated to be caused by the operation of the diversion. Sections 4.13.5.1.2.1 and 4.13.5.3.2.1 in Socioeconomics of the Final EIS has been updated to include potential impacts such as vehicle damage, accumulation of siltation and sludge, cemetery inundation and interruption of emergency services. Recognizing the potential for these impacts, CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits

---

prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Final EIS concludes that the proposed Project would not have impact on the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for**

---

**lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties

---

and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be

implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

[REDACTED]  
[REDACTED]  
[REDACTED]  
[REDACTED]  
[REDACTED]

The 2 above addresses comprise my main property. I also purchased an investment property next to my lots, which I don't think have an official address. These 3 lots are used as trailer rental spaces (4) which I rent to plant workers, levee construction workers, etc.

I have 2 questions if you could answer. I called and left a message, so if someone calls back I will ask them. Will our property be transferrable after receiving any mitigation? Will we continue to be able to purchase insurance for our houses, property, and improvements if we receive mitigation?

I attended and watched your presentation on Wednesday, April 14, 2021. Projections for increased water levels seem lower than what would be expected because the river water levels quoted are much lower than the river has averaged in recent years. I also noticed that the increases in water levels were "averages". I am not disputing your calculations, but if these are the "average" increases, there will be times when the level will be increased much more. These "peak water level" occurrences will prove to be the most challenging times with the most potential for damage to our property.

I will send pictures of the construction of my bulkhead, dock, boathouse, and house for reference.

I would expect that opportunity cost / time missed enjoying our property because of construction should be compensated.

My boat house is constructed of class B "commercial" pilings and a metal roof. I have 3 boat slips and a concrete covered area as well as a fish cleaning table with plumbing, electricity, green led lighting, and 3 boat hoists. Electric and water lines will have to be re-run or altered. My bay boat, mud motor boat/shallow drive, and aluminum flat boat are kept in the 3 boat slips with hoists for each boat. The boats are kept high in the slips so that when the tide rises very high due to a south wind or typical storm (not a hurricane), the boat and motor will remain above the water line. If the diversion raises the water level, these boats would have to be raised higher than the current level so boats can fit under roof when water rises (based on your estimates, 2 additional feet). I expect that in order to do so, the current boat house and pilings would have to be removed and longer pilings would have to be installed and a new boat house built. Also, the current concrete covered area and cleaning table will have to be removed and replaced.

We paid a company to construct a bulkhead made with "sheet piles", using "dead men" pilings with metal rods running to the back of the wall (on my property). The current bulkhead would have to be removed and replaced to raise the level of the bulkhead 2'. Behind this higher wall would have to be back filled with dirt. Doing so would upset the grade and flow of water from

the property, so the land would have to be raised and the concrete slabs which are currently "stepped down" would have to be removed and re-worked. My current fishing dock, built from the bulkhead out over the water, would have to be removed and replaced. My property is just over 100 feet wide along the water side, and there are 3 piers that extend over the water. All dock area would have to be removed and replaced 2 feet above the current level.

The road across the side and back of my property would have to be raised 2'. Currently, I have installed crushed concrete and limestone. Concrete would be required if the water level will be raised and water will be flowing across this road. My driveway meets the current level of the current road, so the driveway will have to be removed and replaced at a higher level where it will meet the road. I have maintained and paid for the current road. My lot is 246.52' across Orange Ln, plus there is a distance between my lot and the road that the Corps of Engineers installed along the wall they installed. There is 63.77' of road along the back of my property.

The boat launch used by my neighbor and I who co-own the road, will have to be raised/reworked to meet the raised Orange Ln. FYI, I have an option to purchase the remaining property of my neighbor, and I already purchased the 3 lots on the highway side of his property where I currently have 4 trailer rental spots.

All of my property will have to be raised 2'. I trucked in around 100 loads of river sand and premium dirt fill to raise the area where my home was built (to account for storm flooding), and raised the rest of my property so it would not flood during typical high tide and/or typical storms. My neighbors have parked their vehicles on my property for past storms. Remove and replace perimeter fence after land has been raised.

Install steps/ladders along dock and by boat hoists for increased height during low tide situations so we can step down into boats. Compensation for low tide inconvenience of higher docks and land. (Difference between high water mark and low water mark will increase.)

Orange trees. 5-7 Years of growth. Loss of fruit. Can't grow citrus in low areas.

I installed St. Augustine Sod - approximately 4 pallets. If the land is raised, new sod will be required.

There is a 20' x 24' storage shed with electric on the property which sits on pilings. Raise shed and install steps.

Raise house 2 - 3 feet to be above flood level required by govt. When we custom built this home, we built the home according to the government's requirement of the home being built so many feet above sea level. Raising the house will require installing additional hardy plank etc. Caulk, seal, paint exterior house walls. Stairs will have to be replaced/re-worked to meet the new height of the house, sheet rock repairs and repaint interior of home if damaged during raising (if damaged/compromised). Install concrete pilings because of extra height. It would not be structurally sound to try to piece together something over existing pilings. Interior garage walls fill in gaps. (Walls are next to current pilings. Will they have to be removed and replaced along with 3 garage doors?)

Compensation for when entry is flooded and land is flooded, when we can not access our house.

Decrease in property value because brackish/salt water species gone. Shrimp and fish/crabs I get in trade from Mark and Gary who park their boats on my property. I provide fish for my parents and family. The trout and redfish I currently harvest will not be present in the areas I fish. I will also have to learn how to fish new areas which takes many years to learn.

I have spent an abundance of money, time and effort to create my "dream retreat". I did not want this diversion, but I realize that something must be done for the good of our parish, the state, and even the country. Will I be made whole?

I purchased this as an investment combined with it being a pleasurable recreational fishing second home. I am including a picture of the advertisement from 2004 when I purchased this property. I paid \$175,000.00 for the land in 2004. Recreational property and all real estate has appreciated. Water front lots here almost never come up for sale, and have been passed to generations from those who were able to purchase the lots the formerly leased. I was considering doing like many of my neighbors, earning retirement income from my launch, bait traps, shrimp and camp rental.

This is my "dream home". I hope you are going to compensate us fairly. If you would research the cost of 100 feet of bulkhead sheet pile, plus a dock over the water with 3 piers, plus a boat house for 3 boats with a covered concrete area, along with a lot that's 246 feet deep with 100 feet of water front, where we literally catch redfish and trout off the dock (I will send pictures). Where else can I purchase that? I don't think anywhere. And this is 45 minutes from my home in Metairie. So I can jump in my car and be in my boat or fishing off my dock within one hour. This is priceless. If you have a boat, you know what it feels like to take off and see the sunrise and the water and marsh. I guess I would consider either a buy out or mitigation sufficient enough to lower my investment in this property to the point that I would feel like I could stay there and be OK if I couldn't be there because of the water level on land or lack of saltwater fish.

I also purchased 3 lots from my neighbor, which would be [REDACTED]. I had many truck loads of crushed concrete trucked in and spread, and also poured a slab, installed 4 electrical services, water lines, and connected a septic tank, so I could rent trailer spaces. I have 4 spaces and I rent them for \$500.00 per month. Workers would not want to rent spaces if the water level was increased 2'. A 2' rise in water level would put water on the lots. I am interested in learning how/if you would be able to mitigate the loss of income for this investment because of the increased water level.

I catch many fish, as can be seen in a picture from a week and a half ago when we fished 5 minutes from my house. I would be glad to take you fishing minutes from my home to show you what I will lose because of the diversion. It's not only the food sustenance, but the joy and fun of fishing so close to my house. My grandchildren and children fish with me often. We will lose these opportunities, and again, I would hope you would fairly consider this and compensate us for taking this away for the good of the state and country.

---

# Mid-Barataria Sediment Diversion Community Outreach Survey

---

## SECTION 1: WE WOULD LIKE TO ASK SOME QUESTIONS ABOUT YOU AND YOUR COMMUNITY.

1. Where do you live? Please check the most appropriate neighborhood/community:

- Myrtle Grove
- Woodpark
- Suzie Bayou
- Deer Range
- Hermitage
- Grand Bayou
- Happy Jack

2. How long have you lived in your community? \_\_\_\_\_

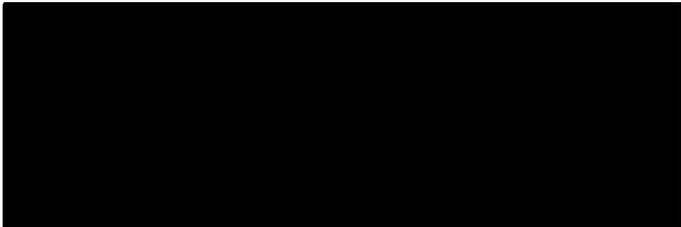

3. Do you own the property where you live?

- Yes
- No – if you check this option, what is your living situation? (for example, renting, live with family)

4. Do you live here year-round or just sometimes? Please check your response:

- All the time
- Sometimes – during Weekends and some week nights season/months

5. Are you single (live alone and don't share money with others where you live), or do you live in a family that shares money?

6. Which race/ethnic groups do you identify with (check all that apply)?

- American Indian or Alaska Native
- Asian
- Black or African American
- Hispanic or Latino
- Native Hawaiian or Other Pacific Islander
- White
- Other: \_\_\_\_\_

7. Is English your first language?

- Yes
- No

8. Does your family depend on fish from Barataria Basin for food?

- Yes
- No

9. Is fishing in Barataria Basin the main way you or your family make money?

- Yes
- No

SECTION 2: NOW WE WANT TO ASK ABOUT FLOODING IN YOUR COMMUNITY

NOTE: These questions are asking you about flooding in your community not during a tropical storm, tropical depression, and/or hurricanes.

10. Does the property where you live flood?

- Yes *roads + sometimes land when tide is very high + a south wind.*
- No

11. Does your neighborhood/community flood?

- Yes
- No

12. If yes, how many times a year? \_\_\_\_\_ times per year.

*during bad storms*

13. How deep is the flooding? Just a guess is fine. \_\_\_\_\_  
14. How long does the flooding last? Just a guess is fine. \_\_\_\_\_

15. Do you leave when it floods or do you stay where you live?

- Leave
- Stay

16. Have you changed your house to prevent flooding (e.g., did you elevate or flood proof your house?)

Yes – if yes, what changes have you made to your house to avoid flooding?

Tucked in ~~100~~ 100 loads of mud before building, and built a raised home on the mound we created by purchasing dirt.

No

17. If flooding gets worse because of the Mid-Barataria Sediment Diversion, would you stay or move?

- Stay NOT SURE. Depends how bad it gets.
- Move

18. If flooding gets worse because of the Mid-Barataria Sediment Diversion, CPRA would like to work with community members to help. Mark any of the items you would be interested in:

- Elevate homes and structures
- Reduce flooding of their septic/sewer systems and other utilities
- Elevating roadways or utilities
- Pay property owners for losses in property value because of flooding, if any

19. Are there any other ways CPRA can help you and your community with flooding that may result from the Mid-Barataria Sediment Diversion?

elevate bulkhead and dock + boat house to account for rise in water level caused by diversion.

**SECTION 3: WE WANT TO ASK YOU ABOUT THE FISHERIES AND FISHING IN YOUR COMMUNITY:**

20. What fish/seafood do you mainly fish in Barataria Bay?

- White Shrimp
- Brown Shrimp

- Oysters
- Blue Crab
- Red Drum
- Speckled Trout
- Other *Sheepshead, Bass, Flounder*

21. Where do you fish in Barataria Bay?

*all over Barataria Bay. The marsh close to my house mainly during the winter. Round Lake, Lake Lamerie, Bayou Dupont, Wilkinson Bay, Bay Jimmy, Bay Long, Manilla Village, St. Mary's Point, Thruway, Chenet Fleuve, etc.*

22. Do you fish by boat or on the shoreline?

- Boat *Both (3 Boats)*
- Shoreline

23. How many times a week do you or your family eat fish/seafood from the Basin? 4 times/week

24. If fishing conditions or fisheries change because of the Mid-Barataria Sediment Diversion, CPRA would like to work with community members to help. Mark any of the items you would be interested in:

- Help with new equipment (i.e. upgraded vessel refrigeration or gear improvements) *larger boat to travel further.*
- Help for small business/startup support (i.e. grant programs)
- Training programs
- Small business development and operations training

25. If CPRA can add new access points for fishing, where should they go? (like a kayak or small boat launch, shoreline fishing dock, pier, etc.)

*I prefer the private area the residents have, without crowding from the general public.*

26. Are there any other ways CPRA can help you and your community with potential changes in fisheries from the Mid-Barataria Sediment Diversion?

*Fairly compensate us for what we will lose, including the "paradise" we have created.*

SECTION 4: FUTURE OUTREACH REGARDING EIS AND RESTORATION PLAN

27. How can we give you more information in the future? If you would like to provide us your phone number, email address, or any other contact information, enter it here.

[Redacted area]

28. The Draft Environmental Impact Statement and Draft Restoration Plan about the diversion will be available in March 2021. How can we help you submit comments on those documents?

Be specific about where I should send comments.

---

**Concern ID: 64832**

**A commenter is concerned about the negative impacts of the diversion on fishing near their home and request compensation for this loss.**

**Response ID: 16700**

The Draft EIS considered how changes in the Project area both with and without implementation of the Project will potentially impact commercial fisheries in Chapter 4, Sections 4.14 (Commercial Fisheries) and recreational fisheries in Section 4.16 (Recreation and Tourism).

CPRA's proposed Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) contained information on potential fisheries mitigation, including mitigation that would be undertaken before Project construction. In response to public comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS, including providing additional detail on several fisheries mitigation and stewardship efforts that would be undertaken before Project construction, including funding for public and private oyster seed ground enhancement, marketing, shrimp vessel and facility improvements, workforce and business training, and subsistence and recreational fishing access (see Appendix R1 to the Final EIS for additional details). Specific to recreational fishing, CPRA will provide public access opportunities within the Barataria Basin and Mississippi River Basin. This is intended to address effects on proximity of resources for both consumptive and non-consumptive use. These effects will be primarily addressed through the provision of public shoreline access and watercraft launching around the Project area to assist recreational and subsistence fishing. In total, \$54 million would be allocated for mitigation and stewardship measures to address impacts to commercial and recreational fisheries.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

---

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61905**

**Commenters expressed that residents' way of life including living off of and recreating in the water would be impacted by an influx of fresh water due to the MBSD Project.**

**Response ID: 16235**

The issues raised by the commenters were considered in the Draft EIS. As described in the Existing Conditions in Chapter 3, Section 3.16 Recreation and Tourism, as well as Appendix H1 Socioeconomics Technical Report, the Draft EIS acknowledges the importance of recreational use in the region, describing many types of outdoor recreational activities, including fishing, hunting, boating, wildlife viewing, and general shoreline use, among others. The EIS further acknowledges that extensive estuarine and freshwater wetlands provide habitat for many kinds of fish, birds, reptiles, and mammals that are an integral component of recreation in the region. The evaluation of environmental changes in the basin under the No Action Alternative shows that the abundance of target recreational species, including spotted seatrout and red drum, would decline over time. Access to recreational boating sites would also increase from negligible impacts in the early decades to major, adverse impacts in the later decades, leading to decreases in recreational use in the southern portions of the basin even without the Project. Chapter 4, Sections 4.16.4.2 and 4.16.5.2 in Recreation and Tourism describe how changes in the amount of fresh water due to the MBSD Project would impact recreation and tourism. As noted, there would be adverse impacts on-site accessibility, recreational boating, and boat-based recreational fishing due to tidal flooding, sedimentation, and invasive plants. There would be adverse impacts on recreational fishing for spotted seatrout and beneficial impacts on recreational fishing for red drum.

CPRA has developed a suite of mitigation and stewardship measures to help address and offset Project impacts (see the Draft Mitigation and Stewardship Plan in Appendix R1 to the Draft EIS). In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 62284**

**Projections for increased water levels seem lower than what would be expected because the river water levels quoted are much lower than the river has averaged in recent years, and showing the “average” water level increases means that there would be higher peak water levels that are most damaging.**

**Response ID: 15812**

The Delft3D Basinwide Model represents the best tool currently available to inform the impact analysis for the EIS. Draft EIS Chapter 4, Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the No Action Alternative.

While Draft EIS Section 4.4.4.2 in Surface Water and Coastal Processes referenced average water levels to generally illustrate impacts to water levels for each alternative, Section 4.20.4.2 in Public Health and Safety used daily projected peak water surface elevations to estimate potential tidal (non-storm) flooding in communities outside federal levee systems.

---

This analysis of daily peak water surface elevations utilized model outputs that were based on the 2011 Mississippi River Hydrograph, which was a “high flow” year when the diversion was projected to be operating at or near maximum capacity for several months.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA’s MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of

the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances

where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63096**

**Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).**

**Response ID: 16699**

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude

would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63101**

**Commenter requests information on whether property will be transferrable after receiving mitigation and whether insurance will continue to be available.**

**Response ID: 16639**

Details regarding CPRA's planned mitigation and stewardship measures are explained in CPRA's Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS. Any property that is subject to a Project servitude would remain transferrable, however, subsequent transfers of that property would remain subject to the terms of the servitude. Similarly, if CPRA were to implement structural mitigation measures on a landowner's property (such as improving the bulkhead), the property would remain transferrable, however, subsequent transfers of the property would remain subject to the terms of any servitude or other agreement granted to CPRA.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

CPRA and the LA TIG would not place any restrictions on the ability to obtain or receive insurance as a condition to implementation of any mitigation measures.

McLindon Geosciences, LLC

# A Geological Evaluation of the vicinity of the Mid-Barataria Sediment Diversion

submitted as comments on Draft Restoration Plan and Environmental Impact  
Statement

Chris McLindon  
4/17/2021

These comments are being submitted on the Draft Restoration Plan and Environmental Impact Statement: Mid-Barataria Sediment Diversion (the “Draft EIS”). Comments submitted prior to drafting this Statement ([McLindon et al, 2017](#)) recommended: “that a thorough subsurface geological evaluation of the vicinity of MBSD [Mid-Barataria Sediment Diversion] be conducted to attempt to determine the location of geological faults, the recent history of fault movement and the effects of active faults on subsidence rates and variations in the thickness of highly compactible soils.” This recommendation included evaluation including the use of oil and gas industry seismic data, the acquisition of high resolution seismic data, the acquisition of sediment cores, and the development of subsidence measuring capabilities. The Draft EIS concluded in response to this recommendation that “there is insufficient information on which to evaluate the impact of faulting on the proposed Project or the impact of the proposed Project on the future fault movement.” It was the intention of the McLindon et al (2017) recommendation to collect the information necessary to make such an evaluation.

The comments submitted here are in the form of a geological evaluation of the vicinity of the MBSD. There are two principal objectives to this evaluation:

1. To provide a framework within which to develop the ability to forecast a probabilistic distribution for the frequency and magnitude of fault slip events in the vicinity of MBSD and other large infrastructure projects on the coastal plain, and
2. To provide insights into the historical relationships between sediment loading, fault slip events, and fault-induced subsidence that may be incorporated into predictive models for land elevation and land area gain in the MBSD project area.

This evaluation has been constructed with the best available data, and is in no way intended to replace or substitute for the thorough geological evaluation recommended in McLindon et al (2017). The subsurface geological maps used here represent a compilation of geological interpretations over many decades. Inputs to the interpretation have included well logs, biostratigraphic data from micropaleontology, seismic data, gravity data, published subsurface geological interpretations from peer-reviewed technical literature and atlases constructed by the New Orleans and Lafayette Geological Societies, and interpretations submitted to the Louisiana Office of Conservation in support of oil and gas unitization

### **The Ironton fault**

The Ironton fault is the most likely geological feature to have a direct impact on the MBSD Project. The fault plane has been mapped in the subsurface, and it is expressed on subsurface structural contour maps as a fault trace delineating the intersection of the fault plane and the mapped stratigraphic horizon. The fault can also be seen in cross sections constructed with oil and gas well logs, as well as 2-D and 3-D seismic data. Gagliano (2003) described this fault and other faults and salt domes in the area as being part of a “linked tectonic system”. This implies that individual elements within the system may be impacted by activity on other elements such as episodic fault slip events, diapiric salt movement (halokinesis), or salt dissolution. It also implies that faults within the system are likely to share similar characteristics. There is not adequate data available on the Ironton fault to derive the objective

Figure 1. Surface fault traces

framework for modeling fault slip activity and its impacts, so data from other faults in the system and within the basin will be used here to construct the framework.

This evaluation will consider aspects of the ten faults labeled here to derive a set of characteristics that may be applied to the Ironton fault. Taken together this set of characteristics can be used to make reasonable estimates of a probabilistic distribution of the frequency and magnitude of episodic slip events on the Ironton fault. The map of surface fault traces shown in Fig.1 is a compilation of numerous individual interpretations including university theses and dissertations and peer-reviewed publications ([Akintomide & Dawers \(2019\)](#), Armstrong et al (2014), [Bullock et al \(2018\)](#), [Culpepper et al \(2019\)](#), [Frank \(2017\)](#), [Johnston et al \(2017\)](#), [Levesh et al \(2019\)](#), McLindon (2017)). A portion of this map is available in a [GIS application](#) on the Louisiana Department of Transportation and Development website.

A subsurface contour map of the Ironton fault plane is shown in Fig. 2 along with subsurface contours on the top of salt at the Lafitte and Lake Hermitage salt domes. A fault plane map is constructed by integrating the interpretation of biostratigraphy, well log correlation and seismic data. The values in blue in Fig. 2 are the depths at which the fault can be interpreted on a well log by the “missing section” in the log relative to surrounding well logs. A cross section of six well logs across the fault plane is

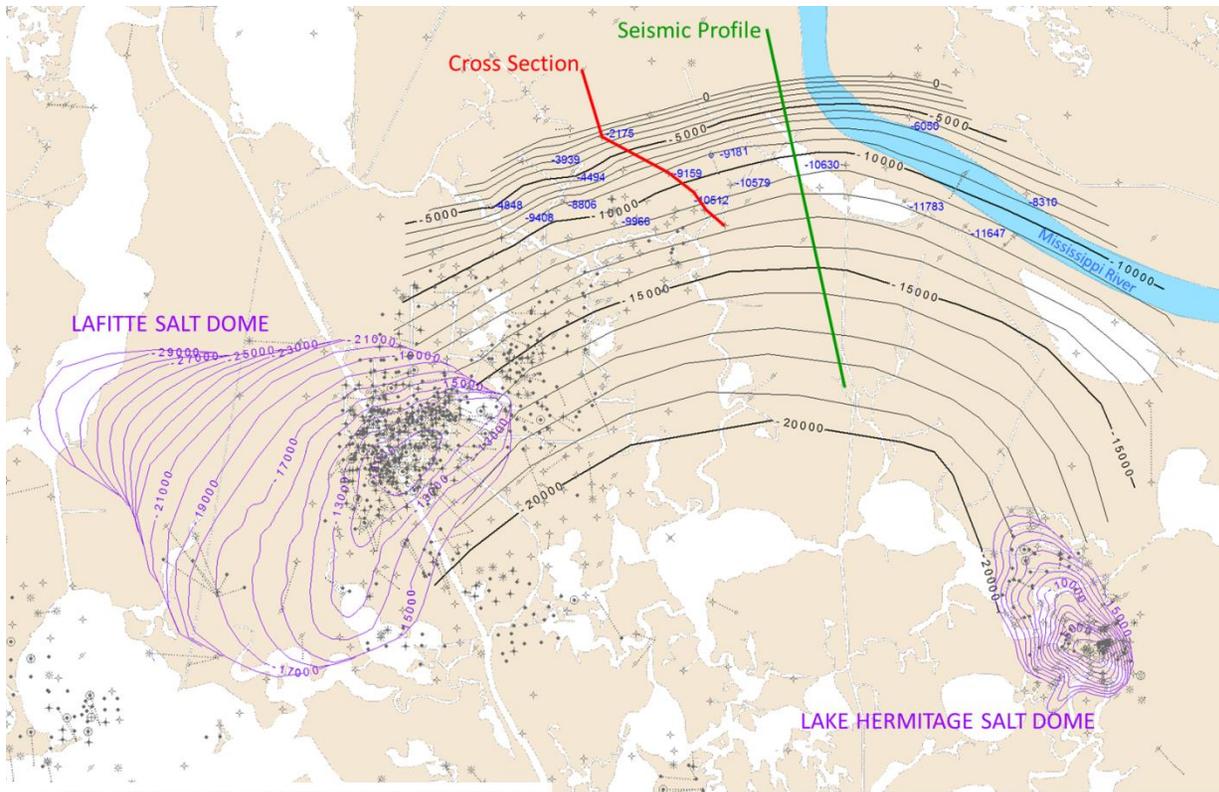

Figure 2. Ironton fault plane; Lafitte and Lake Hermitage top of salt contours

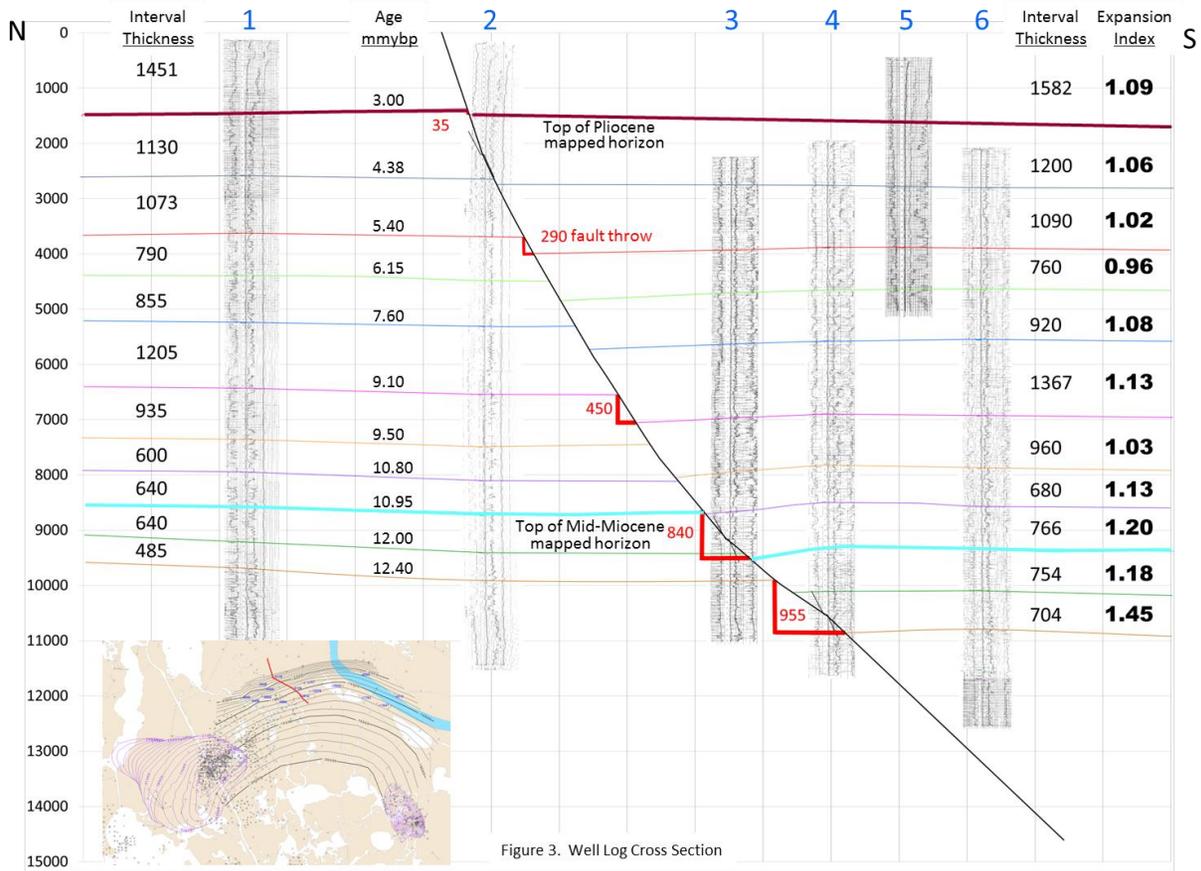

Figure 3. Well Log Cross Section

shown in Fig. 3. Wells 2, 3 and 4 exhibit missing stratigraphic section due to the fault at depths of -2175, -9,195', and -10,512' respectively. These values are integrated with those from other wells that intersect the fault plane along with seismic data interpretation to construct the fault plane map. The tops of the biostratigraphic intervals are shown as colored lines on the cross section. Each of these interval tops is correlated between the well logs and could be a potential mapping horizon. Mapped horizons at the top of the Pliocene and top of the Mid-Miocene Epoch are indicated on the cross section. The subsurface structure maps for these horizons are shown in Figs. 6 and 7, respectively. The vertical change in elevation across the fault, or fault throw, is shown for 5 horizons. The throw of the fault is 35' and 840' for the top of Pliocene and top of Mid-Miocene horizons respectively. These values could be measured from the cross section or by comparing the values of the subsurface elevation contours on either side of the fault on the subsurface structure maps. The throw of the fault continually increases with depth in the classic form of a Gulf Coast "growth fault". Increasing throw with depth indicates that the fault has been continually, if episodically, moving throughout the geological timespan measured by biostratigraphic control.

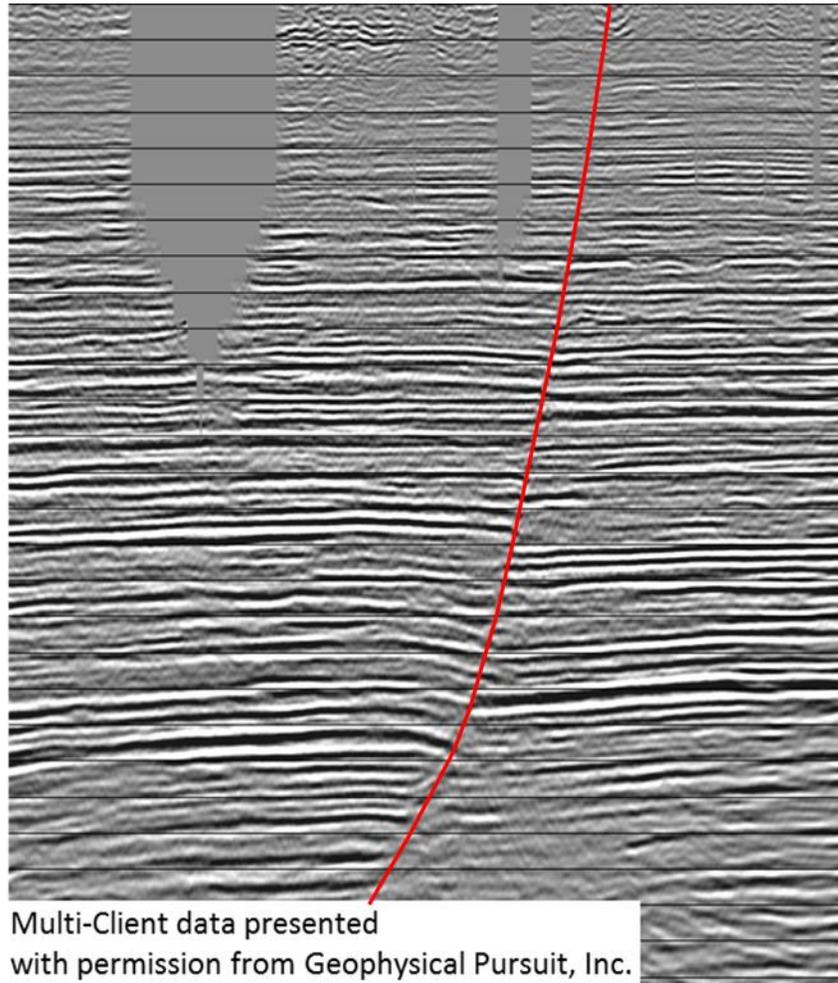

Figure 4. 2-D seismic profile

The interval thickness between each horizon is shown for a well on the upthrown, or foot wall side of the fault, and one on the downthrown or hanging wall side. The ratio of the hanging wall thickness to the footwall thickness for any interval is called the “expansion index”, and it is used gain insight into historical fault movement. The deepest correlated interval is 485’ thick on the foot wall side and 704’ thick on the hanging wall side. The expansion index across the fault at this interval is 1.45, or the hanging wall side is 145% thicker than the foot wall side. The cross section also shows that the Ironton fault has a classic listric shape, which flattens with depth. The magnitude of the horizontal component of fault displacement increases with depth relative to the vertical component as the fault plane flattens. This illustrates the significant lateral movement that is associated with fault slip over time. It is likely that the horizontal vectors of movement measured at CORS stations in Fig. 33 are due to fault slip.

Fig. 4 is a portion of an oil and gas industry 2-D seismic profile across the Ironton fault. Seismic data can be integrated with subsurface well log interpretations in the construction of the fault plane map and subsurface structure maps within the interval of biostratigraphic control. It can also be used to map the fault plane and subsurface structure below this interval, allowing for the projection of fault plane contours to depths of up to 20,000 feet. Oil and gas industry seismic data is acquired and processed to optimize imaging of the subsurface between depths of about 2,000 and 15,000 feet below the surface, where most oil and gas is found. Seismic profiles such as that shown in Fig. 4 are less than optimal for imaging the near-surface extent of a fault, and interpretations generally have to be extrapolated to the surface. The acquisition of new high resolution seismic data across the Ironton fault recommended in McLindon et al (2017), and reiterated here, is intended provide the necessary imaging to evaluate the near-surface extent of the fault.

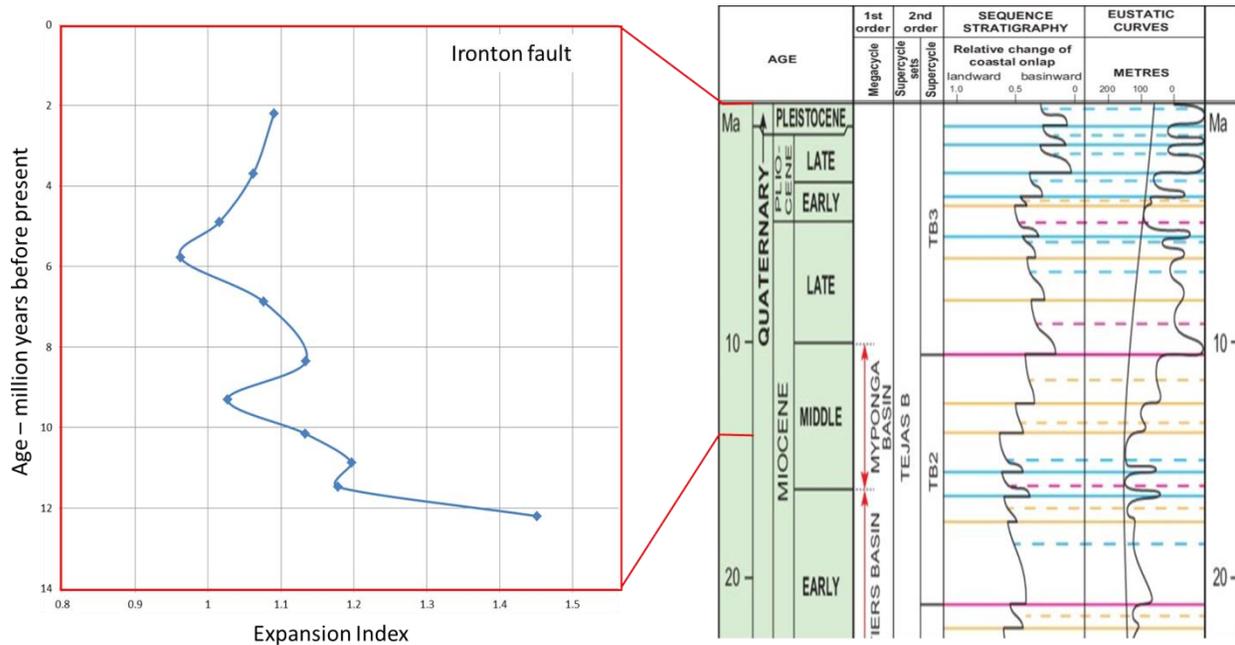

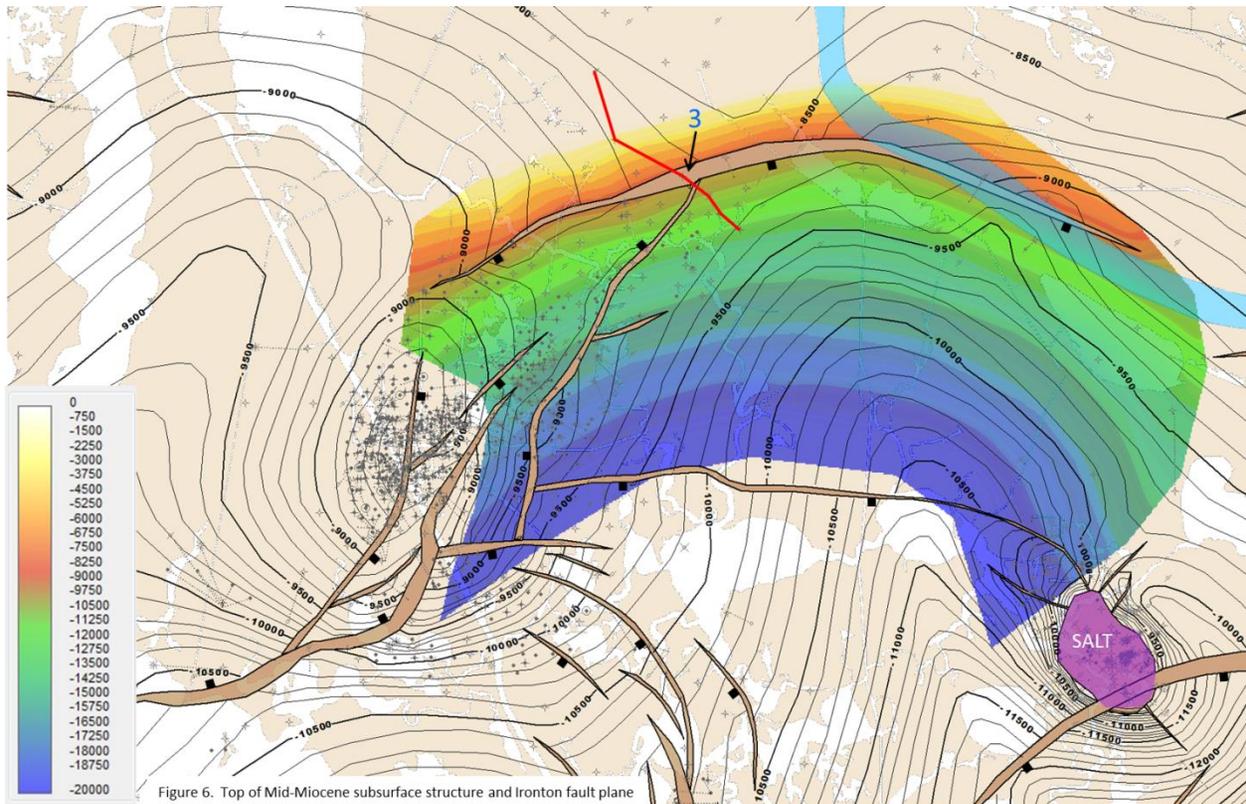

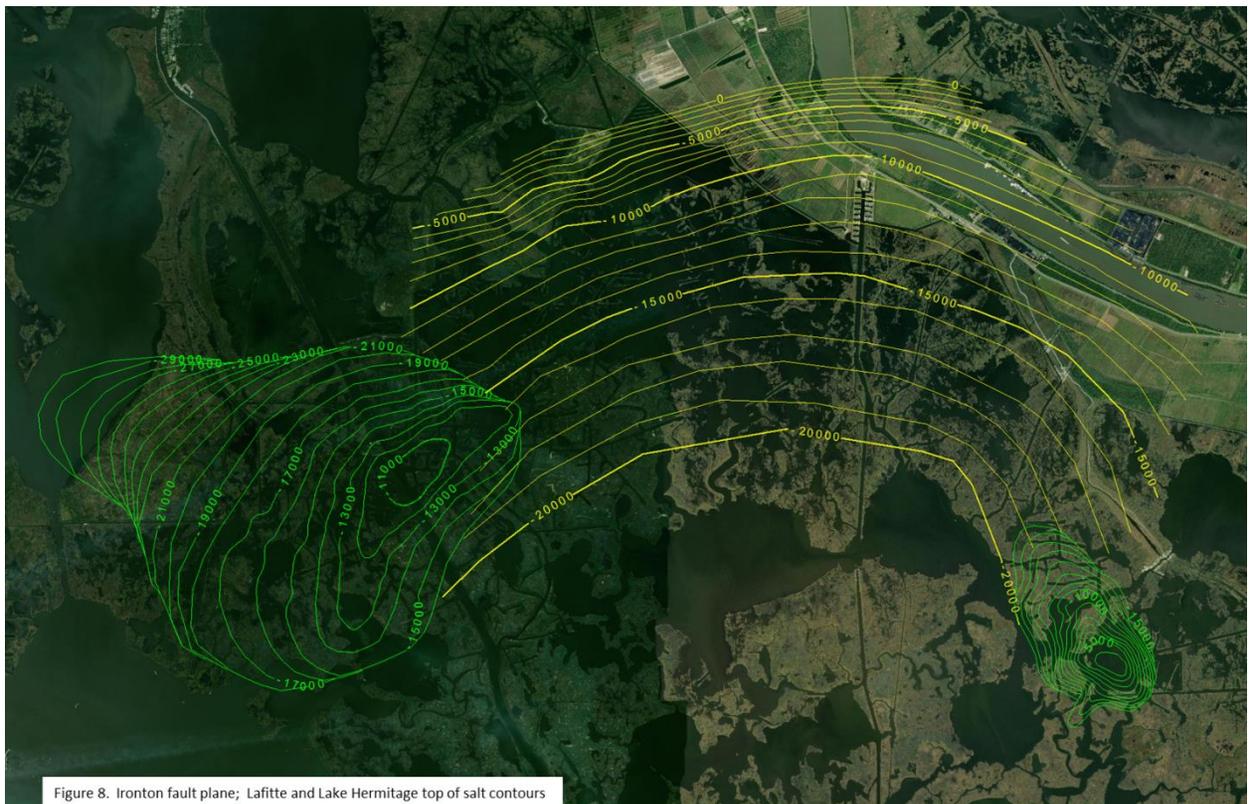

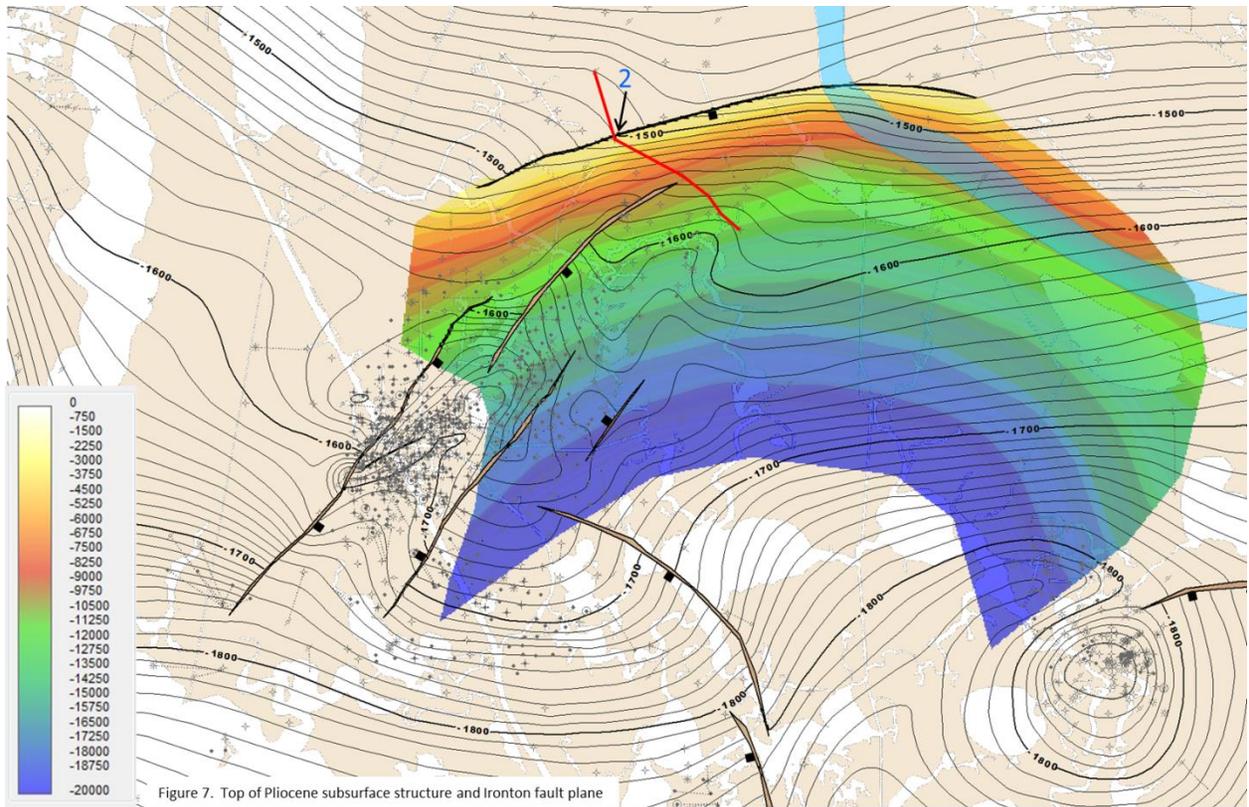

Figure 5. Ironton fault – Expansion Index vs Age

Fig. 5 is a graph of the variation of the expansion index across the Ironton fault through the span of geological time between the Mid-Miocene and Pliocene mapping horizons. The expansion index is generally above the value of 1 throughout most the time span indicating continual movement of the fault. As will be discussed in more detail in a subsequent section, the higher values of expansion index on the fault can be related to periods of increased sedimentary loading associated with an active delta system. Graphs like this can be used to assign a generalized relative quantitative value to the distribution of fault slip events over geologic time. It is likely that the history of fault movement has consisted of a distribution of individual events over time whose variation in magnitude is similar to other natural phenomenon such as earthquakes, floods and hurricanes. Unlike tectonic fault movement associated with earthquakes, the movement of listric faults in a passive margin setting is generally aseismic. The relative distribution of the magnitude of slip events over time may, however, be similar. In other words, fault slip on these faults may consist primarily of low magnitude slip events that manifest as a creeping motion on the fault, but larger events may occur sporadically over time. The primary intention of a thorough geological evaluation is to attempt to put ranges on the magnitude and frequency of slip events on the Ironton fault.

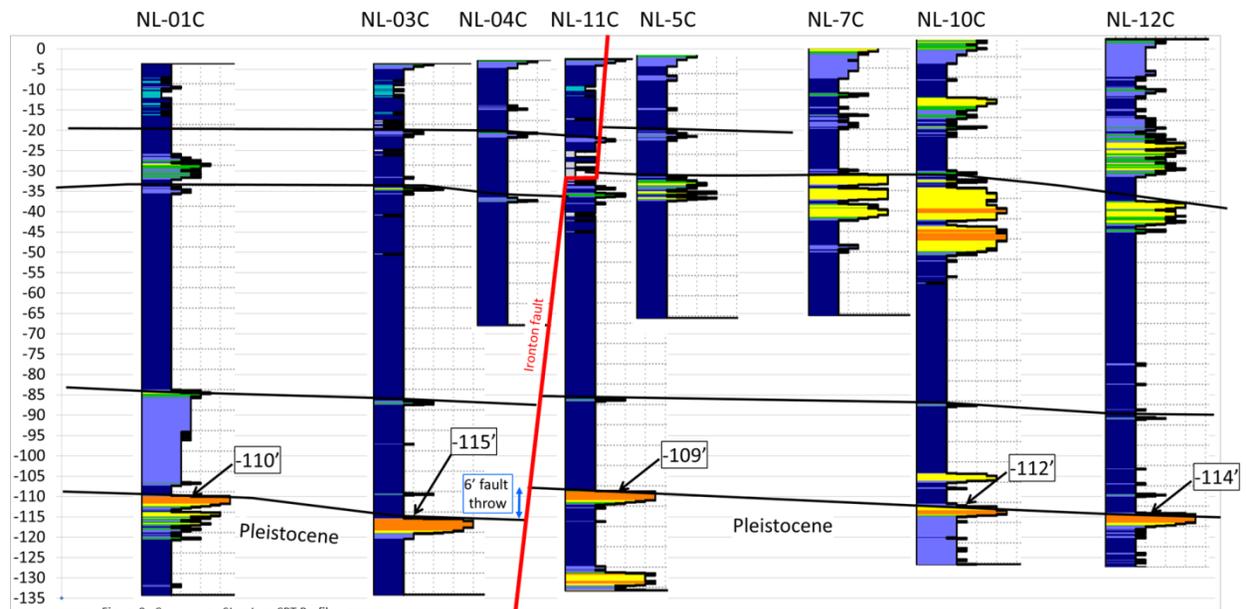

The Ironton fault plane is represented as a colored grid overlain on the subsurface structure map for the top of Mid-Miocene mapped horizon in Fig. 6. The subsurface trace of the fault is the brown polygon on the structure map based on the lateral component of displacement. Black squares indicate the down-dropped side of the fault. Well 3 from the cross section falls within the fault trace polygon for the Ironton fault on this horizon meaning that the horizon is “faulted out” of the well. It can be seen on the

cross section that the Mid-Miocene mapped horizon is not present in the well, as it has been displaced vertically and laterally by the fault. A comparison of the Mid-Miocene map in Fig. 6 and the Pliocene map in Fig. 7 shows how the trace of the fault on the map reflects the decrease in throw with depth. Subsurface geological structures generally become simpler and flatter at shallower depths. At the depth of the Pliocene mapped horizon only the major faults are still active. These are the same faults that appear to reach the surface. The 0'-depth contour of the Ironton fault plane is coincident with the surface trace of the fault shown in Fig. 1. The most significant impacts of a potential future fault slip event should be expected along this trace, and future geological evaluation of the fault should be focused on more fully delineating the near-surface fault plane with high resolution seismic and sediment cores. Fig.8 also shows the connection of the Ironton fault plane to the Lafitte and Lake Hermitage salt domes. These are elements of the linked tectonic system described by Gagliano et al (2003). There is likely to be a genetic relationship between the structural evolution of the fault and the salt domes. It is probable that halokentic salt movement on the domes has affected the history of movement on the fault. It is also possible that the dissolution of salt at the domes may have contributed to triggering fault slip events. Halokinesis and salt dissolution should be considered as potential causes for future slip events on the Ironton fault.

A near-surface expression of the Ironton fault can be seen in a profile of cone penetrometer tests (CPT) taken along the proposed conveyance structure for the MBS. Interpreted images of a profile including the same tests were published in the Geotechnical Baseline Report for 30% Design (CPRA, 2014). These interpreted images indicated the correlation of the top of the Pleistocene interval with an overlying deposit of "Near Shore Gulf" sand shown in orange in Fig. 9. This sand layer is likely to represent a basal Holocene transgressive unit associated with the first submergence of the Pleistocene surface by rising sea level.

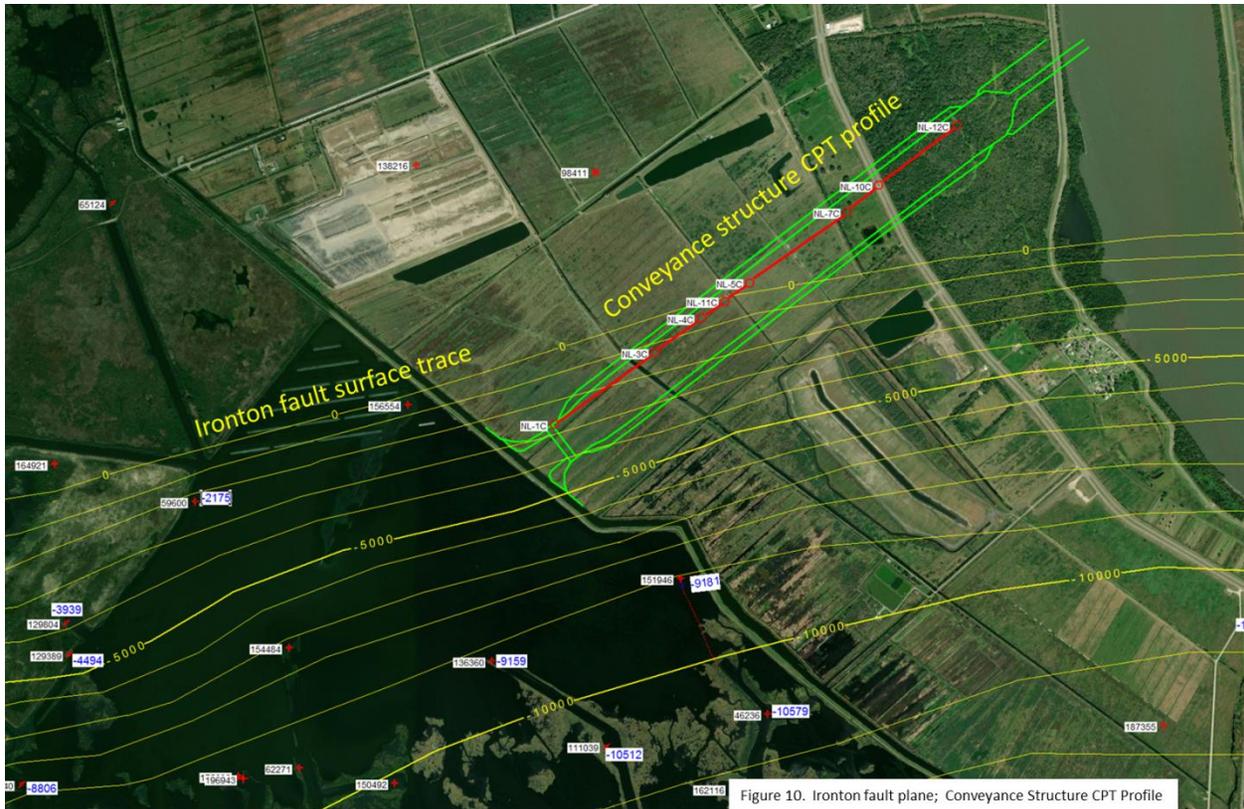

Figure 10. Ironton fault plane; Conveyance Structure CPT Profile

Frazier (1967) interpreted borings taken along the Barataria Waterway, and defined the top of deposits associated with the Bayou Families Delta at between 30 and 40 feet below the surface in this area. The sandy, silty layer in this depth range on Fig. 9 is likely to be associated with this delta lobe. These approximate ages may be used to generally approximate rates of fault slip on the Ironton fault, however much more accurate age determinations from sediment cores used in association with high resolution seismic profiles would be necessary to provide estimates accurate enough to be used in predictive modeling.

Fig. 9 indicates 6 feet of throw on the Ironton fault at the top of the Pleistocene surface. If the more detailed geological evaluation recommended here supports this interpretation, it may be concluded that the 6 feet of throw is consistent with the pattern of throw versus depth seen on the cross section in Fig. 3. It is likely that the magnitude of this throw is the result of the cumulative effect of multiple fault slip events that have occurred since the deposition of the basal transgressive sand. Fig. 10 shows the fault plane contours of the Ironton fault crossing the CPT profile at the interpreted location of the fault on the profile. Oil and gas wells in the area are identified by their Louisiana DNR serial number, and the depth of the Ironton fault is indicated in blue.

## Characteristics of other faults in the area

Each of the nine other faults shown in Fig. 1 will be considered here to provide a collective characterization that may be used as a framework within which to develop the ability to forecast a probabilistic distribution for the frequency and magnitude of fault slip events on the Ironton fault. Each of these faults exhibits some indication of recent fault movement. Some reveal the potential impacts of faults on infrastructure, and some document differential rates of Holocene sediment accumulation across the fault.

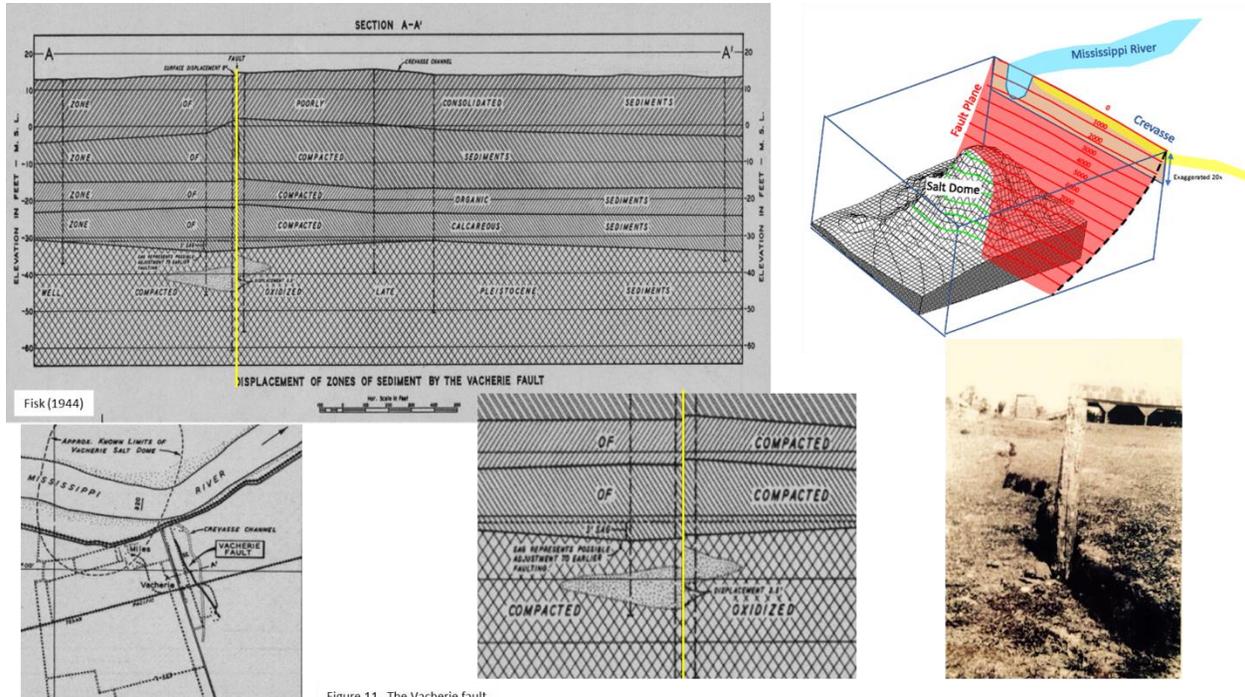

Figure 11. The Vacherie fault

The Vacherie fault (Fig. 11) provides the highest quality data point for the magnitude of a recent individual fault slip event. The event occurred between April 12th and 15th, 1943, and the magnitude of the vertical displacement was reported by Fisk (1944) to be 8 inches. There was some reported local ground shaking, but there was no detection of seismic activity at the Loyola University seismometer only 50 miles away. This appears to have been an aseismic fault slip event. Fisk used a boring profile across the fault escarpment to measure 3 feet of vertical displacement across the fault at the top of the Pleistocene. He interpreted this to indicate recurrent movement on the fault. Fisk also noted “Of particular interest is the fact that faulting occurred at a place along the river where repeated crevasing took place.”

It is probable that the 3 feet of displacement at the top of the Pleistocene is representative of the cumulative total of all of the recurrent fault slip events throughout the Holocene. If each recurring event produced a displacement of 8 inches, then there could have been three previous events over the 7,000 year span that is likely to be represented by the Holocene sediments. Some of the displacement could have been taken up by compaction of the poorly consolidated sediments, which may allow for more events of the same magnitude, but it may also be true that larger magnitude events in the past

would have been necessary to cause a crevasse of the river. If the history of movement on the Vacherie fault could be accurately reconstructed, it would likely show a log-normal distribution in the magnitude of the fault slip events. Subsurface mapping indicates that the fault has been active since at least the early Miocene. Movement since the deposition of the first Holocene sediments would probably be represented by many small slip events that would have propagated a creeping movement on the fault, and a few large events, perhaps with magnitudes of a foot or more vertical displacement adequate to cause a crevasse of the river.

The correlation of the fault and the site of the historical crevasses of the river is significant. The 1943 fault slip event occurred during flood stage on the river. It is likely that the dilation of near-surface aquifers near the river channel during flood stages may alter the stress fields within the near surface sedimentary layers, and provide a potential trigger mechanism for fault slip events. The 6 feet of vertical displacement at the top of the Pleistocene seen on the CPT profile in Fig. 9 is twice the value seen on the Vacherie fault. This may suggest that the Ironton fault has had more and higher magnitude fault slip events during the Holocene. There is no evidence of historical crevasses of the river at the Ironton fault, but some effort should be made to evaluate the magnitude of an event that would be necessary to cause a crevasse of the river, and the probability that such an event could occur using predictive modeling based on a likely distribution of the magnitude of historical events. This is particularly true given that differential sedimentary loading across the fault, as intended by the MBSD project, may provide a trigger mechanism for a fault slip event.

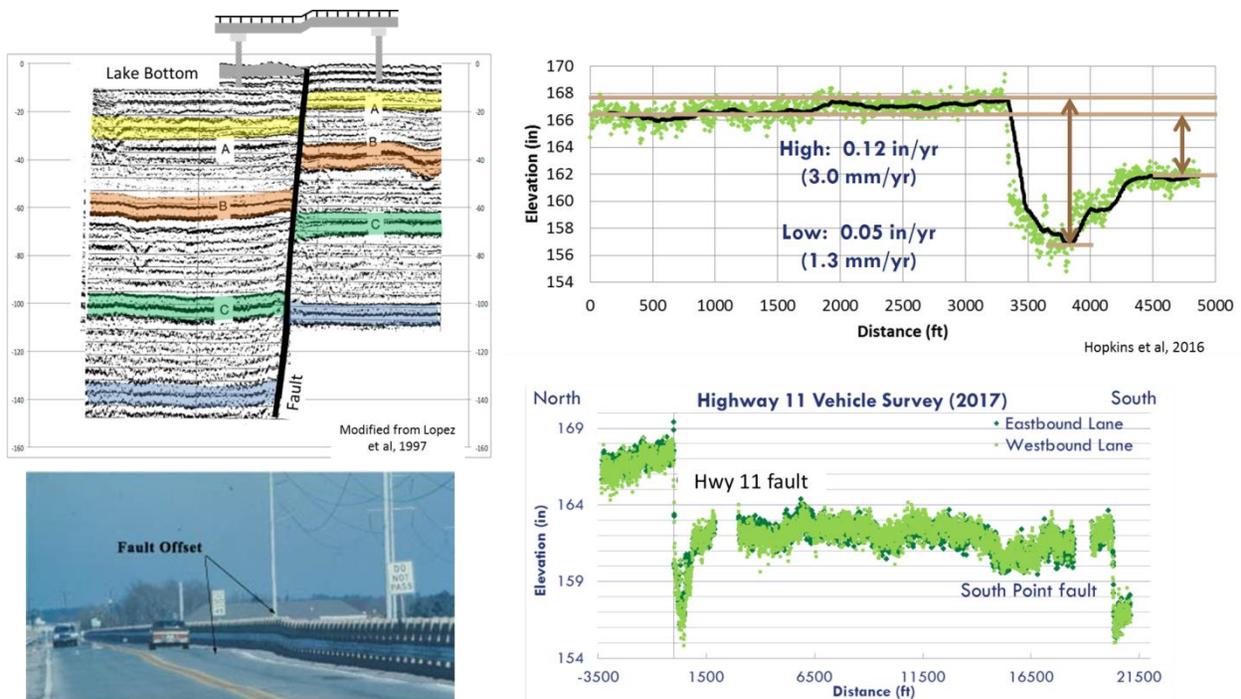

Figure 12. The Hwy 11 fault

The Highway 11 fault (Fig. 12) provides the most tangible evidence for the impact of a fault on infrastructure in the area. The fault also provides valuable insights because it is the single place in south Louisiana where a fault is crossed by a high resolution seismic line capable of measuring near-surface fault throw on multiple horizons (Lopez et al, 1997). Vertical displacement on the fault at the surface has also been measured by elevation surveys across the Highway 11 Bridge (Hopkins et al, 2016).

The seismic profile across the fault exhibits high-quality imaging of Pleistocene sedimentary layers to a depth of about 150 feet with a vertical resolution of less than a few feet. This type of imaging capability is necessary to evaluate faults in the near-surface, and is recommended for a geological evaluation of the MBSD project area. Lopez et al (1997) provided interpreted correlation of seismic horizons associated with sedimentary layers across the fault. The fault exhibits increasing throw with depth and thickening of stratigraphic intervals on the hanging wall side up to the surface. It is likely that this pattern extends to all faults delineated on Fig. 1, and it suggests continual episodic movement on the faults throughout the Quaternary. If this seismic profile had been combined with high resolution dating of sediment cores, it would have been possible to reconstruct a detailed history of fault movement. A reconstruction of fault movement from this type of data is likely to reveal averaged movement over intervals of time rather than individual episodic fault slip events, but it would be valuable for putting reasonable ranges on the magnitudes of individual events within a given interval.

The elevation profiles from Hopkins et al (2016) indicate the magnitude and span of displacement across the fault, and valuable estimates of average rates of fault slip. The lower of the two elevation profiles in Fig. 12 shows the entire span of the Highway 11 Bridge. It is important to note that while there is a localized increase in offset immediately adjacent to the fault, the entire hanging wall side of the fault has a lower elevation than the footwall side. This indicates that subsidence due to cumulative fault slip has affected an area of up to 100 square miles or more. The average rate of subsidence associated with fault slip is between 1.3 and 3.0 mm year over the time span measured. This is likely to be the result of cumulative slow slip movement, as there have been no reported episodic events on the fault over the past few decades. Lopez et al (1997) did however document the occurrence of two small earthquakes associated with the South Point fault near the end of the bridge in 1987.

The St. Rose fault (Fig. 13) also appears to exhibit the impact of faults on infrastructure. The surface trace of the fault is clearly delineated by a sharp tree line in the cypress swamp. Trees on the hanging wall side of the fault have mostly died. The plane of the fault can be mapped in the subsurface with well log correlation and 3-D seismic data interpretation. One possible explanation for the death of the trees is the migration of saline fluids to the surface along the fault plane. A similar configuration exists at the Montegut fault (Fig. 16) where Kuecher et al (2001) measured a distinct anomaly in total dissolved solids in soils adjacent to the fault. Saline fluid migration has also been documented on faults in the Baton Rouge fault system.

The clearly defined surface trace of the St. Rose fault very closely coincides with two apparent impacts on infrastructure. An elevation survey on Highway 626 shows a vertical offset on the road bed. The trace of the fault also coincides with a crack and vertical offset in a T-wall in the St. Rose drainage structure.

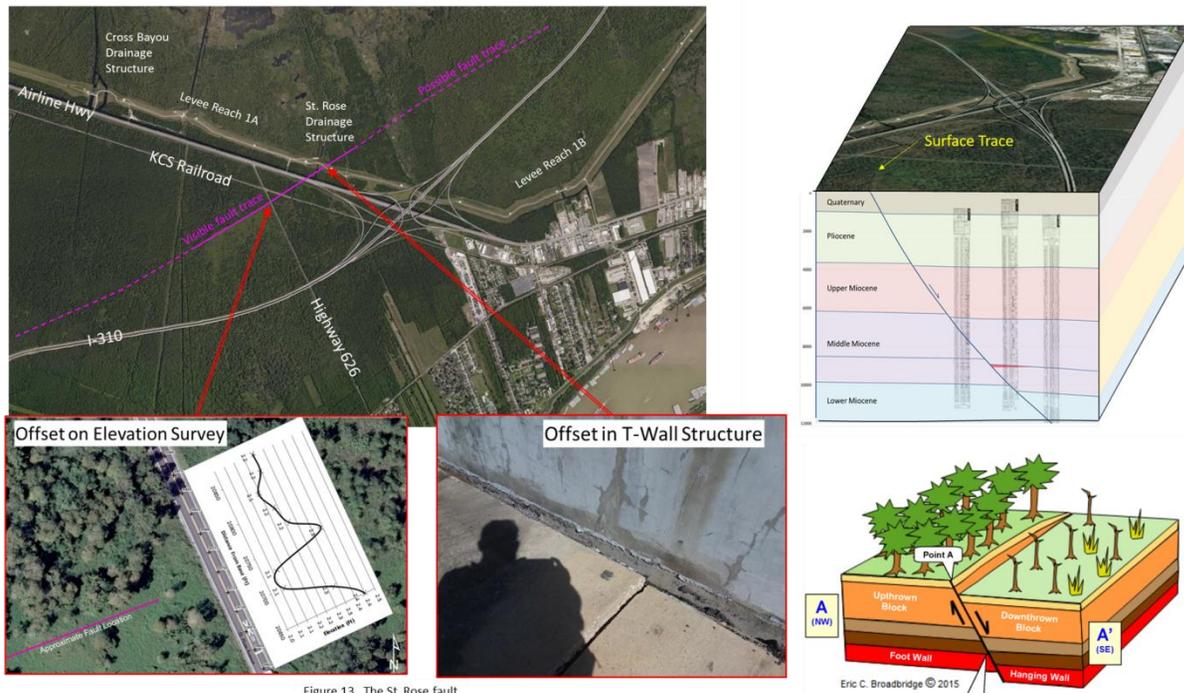

Figure 13. The St. Rose fault

The Gentlyly fault (Fig. 14) was identified in a boring profile by Fisk (1944). The vertical offset at the top of the Pleistocene (blue on the profile) is nearly 20 feet. As a result, the Holocene sediments, and in particular the organic clay and peat deposits near the surface are thicker on the hanging wall side of the fault than they are on the foot wall side. A map of peat thickness across the area by Gould and Morgan

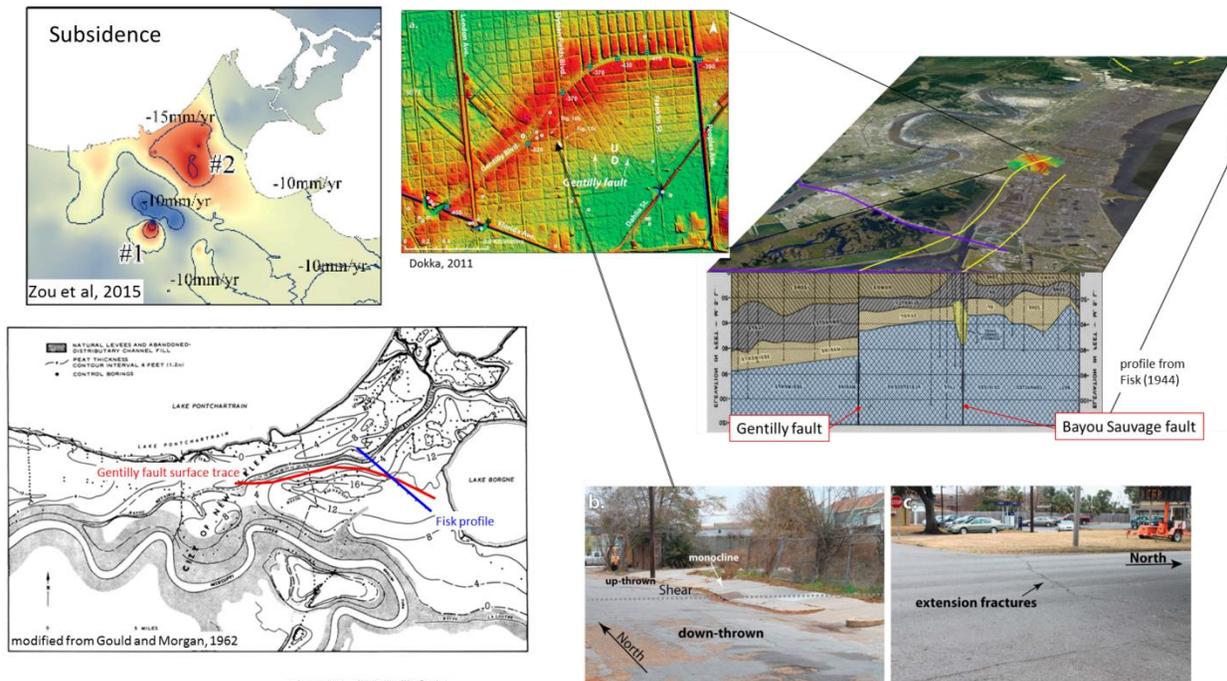

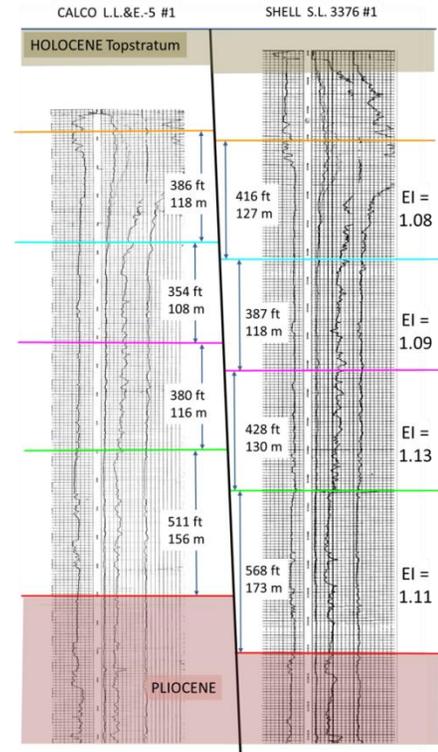

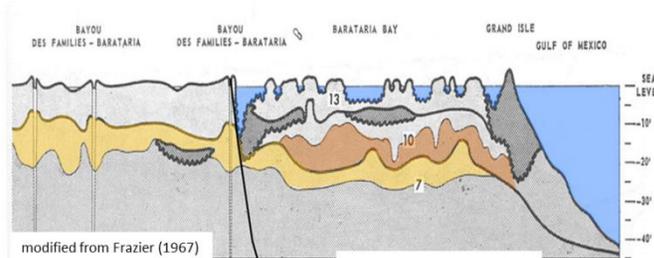

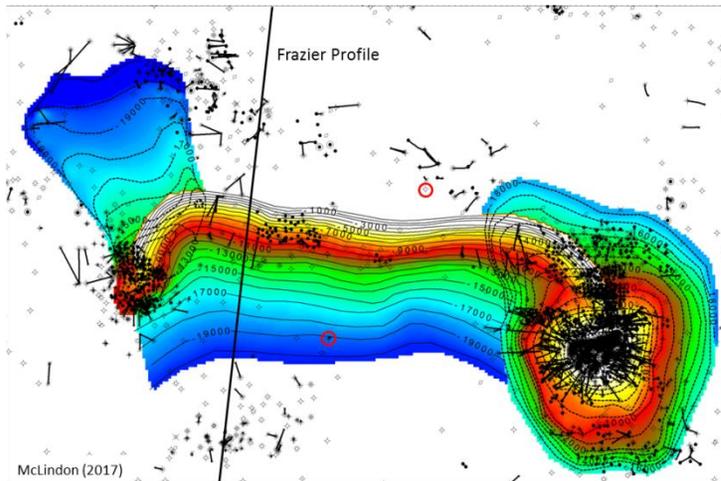

Figure 14. The Gentlyly fault

(1962) shows that the thickest accumulation of peat in the area is on the hanging wall side of the fault.

Zou et al (2015) used US Coast and Geodetic Survey data from repeat surveys of elevation benchmarks in the area to delineate a high subsidence anomaly that coincides the thick accumulation of peat on the hanging wall side of the Gentilly fault. This is likely to be a result of a feedback loop between fault slip and sediment accumulation. Subsidence rates are logically higher across an area of thick peat accumulation because sedimentary layers composed primarily of poorly consolidated organic material are likely to exhibit higher rates of compaction resulting in subsidence expressed at the surface. A consideration of why the peat layer is thick in the first place would lead to the recognition that peat accumulation is itself a response to subsidence. The accumulation of peat has both a cause and effect relationship with subsidence in the area. Marsh and swamp ecosystems on a delta plain maintain elevation through organic growth with some input of mineral sediment from river flooding or tidal flux. As plants in the ecosystem die and are submerged new plants grow on top of them. The rate of the accumulation of organic material is controlled by the rate of subsidence. Areas with the high subsidence rates, such as the hanging walls of faults, tend to have thicker peat accumulations.

The total vertical displacement of 20 feet at the top of the Pleistocene suggests that the Gentilly fault has had higher magnitude and possibly more frequent individual slip events than either the Vacherie or Ironton faults. Possible ranges for values of a distribution of magnitude and/or frequency of fault slip events can be considered. If a distinct fault slip event occurred an average of once a century over the 7,000 year span representing the accumulated Holocene sediments, then there would have been 70 individual slip events and the average magnitude of each event would have been about 3.4 inches of vertical displacement. If distinct slip events occurred once a decade, then there would have been 700 events with an average magnitude of about 1/3 inch. Given the size distribution patterns of other natural phenomenon like earthquakes, floods and hurricanes, it is more likely that fault slip events have not occurred at evenly spaced intervals of time with equal magnitudes. It is more likely that the historical distribution the magnitude of slip events on the Gentilly fault exhibits a log-normal pattern, and that high-end magnitudes with less than a 1% chance of occurrence may have values of 2 feet or greater, while low-end magnitudes may be fractions of an inch. The cumulative effect of all of the individual fault slip events since the beginning of Holocene deposition accounts for the 20 feet of vertical offset at the top of the Pleistocene.

The Central Wetlands Unit, which overlies the thick peat accumulation on the hanging wall side of the Gentilly fault is recognized as a hot spot of wetlands loss. It is likely that subsidence associated with fault slip and differential compaction of the peat layer across the fault has contributed significantly to the submergence of the wetlands. The magnitude of the rate of subsidence is evidenced by the submergence of Old Paris Road, which as constructed in the 1930s, and is now 2 feet below the water's surface. This is an obvious impact on infrastructure. It also appears likely that the surface trace of the Gentilly fault can be extrapolated to connect with a fault segment documented by Dokka (2011). He used a LIDAR digital elevation model to reveal the escarpment of a fault crossing Gentilly Blvd. in eastern New Orleans. Dokka also documented shear and extension fractures in the streets that coincided with the location of the fault.

The Barataria fault (Fig 15.) is a critical component of the linked tectonic system that includes the Ironton fault. The fault plane connects the Bay de Chene and Lake Washington salt domes at the western and eastern ends of the fault plane respectively. It is probable that the domes and the fault have interacted throughout the Cenozoic Era, and that halokinesis and salt dissolution have played a causal role in fault slip events. Expansion index evaluation across the fault indicates continual episodic movement of the fault throughout the Pleistocene, but there is not adequate data to determine the vertical offset at the top of the Pleistocene. A boring profile from Frazier (1967) crosses the fault near its western edge. Frazier interpreted the sedimentary layers associated with the Bayou des Families (#7), Bayou Blue (#10) and early Mississippi (#13) deltas. The vertical trace of the fault has been superimposed on the profile to highlight the offset of the sedimentary layers across the fault. It is likely that each of the Holocene deltas defined by Frazier interacted with the components of the linked tectonic system, and that the architecture of each delta lobe reflects its interaction with the structural system. As will be discussed in a subsequent section, there is good evidence that sedimentary loading associated with the Miocene deltas that were active across this area caused accelerated slip on certain faults. It is probable that the deposition of deltaic sediments in the Holocene also contributed to fault slip events, and fault slip probably played an important role in the submergence of the delta lobes. The same depth interval associated with the Bayou des Families delta on the boring profile in Fig. 15 can be seen in the CPT profile in Fig. 9, and it appears that this interval has been offset by the Ironton fault.

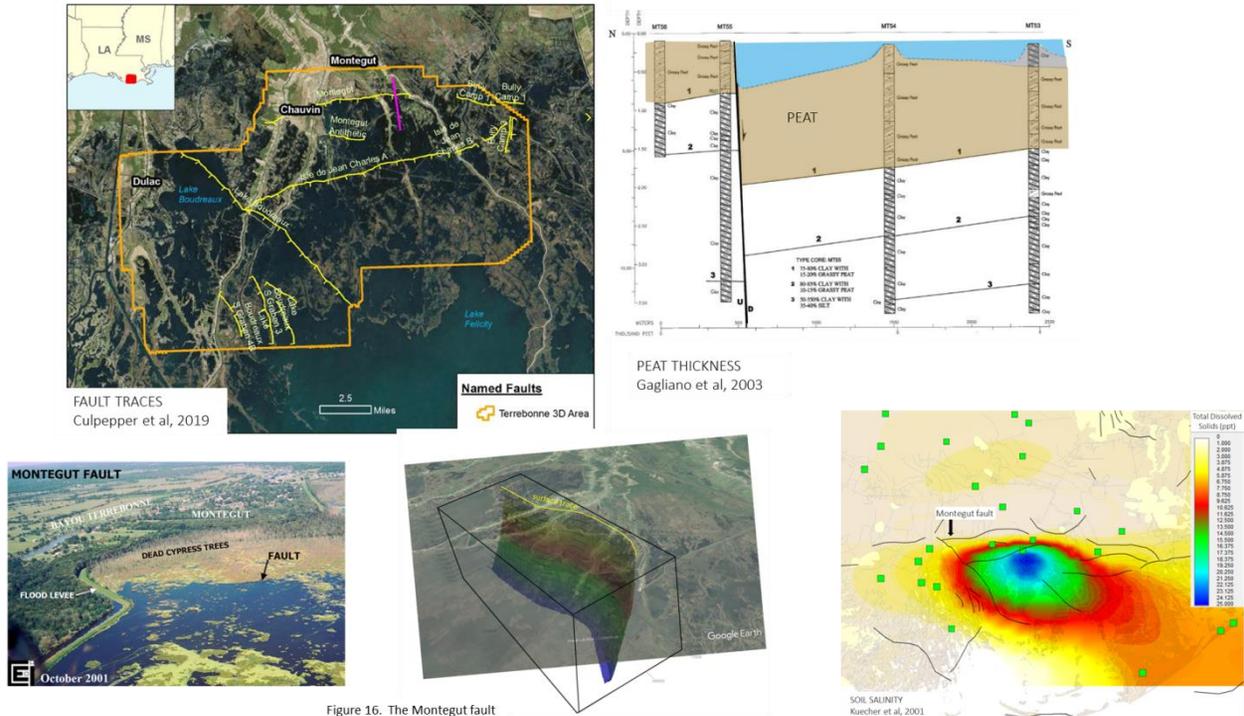

Figure 16. The Montegut fault

The Montegut fault (Fig 16.) is along a trend of faults that extend westward from the Barataria fault that Gagliano et al (2003) called the Golden Meadow fault trend. The fault is one of several faults that were mapped in the subsurface with 3-D seismic data and extrapolated to surface traces that coincide with lineations in the marsh (Culpepper et al, 2019). Gagliano et al (2003) used a boring profile to document thicker peat accumulations on the hanging wall side of the fault, and related the fault to a lineation in the marsh surface and an area of dead cypress trees. Keucher et al (2001) identified a distinct anomaly in total dissolved solids in the soils adjacent to the fault. It is likely that saline fluid migration along the fault plane is associated with the soil salinity anomaly, and may have contributed to the death of the cypress trees.

The Bastian Bay fault (Fig. 17) parallels the Empire fault (Fig. 18), and both extend from the eastern flank of the Lake Washington salt dome. The fault plane has been mapped in the subsurface with well logs and 3-D seismic data, and it can be extrapolated to a surface trace that coincides with a distinct lineation in the marsh. A profile of well log correlations across the fault shows increasing fault throw with depth throughout the Pleistocene, and a vertical displacement at the top of the Pleistocene can be reasonably estimated at about 40 feet. Martin (2006) also documented expansion indices across the fault in the same depth range that indicate continual fault movement. The magnitude of the vertical offset at the top of the Pleistocene also suggests that it may be the result of larger and/or more frequent fault slip events that those previously discussed here. The nature of one of these events may be revealed in a comparison of the marsh surface across the area in images from ProPublica (2014). In the period between 1973 and 1975 a large area across the hanging wall of the Bastian Bay fault submerged and converted from mostly saline marsh to open water. Gagliano et al (2003) estimated that the vertical

displacement on the fault at the surface was 3.0 to 3.5 feet, and reported anecdotal evidence from oyster fishermen and camp owners.

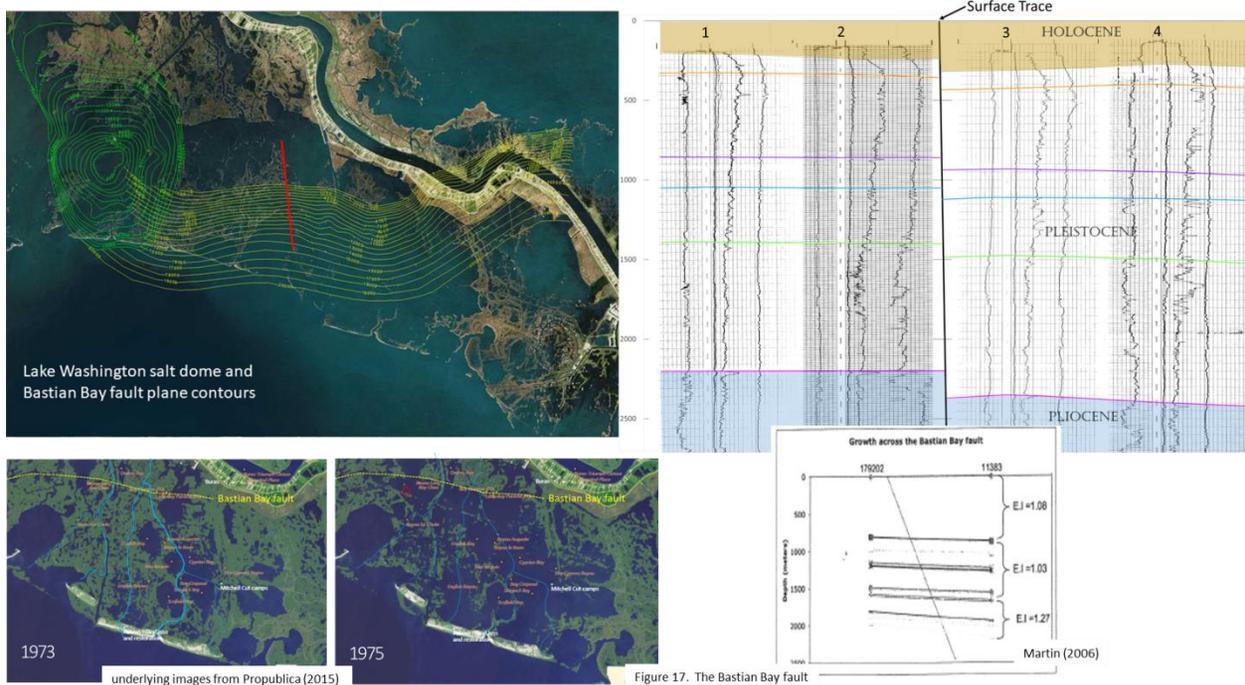

Figure 17. The Bastian Bay fault

This pattern of rapid subsidence across a large area would be consistent with a fault slip event, but it may be possible that the “event” lasted for several weeks or months. In this type of scenario the entire magnitude of the fault slip would not be contained in a single catastrophic slip event, but it may have distributed over time as a series of smaller slip events or an extended period in which the rate of a continuous slow-slip motion was accelerated. Much more investigation is needed to understand the potential for this type of fault movement in the delta plain environment, but it should be considered in an evaluation of the Ironton fault.

The Empire fault (fig 18) was named by Gagliano et al (2003). The same fault has also recently been referred to as the Adams Bay fault, but the original name is used here to avoid confusion. The Empire fault is parallel to and just north of the Bastian Bay fault. The Empire fault plane has been mapped in the subsurface with well logs and 3-D seismic data, and it can be extrapolated to one of the most distinct surface escarpments on the delta plain. Expansion indices across the fault indicate continual movement throughout the Pleistocene (Martin, 2006) Gagliano et al (2003) constructed an auger boring profile across the fault to illustrate a vertical offset across the fault of 3.0 to 3.5 feet at the surface. Martin (2006) also quoted anecdotal evidence from Greg Linscombe of the Louisiana Department of Wildlife and Fisheries that the marsh break associated with the fault escarpment formed between 1976 and 1977. The magnitude and pattern of this fault slip event are similar to that associated with the Bastian Bay fault, but they appear to be separated in time by 3 or 4 years. The relationship between these two apparent fault slip events may provide insights into the nature of the connection between elements in the linked tectonic system. It may be possible that the Bastian Bay fault slip event changed

the stress fields in the near-surface in a way that affected and contributed to the cause of the Empire fault slip event. Much more work is needed to understand these relationships, but the possibility for other components of the linked tectonic system to affect the Ironton fault should be considered in the evaluation.

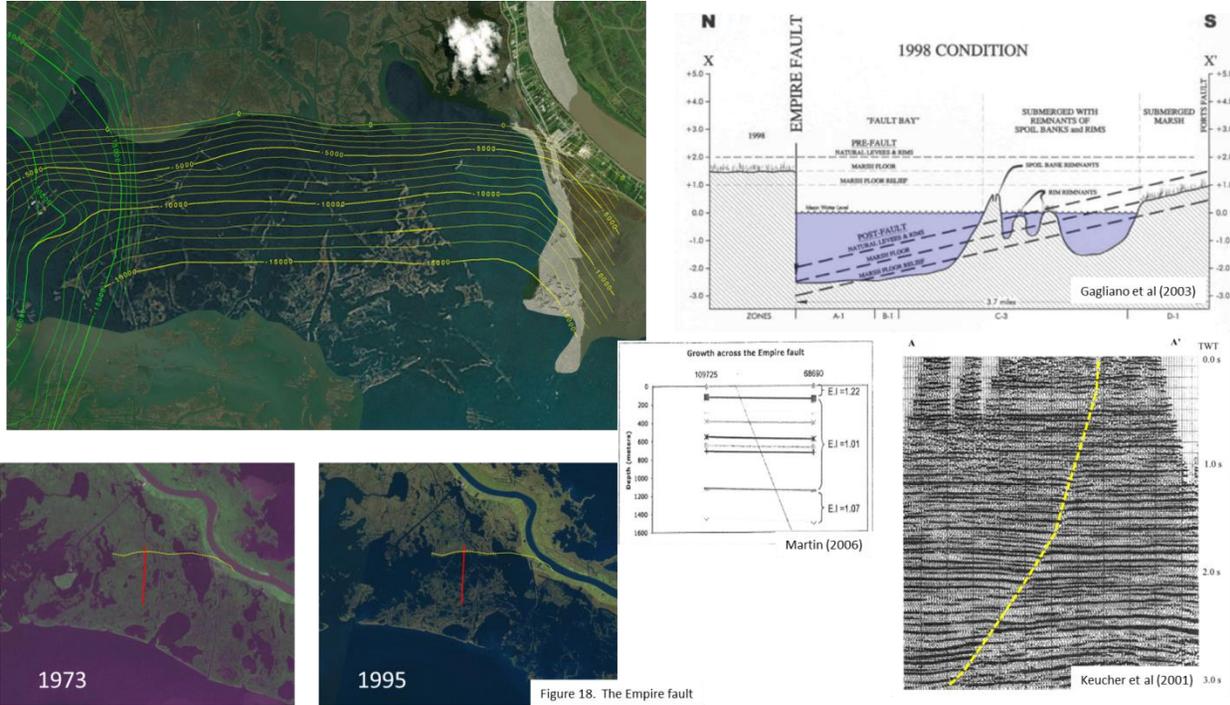

Figure 18. The Empire fault

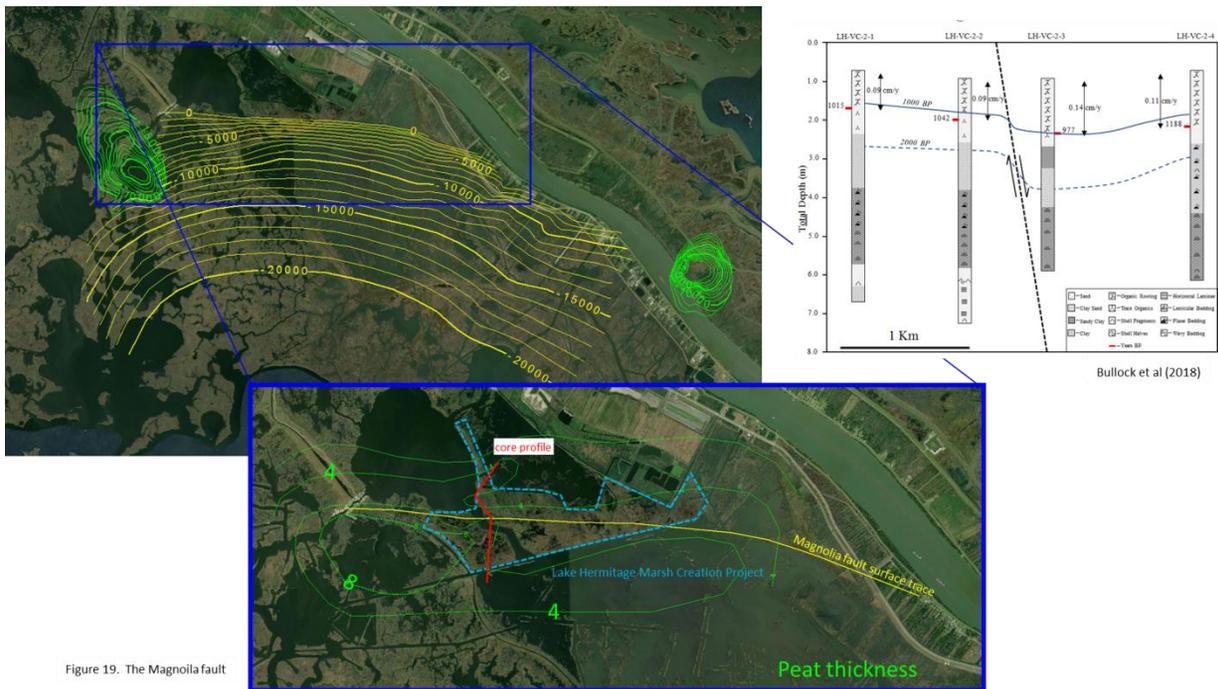

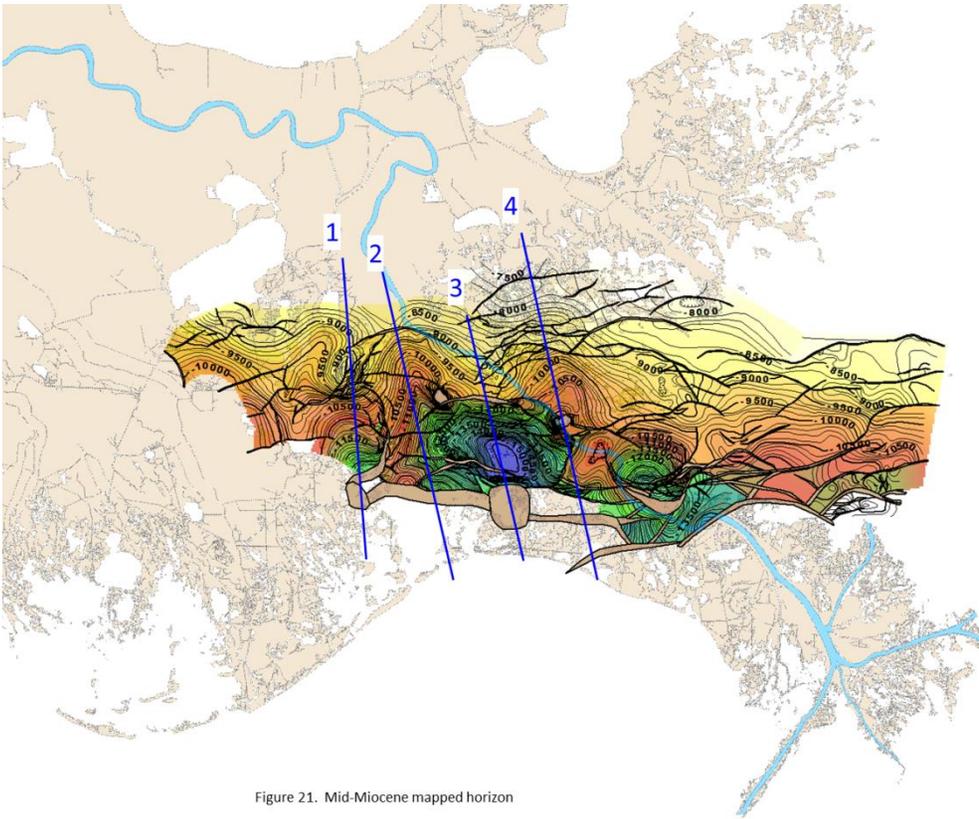

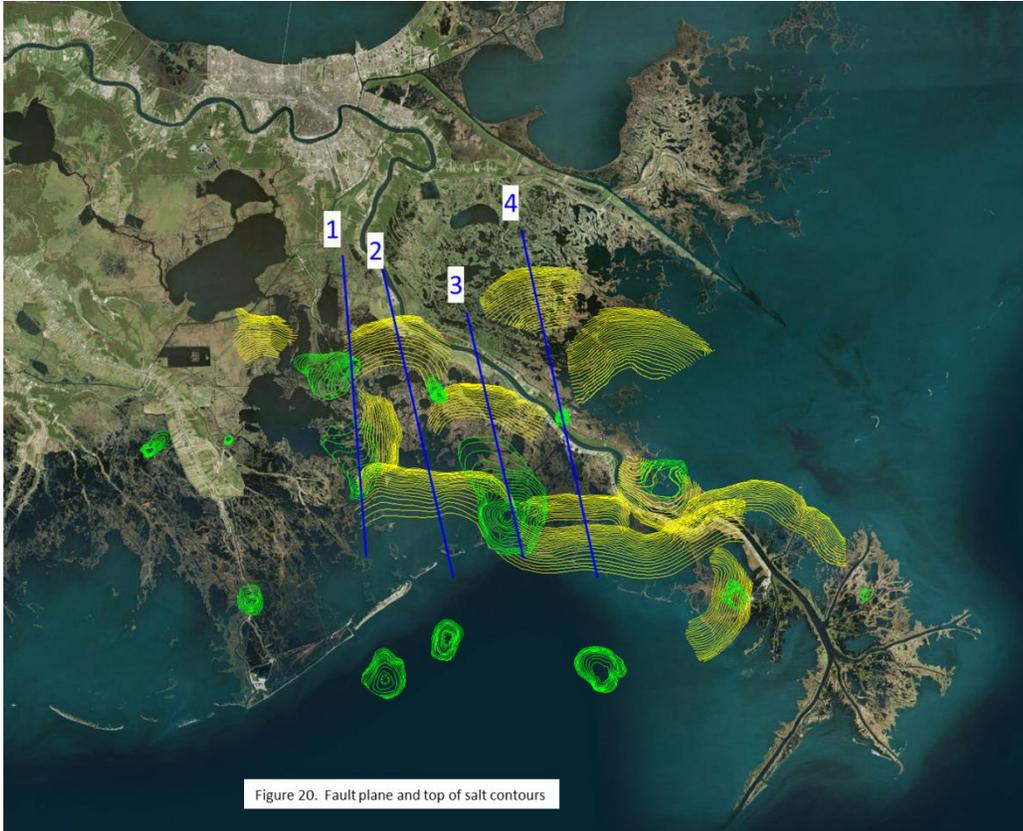

Figure 19. The Magnolia fault

The Magnolia fault (Fig. 19) appears to be linked to the Ironton fault through a connection with the Lake Hermitage salt dome. The Magnolia faults extends out of the eastern flank of the dome toward the Potash salt dome, but it not clear if it connects directly to the Potash dome from available data coverage. The plane of the Magnolia fault has been mapped with well logs and 3-D seismic data (Bullock et al, 2018) and the fault plane has been extrapolated to a surface trace which coincides with a fairly distinct lineation in the marsh. Bullock et al (2018) used a sediment core profile to illustrate the near surface offset of the fault and increased thickness of sedimentary layers on the hanging wall side of the fault. The upper layer of accumulated peat is thicker on the hanging wall of the fault, and higher average subsidence rates over about the last 1,000 years have also been interpreted by the incorporation of carbon dating of the organic sediments.

The surface trace of the Magnolia fault crosses the Lake Hermitage Marsh Creation Project. A reasonable peat thickness map can be constructed from the geotech cores from this project and cores taken by Bullock et al (2018). Peat thickness is greater on the hanging wall side of the fault, and it is likely that this reflects a cause and effect relationship with fault-induced subsidence. This configuration also provides valuable insights into the effect of sediment loading across the fault, as emplaced fill from marsh creation project extends across portions of the footwall and hanging wall sides of the fault. Simoneaux et al (2016) reported that “the magnitude of lateral displacement of these soft organic soils after fill material placement (aka ‘mudwaving’) was grossly underestimated.” It is not clear if lateral displacement of organic soils was greater on the hanging wall side of the fault, but that would be a reasonable assumption given the evidence of their thickness. This phenomenon should be further investigated, and some effort should be made to evaluate the potential for the lateral displacement of thick deposits of highly organic soils in the vicinity of the MBSD Project the as a result of mineral sediment deposited by the MBSD Project. This will be discussed in more detail in a subsequent section.

### **Subregional geological structure**

To meet the objective of providing insights into the historical relationships between sediment loading, fault slip events, and fault-induced subsidence that may be incorporated into predictive models for land elevation and land area gain in the MBSD project area, this evaluation will review the sub-regional geological structure in the vicinity of the project area. It will also examine the interactions between the structural system and four major Miocene delta systems. Fig. 20 shows an expanded scope of the linked tectonic system around the MBSD project area with a map of fault plane contours in yellow and salt dome contours in green. The contours are not labeled, but the contour interval is 1,000' feet, and each of the faults extends to the surface with a 0'-depth contour. Figs. 21-23 show the extent of the mapped horizons at the Mid-Miocene, Pliocene and Pleistocene respectively. The Pleistocene map as derived from subsurface depth contours on the maps in the Coastal Plain section of the USACE Engineering Geology Mapping website. Faults that appear to reach the surface were integrated with the contours, and the contours were adjusted to reflect reasonable amounts of throw at the depth of the Pleistocene. Four sub-regional profiles are indicated on each map. These profiles are shown in block diagram form in Figs. 24-27.

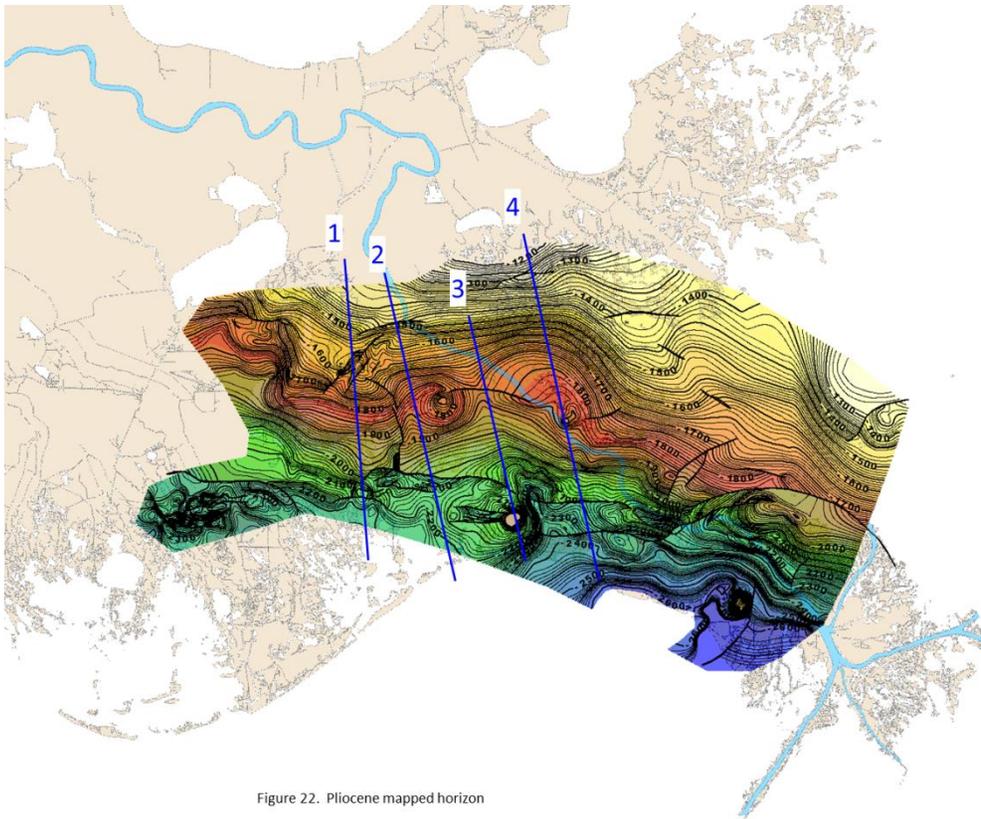

Figure 22. Pliocene mapped horizon

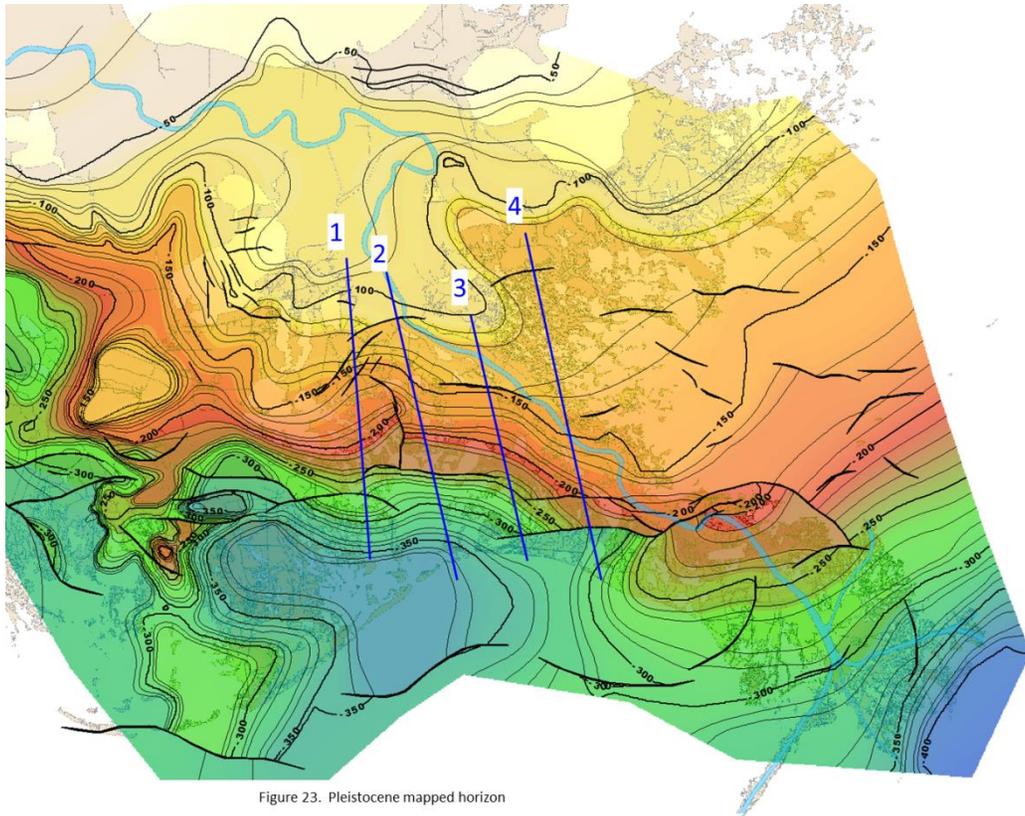

Figure 23. Pleistocene mapped horizon

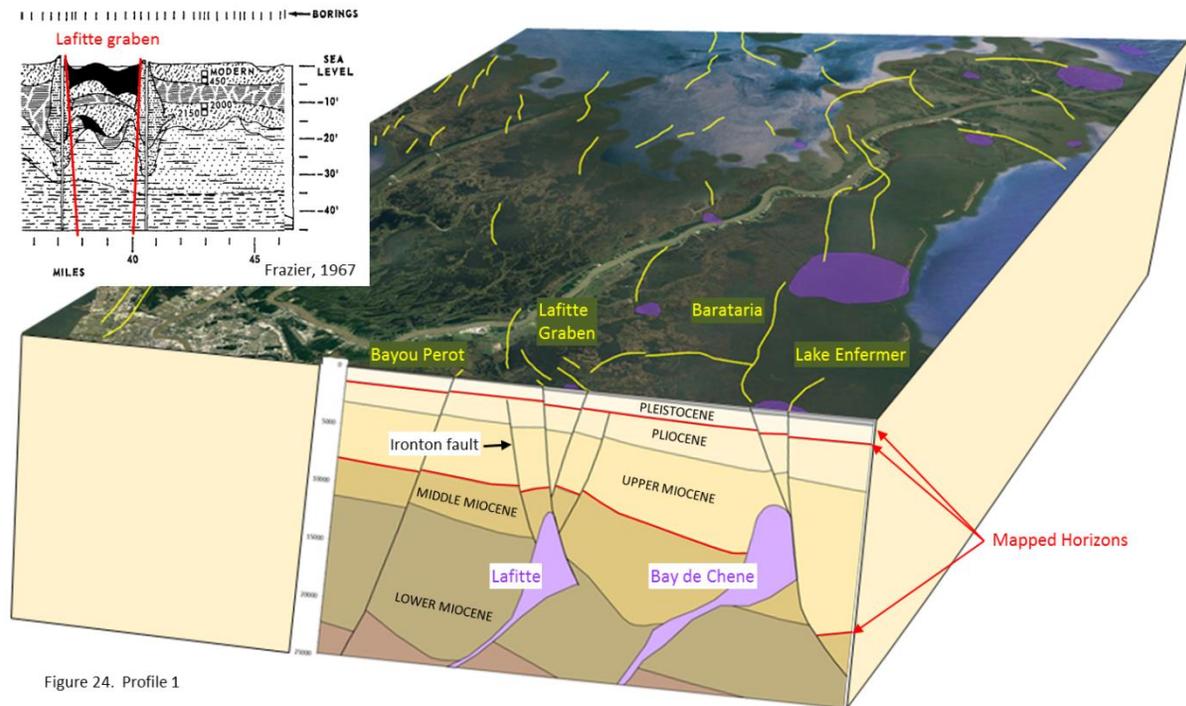

Figure 24. Profile 1

Profile 1 crosses the Lafitte and Bay de Chene salt domes at the western ends of the Ironton and Barataria faults. The profile is just west of the surface trace of the Ironton fault, and the fault can be seen on the profile extending up from an intersection with the Lafitte salt dome, but not reaching the Pliocene mapped horizon. The salt domes exhibit a pattern that reflects a history in which they were probably squeezed up from an original Jurassic layer of salt under the weight of late Cretaceous and Paleogene sediments. Their tilted alignment may also suggest some association with down to the north faults that are related to “toe structures” that are antithetic to the Baton Rouge fault system.

The Lafitte graben is expressed above the top of the salt dome. “Graben” is derived from the German word for grave, and it refers to the down-dropped area between sets of opposing faults. Movement on these faults is directly associated with halokinetic movement on the salt dome. The fact that these faults appear to extend to the surface suggests some degree of geologically recent salt movement. Profile 1 very closely coincides with the boring profile constructed by Frazier (1967). The inset in the upper left corner of Fig. 24 shows the boring profile with the interior faults of the Lafitte graben superimposed. The black layer at the top of the graben indicates accumulated peat within the graben. This would further suggest recent fault movement and related subsidence at the Lafitte graben.

The profile also shows the dramatically expanded upper Miocene section on the hanging wall of the Barataria fault. This is reflected in the expansion index graph for the fault in Fig. 31.

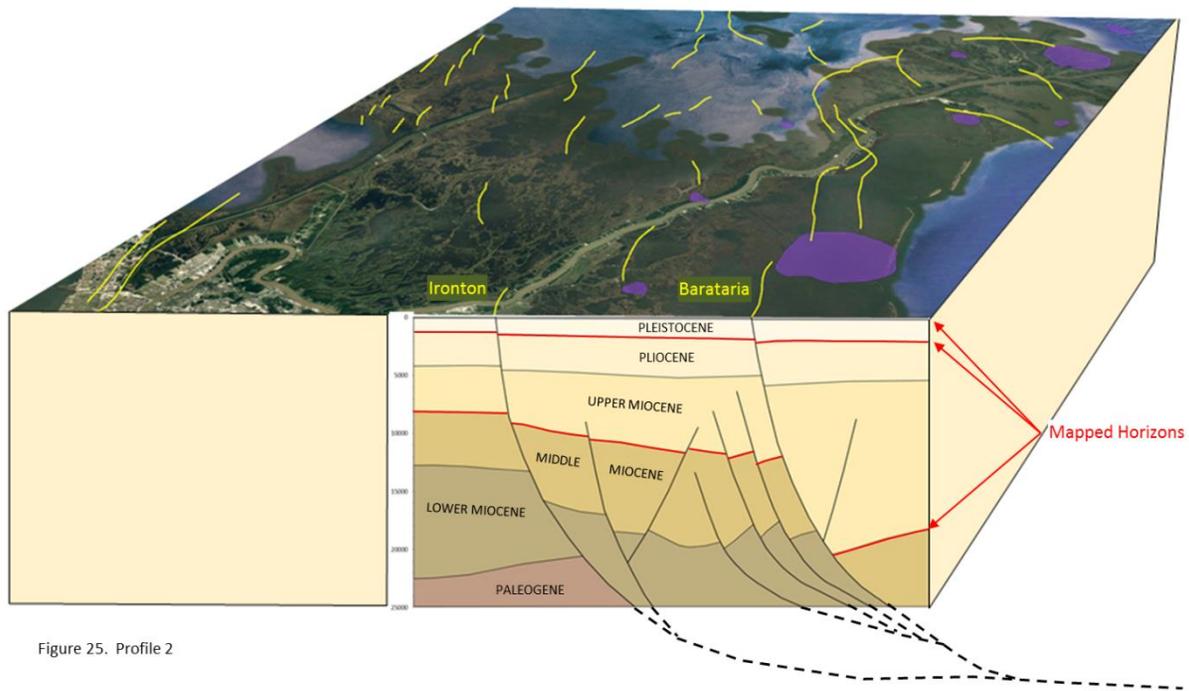

Figure 25. Profile 2

Profile 2 crosses near the center of the Ironton and Barataria Bay fault planes. It clearly shows the listric nature of the faults. With the ability to seismically image below the 20,000' depth of the profile, it would be possible to see the deeper extents of these fault planes. It is likely that the faults would continue to flatten and to eventually merge into a nearly horizontal glide plane or decolment surface, as suggested by the dashed lines. This probable deep connection between the faults is another aspect of the linked tectonic system that is not presented in the maps and profiles of this evaluation. Dokka et al (2006) referred to this configuration as the "southeast Louisiana allochthon", an extensional complex driven by gravity instabilities. They used GPS data to assign rates of vertical and lateral motion associated with movement on this tectonic system. (Also see Karegar et al (2015), Fig. 33)

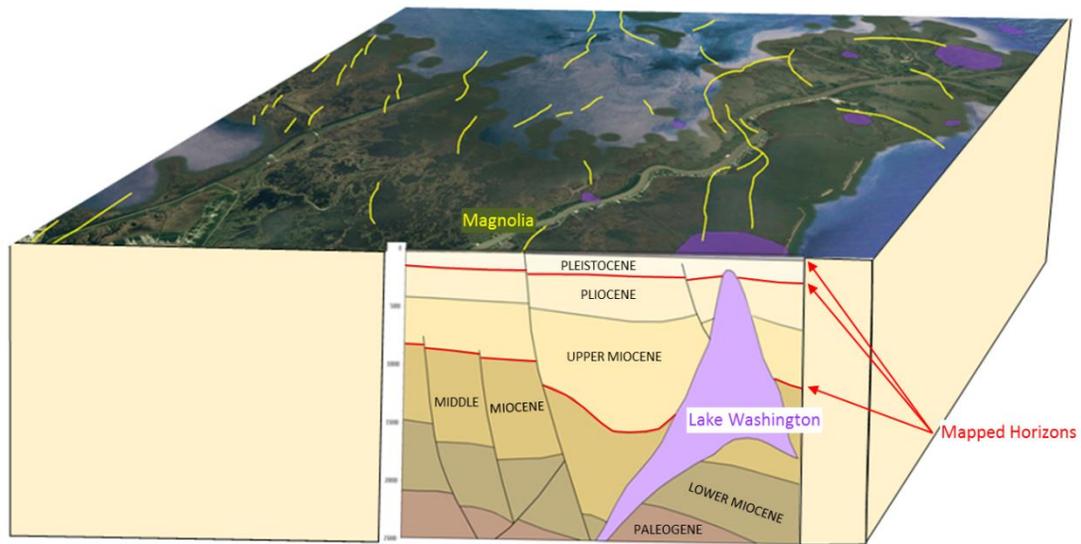

Figure 26. Profile 3

Profile 3 crosses the Magnolia fault and the Lake Washington salt dome. Lake Washington exhibits a pattern that suggests a strong component of lateral movement through the middle Miocene followed by a period of vertical diapiric movement. The top of the dome is at a depth of about 2,000' and it intersects the Pliocene mapped horizon. There appears to be a genetic relationship between the Lake Washington salt dome and the Magnolia fault. Expansion on the fault appears to be greatest in the middle Miocene. The thickness of the upper Miocene increases into the center of structural syncline that is probably related to salt withdrawal in the early stages of vertical diapiric movement on the dome. The extent of this syncline can be seen in map view on Fig. 21. It is probable that the downward movement of the syncline due to salt withdrawal would have contributed to movement on the Magnolia fault throughout the upper Miocene and Pliocene.

Throughout the Cenozoic Era the faults moved in response to sedimentary loading. Some of the smaller faults on the profile that were active in the upper and middle Miocene ceased their movement, and became covered with enough sedimentary overburden to prevent future movement. The major faults continued to move episodically throughout the span of geological time, which has allowed them to propagate to the surface. It is likely that, if properly imaged, these faults would exhibit evidence of movement in the recent geologic past and in the historical past over the last few centuries. It is more probable that these faults are still capable of active movement in the present, than they that they lost that capability sometime in the recent past.

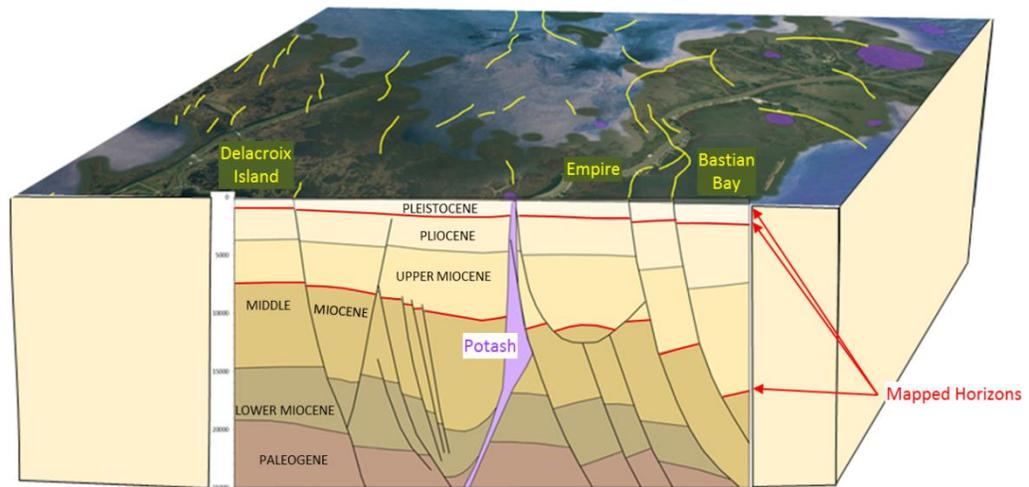

Figure 27. Profile 4

Profile 4 crosses the Delacroix Island fault, the Potash salt dome, the Empire fault and the Bastian Bay fault. Interval thickening across the fault is greatest in the middle Miocene at Delacroix Island and upper Miocene at Bastian Bay. The Bastian Bay fault also significantly expands the Pliocene interval. As will be discussed in the next section, the changes in expansion index for any of these faults can be related to their relationships with the active deltas that prograded across southeast Louisiana in the Miocene. There is a very clear relationship between sediment loading during active deltaic deposition and the magnitude of fault movement. Insights from these relationships could be used to formulate a predictive framework to assess the impacts of sediment loading at the MBSD Project.

### **Fault-Delta Interactions**

Curtis (1970) provided detailed delineations of the Miocene delta systems of southeast Louisiana and a generalized conception about their relationships with faults that were active on the continental margin at the time. The general pattern over the period of several million years was a progressive advancement of the continental shelf edge to the south. Delta systems tended to cluster into phases, and each phase had a relationship with a different set of faults. Fig. 28 from Curtis (1970) begins with the advancement of deltas of the Mid-Miocene transgressive phase. The block diagram on the right shows the engagement of the delta systems with a theoretical fault system in the center of the block. Mid-Miocene regressive phase deltas fully engaged with this fault system, and deltaic sediments are thicker on the hanging wall side of the fault. Fault activity is implicitly caused by sedimentary loading from the delta, and fault-induced subsidence creates accommodation space that allows for the accumulation of more sediment. Deltas in the Late Miocene regressive phase prograded beyond the area of influence of

the fault system, and engaged with another fault system further to the south and more capable of accepting the sedimentary load. Through this process each fault system has an expansion index that reflects its engagement with a delta system of a certain age.

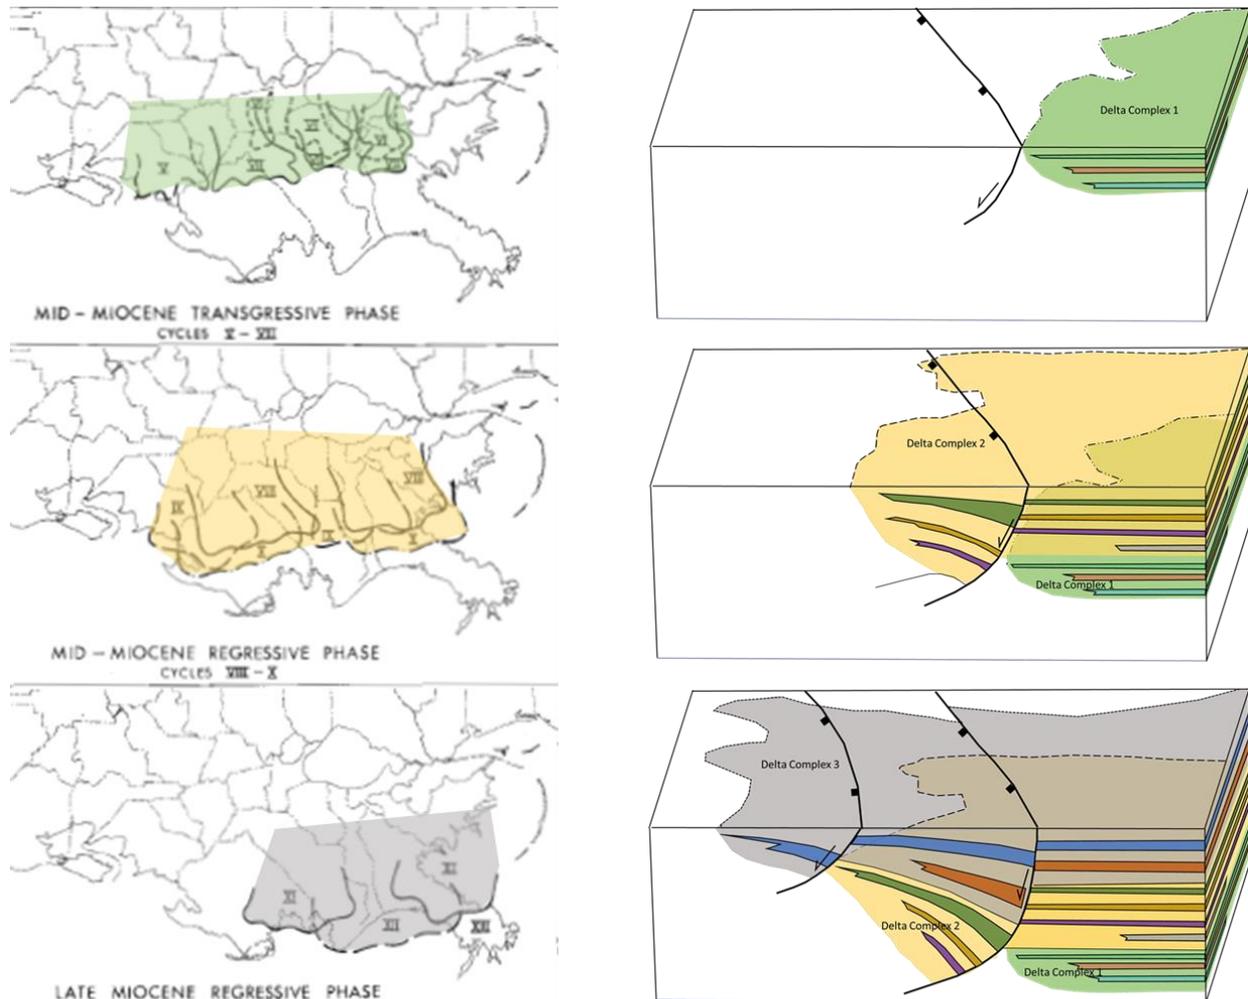

Figure 28. Miocene delta systems

Curtis (1970)

Six faults in the vicinity of the MBSD Project are evaluated here to consider the relationships between sedimentary loading associated with Miocene deltas and fault movement. Each of these faults labeled in Fig. 29 is a major fault that is considered to be a part of a linked tectonic system with other faults and salt domes. Each fault has been active since at least the middle Miocene, and all appear to extend to the surface and show some evidence of activity in the recent past. Fig. 29 represents a generalized map of fault traces and salt domes in the subsurface. It is not intended to represent any particular subsurface stratigraphic horizon, but it is a representation of an approximate location of the fault trace at a depth of about 10,000 feet. The map is a compilation of interpretations from numerous sources. It is primarily intended to provide more detail than fault maps currently available in the technical

The Delta Farms, Ironton and Delacroix Island faults align with the boundary between the continental shelf and the upper continental slope in middle Miocene between 12 and 13 million years before present. The time interval is highlighted in yellow on the stratigraphic chart in the upper right and on each of the expansion index graphs. These shelf edge faults are an integral part of the paleogeographic reconstruction. The outlines of the active delta systems are derived from Curtis (1970) by relating the transgressive-regressive sequences to global sea level cycles. Eustatic curves for global sea levels were not established at the time of the publication of Curtis (1970), but the patterns of the transgressive-regressive cycles used at the time can be correlated to the eustatic curves with reasonable accuracy. A regional interval isopach (thickness) map for the same stratigraphic interval reveals two discrete depositional centers in which deltaic deposits of that age are measurably thicker than in surrounding areas. A generalized cross section across any of these faults at the time of deposition would be similar to the center block diagram in Fig. 28.

The expansion index graph for each fault reveals maximum expansion on the fault during this time interval. The faults are most active at the time of depositional loading, and fault-induced subsidence provides the accommodation capacity that keeps the delta engaged with the tectonic system during the span of deposition. These relationships underscore the observation that faults are as much a part of a delta system as the channels and sand bars. Fault movement caused by depositional loading should be an expected response in an active delta environment.

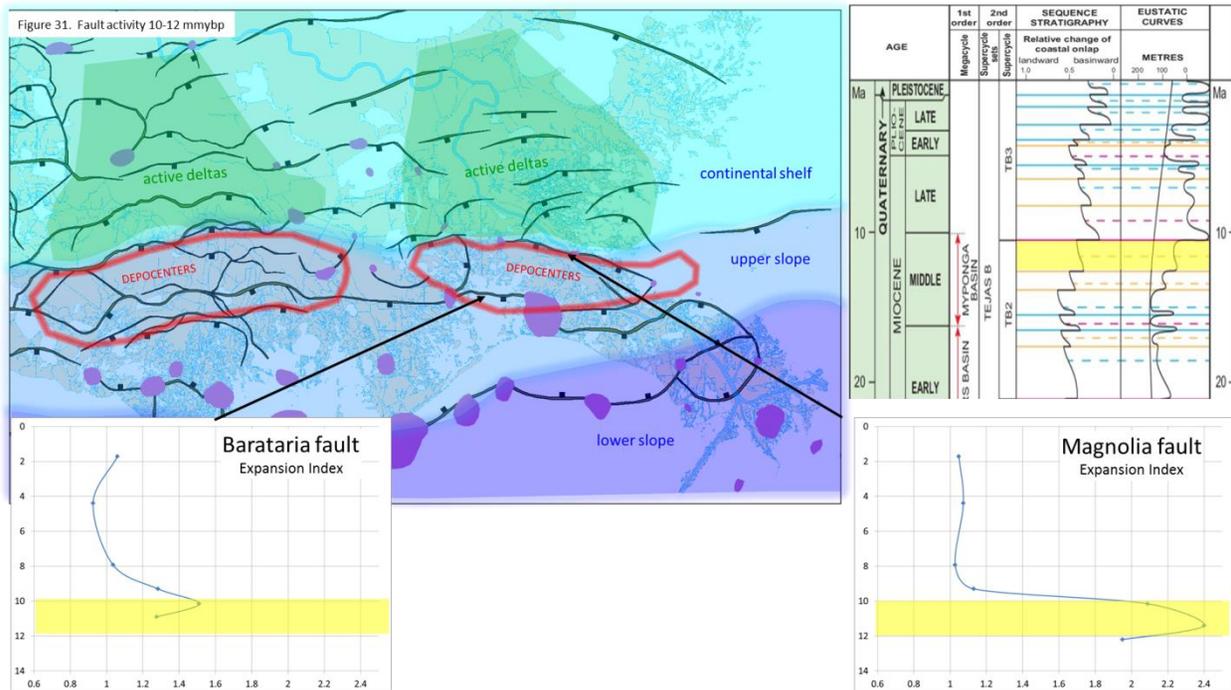

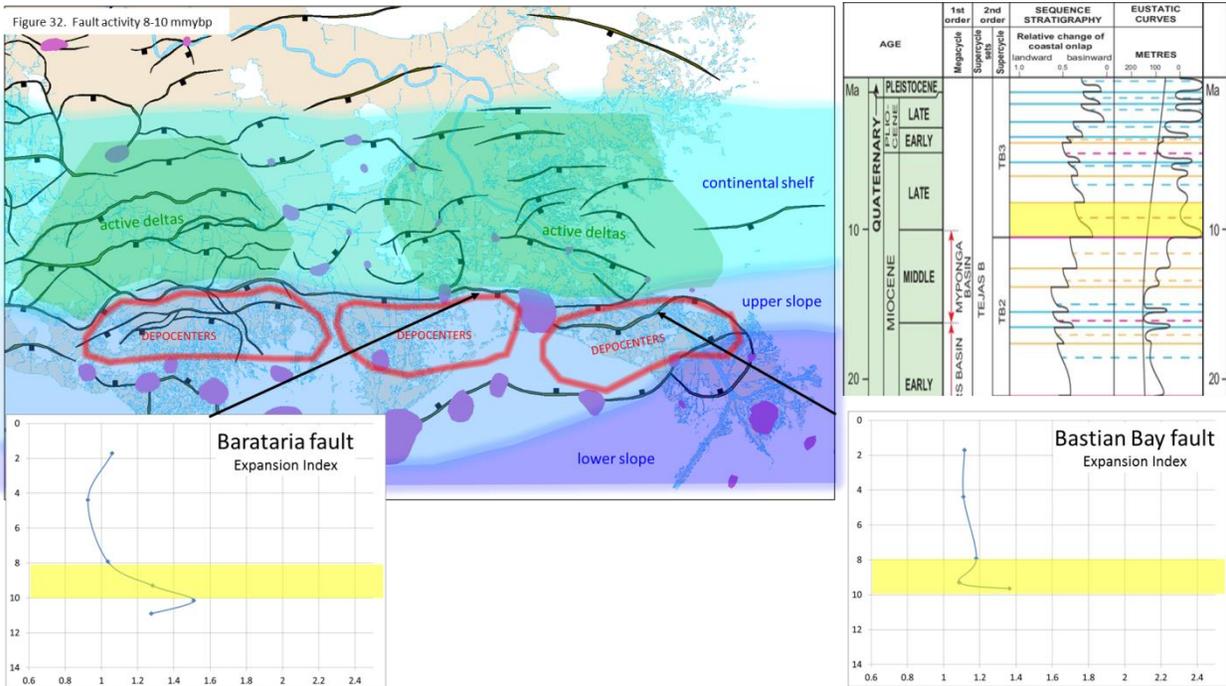

Fig. 31 shows the paleogeographic reconstruction for the end of the middle Miocene between 10 and 12 million years before present. The shelf edge and the active delta complexes have prograded to the south and the active depositional centers have shifted to another set of faults that include the Barataria and Magnolia faults. The expansion index graphs on these faults indicate maximum fault movement

during this time interval. The graphs in Fig. 30 exhibit expansion indices greater than 1 during this time period. This indicates that those faults also interacted with delta systems of this time, but with significantly lower magnitudes of fault activity.

The paleogeographic reconstruction for the upper (or late) Miocene in Fig. 32 shows the major depositional centers positioned along the northern boundary of the Terrebonne Trough. The Trough is defined by the alignment of down to the south faults along its northern boundary (including the Barataria and Bastian Bay and Montegut faults), and down to the north faults and salt domes along its southern boundary. The accommodation capacity of this structural system kept the major delta systems engaged throughout the remainder of the Miocene and into the Pliocene. The magnitude of accumulation of relatively thick and dense sedimentary layers within this basin created a regional density anomaly that is obvious on maps of the Earth's gravitational field. The density differential across the area has been a contributing factor to fault movement and subsidence since the end of the Miocene.

### **Framework assessments for fault slip and subsidence rate models**

The objectives of this evaluation are to provide a framework for predictive models for the magnitude and frequency of fault slip events and the relationships between fault slip, subsidence, elevation and land gain associated with the MBSD Project. This type of framework can now be considered in the context of the characteristics other faults presented here. The Ironton fault is a part of a linked tectonic system which allows for comparison with other faults in the system to help derive some preliminary values for the magnitude and frequency of fault slip, the rates of subsidence associated with the fault, and the probable response of loading sediment across the fault. The principal metric that allows for

comparison among the faults is the throw of the fault at the top of the Pleistocene horizon. This value is estimated to be 6 feet on the Ironton fault based on the interpretation of the Conveyance Structure CPT profile presented here in Fig. 9. The value of throw at this horizon on other faults in the area established here is 3 feet on the Vacherie fault (Fig. 11), about 20 feet on the Gentilly fault (Fig. 14), and about 40 feet on the Bastian Bay fault (Fig. 17). Fisk (1944) documented a recent slip event on the Vacherie fault with 8 inches of vertical displacement, and Gagliano provided evidence for a recent slip event on the Bastian Bay fault of 3.0 to 3.5 feet of vertical displacement.

The intention of the recommendations made in McLindon et al (2017) was to collect the data necessary to evaluate the potential for fault slip in the vicinity of the MBSD Project. In the absence of the data necessary to fully develop a probabilistic model for future fault slip events, the values provided in this evaluation can be used to make some framework estimates. The expansion index graph on the Ironton fault in Fig. 5 gives some insight into the historical distribution of fault slip events. If the full historical distribution could be known, it would be very likely to exhibit a log-normal pattern for the magnitude of the events. This would mean that the distribution would consist of very many small events and very few large events. This type of size distribution is commonly associated with magnitude of earthquakes, which are the result of fault slip events in tectonic regions. The 6 feet of vertical offset at the top of Pleistocene on the Ironton fault is the cumulative offset of all slip events that have occurred since the beginning of Holocene deposition in the area. Frazier (1967) dated the basal transgressive deposit on the top of the Pleistocene in St. Bernard Parish at about 7,000 years before present. The orange sandy layer on the CPT profile in Fig. 9 is likely to represent a similar basal transgressive unit, and it is reasonable to assume that it has a similar age. This would mean that 6 feet of vertical offset has occurred over the last 7,000 years. If fault slip events occurred an average of once every century over that time span, then there would have been 70 discrete events with an average magnitude of about 1 inch of offset. If the magnitude of the slip events were log-normally distributed, as should be expected, then the distribution would reflect many small events of perhaps a fraction of an inch of offset and a few large events with magnitudes of possibly 1 foot of offset or more. This type of distribution would be consistent with the implications of the relationships between slip events on the Vacherie fault and crevasses of the river at the site of the fault (Fisk, 1944). Given that 8 inches of vertical offset in 1943 was not adequate to crevasse the river, it is reasonable to assume that a larger magnitude event would have been required, which would support a high-end value of about 1 foot vertical displacement at Ironton.

These framework estimates indicate that if a probabilistic distribution for future slip events were developed, it would include a non-zero value for the probability of the occurrence of a slip event on the Ironton fault during the time span of the MBSD project, and a smaller, but still non-zero value for the occurrence of an event with a magnitude of 1 foot of vertical offset. The acquisition of high resolution seismic data and high resolution dating of sediment cores across the fault should contribute to a significant improvement in the development of probabilistic models, and the recommendations of McLindon et al (2017) are reiterated here.

Estimates for subsidence rate models for the vicinity of the MBSD Project can be derived from observations about the relationships between subsidence rates, the thickness of the Holocene interval,

and the organic content of the Holocene sediments in the areas examined here. The depth to the top of the Pleistocene (or the thickness of the Holocene) can be estimated at each of the faults examined here. The organic content of the soils has been estimated by the thickness of accumulated peat at the Gentilly fault, the Montegut fault and the Magnolia fault. A fairly detailed map of the thickness of accumulated peat and organic clays has been made with data from geotech cores taken for the MBSD Project and the Bayou Dupont Marsh Creation Project (Fig. 35). Byrnes et al (2019a & 2019b) found a “compelling relationship between subsidence and the age, composition and thickness of Holocene deltaic deposits” in the Breton and Barataria hydrologic basins, which includes the MBSD Project area. An estimate of total Holocene thickness could be derived from the top of Pleistocene map (Fig. 23), however the Holocene “topstratum” contains the more highly organic and compactable sediments of the Holocene and the topstratum isopach map (Kulp, 2000) is more informative in evaluating subsidence.

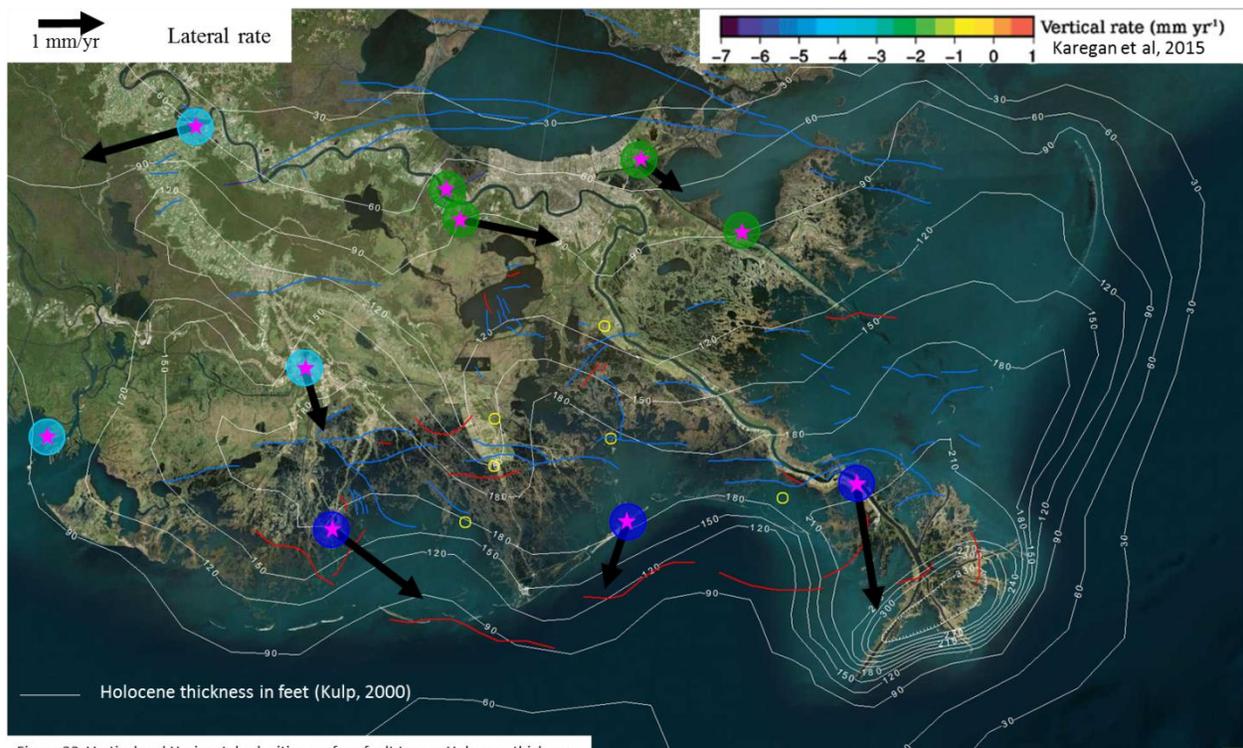

Figure 33. Vertical and Horizontal velocities, surface fault traces, Holocene thickness

Fig. 33 combines Holocene topstratum thickness contours from Kulp (2000) with measurements of horizontal and vertical (subsidence) velocities from Karegar et al (2015) and surface fault traces where blue are down to the south faults and red are down to the north faults. Land motion velocities are measured at stations in the Continuously Operating Reference System using GPS technology. The relationship between the values of vertical velocities measured at these stations and the thickness of the Holocene is obvious. The three stations with subsidence values near 7 mm/yr lie along the axis of the Terrebonne Trough which coincides with the axis of thick Holocene sediments. Karegar et al (2015) also found that the horizontal vectors of land motion “may reflect slow downslope movement on a series of listric normal faults due to gravitational sliding”. Some consideration should be given to the potential impacts of horizontal land motion due to movement on the Ironton fault on the MBSD Project.

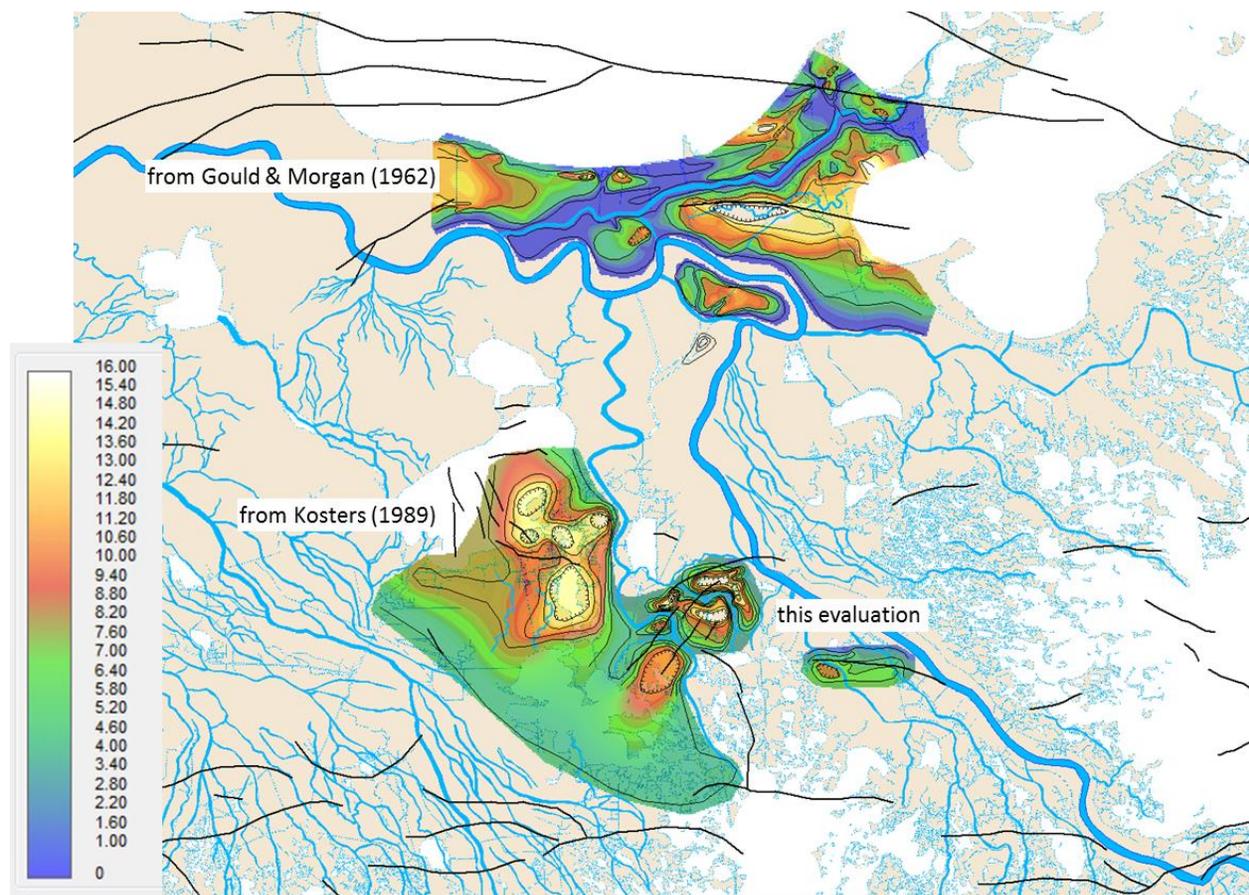

Figure 34. Peat thickness with surface fault traces and distributary channels

A patchwork compilation of interpretations by Gould & Morgan (1962), Kusters (1989) and in this evaluation using geotech cores from the MBSD Project, the Bayou Dupont Marsh Creation Project, and the Lake Hermitage Marsh Creation Project in Fig. 34 provides insight into the probable thickness distribution of highly organic soils across the rest of the area. There is a general tendency for thicker peats to accumulate off the natural levee flanks of distributary channels and on the hanging wall of faults that appear to extend to the surface. Keucher et al (2001) indicated that the consolidation of highly organic and clay rich-facies in recent delta deposits is a primary component of subsidence. Zou et al (2015) measured a subsidence rate anomaly from geodetic data that coincided with the thick peats between the natural levees of the Mississippi River and the Bayou Sauvage distributary channel and on the hanging wall of the Gentilly fault. Maximum values of subsidence in this area were over 15 mm/yr. Dixon et al (2006) documented similar values in the same area using InSAR technology. A closer examination of peat thickness in the vicinity of the MBSD Project in Fig. 35 shows thickness contours constructed from measurements of thickness of the upper layer of organic clay and peat in geotech cores. The pattern of the contours conforms to the general concept of thick peats accumulating off the natural levee flanks of distributary channels (taken from maps on the USACE Engineering Geology Mapping website) and on the hanging wall of a fault.

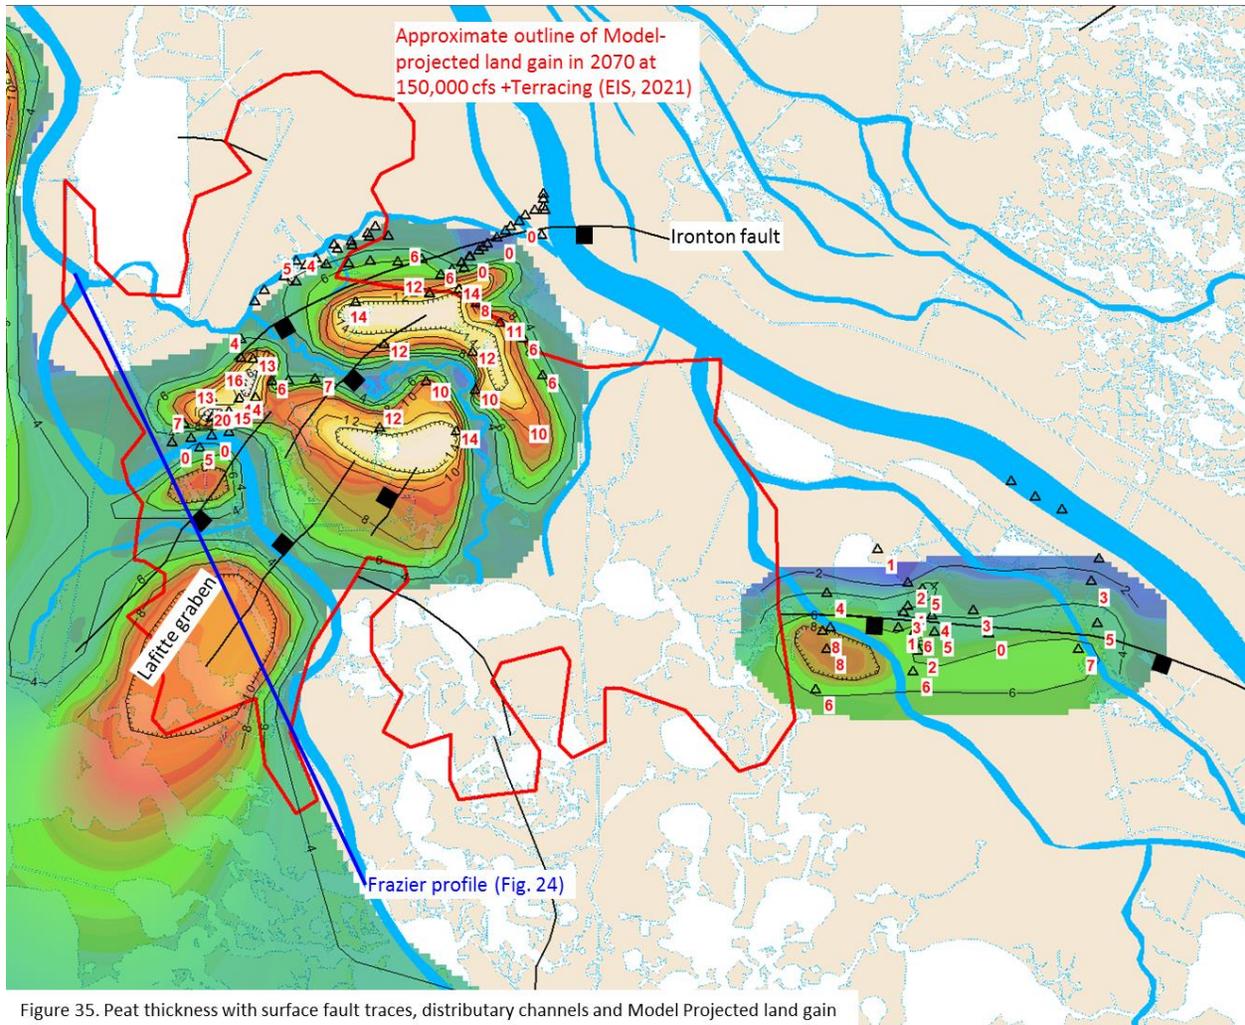

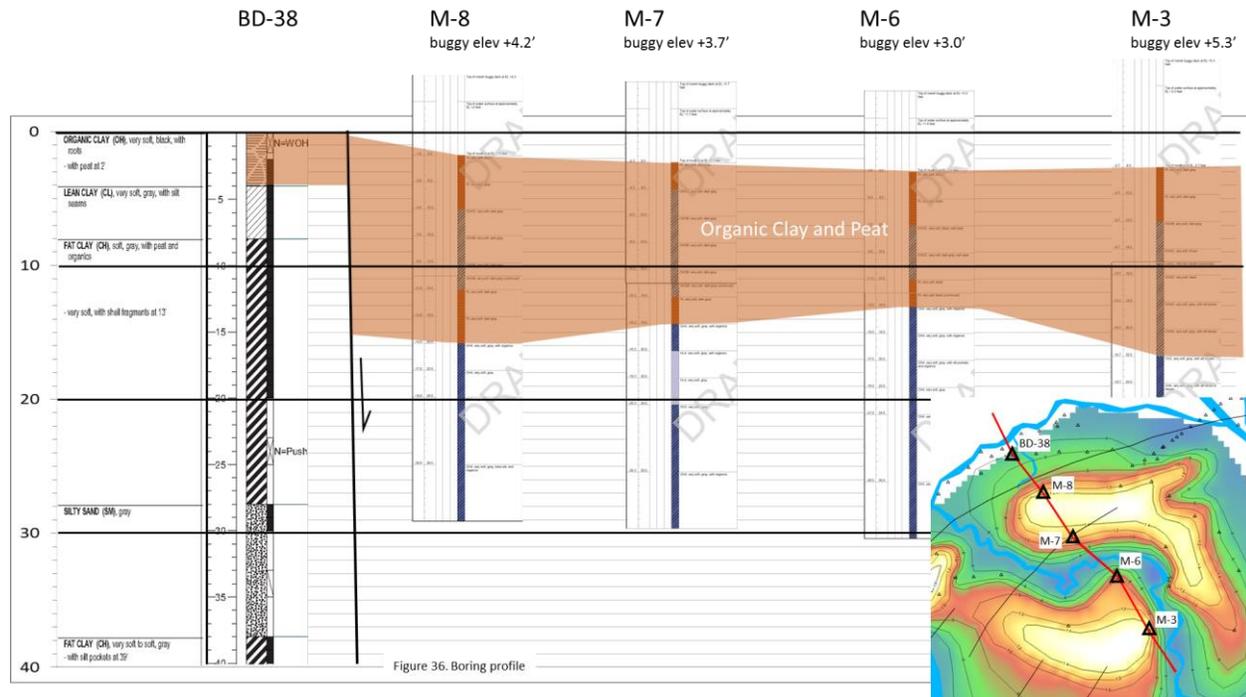

Figure 35. Peat thickness with surface fault traces, distributary channels and Model Projected land gain

Thick peats have accumulated between the distributary channels Cheniere Traverse Bayou to the north Bayou Dupont in the middle and Bayou des Families to the southwest and the hanging walls of the Ironton fault and in the Lafitte graben. There are no direct measurements of subsidence in these areas. Predictive modeling of elevation and land gain for the MBSD Project should allow for subsidence rate values as high as 15 mm/yr above the areas of thick accumulations of organic clay and peat based on the analogy with the Gentilly fault area. Some qualitative insights into the patterns of subsidence in this area can be gained from the patterns of wetlands loss shown in Fig. 36. Reconstructions of what the marsh surface looked like in 1956 and 2009 from ProPublica (2014) indicate areas of wetlands loss due to subsidence in relationship to the thick peat accumulations. The compelling correlation suggests that compaction of the upper layer of organic clays and peats is the primary mechanism of subsidence. It is probable that the episodic slip events on the faults has contributed to historical subsidence that allowed for the thicker accumulation of peat on the hanging wall of the fault, but the contribution of fault slip to the current subsidence rate is unknown. Predictive modeling for the MBSD Project should provide for an accelerated rate of compaction of the upper organic soils in response to the deposition of mineral sediment caused by the MBSD Project, which is currently in the models described in the Draft EIS

(indicated by the red outline on Fig. 35). The models should also allow for lateral displacement of the the

soft organic soils (mudwaving) in response to sediment accumulation based on analogous configurations of a fault and thick peats at the Lake Hermitage Marsh Creation Project (Fig. 19).

The profile in Fig. 36 is constructed from geotech cores from the MBSD Project and the Bayou Dupont Marsh Creation Project it shows the thickening of the organic clay and peat across the Ironton fault. The thick accumulation of highly organic soils on the hanging wall is very similar to the pattern at the Gentilly fault.

Morton et al (2009) concluded that the extraction of oil and gas from the Lafitte Field has been the primary cause of subsidence over the last few decades in the vicinity of the MBSD Project. They provided no discussion of a causal process by which fluid extraction at the field would have induced subsidence, nor did they provide any evidence that the conditions necessary for such a process existed at the field. Although never stated in Morton et al (2009), the implicit mechanism for extraction-induced subsidence at the field was compaction of the produced reservoirs caused by the change in volume due to the extraction of fluids. Chan and Zobak (2007) documented that the magnitude of subsidence at the surface due to the extraction of fluids in the subsurface is a function of pressure change in the reservoir at depth. The reservoirs that they studied in Lapeyrouse Field in Terrebonne Parish had all experienced significant reductions in reservoir pressure due to the extraction of natural gas. Their calculations of reservoir compaction were based on the reduction in reservoir pressure. Their models showed that if reservoir compaction did occur, the expression of subsidence at the surface would be in the form of a bowl-shaped depression immediately above the reservoir. The reservoirs at Lafitte Field are almost entirely oil reservoirs that are portions of very large saline aquifers. The oil is

more buoyant than the saline pore fluid, and so oil accumulations tend to be in reservoirs around anticlinal structures, such as the Lafitte salt dome. The size of any individual reservoir is very small relative to the size of the entire aquifer. As oil is extracted from these reservoirs, the natural expansion of the aquifer is allowed by a slight compressibility of the pore fluids due to dissolved gases. The saline fluids naturally flow into the pore spaces from which oil has been extracted in a process called “water drive”. There is no significant change in pore pressure, nor is there any meaningful change in the volume of the aquifer. The submerged marshes in this area are well-removed from the produced reservoirs at Lafitte field. It is considered to be highly improbable that oil and gas extraction at Lafitte Field contributed to subsidence in the vicinity of the MBSD project. There is compelling evidence that subsidence in this vicinity is due primarily to the compaction of the upper layer of organic clays and peats.

Figure 37. Peat thickness, faults, marsh coverage from ProPublica (2015)

**Reiteration of Recommendations** McLindon et al (2017) recommended:

1. A review the subsurface geology using oil and gas industry 3-D seismic data. This may be accomplished through a collaborative engagement with owners, licensees and interpreters of the 3-D seismic surveys in the area. Such a collaborative engagement may be facilitated with the assistance of the New Orleans Geological Society, the Louisiana Mid-Continent Oil and Gas Association, or the Louisiana Oil and Gas Association.
2. The acquisition of high resolution seismic data in the immediate vicinity of the diversion structure. This should necessarily include land-based acquisition along both banks of the river and marine acquisition in the river channel, as indicated in Figure 6.
3. The acquisition of sediment core profiles across potential faults. The arrangement of these core profiles should be of adequate density to allow for the interpretation of faults by the vertical offset and variations in thickness of the sedimentary layers. The evaluation of core profiles should include detailed stratigraphic analysis and age-dating of the sedimentary layers to allow for estimates of historical subsidence rates and rates of fault movement.
4. The addition of subsidence measurement capabilities similar to those of the Myrtle Grove Superstation at several additional locations in the vicinity of the diversion. These stations should be positioned with advance knowledge of the location of faults in the area to allow for the direct measurement of variations in subsidence velocities across the faults.
5. The integration of detailed variations in subsidence rate and estimates of fault slip rate into predictive subsurface geological models including models for the response to sediment loading associated with diversion operations.

These recommendations are reiterated here and should be enhanced to insure that the acquisition of high resolution seismic data is based on survey design that provides for quality imaging to at least 200 feet and vertical resolution of at most a few feet. Sediment cores should be subjected optically stimulated luminescence and carbon dating techniques.

It is further recommended here that the Draft EIS should consider:

1. The potential impacts of an episode of fault slip on the MBSD Project infrastructure based on a predictive model for the magnitude and frequency of future episodes
2. The potential for accelerated rates of subsidence due to sedimentary loading associated with the MBSD Project,
3. The potential for an induced fault slip event due to sedimentary loading associated with the MBSD Project.

**Concern ID: 61774**

The commenter referred to the recommendations made in McLindon et al. (2017), which stated that data collection is necessary to evaluate the potential for fault slip in the vicinity of the proposed MBSD Project. The commenter stated that in the absence of collecting data necessary to fully develop a probabilistic model for future fault slip events, the values provided in McLindon et al. (2017) can be used to make some framework estimates.

**Response ID: 16175**

The commenters' concerns regarding the potential for fault slip of the Ironton fault in the vicinity of the proposed Project were considered in the Draft EIS. Further, the commenters' suggestions for acquisition and analysis of additional seismic, sediment core profile, and subsidence data in service of the development of predictive subsurface geological models as discussed in McLindon et al. (2017) is acknowledged. To address these concerns, additional language has been added to the Final EIS to make clear the potential, but unquantified, probability for slip events along the Ironton fault during operations of the proposed Project based upon the framework estimates in the McLindon et al. (2017) provided by the commenters. This additional discussion and a citation for McLindon et al. (2017) has been added to the Geology and Soils section of Chapter 4, Section 4.2.3.2.2.4 Faulting of the Final EIS.

McLindon, C.D., Dawers, N.A., Culpepper, D., Kulp, M.A., and McDade, E. 2017. Comments to the U.S. Army Corps of Engineers, New Orleans District in reference to the Environmental Impact Statement for the Mid-Barataria Sediment Diversion. 11 pg.

Jeffrey Lavina

My name is Jeffrey Lavina. I'm a 20-something year resident of south Louisiana. I'm just a little confused at the thought process behind destroying all the livelihood and beautiful culture of Louisiana, especially south Louisiana. I also don't understand how they could possibly think that a diversion is going to form islands when they take 500 years to develop and that was when, in my understanding, there was a lot more sediment coming down the Mississippi. So, it seems to me, you're going to destroy a lot of wildlife habitat, lot of people's livelihoods, a lot of our way of life to build these diversions, when dredging is so much less costly and so much more effective. My phone number is [REDACTED]. Please, somebody call me and explain this to me. I just don't see the logic. Unfortunately, I don't have a lot of confidence in the Corps of Engineers, I'd like to, but..... (cut off)

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated

from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62778**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels

due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:22730**

Hamilton Bell

The Louisiana Coastal Regions are vital to our state and our nation. Restoring the natural flow of water and the renewing effects of its sediments are the Best and possibly only way to begin to restore our coastline. As a native son of Louisiana, the fate of our coastal areas is Very important to me even though I live In Arkansas now.

Please find a way.

---

**Concern ID: 63334**

**The proposed MBSD Project would maintain and restore coastal lands and should move forward.**

**Response ID: 16291**

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Brian LeBlanc

I've worked in the Barataria Basin , it's sad to see what is happening with the land lost. This project need to be done for the future of this region..

---

**Concern ID: 63336**

**This proposed Project is absolutely crucial for the future of our coast and the safety and livelihoods of our coastal communities.**

**Response ID: 16292**

The commenter's support for the proposed Project is noted. The proposed Project, by reestablishing deltaic processes, is intended to build coastal resiliency and protection for the coastal communities behind Barataria Basin. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

See Sections 3.2.1.6 (Benefits Multiple Resources) and 3.2.1.7 (Public Health and Safety) of the LA TIG's Restoration Plan for a detailed discussion of the proposed Project's potential benefits and public health and safety impacts, respectively.

Ace of Trade, LLC

Harry Cheramie

I have been an active part of the commercial fishing industry for 50 years on the coast of the Gulf of Mexico in Louisiana, shrimping from east of the Mississippi River and west to Cameron, Louisiana.

We currently have the largest dead zone between the Atchafalaya River and the Mississippi and this proposal will create more dead zone from Barataria Bay going out to the Gulf of Mexico. We already have at least one diversion that comes out from the River and goes into Barataria. What needs to be done is dredging in different parts of Barataria Bay, Barataria Lake, Caminada Bay to build islands to save the Coast. For example, on the channel from the east-west canal to Grand Isle, dredge that and all that fill, use to build islands with. As they dredge, build islands. Dredge a big channel going to Grand Isle and put the fill in different areas on the Lake. And the Lafitte Channel needs to be dredged and put the fill to create islands and protect them all with rock.

An important example of attempted fixes done by the Corps of Engineers is when they dug to put rocks behind Grand Isle, why didn't they just leave the fill as a levee to help erosion? Instead, they put it all back in the water. If they had left it, it would have left us a channel for shrimp boats and others to travel behind the Island from Caminada Pass to Bayou Rigeaux (sp?). But now the whole area has been torn up, skimmer boats can't work, and we can't pass with our shrimp boats. Efforts like these are counterproductive to the end goal of saving the coast and the commercial fishermen of Louisiana simultaneously. One should compliment the other.

---

**Concern ID: 61812**

**Commenters expressed concern that the proposed Project would have adverse water quality impacts in the Barataria Basin due to the introduction of nitrate and phosphate from the Mississippi River. Several commenters questioned whether the proposed Project would create harmful algal blooms and hypoxia in the Barataria Basin similar to the hypoxic "dead zone" in the Gulf of Mexico that exists due to nutrients in Mississippi River waters. One commenter expressed concern that the EIS does not adequately assess the potential for the proposed Project to create algal blooms and hypoxia in the basin, other than acknowledging it.**

**Response ID: 16425**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA's Mississippi River/Gulf of Mexico Hypoxia Task Force "Hypoxia 101" webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal

---

stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone “water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen” (<https://www.epa.gov/ms-hf/northern-gulf-mexico-hypoxic-zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.>)

Dissolved oxygen concentrations associated with the Applicant’s Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model’s dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.2 Applicant’s Preferred Alternative in Surface Water and Sediment Quality of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section is included in Section 4.5.5.3 in Surface Water and Sediment Quality and has been added to Section 4.5.5.4.2 Applicant’s Preferred Alternative of the Final EIS. Finally, the EIS acknowledges the potential for major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) if warranted, in the Barataria Basin during Project operations to guide CPRA’s management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61970**

**The only alternatives in the EIS are diversions at different flow rates. The EIS has not listed other possible methods on building land in the Barataria Basin. One alternative is to study the creation of barrier islands and compare the result with the diversion alternative. Also consider fortifying the barrier islands with sheet piles, boulders, and rocks, and dam all pipeline canals and washed-out marsh openings with concrete dams.**

**Response ID: 15972**

The Draft EIS considered barrier islands as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.4 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS. While barrier islands play a critical role in reducing land loss, they are not intended or designed to transport sediment, fresh water, or nutrients.

Past investments through a multitude of restoration programs have resulted in the restoration of every major barrier island in the Barataria Basin. CPRA's Coastal Master Plan includes programmatic barrier island restoration to support future maintenance of the restored islands. However, CPRA has stated that fortifying barrier islands with hard structures is not feasible.

---

**Concern ID: 63137**

**A commenter noted that the coast and shrimpers should be saved simultaneously and suggested that when USACE placed rocks behind Grand Isle, it should have left a channel behind Grand Isle for use by the fishers and placed the fill from that channel on Grand Isle as a levee.**

**Response ID: 16521**

The commenter's suggestion to save the coast and fishers at the same time is noted. The Grand Isle work is not related to this Project.

---

**Correspondence ID:22849**

Horace Page, Jr.

My name is Horace Page, Jr. The proposal for this is, I don't think, good for the Parish because of the fishermen. I was a fisherman until I retired. I know there's another way, a better way, you could do this. I know we need it, but there's always a better way, so I'm against this one at this time. I'm against it period. So when y'all come up with another idea, I'll agree with it. My address is [REDACTED]. Thank you.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Land Trust for Louisiana

Cynthia Brown

I'd like to voice the Land Trust for Louisiana's support for this important project. As we all know, scale matters and the scale of this project will take us a long way toward restoring and sustaining this part of our coast.

One message we tell our supporters all the time is that we are in fact perhaps the luckiest coastal community in the country. We have this incredible tool - the river - that, if built and operated effectively, can help this part of the state actually keep up with sea level rise. We believe the best minds have been working on this project and have long been a supporter of the Mid-Barataria Sediment Diversion.

We're eager to see the river do its job!

Thank you,

Cindy Brown, Executive Director

Land Trust for Louisiana

---

**Concern ID: 63339**

**The Mid-Barataria Sediment Diversion is the largest individual ecosystem restoration project in our country's history, which is fitting since the Barataria Basin is experiencing one of the highest rates of land loss on the planet. Large-scale projects like the Mid-Barataria Sediment Diversion are just the kind of bold actions that are needed if there is to be any hope of a truly sustainable coast.**

**Response ID: 16297**

The commenters' support for the proposed Project is noted. Land and wetland loss along coastal Louisiana is described in EIS Chapter 3, Sections 3.1.4.1 and 3.1.4.2 in Introduction.

---

**Correspondence ID:22869**

Jeff

The mid end Barataria the version seems like a good idea, and I do not want the best to become the enemy of the good. However, was an alternative looked at? Specifically, a sediment diversion near Edgard would end the need to open the Bonnet Carre Spillway which dumps the sediment into Lake Ponchartrain. My idea is to build a couple of bridges, one on LA 3127 and the other on US 90 from Boutte to Raceland. US90 is already scheduled to be upgraded to I-49, so both upgrades can be done with one construction project. The river water would then flow from the diversion at Edward, under the new LA 3127 bridge to Lake Des Allemands, then under the new US90/I49 bridge to Lake Salvador and Barataria Bay.

---

**Concern ID: 63999****Commenters asked to consider the alternative of building a sediment diversion near Edgard to end the need to open the Bonnet Carré Spillway.****Response ID: 15937**

Chapter 2, Section 2.4.1 Evaluation of Location Alternatives under Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow in the Draft EIS, detailed the evaluation of alternatives based on geographic location and the reasoning for selecting the proposed location for the MBSD Project. Consideration for the location of the proposed MBSD Project took into account the availability of sediment from the Mississippi River, the potential for accretion of sediment in the basin, and the creation, maintenance, and sustainability of existing and future wetlands and marshes. While Edgard is located within the defined proposed Project area which is the Barataria Basin and the Mississippi River birdfoot delta, it is located within the Upper Barataria Basin. During the EIS alternatives analysis process it was determined that alternatives in the Upper Barataria Basin would not meet the purpose and need. Siting the diversion in the Upper Barataria Basin would promote the long-term sustainability of existing marshes since the marshes are still relatively intact and more protected from the combined influence of erosion, relative sea-level rise, and saltwater intrusion relative to the lower reaches of the basin. However, it would not effectively promote the sustainability of newly created marsh or restoration of degraded marsh in the middle or lower basin, which is where the need to restore new and preserve existing marsh is greater than in the upper basin due to sea-level rise and coastal erosion (see Chapter 2, Section 2.4.1.3 Application of Additional Considerations to Potential Alternative Locations in Upper, Middle, or Lower Barataria Basin).

The LA TIG identified the Barataria Basin in their restoration planning as the location for the proposed Project because it suffered the most severe and persistent oiling from the DWH oil spill. In addition, CPRA's Louisiana Coastal Master Plan does consider other diversions for the Pontchartrain Basin including the Maurepas Diversion (River Reintroduction into Maurepas Swamp).

Additionally, the purpose of the proposed MBSD Project is not flood risk reduction. USACE operates the Bonnet Carré Spillway for emergency flood control and the spillway's design capacity is 250,000 cfs, much greater than the proposed MBSD. Building a sediment diversion near Edgard would likely not negate the need for operation of the Bonnet Carré Spillway, although that question has not been analyzed as part of this Project.

**Correspondence ID:22885**

Emmaline Brown

This project is absolutely crucial for the future of our coast and the safety and livelihoods of our coastal communities.

---

**Concern ID: 63336**

**This proposed Project is absolutely crucial for the future of our coast and the safety and livelihoods of our coastal communities.**

**Response ID: 16292**

The commenter's support for the proposed Project is noted. The proposed Project, by reestablishing deltaic processes, is intended to build coastal resiliency and protection for the coastal communities behind Barataria Basin. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

See Sections 3.2.1.6 (Benefits Multiple Resources) and 3.2.1.7 (Public Health and Safety) of the LA TIG's Restoration Plan for a detailed discussion of the proposed Project's potential benefits and public health and safety impacts, respectively.

**Correspondence ID:22917**

Chandara Kim

This draft restoration plan can hurt a lot of our communities fisherman. There is a pro and con to everything, however if this is affecting their way of bringing income for their families then some kind of grant or fund should be considered.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public

Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiessky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Cary Trapani

I live on the beautiful Mississippi Gulf Coast. Our home is actually on a bayou off of the Bay of St. Louis. Mallini Bayou is a vacation weekend and residential community. In 2019 when the BonneCarrie spillway was opened the freshwater closed our beaches killed her dolphins, Oysters shrimp crabs. It did produce swarms of flies and algae and disgusting odors in our beautiful community. It took months and months and months for the water to filter out after the spillway was closed. The flies that swarmed our homes cars boats permanently stained anything they lite/sat on.

Dredge the passes at the end of the Mississippi River.

The proof of this proposal's harm is so fresh in my mind that it is compelling me to write this letter.

Mississippi is booming and our beauty is in our estuaries and barrier islands. Don't take that away!!!!

Dredge the Passes!!!!

Cary Trapani

[REDACTED]

[REDACTED]

[REDACTED]

---

**Concern ID: 61973**

**Consider dredging the passes (south pass and south east pass) to relieve pressure on rising rivers and let the natural process of building the river there, along with rock jetties along the Louisiana coastline, support growth and protect from oncoming storms. Then use dredging to build up specific areas inland.**

**Response ID: 15974**

This alternative as presented, specifically dredging the passes and building rock jetties to create marsh, would not meet the goals and objectives as stated in the purpose and need and described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives in the EIS. Similar to marsh creation alternatives (as described in Chapter 2, Section 2.3.5 Large-Scale Marsh Creation), it would not deliver enough fresh water, nutrients, and fine sediments to sustain existing and created wetlands beyond the marsh creation area and over the long-term would require repeated lifts and maintenance through placement of additional dredged material. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Other similar restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan, which will be updated in 2023, and by the LA TIG through Natural Resource Damage restoration planning.

**Concern ID: 62709**

---

**The 2019 opening of the Bonnet Carré Spillway caused significant impacts to aquatic fauna from the release of river water, and resulted in a declared fisheries disaster of at least \$58 million.**

**Response ID: 16087**

A summary of select natural and man-made diversions in southeastern Louisiana, including the Bonnet Carré Spillway, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment, including area fisheries. This summary is available in Appendix U of the Final EIS. However, it is important to note that the Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological purposes. The anticipated impacts of the proposed Project on aquatic fauna from the release of river water is discussed in detail in Chapter 4, Section 4.10 Aquatic Resources.

---

**Concern ID: 63067**

**The majority of the bottlenose dolphin population of this area will be destroyed... not just killed but sentenced to a horrific death. Freshwater releases at Bonnet Carré Spillway in 2019 resulted in an unusual mortality event (UME), demonstrating the harm that freshwater releases can cause to dolphins. A study by the Galveston Bay Dolphin Research Program also found that dolphins in upper Galveston Bay developed skin lesions after flooding from Hurricane Harvey. Additional studies further support the harm that the diversion could cause by demonstrating negative impacts to dolphins from exposure to low-salinity conditions (Deming and Garrison, 2021; Duignan et al., 2020; McClain et al., 2020).**

Deming, A., and L. Garrison. 2021. 2019 Northern Gulf of Mexico bottlenose dolphin unusual mortality event. Marine Mammal Commission meeting/webinar on “Effects of Low Salinity Exposure on Bottlenose Dolphins,” 23 March 2021. Oral presentation. <https://www.mmc.gov/events-meetings-and-workshops/other-events/effects-of-low-salinity-exposure-on-bottlenose-dolphins-webinar/>

Duignan, P.J., N.S. Stephens, and K. Robb. 2020. Fresh water skin disease in dolphins: a case definition based on pathology and environmental factors in Australia. *Scientific Reports* 10:21979.

McClain, A.M., R. Daniels, F.M. Gomez, S.H. Ridgway, R. Takeshita, E.D. Jensen, and C.R. Smith. 2020. Physiological effects of low-salinity exposure on bottlenose dolphins (*Tursiops truncatus*). *Journal of Zoological and Botanical Gardens* 1:61-75.

**Response ID: 16590**

The Draft EIS included an analysis based on extensive literature and soon-to-be published data (now published) demonstrating the impacts of low-salinity conditions on dolphins. These data were considered as part of an Expert Elicitation (a garnering of expert opinions to determine or quantify an unknown) that resulted in dose-response curves (Booth et al. 2020) and summarized in Chapter 4, Section 4.11.3 (Marine Mammals - Overview of Impact Analysis Approach) of the EIS. While Deming and Garrison (2021) was presented after the release of the Draft EIS, the presentation was based on data that were fully considered in the Draft EIS, including as part of the Expert Elicitation. Along with other relevant data (for example, BBES tagging studies), the analysis contained in the Draft EIS determined that there would be a significant, adverse, permanent impact on the BBES Stock. Further, the

analysis in the Draft EIS concluded that if the 75,000 cfs Alternative were implemented, impacts would be immediate and only a remnant population would be likely to exist near the barrier islands after 50 years of operation.

After release of the Draft EIS, at the request of the Marine Mammal Commission, the National Marine Mammal Foundation and University of St. Andrews released a population impact projection based on the information presented in the Draft EIS (including annual survival rates from Garrison et al. 2020) coupled with an updated population model for BBES dolphins (Schwacke et al. 2022, Thomas et al. 2021). This new, additional analysis has been incorporated into the Final EIS in Chapter 4, Sections 4.11.5.2 Barataria Bay Estuarine Stock and supports the original determination in the Draft EIS of major, permanent, adverse impacts on the BBES dolphin population. The research presented in the McClain et al. (2020) study cited by commenters was considered in the Draft EIS [cited at the time as McClain et al. (in prep)]; the research presented by Duignan et al. (2020) is consistent with the established literature and does not change the conclusions of the Draft EIS, but this study has been incorporated in Chapter 4, Section 4.11.5.2.2.1 General Effects on Dolphin Health of the Final EIS. Similarly, the information included in the Deming and Garrison presentation was considered in the Draft EIS, is consistent with the conclusions of the Draft EIS, and the presentation has now been cited in Section 4.11.5.2.2.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include specific marine mammal response triggers that may affect Project operation mitigation efforts; see Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures

are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63125**

**The commenter's home is on a bayou off of the Bay of St. Louis on the beautiful Mississippi Gulf Coast. According to the commenter, in 2019 when the Bonnet Carré Spillway was opened, it caused swarms of flies, algae, and disgusting odors in the beautiful community that took months to return to normal. The flies that swarmed homes, cars, and boats permanently stained anything they sat on.**

**Response ID: 16283**

The proposed Project is not anticipated to have discernable effects on aquatic life outside of the Project area, which is limited to Louisiana, and particularly the Barataria Basin and the Mississippi River birdfoot delta, as defined in Chapter 3, Section 3.1.1 in Introduction of the EIS; therefore, negligible to no impacts on the Mississippi Sound are anticipated from the construction and operation of the proposed MBSD Project. It is important to note that the Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological purposes. However, a summary of select natural and man-made diversions in southeastern Louisiana, including the Bonnet Carré Spillway, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS and discusses conditions that might have led to stagnant waters and/or odors after the Bonnet Carré Spillway openings.

Commenter

I don't live in Plaquemines Parish, but my Wife's family does, scattered from Belle Chasse to Port Sulphur. So we spend a lot of time in the area, love it and have a keen interest in seeing that unique part of America preserved. We are therefore, concerned about and have grave doubts about, the proposed Mid-Barataria Sediment Diversion Project. First and foremost, I note that this is a 50 year proposal based on the projections of a group of climate and costal change "experts" who state:

"Louisiana's land loss crisis is dire and will significantly worsen without investments in large-scale coastal restoration and protection projects. Since the 1930s, Louisiana has lost 2,000 square miles of coastal wetlands. Without action, the state could lose double that amount - an additional 4,000 square miles of land - in the next 50 years."

That statement alone gives me great concern, especially "in the next 50 years". A little personal history. When I was a child I would often visit my Grandparents farm in West Carroll Parish. Once as I was exploring the area near the Boeuf River I came upon a huge machine, we called it a "Drag Line", with large feet on each side. The machine would put its feet forward and drag itself along through the swamps digging as it went. When I got back to my Grandparent's farm I breathlessly told my "Grandma" about the machine. "Boy", she said, "stay away from there. They are messing with nature. It's going to turn out bad and you could get hurt." Grandma was smarter than I thought. That was over 50 years ago. At that time the Boeuf River in North Louisiana was a scenic, wilderness river. Winding its way along, the clear waters of the Boeuf provided recreational and commercial fishing and pristine areas for boating and swimming and just walking along the river. But the "Government" thought that the winding river should be straightened and dug out to make it a navigational waterway for future commercial traffic. They thought that could help. They were wrong. Go and ask anyone living near the muddy trench, that was once the beautiful Boeuf River, just what they think of that "project". Ask them how much commerce they've seen on the river. But it's too late for the old Boeuf. After all, who can accurately predict what will happen in 50 years?

Now back to Barataria and the Diversion project. The "Government" says we could lose more land in the next 50 years without action. Notice they said "could". We, they, really don't know what could happen to the area if we take action or if we don't. It could help or it might not. But we do really know some bad things that will happen if the Diversion project is put into action. No matter the outcome, it will:

1. Cost unknown billions over 50 years or more, with or without the desired results.
2. Make the land from Myrtle Grove south (roughly) less habitable. Many of the present communities and home sites might not be livable due to the project raising the water levels.
3. Drastically reduce the shrimp, oyster, bottle nose dolphin and other aquatic life population and significantly impact or destroy the area's commercial fishing industry by changing the salinity of the water.

I could go on and on, point by point, but in fact the arguments for all the points are much the same. Our Government wants to "bet" billions of dollars that they could or might be right about the continued land loss and how to "fix" it. Right or wrong, fix it or not, no one will know for sure for 50 years, while the residents, sea life and anyone who enjoys sea food or works in

the seafood industry may be damaged immediately. I believe that the Mid-Barataria Diversion Project is a very questionable gamble with money that could be much better spent repairing the oil spill damages to Louisiana's seafood industry, its residents and that unique slice of America, "down the road", in Plaquemines Parish.

---

**Concern ID: 61831**

**The commenter questioned the level of certainty of land-loss estimates under the No Action Alternative over the 50-year period of analysis. Commenter further questioned how that level of certainty compares to the level of certainty of some of the adverse impacts that are projected to occur from the proposed Project.**

**Response ID: 16478**

It is correct that the Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties were incorporated into the Draft EIS impact conclusions and are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in (Model Limitations and Uncertainty), and in detail in Appendix E (Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties). Hurricanes were not modeled as part of the Delft3D Basinwide Model; they were, however, modeled as part of the ADCIRC modeling conducted for the Draft EIS, Chapter 4, Section 4.20 Public Health and Safety, Including Storm and Flooding Risk Reduction. The rationale for that omission and explanation of how it was accounted for are provided in Appendix E Delft3D Basinwide Modeling, Section 8.1. The land-change uncertainty bounds were not included in the summary in Section 4.1.3.3. In response to this comment, a summary of land-change uncertainty has been added to that section in the Final EIS. The USACE and LA TIG agree that the model uncertainties should be clearly stated in the EIS with respect to the Model's quantitative results. A footnote has been added to the Executive Summary and to Table 4.2-6 in Section 4.2 Geology and Soils of the Final EIS providing the uncertainty bounds for land-change projections. Uncertainties related to the Marine Mammals impact analysis are summarized in detail in Chapter 4, 4.11.3.1 (Marine Mammals, General Caveats to Impact Analysis Approach).

As part of developing the EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

---

**Concern ID: 62659**

**The proposed Project is an experiment, and it is not possible to guarantee its alleged benefits.**

**Response ID: 16632**

The uncertainties associated with the Project's success were considered in the Draft EIS. While the benefits of the Project cannot be guaranteed, the EIS uses state-of-the-art modeling, including but not limited to the Delft3D Basinwide Model, to project the Project's beneficial and adverse impacts. These modeling projections of Project impacts include uncertainties. Following standard professional practice, model uncertainties are clearly stated in the EIS with respect to the model's quantitative results. Uncertainties are incorporated into the EIS impact conclusions and are briefly summarized in EIS Chapter 4, Section 4.1.3.3

---

Model Limitations and Uncertainty, and in detail in Section 8.0 Model Limitations and Uncertainties of EIS Appendix E Delft3D Modeling.

The likelihood of success of the Project was also considered in the LA TIG's Draft Restoration Plan. While recognizing the innovative nature of the proposed Project, the Restoration Plan discusses in detail the factors that would contribute to the Project's success. More specifically, Sections 3.2.1.4 (Likelihood of Success - Alternative 1) and 3.2.2.4 (Likelihood of Success - Alternatives 2-6) of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, such a sediment diversion has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Section 3.2.1.4 [Likelihood of Success - Alternative 1] of the Restoration Plan). The Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62777**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).**

**Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result

---

in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62778**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

---

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions,

would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are

---

identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62789**

**The cost of designing and building the proposed MBSD Project is too high for a project that has undependable results.**

**Response ID: 16370**

The commenter's opposition to the proposed Project is noted. With respect to the dependability of the future benefits of the proposed Project, the Draft EIS acknowledged that the Delft3D Basinwide Model projections of future conditions includes uncertainties, which are incorporated into the EIS impact conclusions. These uncertainties are briefly summarized in the EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties. However, in addition to the modeled data, Chapter 4 - Environmental Consequences -includes analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in preparing the EIS. As part of developing the EIS, the USACE, together with the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the EIS impacts analysis of the alternatives.

Consistent with OPA regulations (15 CFR §990.54), the LA TIG's Restoration Plan evaluated multiple alternatives based on a number of criteria, including the cost of the alternative. For more information see Section 3 of the LA TIG's Final Restoration Plan. The costs associated with developing, constructing, and managing the Applicant's Preferred Alternative are discussed in Chapter 3, Section 3.2.1.2 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan.

Jane Bladsacker

## Diversion Consequences

First, I would like to start by saying that I am definitely for preserving and protecting Louisiana's coast. Often, the media depicts the Myrtle Grove community as not caring about preserving the coast of Louisiana. Of course we care, we are Louisianians and we definitely want to preserve the coast of Louisiana. We also want to save the community of Myrtle Grove and the people of Louisiana. We care about the future, but we also care about the present. It is our belief that we can prepare for the future without destroying communities and people in the present. We can save the coast without sacrificing our present lives, homes, livelihoods, way of life, and occupations.

There are solutions that will not sacrifice our communities while saving the coast. One solution is to build flood walls to save the communities. It should not be a choice of one or the other. The choice should be to find a solution to preserve both the present and the future.

I would like to make this very personal and ask that you also put yourself in the place of the people of these communities that you will be sacrificing. We are living now in the present. I understand that this will bring sediment to the coast in the future some 50 years from now, IF it works and IF there are no natural hurricanes that come through and undo all the sediment that is being created. There are a lot of "ifs" that is being gambled on at the priceless cost of positively flooding our community. I cannot believe that the very present has to be sacrificed on a lot of "ifs" to preserve the future.

We built our dream home two years ago in Myrtle Grove Estates. We are parents of four adult children each have significant others. We are expecting our six and seventh grandchild. We have huge families all living here in Louisiana. Our ancestors were Louisianians. All of our generations have stayed in Louisiana. We could not imagine moving anywhere else. We are hard-working, middle-class, God-fearing, good people, willing to help others in need and contribute to society in a positive aspect everyday. Within our immediate family we are proud to have two teachers, preparing the future generations. We also have a medical assistant, two process operators, a lab tech, a welder, a process operator supervisor, as well as homemakers raising our future generations. Our grandkids are blessed to be part of schools for advanced students, with hopes of becoming a veterinarian, another a medical research doctor, and another a teacher. Our extended family lives everywhere from Donaldsonville, Baton Rouge, Gonzales, Mandeville, down to Lafitte and Grande Isle. We have family in Luling, Marrero, Harvey and Gretna. Now we have extended our roots to Myrtle Grove. As you can see, we love Louisiana and cover a great deal of the cities with our family.

I say all this to show you that our loyalty is to Louisiana. With that being said, we are so disappointed in our politicians and our state government.

We have worked hard all of our lives and two years ago spent all of our savings to build our dream home. We said it was our final home until heaven, our eternal home. We built this home to be able to celebrate our family and life as a family gathering place! There are 15 in our immediate family! We've enjoyed hosting baby reveal parties, first birthday parties, Thanksgiving, Christmas and Easter as well as Sunday evening family dinners. We've enjoyed the crawfish boils, shrimp and crab boils, fish fries, and barbecues. It's been the family gathering place with fishing, crabbing, boating, tubing, and the kids just splashing

around swimming. It's celebrating our life's hard work , and reaping the blessings of a life of sacrifices to get to this point to be able to enjoy our family and the blessings Myrtle Grove has to offer!

We realize we chose to build in an area that the water rises three or four times a year for a day or so. That is worth the trade off for the rest of the year. We elevated our home above the flooding levels being aware of natural levels. What we were never told until now, is that this diversion could possibly flood 180 days out of the year. It will bring in twice the amount of water and even at the height we built up for natural flooding, man made flooding will exceed . I'm asking you to put yourself in our shoes. If your family home flooded up to 180 days out of the year, How would you survive? How would you go back-and-forth to work? How could you survive being locked down for that length of time? Would you have to evacuate and where would you go? How would your children be able to go back-and-forth to school? How would you be able to go back and forth to get groceries? And how would that affect the electricity? Would you have electricity? What would that do to your vehicles? What would that do to the structure of the streets? Having to put up with natural disasters such as weathering storms and flooding or evacuating or a day or two during hurricane season is one thing. That's the cost of living in Louisiana. But having to endure up to 180 days of man-made flooding is entirely different. How can that be justified?

What if the government came in and said we're going to flood your home where you live right now for up to 180 days a year? Sorry, it's the cost to maybe save the coast 50 years from now. Last I checked we lived in the United States of America. Not a dictatorship or a country that comes in and destroys or takes your home and way of life from you. Basically, that's what this diversion, if approved by our government, will be doing to Myrtle Grove Estates. It will destroy our community, our homes, and our way of life. It will destroy the marine life, the dolphins we watch in our back yards, the shrimp, crabs and fish. It will destroy what our family personally has worked for our entire lives. It will destroy what we intended as an inheritance to our children and our children's children. This was to be their gathering place for the generations to come. How is it justifiable to decide to come in and destroy our land?

We cannot even sell our homes now if we had to. The property values will crash. Who would want to buy knowing that it's going to be destroyed by man-made floodwaters? We poured our life savings into the building of our dream home. We put our own sweat and labor into our home. I personally painted my entire house twice. I personally put together my cabinets. I personally sanded and painted all the baseboards. My husband also personally put his hands to the plow! We physically did a lot of the hard labor in addition to working a full-time job! There were many late nights and weekends working and striving to build our home. And we had no knowledge of this diversion when purchased the lot. We were not made aware of plans for this diversion when we applied for the permits and the permits were approved. Why were we not made aware of this diversion until after the fact? Why were permits granted? So, after half a million dollars, our lifetime savings, and two years of our life, our hard labor and sacrifices, we will be left with nothing?

Since we've heard about the diversion and started attending the meetings, we've been so stressed and upset and spend many sleepless nights just wondering what will happen to us now? How can the government pick and choose which communities they decide no longer need to exist? I've always lived by the motto, God, family, church, and the United States of America are priority . It's hard to believe that the government in the United States of America

would do this to their citizens. I always thought the government was here to protect it's citizens, not to destroy their lives. If this diversion is approved, that is exactly what you will be doing to the citizens of Myrtle Grove Estates as well as other communities.

To save the Louisiana coast you must find a way to also protect and save these communities. I sincerely hope and pray you consider the great destruction and disaster you will be causing in this community and the lives of those you will be affecting. Building flood walls of protection may be a solution to save these communities and still continue the diversion experiment. You cannot possibly destroy whole communities with an experiment that may succeed in 50 years or may not! You must implement a solution that will protect the present while preserving the future.

---

**Concern ID: 62013**

**The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.**

**Response ID: 16210**

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the

---

proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact

determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62193**

**A commenter asked why permits were granted for construction of residential homes if there was knowledge of a forthcoming diversion, and why these applicants were not made aware of the diversion when applying for permits.**

**Response ID: 15742**

The USACE is evaluating whether to grant the State of Louisiana's (through CPRA) requested DA Section 10/404/408 permits for the proposed Project. Without those permits, the Project cannot proceed. The LA TIG cannot speak on behalf of the local permitting agency and their consideration of potential future projects in granting residential construction permits. The LA TIG has no authority over decisions regarding the construction or permitting of residential homes.

---

**Concern ID: 62224**

**Communities like Happy Jack, Lake Hermitage and Myrtle Grove, some of which have homes that are not above the new base flood elevation, already experience some degree of flooding which would be made worse by the diversion. This would affect the ability of residents to access and enjoy their homes and communities.**

**Response ID: 15757**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discuss the anticipated increased flooding impacts outside of federal levee systems to be caused by the operation of the diversion. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially

offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes, which would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62785**

**This type of freshwater and sediment diversion project is unproven and there are uncertainties with respect to what the diversion would do (that is, if it would work and, if so, to what extent).**

**Response ID: 16367**

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties have been incorporated into the EIS impact conclusions and were briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties.

Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or as predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the projected changes for the No Action Alternative.

In addition to the modeled data, Chapter 4 Environmental Consequences of the EIS includes additional analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in drafting the EIS. In response to public comments, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The LA TIG recognizes and acknowledges that a controlled sediment diversion of this scale has not been constructed in Louisiana previously. However, a sediment diversion at this location has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Chapter 3, Section 3.2.1.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan). The proposed Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management [MAM] Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship,

---

monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62794**

**This poorly planned and executed proposed Project is being pushed forward for the financial gain of politicians and contractors because taxpayer dollars are being used. Private investment dollars would entail more deliberation and a full impact study, including more natural options with less risk and more overall benefits.**

**Response ID: 16375**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance and constitutes a full impact analysis. A variety of alternatives assessed in the EIS are identified in Chapter 2 Alternatives. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

The LA TIG's Restoration Plan evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. The LA TIG recognizes that

---

there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG has selected Alternative 1 as the LA TIG's Preferred Alternative.

---

**Concern ID: 62850**

**The commenter questions how the government can pick and choose which communities they decide no longer need to exist and indicates that is what the government would be doing to the citizens of Myrtle Grove Estates, as well as other communities, if the proposed Project were approved.**

**Response ID: 16396**

The commenter's concern regarding the projected effect of the proposed Project on several communities near the diversion outfall outside of flood protection is noted. The EIS analysis considers the beneficial and adverse impacts of the proposed Project. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Independent of the joint Draft EIS and Draft Restoration Plan public meetings, CPRA held meetings with communities potentially affected to receive their input on how best to mitigate Project effects on water levels. Based in part on that feedback, the revised Mitigation and Stewardship Plan (Appendix R1 of the Final EIS) includes mitigation to partially offset some of the the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This mitigation includes a combination of structural measures (for example, raising roads, boat houses, docks and utilities) and non-structural measures (for example, Project servitudes). The mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if the permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the

---

final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water

---

levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63102**

**Commenters expressed concern that they will not be able to use their property if the Project proceeds. Commenters believe that the amount of funds proposed for mitigation is insufficient.**

**Response ID: 16640**

The commenters' concern regarding the adequacy of the funding for mitigation measures was considered by CPRA and the LA TIG in developing CPRA's Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included proposals to address and partially offset some of the projected impacts of the Project on surrounding communities outside levee protection, including potential mitigation measures to address increased water levels due to the Project. In response to

---

comments, CPRA further expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The mitigation and stewardship measures would vary by community. In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the Project. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and the utilities of those communities. Also in these communities, CPRA plans to acquire Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:23049**

Lindy Brown

Do not do this.

---

**Concern ID: 62782****A large number of commenters expressed general opposition to the proposed Project.****Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:23058**

Jed Bourgeois

We do not need anymore fresh water diversions in this state. The core has killed lake ponchartrain basin and now this will kill the barataria estuary. Y'all need to listen to the Fisherman who live and make a living in these areas. You cannot do with a diversion what the Mississippi River did over thousands of years. Do what Texas and Mississippi does. Use dredges and pump sand for 1/3 the cost. You introduce fresh water and kill all the brackish water grass holding the land then what you got. It's a shame what is going on in this state. Truly ruining the Sportsman's Paradise.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated

Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRAs and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62784**

**Prior or proposed diversions and diversion-like projects (including the Caernarvon Diversion, MRGO, Mardi Gras Pass, Maurepas Bonnet Carré Spillway openings) did not work or caused adverse impacts on area resources.**

**Response ID: 16366**

The commenter's concern regarding the effectiveness and adverse impacts of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the Caernarvon Diversion, MRGO, Mardi Gras Pass, and Bonnet Carré Spillway, is available in Appendix U of the Final EIS. The Maurepas Diversion is subject to an ongoing NEPA analysis, which is anticipated to be finalized in 2022.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The referenced projects all had unique goals, and, where goals existed, each of those projects have achieved their goals. Those achievements increase confidence in the ability of the LA TIG to set goals and select approaches appropriate for achieving those goals. The proposed Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the current geomorphological features of the Lower Mississippi River, as well as data and knowledge gained from the referenced projects.

Change The Support For This Project You Are Not Receiving From My Family And Other Myrtle Grove Homeowners By Redirecting The Levee That Is About To Be Constructed Around Myrtle Grove Estates And Install A Flood Gate/ Locks Near The Pumping Station. This Would Solve Flooding Problems We Have Experienced In The Past And The Additional Flooding Problems We Will Incur After The Construction Of The Levee Is Complete And From The Proposed Diversion.

Protect Us! Do Not Flood Us!

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

NASA Ames Research Center

Christopher Potter

The key statement made on p.3-2 that "The Barataria Basin lost approximately 25% of its total land area between 1932 and 2016 (Couvillion et al., 2017)" is based on flawed data analysis by the USGS and represents a large and biased overestimate of the land area lost in the Barataria Basin, at least since since Hurricane Katrina in 2005. As documented and published in the studies by Potter et al.(2020 and 2021) in the Journal of Coastal Research, it must be concluded that the USGS coastal land area change product (cited as Couvillion et al., 2017) has not reported widespread wetland area gains in southern Louisiana and has instead overestimated net marshland losses on most sections of the Gulf Coast since at least 2005. Therefore, this Draft Restoration Plan and Environmental Impact Statement is based on erroneous land loss rates and locations within the Mid-Barataria Sediment Diversion impact area.

Here are the peer-reviewed references cited for this comment:

Potter, C. and Amer, R., 2020. Mapping 30 years of change in the marshlands of Breton Sound basin (southeastern Louisiana, U.S.A.): Coastal land area and vegetation green cover. *Journal of Coastal Research*, 36(3):437-450.

Potter, C. 2021. Remote sensing of wetland area loss and gain in the western Barataria Basin (Louisiana, U.S.A.) since Hurricane Katrina. *Journal of Coastal Research* (in press).

**Response ID: 16048**

The analysis in the EIS is not based on past land-loss rates. The projected changes in wetland extent over the analysis period are based on current baseline conditions (including bathymetry, topography, and hydrologic conditions) and the Delft 3D Modeling analysis (see Appendix E of the EIS) regarding future conditions for the No Action Alternative and the action

---

alternatives (including the Applicant's Preferred Alternative). The Delft 3D model used a variety of inputs to project future conditions and was not based on historical land-loss trends. The difference between USGS data and the land loss cited in the literature would not invalidate the Delft 3D model projections. However, Chapter 3, Section 3.6.2 Wetland Loss of the Final EIS has been revised to include additional detail regarding the historic rate and extent of land loss in the Barataria Basin based on review of the literature cited by the commenter (Potter and Amer 2020 and Potter 2021).

Thomas Sherry

I am a scientist and professor of Ecology and Conservation Biology at Tulane University. Please consider supporting the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion, and the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project.

I was stunned when I moved to LA in 1989 and travelled along the coast from New Orleans to Cameron/Sabine Wildlife Refuge, and quickly realized how damaged the coast was already. It's FAR worse today, as subsidence, salt water intrusion, canal-induced erosion, and sea level rise (in part supported by LA's unwavering support for fossil fuel extraction and combustion) have all carved away our wetlands. The ONLY way to staunch this environmental bleeding is to do what the MS River used to do, namely contribute to accretion with mud sediment carried by the river. This is the only long-term solution, and it has been deeply researched and considered. I recognize that going forward with this plan is strongly opposed by local communities, and I recognize their concerns, which are mostly short-term, centered on fishing and local recreation. Long-term solutions to LA coastal erosion must override short-term ones. The needs of local communities can mostly be accommodated without scuttling the long-term coastal issues.

I care deeply about this issue for several reasons. First, I teach locally, and depend on intact ecosystems for my classes. Second, the project area is within the Barataria-Terrebonne Important Bird Area, and as such it will restore habitat for Reddish Egret, Seaside Sparrow, Brown Pelican, Snowy, Piping and Wilson's Plovers, as well as wintering waterfowl, including Blue-winged and Green-winged Teal, American Widgeon and Ring-necked Duck. I've taken my students to coastal sites, and crawfish ponds near Lafayette, and these areas and birds and other wildlife supported by a healthy Gulf Coastal area are invaluable- -no monetary value can be put on them, emphasizing the need to protect at all costs. Third, I live in New Orleans, and the safety of New Orleansians, and others living in coastal cities in LA, depends on maintaining the wetlands- -including salt marshes, mangroves, and cypress and tupelo swamps to protect against hurricanes and against further coastal erosion. These wetlands won't last if we don't restore the outer areas of coastal marsh. Fourth, all of Louisiana depends heavily on tourism economically, and much of this centers on the coast and coastal activities (bird-watching, fishing, boating, hunting, alligator tours, etc.). This should make it obvious that LA writ large, and the rest of the country and world that comes to visit LA and spend tourist dollars, depends on a healthy coast long-term. I know that it's tempting for local people, e.g., those living in lower Plaquemines and Jefferson Parishes to think of where they live as "theirs", and this is partly true, but additionally the coast belongs to a far greater group of people, for all the reasons I've described above.

---

**Concern ID: 61910**

**The MBSD Project would help wildlife, fisherman, recreationalists, and hunters who depend on a healthy coast in the long term.**

**Response ID: 16240**

EIS Chapter 4, Sections 4.16.4.2 and 4.16.5.2 in Recreation and Tourism describe anticipated effects of the MBSD Project on wildlife viewing, recreational fishing, hunting, and

---

other recreational activities that utilize the Project area. As compared to the No Action Alternative, long term minor to moderate adverse impacts on-site accessibility, recreational boating, and boat-based recreational fishing due to increased tidal flooding at access points at Lafitte, Myrtle Grove, and Grand Bayou, as well as introduction and spread of invasive species, are anticipated. The proposed Project would also cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum throughout the basin. Beneficial impacts on hunting and wildlife watching due to an increase in wetland habitat in some areas of the Barataria Basin are also anticipated.

CPRA has developed a suite of mitigation and stewardship measures to help address and offset Project impacts, including those related to recreation (see the Draft Mitigation and Stewardship Plan in Appendix R1 to the Draft EIS). In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62233**

**Restoration of coastal habitat and the delta would provide protection from storm damage.**

**Response ID: 15752**

While the intent of the proposed Project is to reestablish deltaic processes to restore resources injured by the DWH oil spill, the Draft EIS Chapter 4, Section 4.20.4.2 Public Health and Safety described the ancillary benefit of storm damage risk reduction on communities

---

north of the proposed diversion due to the creation and maintenance of wetland habitat and increases in topography and land acreage within the delta formation area. At the same time, operation of the Project would have permanent, minor to moderate, adverse impacts on storm hazards in communities south of the diversion, with anticipated increases in storm surge of up to 1.7 feet near Myrtle Grove (as compared to the No Action Alternative). Section 4.20.4.2.2.2 in Public Health and Safety of the Final EIS has been revised to include additional information and figures further explaining the impacts of the Project on storm surge and wave height

---

**Concern ID: 62892**

**The proposed MBSD Project would create wetlands supportive of birds (bald eagles, spring and fall migrants, waterbirds, and marsh birds) and other wildlife that are experiencing a high rate of coastal land (habitat) loss.**

**Response ID: 16191**

Chapter 4, Section 4.9.4.2 in Terrestrial Wildlife and Habitat of the Draft EIS, discussed the maintenance and creation of marsh that is projected to occur as part of the proposed Project, and identified that the net addition of wetlands would generally be beneficial to area birds. As identified in Section 4.12.3.2 in Threatened and Endangered Species of the Draft EIS, the creation and maintenance of wetlands could affect bald eagle aquatic foraging habitat and prey species, but would likely result in negligible effects on the bald eagle itself.

The potential benefits of the proposed Project to resources in the Gulf, including birds, are also described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63334**

**The proposed MBSD Project would maintain and restore coastal lands and should move forward.**

**Response ID: 16291**

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54

and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:23065**

## Form Letter 13

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

As the project advances, I urge federal and state decision makers to center community needs in planned mitigation and stewardship efforts. This project will have many positive, long-term benefits, including increased storm surge protection, job creation and regional economic impact during construction, and increased productivity of natural resources. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. The Trustees must work proactively and collaboratively with potentially impacted communities to develop and implement ideas and proposals for adaptation and mitigation, and be as detailed and transparent as possible throughout the process.

I encourage the development and implementation of a robust adaptive management program that incorporates knowledge gained from monitoring of the project over time and also considers input from key stakeholders.

A future without the Mid-Barataria Sediment Diversion is a future we cannot afford, which is why I support the preferred alternative outlined in the draft Environmental Impact Statement and the expenditure of Deepwater Horizon settlement dollars to pay for the project's construction and associated mitigation and stewardship activities.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship,

---

monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the

EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:23070**

Robert Bengé

I am in favor of the Sediment Diversions. For too long the marsh has been cut off from the life blood (sediment) of the Mississippi River, and in roughly 95 short years, we have undone the deltaic building of Southeast Louisiana.

---

**Concern ID: 63334**

**The proposed MBSD Project would maintain and restore coastal lands and should move forward.**

**Response ID: 16291**

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

MarshOnTheFly

Peter Scafaru

Diverting Mississippi River water back to where it traditionally flowed is the only scientifically proven method of creating new land on the Louisiana coast. We need more and larger diversions to save the fishery, thousands of jobs and ultimately the entire LA coast. We are currently losing between 25 and 30 square miles of wetlands a year and the MBSD is a solid proposal based on sound science that will reverse this scary trend of loss. Please make the MBSD happen right away!

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

First Equity, Inc.

**Commenter**

CPRA has indicated the Diversion will raise water levels approximately ½' - 1' at Happy Jack.

If the increase in water height is anticipated not to exceed 1', then:

First Equity, Inc. , as owner of a number of vacant lots on the upriver side of Happy Jack (Martin Lane), recommends the following remedial measures:

- 1) Raise the road (Martin Lane) to a sufficient elevation (approximately 1.5' higher) to decrease the risk of flooding and to allow drainage from the road, over the lots, to the water's edge;
- 2) Raise the ROW (on either side of Martin Lane) to a sufficient elevation to decrease the risk of flooding and to allow drainage from the road / ROW, over the lots, to the water's edge;
- 3) Raise the lots (between the road / ROW and the water's edge) to a sufficient elevation to decrease the risk of flooding to allow drainage from the road / ROW, over the lots, to the water's edge;
- 4) Raise the bulkhead (along the water's edge) to a sufficient elevation to decrease the risk of flooding and to allow drainage from the road / ROW, over the lots and bulkhead, to the water's edge.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

---

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed

instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of

---

the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Myrtle Grove Waterfront Properties, LLC

Commenter

CPRA has indicted the Diversion will raise water levels approximately 1 ½' - 2' at Myrtle Grove.

Myrtle Grove Waterfront Properties, LLC (MGWP) is the owner of a number of vacant lots in Myrtle Grove Phase 2.

Myrtle Grove Estates is effectively divided by Myrtle Grove Canal into two sections:

Phase 1 (downriver side) comprised of approximately 160 lots; there are approximately 65 homes / structures built on the lots in Phase 1.

Phase 2 (upriver side) is comprised of approximately 172 lots; there are approximately 17 homes / structures built on the lots in Phase 2.

If the increase in water height is anticipated to exceed 1', then:

MGWP, as the owner of a number of vacant lots in MG Phase 2, recommends the following remedial measures:

- 1) For the vacant lots owned by MGWP, MGWP recommends that CPRA purchase the vacant lots owned by MGWP;
- 2) For lots with house / structures - these properties should be viewed on a case-by-case basis to determine the preference of the individual home / structure owner(s)

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed

instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

Kenneth Smith

This is Kenneth Smith. I live at [REDACTED]. So far, as of this year, I've flooded 5 times. The water level is 3 feet in the street. I cannot leave my home, I get no mail service, garbage pickup will not pick up because they don't drive back here. The diversion will just raise more water upon me. Sometimes it lasts anywhere from 3, I mean from, 5 to 6 days as water is invaded around my home and property, so this diversion, I'm totally against the diversion. Something has to be done prior, or not at all to this diversion project. Other than that, you're going to kill everything in Barataria Bay basin and all around the neighboring parish. There'll be fish kills, dolphin kills, no more shrimping, no more oystering, no more crabbing, and it's not going to do any good. You have to build the coast back up. Land goes away when the tide goes out. It's visible all the time, year after year.

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)

- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62224**

**Communities like Happy Jack, Lake Hermitage and Myrtle Grove, some of which have homes that are not above the new base flood elevation, already experience some degree of flooding which would be made worse by the diversion. This would affect the ability of residents to access and enjoy their homes and communities.**

**Response ID: 15757**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discuss the anticipated increased flooding impacts outside of federal levee systems to be caused by the operation of the diversion. Final EIS Appendix R1 Mitigation and

---

Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes, which would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued.

Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62660**

**Commenters stated that the proposed Project will not provide the benefits described in the Draft Restoration Plan and EIS. The proposed Project will not stop the problems of sea-level rise and marsh erosion.**

**Response ID: 16633**

How sea-level rise and marsh erosion would affect the proposed diversion's land-building capability has been considered in the Draft EIS in Chapter 4, Section 4.2.3.2 Operational Impacts in Geology and Soils. In addition, sea-level rise and subsidence are explicitly accounted for in the Delft3D Basinwide Model projection of Project impacts, as described in Sections 3.2.4 and 3.2.3, respectively, of EIS Appendix E (Delft3D Modeling).

The potential benefits of the Project and how those benefits relate to sea-level rise and marsh erosion have also been considered in the LA TIG's Draft Restoration Plan. The LA TIG agrees that the Project would not stop sea-level rise, subsidence or other erosive forces that result in marsh erosion. However, the Project is designed to counteract these forces by transporting sediment from the Mississippi River to create thousands of acres of marsh that would be sustained over decades, even in the face of erosion and rising sea levels (see Section 3.2.1.6 [Benefits Multiple Resources] in the Restoration Plan).

---

**Concern ID: 62708**

**The release of polluted river water into the Barataria Basin would create harmful algal blooms and/or large areas of low dissolved oxygen that could negatively affect aquatic fauna including mortality of adults and juveniles that may not be able to escape impacted areas.**

**Response ID: 16086**

As discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS, the input of nutrients from the Mississippi River is generally anticipated to be beneficial to the food web, although there is an acknowledged potential for harmful algal blooms. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and well-mixed by wind and tidal action, such that it is not typically prone to stratification that promotes hypoxic (dissolved oxygen of less than 2 to 3 mg/L) conditions. Further, as discussed in Section 4.10.4.4 in Aquatic Resources, the Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation

---

would result in oxygen concentrations below 5 mg/L on an average monthly basis; therefore, although sporadic and limited areas of low dissolved oxygen may occur, mainly in the summer months, no large or prolonged periods/layers of low dissolved oxygen are projected by the Delft3D Basinwide Model, nor anticipated based on the Barataria Basin's identification as a largely well-mixed estuary. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to Project implementation has been added to Section 4.5.5.5.2 in Dissolved Oxygen of the Final EIS.

The Monitoring and Adaptive Management (MAM) Plan (Appendix R2), which has been updated for the Final EIS in response to public comments, includes CPRA's plan to implement a monitoring program for phytoplankton species composition, including harmful cyanobacterial/algal bloom species (and associated toxins) (see Sections 3.7.3.10 and 3.7.3.11 of Appendix R2 of the Final EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62777**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).**

**Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result

---

in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Teresa Smith

This is Teresa G. Smith, [REDACTED] The dirt division will be truly a nightmare. We are dealing with water now, days at a time. Just think what the diversion will do. So, all the people that worked and saved all their money to build a home and put all their life savings into their dream homes, will be forced to move. Many of them are senior citizens. So I want y'all to imagine and put yourselves into their shoes and think, how would you feel?

---

**Concern ID: 62013**

**The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.**

**Response ID: 16210**

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

---

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in

the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Robert Shaw

I support the Mid-Barataria Sediment Diversion project. In brief, we see the results of doing nothing as the coast disappears. We should allow the river to deposit sediment in the manner that built up the land in the first place, before humans disrupted the process with the current levee system.

---

**Concern ID: 63334**

**The proposed MBSD Project would maintain and restore coastal lands and should move forward.**

**Response ID: 16291**

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:23220**

Gerry Helmer

I have been fishing shrimp, crab or oysters out of Barataria Basin for over 60 years. As a small boy, I've watched my father and his father fish in these same waters, and grew up hearing the stories of their fathers doing the same. As a man, I have taught my son all that I know, and the tradition of fishing out of the Barataria Basin will live on. Key details were passed down from generation to generation on how to be a successful fisherman. Where to fish when the tides were high, the location of underwater snags to avoid, and how to anticipate where to go next. So in addition to my 60 years, I have 100 years of experience behind me. I have watched these waters long enough to know better.

When we heard of the proposed Mid Barataria Sediment Diversion, the local fisherman in this area knew one thing: this project would destroy our way of living. In south Louisiana, many families rely on the land and the water to make a living. From the hundreds of fisherman like myself, to the lucrative hunting and fishing industries that promote areas like Myrtle Grove and Lafitte as a Sportsman Paradise. This diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.

It's not only personal experience that support my opinion against the Mid Barataria Sediment Diversion, but several key factors. For one, the amount of freshwater pouring in to the Barataria Basin would disparately impact the salinity of the sounding estuaries of the area. How is this important? Various studies can prove that the higher the salinity of the water, the less mortality rate of brown and white shrimp and the higher percentage of reproduction. The introduction of nearly 6.5 BILLION cubic feet of freshwater PER DAY would significantly decrease the amount of shrimp and other seafood from reproducing, and would increase their mortality rate.

The next key factor is the water temperature. The Mississippi river starts in Lake Itasca, Minnesota, not very far from the Canadian border. Starting as a small glacial lake, the river winds its way down 2000 miles to deposit here. On average, the Mississippi river gets up to 79 degrees Fahrenheit at the height of the reproductive cycle of white shrimp. The Barataria Basin during that same time frame measures on average 91 degrees Fahrenheit. Over 10 degree difference makes significant adverse reactions: species of shrimp will be less likely to grow or survive, and of those that do, the Barataria Basin will no longer be the optimal breeding ground. The shrimp will move to a more favorable habitat.

It was reported that 75,000 cubic feet of freshwater and sediment will flood the Barataria Basin EVERY SECOND it is open. That's nearly 6.5 BILLION cubic feet per day. The sheer current of the water will force shrimp and other species out of the area, pushing them further in to the Gulf. Have this level of current continue for over a long period of time, these species will not return again.

When combined with a lower salinity, temperature of the water, and the current, the once prosperous Barataria Basin will be a void. Shrimp, crab, fish, oysters will be gone. With the absence of these species, other species below and above the food chain will also be impacted.

In conclusion, continuing with the Mid Barataria Sediment Diversion project will end the prosperity of the Barataria Basin. It will negatively impact the Commercial Fishing industries, along with other industries that benefit from the area as well. In addition, the environmental

impacts will effect this area for generations, and ensure the end to the traditions of south Louisiana and its families.

---

**Concern ID: 62029**

**The EIS describes immediate, major, and permanent adverse impacts on several critical species in the Barataria Basin, including shrimp and oysters. The health of commercial fisheries and the socioeconomic well-being of coastal communities are closely intertwined. Such impacts would inflict economic harm on businesses, families, and individuals.**

**Response ID: 16225**

The issues raised by the commenters were considered in the Draft EIS. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted. The EIS also acknowledges the importance of commercial fisheries to the Louisiana economy and communities, as described by commenters. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana and Section 4.14 Commercial Fisheries describes impacts to commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts to shrimp and oyster fisheries in the proposed Project area are anticipated under the Applicant's Preferred Alternative. Changes in abundance may exacerbate trends of aging fishers leaving the industry and would have adverse impacts on the overall fishery. Adverse impacts may be partially offset by changes in fisher behavior. Additional details on the regional and community level economic impacts on commercial fisheries due to the proposed MBSD Project can be found in Section 4.14 Commercial Fisheries.

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public

---

comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62077**

**The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.**

**Response ID: 16242**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and

---

stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62723**

**Various studies can prove that the higher the salinity of the water, the lower the mortality rate of brown and white shrimp, and the higher percentage of reproduction. The introduction of nearly 6.5 billion cubic feet of fresh water per day would significantly decrease the amount of shrimp and other seafood from reproducing, and would increase their mortality rate.**

**Response ID: 16101**

The impacts of the proposed Project's introduction of fresh water on brown and white shrimp were analyzed and are discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS. The impacts on brown shrimp from Project operations are anticipated to be major and adverse, due in part to salinity changes; however, white shrimp are more tolerant of lower salinities and younger life stages are present in the basin later in the year than brown shrimp, resulting in less exposure to higher diversion flows. Therefore, no significant adverse impacts on white shrimp survival are projected. White shrimp would be expected to experience minor to moderate benefits from the increased marsh, SAV, and primary production projected to

---

occur from the proposed Project. The projected benefits of the proposed Project to white shrimp outweigh the negative effects, resulting in an overall negligible to minor benefit on white shrimp from the Project. See Section 4.10.4.5 Key Species of the EIS. Both brown and white shrimp spawn outside of the estuary, where salinity would not be affected by Project operations. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

---

**Concern ID: 62724**

**On average, the Mississippi River gets up to 79 degrees Fahrenheit at the height of the reproductive cycle of white shrimp. The Barataria Basin during that same timeframe measures on average 91 degrees Fahrenheit. The temperature differential would cause adverse reactions to shrimp species including lower growth and survival rates, a decrease in habitat suitability, and relocation of the shrimp to more favorable habitat.**

**Response ID: 16102**

The changes in water temperatures in the Barataria Basin based on the input of cooler river water were analyzed and discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS, which acknowledges that the average monthly temperature under the Applicant's Preferred Alternative would decrease by up to 11.9°F (6.6°C), particularly in cooler months near at the outfall, which may result in changes in bioenergetics and area avoidance by fauna. As discussed in Section 4.10.4.5 in Aquatic Resources, temperature is one of the principal drivers of growth and survival for white and brown shrimp. For white shrimp, post-larvae (the youngest stage occurring in the basin) generally enter the basin from May through November (with peaks in June and September) when temperature differentials would be smaller compared to the No Action Alternative. Further, the HSI model results for juvenile white shrimp, which consider optimum temperature ranges, did not identify significant decreases in habitat suitability. Although individual adverse impacts on white shrimp would occur from the proposed Project, the overall impact of the Project on white shrimp is anticipated to be negligible to minor beneficial. For brown shrimp, post-larvae (the youngest stage occurring in the basin) generally enter the basin from January through June when temperature differentials would be larger compared to the No Action Alternative, particularly in the outfall area. However, although the HSI model results for juvenile brown shrimp did identify significant decreases in habitat suitability, the driver for these impacts primarily related to salinity, rather than temperature, decreases. The overall impact of the Project on brown shrimp is anticipated to be major, permanent, and adverse. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

---

**Concern ID: 62725**

**The sheer current of the inflowing water would displace shrimp and other species, pushing them further into the Gulf and precluding them from returning to the basin over time.**

**Response ID: 16103**

The changes in water flows in the Barataria Basin from the proposed Project are discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources, which states that water would continue to follow its general trend of daily movements through the basin passes during Project operations, such that larval advection from marine habitats into the estuary would likely not be affected. The effects on shrimp and other species, from current-related impacts within the

---

basin, are discussed in Section 4.10.4.5 in Aquatic Resources of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

---

**Concern ID: 62726**

**The proposed Project would change the habitat of the Barataria Basin in a manner that would decrease key shellfish and finfish, which would subsequently affect higher and lower trophic levels in the food chain.**

**Response ID: 16104**

The commenter is correct that the proposed Project would change the habitat in the Barataria Basin in a manner that would decrease or increase key shellfish and finfish, as noted in Chapter 4, Section 4.10, Table 4.10.6 in Aquatic Resources of the Draft EIS. A discussion of the food web impacts from the proposed Project in the Barataria Basin is included in Section 4.10.4.4 in Aquatic Resources of the Draft EIS.

---

**Concern ID: 64057**

**The socioeconomic impacts would affect southeast Louisiana and the area impacted by the proposed MBSD Project for generations and ensure the end to the traditions and culture of south Louisiana and its families.**

**Response ID: 16230**

The EIS discusses impacts on the local communities and various quantitative and qualitative impacts from the proposed Project in Chapter 4, Section 4.13 Socioeconomics, including Community Cohesion (Section 4.13.5.6). Consistent with the concern of the commenter, the EIS does find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative.

---

**Correspondence ID:23232**

Mariann Sengelmann

We, as property owners in the Myrtle Grove Marina Estates subdivision, understand that the proposed diversion will adversely affect our neighborhood, according to what we have read on the provided hydrology study and public hearings. We feel that the hydrology study is outdated, and the proposed diversion will have a more significant impact on our property than you are projecting, due to current environmental conditions. We purchased our property and home with the expectation to use public streets for ingress and egress to our property, to have access to public works including but not limited to trash removal services, mail services, and safety, fire, and emergency services. The flood impacts created by this proposal due to tidal fluctuations and your increased water level in our neighborhood will create flooding that will make all of the aforementioned services unusable. Your Corp of Engineers project consisting of raising the levees around Myrtle Grove Marina Estates, in conjunction with this proposed project, causes us to have grave concerns. After great deliberation and weighing all of our options, if your project proceeds, we would accept either of the following solutions to the flooding the projects will create:

1. Raise the existing infrastructure (public roadways, property, etc. ). This would allow us to use our property as we have, since it was purchased. Or,
2. Compensate me for the full investment that I have made on my property so that I may find another home.

Although this proposal will benefit the greater good, realistically, it will decrease our property value, and create safety concerns that did not exist prior to this project. On a more personal level, we purchased this property to be next door to, and own the adjoining lot with, our family. This fact alone makes our property irreplaceable and invaluable.

---

**Concern ID: 62013**

**The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.**

**Response ID: 16210**

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would

attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62227**

**The diversion would flood access roads, damage vehicles, cause siltation/sludge, cause cancellation of flood insurance, inundate cemeteries, stress levees, impact provision of emergency services, and increase the cost to raise homes, slabs and wharves.**

**Response ID: 15820**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discusses the increased flooding impacts outside of federal levee systems, including road inundation and infrastructure damage, anticipated to be caused by the operation of the diversion. Sections 4.13.5.1.2.1 and 4.13.5.3.2.1 in Socioeconomics of the Final EIS has been updated to include potential impacts such as vehicle damage, accumulation of siltation and sludge, cemetery inundation and interruption of emergency services. Recognizing the potential for these impacts, CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to

---

mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Final EIS concludes that the proposed Project would not have impact on the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances

where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62228**

**The commenter feels that the hydrology study is outdated, and the proposed diversion would have a more significant impact on the commenter's property than projected, due to current environmental conditions.**

**Response ID: 15796**

The Delft3D Basinwide Model represents the best tool currently available to inform impact analysis for the EIS. Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the No Action Alternative. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures such as raising roads or improving bulkheads in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if this permit is approved, would not be authorized under the DA permit. Many of these structural

---

measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62450**

**The commenter expressed concern about potential combined adverse impacts from both the raising of the proposed NOV-NFL Federal levee near the Myrtle Grove Marina Estates and construction and operation of the proposed MBSD Project.**

**Response ID: 16469**

The commenter's concern about the combined impacts of the reasonably foreseeable NOV-NFL Levee project near Myrtle Grove and the proposed MBSD Project was considered in the Draft EIS in Chapter 4, Section 4.25.4.4 Cumulative Impacts - Stormwater Management and Drainage.

CPRA has developed a Mitigation and Stewardship Plan with measures to minimize and/or offset some impacts of the proposed MBSD Project on the communities outside of flood

---

protection. This plan, which was included in the Draft EIS Appendix R (Mitigation and Stewardship Plan and the Monitoring and Adaptive Management [MAM] Plan), has been revised in the Final EIS in response to public input. For Myrtle Grove, the Final Mitigation and Stewardship Plan includes improvements to the bulkhead around the Myrtle Grove Marina Estates Subdivision, docks, and boat houses, as well as other infrastructure improvements (sewer system). See Appendix R1 of the Final EIS for details regarding this plan.

Structural measures such as raising roads or improving bulkheads in the Mitigation and Stewardship Plan were not included in CPRA's MBSD DA permit application and are not part of the currently-proposed MBSD Project. Many of these structural measures would require USACE and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these

servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Louisiana Historical Society

William Reeves

At present so much of the river sediment is wasted off shore when the Barataria needs it and the soil will immediately preserve threatened marsh. New Orleans and southern Louisiana need the marsh because of its beauty, its animals that are only found there, and contribution to fresh water streams and lakes.

---

**Concern ID: 63042**

**River sediment is currently wasted offshore when the Barataria Basin needs it to restore and preserve marsh, and the life the marsh supports.**

**Response ID: 16049**

Comment noted. The benefits of diverting river sediments to the Barataria Basin through the proposed Project were discussed throughout Chapter 4 Environmental Consequences of the Draft EIS.

Dian Campbell

Comments on the Mid - Barataria Sediment Diversion

Dian Campbell

[REDACTED]

[REDACTED]

[REDACTED]

I have lived in Louisiana all my life and in Plaquemines Parish since 1982. I have been a property owner at [REDACTED] since 1999. I fish in the Deer Range/Hermitage area by kayak or motorized canoe every weekend and frequently during the week. I built my home which is frequently referred to by others as a camp in 2000 with the intent that it would be my retirement home. I know firsthand the significance and the rate of the coastal erosion by paddling the bayou every week. I agree the land loss must be stopped or greatly reduced. I do not agree that the Mid - Barataria Sediment Diversion is the best solution with the multiple negative socioeconomic consequences that will go along with it.

The Draft Environmental Impact Statement for the MBSD states it will negatively impact/kill the fisheries and increase water levels causing property and roadway flooding in the surrounding area. The EIS states that Coastal Protection and Restoration Authority will be available to mitigate damages to those affected. State officials have identified about 530 properties that might need mitigation assistance. My concern is it also states that only 25% of those properties claim homestead exemption. I dont understand the relevance of the statement of claiming homestead exemption. My property and home cost are the same regardless if I claim homestead exemption and regardless if I spend 365 nights a year at that location or two nights a year. The value does not change if you call it a home or a vacation camp. For the record I do not claim homestead exemption at this residence but do live here more than 50% of the time. It is more convenient for me to travel from Belle Chasse than Hermitage to go to work in New Orleans. Coastal Protection and Restoration Authority is stating that at least \$305 million will be available to make up for permanent damage to wildlife and nearby communities but no mitigation plan strategy is presented. I attended the Public Meeting Presentation in March, the DEIS meeting by video in the beginning of April and the CPRA meetings held at the end of April. I am reassured there are funds available to mitigate the damages but no specifics. The mitigation plan should have been presented with the Draft EIS.

The Draft EIS states it has six alternatives which is the sediment diversion plan and six alternate flow rates with comparisons to do nothing. However, in the meeting when questioned about if this plan is not approved what else could be done, I am answered this is only one tool in a bag with lots of tools. Why are the other options/solutions/tools not mentioned in the Draft EIS as an alternate plan?

The Draft EIS has all kinds of statistical information supporting the sediment diversion but Chip Kline, Executive Assistant to the Governor for Coastal Activities and CPRA Chairman boasts to the media, The Mid - Barataria Sediment Diversion is the largest project of its kind ever undertaken in U. S. history, and represents an unparalleled, innovative coastal

restoration effort unlike anything else in the world. So, I ask if this project is unparalleled and innovative, what is the reference of the statistics.

There are lots of facts not mentioned in the Draft EIS:

" The sediment as well as the pollutants in the Mississippi River will directly flow into the marsh. Pollutants such as pesticides and fertilizers from ground run off and discharges from ships.

" Pollutants such as the billions of nurdles that were dumped in the River by the cargo ship CGM CCG Bianca when it broke free in New Orleans in August 2020 and the New Orleans Port officials determined the nurdles were irretrievable so there was no cleanup.

" Plaquemines Liquids Terminal being proposed by Plaquemines Port and Harbor, Tallgrass Energy LP and Drexel Hamilton just upriver from the diversion site. This is coming after a failed attempt by RAM Terminals LLC to build a coal export at the same site. A 2012 study concluded the terminal could reduce sediment captured by the diversion by 17 percent. Bruce Lelong, project leader with AECOM, the state contractor overseeing engineering and design of the diversion is advising it will have significant and potentially adverse impacts to MBSD. David Muth, Director of Gulf Restoration with the National Wildlife Federation is stating that this cannot be consistent with our states plan for saving our coast. But CPRA chairman Chip Kline said it is the authoritys obligation to try to find ways to allow both projects to be developed that would meet the states restoration goals and support industrial development. CPRA is requiring Tallgrass Energy to provide a study to model the terminals effect on the sediment load entering the diversion. Though still waiting on the study, Tallgrass is moving forward with a public hearing.

" IGP Methanol, LLC moving forward with their work to construct and operate a methanol plant on a 140-acre parcel adjacent to the Mississippi River and Plaquemines Liquid Terminal.

" Venture Global/Gator Express building their 12-mile-long 42-inch liquid natural gas pipeline across Barataria Bay to connect to their facility just south of PLT and IGP.

" Pointe LNG constructing a liquid natural gas facility and Castleton Commodities Incorporated constructing a methanol plant on the east bank of the Mississippi River across from the previous listed proposed construction project.

" Formosa Plastics planned \$9.4 billion complex in St. James Parish

" Each year there are reports of the Gulf of Mexicos hypoxic dead zone that covers up to 6,000 to 7,000 square miles. It is stated that dead zones are worldwide, but the Gulf of Mexico dead zone at the base of the Mississippi River is the largest in the world. This dead zone will be introduced directly to the Barataria Basin.

Other projects done that were presented as innovative speak for themselves:

1. The Mississippi River-Gulf Outlet Canal (abbreviated as MRGO or MR-GO) is a 76 mi (122 km) channel constructed by the United States Army Corps of Engineers at the direction of Congress in the mid-20th century that provided a shorter route between the Gulf of Mexico and New Orleans' inner harbor Industrial Canal via the Intracoastal Waterway. In 2005, the MRGO channeled Hurricane Katrina's storm surge into the heart of Greater New Orleans, contributing significantly to the subsequent multiple engineering failures experienced by the region's hurricane protection network. In the aftermath the channel was closed. A permanent

storm surge barrier was constructed in the MRGO in 2009, and the channel has been closed to maritime shipping.

2. Port Eads Marina Facility on South Pass at the southernmost tip of Louisiana about 21 mile south of Venice, a state-of-the-art \$15 million dollar facility reopened in March 2014 after being destroyed in Hurricane Katrina. The Facility closed in March 2019 due to siltation making South Pass unnavigable for large sport fishing boats.

Current mismanaged projects and business endeavors that continue to damage our coast and cause coastal erosion:

1. A \$36 million restoration of Chenier Ronquille which was partly funded with money BP spent on damages for its Deepwater Horizon oil spill. The islands west side was heavily oiled during the disaster. The Chenier Ronquille rebuild was part of a much larger federal and state effort to restore Louisianas fast-eroding barrier islands. On Sept. 5, 2016, an excavating marsh buggy operated by Great Lakes Dredge accidentally perforated an underground oil pipeline owned by Arrowhead Coast Pipeline and released an estimated 5,250 gallons of oil into Bay Long on the south edge of Barataria Bay. The 12-inch pipeline has two lines with one running from Ostrica, on the east bank of Plaquemines Parish, to Elmers Island, a wildlife refuge next to Grand Isle. A 2013 environmental assessment prepared for the restoration project noted the island's value to a variety of migratory bird species and warned of oil and natural gas infrastructure on and around the work sites. "Oil and gas pipelines lay throughout the proposed project vicinity as active or remnant conveyance of this industry," it said.

Thousands of miles of buried and underwater pipelines lie in tangles across the coast, many of them abandoned or poorly mapped. Last year, the CPRA abandoned plans to rebuild East Timbalier Island after determining that the large number of pipelines, wells and other oil and gas infrastructure there had severely damaged the island and made it too expensive and dangerous for restoration work. Nearly \$20 million had been spent on East Timbaliers recovery before the CPRAs plans were canceled. Great Lakes Dredge & Dock Company is the Houston based company hired for this project and is currently facing criminal charges of violating the Clean Water Act. A sub-contractor asserts he was directed to dig an unauthorized channel that may have exposed pipeline or compromised its buffer of sediment allowing damage to a pipeline. Great Lakes has been involved in several Louisiana Coast restoration projects.

2. The Taylor Energy Mississippi Canyon 20 was constructed in 1984, 11 miles southeast of the Plaquemines-Balize delta. In September 16, 2004, Hurricane Ivan caused submarine landslides that capsized the drill rig resulting in between 25 and 28 leaking wells being buried beneath the sea floor. Although Taylor Energy reported the spill to the Coast Guard at the time, the Coast Guard "monitored the site for more than half a decade without making the public fully aware" of the severity of the leak. Increased attention later came in 2010, when observers monitoring the Deepwater Horizon oil spill discovered a persistent oil slick at the Taylor site. In 2018, the Coast Guard ordered Taylor to fix the problem after a government-commissioned study estimated the platform site was releasing between 10,500 and 29,000 gallons of oil per day. That volume was vastly larger than the dozen or so gallons per day estimated by scientists hired by Taylor. The Taylor Energy site has produced what many scientists say is one of the largest and longest-running oil disasters in U.S. history.

3. In a report to Congress, the U. S. Government Accountability Office determined that federal regulators rarely conduct or require underwater pipeline inspections. Instead U. S.

Bureau of Safety and Environmental Enforcement, which regulates the offshore industry, relies on reports of sheens or oily bubbles on the waters surface to detect leaks. The GAO found that the offshore oil and gas industry has left behind about 18,000 miles of inactive pipeline in the Gulf since the 1960s. While federal rules require removal of decommissioned pipelines, GAO found that 97% of pipelines have been allowed to stay on the seafloor.

We continue to allow outside interest come to Louisiana and profit while destroying our wetlands and polluting our environment:

1. CITGO of Lake Charles to pay \$5.5 million over contaminating Calcasieu River estuary.
2. PCS Nitrogen in Geismar seeking regulators permission to discharge wastewater into the Mississippi River after closing a production line.

Louisiana projects give the appearance of little or lax oversight and appear to lean more toward paying fines, penalties, and cleanup than providing a clean and healthy environment that is safe for our community.

Louisiana coastal protection and restoration projects are not helped when state senators allied with the oil and gas industry interfere with legislation to hold oil and gas companies accountable because it scares away oil and gas investment in Louisiana.

More consideration should be given to projects like:

1. The barrier island restoration at Trinity-East Island where pipelines are pumping sand 15 miles to build 1100 acres of marsh, dune, and beach on three barrier islands and a headland.
2. In Cameron Parish where 319 acres of marsh is being restored by pumping 2.36 million cubic yards of sand that is dredged from the Gulf of Mexico.

Both projects are praised and show improvements with little or no negative socioeconomic consequences. Projects like these in conjunction with articulated concrete matts like the Army Corps of Engineers revetment project which controls the erosion on the Mississippi River. The Corps started experimenting with the concrete matts in 1914 and are currently still being used. The revetment area is then covered in stone rip rap/rubble.

In discussion with CPRA I have been told that these types of projects are too costly, or cost prohibited. They would not be if Louisiana would hold profit making companies accountable for the damages they cause. No other state allows the damage to their coast, environment, and heritage that Louisiana tolerates.

Do nothing is not a choice if South Louisiana intends to exist in the next couple of decades. However, I believe the Mid Barataria Sediment Diversion will end South Louisiana quicker.

---

**Concern ID: 61812**

**Commenters expressed concern that the proposed Project would have adverse water quality impacts in the Barataria Basin due to the introduction of nitrate and phosphate from the Mississippi River. Several commenters questioned whether the proposed Project would create harmful algal blooms and hypoxia in the Barataria Basin similar to the hypoxic “dead zone” in the Gulf of Mexico that exists due to nutrients in Mississippi River waters. One commenter expressed concern that the EIS does not**

---

**adequately assess the potential for the proposed Project to create algal blooms and hypoxia in the basin, other than acknowledging it.**

**Response ID: 16425**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA's Mississippi River/Gulf of Mexico Hypoxia Task Force "Hypoxia 101" webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone "water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen" (<https://www.epa.gov/ms-htf/northern-gulf-mexico-hypoxic-zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.>)

Dissolved oxygen concentrations associated with the Applicant's Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River

---

diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section is included in Section 4.5.5.3 in Surface Water and Sediment Quality and has been added to Section 4.5.5.4.2 Applicant's Preferred Alternative of the Final EIS. Finally, the EIS acknowledges the potential for major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) if warranted, in the Barataria Basin during Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61819**

**Commenters expressed concern that the proposed Project would have adverse impacts on Barataria Basin's water quality, wetlands, fisheries, recreational uses, and eroding coastlines due to chemicals, oil and hazardous waste, and/or pollutants in the Mississippi River that would be routed to the Barataria Basin via the proposed diversion.**

**Response ID: 16429**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality of the Draft EIS, the segment of the Mississippi River where the proposed diversion river intake structure would be located (subsegment LA070301\_00) fully supports its designated uses. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. LDEQ's water quality assessment indicates that regulated substances are not present in concentrations that would cause a water quality impairment at the location of the intake structure. In response to this concern expressed by commenters, a new subsection has been added to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of nearby industrial facilities on river water routed to the basin during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills from Industrial Sites.

As described in the EIS, Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed.

---

**Concern ID: 61846**

**The commenter requested that the Final EIS, Chapter 4, Section 4.25 Cumulative Impacts be updated to include recent information about IGP Methanol, LLC, Venture Global/Gator Express, Pointe LNG, Castleton Commodities Incorporated, and Formosa Plastics moving forward with construction in the proposed Project area.**

**Response ID: 16460**

Each of these projects was considered in the cumulative impacts analysis of the Draft EIS (Chapter 4, Section 4.25) with the exception of the Formosa Plastics project, which was not included in the cumulative impacts analysis because that project would be located in St. James Parish, far north of the Mid-Barataria Sediment Diversion Project impact area. In Section 4.25 Cumulative Impacts, the Castleton Commodities Inc. project is called "Braithwaite Methanol Plant/CCI Port Nickel LLC."

Reasonably foreseeable projects and information about them was based on the stage of development that the actions and facilities had reached at the time the Draft EIS was being prepared. The cumulative impacts analysis in the Draft EIS was based on the status of projects in May 2020. No related edits have been made for the Final EIS for these facilities.

In May 2022 after publication of the Draft EIS, the USACE conducted a search to identify any new/additional reasonably foreseeable projects that, cumulatively with the proposed MBSD Project, have the potential to significantly alter the environmental landscape from what was assessed in the Draft EIS. After identifying new, reasonably foreseeable projects, USACE evaluated those projects for their potential to significantly affect the environmental landscape that was presented in the Draft EIS and concluded that none would significantly change the MBSD cumulative impacts as described in the Draft EIS. Nevertheless, USACE determined that five newly-identified projects would have more than negligible cumulative impacts. To provide a complete picture of MBSD cumulative effects to the decision maker(s) and the public, these five projects have been added to the Final EIS in Chapter 4, Section 4.25.25 Cumulative Impacts Analysis 2022 Update.

---

**Concern ID: 61879**

---

**Commenters questioned why other alternatives are not being considered other than No Action and a sediment diversion with various levels of flow rates. CEQ's regulations require that the EIS rigorously explore and objectively evaluate all reasonable alternatives, which is a requirement that the Draft EIS does not meet. Consider analyzing a range of other alternatives, options, and tools that better preserve and protect the environment and minimize the severe impacts to Louisiana fisheries, the communities, and the entire Gulf Coast ecosystems.**

**Response ID: 15835**

The range of reasonable alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2 of the Draft EIS (Alternatives), an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

---

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in its SRP/EA #3 and found that a combination of “marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats” (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in its Restoration Plan. The LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG’s Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

---

**Concern ID: 61970**

**The only alternatives in the EIS are diversions at different flow rates. The EIS has not listed other possible methods on building land in the Barataria Basin. One alternative is to study the creation of barrier islands and compare the result with the diversion alternative. Also consider fortifying the barrier islands with sheet piles, boulders, and rocks, and dam all pipeline canals and washed-out marsh openings with concrete dams.**

**Response ID: 15972**

The Draft EIS considered barrier islands as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.4 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS. While barrier islands play a critical role in reducing land loss, they are not intended or designed to transport sediment, fresh water, or nutrients.

Past investments through a multitude of restoration programs have resulted in the restoration of every major barrier island in the Barataria Basin. CPRA’s Coastal Master Plan includes programmatic barrier island restoration to support future maintenance of the restored islands. However, CPRA has stated that fortifying barrier islands with hard structures is not feasible.

---

**Concern ID: 62318**

**CPRA, with assistance of Attorney General and federal agencies, should hold E&P companies accountable for failure to maintain coastal zone structures that has led to coastal marsh loss. Louisiana should hold profit making companies accountable for the damages they cause.**

**Response ID: 15772**

The Draft EIS recognized causes and impacts of coastal land loss (see EIS Chapter 3, Section 3.6.2 Wetland Loss). The suggestions regarding accountability are outside the scope of this EIS.

---

**Concern ID: 62337**

**There should be better inspection of oil rigs/pipelines and prosecution in incidents that harm nature. Our taxes pay to clean up environmental damage caused by negligence.**

**Response ID: 15784**

While the proposed Project is intended to restore habitat and ecosystem services injured by the DWH oil spill, the commenters are raising issues associated with the wider oil and gas industry that are outside the scope of this EIS.

---

**Concern ID: 62338**

**The commenter gives two examples of corporations releasing contaminants in Louisiana, and believes that Louisiana coastal protection and restoration projects are hindered by oil and gas interests.**

**Response ID: 15785**

While the proposed Project is intended to restore habitat and ecosystem services injured by the DWH oil spill, the commenters are raising issues associated with the wider oil and gas industry that are outside the scope of this EIS.

---

**Concern ID: 62351**

**The commenter asked what the reference for the statistics in the EIS is if the Project is unparalleled and innovative.**

**Response ID: 15846**

The impacts and projections discussed in the Draft EIS were based on USACE's and the LA TIG's consideration of the best information and data available to them, including peer-reviewed literature, subject matter expertise, and computer modeling which simulates future conditions. That data and USACE's evaluation of that data, done in coordination with the LA TIG, are included in the EIS to inform the public and the decision maker.

---

**Concern ID: 62442**

**Commenters requested that additional information about the reasonably foreseeable Plaquemines Liquids Terminal be added to the Final EIS, Chapter 4, Section 4.25 (Cumulative Impacts), such as the potential for the project to affect sediment transport capabilities of the proposed MBSD Project.**

**Response ID: 16467**

Furthermore, CPRA entered into a Memorandum of Understanding with the Plaquemines Port Harbor & Terminal District (PPHTD) and the Plaquemines Liquid Terminal, LLC (PLT) requiring PPHTD and PLT to perform sediment transport modeling and a navigation study to determine the impact, if any, that the PLT Project may have on the proposed MBSD Project, and to agree to certain terms and conditions, as needed, to ensure that the PLT, once constructed and operated, does not have unreasonable adverse impacts on the design, construction, or operation of the proposed MBSD Project. These steps would help ensure that the PLT Project remains consistent with the Louisiana Coastal Master Plan.

Since publication of the Draft EIS, the Tallgrass/PLT facility's sponsors PPHTD/PLT have withdrawn their Joint Permit application (Louisiana Department of Natural Resources Coastal Use Permit [CUP] number P20180379 and DA Permit number MVN-2012-0123-EPP), and terminated the Memorandum of Understanding (MOU) (originally dated April 24, 2019) between CPRA and PPHTD/PLT pertaining to the facility. A footnote has been added in Section 4.25.1.3.2 Reasonably Foreseeable Future Projects of the Final EIS to reflect the withdrawal of the PLT Project.

---

---

**Concern ID: 62664**

**The Project, instead of restoring coastal Louisiana, would accelerate its degradation. The Upper Barataria Basin, which was not affected by the DWH oil spill, would be negatively affected by the proposed Project in terms of cultural, topographic, and ecological impacts. Because the Oil Pollution Act is designed to restore areas affected by an oil spill to their pre-spill conditions, the proposed Project should not be funded because it does not achieve this goal.**

**Response ID: 16623**

The potential impacts of the proposed Project on affected ecosystems and communities were considered in the Draft EIS. For example, Chapter 3 Affected Environment of the EIS describes existing conditions within the Project area and Section 3.1 Introduction provides an overview and history of the Project area. These existing conditions are factored into the impact analysis in Chapter 4 Environmental Consequences of the EIS. Further, Chapter 3, Section 3.6.2.2 in Wetland Resources and Waters of the U.S. notes the ongoing impact of the DWH oil spill on wetland loss, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 in Aquatic Resources provides an overview of the adverse impact of the oil spill on key aquatic species within the Barataria Basin.

The impacts raised by the commenters were also considered in the LA TIG's Draft Restoration Plan. As described in the Restoration Plan in Section 1.3 (Authorities and Regulations), the goal of the Oil Pollution Act of 1990, 33 USC 2701 et seq., is to make the environment and public whole for injuries to natural resources and services resulting from an incident involving a discharge or substantial threat of a discharge of oil. This goal is achieved through the return of the injured resources and services to baseline, and compensation for interim losses from the date of the incident until recovery. According to 15 CFR, Part 990.30, restoration is defined as "any action...to restore, rehabilitate, replace, or acquire the equivalent of injured natural resources...and services", and 15 CFR, Part 990.53 (c) (2) specifies that compensatory restoration actions can include actions that provide natural resources and services of the same or comparable type and quality as the injured resources.

Considering the scale of impacts from the oil spill, the LA TIG also understands the importance of increasing the resiliency and sustainability of this highly productive Gulf ecosystem through restoration. As noted in the PDARP/PEIS, diversions of Mississippi River water into adjacent wetlands have a high probability of providing these types of large-scale benefits for the long-term sustainability of deltaic wetlands. As described in Section 2.3.3 (Proposed MBSD Project Location Alternatives) of the Restoration Plan, while a project in Lower Barataria Basin would provide restoration closest to where the heaviest oiling and associated injuries occurred, such a project would also require more time and more sediment to build land given the relatively deep open water in that area, and newly created marshes would be more quickly eroded by waves, tidal action, and storm surge. A project in the Mid-Barataria Basin is close to oiled shorelines but farther away from additional erosive forces found in the Lower Barataria Basin. The LA TIG selected the proposed Project location in the Mid-Barataria Basin because a project in this location would have the capacity to accept and disperse sediments and nutrients and would promote the long-term sustainability of existing and newly created marshes.

---

The LA TIG recognizes that the proposed Project would result in some adverse impacts to natural resources as described in Section 3.2.1.5 (Avoids Collateral Injury) of the Restoration Plan. However, these injuries occur primarily in the middle and Lower Barataria Basin, and the proposed Project would also restore natural resources that were injured by the DWH spill as described in Section 3.2.1.6 (Benefits Multiple Resources) of the Restoration Plan. The increase in wetland area under the Project is also expected to benefit communities on the West Bank, north of the diversion, by providing increased protection from storm surge (see Section 3.2.1.7).

Because the proposed Project would contribute to restoring natural resources injured by the DWH oil spill to their baseline conditions, the Project is consistent with OPA, the OPA NRDA regulations, the PDARP/PEIS, and the SRP. See Section 3 (OPA Evaluation of the Alternatives) of the Restoration Plan for more details about the LA TIG's evaluation of the proposed Project and its alternatives.

The LA TIG has also funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 (Screening for a Reasonable Range of Alternatives) of the Restoration Plan provides a detailed discussion of the selection of the location for the LA TIG's Preferred Alternative in the Restoration Plan.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62784**

**Prior or proposed diversions and diversion-like projects (including the Caernarvon Diversion, MRGO, Mardi Gras Pass, Maurepas Bonnet Carré Spillway openings) did not work or caused adverse impacts on area resources.**

**Response ID: 16366**

The commenter's concern regarding the effectiveness and adverse impacts of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to

---

compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the Caernarvon Diversion, MRGO, Mardi Gras Pass, and Bonnet Carré Spillway, is available in Appendix U of the Final EIS. The Maurepas Diversion is subject to an ongoing NEPA analysis, which is anticipated to be finalized in 2022.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The referenced projects all had unique goals, and, where goals existed, each of those projects have achieved their goals. Those achievements increase confidence in the ability of the LA TIG to set goals and select approaches appropriate for achieving those goals. The proposed Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the current geomorphological features of the Lower Mississippi River, as well as data and knowledge gained from the referenced projects.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final

EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63100**

**Commenters request additional information on how homestead exemption will be considered in compensation for acquisition.**

**Response ID: 16638**

The reference to homestead exemption in the Draft EIS was for informational purposes, and not intended to determine how compensation or mitigation would be provided. As part of any property acquisition to implement the Project, CPRA intends to compensate landowners for the value of any property interest acquired in accordance with applicable law..

---

**Concern ID: 63180**

**Mitigation plan should have been presented with the Draft EIS.**

**Response ID: 16557**

The Draft Mitigation and Stewardship Plan for the Project was included as Appendix R1 to the Draft EIS, for which a NOA was published in the Federal Register on March 5, 2021 (86 FR 12942). The LA TIG presented an overview of the Mitigation Plan during the April Draft EIS

---

Public Meetings. The Mitigation and Stewardship Plan included in the Draft EIS was a draft plan, with specific issues that required further development before the plan was finalized. The Final Mitigation and Stewardship Plan is published as Appendix R1 to the Final EIS. CPRA expanded and refined the Final Mitigation and Stewardship Plan (Appendix R1) in response to community and resource agency input.

The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Thomas Budde Sr

I fully support the Diversion project. While recognizing the project will have some negative consequences I have personally witnessed the loss of vast tracts of marsh fishing the area over the last 45 years. Much more good will come from this project than will bad. We need this project, and more just like it, NOW. Let nature repair the harm done by levees.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:23401**

Wayne Clement Sr

The information does not mention the impact to the Mississippi Gulf Coast (MGC). The studies I have read indicate that the diversion project would divert the Mississippi River waters toward the MGC. The results would far worse than the impact of opening the Louisiana spillways and would be permanent. The MGC seafood industry and sport fishing would be devastated. The MGC would see rising water levels that would intensify the effect of hurricanes. How can anyone allow this to happen? The impact to not only Louisiana but the surrounding area MUST be considered! Please do not allow this diversion project to become reality to some and a nightmare to others. Please say NO!

---

**Concern ID: 61784**

**The commenter expressed concern that proposed Project operations would divert Mississippi River waters toward the Mississippi Gulf Coast. The results would be far worse than the impact of opening the Louisiana spillways and would be permanent. The Mississippi Gulf Coast would see rising water levels that would intensify the effect of hurricanes. The commenter noted that other studies indicate this, but the Draft EIS does not mention impacts on the Mississippi Gulf Coast.**

**Response ID: 16414**

The geographic area of flooding and other impacts of the proposed Project were considered in the Draft EIS in Chapter 4, Section 4.4.4 Hydrology and Hydrodynamics and Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction. As discussed and illustrated in these sections, the proposed Project would not have more than negligible impacts on the Mississippi Gulf Coast. The proposed Project would divert water into the Barataria Basin, on the west side of the Mississippi River, away from the Mississippi Gulf Coast, not toward it. No related edits have been made to the Final EIS.

---

**Concern ID: 62084**

**Commenters believe that the proposed MBSD Project would cause economic loss annually to other Gulf Coast states. The Mississippi Gulf Coast seafood and fishing industry would be devastated.**

**Response ID: 16248**

Chapter 3, Section 3.1.1 Project Area of the Draft EIS identifies the analysis area for the EIS. This is the area in which the Project is anticipated to have discernable effects. For socioeconomic impacts, the EIS identifies the area of potential impacts as the 10-parish Project area due to indirect socioeconomic impacts. Most impacts would likely be concentrated in Plaquemines, Lafourche and Jefferson Parishes, Louisiana. For Commercial Fisheries, the Project area includes two basins (the Barataria Basin and a portion of the Mississippi River Basin). The proposed Project is not anticipated to have discernable effects on aquatic resources outside of the Project area. Commercial fishermen that travel to Barataria Basin to fish for species that would be adversely affected, particularly shrimp and oysters, could also be adversely affected by the proposed Project. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Final EIS has been revised to acknowledge this. Those commercial fishermen would be eligible to participate in the fishery mitigation programs discussed in the Mitigation and Stewardship Plan (Appendix R1 to the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project. Impacts related to subsistence activities are discussed in Section 4.15 Environmental Justice.

---

**Concern ID: 62786**

**Multiple commenters expressed concern with the impacts of diverted waters on the economy and natural environment of the State of Mississippi.**

**Response ID: 16368**

The proposed Project is not anticipated to have discernable effects on resources outside of the Project area, which is limited to Louisiana, and particularly the Barataria Basin and the Mississippi River birdfoot delta (as defined in Chapter 3, Section 3.1.1 in Introduction and the subsections entitled Area of Potential Effects for each resource heading in Chapter 4 Environmental Consequences). Because these resource-specific areas of potential effects were determined based on the anticipated limits of discernable impacts, negligible to no impacts on the natural or human environment are anticipated in the State of Mississippi from the construction and operation of the proposed MBSD Project.

Mary Tucker

We as property owners in the Myrtle Grove Marina Estates subdivision, understand that the proposed diversion will have significant and permanent detrimental impacts on our subdivision. We bought and built our house to code. Based on the CPRA meetings that I have attended, and the EIS, the diversion will increase tidal flooding in Myrtle Grove by at least 119 days which is unacceptable. I will not grant an easement to the Corp to flood my property at their discretion. I am also not aware of any flowage easements in residential subdivisions. Why is there not a Real Estate Plan for Myrtle Grove similar to the one for the Upper Barataria EIS? This project threatens the "Culture" and way of life for the residents of Myrtle Grove. I vehemently object to the harming of the Dolphins!

If this project proceeds, we will accept either of the following solutions to the flooding this project will create:

1. Compensate me for the full investment that I have made on my property
2. Raise all the existing infrastructure, inclusive of public roadways, lift stations, docks and my property

---

**Concern ID: 62777**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).**

**Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement.

Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62778**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement,

---

CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates,**

---

**and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the

---

landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Alan Drake

Broadcast seed of both black and red mangroves (*Avicennia germinans* & *Rhizophora mangle*) by air and boat until such time as newly established seedlings start bearing seed. Mangroves have a unique ability to hold and create land in brackish water while enhancing fish habitat. The natural growth of land will be enhanced by the widespread presence of mangroves. Both are native to Louisiana.

White mangrove (*Laguncularia racemosa*) and buttonwood (*Conocarpus erectus*) will likely naturally migrate to Louisiana with Global Warming and may serve complimentary roles and should be considered as well.

Small trees and shrubs will increase the friction of the land during hurricanes. Both wind and storm surge will be reduced by even small mangroves. More so by larger trees. This benefit will come at a low financial cost.

Mangroves are frost intolerant, so every so many years they will be killed by frost (until global warming progresses further). However, the rot resistant dead trees will still provide benefits for many years afterwards. In some cases, an established grove of now dead mangrove trees may be a good place to plant cypress trees as a successor species.

If the annual broadcast of mangrove seeds has ceased because of indigenous seed production, it should restart after a killing frost, at least in the areas affected.

Bald or related species cypress trees should be planted where they would be viable. Every few years, the changing landscape will require a survey to determine what new areas have become viable for cypress planting. Once established, cypress stands are likely to remain through future storms and aid retention of new lands created. However, cypress trees are unlikely to survive on newly formed land as well as mangrove trees.

Seeding of mangroves by broadcast is low cost and should have significant benefits, giving this effort an excellent cost-benefit ratio.

---

**Concern ID: 61892**

**Consider including in the design of the diversion the planting of black, red, and white mangroves to create and sustain land in the Barataria Basin, as well as planting bald or related species cypress trees to aid in the retention of land. Even dead trees would stabilize the soils.**

**Response ID: 15986**

The Draft EIS acknowledged impacts on wetland vegetation and terrestrial vegetation due to the proposed MBSD Project in Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S. and Section 4.9 Terrestrial Wildlife and Habitat, respectively. While mangroves can provide areas of soil retention, their relative lack of cold tolerance does not currently allow growth throughout the entire coast of Louisiana. Red or white mangroves are not currently found in Louisiana because they are not as cold tolerant as black mangrove, although as the climate changes, CPRA recognizes that dedicated plantings of black mangrove and exploratory plantings of other mangrove species are a potential option in areas that are not currently suitable. Cypress trees are a viable option today and have been used (along with willows) to stabilize newly deposited sediments at the outfalls of existing diversions. CPRA would consider these options in the outfall area as part of future adaptive management

---

efforts, especially to the extent base flows would provide suitable freshwater habitat, as well as to increase sediment stabilization and retention.

---

Berry Tucker

I am a property and house owner in Myrtle Grove Marina Estates. From the scoping meetings I have attended and information that I have read on the proposed Mid- Barataria Sediment Diversion will have devastating impact on our family, lives and homes. Last year our subdivision flooded about 8 times. Your proposal is saying we will be flooded about half the year. We are going to kill wildlife, birds and mammals with the proposed plan. We have to come up with a better solution of combination diversions and dredging. If not a Real estate plan needs to be developed. It is my expectation that the following one of the following solutions happen:

1. Raise infrastructure, property, dwellings, and boat houses so that there will be no flooding from tidal or diversion impact.
2. Full compensation buyout.
3. Relocate us to another area.

---

**Concern ID: 61974****Consider the alternative that consists of a combination of diversions and dredging.****Response ID: 15975**

The EIS considered a sediment diversion combined with marsh creation alternative as a functional alternative to the proposed Project. See the explanation in Chapter 2, Section 2.3.6 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why combination alternatives were eliminated from further analysis in the EIS.

---

**Concern ID: 62893****The proposed MBSD Project would kill wildlife.****Response ID: 16192**

As described in Chapter 4, Section 4.9 Terrestrial Wildlife and Habitat of the Draft EIS, wildlife would experience both adverse and beneficial impacts during proposed Project construction and operations, with specific impacts depending on the individual life history and tolerances of a given species.

---

**Concern ID: 62951****CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.****Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the

---

particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:23500**

Brent Foret

I own and have a camp (retirement home, 1200 sq.ft., 3 bedroom 1 bath, central ac/heat, 10 ft. elevated on pilings) in Lake Hermitage [REDACTED]. I typically spend most of my retired time there daily fishing, working, maintaining etc...

Obviously this is not my main residence and I do not own the property but have leased this land from the Lachmann family for 40 years. I have paid the property taxes on this lot also since leasing it.

My camp site floods with up to 1 ft. of water underneath when the wind blows hard (20-30 mph) from a South/Southwest direction for any substantial amount of time.

I did attend the meeting at the Lake Hermitage firehouse about the impact of this diversion project to our area.

It is obvious that we will loose access to the Lake Hermitage area for a period of 3-5 months after the project is completed.

Mitigation measures for my site would include raising the property/docks 2-3 feet and raising the access roads accordingly. I do not think this would be feasible dollar wise although would approve if these mitigation measures could be accomplished.

I think the buy out option that was mentioned in the meeting will be the identified litigation for this area and would be in favor of this. Hopefully they would pay me fair market value for my secondary home even though I do not own the property.

My lifestyle will totally change if I lose my camp in Lake Hermitage but understand something drastic needs to occur to save our estuaries.

---

**Concern ID: 62224**

**Communities like Happy Jack, Lake Hermitage and Myrtle Grove, some of which have homes that are not above the new base flood elevation, already experience some degree of flooding which would be made worse by the diversion. This would affect the ability of residents to access and enjoy their homes and communities.**

**Response ID: 15757**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discuss the anticipated increased flooding impacts outside of federal levee systems to be caused by the operation of the diversion. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes, which would allow CPRA to flow water over the landowner's property at heights and duration that are

greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove

---

Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department

of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:23510**

Laura Braly

Hello:

I am not an environmental scientist, but the climate crisis is of utmost concern to me. Action must be taken in an attempt to mitigate: sea level rise, the severity of hurricanes, out of control fossil fuel dependence, and to protect the people who live and work in coastal Louisiana and along the Gulf Coast region.

Humans diverted the Mississippi River and thereby exacerbated the massive ongoing loss of coastal lands, and it is immediately necessary to reverse this course. Let the Mississippi River again deliver desperately needed sediment to this basin!

As an active birder and member of Orleans Audubon Society, I fully support the Mis-Barataria Sediment Diversion project. Save the coast, save wildlife habitat, and save Louisiana culture!

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

**Correspondence ID:23520**

Warren Delacreaux

My name is Warren Delacreaux. I own Fishermen Net Supply, fishermen wholesale supply, primarily commercial and recreational. The company's been in business for 40 years. If the Mid-Barataria and Breton Sound unit goes through, I expect the Corps of Engineers to buy my business out because we are done, we'd be finished. I'm a previous member of the Wildlife and Fisheries Commission. I've been around this a long time and this is just a moneymaking deal that somebody's making. They need to dredge, they know what does the dredging, the Barataria, there's no sediment that comes in. It's proven, the Corps already wrote a note in the paper. There's no sediment in the river. It's just a money grab that some politicians up in Washington debt relations are going to get rich on building this wasted thing that they're trying to do.

I would like to talk to someone personally. I've been in CPRA meetings, I've been a proponent of trying to get the Rocks open up the Ship Channel, I'm the one who started it, and if somebody has the nuts or the balls to call me, I would like to speak to him, because this is a total farce. Thank you, [REDACTED]  
Warren Delacreaux, own the Fishermen Net Fishermen Wholesale. They can prepare to buy us out. If they do something like this on both sides, they can buy a lot of businesses up because we will be out of business. Thank you

---

**Concern ID: 61782****Commenters expressed concern that there's not enough sediment in the river to achieve wetland and land creation goals of the proposed Project.****Response ID: 16412**

The commenter's concerns regarding the sediment load of the river and whether the river carries sufficient sediment to achieve the land projected to be built during diversion operation were considered in the Draft EIS. The Mississippi River carries much less sediment than it did in the past. It still carries a massive sediment load, but not as massive as before. As explained in Chapter 3, Section 3.4.2.5 Sediment Transport, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes. Quantifying the relative contributions of multiple factors to the diminished sediment load is beyond the scope of the Draft EIS. The Draft EIS (Appendix E Delft3D Modeling, Delft3D Modeling Section 5.2.2) takes this diminished sediment load into account when computing the sediment that would be delivered to the Barataria Basin. To help clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations, discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

---

**Concern ID: 61966****The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It**

---

**would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment

---

diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process. CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently

contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62794**

**This poorly planned and executed proposed Project is being pushed forward for the financial gain of politicians and contractors because taxpayer dollars are being used. Private investment dollars would entail more deliberation and a full impact study, including more natural options with less risk and more overall benefits.**

**Response ID: 16375**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance and constitutes a full impact analysis. A variety of alternatives assessed in the EIS are identified in Chapter 2 Alternatives. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

The LA TIG's Restoration Plan evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG has selected Alternative 1 as the LA TIG's Preferred Alternative.

---

**Concern ID: 62817**

**One commenter requested an individual discussion.**

**Response ID: 16390**

USACE NEPA practice is to respond to public comments in writing. However, the USACE was able to discuss the commenter's concern, which was based on impacts of the MRGO rock closure on salinity in Lake Pontchartrain, and pass those concerns on to the appropriate USACE staff. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts

---

on the natural environment. This summary, which includes discussions on the MRGO is available in Appendix U of the Final EIS.

---

**Concern ID: 63092**

**Further development of the Mitigation Plan is needed for properties that would be impacted by flooding caused by Project operations. Multiple commenters made specific requests for how their property should be handled (for example, through sales or easements), while others wondered why a more detailed, “real estate plan” for impacted communities was not available.**

**Response ID: 16511**

The Draft Mitigation and Stewardship Plan included with the Draft EIS (Appendix R1) included CPRA’s initial framework for mitigation and stewardship measures to assist property owners in these communities impacted by increased tidal flooding and to address the Project impacts of Project operations on water levels. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

CPRA states that it is interested in assisting affected communities to remain in place as long as they would like. Mitigation would include a combination of structural measures (for example, raising roads, boat houses, docks and utilities) and non-structural measures. Structural measures in CPRA’s Mitigation and Stewardship Plan are not included in CPRA’s DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

Where the proposed Project would cause increased water levels and/or increased incidence of flooding, CPRA plans to acquire the right to add and/or increase water flow on landowners’ properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner’s property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to purchasing a flowage servitude, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property (rather than a servitude) would be made on a case-by-case basis depending on the particular circumstances.

A complete listing of the mitigation and stewardship measures that CPRA would implement if the proposed Project is approved and funded is included in CPRA’s Mitigation and Stewardship Plan included in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

---

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Bill Bubrig

Residents of Myrtle Grove should be bought out at fair market value as these properties will no longer be functional as their intended usage.

---

**Concern ID: 63096**

**Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).**

**Response ID: 16699**

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA

---

permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Form Letter 14

We live in Plaquimines Parish and are long time camp owners on Martin Lane in Happy Jack Port Sulphur. We are very disappointed in the government attempting to go thru with another MRGO. It has proven in New Orleans not have helped the growth of new land.

From what we understand they will be spending \$2 billion to create what is equal to 10 football fields of marsh while destroying the oysters and brown shrimp in the area, increase in tidal flooding (docks/properties/road), impact on the Dolphin population, and a permanent change our piece of "paradise." We all should have something to say about this project.

We also understand that Martin Lane will be raised leaving the southside of Martin Lane residents vulnerable to High waters and access to the camp will be impossible at times with high tide and a little southeast wind. We recently installed a new bulkhead and raised our property. At this point our property would be flooded and there is probably not enough funds set aside to make everybody's property on the south side of Martin Lane to the same elevation as Martin Lane. Not only would our property be flooded but it also makes our house in the floodplain. So you'll have to raise all the residents on the southside so flood insurance will not be astronomical cost. We are not in the floodplain at this time!

We truly and honestly oppose this idea and are not in favor of the MRGO! This is just a waste of funds and will not help anyone iexcept the contractors and the government.

Please reconsider and look at the facts and history of similar projects

Thank You

Philip J Spezio

---

**Concern ID: 62777**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).**

---

**Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62783**

**Commenters noted that the cost of designing and building the proposed MBSD Project is too high for the small amount of land anticipated to be built.**

**Response ID: 16365**

The commenter's opposition to the cost of the proposed Project is noted. Under NEPA, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that the permit applicant has conducted its own economic evaluation of a proposed project. Consequently, a cost-benefit analysis is not relevant to USACE's permitting decisions. As part of evaluating the proposed Project, the LA TIG considered the costs associated with developing, constructing, and managing the

---

Applicant's Preferred Alternative consistent with the Restoration Plan alternatives evaluation criteria in 15 CFR §990.54. This discussion is in Chapter 3, Section 3.2.1.2 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan.

---

**Concern ID: 62784**

**Prior or proposed diversions and diversion-like projects (including the Caernarvon Diversion, MRGO, Mardi Gras Pass, Maurepas Bonnet Carré Spillway openings) did not work or caused adverse impacts on area resources.**

**Response ID: 16366**

The commenter's concern regarding the effectiveness and adverse impacts of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the Caernarvon Diversion, MRGO, Mardi Gras Pass, and Bonnet Carré Spillway, is available in Appendix U of the Final EIS. The Maurepas Diversion is subject to an ongoing NEPA analysis, which is anticipated to be finalized in 2022.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The referenced projects all had unique goals, and, where goals existed, each of those projects have achieved their goals. Those achievements increase confidence in the ability of the LA TIG to set goals and select approaches appropriate for achieving those goals. The proposed Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the current geomorphological features of the Lower Mississippi River, as well as data and knowledge gained from the referenced projects.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in

---

soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove

community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:23537**

Raymond Jeanfreau III

I am against the proposed diversion. Myself and my wife live in Myrtle Grove. My whole life I had a dream of living on the water. To live where I do in Myrtle Grove I work 2 jobs. Now you are coming and going to destroy our property and value and all of the fish, crabs, shrimp, etc. that we catch where I live. With the diversion my neighborhood will be flooded for a minimum of 119 days per year to up to two thirds of the year.

To top it all of there are no buyouts for my area. It is bad enough that I feel you are going to force this on us but why would I not be paid fair market value for my property. There is no proposal to do so for my area. How do you expect me to get to work with the water levels you are talking about. How in this great country of ours can you ruin my home that I have worked a lifetime for and not pay me. How would you feel? This is no laughing matter. I will be 65 this year, planned on retiring soon and you are going to ruin my property, its value and my way of life and just walk away and say screw you.

NO DIVERSION. As I stated I feel that no matter what we say it will still take place. The only way that I would not mind the diversion is if I am compensated at fair market value for my property so that I can find another place to live. Your proposal is absolutely crazy to allow you to screw us and just move on. How can this be? Reconsider and cancel this INSANE project.

---

**Concern ID: 62778**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the

Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63096**

**Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for**

---

**acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).**

**Response ID: 16699**

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or

---

will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Kenneth Ragas

The alternative of marsh creation utilizing dredged material from near shore of the Gulf of Mexico (GOM) was not included in the draft EIS. The cost of using GOM borrow on project BA-68 was \$6 per cubic yard. The Spanish Pass project will probably use this same source near Sandy Point on the next stage of that project. Is it possible to include this item in the EIS? At that price the 1.5 billion cost of the diversion will generate nearly 250,000,000 cubic yards of marsh creation material. Salt/brackish marsh platform is more resilient than fresh marsh and marsh creation will be a timely benefit against storm surge protection. The diversion will not provide this critical protection for our generation and it is not feasible to predict what the planet will look like in 50 years based on a computer model with tainted input data from the West Bay Diversion.

I'm sure you will agree that a timely method of help in many areas is essential for the survival of southeast Louisiana. The cost of rebuilding 50 years of hurricane

consequences outweighs the results of a 50 year unpredictable results of diversions. The LSU Rex Caffey paper concludes poor performance of diversions due to many periods of inoperation due to socioeconomic uncertainties. The people of Plaquemines Parish, Lafitte and Grand Isle will certainly be opposing the diversions and requesting more storm surge protection for their families.

Spending 1.5 billion dollars for an undependable source of project results is not a "good business" practice. The variables don't support the spending. We need

immediate proven results which dredging from the near shore of the GOM will provide. Can you include this in my comments on the EIS?

Sir or Madam,

Please accept the above comment on the Mid Barataria Diversion.

Thank you,

Kenneth Ragas

**Concern ID: 61852**

**The cost per acre of marsh creation by the diversion is far higher than a corresponding alternative of marsh creation through the use of dredged material. Marsh creation through a diversion takes 50 years unlike marsh creation through dredging. In addition, brackish/salt marshes (which would be created by dredging) are more resilient than freshwater marshes, and thus marsh created through dredging would be a more sound investment of restoration funding than a sediment diversion.**

**Response ID: 16617**

The timing of marsh benefits created by the proposed diversion was considered in the Draft EIS in Chapter 4, Section 4.6.5 Wetland Resources, Operational Impacts. In response to these comments, additional detail has been added regarding the resiliency of fresh marsh compared to brackish marsh in the Final EIS, Sections 4.6.5.1.2.3 Soil Shear Strength and 4.6.5.1.2.4 Land Accretion. Under relevant NEPA regulations, a cost-benefit analysis is not

required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

While the commenters suggest that marsh creation through dredging would cost less than the proposed Project, the LA TIG does not believe that comparing the costs of a sediment diversion to marsh creation projects using dredged material is relevant for several reasons. Most importantly, as explained in the LA TIG's Restoration Plan, the goal of the Project is to create a long-term sustainable ecosystem through the reestablishment of deltaic process. Marsh creation through the use of dredged material would not bring fresh water or nutrients to the basin on an ongoing basis. The benefits of marsh created with dredged material would diminish over time without maintenance in the form of additional pumping events due to subsidence and sea-level rise; thus, the temporal nature of Project benefits in the absence of periodic maintenance would also be very different. The costs and benefits of the Project were fully considered by the LA TIG and are discussed in the Draft Restoration Plan in Section 3.2.1.2 Cost to Carry Out the Alternative.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various

alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62639**

**The proposed Project is unlikely to succeed because similar types of projects have failed to build land, and have caused a range of other issues, like destroying habitat, exacerbating flooding, and reducing water quality. Specific examples of similar, problematic projects include the Mississippi River Gulf Outlet, Bonnet Carré Spillway, Caernarvon Freshwater Diversion, Davis Pond, West Bay, Baptiste Collette, Fort St. Philip, and Cubits Gap. In fact, data show that the Caernarvon Diversion in particular was unable to show sustained land gains in the face of Hurricane Katrina-driven losses in wetland habitat (Underwood 1994, Kearney et al. 2011). Davis Pond has seen increased land loss inside the diversion compared to a reference area (Couvillion et al. 2017). Fort St. Philip has lost large areas of wetlands (Suir et al. 2014). While the Atchafalaya River is building land in the Atchafalaya and Wax Lake Deltas, the Atchafalaya River carries more sediment than the Mississippi River does currently (Blum and Roberts 2009), and more of the Atchafalaya River is diverted to each of these deltas and marshes farther south. Additionally, one study identified poor**

---

performance of diversions due to many periods of inoperation due to socioeconomic uncertainties (Caffey et al. 2014).

**Response ID: 16631**

The issues raised by the commenters were considered in the Draft EIS. The EIS states in Chapter 2, Section 2.1.1 Overview of Sediment Diversions, that CPRA considered information from other diversions in its assessment of the Project alternatives, but because the projects mentioned by the commenters had been designed to discharge primarily water, not sediment, they are not fully comparable to the proposed Project. As explained in the EIS Chapter 4, Section 4.1.3 (Environmental Consequences, Overview of Delft3D Basinwide Model for Impact Analysis), Delft3D Basinwide Modeling software was used to assess impacts of the Project on hydrology, land gains and losses, water quality, and vegetation in the Barataria Basin and birdfoot delta. Using standard professional practice, this physics-based model was validated to the West Bay Sediment Diversion. The West Bay Sediment Diversion is useful for validating the physical processes of erosion and deposition of sediment because it, like the proposed MBSD Project, is a sediment diversion that extracts relatively more sediment in the river. The other diversions cited were designed to primarily deliver water, not sediment, and are less useful comparisons.

The West Bay Sediment Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, "A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that diversions do not lead to appreciable sediment accumulation" (Kolker, A. S., Miner, M. D. and Weathers, H. D. 2012. Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, *Estuarine, Coastal and Shelf Science*, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005> ).

---

Comparing diversions outside of physics-based numerical modeling has limited value because diversions and receiving environments often exhibit unique behaviors that correlations do not account for. For that reason, the physics-based Delft modeling, even with its limitations and uncertainties, is a better predictor than anecdotal comparisons to Fort St. Phillip or other sites. Uncertainties associated with the validation and application of the Delft3D Basinwide Modeling conducted for the proposed Project were assessed by the West Bay application, sensitivity tests, and by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in EIS Appendix E Delft3D Modeling and incorporated into the EIS conclusions throughout Chapter 4 Environmental Consequences. While most citations mentioned by commenters were already included in the Draft EIS, the Final EIS has been edited to include Caffey and Petrola (2014) to Chapter 4, Section 4.6.5.1.2.4 Land Accretion.

The likelihood of success of the Project and information from other freshwater diversions was also considered in the LA TIG's Draft Restoration Plan, Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. The proposed MBSD Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the geomorphological features of the Lower Mississippi River as of 2012, including data from the referenced projects. All citations referenced by the commenters were included in the Final EIS and were considered by the LA TIG in the Final Restoration Plan.

---

**Concern ID: 62789**

**The cost of designing and building the proposed MBSD Project is too high for a project that has undependable results.**

**Response ID: 16370**

The commenter's opposition to the proposed Project is noted. With respect to the dependability of the future benefits of the proposed Project, the Draft EIS acknowledged that the Delft3D Basinwide Model projections of future conditions includes uncertainties, which are incorporated into the EIS impact conclusions. These uncertainties are briefly summarized in the EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties. However, in addition to the modeled data, Chapter 4 - Environmental Consequences -includes analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in preparing the EIS. As part of developing the EIS, the USACE, together with the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the EIS impacts analysis of the alternatives.

Consistent with OPA regulations (15 CFR §990.54), the LA TIG's Restoration Plan evaluated multiple alternatives based on a number of criteria, including the cost of the alternative. For more information see Section 3 of the LA TIG's Final Restoration Plan. The costs associated with developing, constructing, and managing the Applicant's Preferred Alternative are

---

discussed in Chapter 3, Section 3.2.1.2 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan.

---

**Concern ID: 62818**

**The people of Plaquemines Parish, Lafitte, and Grand Isle will certainly be opposing the diversions and will be requesting more and immediate storm surge protection for their families, which could be provided by dredging projects.**

**Response ID: 16391**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 2 Alternatives of the EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. As discussed in Chapter 2, Section 2.3.5 Large-Scale Marsh Creation, without periodic maintenance, dredging to create large-scale marsh in the Barataria Basin would not be expected to have long-lasting results. After 50 years without nourishment through additional dredge events, approximately half of the dredged material placed for one of these projects in the basin would be lost by the end of a 50-year Project life. The EIS does evaluate reasonably foreseeable large-scale marsh creation projects working in tandem with the sediment diversion alternatives in the cumulative impacts section of the EIS (see Chapter 4, Section 4.25 Cumulative Impacts). Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

St. Bernard Parish

Guy McInnis

EXTRACT OF THE OFFICIAL PROCEEDINGS OF THE COUNCIL OF THE PARISH OF ST. BERNARD, STATE OF LOUISIANA, TAKEN AT A REGULAR MEETING HELD IN THE COUNCIL CHAMBERS OF THE ST. BERNARD PARISH GOVERNMENT COMPLEX, 8201 WEST JUDGE PEREZ DRIVE, CHALMETTE, LOUISIANA ON TUESDAY, APRIL 20, 2021 AT THREE O'CLOCK P.M.

On joint motion of the Chair, without objection and by unanimous consent, it was moved to adopt the following resolution:

RESOLUTION SBPC #2124-04-21

A RESOLUTION OPPOSING THE PROPOSED MID-BARATARIA SEDIMENT DIVERSION PROJECT.

WHEREAS, The Coastal Protection and Restoration Authority is proposing the Mid-Barataria Sediment Diversion Project; and,

WHEREAS, water, and the wildlife that inhabits it, does not respect parish boundaries, any project effecting Plaquemines water quality and estuaries will have similar impact on the waters and related businesses of St. Bernard Parish; and,

WHEREAS, while the loss of coastal wetlands is a valid concern, the resolution or remediation of that problem must avoid ancillary damages to the people and wildlife of Plaquemines and St. Bernard Parish; and,

WHEREAS, the Environmental Impact Statement related to the current proposed Mid-Barataria Sediment Diversion Project indicates that the project will do permanent harm to the wildlife of Plaquemines and St. Bernard Parish and their respective seafood industries; and,

WHEREAS, the seafood industry of Plaquemines and St. Bernard Parish are central to their respective economies, culture, and heritage; and,

WHEREAS, the environmental remediation efforts related to the potential harm caused by the current proposed Mid-Barataria Sediment Diversion Project is insufficient; and,

WHEREAS, the potential benefits in the minimal land development that is predicted are far outweighed by the unremediated damage that the Mid-Barataria Sediment Diversion Project will cause to the people and wildlife of Plaquemines and St. Bernard Parish; and,

Page -2-

Extract #16 continued

April 20, 2021

WHEREAS, the long term damage caused by the Mid-Barataria Sediment Diversion Project to the wildlife and fisheries of Plaquemines and St. Bernard Parish will destroy the livelihood of countless local businesses and people; and,

WHEREAS, the destruction of those livelihoods will lead to the loss of the St. Bernard tax revenues that are used to fund vital services to the people of St. Bernard Parish.

NOW THEREFORE, BE IT RESOLVED, that the St. Bernard Parish Council, the Governing Authority, opposes the proposed Mid-Barataria Sediment Diversion Project.

BE IT FURTHER RESOLVED, that this Resolution be forwarded to all of the following:

- Governor John Bel Edwards
- The Coastal Protection and Restoration Authority
- The House Natural Resources and Environment Committee
- The Senate Natural Resource Committee
- Representative Mack Cormier, Representative Ray Garofalo, Senator Sharon Hewitt, Senator Joseph Bouie and Senator Troy Carter
- U.S. Army Corps of Engineers, Brad Laborde

The above and foregoing having been submitted to a vote, the vote thereupon resulted as follows:

YEAS : McCloskey, Moran, Luna, Alcon, Everhardt, Callais

NAYS: None

ABSENT: None

The Council Chair, Mr. Lewis, cast his vote as YEA.

And the motion was declared adopted on the 20th day of April, 2021.

Page -3-

CERTIFICATE

I HEREBY CERTIFY that the above and foregoing is a true and correct copy of a motion adopted at a Regular Meeting of the Council of the Parish of St. Bernard, held at Chalmette, Louisiana, on Tuesday, April 20, 2021.

Witness my hand and the seal of the Parish of St. Bernard on this 20th day of April, 2021.

RONNEADAMS

CLERK OF COUNCIL

April 21, 2021

At its April 20, 2021 regularly scheduled council meeting, the St. Bernard Parish Council unanimously approved Resolution SBPC #2124-04-21, "A Resolution opposing the proposed Mid- Barataria Sediment Diversion project". As Parish President, I join with the council in objecting to this proposed project. As the draft Environmental Impact Statement from the US Army Corps of Engineers confirms, this project will do irreparable harm to the wildlife and estuaries of St. Bernard and Plaquemines Parish, and therefore to our respective seafood and tourism industries. We respectfully request alternative projects be considered to rebuild our all- important coastlines in St. Bernard Parish, while preserving our economy, culture, and heritage.

Respectfully,

Guy McInnis, Parish President, St. Bernard Parish

---

**Concern ID: 62014**

**The proposed MBSD Project would reduce tax revenue for the parishes located in the impacted area and the funds to support vital services in these areas.**

**Response ID: 16211**

---

The EIS considers and describes impacts on tax revenue in Chapter 4, Section 4.13.4 and 4.13.5 in Socioeconomics. There is also a discussion of Public Services and Utilities in this chapter (Section 4.13 Socioeconomics). As described, the proposed Project construction would have minor to moderate short-term benefits on sales and use taxes in local jurisdictions and the state associated with construction spending. Negligible to minor permanent adverse impacts on tax revenues from sales and use taxes, including associated with impacts on commercial fishing activities, as well as property tax collections associated with reduced property values are anticipated in Plaquemines Parish due to operation of the proposed Project. Potential adverse effects on utilities associated with reduced property taxes are also anticipated during the operations phase of the proposed Project.

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)

- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15

---

CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62782**

---

**A large number of commenters expressed general opposition to the proposed Project.****Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63182****Proposed mitigation is insufficient and not guaranteed, and the amount of funding for mitigation is not clearly stated.****Response ID: 16559**

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

---

10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:23547**

Warren Lawrence

The residents of Plaquemines, and the hunters, and fishermen, crab fishermen, that don't have to have an engineers degree, to know this is the stupidest thing you have come up for this parish. I don't care who you talk to. You need to talk to the long time residences, they know it won't work, and your spending a lot of money, for another Mr. GO. Wake up and don't talk to engineers. Sometimes I wonder where they got their degree, certainly not from experience. I'm getting ready to call the USA HUMANE SOCIETY. You are killing at least 300 dolphins 😞😞😞😞. I'm just wondering who's paying to get this through, the have some politicians involved.

---

**Concern ID: 62794**

**This poorly planned and executed proposed Project is being pushed forward for the financial gain of politicians and contractors because taxpayer dollars are being used. Private investment dollars would entail more deliberation and a full impact study, including more natural options with less risk and more overall benefits.**

**Response ID: 16375**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance and constitutes a full impact analysis. A variety of alternatives assessed in the EIS are identified in Chapter 2 Alternatives. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

The LA TIG's Restoration Plan evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG has selected Alternative 1 as the LA TIG's Preferred Alternative.

---

**Correspondence ID:23565**

Adrienne Petrosinj

You don't need to be a scientist to understand the need for saving our wetlands. The future of our economy, the fishing industry, the city of New Orleans, the state of Louisiana depends on their restoration, we cannot continue to experience the land loss that will occur without this diversion. We cannot continue to experience the flooding and high water level that occurs and will worsen without the diversion. As a member of the Audubon Society and the Sierra Club, I am concerned that increasing salinity will impact wildlife.

Without the diversion, widespread disruption and devastation to people, wildlife and the region's economy will occur. Put simply: We cannot afford a future without action. Please support this project to restore and rebuild wetlands and strengthen the health of the overall ecosystem to protect people, wildlife and the economy.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

**Correspondence ID:23566**

Plaquemines Parish Resident

The CPRA has bullied itself onto private property issuing statutory right of entries for prolonged periods of time in relation to the Mid Barataria and Mid Breton diversions.

The arrogance of a statutory right of entry by a government agency leaves little credibility to the notion the actions of this agency are in the best interest of the tax payers of Louisiana.

Modeling showing the timeline of detrimental effects vs positive effects of large scale diversions has been done by the USGS. These models should be presented to the public and considered by all government agencies. Sea level rise, subsidence and the frequency of hurricanes will not allow for a multiple decade long positive effect.

Other methods of introducing sediments to the wetlands should be considered.

In the event these diversions will be constructed, the general population needs to be considered in the "mitigation". Lifestyles, Culture and in many cases livelihoods will be altered and in some cases destroyed. Any land loss associated with the initial operations of a diversion is unacceptable to the landscape for the residents relying on this landscape to protect their homes from storm surge events. Home owners cannot wait years or decades for positive results.

If these diversions will indeed be constructed, the residents in lower Plaquemines need the option of relocation.

A very concerned resident of Plaquemines Parish.

---

**Concern ID: 61785**

**The commenter stated that the USGS has conducted modeling that shows that sea-level rise, subsidence, and the frequency of hurricanes would not allow for benefits of diversions to last multiple decades. The commenter questioned whether these factors were taken into account in the modeling for the EIS.**

**Response ID: 16415**

Modeling conducted by the USGS (for example, Barras et al. 2003. Historical and projected coastal Louisiana land changes: 1978-2050: USGS Open File Report 03-334) was considered in the preparation of the Draft EIS. That work is based on extrapolation of past Barataria Basin behavior and is not directly comparable to the physics-based Delft3D Basinwide Model used to assess the MBSD Project alternatives in the Draft EIS.

Sea-level rise and subsidence were explicitly accounted for in the Delft3D Basinwide Model, as described in the Draft EIS, Appendix E Delft3D Modeling, Sections 3.2.4 and 3.2.3, respectively. Potential land-change effects from hurricanes were not modeled as part of the Delft3D Basinwide Model. The rationale for that omission and explanation of how it was accounted for are provided in Appendix E Delft3D Modeling, Section 8.1. Storm modeling, described in Appendix P, included the effects of land building on storm surge and waves but did not simulate either erosion or deposition for reasons given in Appendix E, Section 8.1. No related edits have been made to the Final EIS.

---

**Concern ID: 61879**

**Commenters questioned why other alternatives are not being considered other than No Action and a sediment diversion with various levels of flow rates. CEQ's regulations**

---

**require that the EIS rigorously explore and objectively evaluate all reasonable alternatives, which is a requirement that the Draft EIS does not meet. Consider analyzing a range of other alternatives, options, and tools that better preserve and protect the environment and minimize the severe impacts to Louisiana fisheries, the communities, and the entire Gulf Coast ecosystems.**

**Response ID: 15835**

The range of reasonable alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2 of the Draft EIS (Alternatives), an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in its SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of

---

benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats” (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in its Restoration Plan. The LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG’s Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

---

**Concern ID: 62352**

**CPRA has issued statutory rights of entry for the diversion projects, which deter from the credibility of the agency having the best interest of Louisiana taxpayers in mind.**

**Response ID: 15892**

Comment noted.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a

---

combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63043**

**Sea-level rise, subsidence, and the frequency of hurricanes would not allow for a multiple decade-long positive effect from operation of the proposed Project.**

**Response ID: 16050**

Chapter 4, Sections 4.1.3 in Approach to Evaluation of Environmental Consequences and 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS acknowledge that sea-level rise and subsidence would affect the extent of wetland creation that would occur if the proposed Project were implemented. The projected land gains in the Barataria Basin developed via the Delft3D Basinwide Model take into account estimates of sea-level rise and subsidence. Additional analysis regarding the potential impact of hurricanes on the extent of wetlands in the proposed Project area during the period of diversion operations is included in Chapter 4, Section 4.6.5.1.2 Applicant's Preferred Alternative of the Final EIS.

Robin Wang

The project document appendix P included the hydrographs of the storm used. I believe the units of the hydrograph are incorrect. please do check.

---

**Concern ID: 62181**

**The commenter believes the units on the storm hydrographs in Draft EIS Appendix P are incorrect.**

**Response ID: 15764**

Figures 3-24 through 3-39 and 3-62 through 3-77 in Draft EIS Appendix P1 Surge and Wave Conditions Report (ADCIRC Model) are correctly plotted in feet. No changes were made to the Final EIS.

---

**Correspondence ID:23578**

Kira Marchenese

I support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help restore the overall health of the ecosystem that was injured as a result of the oil spill.

It's only fair that part of the settlement funds go toward making the ecosystem healthier and more resilient.

With that in mind, I ask the following of the Army Corps and Louisiana Trustee Implementation Group:

- Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion: For decades, scientists and engineers have considered all the tools available and overwhelmingly agree that this project is the best long-term solution and necessary to meet the challenges we face from land loss, sea level rise and climate change. The Mid Barataria Sediment Diversion is the cornerstone of Louisianas Coastal Master Plan and will help support and enhance the lifespan of other coastal restoration and protection projects.
- Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan. The sediment diversion plan is exactly the scale needed to address the very serious challenges facing Louisianas coast.

As the project advances, I urge federal and state decision makers to consider the following:

- Center community needs. This project will have many positive, long-term benefits for coastal communities, including increased storm surge protection from restored wetlands, job creation and regional economic impact during construction, and increased productivity of natural resources. There is also foreseeable potential harm. effects possible. The Trustees must work proactively and collaboratively with potentially impacted communities to develop and implement ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning and implementation processes.
- Commit to developing a robust adaptive management program to ensure the project meets its restoration goals in response to changing environmental conditions.

---

**Concern ID: 61756**

**The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.**

**Response ID: 15891**

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment

Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not

know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62835**

**Federal and state decision makers and the Trustees should work proactively, transparently, and collaboratively with communities with environmental justice concerns and stakeholders to develop ideas and proposals for adaptation and mitigation as environmental conditions change.**

**Response ID: 16662**

CPRA undertook substantial community outreach, particularly aimed at soliciting input from low-income and minority populations, during the period between the Draft and Final EIS and LA TIG's Draft and Final Restoration Plan. CPRA engaged the communities potentially impacted by the Project, including low-income and minority community members, through public meetings to solicit input on mitigation and stewardship strategies. Further, CPRA engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. CPRA also used a survey tool to gather feedback from low-income and minority community members regarding Project impacts and on mitigation concepts. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. If the Project is implemented, CPRA plans to continue outreach to the communities and stakeholders with environmental justice concerns through Project construction and operations.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from

---

the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:23588**

Margaret Burwell

I SUPPORT the proposal in the DRAFT RESTORATION PLAN to use funds from the Deepwater Horizon Oil Spill settlement to help restore the overall health of the Barataria Basin ecosystem that was injured as a result of the oil spill.

Louisianas coast is in crisis caused by the ongoing loss of its coastal wetlands, increased vulnerability to stronger hurricanes, sea level rise and saltwater intrusion. As we all know, Deepwater Horizon Oil Spill severely and negatively impacted the Louisiana coast.

EVERY YEAR the loses are greater to coastal communities, wildlife and the entire ecosystem.

You now have an opportunity to harness the natural land-building power of the Mississippi River to maintain vital wetlands and restore the health and vitality of the entire ecosystem.

I ask the Army Corps and Louisiana Trustee Implementation Group:

- SELECT THE PREFERRED ALTERNATIVE in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion- chosen by scientists and engineers as the best long-term solution and necessary to meet the challenges from land loss, sea level rise and climate change.

- FUND THE PROJECT WITH DEEPWATER HORIZON SETTLEMENT DOLLARS as outlined in the draft Restoration Plan.

- CONSIDER COMMUNITY NEEDS IN PLANNED MITIGATION & STEWARDSHIP EFFORTS.

- COMMIT TO A ROBUST ADAPTIVE MANAGEMENT PROGRAM to incorporate changing environmental conditions with input from key stakeholders.

I STRONGLY SUPPORT PREFERRED ALTERNATIVE for the Mid Barataria Sediment Diversion.

Thank you for your consideration

---

**Concern ID: 62675**

**Commenters noted that the impacts of the DWH oil spill on wetlands, wildlife, birds, communities, and land loss are still felt by this region and in particular, Barataria Basin where 95 percent of the oiling occurred. These impacts are exacerbated by decades of saltwater intrusion, sea-level rise, and subsidence.**

**Response ID: 16497**

The impacts of the DWH oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss of the EIS notes the ongoing impact of the DWH oil spill on wetlands, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species of the EIS provides an overview of the adverse impacts of the oil spill on key aquatic species within the Barataria Basin.

The LA TIG agrees with the commenters that the impacts of the DWH oil spill are significant in this region and thus the LA TIG is committed to continuing to plan and implement significant restoration projects like the LA TIG's Preferred Alternative in the Restoration Plan. The LA TIG's Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin. These habitats are critical components of the broader northern

Gulf of Mexico ecosystem and suffered the greatest degree of oiling in Louisiana due to the DWH oil spill.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

---

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

Al Wocman

You created this mess, you fix it.

---

**Concern ID: 62363**

**USACE should identify the river management problems their projects have caused and correct those, not adding more patches to the system it broke.**

**Response ID: 15876**

The proposed Project is not a USACE project. The State of Louisiana through CPRA is the permit Applicant and would construct and operate the diversion. The combined effects of USACE's past, present and reasonably foreseeable projects, in combination with the MBSD Project, were considered in Chapter 4, Section 4.25 Cumulative Impacts of the Draft EIS.

---

**Correspondence ID:23626**

Commenter

Dear Sir / Madam,

Please review the below points below. I appreciate your time.

- The diversion will have permanent, detrimental effects to Myrtle Grove.
- The EIS will increase tidal flooding in Myrtle Grove by at least 119 days per year and up to two-thirds of the year which is unacceptable for a subdivision.
- The diversion will silt Wilkinson Canal making it impossible to leave Myrtle Grove by boat. The EIS does not require CPRA to remedy this-only that they MIGHT do so.
- I will not grant an easement to the Corps of Engineers to flood my property at their discretion. I am also not aware of any flowage easements in residential subdivisions.
- Why is there not a Real Estate Plan for Myrtle Grove similar to the one for the Upper Barataria EIS? Why is there a buy-out for the homes in the Upper Barataria and not for Myrtle Grove and the other affected communities in the Mid-Barataria?
- I object to the EIS not detailing the impact upon the dolphins. While an exemption for killing dolphins was included in a budget bill, the actual impact must be studied and disclosed to the public. The recent flow of fresh water from the Bonnet Carre spillway into Lake Pontchartrain caused the death of at least 200 dolphins and this was only a short-term flow of fresh water.
- There was not a hydrology report in the EIS showing the impact upon the water levels. Without this information, it is impossible to confirm the amount of increased water in Myrtle Grove.
- Why were the effects on people not included in the study? The water from the Mississippi River contains significant amounts of fertilizer which results in dead zones at the mouth of the River and the flow into Lake Pontchartrain resulted in harmful amounts of blue-green algae.

---

**Concern ID: 61812**

**Commenters expressed concern that the proposed Project would have adverse water quality impacts in the Barataria Basin due to the introduction of nitrate and phosphate from the Mississippi River. Several commenters questioned whether the proposed Project would create harmful algal blooms and hypoxia in the Barataria Basin similar to the hypoxic “dead zone” in the Gulf of Mexico that exists due to nutrients in Mississippi River waters. One commenter expressed concern that the EIS does not adequately assess the potential for the proposed Project to create algal blooms and hypoxia in the basin, other than acknowledging it.**

**Response ID: 16425**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA's Mississippi River/Gulf of Mexico Hypoxia Task Force "Hypoxia 101" webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone "water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen" (<https://www.epa.gov/ms-htf/northern-gulf-mexico-hypoxic-zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.>)

Dissolved oxygen concentrations associated with the Applicant's Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section is included in Section 4.5.5.3 in Surface Water and Sediment Quality and has been added to Section 4.5.5.4.2 Applicant's Preferred Alternative of the Final EIS. Finally, the EIS acknowledges the potential for major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) if warranted, in the Barataria Basin during Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62224**

**Communities like Happy Jack, Lake Hermitage and Myrtle Grove, some of which have homes that are not above the new base flood elevation, already experience some degree of flooding which would be made worse by the diversion. This would affect the ability of residents to access and enjoy their homes and communities.**

**Response ID: 15757**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discuss the anticipated increased flooding impacts outside of federal levee systems to be caused by the operation of the diversion. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially

---

offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes, which would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62234**

**There was not a hydrology report in the Draft EIS showing the impact upon the water levels.**

**Response ID: 15760**

The EIS does not include a separate, stand-alone hydrology report; however, hydrology is one of the outputs provided by the Delft3D Basinwide Model. The results of this modeling are included in Appendix E, Delft3D Modeling. Based on these results, several sections of the Draft EIS discussed the projected impacts on water levels throughout the basin for all Project alternatives, including in the vicinity of Myrtle Grove. These sections include Section 4.4 Surface Water and Coastal Processes and Section 4.20 Public Health and Safety. These sections are supplemented by additional information in Appendix P, Flood & Storm Hazards Evaluation.

---

**Concern ID: 62968**

**If operation of the diversion causes infill of various canals used to access surrounding communities, who will be responsible for dredging to maintain access? For example, if Wilkinson Canal is filled with silt then the canal cannot be used and waterfront property owners with boat lifts in Myrtle Grove will not be able to get out using their boats; the EIS does not require a remedy or provide a funded maintenance plan for this issue (including who would pay for dredging).**

**Response ID: 16642**

The impacts raised by the commenters were considered in the Draft EIS. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the Project area during Project operations.

In acknowledgement of commenters' concerns regarding maintenance of non-federal navigation channels and canals impacted by sedimentation of the proposed diversion, the Mitigation and Stewardship Plan includes measures to mitigate impacts on navigation resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures

---

CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63069**

**The Draft EIS did not include detailed information about the potential impacts of the proposed Project on bottlenose dolphins.**

**Response ID: 16592**

The Draft EIS included an analysis of the impacts to marine mammals, including bottlenose dolphins, in Chapter 4, Section 4.11 (Marine Mammals). The EIS quantifies the impact on dolphin survival rates (the percentage of existing dolphins that would survive from one year to the next year) for different populations of dolphins (Table 4.11-5) from the most pronounced stressor, salinity, but also includes a qualitative assessment on other impacts such as wetland shifts, prey species impacts, HABs, water temperature, and other impacts. The Final EIS includes the incorporation of additional population impact analysis that was completed by Thomas et al. (2021) after the Draft EIS was released for public comment.

---

**Concern ID: 63092**

**Further development of the Mitigation Plan is needed for properties that would be impacted by flooding caused by Project operations. Multiple commenters made specific requests for how their property should be handled (for example, through sales or easements), while others wondered why a more detailed, "real estate plan" for impacted communities was not available.**

**Response ID: 16511**

The Draft Mitigation and Stewardship Plan included with the Draft EIS (Appendix R1) included CPRA's initial framework for mitigation and stewardship measures to assist property owners in these communities impacted by increased tidal flooding and to address the Project impacts of Project operations on water levels. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

CPRA states that it is interested in assisting affected communities to remain in place as long as they would like. Mitigation would include a combination of structural measures (for example, raising roads, boat houses, docks and utilities) and non-structural measures. Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

Where the proposed Project would cause increased water levels and/or increased incidence of flooding, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to purchasing a flowage servitude, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property (rather than a servitude) would be made on a case-by-case basis depending on the particular circumstances.

A complete listing of the mitigation and stewardship measures that CPRA would implement if the proposed Project is approved and funded is included in CPRA's Mitigation and Stewardship Plan included in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Rachel Scown

You know why I'm writing...

The almost irretrievable loss of natural ecosystem wetlands is devastating to whole life populations. I believe nature can heal if given the chance. Please add my voice and name supporting reconnection of vital wetland functions.

---

**Concern ID: 63332****A large number of commenters expressed general support for the proposed Project.****Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:23667**

Nancy Sullivan

I vividly remember seeing the movie "Hurricane on the Bayou" when it was shown in Cincinnati Museum Center's I-Max theater 15 years ago. My son traveled to NO not long afterwards to do some kind of service project.

We know that Katrina ravaged the region in part because of the loss of coastal wetlands. All the communities living close tin that region are suffering from loss- their communities are literally dissolving into the Gulf as they are battered by hurricanes and sea level rise. Wildlife and critical fish nurseries are also at risk.

Of course, the impacts of the Deepwater Horizon Oil Spill are still being felt.

Long ago the Army Corps of Engineers thought that channeling the Mississippi and draining wetlands were in everyone's interest. we have learned better since. Sediment from the river has maintained much of the coast for generations. We must return to this natural method of sustaining the region by harnessing the land-building power of the Mississippi River. through the Mid-Barataria Sediment Diversion project

I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the Army Corps and Louisiana Trustee Implementation Group:

- Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion: For decades, scientists and engineers have considered all the tools available and overwhelmingly agree that this project is the best long-term solution and necessary to meet the challenges we face from land loss, sea level rise and climate change. Reconnecting the river to nearby wetlands through this project provides our greatest opportunity to avoid a devastating future for Louisianas communities, wildlife and economy. The Mid Barataria Sediment Diversion is the cornerstone of Louisianas Coastal Master Plan and will help support and enhance the lifespan of other coastal restoration and protection projects.
- Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan: As Barataria Basin continues to recover from the devastating impacts of the oil spill, this project is vital to restoring the health and function of the entire ecosystem. The Mid-Barataria Sediment Diversion is the single largest ecosystem restoration project in the history of the United States. Combined with other proposed restoration projects, the Mid-Barataria Sediment Diversion would build and preserve more than 17,000 acres of wetlands over the next 30 years to restore critical wetland habitat injured by the oil spill. It is exactly the scale needed to address the very serious challenges facing Louisianas coast.

As the project advances, I urge federal and state decision makers to consider the following:

- Center community needs in planned mitigation and stewardship efforts. This project will have many positive, long-term benefits for coastal communities, including increased storm surge protection from restored wetlands, job creation and regional economic impact during construction, and increased productivity of natural resources. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. We

applaud the commitment of the Federal Trustees and Louisianas Coastal Protection and Restoration Authority to address impacts that could result from the construction and operations of the project. Louisiana and the other Trustees will dedicate approximately \$300 million to fund a robust stewardship and mitigation plan, addressing any potential impacts that may occur. The Trustees must work proactively and collaboratively with potentially impacted communities to develop and implement ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning and implementation processes.

- Commit to developing a robust adaptive management program: To ensure the project meets its restoration goals in response to changing environmental conditions, I encourage the development and implementation of a robust adaptive management program that incorporates knowledge gained from monitoring of the project over time and also considers input from key stakeholders.

A future without the Mid Barataria Sediment Diversion is a future we cannot afford, which is why I support the preferred alternative outlined in the draft Environmental Impact Statement and the expenditure of Deepwater Horizon settlement dollars to pay for the projects construction and associated mitigation and stewardship activities.

---

**Concern ID: 62675**

**Commenters noted that the impacts of the DWH oil spill on wetlands, wildlife, birds, communities, and land loss are still felt by this region and in particular, Barataria Basin where 95 percent of the oiling occurred. These impacts are exacerbated by decades of saltwater intrusion, sea-level rise, and subsidence.**

**Response ID: 16497**

The impacts of the DWH oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss of the EIS notes the ongoing impact of the DWH oil spill on wetlands, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species of the EIS provides an overview of the adverse impacts of the oil spill on key aquatic species within the Barataria Basin.

The LA TIG agrees with the commenters that the impacts of the DWH oil spill are significant in this region and thus the LA TIG is committed to continuing to plan and implement significant restoration projects like the LA TIG's Preferred Alternative in the Restoration Plan. The LA TIG's Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin. These habitats are critical components of the broader northern Gulf of Mexico ecosystem and suffered the greatest degree of oiling in Louisiana due to the DWH oil spill.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63008**

**The commenter states that all the communities living close to that region are suffering from loss, and the communities are dissolving into the Gulf as they are battered by hurricanes and sea-level rise.**

**Response ID: 15762**

Draft EIS Section 3.20 Public Health and Safety recognized ongoing flooding impacts caused by the combination of multiple forces, including land loss, hurricanes, and sea-level rise, within the Project area.

---

**Concern ID: 63179**

---

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

James Klein

Louisianas coast is in crisis. The ongoing loss of its coastal wetlands, which has already claimed an area equal in size to the state of Delaware, makes communities increasingly vulnerable to stronger hurricanes and sea level rise.

This loss, coupled with saltwater intrusion and sea level rise, threatens the health and stability of the entire Barataria Basin upon which a number of communities, wildlife and vital resources depend. This region continues to feel the impacts of the Deepwater Horizon Oil Spill, which further decimated wetlands and devastated wildlife more than 10 years ago.

In the face of these challenges, we have an opportunity to harness the natural land-building power of the Mississippi River to maintain vital wetlands and restore the health and vitality of the entire ecosystem. I support. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the Army Corps and Louisiana Trustee Implementation Group:

- Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion: For decades, scientists and engineers have considered all the tools available and overwhelmingly agree that this project is the best long-term solution and necessary to meet the challenges we face from land loss, sea level rise and climate change. Reconnecting the river to nearby wetlands through this project provides our greatest opportunity to avoid a devastating future for Louisianas communities, wildlife and economy. The Mid Barataria Sediment Diversion is the cornerstone of Louisianas Coastal Master Plan and will help support and enhance the lifespan of other coastal restoration and protection projects.
- Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan: As Barataria Basin continues to recover from the devastating impacts of the oil spill, this project is vital to restoring the health and function of the entire ecosystem. The Mid-Barataria Sediment Diversion is the single largest ecosystem restoration project in the history of the United States. Combined with other proposed restoration projects, the Mid-Barataria Sediment Diversion would build and preserve more than 17,000 acres of wetlands over the next 30 years to restore critical wetland habitat injured by the oil spill. It is exactly the scale needed to address the very serious challenges facing Louisianas coast.

As the project advances, I urge federal and state decision makers to consider the following:

- Center community needs in planned mitigation and stewardship efforts. This project will have many positive, long-term benefits for coastal communities, including increased storm surge protection from restored wetlands, job creation and regional economic impact during construction, and increased productivity of natural resources. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. We applaud the commitment of the Federal Trustees and Louisianas Coastal Protection and Restoration Authority to address impacts that could result from the construction and operations of the project. Louisiana and the other Trustees will dedicate approximately \$300 million to fund a robust stewardship and mitigation plan, addressing any potential impacts that

may occur. The Trustees must work proactively and collaboratively with potentially impacted communities to develop and implement ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning and implementation processes.

- Commit to developing a robust adaptive management program: To ensure the project meets its restoration goals in response to changing environmental conditions, I encourage the development and implementation of a robust adaptive management program that incorporates knowledge gained from monitoring of the project over time and also considers input from key stakeholders.

A future without the Mid Barataria Sediment Diversion is a future we cannot afford, which is why I support the preferred alternative outlined in the draft Environmental Impact Statement and the expenditure of Deepwater Horizon settlement dollars to pay for the projects construction and associated mitigation and stewardship activities.

This, like numerous other issues (climate change, gun safety, immigration reform, prison reform, education reform, short-term lending regulation, healthcare reform, banking regulation, opioid regulation) remains a vexing problem primarily due to corporations' ability to curry favor with elected officials. The corrupting influence of money in our political system is undermining our democratic traditions and discouraging Americans from voting and/or running for office. This ominous development may well end our experiment in representative democracy unless we alter this decades-long trend. For the sake of the republic, we must amend the US Constitution to state that corporations are not people (and do not have constitutional rights) and money is not speech (and thus can be regulated by state and/or federal campaign finance laws). Short of accomplishing this, no other reform of significance will be achieved. The moneyed interests will turn any reform to their benefit, often at the expense of the nation as a whole.

---

**Concern ID: 61716**

**The ongoing loss of Louisiana's coastal wetlands makes communities increasingly vulnerable to stronger hurricanes and sea-level rise and threatens the health and stability of the entire Barataria Basin upon which a number of communities, wildlife, fish nurseries, sportsman culture, economy, and vital resources depend.**

**Response ID: 16026**

The importance of maintaining wetlands for the protection of coastlines, coastal communities, wildlife resources, and recreation was considered in the Draft EIS in Sections 3.6 Wetland Resources and Waters of the U.S., 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, and 3.16 Recreation and Tourism.

---

**Concern ID: 62675**

**Commenters noted that the impacts of the DWH oil spill on wetlands, wildlife, birds, communities, and land loss are still felt by this region and in particular, Barataria Basin where 95 percent of the oiling occurred. These impacts are exacerbated by decades of saltwater intrusion, sea-level rise, and subsidence.**

**Response ID: 16497**

The impacts of the DWH oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss of the EIS notes the ongoing impact of the DWH oil spill on

---

wetlands, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species of the EIS provides an overview of the adverse impacts of the oil spill on key aquatic species within the Barataria Basin.

The LA TIG agrees with the commenters that the impacts of the DWH oil spill are significant in this region and thus the LA TIG is committed to continuing to plan and implement significant restoration projects like the LA TIG's Preferred Alternative in the Restoration Plan. The LA TIG's Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin. These habitats are critical components of the broader northern Gulf of Mexico ecosystem and suffered the greatest degree of oiling in Louisiana due to the DWH oil spill.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be

---

implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Concern ID: 62353**

**The corrupting influence of money in our political system is undermining our democratic traditions**

**Response ID: 15847**

Comment noted, but is outside the scope of this EIS. This EIS is focused on evaluating and disclosing the potential environmental impacts associated with the proposed Mid-Barataria Sediment Diversion Project.

**Correspondence ID:23683**

Lawrence Rosin

I ask you to support the restoration of Louisiana's Barataria Basin. There are ecosystems in the Louisiana's Barataria Basin. Therefore if you restore the Louisiana's Barataria Basin, you are helping keep their ecosystems healthy. And if you help keep their ecosystems healthy, you are helping protect the species living there alive and healthy.

The Louisiana's Barataria Basin has lost lots of lands. But when you connect it to the Mississippi River, the Louisiana's Barataria Basin could harness its resources and start getting healthier.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

**Correspondence ID:23686**

## Form Letter 15

I ask the following of the Army Corps and Louisiana Trustee Implementation Group:

- Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion: For decades, scientists and engineers have considered all the tools available and overwhelmingly agree that this project is the best long-term solution and necessary to meet the challenges we face from land loss, sea level rise and climate change. Reconnecting the river to nearby wetlands through this project provides our greatest opportunity to avoid a devastating future for Louisianas communities, wildlife and economy. The Mid Barataria Sediment Diversion is the cornerstone of Louisianas Coastal Master Plan and will help support and enhance the lifespan of other coastal restoration and protection projects.
- Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan: As Barataria Basin continues to recover from the devastating impacts of the oil spill, this project is vital to restoring the health and function of the entire ecosystem. The Mid-Barataria Sediment Diversion is the single largest ecosystem restoration project in the history of the United States. Combined with other proposed restoration projects, the Mid-Barataria Sediment Diversion would build and preserve more than 17,000 acres of wetlands over the next 30 years to restore critical wetland habitat injured by the oil spill. It is exactly the scale needed to address the very serious challenges facing Louisianas coast.

As the project advances, I urge federal and state decision makers to consider the following:

- Center community needs in planned mitigation and stewardship efforts. This project will have many positive, long-term benefits for coastal communities, including increased storm surge protection from restored wetlands, job creation and regional economic impact during construction, and increased productivity of natural resources. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. We applaud the commitment of the Federal Trustees and Louisianas Coastal Protection and Restoration Authority to address impacts that could result from the construction and operations of the project. Louisiana and the other Trustees will dedicate approximately \$300 million to fund a robust stewardship and mitigation plan, addressing any potential impacts that may occur. The Trustees must work proactively and collaboratively with potentially impacted communities to develop and implement ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning and implementation processes.
- Commit to developing a robust adaptive management program: To ensure the project meets its restoration goals in response to changing environmental conditions, I encourage the development and implementation of a robust adaptive management program that incorporates knowledge gained from monitoring of the project over time and also considers input from key stakeholders.

A future without the Mid Barataria Sediment Diversion is a future we cannot afford, which is why I support the preferred alternative outlined in the draft Environmental Impact Statement and the expenditure of Deepwater Horizon settlement dollars to pay for the projects construction and associated mitigation and stewardship activities.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

---

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:23704**

David Valle

as it's especially in the midst of the ever-present concerns how serious the environmental exploiting has become that it's cost us an infinite amount of potential in the long run and how, meanwhile the silver lining of there being cloning or resighting or once extinct species, this is still a long mountainous trek in the interests of our own domestic environmental safety and these begin in ground-shifting examples, such as the climate change weather extremes ranging from Texas but also to Louisiana itself, the tornadoes and the easy occurrences of strong winds, let alone the the close ties of West, North and Texas but to Oklahoma and also Florida, the battling close quarters of what are historically natural landscapes of this but where we've add flame to the fire, and this accompanies the dangerous tasks we've taken, one of several,

On the subject of renewable energy, it's also necessary to say that, as the United States rejoined the Paris Climate Accord and in the fast-paced interests of how a carbon footprint continues but also the given on how an everyday human presence especially makes it serious, but in a country such as Costa Rica where an ambitious economy has also shown an advantage of their own natural resources and the Northern neighbor Nicaragua where they've easily sailed through initiatives and gained into 75% efficiency in 2015, with hopes of 75% efficiency by 2017 and 90 percent by 2020 and in a country where a luxurious lifestyle is not the one of the US, but also where I personally know single grocery store shopping bags are non-existent, and instead improvised baskets and carts, compared to the US' 13 percent but also in the complex differences of the #1 economy not owning its own obligations of this, especially as a socialist country such as Daniel Ortega's where his renewables record dates to 2007 with a \$1.5 million investment and what has earned it #5 renewable GDP by 2012. It's especially in the time-ticking circumstances where the 2006-2012 assessing shows: 16 percent of geothermal, 15 percent of wind, 12 percent of hydropower and 7 percent of biomass, but also a country where the sharp issues of complete natural biodiversity are met with continued ecosystem changes and as with South America, where the incomparable history of centuries is as easily removed as several world treasures, there cannot be wasted time as there is, whether or not the climate change support is silent as is expected with the new extremist views taking society today, but also where such a #1 economy is as capable as the #1 world pineapple producer Costa Rica easily achieved a 2015 record of 285 days of 100% renewable energy, and in such an economy where it averages an easy 1,000 over the #2 pineapple producer, the Philippines, another country that has raged into a renewables sector including as coal was once still a strong presence, it's also Costa Rica that sets its 1000 away from our fellow American continental Brazil and also then Indonesia, it's also Nicaragua that set the US apart when they signed the Paris Climate Accord in October 2017, a coincidental occurrence before there was the violent government protests the following year, there is no such thing as environmental peace if it's not a world initiative.

It's also Brazil where since 2014 and 2017 themselves, hydropower is a constant renewable presence and a steep difference from the classic fossil fuels, but it's also no match to the still occurring deforestation in the country of the one and only Amazon, and also in a country where South America altogether is seeing an environmental crisis, and one unable to be resolved without a motherboard of rebooting the internal systems running in their government, and especially necessary to say since Ecuador is #1 at endangered species of all South

American countries, 2589, and Brazil is the #2 with 1721, Colombia at #3, 1484, the issues couldn't be clearer when Venezuela follows #4 at 792, it's an issue regarding a double-handed approach in closing all human presence-driven threats happening in the first place, and these threats also couldn't be clearer in a Jair Bolsonaro approach of the similarly pro-restoring of business once as usual before such as Mexico's fossil fuels dependence and one following our own, with former President Trump's coal industry reviving but also where this current year allows a new makeover of the entire last 4 years of one where history can still turn the page on otherwise laudable examples. Especially since the second Brazil nature threat is the ecosystem-impacting human activities that also follow in #3, developing, and it's also where the major Brazilian states are expected in these threats: Bahia, Minas Gerais, Rio de Janeiro, Espirito Santo, Amazonas and Sao Paulo, and in a country where being the 2nd largest hydropower producer in the world, over 70% of its entire electric grid, and with China at #1 and it is sure to say there was a lot not captured in the US energy interests including in a country of such vastness including with two coasts but also all the advantageous daily resources and in the drought sense, we can also only attribute to climate change given Brazil itself saw another yet continuance of a 40 year long drought, and one that as recent as February's data showing the typical dry season became heavily drier, with only 3 sparse areas of South American heavy rains alone, East Venezuela-West Guyana to nearly Suriname, Far East Brazil and North Argentina-South Bolivia, and in these areas, where extreme drought shook the Central, North and East of Colombia, worse when considering the earlier statistics, it continues with all coastal Peru, edging into the trifecta of Bolivia, Chile and Argentina, where it affects all three of these but also the other countries Paraguay and Uruguay, the only silver linings here were the one Argentina had with better rain into February accounting to better corn harvesting, as the world's #3 corn producer.

It's also in returning to Brazil where the NASA GRACE satellite especially has captured the insistent grips of drought in Brazil, calculated from 2003 where drought was especially noticed and a constant zig-zag throughout but especially worsening post-2008 global recession, 2012 and onto where the latest data came, 2014 and 2015 and including at a time where the 2015-2016 El Nino event saw the worst droughts, something of a redundance given it has continued the last 40 years but especially where this also mirrors the previous data showing East Brazil, and where the populous areas saw their energy usage return to fossil fuels in the last month of 2015 and only the drought subsiding because of early 2016 rain, but also with Sao Paulo being South America's #1 populated city, they were especially hit hard by the 2015 drought, but it's also because this happened over the highly celebrated Christmas season in mainly Christian-Catholic and Protestant Brazil and one where temperatures ticked at 95F, and where Sao Paulo trains were delayed, opposite an area where the Central West Brazil had severe droughts, barely south out of the Amazon and edging close to Bolivia, but the exceeding tensions of having to import energy from Argentina, a country of mainly natural gas, but also where oil drilling is still a threat in Argentine, a sensitive subject when Nicaragua has no oil and instead harvests its own renewable sources, alike to the entire South of South America, Argentina, Brazil, Chile, Peru and Uruguay all hotspots of wind energy in the entire continent. The other pending issue is what the Paris Climate Accord has cost us as we're the only pin standing with Syria, a war-torn country with the cause of not signing.

Climate change in Brazil has especially roared its shaking presence given climate change was the cause of 95 endangered species, the species being all over the place, and there are

6 different aviary species, 2 flower and shark, 1 frog, fungi and shark species, but it's especially the neighbors Uruguay whose energy grid is 60% of hydropower that also share their own worrisome species issues and in country entirely shaped out by water except the northern side with Brazil, the entire South American system is affected by climate change and where the new and old statistics show again but also where the climate change heat sense is felt everywhere, an area where, without the Amazon, greenhouse emissions would surely worsen but it's also ecosystem restoring what we need in balancing environmental peace again: 36 Venezuelan, 31 Ecuador species, 17 Colombian, 16 Bolivian and Brazil, together as these nations, the endangered species count is 532 and there's 1 casualty to the graveyard so far: longnose harlequin frog, the quint state-inhabiting frog but it was a multi-threat stacked of agriculture and aquaculture, developing, ecosystem changing, invasive species and pollution (including agricultural waste), but it's especially a South American issue given Uruguay's neighboring waterways are a climate change threat: the namesake Uruguay River, the Rio Parana (coming from the Paraguayan Paraguay River as it is), Rio Parana de las Palmas, Rio Parana Guazu.

Renewables are a captured reality in Brazil with an expected 69% of wind power by 2025, meanwhile it has taken contemplating so long on the S. 372 (Thirty by Thirty),

---

**Concern ID: 62332**

**The commenter provided a general critique of failures to tackle climate change, to embrace renewable energy and to halt environmental degradation.**

**Response ID: 15783**

Comment noted. The comment does not appear to include any comments regarding the analysis of the Project contained in either the EIS or Restoration Plan.

Seems like we have an opportunity to actually fix a problem. Might as well take it while it lasts. I support the Mid-Barataria Sediment Diversion Project.

---

**Concern ID: 63332****A large number of commenters expressed general support for the proposed Project.****Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Linda Yow

The ongoing loss of Louisiana's coastal wetlands makes communities increasingly vulnerable to stronger hurricanes and sea level rise. This loss threatens the health and stability of the entire Barataria Basin. This region also continues to feel the impacts of the Deepwater Horizon Oil Spill.

We now have an opportunity to harness the natural land-building power of the Mississippi River to maintain vital wetlands and restore the health and vitality of the entire ecosystem. The proposal in the draft Restoration Plan to use funds of the Deepwater Horizon Oil Spill settlement to implement this project is a good one.

A future without the Mid Barataria Sediment Diversion is a future we cannot afford, which is why I support the preferred alternative outlined in the draft Environmental Impact Statement and the use of Deepwater Horizon settlement dollars to pay for the projects construction and associated mitigation and stewardship activities.

God bless you and your work there.

---

**Concern ID: 63045**

**The ongoing loss of Louisiana's coastal wetlands makes local communities increasingly vulnerable to stronger hurricanes and sea-level rise, threatening the health and stability of the entire Barataria Basin.**

**Response ID: 16051**

The Draft EIS discussed the value of wetlands in the Barataria Basin, including as flood control and protection from storm surge (see Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S. of the EIS).

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Wade DesRoches

I own a camp/home in the Deer Range area in Plaquemines parish. I am hearing that this diversion will raise the tides in my area which will flood our property. This diversion will also ruin the fishing without a doubt. What mitigation plan is considered to offset ruining our properties in my area which has hundreds of homes and camps? Raising the tides at our camps and homes will render the properties useless. Myself and many others have invested a lot of money in the area and it is not fair to disregard the residents.

I am totally against this project as are all people in the area but we are not being kept up to date on what is happening.

My home address is [REDACTED]. I would like to have a say in what is happening and what mitigation processes are considered.

Wade DesRoches  
[REDACTED]

---

**Concern ID: 62807****The local population is not being kept up-to-date on the mitigation that would be done for their communities.****Response ID: 16381**

CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area over the past several years. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures, which were informed by CPRA's public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as

---

conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63102**

**Commenters expressed concern that they will not be able to use their property if the Project proceeds. Commenters believe that the amount of funds proposed for mitigation is insufficient.**

**Response ID: 16640**

The commenters' concern regarding the adequacy of the funding for mitigation measures was considered by CPRA and the LA TIG in developing CPRA's Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included proposals to address and partially offset some of the projected impacts of the Project on surrounding communities outside levee protection, including potential mitigation measures to address increased water levels due to the Project. In response to comments, CPRA further expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The mitigation and stewardship measures would vary by community. In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the Project. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and the utilities of those communities. Also in these communities, CPRA plans to acquire Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:25381**

Vu Nguyen

My name is Vu Nguyen and would like your help with a loan to help with making our vessel able to provide better quality shrimp. We would use the loan for vessel refrigeration to keep the product fresh as we can stay longer on the fishing grounds. Gear improvement, as the water rises we need to make our out rigger bigger to reach the button and strong enough for the weather that has to come while we're out there.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiessy, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Maggie Miller

After reading this and evaluating all the alternatives, the first alternative is still the best choice. There are some concerns with this, such as temporary habitat degradation. Still, this method also considers the flow rate at which the Mississippi River prevents the reverse flow of sediments from the Barataria Basin. Going with the second alternative could avoid reversal flow and cause the least amount of temporary habitat degradation, but it will also limit the growth of the Barataria Basin. Therefore, I believe that temporary habitat degradation can be overlooked to provide a better outcome. But something that this project does not consider is the number of sediments that are trapped upstream by dams further north on the Mississippi River (National Academies Press, 2011, 100). Will there be enough sediment and a consistent amount of deposit to maintain the repairs to the coastal wetlands? To keep this project, will changes need to be made upstream on the Mississippi River? With these questions in mind, I believe that it would be essential to understand how dams affect this project and how the removal could benefit this project or make it more sustainable. Another factor that should be addressed in this project is how recreational activities will need to be limited to protect the area as it is recovering. Certain water activities can also cause changes to the outflow of sediments, and this is a crucial piece of information that has been overlooked in this project.

Reference:

S.), National Academies Press (U. "Sediment Management Alternatives and Opportunities." Essay. In Missouri River Planning: Recognizing and Incorporating Sediment Management, 88-102. National Academies Press, 2011.

---

**Concern ID: 61786**

**The commenter stated that something that this Project does not consider is the number of sediments that are trapped upstream by dams farther north on the Mississippi River, calling into question whether there would be enough sediment in the river to build coastal wetlands in the basin. The commenter requested that a study be conducted to determine whether changes like the removal of dams would need to be made upstream of the diversion for the Project to achieve land and wetland creation goals.**

**National Academies Press. 2011. Sediment Management Alternatives and Opportunities. Missouri River Planning: Recognizing and Incorporating Sediment Management, 88-102.**

**Response ID: 16416**

The commenter's concerns regarding the sediment load of the river were considered in the Draft EIS. The USACE agrees that the Mississippi River is carrying much less sediment than it did in the past. It still carries a massive sediment load, but not as massive as before. As explained in Chapter 3, Section 3.4.2.5 Sediment Transport, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. As stated in the National Academies report cited

by the commenter, the possible causes of the diminished sediment load include both trapping by dams and hardening of banklines. Other possible contributing factors include improved farming practices across the river basin, as explained in Chapter 3, Section 3.4 Surface Water and Coastal Processes. Quantifying the relative contributions of multiple factors to the diminished sediment load is a worthy research project, but beyond the scope of the Draft EIS. Appendix E Delft3D Modeling, Section 5.2.2 of the EIS takes the diminished sediment load into account when computing the sediment load that would be delivered to the Barataria Basin. The National Academies Press (2011) citation has been added to the discussion in Chapter 3, Section 3.4.2.5.1 Historical Context in Surface Water and Coastal Processes in the Final EIS.

---

**Concern ID: 61907**

**Commenters suggested that recreational activities would need to be limited to protect the area as it is recovering. In addition, water activities can cause changes to the outflow of sediments.**

**Response ID: 16237**

The issues raised by the commenters were considered in the Draft EIS. EIS Chapter 4, Section 4.16.5.2 in Recreation and Tourism describes how the proposed Project would impact recreational and sport fishing in the Barataria Basin, including the potential for the Project to affect site accessibility due to sedimentation in some navigation channels. Permanent, moderate, adverse impacts on boat-based recreation may occur where sedimentation from proposed Project operations accumulates to the extent that water depths decrease and restrict access to deeper draft vessels.

---

**Concern ID: 61913**

**While a commenter acknowledges temporary habitat degradation with the Applicant's Preferred Alternative, the commenter supports the Applicant's Preferred Alternative.**

**Response ID: 16000**

The commenter's support of the proposed Project is acknowledged. Refer to Chapter 4, Section 4.9 Terrestrial Wildlife and Habitat of the EIS for terrestrial wildlife and habitat impacts.

---

**Correspondence ID:26571**

Anita Klaeser

The Mid-Barataria Sediment Diversion has been heavily researched and seems to be an adequate solution for restoring habitat after the Deepwater Horizon oil spill. There have been sufficient alternatives evaluated and the process for evaluation did not seem to be flawed. However, I think that the public participation process is flawed. The public participation options did include a wide range of activities from in-person meetings and media events to conferences and environmental NGOs. However, the geographical range for these events did not extend very far. Because this project was brought into motion because of the Deepwater Horizon oil spill, which was covered by media nationally, I believe that the public participation for this project should extend beyond coastal Louisiana. There are many people throughout the country that were invested in the outcome of the Deepwater Horizon oil spill that would be interested in knowing what measures are being taken to restore the areas that were most affected. While expanding community meetings may take too much time or cost too much money, I think that expanding certain public participation methods such as media events or environmental NGOs beyond Coastal Louisiana would be productive for the project. This project is a great example of one option for restoration after an oil spill and there are likely people beyond Louisiana that have expertise in this field that could be helpful in the public participation process. Ensuring that the project is able to have the best possible commentary from experts in the field is essential to its success. Expanding the geographical location of the public participation would allow for more expertise during the comment period.

---

**Concern ID: 61953**

**The public participation process is flawed because the public participation for this proposed Project should extend beyond coastal Louisiana. Expanding certain public participation methods such as media events or environmental NGOs beyond coastal Louisiana would be productive for the proposed MBSD Project. This proposed Project is a great example of one option for restoration after an oil spill and there are likely people beyond Louisiana that have expertise in this field that could be helpful in the public participation process. Ensuring that the proposed Project is able to have the best possible commentary from experts in the field is essential to its success.**

**Response ID: 15897**

The public participation process has been and would continue to be open to all public, agency, and stakeholder input regardless of geographic residence. USACE has provided multiple means for the public to engage in the permit and environmental review processes including providing public notices for the permit application and the scoping process, and for the Draft EIS through Federal Register notices, press releases, newspapers, mail outs to distribution lists, and libraries. Materials and information related to the proposed Project are available on the USACE New Orleans District website, including the Draft EIS at <http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>. The virtual nature of the public meetings held for the Draft EIS and LA TIG's Draft Restoration Plan in April 2021 allowed participants from any geographic residence to participate in the meetings and provide verbal comments through a internet/web-based conferencing application or by telephone.

---

Approximately 39,303 (out of 40,699) comments on the Draft EIS were received from outside the State of Louisiana.

CPRA and the LA TIG would continue to seek input from the public, agencies, and groups interested in and affected by coastal restoration, including the proposed Project if implemented, and other restoration efforts.

---

**Correspondence ID:26724**

Gillian F

Hello,

The first issue that comes to mind in this project is the cost- -yes, the environmental costs, of course, but also the long-term financial costs of it. At first glance, it does seem incredibly possible and beneficial to the area. BP is setting aside \$8 billion to account for the disaster they caused a decade ago; the Mid-Barataria Sediment Diversion Project will cost around \$2 billion. Not only is that cost covered, but it is only a piece of BP's fund. Even if the project goes over budget, there is so much wiggle room that it doesn't even seem possible that the project would need any additional coverage. However, I do wonder about the timeline and long-term effects of the project and what its upkeep costs might end up becoming, as well as the cost of what local basin oystermen and fishermen will incur by how the new freshwater will impact their catches. With the project set to last about 50 years, what will truly happen after its lifetime ends, or even before then? With current climate change trends (which could easily become more severe) leading to rising sea levels, it seems that a very close watch on this project would need to be kept in order for the concrete structure in Plaquemines Parish to change with any rising sea levels and changing water flows. At the area's current state, this project's benefits seem to very much so outweigh any negatives. But with the unpredictability of the local and national environmental health, there seems to be the possibility of complications, especially for local residents' land. The project will bring elevated water levels and those levels can certainly negatively impact the locals' land through things like flooding.

To perhaps better account for that possibility, perhaps using some more of BP's fund to create protections against inevitable flooding for local residents could alleviate at least some of the downsides and potential negative impacts of the project. As of right now, the solutions proposed to alleviate the hardships that will be inflicted on locals often seem inadequate. For example, the offer to pay for refrigeration for shrimp boats because of longer journeys now necessary for catching shrimp only helps boats that can even handle that sort of equipment; most shrimping boats cannot (Schleifstein 2021). Much of the collaboration between project officials and local fishermen seems performative, like nothing significant will actually come of it. Putting in more time to communicate with these workers could result in better ideas that work for both parties. In short, the project has support- -and it should. It is possible and has great potential to benefit the environment. However, there are probable negative effects that should be focused on more, and communication with locals should have a much higher level of consideration and influence.

Schleifstein, Mark. 2021. "The Host Parish for Mid-Barataria Diversion Just Voted against It; Here's Why." The Times Picayune, April 9, 2021.

[https://www.nola.com/news/environment/article\\_a787e932-996f-11eb-9b2a-8b8fd10c9798.html](https://www.nola.com/news/environment/article_a787e932-996f-11eb-9b2a-8b8fd10c9798.html).

**Concern ID: 63934**

**Implementing agencies should be adaptive and transparent in how they mitigate impacts to communities. CPRA has done a great job in outreach and the same level of outreach and engagement should continue through construction and Project operation.**

**Response ID: 16581**

---

CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. Further, CPRA engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA would continue outreach to help ensure that impacted communities become aware and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded. The MAM Plan also includes particular measures including engagement with stakeholder groups. See Section 2.2.2.2 (Stakeholder Review Panel) of the MAM Plan (Appendix R2 to the Final EIS).

**Correspondence ID:26873**

## Form Letter 16

Louisianas coast is in crisis. The ongoing loss of its coastal wetlands, which has already claimed an area equal in size to the state of Delaware, makes communities increasingly vulnerable to stronger hurricanes and sea level rise.

This loss, coupled with saltwater intrusion and sea level rise, threatens the health and stability of the entire Barataria Basin upon which a number of communities, wildlife and vital resources depend. This region continues to feel the impacts of the Deepwater Horizon Oil Spill, which further decimated wetlands and devastated wildlife more than 10 years ago.

In the face of these challenges, we have an opportunity to harness the natural land-building power of the Mississippi River to maintain vital wetlands and restore the health and vitality of the entire ecosystem. I support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the Army Corps and Louisiana Trustee Implementation Group:

- Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion: For decades, scientists and engineers have considered all the tools available and overwhelmingly agree that this project is the best long-term solution and necessary to meet the challenges we face from land loss, sea level rise and climate change. Reconnecting the river to nearby wetlands through this project provides our greatest opportunity to avoid a devastating future for Louisianas communities, wildlife and economy. The Mid Barataria Sediment Diversion is the cornerstone of Louisianas Coastal Master Plan and will help support and enhance the lifespan of other coastal restoration and protection projects.
- Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan: As Barataria Basin continues to recover from the devastating impacts of the oil spill, this project is vital to restoring the health and function of the entire ecosystem. The Mid-Barataria Sediment Diversion is the single largest ecosystem restoration project in the history of the United States. Combined with other proposed restoration projects, the Mid-Barataria Sediment Diversion would build and preserve more than 17,000 acres of wetlands over the next 30 years to restore critical wetland habitat injured by the oil spill. It is exactly the scale needed to address the very serious challenges facing Louisianas coast.

As the project advances, I urge federal and state decision makers to consider the following:

- Center community needs in planned mitigation and stewardship efforts. This project will have many positive, long-term benefits for coastal communities, including increased storm surge protection from restored wetlands, job creation and regional economic impact during construction, and increased productivity of natural resources. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. We applaud the commitment of the Federal Trustees and Louisianas Coastal Protection and Restoration Authority to address impacts that could result from the construction and operations of the project. Louisiana and the other Trustees will dedicate approximately \$300 million to fund a robust stewardship and mitigation plan, addressing any potential impacts that may occur. The Trustees must work proactively and collaboratively with potentially impacted

communities to develop and implement ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning and implementation processes.

- Commit to developing a robust adaptive management program: To ensure the project meets its restoration goals in response to changing environmental conditions, I encourage the development and implementation of a robust adaptive management program that incorporates knowledge gained from monitoring of the project over time and also considers input from key stakeholders.

A future without the Mid Barataria Sediment Diversion is a future we cannot afford, which is why I support the preferred alternative outlined in the draft Environmental Impact Statement and the expenditure of Deepwater Horizon settlement dollars to pay for the projects construction and associated mitigation and stewardship activities.

---

**Concern ID: 61716**

**The ongoing loss of Louisiana’s coastal wetlands makes communities increasingly vulnerable to stronger hurricanes and sea-level rise and threatens the health and stability of the entire Barataria Basin upon which a number of communities, wildlife, fish nurseries, sportsman culture, economy, and vital resources depend.**

**Response ID: 16026**

The importance of maintaining wetlands for the protection of coastlines, coastal communities, wildlife resources, and recreation was considered in the Draft EIS in Sections 3.6 Wetland Resources and Waters of the U.S., 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, and 3.16 Recreation and Tourism.

---

**Concern ID: 62675**

**Commenters noted that the impacts of the DWH oil spill on wetlands, wildlife, birds, communities, and land loss are still felt by this region and in particular, Barataria Basin where 95 percent of the oiling occurred. These impacts are exacerbated by decades of saltwater intrusion, sea-level rise, and subsidence.**

**Response ID: 16497**

The impacts of the DWH oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss of the EIS notes the ongoing impact of the DWH oil spill on wetlands, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species of the EIS provides an overview of the adverse impacts of the oil spill on key aquatic species within the Barataria Basin.

The LA TIG agrees with the commenters that the impacts of the DWH oil spill are significant in this region and thus the LA TIG is committed to continuing to plan and implement significant restoration projects like the LA TIG’s Preferred Alternative in the Restoration Plan. The LA TIG’s Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin. These habitats are critical components of the broader northern Gulf of Mexico ecosystem and suffered the greatest degree of oiling in Louisiana due to the DWH oil spill.

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates**

---

**knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63361**

**Move this proposed Project forward and prohibit the oil companies from endangering the local people and their way of life.**

**Response ID: 16323**

The commenter's support for the proposed Project is noted. The regulation of oil companies and their activities is outside the scope of the EIS, as described in Chapter 1, Section 1.6 of the EIS; however, past, present, and reasonably foreseeable activities in the Project area (including oil and gas activities) are included in the Cumulative Impacts assessment (Chapter 4, Section 4.25 Cumulative Impacts of the EIS), where their contribution to impacts on resources within the proposed Project area are considered. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

---

Anthony Henry

My name is Anthony Henry. I have washed the leases in Bayou Cook in Bay Adams. My grandfather started this back in 1920. We'll keep trying to keep a family tradition going and your type of waterway will ruin the whole system. It is not appreciated in any respect. There should be different ways that you can find to make land since the oil companies already tore it up, now you're going to totally ruin it. No thank you for it, and, just letting you know, I think it's the ruination of the whole entire area. Goodbye.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

**Correspondence ID:27243**

Scott Bergeron

I don't want the fresh water conversion. Because it will raise the water levels the streets that are already flooding. Also it will erode the streets that need to be fixed already. Stop wasting money on that and put in a levy with a gate around the Myrtle Grove subdivision. To protect millions of dollars of real estate and the streets from repair.

---

**Concern ID: 63103**

Commenter suggests that a floodgate across the canal would be a better solution and would not harm property.

**Response ID: 16641**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) outlined the mitigation measures proposed by CPRA to address and offset the projected impacts of Project operations on surrounding communities, including providing mitigation for increased water levels due to the Project. In response to comments, CPRA has expanded and refined the Final Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

As part of developing the Final Mitigation and Stewardship Plan, CPRA considered the possibility of installing a flood gate for the Myrtle Grove Marina Estates Subdivision. CPRA decided not to pursue this option for several reasons. While some property owners in Myrtle Grove have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the Barataria Basin. CPRA has proposed instead other structural mitigation measures to address the projected impacts of the Project on water levels and boat accessibility in the Mitigation and Stewardship Plan.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE

does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62224**

**Communities like Happy Jack, Lake Hermitage and Myrtle Grove, some of which have homes that are not above the new base flood elevation, already experience some degree of flooding which would be made worse by the diversion. This would affect the ability of residents to access and enjoy their homes and communities.**

**Response ID: 15757**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discuss the anticipated increased flooding impacts outside of federal levee systems to be caused by the operation of the diversion. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes, which would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to

---

installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Episcopal Church

Frederick Devall

Friends,

I fully support the Mid-Barataria Sediment Diversion. The sooner this project comes on line, the sooner we will begin stabilizing wetlands on the west bank.

From the air, one can see the vast difference between east and west bank marshes. On the east, where there are enough natural breaks in the river levees, it's easy to see the vibrant green vegetation growing on old and new- yes newly built land from the natural process of delta building. Mid-Barataria will replicate that building process on the west bank in a process that has been studied and verified.

Please do not let the interests of the few who oppose this diversion outweigh the interests of the many hundreds of thousands of people and jobs who will benefit from a healthier ecosystem and improved hurricane protection. We cannot afford further delay. The time to act is now.

Sincerely,

Fred Devall

---

**Concern ID: 63053**

**Newly built land is evident from the air on the east bank of the Mississippi River, where there are enough natural breaks in the river levees to allow the natural process of delta building.**

**Response ID: 16059**

The commenter's support for the proposed Project is noted. Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives of the Draft EIS explained how the proposed Project is designed to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin. This is also discussed in Chapter 3, Section 3.2.1.1 in Geology and Soils of the LA TIG's Restoration Plan.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

Chris Bowers

I'm not opposed to the diversion simply because I know it'll happen. All I can do is adapt and hope for the best. I harvest oysters and I am a shrimper. As far as oystering goes, I'd just reform my oyster boat into a tour boat and charge \$150 a head to take people out to see alligators because there will be plenty of them when this diversion is built. As for shrimping, that will all be killed, I'd have to take money for gear improvements and money for a bigger boat because I'd have to most definitely go out further. There's just no money in shrimping anymore sadly and this is going to be the nail in the coffin for many fishermen who don't know how to adapt or have other marketable skills to do so. I'm fortunate in that I can make money in many other ways than a lot of fishermen where I'm from. And one last thing, WHY ISN'T DREDGING AN OPTION??? Diversions aren't going to build as much land as they think, at least not fast enough. But there's some college graduate or Senator's son who said that diversions are the way and so as long as they're making money then who cares about the little guy. The paltry mitigation measures just won't be enough to make people whole despite what you all think. The industry will be KILLED BY THIS DIVERSION.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale

sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPR and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63726**

**Some commenters felt that the amounts allocated for mitigation were insufficient, while others felt that no amount of mitigation would suffice, for example for the more senior fishers who won't be in a good position to adapt to the changing environment.**

**Response ID: 16702**

The Draft EIS considered how changes in the commercial fisheries, both with and without implementation of the proposed Project, would impact more senior fishers in Chapter 4, Section 4.14.4 in Commercial Fisheries. In response to public comments and resource agency input about the proposed mitigation efforts, CPRA has expanded and refined its fisheries mitigation and stewardship measures. CPRA's mitigation and stewardship strategies and associated expenditures would focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for fisheries in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to fisheries in the early years of the Project's operational life. The provisions of the fishery mitigation and stewardship plan, valued at approximately \$54 million, would help to achieve that goal and to mitigate the impacts of the proposed Project on oyster fishers. While not mitigation for the Project impacts, examples of other restoration/fishery improvement actions include: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, CPRA's allocation of \$2 million in adaptive management funding to support off-bottom oyster culture, the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery and the LA TIG's allocation of \$38 million in recreational use funds to support subsistence and recreational fisheries. The Final Mitigation and Stewardship Plan is included in Appendix R1 to the Final EIS.

The comments of more senior fishers who expressed concern about their ability to adapt to changing fishery conditions are acknowledged. If permitted by USACE and funded by the LA TIG, it would take CPRA approximately 5 years to complete construction of the proposed Project and to begin operations. This relatively long period provides those affected with the time and opportunity to decide how they want to go forward, ranging from taking advantage of the adaptation opportunities offered through the Mitigation and Stewardship Plan (Appendix R1 to the EIS) to transitioning out of the fishing industry or retiring.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:27453**

Donald McMillion

Why would you destroy the fishing industry and sport fishing in such a huge area all in the misconception on deposits from the fresh water. The fresh water indulging into the salt water estuary will kill off many of the saltwater species and vegetation. The water flows a such a velocity that sediment can't fall out and the rushing water will erode the banks as it flows thru. Nature build up the land mass over thousands of years with over banking of the rivers during the spring that was slow moving water over the whole area before the levees where built and it is not going to be replaced with the torrent water flow from a diversion. More land will be lost than is gained until the flow slows down. Jobs will be lost due to the decline in the fishing industry, which is contrary to what the economy needs right now. Now there are dredging processes going on continuously at the mouth of the river because when the water flow slows down sediment falls out and if water from the river is diverted the water flow will slow down and more sediment will form. A better solution maybe to take the dredgings from the mouth of the river and deposit them along the barrier islands building up the area without the torrent water flow from a diversion.

In short man has changed, damaged, what mother nature took thousands of years to develop by building the levees along the river, there should have been hundreds of small overflows thru-out the South, channeling the water with its sediment to the Gulf and man can't change it in a few years.

---

**Concern ID: 61970**

**The only alternatives in the EIS are diversions at different flow rates. The EIS has not listed other possible methods on building land in the Barataria Basin. One alternative is to study the creation of barrier islands and compare the result with the diversion alternative. Also consider fortifying the barrier islands with sheet piles, boulders, and rocks, and dam all pipeline canals and washed-out marsh openings with concrete dams.**

**Response ID: 15972**

The Draft EIS considered barrier islands as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.4 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS. While barrier islands play a critical role in reducing land loss, they are not intended or designed to transport sediment, fresh water, or nutrients.

Past investments through a multitude of restoration programs have resulted in the restoration of every major barrier island in the Barataria Basin. CPRA's Coastal Master Plan includes programmatic barrier island restoration to support future maintenance of the restored islands. However, CPRA has stated that fortifying barrier islands with hard structures is not feasible.

---

**Concern ID: 62659**

**The proposed Project is an experiment, and it is not possible to guarantee its alleged benefits.**

**Response ID: 16632**

---

The uncertainties associated with the Project's success were considered in the Draft EIS. While the benefits of the Project cannot be guaranteed, the EIS uses state-of-the-art modeling, including but not limited to the Delft3D Basinwide Model, to project the Project's beneficial and adverse impacts. These modeling projections of Project impacts include uncertainties. Following standard professional practice, model uncertainties are clearly stated in the EIS with respect to the model's quantitative results. Uncertainties are incorporated into the EIS impact conclusions and are briefly summarized in EIS Chapter 4, Section 4.1.3.3 Model Limitations and Uncertainty, and in detail in Section 8.0 Model Limitations and Uncertainties of EIS Appendix E Delft3D Modeling.

The likelihood of success of the Project was also considered in the LA TIG's Draft Restoration Plan. While recognizing the innovative nature of the proposed Project, the Restoration Plan discusses in detail the factors that would contribute to the Project's success. More specifically, Sections 3.2.1.4 (Likelihood of Success - Alternative 1) and 3.2.2.4 (Likelihood of Success - Alternatives 2-6) of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, such a sediment diversion has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Section 3.2.1.4 [Likelihood of Success - Alternative 1] of the Restoration Plan). The Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62690**

---

**The proposed Project would destroy the ecosystem and its flora and fauna, including oyster, shrimp, crabs, fish, sea turtles, and dolphins.****Response ID: 16073**

As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated to those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts on the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. For example, the decrease in salinity that would occur upon initial operation of the proposed Project would result in major adverse impacts on various species (oysters, brown shrimp, bottlenose dolphins) over a relatively short period of time; however, the accumulating fresh water and sediments would create or maintain wetlands over long-term or permanent basis (that is, extending through the remainder of the 50-year period of analysis) which would benefit other commercially or recreationally important aquatic species such as white shrimp, blue crab, and Gulf menhaden, and would increase storm protection for communities north of the immediate outfall area; the Delft3D Basinwide Model projects these benefits to increase over time and to be greatest in the 2060s (see Chapter 4, Sections 4.6.5.1 in Wetland Resources and Waters of the U.S., 4.10.4.5 in Aquatic Resources, 4.11.5.2 in Marine Mammals, and 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction). As discussed in Section 4.12.2.2 Sea Turtles, the proposed Project would have negligible to minor adverse impacts on hawksbill and leatherback sea turtles, but minor to moderate adverse impacts on Kemp's ridley, green, and loggerhead sea turtles due to the potential for increased interactions between sea turtles and commercial shrimp fishing efforts, if shrimp and shrimp fishers move from mid-basin locations to locations lower in the basin or in nearshore/offshore waters (where more sea turtles would be present). However, NMFS has determined that these impacts would not jeopardize the continued existence of sea turtles (see Appendix O4 NMFS Biological Opinion of the Final EIS).

The USACE and the LA TIG are evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the LA TIG's Restoration Plan). The intended restoration of fresh water flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions in the basin. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the

---

suitability of habitat for many of the species that currently occur in Barataria Basin. The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. The LA TIG's Restoration Plan indicates that by reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Final Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the NRDA Trustees' Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

The CPRA has revised its Mitigation and Stewardship Plan and Monitoring and Adaptive Management (MAM) Plan in response to public concerns about these impacts. See Appendices R1 and R2 to the Final EIS for more information.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider

public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:27745**

Scott McQuaig

Dear Sirs - My parents and I have been residents of Happy Jack, Louisiana, for over fifty years. The following are our comments relative to the proposed Mid-Barataria Diversion project. We oppose the project, for the following reasons. First, the effect it will have on the fisheries upon which we all rely will be devastating. It will negatively change the salinity levels and corresponding eco-system for miles below the project location. Next, it has been projected that the project will result in a permanent increase of our water levels by .5 ft to over 1 foot or more. An increase of this amount will render our road useless, will put most of our homes, lots, docks and boathouses under water, and will negatively change the flood elevation levels of our homes making them uninsurable. We have been advised that mitigation and remediation funds will be allocated to compensate property owners in this regard. Once again, an increase in the water level to that extent will require all of our docks, boathouses, homes, and lots to be raised and elevated to avoid the higher water levels and allow usage of our properties, and will also require the construction of a new road as our existing road will be permanently underwater. It is suggested that the amount of funds presently discussed for these purposes is woefully insufficient. Property owners in our area have lived there and paid taxes for many, many years and our properties should not be sacrificed at our expense. Finally, the project in question is not accompanied by other collateral, and likely more efficient projects, such as the construction of linear islands in Barataria Bay, which would stop storm surge and create natural barriers to further erosion. We oppose the project.

---

**Concern ID: 61970**

**The only alternatives in the EIS are diversions at different flow rates. The EIS has not listed other possible methods on building land in the Barataria Basin. One alternative is to study the creation of barrier islands and compare the result with the diversion alternative. Also consider fortifying the barrier islands with sheet piles, boulders, and rocks, and dam all pipeline canals and washed-out marsh openings with concrete dams.**

**Response ID: 15972**

The Draft EIS considered barrier islands as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.4 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS. While barrier islands play a critical role in reducing land loss, they are not intended or designed to transport sediment, fresh water, or nutrients.

Past investments through a multitude of restoration programs have resulted in the restoration of every major barrier island in the Barataria Basin. CPRA's Coastal Master Plan includes programmatic barrier island restoration to support future maintenance of the restored islands. However, CPRA has stated that fortifying barrier islands with hard structures is not feasible.

---

**Concern ID: 62083**

**Commenters suggested that shrimping, fishing, and oysters would disappear in the Barataria Basin because of the fresh water diluting the salinity to a level that cannot sustain breeding of these species.**

**Response ID: 16247**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS described impacts of the proposed Project on finfish and shrimp and oyster species. As described, impacts may include those associated with changes in salinity. As summarized in EIS Section 4.14.5 in Commercial Fisheries, as compared to the No Action Alternative moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative sometime after 2050. While abundance of shrimp and oysters would decline under the Applicant's Preferred Alternative (as compared to the No Action Alternative), the EIS impact analysis does not anticipate shrimp and oysters would disappear from the basin. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the

final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project. Impacts related to subsistence activities are discussed in Section 4.15 Environmental Justice.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63102**

**Commenters expressed concern that they will not be able to use their property if the Project proceeds. Commenters believe that the amount of funds proposed for mitigation is insufficient.**

**Response ID: 16640**

The commenters' concern regarding the adequacy of the funding for mitigation measures was considered by CPRA and the LA TIG in developing CPRA's Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included proposals to address and partially offset some of the projected impacts of the Project on surrounding communities outside levee protection, including potential mitigation measures to address increased water levels due to the Project. In response to comments, CPRA further expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

---

The mitigation and stewardship measures would vary by community. In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the Project. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and the utilities of those communities. Also in these communities, CPRA plans to acquire Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in

those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:27854**

Amy Weeks

Dear U.S. Army Corps of Engineers, New Orleans District,

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion, and I urge the U.S Army Corps of Engineers to move forward with construction quickly. 30 years of research has led to this point. It is time to act.

I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

Louisiana's coast is in crisis, putting coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

1. Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.
2. Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

As the project advances, I urge federal and state decision-makers to do the following:

1. Develop a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders as well as local community members.
2. Work proactively and collaboratively with potentially impacted communities including local tribal communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

I look forward to seeing the development of resilient coastal communities via the proposed and well-researched plan. We will all benefit from it.

Thank you.

Sincerely,

Amy Weeks

Farmington, MI 48336

---

**Concern ID: 61741**

**Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40 percent of all migratory birds in North America spend a part of their life in coastal Louisiana.**

**Response ID: 16162**

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment. The use of Louisiana's coastal habitats by a large diversity of birds is discussed in Chapter 3, Section 3.9.3 in Terrestrial Wildlife of the EIS. The benefits that the

Project would provide to birds are discussed in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.12 Threatened and Endangered Species of the EIS.

---

**Concern ID: 61756**

**The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.**

**Response ID: 15891**

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders

and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public

---

through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:27923**

## Form Letter 17

Louisiana's coast is in crisis and along with it, a huge part of our American hunting and fishing legacy is in jeopardy. Our Sportsman's Paradise attracts hunters and anglers from all over the world, and is a critical component of our sportsman culture - - not to mention offering major economic impact. The ongoing loss of Louisiana's coastal wetlands threatens the health and stability of the entire Barataria Basin upon which a number of communities, wildlife and vital resources depend. This region also continues to feel the impacts of the Deepwater Horizon oil spill, which further decimated wetlands and devastated wildlife more than 10 years ago.

In the face of these challenges, we have an opportunity to harness the natural land-building power of the Mississippi River to maintain vital wetlands and restore the health and vitality of the entire ecosystem. I support moving forward with the Mid-Barataria Sediment Diversion as the preferred alternative as outlined in the Draft Environmental Impact Statement. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon oil spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following:

\*Reconnect the river to its nearby wetlands and move forward with the Mid-Barataria Sediment Diversion as the preferred alternative outlined in the Draft Environmental Impact Statement: For decades, scientists and engineers have considered all the tools available and overwhelmingly agree that this project is the best long-term solution and necessary to meet the land loss challenges we face from storms, sea level rise and climate change.

\*Use money from the Deepwater Horizon oil spill settlement to fund the project, as outlined in the draft Restoration Plan: As Barataria Basin continues to recover from the devastating impacts of the oil spill, this project is vital to restoring the health and function of the entire ecosystem. The Mid-Barataria Sediment Diversion is the single largest ecosystem restoration project in the history of the United States. The Mid-Barataria Sediment Diversion would build and preserve more than 17,000 acres of wetlands over the next 30 years to restore critical wetland habitat injured by the oil spill. It is exactly the scale needed to address the very serious challenges facing Louisiana's coast.

As the project advances, I urge federal and state decision makers to consider the following:

\*Center community needs in planned mitigation and stewardship efforts. The Trustees must work proactively and collaboratively with potentially impacted communities to develop and implement ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning and implementation processes.

\*Commit to developing a robust adaptive management program: To ensure the project meets its restoration goals in response to changing environmental conditions, I encourage the development and implementation of a robust adaptive management program that incorporates knowledge gained from monitoring of the project over time and also considers input from key stakeholders.

A future without the Mid-Barataria Sediment Diversion is a future sportsmen cannot afford, which is why I support the preferred alternative outlined in the draft Environmental Impact

---

Statement and the expenditure of Deepwater Horizon settlement dollars to pay for the project's construction and associated mitigation and stewardship activities.

Thank you,

Amanda Moore

**Concern ID: 61716**

**The ongoing loss of Louisiana's coastal wetlands makes communities increasingly vulnerable to stronger hurricanes and sea-level rise and threatens the health and stability of the entire Barataria Basin upon which a number of communities, wildlife, fish nurseries, sportsman culture, economy, and vital resources depend.**

**Response ID: 16026**

The importance of maintaining wetlands for the protection of coastlines, coastal communities, wildlife resources, and recreation was considered in the Draft EIS in Sections 3.6 Wetland Resources and Waters of the U.S., 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, and 3.16 Recreation and Tourism.

---

**Concern ID: 62675**

**Commenters noted that the impacts of the DWH oil spill on wetlands, wildlife, birds, communities, and land loss are still felt by this region and in particular, Barataria Basin where 95 percent of the oiling occurred. These impacts are exacerbated by decades of saltwater intrusion, sea-level rise, and subsidence.**

**Response ID: 16497**

The impacts of the DWH oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss of the EIS notes the ongoing impact of the DWH oil spill on wetlands, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species of the EIS provides an overview of the adverse impacts of the oil spill on key aquatic species within the Barataria Basin.

The LA TIG agrees with the commenters that the impacts of the DWH oil spill are significant in this region and thus the LA TIG is committed to continuing to plan and implement significant restoration projects like the LA TIG's Preferred Alternative in the Restoration Plan. The LA TIG's Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin. These habitats are critical components of the broader northern Gulf of Mexico ecosystem and suffered the greatest degree of oiling in Louisiana due to the DWH oil spill.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

---

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach

---

efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:27968**

Form Letter 18

Louisiana's coast is in crisis. This region also continues to feel the impacts of the Deepwater Horizon oil spill, which further decimated wetlands and devastated wildlife more than 10 years ago.

In the face of these challenges, we have an opportunity to harness the natural land-building power of the Mississippi River to maintain vital wetlands and restore the health of the entire ecosystem to ensure the wildlife and habitat Louisiana is famous for has a more sustainable future.

I ask the following:

\*Reconnect the river to its nearby wetlands and move forward with the Mid-Barataria Sediment Diversion as the preferred alternative outlined in the Draft Environmental Impact Statement. For decades, scientists and engineers have considered all the tools available and overwhelmingly agree that this project is the best long-term solution and necessary to meet the land loss challenges we face from storms, sea level rise and climate change.

\*Use money from the Deepwater Horizon oil spill settlement to fund the project, as outlined in the draft Restoration Plan. As Barataria Basin continues to recover from the devastating impacts of the oil spill, this project is vital to restoring the health and function of the entire ecosystem. A future without the Mid Barataria Sediment Diversion is a future we cannot afford, which is why I support the preferred alternative outlined in the draft Environmental Impact Statement and the expenditure of Deepwater Horizon settlement dollars to pay for the project's construction and associated mitigation and stewardship activities.

Thank you,

Lynne Rosenfield

---

**Concern ID: 62680**

**Commenters noted the long-term impacts that have been felt since the oil spill 10 years ago and supported using the natural land-building power of the Mississippi River to maintain and restore the health of the entire ecosystem for the future.**

**Response ID: 16500**

The long-term impacts of the oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss notes the ongoing impact of the DWH oil spill on wetland loss, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species provides an overview of the adverse impact of the oil spill on key aquatic species within the Barataria Basin.

The LA TIG believes that reconnecting and reestablishing deltaic processes between the Mississippi River and Barataria Basin is critical for supporting the long-term viability of existing and planned coastal restoration efforts. These deltaic processes include sediment retention and accumulation and new delta formation. As discussed in Section 3.2.1.6 Benefits Multiple Resources of the LA TIG's Restoration Plan, through reconnecting and reestablishing these sustainable deltaic processes, the Project would help restore the habitat and ecosystem services injured in the northern Gulf of Mexico by the DWH oil spill.

---

**Concern ID: 63337**

---

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Webley Bourgeois

I've been a commercial fishermen all my life and really don't know of any other way to make a living. And although I'm considered a younger fishermen at 49 years old, I don't think I'd benefit from workforce training because employers don't want to hire older people and especially inexperienced. I dropped out of school when I was in the 8th grade and unfortunately I don't have the technical skills to effectively market my business even with help the likes of LA Sea Grant who'd probably assist fishermen with marketing strategies. I could see myself applying for a grant for gear improvements for my existing vessel and/or a refrigeration unit, but then my maintenance expenses would go up because it'd be a bigger boat with more complex equipment to maintain. If I did apply for those grants then I'd definitely need help with covering the increased expense costs for at least five years. Put it this way, I'd be going from driving a Hyundai to a Mercedes and those oil changes aren't the same price. You can't just give me a Mercedes and expect me to be able to afford it right away when you took away my perfectly operating Hyundai! Furthermore, the nuisance flooding will be an issue so I'd definitely need money to elevate my home and what about flood insurance costs? Will my increase premiums be covered too? I'd support a mitigation measure of a lump sum of \$25,000 for each fishermen as well, especially for those who are lower income because we'd be affected the most.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship

---

measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected

impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted**

---

**mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to

---

implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:28181**

Flowers, Bobbie

Louisianas coast is in crisis. The ongoing loss of its coastal wetlands, which has already claimed an area equal in size to the state of Delaware, makes communities increasingly vulnerable to stronger hurricanes and sea level rise.

This loss, coupled with saltwater intrusion and sea level rise, threatens the health and stability of the entire Barataria Basin upon which a number of communities, wildlife and vital resources depend. This region continues to feel the impacts of the Deepwater Horizon Oil Spill, which further decimated wetlands and devastated wildlife more than 10 years ago.

As the project advances, I urge federal and state decision makers to consider the following:

- Center community needs in planned mitigation and stewardship efforts. This project will have many positive, long-term benefits for coastal communities, including increased storm surge protection from restored wetlands, job creation and regional economic impact during construction, and increased productivity of natural resources. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. We applaud the commitment of the Federal Trustees and Louisianas Coastal Protection and Restoration Authority to address impacts that could result from the construction and operations of the project. Louisiana and the other Trustees will dedicate approximately \$300 million to fund a robust stewardship and mitigation plan, addressing any potential impacts that may occur. The Trustees must work proactively and collaboratively with potentially impacted communities to develop and implement ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning and implementation processes.

- Commit to developing a robust adaptive management program: To ensure the project meets its restoration goals in response to changing environmental conditions, I encourage the development and implementation of a robust adaptive management program that incorporates knowledge gained from monitoring of the project over time and also considers input from key stakeholders.

A future without the Mid Barataria Sediment Diversion is a future we cannot afford, which is why I support the preferred alternative outlined in the draft Environmental Impact Statement and the expenditure of Deepwater Horizon settlement dollars to pay for the projects construction and associated mitigation and stewardship activities.

---

**Concern ID: 61716**

**The ongoing loss of Louisiana’s coastal wetlands makes communities increasingly vulnerable to stronger hurricanes and sea-level rise and threatens the health and stability of the entire Barataria Basin upon which a number of communities, wildlife, fish nurseries, sportsman culture, economy, and vital resources depend.**

**Response ID: 16026**

The importance of maintaining wetlands for the protection of coastlines, coastal communities, wildlife resources, and recreation was considered in the Draft EIS in Sections 3.6 Wetland Resources and Waters of the U.S., 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, and 3.16 Recreation and Tourism.

---

**Concern ID: 62675**

---

**Commenters noted that the impacts of the DWH oil spill on wetlands, wildlife, birds, communities, and land loss are still felt by this region and in particular, Barataria Basin where 95 percent of the oiling occurred. These impacts are exacerbated by decades of saltwater intrusion, sea-level rise, and subsidence.**

**Response ID: 16497**

The impacts of the DWH oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss of the EIS notes the ongoing impact of the DWH oil spill on wetlands, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species of the EIS provides an overview of the adverse impacts of the oil spill on key aquatic species within the Barataria Basin.

The LA TIG agrees with the commenters that the impacts of the DWH oil spill are significant in this region and thus the LA TIG is committed to continuing to plan and implement significant restoration projects like the LA TIG's Preferred Alternative in the Restoration Plan. The LA TIG's Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin. These habitats are critical components of the broader northern Gulf of Mexico ecosystem and suffered the greatest degree of oiling in Louisiana due to the DWH oil spill.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances

---

where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project

alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

JoAnn Harper

I live in Bay St Louis, MS on the Jordan River which leads into the MS Sound and the Gulf of Mexico. Two summers ago fresh water was dumped into the MS River causing a Blue/Green Algae that caused the MS Gulf Coast beaches and businesses to close, it was devastating to the economy of the Gulf Coast. Bay St. Louis had the most adverse effects because of its location. Dolphins and sea turtles died because of the salinity of the water changing! Oyster beds, fish and shrimp died along with tourism, restaurants, hotels and a multitude of other businesses. This happened from April through October 2019. So we've had a preview of what this project would cause to MS Gulf Coast and it's unfathomable that this project is actually being considered and in the report it doesn't even mention the effects on the water, animals, economy or lives of Mississippi!

This project should not be delayed any further it just should NOT be approved, EVER!

Sincerely,

JoAnn Harper

**Concern ID: 62786**

**Multiple commenters expressed concern with the impacts of diverted waters on the economy and natural environment of the State of Mississippi.**

**Response ID: 16368**

The proposed Project is not anticipated to have discernable effects on resources outside of the Project area, which is limited to Louisiana, and particularly the Barataria Basin and the Mississippi River birdfoot delta (as defined in Chapter 3, Section 3.1.1 in Introduction and the subsections entitled Area of Potential Effects for each resource heading in Chapter 4 Environmental Consequences). Because these resource-specific areas of potential effects were determined based on the anticipated limits of discernable impacts, negligible to no impacts on the natural or human environment are anticipated in the State of Mississippi from the construction and operation of the proposed MBSD Project.

Re: Mid-Barataria Sediment Diversion EIS

Dear Mr. Brad LaBorde:

This is an unsolicited set of comments on the Mid-Barataria Sediment Diversion EIS. I have read the permit application, examined aerial photographs and published multiple scientific journal articles on issues involved in the diversion impacts.

For the record, we have never met that I can recall; you did not request these comments; and I am providing these comments as a private citizen who has an interest in the stewardship of Louisiana's natural resources. My work address is at LSU, where I have been for 45 years. My expertise includes professional credentials as a research scientist and teacher in wetland ecology at the local, regional and international level.

Sincerely,

R. Eugene Turner

### Summary

The EIS for the proposed Mid-Barataria Diversion (MBD) is premature, the modeling justifying it is incomplete and not trustworthy, and the anticipated benefits are contradicted by empirical data from three large diversions operating for decades. The model does not use any results from these three diversions to calibrate the model. Cautionary notes in the Appendix E (model results) self-identify some sources of this model uncertainty. The low and high sea level rise numbers used to compute land gain and loss are already present for the low one and the high one is not high enough, at all. There would be zero land gain for the high one if realistic SLR rates were used. There are mis-representations about how nutrients in the river will spread out far from the sand deposition area to lower plant biomass belowground. Proven alternatives to build land are not discussed, which would increase wetland area faster and for a much lower cost per area.

## 1

## The existing diversions caused land loss

There are three river diversions on the east and west bank of the Mississippi River go into emergent wetlands. These three diversions resulted in land loss after they began. One is the constructed Caernarvon Diversion that opened in 1992, another is the St. Philips natural crevasse that opened in 1973. A third is the Davis Pond diversion that opened in 2002. These three are discussion below.

### Caernarvon

The Coastwide Reference Monitoring System (CRMS) administered by the Louisiana Department of Natural Resources collects data on plant cover in geographically fixed 1 km<sup>2</sup> sites (Fig. 1). There are 14 sites within the Caernarvon flow path and 18 outside of the flow path located to the east, north and west. There are 65 data sets with a mean  $\pm$  1 SEM of the percent plant cover values in each quadrat from 1985 to 2016. The time periods are for: 1) before the diversion was operational in 1991, 2) after operation began, but before Hurricane Katrina, and, 3) after Hurricane Katrina (n = 8, 16, and 11 years, respectively). The data for CRMS stations within the Caernarvon diversion flow path of Breton Sound were sub-divided into the 7 northern and the 7 southern stations. A Before-After, Control-Impact (BACI) analysis (Underwood 1994) was done using the General Linear Models (GLM) procedure in SAS/STAT software (Version 9.4 TS level 1M2) of the SAS System for Windows (Copyright © [2002-2012] SAS Institute Inc., Cary, NC, USA). The "Before" and "After" classes are based upon the timing of the event being studied (diversion and hurricane). The "Control stations" were the CRMS stations outside of the diversion flow path and the "Impact" stations were within the diversion flow path.

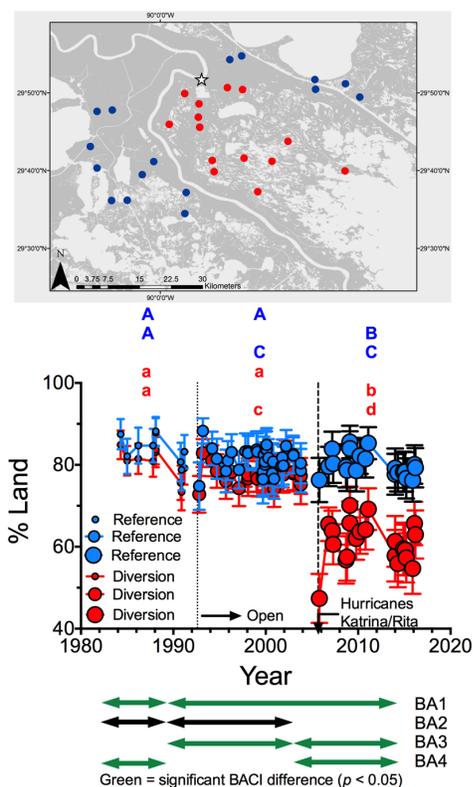

Fig. 1. The percent land in the monitoring sites within the Caernarvon diversion flow path (red dots) and outside (blue dots). The mean and SEM is shown. The data are divided into three periods: 1) small circles representing before the diversion was opened, 2) medium-sized circles after the diversion was opened, but before hurricane Katrina, and 3) the large circles after hurricane Katrina. The results from an ANOVA test for difference between the three periods is indicated by the letters where the upper case blue letters are for the reference site and the lower case red letters are in the diversion flow path. The results from the BACI test indicates a significant change in the percent land after the diversion was opened compared to before the opening for all data (BA1) and after hurricane Katrina (BA4). There was no change detected before the diversion opening and in the first few years afterwards (BA2). The %land after the diversion opened was lower after the hurricane compared to before the hurricane (BA3).

The results (Fig. 1) demonstrate a significant Control-Impact interaction term for intervals BC1, BC3, and BC4, indicating that there was a different response between the Control and Impact sites. There was no increase in the percent land within the flow path (restoration or rehabilitation) from 2010 through 2016 (Fig. 1). The percent land was the same in the 14 reference sites before the diversion opened compared to afterwards (but before the hurricane) ( $p > 0.05$ ), but lower in the flow path after the hurricane ( $p < 0.001$ ; Fig. 1). The interaction term was not significant for interval BC2 indicating that the control and impact sites had the same rate of change.

*Summary Caernarvon:* The Caernarvon diversion had no appreciable land gain, and perhaps a slight land loss in the first few years after it opened, and then considerable losses after Hurricane Katrina which resulted in a loss of 25% of the larger area (Kearney et al. 2011). The hurricane losses in the first few years afterwards were about one-third of the wetlands in the flow path.

### Fort St. Philip

The natural crevasse (100-130 thousand cfs) at Fort St. Philip was described as a “loss accelerant” in a US COE study because it has not regained the 52% of land lost when it opened in 1973 (Suir et al. 2014; Fig. 2). The Fort St. Philip diversion was about 12 times larger at maximum flood than the potential discharge size at Caernarvon, and one-third larger than the flow capacity of diversions proposed. The discharge at Fort St. Philip is not monitored on a regular basis, and so further comparisons are not possible. This natural diversion resulted in land loss.

*Summary Fort St. Philip:* The Fort St. Philip diversion had massive losses of wetlands after it was opened.

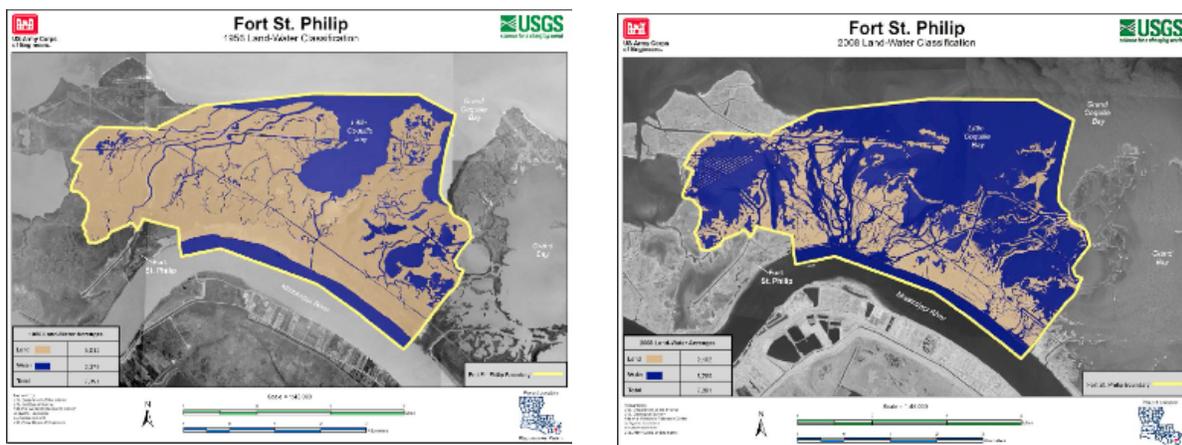

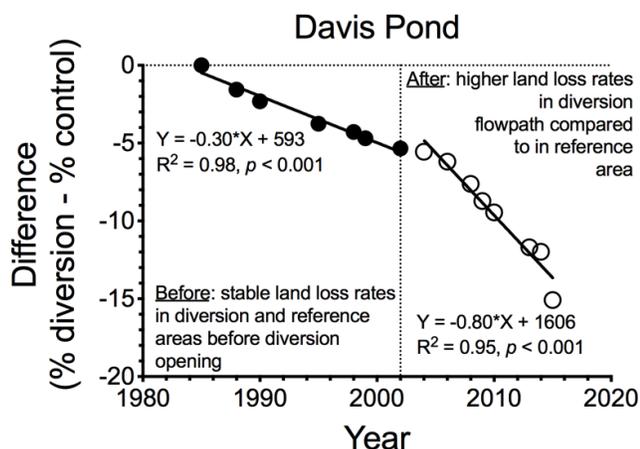

Fig. 2. 1956 and 2008 land (brown) and water (blue) at the St. Philip natural crevasse area that opened in 1973 (from Suir et al. 2014).

### Davis Pond

The Davis Pond diversion began operation in 2002, has a design capacity of  $396 \text{ m}^3 \text{ s}^{-1}$  and was projected to benefit or enhance at least  $3,278 \text{ km}^2$  wetlands (USCOE 2004). It had an average discharge of  $46.1 \text{ m}^3 \text{ s}^{-1}$  from January 2002 to August 2018. The land loss was determined using remote sensing imagery analyses that estimated the percent land in multiple years beginning in 1985. The data sets were developed using Landsat satellites equipped with different multispectral sensors. The data set is from 1985 to 2015 and is described by Couvillion et al. (2016) and located at: <https://www.sciencebase.gov/catalog/item/5a67a8cde4b06e28e9c57150>. A supervised and unsupervised classification was then used to correct for areas incorrectly classified by using only the NDWI. These steps were manually recoded by expert analysis (Couvillion 2017). The data are used by State and Federal programs to monitor land-loss trends for the whole coast and changes within specific restoration project areas (Couvillion 2017). The data were sub-divided into periods for before and after the diversion was first opened. The range in % land cover (normalized to the 1985 values = 100%) for each of the intervals. The percent land loss at Davis Pond remained stable at the reference site but decreased significantly within the diversion flow path after it was opened at an enhanced loss rate of  $0.49\% \text{ y}^{-1}$  (Fig. 3).

Fig. 3. The percent land in the flow path of the diverted water (open circles), and in the reference (filled circles) site. The data were normalized to the land area in 1985. The dotted vertical line indicates when the diversion was first opened.

*Summary Davis Pond:* Land loss inside the diversion compared to in reference area immediately outside the diversion increased from  $0.30\% \text{ y}^{-1}$  to  $0.80\% \text{ y}^{-1}$  after the diversion was opened.

### Summary: Land loss at these three diversions

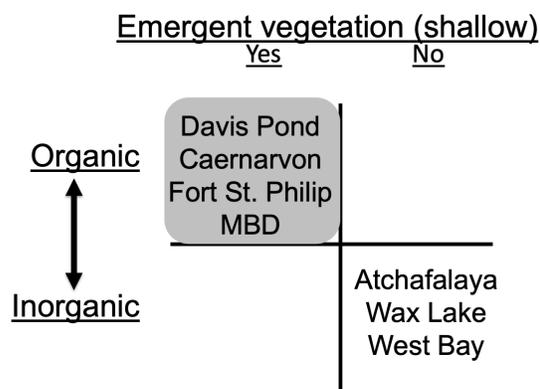

There is no evidence of a net land gain or conservation within the sites after the diversions began. There was sometimes a dramatic land loss afterwards the diversion that has not reversed. The three diversions did not create/restore land, but did result in land loss.

A pregnant question: Why would the proposed MBD be different?

## 2 Uncertainties

The computer model used to predict land gain from these diversions is not validated by reproducing the results from the existing diversions. The models used give no quantification of the unknown outcomes – a confidence interval. Their predictions could be quite wrong or right, but we will not know until the diversion is built for considerable money and time with political trust at risk. The West Bay diversion was used for model verification. But the West Bay diversion goes into mineral soils with deep water, not the shallow soils covered with emergent vegetation inhabiting organic soils (Fig. 4). The unsuccessful West Bay diversion was supposed to create 10,000 acres after 20 years and goes into deeper water, but it has no significant amounts of new emergent wetlands, except from the disposal of beneficial use materials. The Atchafalaya/Wax Lake Delta discharges one third of the flow of the Mississippi River into open water that overlies mineral soils and does not go into wetlands composed of organic soils like at the proposed diversion (Turner 2017). There is no on-the-ground data documentation, no computer code or reliable way of confirming the accuracy of the models and, therefore, and no logical reason to accept the ecosystem model output. The model output is compromised as a result.

Fig. 4. The differences between the proposed and existing diversions and the diversion used to calibrate the model.

### Uncertainties pointed out in Appendix E

Some uncertainties in the model are described in Appendix E. Sections in Appendix E say, for example, that it is an incompletely calibrated model. Some of these are quoted in the next text box. There is uncertainty in any model, but those uncertainties are not indicated in the estimates of net gain or loss – there are no ‘error bars’ as the statistician might say. One way to scale the accuracy needed is to realize that the net gain projected over the entire 50 years is between 2 and 4% of the total land area. This is a very small change that is projected. The model would have to be very precise and accurate to measure such a small change.

The incomplete physical components include consideration of geological faults that Chris McLindon’s comments described as incompletely assessed. Some of the missing, incompletely or poorly unknown processes that are not included in the model are biological – the effects of flooding, nutrients and resistance to erosion occur far from the sand deposition. The executive summary says that the “nutrients transported as part of the proposed project could contribute to increased primary production (above and below ground plant biomass)” (ES-9), which is contrary to results from multi-year experiments nearby in Louisiana and in other places (see

section on nutrients). If the model has positive influences where they are the opposite, and important drivers are absent from the model, then how is the model accuracy not compromised?

“it should be noted that even if the uncertainties associated with one single driver (for example, relative sea-level rise, rainfall) can be projected, quantifying how these uncertainties propagate in the Delft3D Basinwide Model and how they affect the prediction of a specific parameter is a very complex task, and coupled with the complexity of the model setup, feedbacks between different processes and period of predictions, *was not feasible as part of this EIS analysis.* (p.41, Appendix E; *emphasis added*)

“Finally, it should be also noted that while many of the dominant physical processes are included in the Delft#D Basinwide Model, *other common ongoing phenomena are not.* These processes might have different temporal spatial scales and variability, for example erosion caused by hurricanes, marsh edge erosion or bank erosion from vessel traffic navigable channels. *Simulating these processes is beyond the capabilities of any existing modeling software that attempts long-term change at this spatial scale. These processes can have an important role on a long-term scale,* and they are important when forecasting several decades or more into the future. (p.43, Appendix E; *emphasis added*)

“Overall, *these additional uncertainties and their effect on the model predictions are difficult to assess or quantify.*” (p. 43, Appendix E; *emphasis added*)

#### Missed opportunity to calibrate the model

One way to accommodate these uncertainties is to calibrate the model against the results from the other three diversions. In particular, the 1973 Fort St. Philip natural crevasse is well-described by the ACOE report (Suir 2012). It is the same size as the MBD and goes into shallow water with wetlands and lost 58% of its wetlands thereafter. There is no calibration of the system behavior when a diversion has been operating. Using all three diversions to calibrate the model would create conditions to the ‘bounds of expectations’ – the uncertainty.

#### Adaptive management is not a Get-Out-Of-Jail card.

What are the conditions for closure? If the MBD causes 5000 acres of wetland loss in the first 5 years, or floods Lafitte, will it be shut down?

Diverting river water for wetland restoration is new, complex and expensive, and so knowing the long-term consequences makes it important to populate models with empirical results. Model results must accurately reflect the empirical results, even if the underlying causes are not understood. The cost, efficacy, and duration of ecological restoration is illuminated, developed and improved by incorporating the empirically-defined field data, especially in a newly developing modeling field like wetland restoration (Zedler 2017). This one does not do that.

## 3

### Levees on the Mississippi River are not the problem causing coastal land loss.

Fig. 5. Canals and spoil banks in coastal Louisiana.

The Louisiana coastal zone in 2017 had a cumulative total length of 33,705 km of spoil bank created when canals are dredged through wetlands for mineral recovery activities. The dredged material is placed in linear rows on either side of the canal to form spoil banks whose height is up to 3-10 times the natural tidal range (Fig. 5).

The spoil bank length in the Louisiana coastal zone in 2017 was equal to more than 3/4ths the distance around the circumference of the Earth, and long enough to cross the Louisiana coast east-to-west 79 times (Turner and McClenachan 2018). There are multiple kinds of wetland changes documenting how these canals and spoil banks become a significant factor influencing wetland health including longer individual flooding and drying intervals, pond formation, sulfide buildup. Dredging canals at this landscape scale fundamentally changes the movement of water in and out of the wetland, leading to their demise. As a result, about 4.6 times more land is lost for every one of canal formed. The spatial and temporal distribution of permitting is not only coincidental with land loss (Fig. 6A, B), but the intercept of land loss and canal density in Fig 8B is zero, implying a dominant causal relationship. Dredging is the cause (>90%) of all land loss on this coast (Turner and McClenachan 2018).

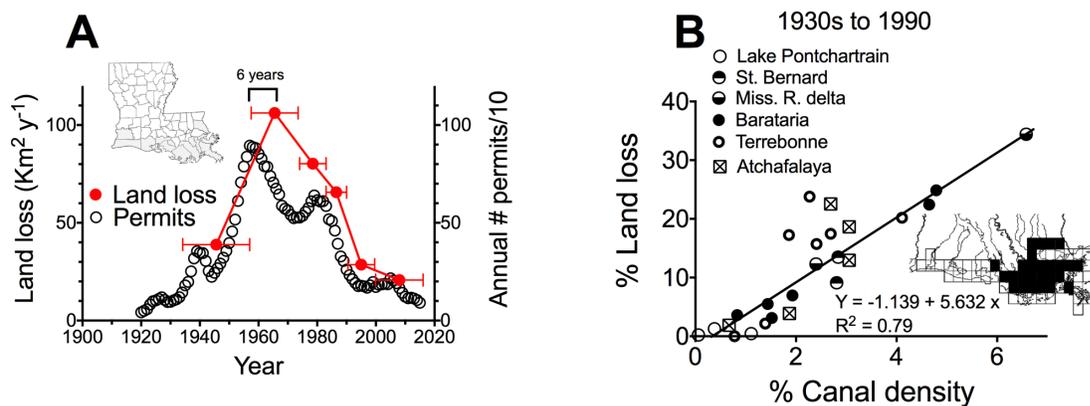

Fig. 6. A. The number of oil and gas permits issued annually in fourteen parishes and the land loss rates. B. The land loss rate from the 1930s to 1990 and canal density in 15 minute quadrangle maps (Turner and McClenachan 2018).

The result is that the land loss on the coast has stabilized (until Sea level rise reaches a tipping point for wetland survival). There has been a slight gain in land since 2010 (Fig. 7).

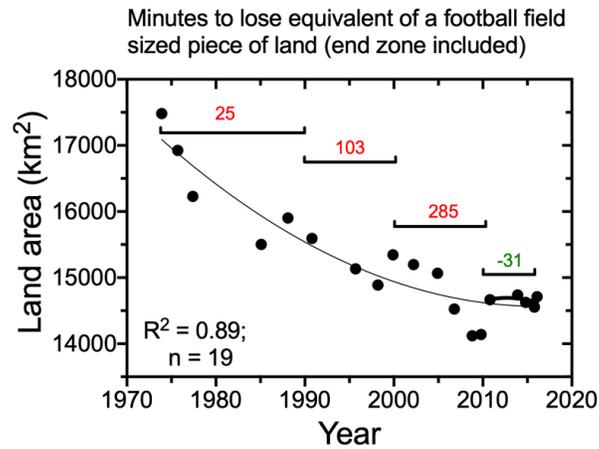

Fig. 7. Land area since the peak of land loss rates in the 1970s (when consistent aerial imagery is available) to present. The numbers above the bars are estimates of how many minutes it takes to lose (red) or gain (green) a football field. Data from Couvillon et al. (2017).

Whatever their role, Mississippi River flood protection levees are greatly exaggerated as a land loss cause. The understated cause of coastal land loss is dredging canals and building spoil banks, which diversions do not address.

## 4 Sea Level Rise

The EIS has two ‘scenarios’ of sea level rise (SLR) from 2020 to 2070 that are used in the model to project land gain/loss. These are 0.39 m and 0.79 m, equivalent to 7.8 and 15.8 mm  $y^{-1}$ . They come from Sweet et al. (2017).

### The low EIS SLR rate has already been exceeded

The low SLR used in the EIS is a lower than is at Cedar Key, Florida for the last 20 years (Fig. 8). The SLR at Cedar Key is about twice the global average, which is not an anomaly for the region. The western Atlantic and the GOM are global highs in eustatic SLR and the Pacific has global lows (Fig. 9). What is the point of using this low rate as a prediction? The SLR has already gone higher than this.

Fig 8. Sea level rise at Cedar Key. The data were downloaded from the National Oceanography Centre, Permanent Service for Mean Sea Level (<http://www.psmsl.org/>).

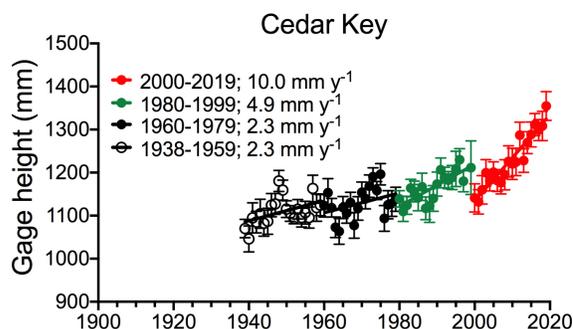

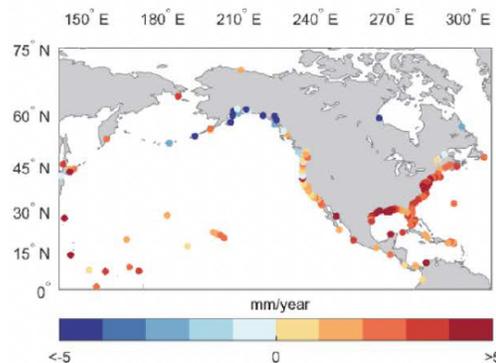

Fig. 9. Sea level trends for >30 years above the global sea level rise. The GOM is about 5 mm  $y^{-1}$  higher (red). From Sweet et al. 2017)

### The EIS high SLR rate is way too conservative

A 2017 update projects uses an intermediate, high, and extreme SLR of 10, 20, and 25 mm  $y^{-1}$ , respectively, by 2050, and 15, 35, and 44 mm  $y^{-1}$ , respectively, by the end of the century (Sweet et al., 2017) (Table 1). The 2070 SLR in this table is 13, 28 and 35 mm  $y^{-1}$ . The EIS chose 15.8 mm  $y^{-1}$  as the high amount by 2070. So the low SLR estimate in the EIS is lower or near the present rate (10 mm  $y^{-1}$ ), and the higher estimate is the same as occurring now is a very conservative amount compared to the global value, and quite low compared to the future regional estimate. If this table is an authoritative trajectory for SLR scenarios, then the ‘Extreme’ scenario is the one to chose since the 2020 value is the present SLR at Cedar Key. The corresponding SLR for 2070 is, therefore, 35 mm  $y^{-1}$ , not 25 mm  $y^{-1}$ .

| <b>GMSL Scenario Rates (mm/year)</b> | <b>2010</b> | <b>2020</b> | <b>2030</b> | <b>2040</b> | <b>2050</b> | <b>2060</b> | <b>2070</b> | <b>2080</b> | <b>2090</b> |

Table 1. The projected rates of global sea level rises ( $\text{mm y}^{-1}$  for 19 year averages; centered on decade) associated with the median Global mean sea level heights for this century. From Sweet et al. 2017). The ‘extreme’ rise in the GOM is  $10 \text{ mm y}^{-1}$  in 2020 in this table, which is the SLR rate at Cedar Key for the last 20 years.

#### Model projections are zero land gain by 2070

When the projected land gain for the two SLR scenarios are plotted out as a function of the SLR used, then the gain is zero when SLR is higher than  $11 \text{ mm y}^{-1}$  (by 2070). Again, this is the ‘intermediate’ value for the global ocean in Table 1, whereas the GOM is twice as high. The clear conclusion is that the model will predict zero land gain by 2070 if even low estimates of an accelerated SLR are used.

## 5

**Increasing nutrient loads from diversions will weaken soils, not strengthen soils**

The modern Mississippi River has nutrient concentrations that are much higher than when the mostly organic soils were created centuries ago (Turner et al. 2007) and may weaken soils by 30%, resulting in less belowground biomass, and change vegetation from being comprised of perennials to annuals (Turner et al. 2011). Increased flooding inundation, which is a consequence of river diversions, also weakens the belowground biomass of wetland plants (Morris et al. 2017) that may erode during high water events or from hurricanes (Kearney et al. 2011; Howes et al. 2010). Individual roots become weaker when exposed to ambient levels of nutrients found in the river (Hollis and Turner 2019a, b, Hollis and Turner 2021). The soil becomes degraded, accumulates less biomass, decomposes and erodes faster (Swarzenski et al. 2008; Hebert et al. 2020). The diversion of riverwater into the nearby marshes will almost certainly weaken soils, making them less resistant to wave energy and hurricanes. A striking example is the net loss of wetlands in the Davis Pond diversion where increased land loss occurred beginning the year after the diversion opened (Turner et al. 2019). This is an area that has no significant sediment input.

## 6

**Alternatives missing**

Less expensive ways to restoring the same area of wetlands are not discussed; the discussion of alternatives is restricted to diversions. But there are much more cost-effective ways of restoring wetlands, and sooner. The price of tearing down spoil banks and filling in canals (without sediment added) was \$9,266 ha<sup>-1</sup> in 2005, and \$12,224 ha<sup>-1</sup> in 2018 when adjusted for inflation. The rough approximation of filling in **all** abandoned canals is, therefore, about \$335 million dollars (Turner and McClenachan 2018). The cost of this diversion is about \$2 billion, so far, at a cost of about \$100 thousand per acre. The same amount of land could be restored by filling in canals (backfilling) at 5% of the per acre cost. This would involve restoring wetlands by dealing with these canals and spoil banks 6 to 17% of the abandoned canals on this coast. The money could be spent to reverse/restore the effects of the main cause of land lost across the whole coast, not one part of one delta, and sooner.

**Other:** The estimates of land gain in the Executive Summary do not match what is in Table 8.2.1.

---

**Concern ID: 61853**

**The amount of acres of habitat that would be restored through the preferred alternative would not justify its high cost. Given Louisiana's annual coastal habitat loss rate, investing in a nearly \$2 billion Project that would provide relatively little benefit compared to this annual loss is not justifiable.**

---

**Response ID: 16618**

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless it is relevant to the agency's decision. USACE generally assumes that a permit applicant has conducted its own economic evaluation of the costs of a proposed Project. USACE will conduct a public interest review as part of its permit decision-making process, which weighs the anticipated harms of a project against its anticipated benefits.

As part of the OPA analysis, LA TIG considered the cost to carry out the Project consistent with the Restoration Plan alternatives evaluation criteria, 15 CFR §990.54. The cost to carry out the Project was evaluated in Section 3.2.1.2 Cost to Carry Out the Alternative of the LA TIG's Draft Restoration Plan. The Project would reestablish deltaic processes that deliver sediment, fresh water, and nutrients; improve the function of existing habitats; and successfully develop deltaic habitats that connect nearshore and offshore ecosystems. Wetlands are one component of a restored ecosystem to be achieved. The LA TIG expects that the Project would result in the creation of a maximum of 17,300 acres of land in the Barataria Basin by year 30 of operations; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 [Alternative 1 Description] of the Restoration Plan). The creation of marsh habitat would provide substantial benefits to nearshore marine ecosystems, water column resources (including fish and invertebrates), birds, terrestrial wildlife, and offshore marine ecosystems (see Section 3.2.1.6 [Benefits Multiple Resources] of the Restoration Plan). Given the high rates of erosion and land loss, the land created by the Project would become even more important to the coastal ecosystem over time.

**Concern ID: 61832**

**Commenters expressed concern that the uncertainties of the model were not quantified or identified in the model results. For example, with respect to the projections of land change, the ranges of potential acres to be created/lost along with a confidence level that each range is accurate were not provided. Commenters noted that the model predicted a net land gain of only 2 - 4 percent of the total land area within the Project area over the 50-year analysis period and questioned whether the model is sensitive enough and accurate enough to predict such a slight change.**

**Response ID: 16479**

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft3D Basinwide Modeling, Section 8.0 Model Limitations and Uncertainties. The land-change uncertainty bounds were not included in the summary in Section 4.1.3.3. In response to this comment, the USACE has added a summary of land-change uncertainty to that section in the

---

Final EIS. Where the model's quantitative results are presented, the EIS identified the model uncertainties. A footnote has been added to the Executive Summary and to Table 4.2-6 in Section 4.2 Geology and Soils of the Final EIS providing the uncertainty bounds for land-change projections.

As part of developing the EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

---

**Concern ID: 61842**

**Commenter is concerned about the accuracy of the sea-level rise projections used in the Delft3D Basinwide Model to predict land changes. In particular, the commenter suggests that if updated sea-level rise rates (as provided in Sweet et al. 2017 and Church et al. 2014) were applied, the modeling would project no land-gain benefits from the diversion.**

**Response ID: 16480**

Large variability in projected relative sea-level rise does introduce corresponding uncertainty into land-loss and land-gain projections. The literature provided by the commenters has been reviewed. Measured and projected relative sea-level rise rates vary substantially by location, and using projections at a station in Florida, such as Cedar Key, are not useful for projections in the central Gulf Coast. Citing the USACE and NOAA sea-level projection tool (USACE 2019d), the MBSD Project Modeling Work Group chose a sea-level rise scenario based on the 2017 Coastal Master Plan "moderate" scenario, which is slightly higher than the USACE's "Intermediate" rate for the Barataria Basin water level station at Grand Isle, LA, as shown in Chapter 4, Figure 4.1.3 of the Draft EIS. The USACE rate reflects sea-level rise data collected at Grand Isle over the period 1947 to 2007. The MBSD Project Modeling Work Group determined that the use of that 2017 Coastal Master Plan Intermediate Sea-Level Rise curve was an appropriate choice at the time the modeling was conducted in 2019.

The sea-level rise value used in the Delft3D Basinwide Model simulation for the Draft EIS considered "intermediate" at the time of the modeling, is close to the low projection (0.3 m Global Mean Sea Level) given by Sweet et al. (2017) for Grande Isle. The commenter's suggestion of the Church et al. 2014 reference, which provides useful information, has been added as a reference in the Final EIS in Chapter 4, Section 4.1.3.2 Sea-Level Rise. Use of a different sea-level rise rate would affect the impact projections of all the alternatives considered in the EIS, including the No Action Alternative. If the relative sea-level rise rate used in the model is an underestimate, the effect on model results was mitigated, but not eliminated, by the use of a "No Action Alternative compared to Action Alternatives" comparison method. (In other words, if sea-level rise was underestimated, it was underestimated for all alternatives, including No Action Alternative. The impacts of the proposed Project presented in the Draft EIS are the net difference in impact magnitude between the No Action Alternative and the proposed Action Alternatives). Chapter 4, Section 4.1.3.2 Sea-level Rise states that higher sea-level rise rates would reduce anticipated land creation. However, in light of the commenters' concern, the USACE has amended the last sentence of the next to last paragraph of that section in the Final EIS to say, "If actual sea-

---

level rise is higher (as is predicted by Sweet et al. 2017) than the value used in the Delft3D Basinwide Model, water levels would be higher and loss rates and land gains would be different than what the Delft3D Basinwide Model projects.”

---

**Concern ID: 61843**

**The Delft3D Basinwide Model results are flawed because the model was not calibrated to data from the Fort St. Philip, Davis Pond, and Caernarvon Diversions. Instead the model was calibrated to the unsuccessful West Bay Diversion, which has not produced any land in 20 years of operation (other than that created by the deposit of dredged material). Calibration to West Bay is not appropriate because the West Bay Diversion outfall area is comprised of deeper water and mineral soils, while the outfall area of the proposed MBSD Project diversion is comprised of shallow water covered with emergent vegetation inhabiting organic soils.**

**Response ID: 16481**

The Delft3D Basinwide Model was not calibrated to Fort St. Philip because it is a naturally-occurring crevasse rather than an engineered diversion. The Davis Pond and Caernarvon Diversions are freshwater diversions intended to reduce salinity through the introduction of fresh water and were not designed to channel sediments from deep in the river.

The West Bay Sediment Diversion is a large, uncontrolled diversion with a discharge of 20,000 to 50,000 cfs. Constructed in 2003, the goals for the project included: 1) increase land:water ratio; 2) increase mean elevation in the wetland; and 3) promote marsh habitat. To date, the restoration actions have successfully restored a portion of the land and habitat previously present in West Bay. (McQueen et al., 2020). Because the modelers considered the West Bay Sediment Diversion to be a reasonable analog to the proposed Project and in accordance with professional standards, they validated the Delft3D Basinwide Model to the West Bay Sediment Diversion. The accretion rate of inorganic sediment was also validated using data from the Big Mar Lake adjacent to the Caernarvon Diversion. The Delft3D Basinwide Model is a public-domain, physics-based model in which water depth and consolidation of underlying soils are accounted for by appropriate equations. The consolidation feature of the model is described in the below reference, which was included in Chapter 10 (References) and cited in Chapter 2 (Alternatives) of the Draft EIS. Therefore, differences in water depth and underlying soils are accounted for in the model's physics-based calculations.

Uncertainties associated with the validation using West Bay were assessed using sensitivity tests and were considered in the analysis by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in Appendix E (Delft3D Modeling) and incorporated into the Draft EIS conclusions throughout Chapter 4 Environmental Consequences.

As part of developing the EIS, the USACE, together with the members of the LA TIG (including cooperating agencies and CPRA), reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative

---

production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

---

**Concern ID: 61844**

**The Delft3D Basinwide Modeling used for the EIS is flawed because it was not calibrated against empirical results from three diversions that, like the proposed MBSD Project diversion, include an outfall area comprised of shallow water with organic soils: Fort St. Philip natural crevasse, Davis Pond Diversion, Caernarvon Diversion (see Zedler 2017, Suir 2012, and Turner 2017). Further, there is no evidence of a net land gain or conservation within those sites after the diversions began. There was sometimes a dramatic land loss after diversion implementation/start that has not reversed (Couvillion 2017, USACE 2004, Suir et al. 2014, Kearney et al. 2011, Underwood 1994).**

**Response ID: 16482**

The Delft3D Basinwide Model was not calibrated to Fort St. Philip because that is a naturally-occurring crevasse rather than an engineered diversion. The Davis Pond and Caernarvon Diversions were designed to primarily divert fresh water in order to lower salinities in the receiving basins. Unlike the MBSD, they were not designed to divert sand-sized sediment, which is needed to build land.

The West Bay Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, "A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that diversions do not lead to appreciable sediment accumulation." (Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, Estuarine, Coastal and Shelf Science, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005> ).

The Zedler (2017) reference cited by the commenter is useful. Zedler wrote approvingly of the application of integrated habitat and hydrodynamic models in an adaptive management framework for restoration of coastal Louisiana. That is the same approach described in the Draft EIS in Chapter 4, Section 4.27 Mitigation Summary.

The Turner (2017) reference about using a correct mineral sediment supply baseline for coastal restoration is also useful. The Delft3D Basinwide Model results used in the EIS confirm the conclusion in Turner (2017) that Mississippi River diversions upstream of the birdfoot delta increase deterioration of the birdfoot delta, as noted in Chapter 4, Section 4.2.3.3 in Geology and Soils of the Draft EIS.

The references provided by the commenter were considered and incorporated into the EIS. Couvillion et al. 2017 is included in Chapter 3, Section 3.2 Geology and Soils and Section 3.6 Wetlands and Waters of the U.S., Kearney et al. 2011 is cited in Chapter 2, Section 2.4.1.3.3 Lower Barataria Basin, and Underwood 1994 is cited in Appendix R2 Monitoring and Adaptive Management Plan of the EIS. Suir et al. 2014 was added to Chapter 2 Alternatives, Table 2.3-1 of the Final EIS.

As part of developing the EIS, the USACE, together with the members of the LA TIG (including cooperating agencies and CPRA), reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives. No related edits have been made to the Final EIS.

---

**Concern ID: 61845**

**The Delft3D Basinwide Modeling for the EIS projects positive results when existing evidence from nearby sites in Louisiana show the opposite results. Commenter stated that the model does not incorporate important biological drivers such as the effects of flooding, nutrients, and resistance to erosion, and consequently questioned the accuracy of the model.**

**Response ID: 16483**

Comparing observed effects of various diversions has limited value, since diversions and receiving environments often exhibit unique attributes or behaviors that correlations do not account for. For that reason, the Delft3D Basinwide Model, even with its limitations and uncertainties, is a better predictor than anecdotal comparison to Fort St. Phillip or other sites where diversions were designed to divert primarily water, not land-building sediment.

The Delft3D modeling did incorporate flooding, nutrients, and resistance to erosion in its results. Flooding, nutrients, and resistance to erosion are described in Appendix E. See generally Figure 5-1 regarding model module interaction, Section 5.2 Morphodynamics Module and 5.4 Vegetation Module in Appendix E for additional information.

Uncertainties associated with the validation using West Bay were assessed using sensitivity tests and were considered in the analysis by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in Appendix E (Delft3D Basinwide Model) and incorporated into the Draft EIS conclusions throughout Chapter 4 Environmental Consequences.

**Concern ID: 61862**

**The estimates of land gain in the Executive Summary do not match what is stated in Chapter 4, Environmental Consequences.**

**Response ID: 15935**

The estimates of land gain were reviewed for discrepancies in both the Executive Summary and Chapter 4, Environmental Consequences of the Draft EIS and have been determined to be accurate in both instances. However, to help address these concerns, the EIS has been revised to add a discussion to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Geology and Soils section of the Executive Summary and to Chapter 4, Section 4.2.3.2.2.1 Geology, of the Final EIS.

---

**Concern ID: 61894**

**Consider the alternative of tearing down spoil banks and backfilling abandoned canals before, in addition to, or instead of implementing the proposed MBSD Project.**

**Response ID: 15987**

This suggested alternative would not meet the goals and objectives as stated in the purpose and need and described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives. It would not re-establish deltaic processes between the Mississippi River and Barataria Basin through the delivery of sediment, fresh water, and nutrients. However, the EIS acknowledges the influence of canals and spoil banks on wetland losses in Barataria Basin (see Chapter 3, Section 3.6.2.2 in Wetland Resources and Waters of the U.S. of the Final EIS), and has

updated the analysis to include additional technical references regarding the influence of canals on the existing environment in the Barataria Basin. The EIS does not describe the proposed Project as a solution to fully reverse ongoing land-loss trends. The EIS recognizes that the proposed Project is projected to create and maintain only a portion of the wetlands that would otherwise be lost in the absence of the proposed Project over the next 50 years.

This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Other similar restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan and the LA TIG through Natural Resources Damage restoration planning.

**Concern ID: 61999**

**A commenter provided a specific reference for use in the EIS regarding diversions and coastal wetland restoration/creation. (Turner RE, Boyer ME 1997. Mississippi River diversions, coastal wetland restoration/creation and an economy of scale. Ecological Engineering 8: 117-128)**

**Response ID: 16331**

The reference has been reviewed, included in the list of references, and some additional information has been included in Chapter 2, Section 2.3.7 Multiple Small-Scale Diversions of the Final EIS.

---

**Concern ID: 62639**

**The proposed Project is unlikely to succeed because similar types of projects have failed to build land, and have caused a range of other issues, like destroying habitat, exacerbating flooding, and reducing water quality. Specific examples of similar, problematic projects include the Mississippi River Gulf Outlet, Bonnet Carré Spillway, Caernarvon Freshwater Diversion, Davis Pond, West Bay, Baptiste Collette, Fort St. Philip, and Cubits Gap. In fact, data show that the Caernarvon Diversion in particular was unable to show sustained land gains in the face of Hurricane Katrina-driven losses in wetland habitat (Underwood 1994, Kearney et al. 2011). Davis Pond has seen increased land loss inside the diversion compared to a reference area (Couvillion et al. 2017). Fort St. Philip has lost large areas of wetlands (Suir et al. 2014). While the Atchafalaya River is building land in the Atchafalaya and Wax Lake Deltas, the Atchafalaya River carries more sediment than the Mississippi River does currently (Blum and Roberts 2009), and more of the Atchafalaya River is diverted to each of these deltas and marshes farther south. Additionally, one study identified poor performance of diversions due to many periods of inoperation due to socioeconomic uncertainties (Caffey et al. 2014).**

**Response ID: 16631**

The issues raised by the commenters were considered in the Draft EIS. The EIS states in Chapter 2, Section 2.1.1 Overview of Sediment Diversions, that CPRA considered information from other diversions in its assessment of the Project alternatives, but because the projects mentioned by the commenters had been designed to discharge primarily water, not sediment, they are not fully comparable to the proposed Project. As explained in the EIS Chapter 4, Section 4.1.3 (Environmental Consequences, Overview of Delft3D Basinwide Model for Impact Analysis), Delft3D Basinwide Modeling software was used to assess impacts of the Project on hydrology, land gains and losses, water quality, and vegetation in the Barataria Basin and birdfoot delta. Using standard professional practice, this physics-based model was validated to the West Bay Sediment Diversion. The West Bay Sediment Diversion is useful for validating the physical processes of erosion and deposition of sediment because it, like the proposed MBSD Project, is a sediment diversion that extracts relatively more sediment in the river. The other diversions cited were designed to primarily deliver water, not sediment, and are less useful comparisons.

The West Bay Sediment Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, "A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that diversions do not lead to appreciable sediment accumulation" (Kolker, A. S., Miner, M. D. and Weathers, H. D. 2012. Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, *Estuarine, Coastal and Shelf Science*, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005> ).

Comparing diversions outside of physics-based numerical modeling has limited value because diversions and receiving environments often exhibit unique behaviors that correlations do not account for. For that reason, the physics-based Delft modeling, even with its limitations and uncertainties, is a better predictor than anecdotal comparisons to Fort St. Phillip or other sites. Uncertainties associated with the validation and application of the Delft3D Basinwide Modeling conducted for the proposed Project were assessed by the West Bay application, sensitivity tests, and by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in EIS Appendix E Delft3D

---

Modeling and incorporated into the EIS conclusions throughout Chapter 4 Environmental Consequences. While most citations mentioned by commenters were already included in the Draft EIS, the Final EIS has been edited to include Caffey and Petrola (2014) to Chapter 4, Section 4.6.5.1.2.4 Land Accretion.

The likelihood of success of the Project and information from other freshwater diversions was also considered in the LA TIG's Draft Restoration Plan, Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. The proposed MBSD Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the geomorphological features of the Lower Mississippi River as of 2012, including data from the referenced projects. All citations referenced by the commenters were included in the Final EIS and were considered by the LA TIG in the Final Restoration Plan.

---

**Concern ID: 62836**

**What are the conditions for closure of the diversion? For example, would the diversion be shut down if there is community flooding or a large amount of wetland loss in the first 5 years? CPRA's stated commitment to adaptive management may eventually result in the agency making substantial adjustments to the operational regime of the proposed Project without providing recourse for affected stakeholder groups.**

**Response ID: 16663**

Information regarding Project operations, including the plan for when the diversion would be shut down for emergencies and storm events, is set forth in CPRA's Operations (Water Control) Plan issued with the Draft EIS (Appendix F2).

With regard to community flooding, the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) details mitigation strategies that would address increased water levels in impacted communities. With regard to ensuring Project performance, in accordance with the Monitoring and Adaptive Management (MAM) Plan, CPRA would monitor Project performance over the life of the Project and adaptively manage the Project to ensure Project success (for examples of potential adaptive management actions, see Tables 4.1-1 through 4.1-3 in the MAM Plan in Appendix R2 to the Final EIS). If the Project is implemented, CPRA would continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued.

---

Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62882**

**The understated cause of coastal land loss is dredging canals and building spoil banks, which diversions do not address.**

**Response ID: 15834**

The EIS acknowledges the influence of canals and spoil banks on wetland losses in Barataria Basin (see Chapter 3, Section 3.6.2.2.4 in Wetland Resources and Waters of the U.S. of the EIS), and the analysis has been updated in the Final EIS to include additional technical references regarding the influence of canals on the existing environment in the Barataria Basin. The EIS does not describe the proposed Project as a solution to fully reverse ongoing land-loss trends. The EIS recognizes that the proposed Project is projected to create and maintain only a portion of the wetlands that would otherwise be lost in the absence of the proposed Project over the next 50 years. In addition, Chapter 1, Section 1.2.1 in Project Background and Chapter 3, Section 3.1.4 in Introduction describes the historical reasons for coastal land loss within the Barataria Basin and notes that as a result of this coastal land loss, various agencies and non-governmental organizations have implemented coastal protection, restoration, and rehabilitation projects within the basin. CPRA has identified the proposed Project for implementation based on the recommendations in its Coastal Master Plan and identified large-scale sediment diversions as a restoration tool for sustainable ecosystem restoration to counter the basin-wide effects of erosive processes such as sea-level rise and subsidence.

---

**Concern ID: 63015**

**There are misrepresentations in the EIS about how nutrients in the river would spread out far from the sand deposition area to lower plant biomass belowground. Increasing nutrient loads from diversions would weaken soils, not strengthen soils.**

**The modern Mississippi River has nutrient concentrations that are much higher than when the mostly organic soils were created centuries ago (Turner et al. 2007) and may weaken soils by 30 percent, resulting in less belowground biomass, and change vegetation from being comprised of perennials to annuals (Turner et al. 2011). Increased flooding inundation, which is a consequence of river diversions, also weakens the belowground biomass of wetland plants (Morris et al. 2017) that may erode during high water events or from hurricanes (Kearney et al. 2011, Howes et al. 2010). Individual roots become weaker when exposed to ambient levels of nutrients**

---

found in the river (Hollis and Turner 2019a, b; Hollis and Turner 2021). The soil becomes degraded, accumulates less biomass, and decomposes and erodes faster (Swarzenski et al. 2008, Hebert et al. 2020). The diversion of river water into the nearby marshes would almost certainly weaken soils, making them less resistant to wave energy and hurricanes. A striking example is the net loss of wetlands in the Davis Pond Diversion where increased land loss occurred beginning the year after the diversion opened (Turner et al. 2019). This is an area that has no significant sediment input.

<https://doi.org/10.1016/j.envint.2019.105409>

**Response ID: 16028**

The literature cited by the commenters has been reviewed, including Turner et al. 2007, Turner et al. 2011, Morris et al. 2017, Kearney et al. 2011, Howes et al. 2010, Hollis and Turner 2019, Swarzenski et al. 2008, Hebert et al. 2020, Turner et al. 2019, and Mo et al. 2020, and Chapter 4, Section 4.6.5.1.2 Applicant's Preferred Alternative of the Final EIS has been revised to include additional analysis regarding the impact of nutrient input from the proposed Project on vegetation communities and soil shear strength.

---

**Concern ID: 63024**

**The Draft EIS failed to properly capture the state of the science on the effects of nutrient inputs on wetlands. While the views indicating the detrimental effects of nutrient input are included, few opposing views are described, and the science is not settled on this issue.**

**Response ID: 16034**

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS acknowledges uncertainty regarding the effects of nutrient inputs on wetlands. Additional analysis regarding the impact of nutrients that would be transported by the proposed Project on vegetation communities and soil shear strength has been incorporated into Chapter 4, Section 4.6.5.1.2 Applicant's Preferred Alternative of the Final EIS.

---

**Concern ID: 63046**

**Coastal land loss is caused by dredged canals through wetlands and associated spoil banks, rather than by Mississippi River levees, resulting in greater than 90 percent of all land loss on this coast (Turner and McClenachan 2018). These features become a significant factor influencing wetland health, resulting in longer individual flooding and drying intervals, pond formation, and sulfide buildup. Large-scale dredging fundamentally changes the movement of water in and out of the wetland, leading to wetland loss; as a result, about 4.6 times more land is lost for every one canal formed. The spatial and temporal distribution of canal permitting is not only coincidental with land loss, but data analysis implies a dominant causal relationship. The result is that the land loss on the coast has stabilized (until sea-level rise reaches a tipping point for wetland survival). There has been a slight gain in land since 2010 (Figure 7 of the attachment).**

**Turner R.E. and G. McClenachan G. 2018. Reversing wetland death from 35,000 cuts: opportunities to restore Louisiana's dredged canals. PLOS ONE 13(12): e0207717.**

<https://doi.org/10.1371/journal.pone.0207717>

**Response ID: 16052**

The influence of canals and spoil banks on wetland losses in Barataria Basin are discussed in Chapter 3, Section 3.6.2.2 Causes of Wetland Loss of the EIS. The literature cited by the commenters (Turner and McClenachan 2018) has been reviewed and additional detail has been added to Chapter 3, Section 3.6.2.2.4 Canals and Spoil Banks of the Final EIS. However, as described in the EIS, risk reduction levees have been shown to reduce the sediment load that enters the Barataria Basin. As the deficit of sediment, combined with

---

increased rates of sea-level rise, contributes to wetland losses, the Mississippi River levees do contribute to coastal land loss.

---

**Concern ID: 64682**

**The Delft3D Basinwide Modeling conducted to assess impacts of the proposed Project in the Draft EIS includes incomplete physical components, including a lack of consideration of geological faults, which McLindon et al. (2017) described as incompletely assessed.**

**Response ID: 16410**

The impacts raised by the commenter were considered in the Draft EIS. To clarify, additional language has been added to the Final EIS to make clear the potential, but unquantified, probability for slip events along the Ironton fault during operations of the proposed Project based upon the framework estimates in the McLindon et al. (2017) provided by the commenters. This additional discussion and a citation for McLindon et al. (2017) has been added to Chapter 4, Section 4.2.3.2.2.4 Faulting of the Final EIS.

The USACE agrees that the Delft3D Basinwide Model results include uncertainties. As discussed in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E (Delft3D Basinwide Modeling, Section 8.0 Model Limitations and Uncertainties), those uncertainties were examined through sensitivity tests and by comparing the No Action Alternative to the Action Alternatives. The results of this comparison are provided in the EIS conclusions throughout Chapter 4 (Environmental Consequences).

As part of developing the EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the proposed MBSB Project EIS impacts analysis of the alternatives.

FEMA

Charlie Cook

Good morning, regarding this project from USACE, please ensure that you are working with the local floodplain administrator to obtain any needed local floodplain permits.

---

**Concern ID: 62192**

**Commenter states that CPRA should coordinate with the local floodplain administrators to obtain any needed local permits.**

**Response ID: 15741**

CPRA would be responsible for coordinating as needed with the appropriate floodplain administrator(s) regarding any necessary permits prior to Project commencement if the Project is approved by USACE and funded by the LA TIG.

---

**Correspondence ID:31969**

Linda Newell

I oppose this project because it will result in "major, adverse, direct and indirect, permanent impact" to our oysters and brown shrimp, "with major decrease in abundance." It is simply unacceptable to decimate this industry, which is a major contributor to the Louisiana economy, and a delight to seafood lovers across the nation.

---

**Concern ID: 62779****Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.****Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 61819**

**Commenters expressed concern that the proposed Project would have adverse impacts on Barataria Basin's water quality, wetlands, fisheries, recreational uses, and eroding coastlines due to chemicals, oil and hazardous waste, and/or pollutants in the Mississippi River that would be routed to the Barataria Basin via the proposed diversion.**

**Response ID: 16429**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality of the Draft EIS, the segment of the Mississippi River where the proposed diversion river intake structure would be located (subsegment LA070301\_00) fully supports its designated uses. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. LDEQ's water quality assessment indicates that regulated substances are not present in concentrations that would cause a water quality impairment at the location of the intake structure. In response to this concern expressed by commenters, a new subsection has been added to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of nearby industrial facilities on river water routed to the basin during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills from Industrial Sites.

---

As described in the EIS, Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed.

---

**Concern ID: 61853**

**The amount of acres of habitat that would be restored through the preferred alternative would not justify its high cost. Given Louisiana's annual coastal habitat loss rate, investing in a nearly \$2 billion Project that would provide relatively little benefit compared to this annual loss is not justifiable.**

**Response ID: 16618**

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless it is relevant to the agency's decision. USACE generally assumes that a permit applicant has conducted its own economic evaluation of the costs of a proposed Project. USACE will conduct a public interest review as part of its permit decision-making process, which weighs the anticipated harms of a project against its anticipated benefits.

As part of the OPA analysis, LA TIG considered the cost to carry out the Project consistent with the Restoration Plan alternatives evaluation criteria, 15 CFR §990.54. The cost to carry out the Project was evaluated in Section 3.2.1.2 Cost to Carry Out the Alternative of the LA TIG's Draft Restoration Plan. The Project would reestablish deltaic processes that deliver sediment, fresh water, and nutrients; improve the function of existing habitats; and successfully develop deltaic habitats that connect nearshore and offshore ecosystems. Wetlands are one component of a restored ecosystem to be achieved. The LA TIG expects that the Project would result in the creation of a maximum of 17,300 acres of land in the Barataria Basin by year 30 of operations; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 [Alternative 1 Description] of the Restoration Plan). The creation of marsh habitat would provide substantial benefits to nearshore marine ecosystems, water column resources (including fish and invertebrates), birds, terrestrial wildlife, and offshore marine ecosystems (see Section 3.2.1.6 [Benefits Multiple Resources] of the Restoration Plan). Given the high rates of erosion and land loss, the land created by the Project would become even more important to the coastal ecosystem over time.

---

**Concern ID: 61954**

**A commenter noted that they attended a scoping meeting in 2017 but were not able to comment.**

**Response ID: 15899**

USACE regrets that the commenter was not able to comment during the 2017 scoping meetings. Note that there were multiple opportunities available to comment on the scoping meetings over a 60-day comment period including in-person orally via a court reporter, written on comment cards or letters either in-person or via the postal service, and via electronic mail.

---

**Concern ID: 61955**

---

**Commenters are concerned that all those that are impacted may not be aware of the proposed Project, its impacts, or potential mitigation. There are many people that may not have the knowledge, time, or resources to be deeply involved in these issues, but who also have a stake in what is happening. Consider the needs of these people in making a decision about moving this proposed Project forward. If this proposed MBSD Project and similar projects move forward consider opportunities to better engage people across Louisiana’s coast in the value of projects like these and why they are crucial to the future of our region.**

**Response ID: 15900**

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG’s Restoration Plan. Allowing submission of comments on either document to the same locations provided commenters a “one-stop shop” and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration Plan and the Draft EIS in its decision-making process. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

USACE and the LA TIG conducted public outreach and provided public comment opportunities throughout the development of the Draft EIS and the LA TIG Draft Restoration Plan. Details on USACE’s and the LA TIG’s outreach activities and the opportunities provided for public participation can be found in Chapter 7 Public Involvement in the Final EIS.

Examples of public outreach provided by USACE for the EIS include providing special public notices for the permit application, the scoping process, and for the Draft EIS through Federal Register notices, press releases, newspapers, mail outs to distribution lists, and provision of hard copies of the Executive Summary and other materials to local libraries. USACE and the LA TIG also coordinated with the SELA Voice organizations to understand the needs of the local communities regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG’s Draft Restoration Plan and during the public comment period.

Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the virtual public meetings on the Draft EIS and the LA TIG’s Draft Restoration Plan. Also, the Public Notice to announce the Draft EIS Notice of Availability, the Executive Summary for the Draft EIS, and the Executive Summary for the LA TIG’s Draft Restoration Plan, were translated into Spanish and Vietnamese. The consolidated pre-recorded public meeting presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage.

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area, in an effort to reach out to community groups to gather information related to the proposed MBSD Project. Throughout the public comment period and concurrent with the

---

preparation of the Final EIS and LA TIG's Final Restoration Plan, CPRA has engaged the public through meetings with the communities and groups projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups.

This included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented.

Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts. In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts

and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)

- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62187**

**The commenter believes that decisions have already been made to approve or fund the proposed Project.**

**Response ID: 15766**

USACE, in its role as the lead federal agency, is responsible for preparing the EIS and ensuring fulfillment of the NEPA process with respect to its decisions on CPRA's Section 10/404 permit application and Section 408 permission request. The Final EIS will inform

---

USACE decision making on the Department of Army Section 10/404 permit and Section 408 permission relative to the proposed Project. By regulation, the USACE is neither for nor against the proposed Project. USACE has not made any decision regarding the proposed Project and will not make a decision until it issues a Record of Decision after publication and public review of the Final EIS.

The LA TIG federal agencies (NOAA, DOI, USEPA, and USDA) participated in the NEPA process as cooperating agencies for the EIS to support LA TIG decision making on the Restoration Plan. The role of the LA TIG is to prepare a Restoration Plan to evaluate the Project and its alternatives under the requirements of the Oil Pollution Act (OPA). The LA TIG proposed a preferred alternative in the Draft Restoration Plan. Decisions regarding the selected alternative are made in the Final Restoration Plan and decisions regarding funding will not be made until the completion of all required administrative waiting periods.

---

**Concern ID: 62354**

**The commenter asserts that elected officials push for the Project even though they know it would increase water levels in some communities.**

**Response ID: 15794**

USACE is evaluating CPRA's proposed Project through the EIS and will make its decision in compliance with the statutes, orders, and policies outlined in Chapter 5 of the EIS.

---

**Concern ID: 62355**

**There are better ways to build land and the Corps knows how. Our elected officials should put people and communities first instead of the pockets of a selected few people.**

**Response ID: 15955**

The range of reasonable alternatives evaluated in the EIS were based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS and consistent with CEQ NEPA regulations. As described in Chapter 2, an alternatives screening process was conducted where screening criteria were identified and a wide range of alternatives were evaluated including other available coastal restoration tools and methods. The screening criteria included key concepts from the purpose and need including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. The Project-specific purpose and need built on analyses in the LA TIG's SRP/EA #3, including its initial screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. Based on a review of the various alternatives against these criteria developed from the purpose and need only large-scale sediment diversions with varying capacities were brought forward as alternatives to the LA TIG's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described

in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

See Sections 3.2.4.7, 3.2.1.5, and 3.2.2.5 of the LA TIG's Restoration Plan for a discussion regarding the LA TIG's evaluation of the range of alternatives and identification of the LA TIG's Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54 and it strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG 2018, page 3-32) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in this Restoration Plan. It is also worth noting that the LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

---

**Concern ID: 63096**

**Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).**

**Response ID: 16699**

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina

Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure

that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:31971**

Tom Taggart

This project will likely have a negative impact on approximately twenty thousand people that live in the area. It will have a positive impact on over one million people residing in the greater New Orleans area.

The good of the many vastly outweighs the good of the few.

I hope your project will be a huge success.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:31972**

Catherine Makk

I fully support the Mid Barataria Sediment Diversion Project. South Louisiana is a treasure that must be cultivated and not only fight against man made climate change but put into place proactive long term solutions.

The only way we will keep future generations in the region is to act now.

---

**Concern ID: 63336**

**This proposed Project is absolutely crucial for the future of our coast and the safety and livelihoods of our coastal communities.**

**Response ID: 16292**

The commenter's support for the proposed Project is noted. The proposed Project, by reestablishing deltaic processes, is intended to build coastal resiliency and protection for the coastal communities behind Barataria Basin. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

See Sections 3.2.1.6 (Benefits Multiple Resources) and 3.2.1.7 (Public Health and Safety) of the LA TIG's Restoration Plan for a detailed discussion of the proposed Project's potential benefits and public health and safety impacts, respectively.

---

**Correspondence ID:31973**

Erin Davis

This is a necessary step toward correcting environmental damage done to Louisiana by artificially directing water down the Mississippi. Information about the necessity of healthy coastal marsh systems wasn't available when those decisions were made. It is especially viable that we restore our coastline in preparation for climate change, which will hit Louisiana harder than most states.

We do have a responsibility to compensate people who have their primary residence in directly affected areas, so that they have the ability to move or elevate their residence, if they insist on remaining. This assistance should NOT apply to vacation homes, rental homes or planned homes.

---

**Concern ID: 62954****Compensation should not be provided for impacts to vacation homes, rental homes, or planned homes.****Response ID: 16612**

The comment that compensation should not be provided for impacts to vacation homes, rental homes, or planned homes, is acknowledged. CPRA's mitigation measures set forth in the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) do not differentiate between primary residences and second, vacation or rental homes in terms of the mitigation planned as part of the Project or offered to any property owner. In cases where CPRA acquires property interests as part of implementing the mitigation measures, CPRA will compensate the landowner for that property interest.

---

**Concern ID: 63362****This is a necessary step toward correcting environmental damage done to Louisiana by artificially directing water down the Mississippi River. Information about the necessity of healthy coastal marsh systems wasn't available when those decisions were made. It is especially necessary that the coastline is restored in preparation for climate change, which would hit Louisiana harder than most states.****Response ID: 16324**

The commenter's support for the proposed Project is noted. The impacts of climate change and sea-level rise in Louisiana were discussed in Chapter 3, Sections 3.1.3 in Introduction and 3.4.1.1 in Surface Water and Coastal Processes of the Draft EIS and were factored into the Delft3D Basinwide model results discussed throughout Chapter 4 Environmental Consequences. Impacts to marsh and to flood risk for various communities are discussed for both the No Action Alternative and the Applicant's Preferred Alternative.

**Correspondence ID:31975**

Wayne Malone

Dont want it! It will be the end of the shrimp and oyster industry as we know and like it.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

---

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

Wayne Malone

Dont want it! It will be the end of the shrimp and oyster industry as we know and like it.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

Bob Stewart

This is an amazing document - the depth and breadth of the issues are exemplary, and thorough. I've often noted that the science based program to produce the program and the draft EIS are fantastic models for national and international program. I realize there are communications coming in that will require some tweaking of the program and look forward to seeing the final.

I've attended or listened to several programs where CPRA presented overviews of the diversion and listened to the discussions with people in the audience. The presentations were excellent and the response from many who were opposed to the diversion were passionate - mostly from those living in the coastal areas. Within their passion it seemed difficult for them to understand the future without the diversion project and the impacts that future would have on their interests or dwellings. So it seems we have additional work to do in education.

I congratulate those involved in the development and writing of this document. I am proud that this program is in Louisiana and that it is serving as a national and international model of how to approach and solve complicated issues.

---

**Concern ID: 61757**

**Commenters recommended educating the public about the proposed Project as well as the impacts of the No Action Alternative. There would be a benefit of continued education with the affected communities.**

**Response ID: 15893**

As part of the Draft EIS process, USACE prepared various materials to educate the public regarding the analysis and impacts included in the Draft EIS. This included an Executive Summary summarizing the details of the Draft EIS into a concise, easy to read, document. Additionally, at the beginning of the public comment period, CEMVN posted to the CEMVN's Project website several pre-recorded presentation videos consisting of an explanation of how to comment on the Draft EIS and/or LA TIG's Draft Restoration Plan, an update on the proposed MBSD Project design, information concerning the ongoing restoration planning efforts and the LA TIG's Draft Restoration Plan, and details about how to navigate and review the contents of the Draft EIS. These pre-recorded presentation videos were then consolidated into one presentation and played at the beginning of each of the three public meetings. This consolidated pre-recorded presentation was also translated into Spanish, Vietnamese, and Khmer and available on CEMVN's Project webpage. In addition, dedicated toll-free numbers were provided during the public comment period on the Draft EIS and LA TIG's Draft Restoration Plan through which Spanish, Vietnamese, and Khmer-speaking individuals could listen to the translated pre-recorded presentation.

Examples of public outreach provided by USACE for the EIS include providing special public notices for the permit application, the scoping process, and for the Draft EIS through newspapers, mail outs, and local libraries. USACE and the LA TIG also coordinated with the SELA Voice organizations to understand the needs of the local communities regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan and during the public comment period. Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the virtual public

meetings on the Draft EIS and the LA TIG's Draft Restoration Plan. The Public Notice to announce the Draft EIS Notice of Availability, the Executive Summary for the Draft EIS, the Executive Summary for the LA TIG's Draft Restoration Plan, and the public meeting presentations were translated into Spanish and Vietnamese. As noted above, the consolidated pre-recorded public meeting presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage. As stated in Chapter 7 Public Involvement of the EIS, public engagement has been a vital element of developing and evaluating the proposed MBSD Project. Since 2016, CPRA has participated in nearly 200 outreach and engagement activities focused on the proposed MBSD Project, reaching more than 7,000 people. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. These outreach and engagement efforts provided the public with an opportunity to ask questions and obtain information about the proposed MBSD Project. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. A summary of these public engagement meetings and public outreach conducted by CPRA can be found in Chapter 7 Public Involvement of the Final EIS.

For more information about proposed Project's operational and adaptive management governance, see Final EIS Appendix R2: Monitoring and Adaptive Management (MAM) Plan. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to Project operations, riverside management, monitoring, maintenance, and adaptive management actions.

In addition, EIS Chapter 4, Section 4.24.3 Operations Impacts in Cultural Resources and Section 4.9 of the Final Mitigation and Stewardship Plan (in Appendix R1 to the Final EIS) discuss the NHPA process and mitigation for the proposed Project. The NHPA Programmatic Agreement developed for the proposed Project through the NHPA Section 106 consultation sets forth the alternative historic and cultural resources mitigation to be implemented by CPRA as part of implementing the Project. An Alternative Mitigation Plan is appended to the Programmatic Agreement and describes in detail the mitigation proposed to resolve adverse effects within the Operational Impacts APE. A website and public education materials are included in the Alternative Mitigation Plan as products to be developed through the alternative historic and cultural resources mitigation. The Programmatic Agreement is provided in Appendix K Cultural Resources Information of the Final EIS and attached as Appendix A to the Final Mitigation and Stewardship Plan located in Appendix R1 of the Final EIS.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring,

or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63363**

**The commenter expressed support for the thorough analysis in the EIS, with the acknowledgement that modifications would be present in the Final EIS to account for ongoing communications about the proposed Project.**

**Response ID: 16325**

The commenter's support for the proposed Project is noted. Revisions have been made to the Final EIS based on public comments received on the Draft EIS, input from cooperating agencies, and continued Project evaluation. Changes between Draft and Final EIS are identified through markings along the margins on the applicable pages, as described in Chapter 1, Section 1.7 Public Involvement Summary.

---

**Correspondence ID:32089**

Lawrence Taggart

I am in support of this project. While it will have negative impact on people and wildlife in the area, I believe the overall benefit to Southeast Louisiana for outweighs the negative aspects. Please proceed with the project.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

**Correspondence ID:32091**

Vick Corso

I am totally against this project. Seems to me there must be a better way channel settlement more to the outer edges of the coastline. Not total destroy all the intercostal areas where people fish and live. This is a great place to fish in myrtle grove and I seen what sediment(from river water down in south pass Venice) does to areas where there is no dredging in place. This mean no access so no people. This is the dumbest proposal I've ever seen.

---

**Concern ID: 61905**

**Commenters expressed that residents' way of life including living off of and recreating in the water would be impacted by an influx of fresh water due to the MBSD Project.**

**Response ID: 16235**

The issues raised by the commenters were considered in the Draft EIS. As described in the Existing Conditions in Chapter 3, Section 3.16 Recreation and Tourism, as well as Appendix H1 Socioeconomics Technical Report, the Draft EIS acknowledges the importance of recreational use in the region, describing many types of outdoor recreational activities, including fishing, hunting, boating, wildlife viewing, and general shoreline use, among others. The EIS further acknowledges that extensive estuarine and freshwater wetlands provide habitat for many kinds of fish, birds, reptiles, and mammals that are an integral component of recreation in the region. The evaluation of environmental changes in the basin under the No Action Alternative shows that the abundance of target recreational species, including spotted seatrout and red drum, would decline over time. Access to recreational boating sites would also increase from negligible impacts in the early decades to major, adverse impacts in the later decades, leading to decreases in recreational use in the southern portions of the basin even without the Project. Chapter 4, Sections 4.16.4.2 and 4.16.5.2 in Recreation and Tourism describe how changes in the amount of fresh water due to the MBSD Project would impact recreation and tourism. As noted, there would be adverse impacts on-site accessibility, recreational boating, and boat-based recreational fishing due to tidal flooding, sedimentation, and invasive plants. There would be adverse impacts on recreational fishing for spotted seatrout and beneficial impacts on recreational fishing for red drum.

CPRA has developed a suite of mitigation and stewardship measures to help address and offset Project impacts (see the Draft Mitigation and Stewardship Plan in Appendix R1 to the Draft EIS). In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)

- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Coalition for Coastal Resilience and Economy

Brandon Nelson

At the beginning of March, we reached a critical moment in Louisiana's battle to combat coastal land loss and rebuild our coast. The U.S. Army Corps of Engineers released its draft Environmental Impact Statement on the Mid-Barataria Sediment Diversion, a key step in permitting for a major component of the state's Coastal Master plan. The Mid-Barataria Sediment Diversion is a game-changing coastal restoration project that must move forward if we are to turn the tide on Louisiana's land loss crisis. As the chairs of Greater New Orleans, Inc., and GNO, Inc.'s Coalition for Coastal Resilience and Economy, respectively, we are voicing support for this project, which implements an innovative and sustainable approach to reducing our land loss, rebuilding our wetlands, and creating significant economic benefit.

Being the largest individual restoration project in U.S. history, the Mid Barataria Sediment Diversion will build more wetlands than any other project of its kind in the world. The project, funded by the BP Deepwater Horizon settlement funds, will develop new land and sustain existing wetlands by using the power of the Mississippi River to move sediment and fresh water from the river into nearby basins, mimicking nature's historic land-building processes. Without this project, over the next 50 years, the Barataria Basin alone could lose an additional 550 square miles of land, which is approximately one and a half times the size of the city of New Orleans. Such outcome would jeopardize the safety and prosperity of the entire region, threaten our way of life, and eviscerate coastal habitat that wildlife need to survive.

In the words of Michael Hecht, President and CEO of GNO, Inc., "Coastal restoration is truly where the economy meets the environment." Economic development and coastal restoration are intrinsically linked: by committing to restoring the coast, we protect existing and future investment in Louisiana, while developing an exportable knowledge-based industry and specialized workforce. Implementation of projects outlined in Louisiana's Comprehensive Master Plan for a Sustainable Coast, such as the Mid-Barataria Sediment Diversion, will preserve our working coast, reduce hurricane storm surge, and encourage business growth.

Coastal projects foster diversity and growth for our economy, as highlighted by GNO, Inc.'s 2019 Coastal Restoration Workforce Outlook, which found that Coastal Master Plan projects will yield thousands of jobs in operations, maintenance and monitoring, as well as construction. The Corps analysis indicates that the Barataria project could generate an impressive 12,400 jobs in the state, mostly in the Greater New Orleans region, during its three to five-year construction period. Particularly if coupled with local training, these jobs will expand opportunities for locals to enter good paying career paths including dredge operators, carpenters, plumbers, pipefitters, drafters, engineers, architects, computer analysts and programmers, and more. In a 2017 report, Dr. Stephen Barnes of LSU found that coastal restoration and protection jobs yield an average wage of \$59,000/year, significantly higher than the state's median wage of \$34,9000/year.

Businesses will benefit, too. According to a 2019 report by economist Dr. Loren Scott, construction of the Mid-Barataria and Mid-Breton Sediment Diversion projects will support an increase in regional business sales by \$3.1 billion.

While the Mid-Barataria Sediment Diversion is the right step in the right direction, we recognize and cannot ignore that there will be inevitable environmental impacts that will have

to be addressed. We are encouraged that the state has outlined mitigation strategies and designated significant resources to lessen the potential impacts, such as job training programs and startup financial assistance for impacted industry members. Along those same lines, organizations, such as GNO, Inc. are postured to serve as connectors to bring together industry and higher education/workforce development training partners to offer assistance to those seeking to transition.

Coastal restoration and protection is a cornerstone to securing a thriving economy in the Greater New Orleans region, presently and for future generations. We support the construction of the Mid-Barataria Sediment Diversion, as it is our best shot at protecting vulnerable communities, reducing hurricane storm surge, and fostering economic growth for years to come. The Mid-Barataria Sediment Diversion is where the economy meets the environment, and thrives.

---

**Concern ID: 62022**

**The Draft EIS lays out how many jobs would be created through construction and the proposed Project would also bring desperately needed jobs and economic growth. Plaquemines Parish, where the proposed Project would be constructed, and the surrounding region - including Orleans and Jefferson Parishes - would expect to see a significant economic boost.**

**Response ID: 16218**

The EIS describes the jobs impact from the construction of the diversion in Chapter 4, Section 4.13.4.2 in Socioeconomics. The EIS finds that moderate to major, temporary economic benefits are anticipated from proposed Project construction.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final

---

EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63334**

**The proposed MBSD Project would maintain and restore coastal lands and should move forward.**

**Response ID: 16291**

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:32104**

Nick G

No more diversion projects- all of these projects are destroying Louisiana's marsh and lakes. People come from all over the world to eat our seafood and go fishing in what is considered some of the best fishing grounds in the U.S. No more of our water ways have to be ruined and fish and animals killed do to these projects that do more harm than good.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

I would like to request to have a deep freezer for my boat to help with shrimping season. Is there any way that we as shrimpers get the opportunity to receive high end nets to help with stability strength while shrimping. ? That would really help all of us as a whole. My family has been struggling to make ends meet. Is there anything that can help with my children for college? I have been with this job almost most of my life. I will continue to support this community with my all. If there is any thing that can help with my children tuitions for school, that would be greatly appreciated. My English isn't where I want it to be, so it's a very hard time trying to keep up with news that can help fund and support my family in these hard times. I believe that we as a community stick together as a team because everything doesn't seem to be flowing all that well. We have been mentally and physically drained from the current state that COVID left us in. All I want to have is a job that I can depend on because this job isn't just a job to me. It's a piece of who I am and i don't know how to sit still or do anything else. The wetlife is where I lay my head half the year.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)

- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiessky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Myrtle Grove Estates

Mark Bergeron

I am adamantly opposed the fresh water diversion project, If the developers cannot present an plan that mitigates the flooding impact residents will experience in and around their Myrtle Grove homes. The incremental 2-3 foot surge on top of high tide and wind effects will disenfranchise home owners; and permanently damage the real estate values and way of life. Further, There has to be a maintenance plan fully funded in place going forward to maintain navigation from the Myrtle Grove area to Bay Barataria as it exists today and before any levees were constructed.

The developers do not have answers to many difficult questions, therefore nothing should move forward until the Residents have real solutions to their concerns.

---

**Concern ID: 62013**

**The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.**

**Response ID: 16210**

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur

in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the

final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62778**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire

---

this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood**

---

**insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or

---

increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62968**

**If operation of the diversion causes infill of various canals used to access surrounding communities, who will be responsible for dredging to maintain access? For example, if Wilkinson Canal is filled with silt then the canal cannot be used and waterfront property owners with boat lifts in Myrtle Grove will not be able to get out using their boats; the EIS does not require a remedy or provide a funded maintenance plan for this issue (including who would pay for dredging).**

**Response ID: 16642**

The impacts raised by the commenters were considered in the Draft EIS. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the Project area during Project operations.

In acknowledgement of commenters' concerns regarding maintenance of non-federal navigation channels and canals impacted by sedimentation of the proposed diversion, the Mitigation and Stewardship Plan includes measures to mitigate impacts on navigation resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

---

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Form Letter 19

\*\*\*\* Attached dolphin reference

Re: Mid-Barataria Sediment Diversion Draft Environmental Impact Statement

To Whom It May Concern:

These comments are on behalf of the Save Louisiana Coalition, and the hundreds of members of the commercial and recreational fishing industries, as well as concerned coastal community residents we represent.

The Save Louisiana Coalition is in total opposition of this project, and the following comments are in direct response to the Draft Environmental Impact Statement.

The EIS states the project's purpose and need is to "restore for injuries caused by the DWH oil spill by implementing a large-scale sediment diversion in the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts. The proposed project is needed to restore habitat and ecosystem services injured in the northern Gulf of Mexico as a result of the DWH oil spill."

As noted in the EIS, this project will NOT restore damages caused by BP, but would actually cause further damage to wildlife habitat, dolphins, brown shrimp, and oysters. The legality of using fines meant to mitigate damages to the environment and wildlife, to further harm the same environment and wildlife, comes into question.

The discharge of water from the Mississippi River, which is classified as the second most polluted River in the U.S., during the 2019 Bonnet Carre' Spillway opening, caused a declared fishery disaster in Louisiana of \$258 million. The Spillway was opened for a total of 123 days. It also resulted in the deaths of over 300 dolphins, causing NOAA to declare an Unusual Mortality Event, (UME), citing fresh water lesions as the cause of the necropsy evaluated deaths of these animals.

According to the planned operational regime of the Mid-Barataria Diversion ,and according to this same river flow of 1,000,000 cubic feet per second, had it been operational, the diversion would have operated at maximum 75,000 cfs for 201 days. This would have resulted in as much river water as the spillway opening, causing just as many millions of dollars of adverse impacts.

The EIS describes the project's likelihood of "severe, permanent adverse impacts on the natural environment", and yet, the vague figure of \$300 million for mitigation of damage is laughable.

In 2018, according to LDWF statistics, the landings value of Brown Shrimp alone, in Barataria Bay was over \$11 million. I would like to point out that retail value is over 4 times greater than landings value, putting the loss of Brown Shrimp at over \$44 million annually.

The EIS also points out severe, permanent, adverse impacts to the socio-economic well being of affected coastal communities. These communities are dependent of harvesting and processing of the seafood resources that will be devastated by this project. This harvesting is directly linked to the favorable conditions of the estuary that will be forever changed by the introduction of polluted river water. This project will undoubtedly cause drastic, permanent, economic harm on businesses, families, and individuals.

The land building capabilities of this project are highly exaggerated, and the EIS supports previous findings that the project may actually accelerate land loss, increasing flood risks. The depletion of historic sediment loads of the Mississippi River is well documented. Given the projected 2000-3000 acre land loss in the Birdsfoot Delta cited in the EIS, the projected land building acres exaggeration is obvious. The Corps own Engineer Research and Development Center, (ERDC), conclude that:

"diversion-induced inundation results in a reduction in plant productivity, which induces acceleration of land loss".

The EIS also notes that the project will raise water levels in Barataria Bay by as much as 1-2 feet, prolonging inundation, and causing flooding issues to the communities in proximity to this project, i.e., Lafitte, Happy Jack, Myrtle Grove, and putting further stress on these communities' levee systems.

CPRA has a history of mis-operation of existing diversions, as well as neglect in maintaining previous salinity control structures, i.e., the Naomi Siphon, Bayou Lamoque, and the Bohemia Control Structure, which is now known as Mardi Gras Pass.

The mitigation for damages to our estuary, water quality, brown shrimp, oysters, dolphins, coastal communities, as well as loss of jobs will run in the BILLIONS of dollars, not millions, and where is a mitigation actual figure stated in the EIS?

The Parish Councils of St. Bernard, Plaquemines, and St. Tammany have passed formal resolutions against this project. Louisiana's own Lt. Governor, Billy Nungesser has publicly voiced his opposition to this project.

Given the specific references in the EIS to the major, adverse, permanent, negative impacts caused by the Mid-Barataria Sediment Diversion, the speculated, exaggerated, long term benefits do not justify the permitting of this project.

Sincerely,

Capt. George Ricks

Captain George Ricks President, CEO

Save Louisiana Coalition

\*\*\*\*\* Attached dolphin reference

Please include this recent study on the effects on the Bottlenose Dolphin affected by the proposed Mid Barataria Sediment Diversion in my recent submission of comments on the project. This project will cause EXTINCTION of the dolphin, not only in Barataria Bay, but out to the barrier islands.

Marine Mammal Commission,  
[REDACTED]  
[REDACTED]

13<sup>th</sup> May 2021

Dear Marine Mammal Commission,

We greatly appreciate your interest in our research, and the letter (dated 5<sup>th</sup> April 2021) with your follow-up questions related to our presentation on 23<sup>rd</sup> March 2021 of the Barataria Bay dolphin population model. Your questions regarding the projected effects of the proposed Mid-Barataria Sediment Diversion (MBSD) project on recovery of the Barataria Bay Estuarine System (BBES) dolphin stock are important to consider when balancing the benefits and costs of the proposed MBSD project. The expected effects on the stock over time and space are also important to consider for ensuring sufficient monitoring of dolphin population health status and resources for stranding response, and to develop potential mitigation measures. To summarize briefly, you asked us to incorporate the modeled annual survival rates estimated by Dr. Garrison into the refined population model discussed by Dr. Schwacke to determine 1) the projected effects of the project on dolphin recovery over time, and 2) how the project could delay recovery of the BBES Stock.

We have conducted the requested analysis and provide a description of methods and findings in an attached report. In brief, our analysis indicates that the project (based on the Applicant's Preferred Alternative [APA]) will not only prevent the recovery of the BBES Stock, but it will result in the functional extinction of dolphins in the West, Central, and Southeast strata of the stock area. The only dolphins remaining in the basin would live adjacent to the barrier islands, and even this group will become severely reduced over the 50-year planning horizon of the MBSD project.

Yours faithfully,

Len Thomas and coauthors Tiago Marques, Cormac Booth, Ryan Takeshita and Lori Schwacke

Dear Drs. Schwacke, Srinivasan, and Garrison:

The Marine Mammal Commission would like to thank you for your participation in the “Effects of Low Salinity Exposure on Bottlenose Dolphins” webinar on 23 March 2021, and the presentations made by Drs. Schwacke and Garrison on the status and health of the Barataria Bay (BB) stock of common bottlenose dolphins and the potential effects of the Mid-Barataria Sediment Diversion (MBSD) on that dolphin stock.

The BB stock of bottlenose dolphins experienced significant mortality from the 2010 Deepwater Horizon (DWH) oil spill. There was a 51 percent mean proportional decrease of the BB bottlenose dolphin stock as a result of acute DWH oil spill-related exposure (Schwacke et al. 2017). A large percentage of the pre-spill cohort continues to exhibit poor health, most notably from persistent lung disease, impaired stress response, and other ailments. The refined population model discussed by Dr. Schwacke on the webinar showed that the BB population is currently near its lowest level, ten years after the spill. The population’s recovery is still uncertain, but the projected time to recovery estimated by the refined model is 32 years. The effects of various restoration efforts (whether positive or negative), as well as a changing climate, were not included in the refined model but Dr. Schwacke noted those effects could have a significant impact on population recovery trajectories.

Dr. Garrison presented a model showing the projected impacts of the MBSD on the BB dolphins, as outlined in more detail in Garrison et al. 2020. The model indicated a 36 percent reduction in the mean annual survival rate of dolphins due to projected freshwater inputs. That projection was based in part on dose-response functions generated by an expert elicitation of the effects of low salinity water exposure on bottlenose dolphins (Cormac and Thomas 2021), which were also presented as part of the 23 March 2021 webinar.

Would it be possible to incorporate the modeled mean annual survival rates estimated by Dr. Garrison into the refined population model discussed by Dr. Schwacke to determine the projected effects of the MBSD project on dolphin recovery over time, and how the MBSD project could delay recovery of the BB dolphin population?

The Commission is very interested to know whether you would be able to conduct these additional analyses, particularly before the end of the public comment period on the MBSD draft environmental impact statement (4 May 2021).

Sincerely,

Peter O. Thomas, Ph.D.,  
Executive Director

## Summary

1. The proposed Mid-Barataria Sediment Diversion (MBSD) project will result in decreased levels of salinity in Barataria Bay, Louisiana. This decreased salinity has been predicted by the National Oceanographic and Atmospheric Administration (NOAA) to cause increased mortality of bottlenose dolphins in the Barataria Bay Estuarine System (BBES) Stock.
2. We used an existing model for the population dynamics of this stock to predict the population consequences of the increased mortality. We compared population projections under two scenarios (described in the Draft Environmental Impact Statement for the proposed project), “Applicants Preferred Alternative” (APA) and “No Action Alternative” (NAA), using the same four geographic regions (“strata”) as NOAA and assuming no movement of animals among strata.
3. The model predicts an immediate and severe population-level decline under the APA. In the first year of operation under the APA (2027), median predicted excess mortality under the APA is 585 dolphins (95% confidence interval [CI] 131-1459), leading to a median stock decline of 23% (95% CI 3-55). By contrast, under the NAA the stock is predicted to increase by 3% (95% CI 1-5) – the increase is because the stock is estimated to still be in recovery from the *Deepwater Horizon* oil spill. Therefore, after one year of operation, the stock is predicted to be 25% smaller (95% CI 6-56) under the APA than under the NAA.
4. After 10 years of operation, the parts of the stock in the Central and West strata are predicted to be functionally extinct (probability of < 30 animals remaining is 1 in the Central stratum and 0.99 in the West stratum). The part in the Southeast stratum, while not extinct, is predicted to be 82% lower (95% CI 44-96) under the APA than under the NAA. The Island stratum is less severely affected with a median predicted decline of 38% (95% CI 9-84).
5. After the planned 50 years of operation, dolphins in three out of the four strata are predicted to be functionally extinct under the APA, with the remaining Island stratum being severely reduced relative to the NAA (median predicted population size of Island stratum is 85% lower [95% CI 28-99] under the APA than under the NAA). Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the APA is 143 dolphins (95% CI 11-706) compared to 3363 (95% CI 2831-4289) under the NAA. In other words, the stock is predicted to be 96% smaller (95% CI 80-100) under the APA than then NAA.

## Introduction

The Barataria Bay Estuarine System (BBES) Stock of bottlenose dolphins was heavily impacted by the *Deepwater Horizon* (DWH) oil spill. A population model (Schwacke et al. 2017) was developed to quantify the impact, and this model has recently been updated as part of a Gulf of Mexico Research Institute consortium project (CARMMHA) to collect additional information and refine the impact quantification (Schwacke et al. in preparation).

One proposed habitat restoration effort is the proposed Mid-Barataria Sediment Diversion (MBSD) project, which proposes to intermittently release water from the Mississippi River into the upper Barataria Basin. This will result in decreased levels of salinity in the basin that, in turn, will cause mortality of dolphins in the BBES Stock. The potential extent of this mortality was examined in a recent report by the National Oceanographic and Atmospheric Administration (NOAA; Garrison et al. 2020). That report gave predictions of annual survival rates in four geographic regions (“strata”) within the Barataria Basin (Island, Southeast, Central and West) under two scenarios presented in the Draft Environmental Impact Statement for the proposed project: the “Applicants Preferred Alternative”, where the MBSD is constructed and begins operation in 2027, and the “No Action Alternative”, where the MBSD is not constructed.

In this report, we integrate the annual survival of dolphins in each of the four strata from the two scenarios of Garrison et al. (2020) into the population model developed under the CARMMHA project, and use this to predict the consequences of the proposed MBSD project for the dolphin stock.

## Methods

### Impact on survival from NOAA analysis

We obtained from NOAA 1,000 replicate predictions of estimated annual survival under APA and NAA scenarios in each of the four strata, derived from the model of Garrison et al. (2020). The replicate predictions represent the range of scientific uncertainty on possible impacts, accounting for factors such as uncertainty on the salinity field for a given set of hydrographic conditions, uncertainty on animal movement and hence exposure, and uncertainty on the effect of low salinity on dolphin survival (see Garrison et al. 2020 for details). Note that all predictions are based on a single assumed annual hydrograph, that for 1970 (Garrison et al. 2020), and so do not account for uncertainty in future hydrographic conditions (see Discussion).

For each replicate prediction and stratum, we calculated the percentage difference in survival between the APA and the NAA as follows:

$$\% \text{ difference in survival} = \frac{\text{survival under APA} - \text{survival under NAA}}{\text{survival under NAA}} \times 100$$

The resulting distribution of percentage difference in survival in each stratum is shown in Figure 1, with associated summary statistics in Table 1. For the Island stratum, the median prediction is of a 2% decline in survival under the APA relative to the NAA, although in 10% of replicates the predicted survival decline is greater than 20%. For the Southeast stratum, the median prediction is of a 14% decline in survival with 40% of replicates predicting a survival decline of greater than 20%. Note, however, that 24% of replicates in this stratum predict an increase in survival under APA relative to the NAA. For the Central and West strata there is a large predicted decline in survival under almost all replicates.

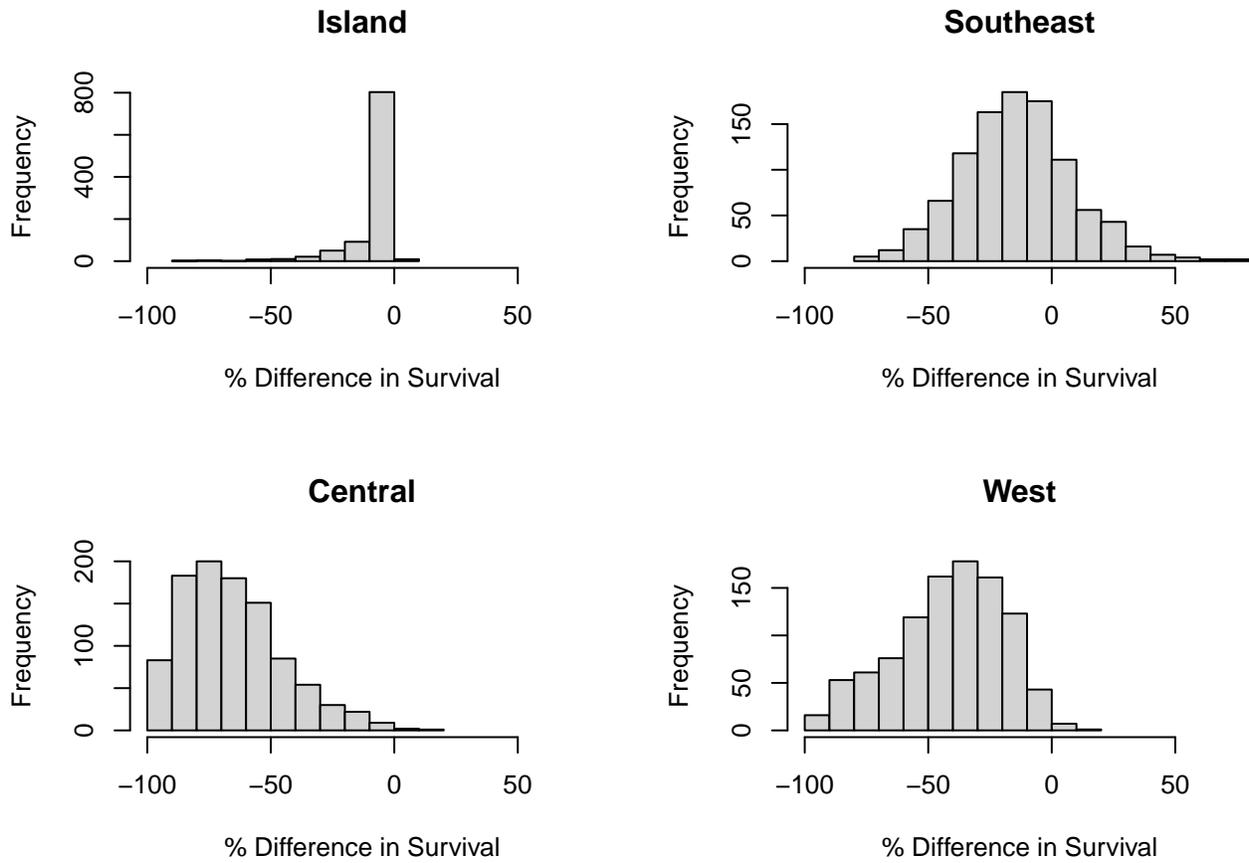

Figure 1: Predicted percentage difference in dolphin annual survival under the Applicant Preferred Alternative (APA) compared with the No Action Alternative (NAA). One thousand predicted survival rates were provided by NOAA and were derived from the model of Garrison et al. (2020).

Table 1: Summary statistics on predicted percentage difference in dolphin annual survival under the APA relative to the NAA. First column is median predicted percentage difference, second is percentage of replicates that predict a decline in survival of 20% or more, third is percentage of replicates that predict an increase in survival.

| Stratum   | median % diff | % (diff < -20%) | % (diff > 0) |
|-----------|---------------|-----------------|--------------|
| Island    | -2            | 10              | 1            |
| Southeast | -14           | 40              | 24           |
| Central   | -68           | 97              | 0            |
| West      | -39           | 83              | 1            |

## Population consequences

The population model of Schwacke et al. (in prep.) gives estimates of the population trajectory of BBES dolphins from 2010 onwards, accounting for the estimated effect of the DWH oil spill. We used this model as the basis to predict the estimated effect of the proposed MBSD project (APA) on the dolphin population. Like the APA survival predictions from Garrison et al. (2020), the population model accounts for scientific uncertainty in predictions by allowing multiple replicates to be drawn. We therefore based our predictions on 1,000 replicate samples.

For each sample, we partitioned the BBES dolphin population into the same four strata as Garrison et al. (2020), using estimates of the proportion of the total population with home range centers in each of the four strata. These estimates come from a spatial capture recapture analysis (Glennie et al. in prep.) that forms part of the inputs to the Schwacke et al. model. For the purposes of this analysis, we assumed that each stratum is demographically independent – i.e., that dolphins in the BBES stock do not move from one stratum to another. For each stratum, we ran the Schwacke et al. model for 75 years (2010-2076), under two scenarios. In the first scenario, representing the APA, for each year after the proposed MBSD project begins in 2027 we adjusted the survival values from the Schwacke et al. model using a random draw from the 1,000 values of percentage difference in survival for that stratum. In the second scenario, representing the NAA, we ran the Schwacke et al. model without modification.

We calculated the following metrics to summarize outcomes from the population model:

- In the first year of operation of the MBSD (i.e., 2027-2028)
  - Excess mortality: the total number of dolphins that are expected to die this year under the APA minus the number that are expected to die in the same year under the NAA.
  - Change in population size under the APA and under the NAA.
  - Percentage difference in population size in 2028 between APA and NAA.
- After 10 years of operation of the MBSD (i.e., in 2037)
  - Probability of functional extinction, where functional extinction is defined as < 30 animals.
  - Percentage difference in population size in 2037 between the APA and NAA.
- In the final year of operation the MBSD operations planning horizon (i.e., 2076)
  - Probability of functional extinction.
  - Population size under the APA and under the NAA.

In each case, we report the median value from the 1,000 replicate simulations, together with the lowest 2.5th and highest 97.5th percentile – these latter values represent a 95% confidence interval on the prediction.

## Results

We first present graphical representations and a qualitative description of the results, before presenting the summary metrics described in the Methods.

Figure 2 summarizes the population trajectories over all 1,000 realizations under APA (red) and NAA (black) scenarios. The populations follow the same trajectory under both scenarios up until 2027, when proposed MBSD operations start. During this period (2010-2027) the populations experience the negative effect of the DWH oil spill and, starting around 2020, begin to recover. After 2027 under the NAA, the populations continue to recover and reach a steady state long before the end of the simulation time period. Under the APA the median prediction for the Island stratum is of a steady decline, while the other strata experience rapid declines to extinction. The prediction at stock level, i.e., summing across strata, is shown in Figure 3. Under the APA, the stock is predicted to decline precipitously at first and then more gradually, reaching very low levels relative to the NAA by the end of the simulation time period.

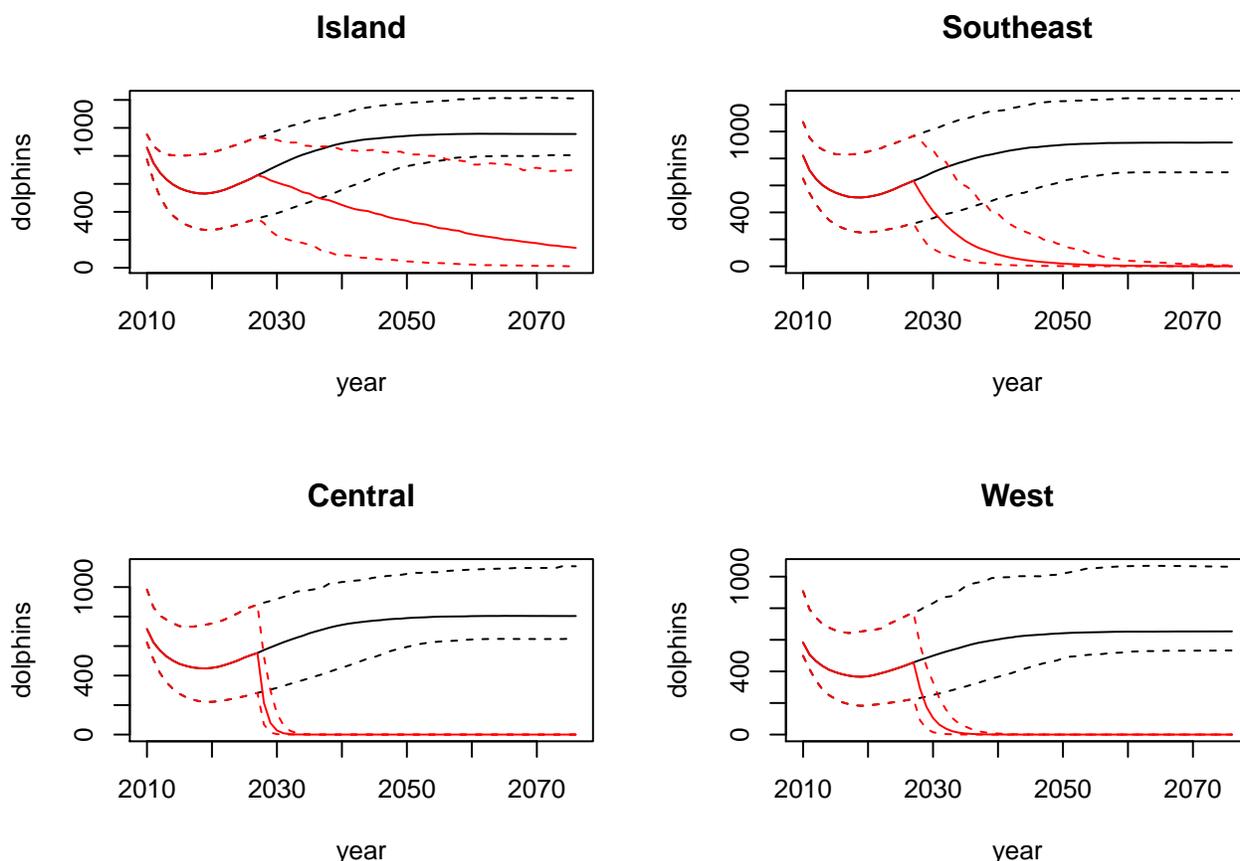

Figure 2: Summary of predicted population trajectories by stratum under the Applicant Preferred Alternative (red) and No Action Alternative (black) scenarios. Solid line shows median; dashed lines show 95% confidence limits.

The summaries given in Figures 2 and 3 are computed from 1,000 random realizations of the model. Figure 4 shows 10 example realizations. The part of the stock in the Island stratum experiences occasional large population decreases associated with years where there is a large decline in survival under the APA; in most years, however, there is little or no decline. After 50 years of operation, all realizations have experienced an overall decline and none are at the level of the corresponding NAA. The part of the stock in the Southeast stratum experiences frequent stronger declines, but also occasional increases associated with survival increase under the APA. Nevertheless, after 50 years of operation, all realizations are at or close to zero. The parts of the stock in the Central and West strata experience rapid declines towards zero in all realizations.

Quantitative summaries of the results are given in Tables 2-6<sup>1</sup>. Table 2 shows the predicted mortalities in the first year of the proposed MBSD operation (2027) under APA, NAA and the difference between the

<sup>1</sup>Note that in all these tables, the median shown in the “Total” row is calculated by first aggregating the strata and then calculating the median. This is not the same as simply summing the stratum medians. The same is true for the confidence limits.

### Barataria Bay Estuarine System Stock

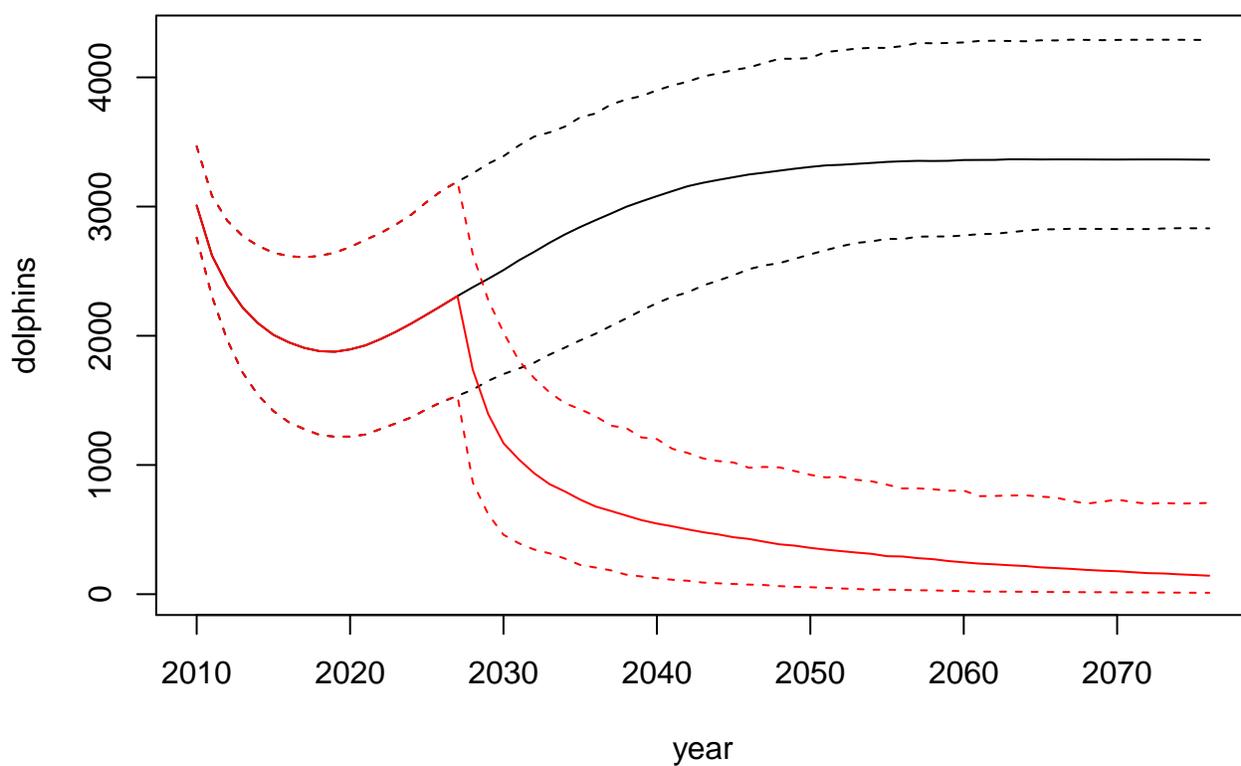

Figure 3: Summary of predicted stock trajectory under the Applicant Preferred Alternative (red) and No Action Alternative (black) scenarios. Solid line shows median; dashed lines show 95% confidence limits.

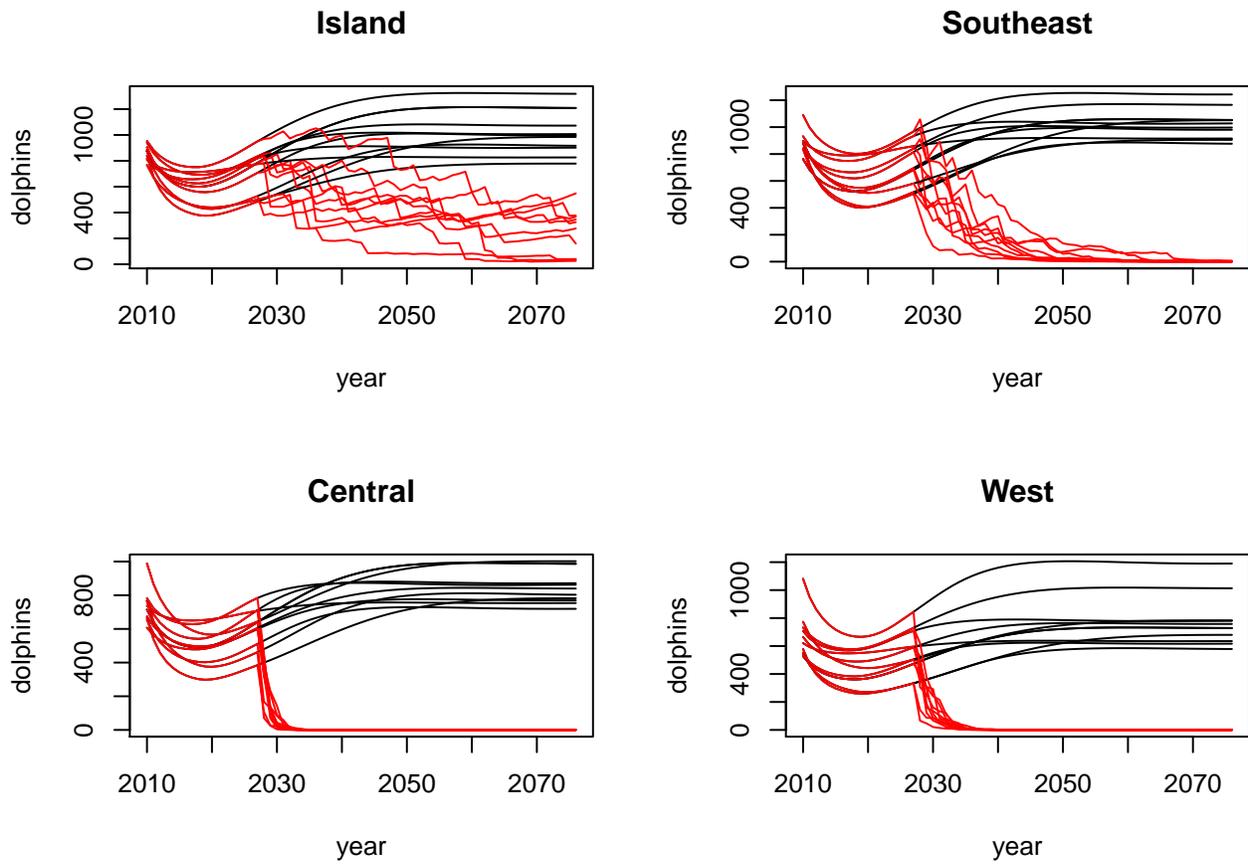

Figure 4: Ten example realizations of the population simulation under the Applicant Preferred Alternative (red) and No Action Alternative (black) scenarios.

two, which represents the predicted excess mortalities under the APA scenario. In this first year of MBSD operation, the median predicted excess mortality under the APA is 585 dolphins with 95% CI 131-1459. This excess mortality represents a median of 26% of the stock (95% CI 6-58) killed by the MBSD in its first year of operation.

Table 2: Predicted dolphin mortality in 2027 under APA and NAA scenarios. Last column shows excess mortality – i.e., mortality under APA minus mortality under NAA. Values are medians from the model simulations, with 95% confidence intervals in brackets.

| Stratum   | APA mortality   | NAA mortality | excess mortality (APA-NAA) |
|-----------|-----------------|---------------|----------------------------|
| Island    | 59 (26 — 261)   | 44 (23 — 64)  | 12 (0 — 217)               |
| Southeast | 111 (0 — 424)   | 42 (22 — 66)  | 69 (-50 — 367)             |
| Central   | 364 (120 — 715) | 37 (19 — 59)  | 326 (92 — 656)             |
| West      | 186 (53 — 461)  | 30 (15 — 52)  | 154 (31 — 420)             |
| Total     | 740 (26 — 261)  | 156 (23 — 64) | 585 (131 — 1459)           |

Estimated stock size in the 2027, before operation of the proposed MBSD, was 2307 animals (95% CI 1535-3193). Estimated stock sizes in 2028 under the APA and NAA are shown in Table 3. Under the APA, the stock is predicted to decline by 23% (95% CI 3-55) due to mortalities caused by the MBSD operation. By contrast, under the NAA the stock is predicted to increase by 3% (95% CI 1-5) – the increase is because the stock is estimated be still in recovery from the DWH oil spill. Therefore, by the end of the first year of MBSD operations, the stock is predicted to be 25% smaller (95% CI 6-56) under the APA than under the NAA (Table 3).

Table 3: Predicted number of dolphins in 2028 (after 1 year of operation of the MBSD) by stratum and overall under APA and NAA scenarios, and percentage difference between scenarios. Values are medians with 95% confidence intervals in brackets.

| Stratum   | APA dolphins      | NAA dolphins       | % difference    |
|-----------|-------------------|--------------------|-----------------|
| Island    | 648 (320 — 926)   | 683 (366 — 942)    | -2 (-31 — 0)    |
| Southeast | 551 (237 — 939)   | 653 (330 — 983)    | -12 (-49 — 7)   |
| Central   | 214 (68 — 528)    | 573 (294 — 894)    | -61 (-87 — -17) |
| West      | 291 (90 — 567)    | 472 (232 — 789)    | -35 (-79 — -7)  |
| Total     | 1736 (864 — 2629) | 2376 (1584 — 3258) | -25 (-56 — -6)  |

Tables 4 and 5 show the predicted population size in 2038 and 2076 respectively (i.e., after 10 years of operation of the MBSD and at the end of the 50 year planning horizon) under APA and NAA, as well as the difference between the two scenarios.

Table 4: Predicted number of dolphins in 2038 (after 10 years of operation of the MBSD) by stratum and overall under APA and NAA scenarios, and percentage difference between scenarios. Values are medians with 95% confidence intervals in brackets.

| Stratum   | APA dolphins     | NAA dolphins       | % difference       |
|-----------|------------------|--------------------|--------------------|
| Island    | 491 (118 — 868)  | 852 (503 — 1070)   | -38 (-84 — -9)     |
| Southeast | 137 (28 — 497)   | 810 (457 — 1126)   | -82 (-96 — -44)    |
| Central   | 0 (0 — 0)        | 712 (409 — 997)    | -100 (-100 — -100) |
| West      | 2 (0 — 21)       | 581 (328 — 964)    | -100 (-100 — -97)  |
| Total     | 644 (184 — 1304) | 2946 (2076 — 3790) | -78 (-93 — -59)    |

Table 5: Predicted number of dolphins in 2076 (at the end of the planning horizon for the MBSD) by stratum and overall under APA and NAA scenarios, and percentage difference between scenarios. Values are medians with 95% confidence intervals in brackets.

| Stratum   | APA dolphins   | NAA dolphins       | % difference       |
|-----------|----------------|--------------------|--------------------|
| Island    | 142 (11 — 700) | 956 (805 — 1210)   | -85 (-99 — -28)    |
| Southeast | 0 (0 — 7)      | 918 (698 — 1243)   | -100 (-100 — -99)  |
| Central   | 0 (0 — 0)      | 804 (650 — 1141)   | -100 (-100 — -100) |
| West      | 0 (0 — 0)      | 654 (533 — 1063)   | -100 (-100 — -100) |
| Total     | 143 (11 — 706) | 3363 (2831 — 4289) | -96 (-100 — -80)   |

Table 6 shows the predicted probability of functional extinction (i.e., proportion of simulation runs where the number of dolphins is less than 30) in each stratum in 2038 and 2076.

Table 6: Predicted probability of functional extinction (i.e., fewer than 30 dolphins remaining) by stratum in 2038 (after 10 years of operation of the MBSD under APA) and 2076 (at the end of the planning horizon for the MBSD)

| Stratum   | p(extinct) in 2038 | p(extinct) in 2076 |
|-----------|--------------------|--------------------|
| Island    | 0.00               | 0.1                |

| West      | 0.99               | 1.0                |

## Discussion

Under the assumptions of this model, there is predicted to be a severe decline in stock size caused by the MBSD under the APA scenario. The stock is predicted to become functionally extinct in three out of four strata and severely reduced in the fourth. The declines are more severe than those estimated to have been caused by the DWH oil spill and will take place just as the stock is starting to recover from the oil spill. While the stock is estimated to recover fully from the DWH oil spill under the NAA scenario, this will not happen under the APA scenario.

We set a limit for “functional extinction” of 30 animals. To our knowledge there is no agreed threshold, and other reasonable values could have been used to indicate the point at which there are so few animals they no longer form a functioning part of the ecosystem. Regardless of the value used, the above findings would be

qualitatively the same

These results were generated by combining two separate analyses: the survival predictions from Garrison et al. (2020) and the population model of Schwacke et al. (in prep., updating Schwacke et al. 2017). These use some overlapping information – the photo-ID surveys undertaken in Barataria Bay from 2010-2019. Hence it would be possible, with more modelling effort, to integrate the two more closely by building components of the Garrison et al. model into the population model. However, this is not expected to make a qualitative difference to the population predictions.

The analysis undertaken here sampled values at random each year from the predicted survival effects under the APA and NAA generated by Garrison et al. (2020). This is equivalent to assuming the factors driving the uncertainty in predicted survival effects vary each year. While this is correct for some sources of uncertainty (e.g., uncertainty in salinity field given hydrography; animal movement and hence exposure), it is not fully correct for others (e.g., uncertainty on dolphin survival response given exposure). Ideally, the different components of uncertainty in the Garrison et al. model would be separated and then we could sample as appropriate at the annual level or just once per population projection. This reduction in annual variability would be expected to produce a somewhat more positive population projection, particularly in the Island stratum. However, one very important source of annual variability was neglected in these simulations: annual change in hydrography. The predictions we used from Garrison et al. model were based on a single annual hydrograph, from 1970 (cycle0, Garrison et al. 2020), when in reality hydrography is expected to vary substantially between years. This variability will mean that there are years of worse survival than predicted by Garrison et al. and years of better survival. The overall effect of this on the dolphin population will be to produce a more negative trajectory, because years of poor survival produce large decreases in population size, but in years of good survival the population can only increase by a small amount as it is constrained by the birth rate. The population can decline by 25% in a bad year but it cannot increase by 25% in a good year. Given this, we anticipate that addressing all of the issues related to uncertainty discussed in this paragraph will lead overall to more negative population predictions.

Another factor that makes our projections optimistic is that the population dynamics model is deterministic – it does not account for the random nature of births and deaths, and also allows non-integer population counts. Incorporating demographic stochasticity in the model, and restricting population sizes to be whole numbers will produce more negative predictions, although the difference will not be significant until the populations become small.

The analysis also assumed that the four strata are demographically independent. If dolphins move away from the three more affected strata into the Island stratum in response to low salinity then the stock-level effects may be lower; on the other hand, if dolphins disperse between strata without regard to salinity changes then more animals will move into the strongly-affected strata from the less-affected Island stratum and the stock-level effects may be greater. Genetic analyses have supported spatial structure within the Barataria Basin population, and have identified genetically distinct dolphin groups in the Western, East/Central, and Island portions of the basin (Rosel et al. 2017, Speakman et al. in prep.). Tracking of Barataria Basin dolphin movement patterns via satellite-linked tags has shown multi-year site fidelity to small home ranges (Wells et al. 2017), and have not shown changes in movement that are coincident with fluctuating salinity (Takeshita et al. submitted).

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions. To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61819**

**Commenters expressed concern that the proposed Project would have adverse impacts on Barataria Basin's water quality, wetlands, fisheries, recreational uses, and eroding coastlines due to chemicals, oil and hazardous waste, and/or pollutants in the**

---

**Mississippi River that would be routed to the Barataria Basin via the proposed diversion.****Response ID: 16429**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality of the Draft EIS, the segment of the Mississippi River where the proposed diversion river intake structure would be located (subsegment LA070301\_00) fully supports its designated uses. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. LDEQ's water quality assessment indicates that regulated substances are not present in concentrations that would cause a water quality impairment at the location of the intake structure. In response to this concern expressed by commenters, a new subsection has been added to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of nearby industrial facilities on river water routed to the basin during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills from Industrial Sites. As described in the EIS, Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed.

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)

- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62224**

**Communities like Happy Jack, Lake Hermitage and Myrtle Grove, some of which have homes that are not above the new base flood elevation, already experience some**

---

**degree of flooding which would be made worse by the diversion. This would affect the ability of residents to access and enjoy their homes and communities.**

**Response ID: 15757**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discuss the anticipated increased flooding impacts outside of federal levee systems to be caused by the operation of the diversion. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes, which would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the

LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62356**

**CPRA has a history of mis-operation of existing diversions, as well as neglect in maintaining previous salinity control structures.**

**Response ID: 15875**

CPRA's history regarding its operation of other diversions and salinity structures was not evaluated as a factor contributing to the projected impacts of the proposed Project in the EIS and LA TIG's Restoration Plan.

---

**Concern ID: 62666**

**It would be inappropriate, and contrary to the stated purpose of restoring injured resources, to use DWH settlement funds to implement a project that would harm the same wildlife (for example, shrimp, oysters, bottlenose dolphins, *Spartina alterniflora*) and ecological services that were negatively affected by the oil spill.**

**Response ID: 16625**

USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore the damage caused by the DWH oil spill. USACE's involvement with the proposed Project is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under the CWA Section 404 and RHA Sections 10 and 14 (33 USC Section 408). USACE is not executing any DWH restoration actions under the OPA. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH spill in the Louisiana Restoration Area. As explained in the Final EIS, Appendix B2 DEIS Public Review and Public Meetings, Section 2.0 Agency Roles in the Responses to Public Comments, response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views.

In the Restoration Plan, the LA TIG explained that the DWH oil spill resulted in the oiling of more than 1,100 kilometers of wetlands, nearly all of which were located in coastal Louisiana (DWH NRDA Trustees, 2016). The heaviest oiling occurred in the Barataria Basin, resulting in substantial injuries to natural resources in the basin (DWH NRDA Trustees, 2016).

Recognizing that the resulting loss of marsh productivity affected resources throughout the northern Gulf of Mexico ecosystem, the State of Louisiana and the federal Trustees that negotiated the DWH Natural Resource Damages settlement allocated \$4 billion, almost half of the total settlement amount, to restoring Louisiana's wetland, coastal, and nearshore habitats.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree of collateral injuries, to natural resources injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the LA TIG's Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, as noted in the LA TIG's Restoration Plan, without the proposed Project, sea-level rise, subsidence, and other existing stressors would result in additional marsh loss over time reducing the suitability of habitat for many of the same species.

The LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing a deltaic process, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Final Restoration Plan because the LA TIG believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the NRDA Trustee's Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

In its Strategic Restoration Plan for Barataria Basin (2018), the LA TIG evaluated the potential and extent of collateral injury for a range of restoration techniques. Unfortunately, almost all large-scale restoration comes with some potential for collateral injury. The LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54. In the Restoration Plan, the LA TIG strives to identify an alternative that would provide what it

considers the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. Again, see Section 3.2.4 of the Restoration Plan for a discussion of how the LA TIG came to its decision.

In recognition of the potential for collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA will implement a suite of stewardship measures (see Section 3.2.1.1.5 [Associated Stewardship Measures] of the Restoration Plan and Appendix R1 to the EIS). The LA TIG is also committed through these measures to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63020**

**The Draft EIS highly exaggerated the land-building capabilities of the proposed Project, given that the depletion of historic sediment loads of the Mississippi River is well documented (including by the Expert Panel on Diversion Planning and Implementation [convened by the Water Institute of the Gulf] and USACE's ERDC) and that increased periods of inundation have been found to adversely impact existing vegetation and contribute to land loss. Further, significant uncertainty exists with respect to the response of the existing wetland vegetation to diversion-induced inundation (Brown et al., 2019, p. iii).**

**Response ID: 16032**

---

The Draft EIS considered the commenter's concerns regarding the rates of land loss and land projected to be built during diversion operations. The Mississippi River is carrying much less sediment than it did in the past. As explained in Chapter 3, Section 3.4.2.5 in Surface Water and Coastal Processes, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The Delft3D Basinwide Modeling accounts for those sediment supply changes as described in Appendix E Delft3D Modeling of the EIS, Sections 5.2.2 and 8.

Further, the Delft3D Basinwide Model incorporates inundation depths in the critical vegetation parameters to simulate vegetation losses and gains as a result of the diversion, as well as other sources of inundation (such as subsidence and sea-level rise). The model results should be interpreted in light of the uncertainties involved. The USACE-ERDC report cited by the comment (Brown et al. 2019), which documents the development and validation of the Adaptive Hydraulics (AdH) model to simulate hydrodynamic, salinity, sedimentation, and morphodynamic processes in the Mississippi River and Delta, was reviewed and used in preparing the navigation analyses in the EIS (see Appendix Q1 Dredging Analysis). The USACE-ERDC report also describes the SEDLIB-VEG model, which is less complex than the vegetation model (LaVegMod) used to project impacts from the proposed Project. While the AdH model was not used in preparing the land-building analyses in the EIS and the SEDLIB-VEG model was not used for the assessment of vegetation impacts from the Project, uncertainties identified in the report for numerical modeling (including uncertainty in the sediment rating curve, subsidence rates, and inundation effects on vegetation) were considered. As discussed in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences and Section 8 of Appendix E Delft3D Modeling, those uncertainties include the parameters used to simulate vegetation growth and mortality. Vegetation ranges were determined by the probability of establishment and mortality of each species used in modeling simulations, based on salinity and inundation depth tolerances.. Where feasible, uncertainties have been examined through sensitivity tests and model-to-model comparisons and incorporated in the conclusions. However, to further address the concern of exaggerated land building, Chapter 4, Section 4.1.3.3 in Model Limitations and Uncertainty, has been revised in the Final EIS to clarify uncertainty related to currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations.

---

**Concern ID: 63067**

**The majority of the bottlenose dolphin population of this area will be destroyed... not just killed but sentenced to a horrific death. Freshwater releases at Bonnet Carré Spillway in 2019 resulted in an unusual mortality event (UME), demonstrating the harm that freshwater releases can cause to dolphins. A study by the Galveston Bay Dolphin Research Program also found that dolphins in upper Galveston Bay developed skin lesions after flooding from Hurricane Harvey. Additional studies further support the harm that the diversion could cause by demonstrating negative impacts to dolphins from exposure to low-salinity conditions (Deming and Garrison, 2021; Duignan et al., 2020; McClain et al., 2020).**

---

**Deming, A., and L. Garrison. 2021. 2019 Northern Gulf of Mexico bottlenose dolphin unusual mortality event. Marine Mammal Commission meeting/webinar on “Effects of Low Salinity Exposure on Bottlenose Dolphins,” 23 March 2021. Oral presentation. <https://www.mmc.gov/events-meetings-and-workshops/other-events/effects-of-low-salinity-exposure-on-bottlenose-dolphins-webinar/>**

**Duignan, P.J., N.S. Stephens, and K. Robb. 2020. Fresh water skin disease in dolphins: a case definition based on pathology and environmental factors in Australia. Scientific Reports 10:21979.**

**McClain, A.M., R. Daniels, F.M. Gomez, S.H. Ridgway, R. Takeshita, E.D. Jensen, and C.R. Smith. 2020. Physiological effects of low-salinity exposure on bottlenose dolphins (*Tursiops truncatus*). Journal of Zoological and Botanical Gardens 1:61-75.**

**Response ID: 16590**

The Draft EIS included an analysis based on extensive literature and soon-to-be published data (now published) demonstrating the impacts of low-salinity conditions on dolphins. These data were considered as part of an Expert Elicitation (a garnering of expert opinions to determine or quantify an unknown) that resulted in dose-response curves (Booth et al. 2020) and summarized in Chapter 4, Section 4.11.3 (Marine Mammals - Overview of Impact Analysis Approach) of the EIS. While Deming and Garrison (2021) was presented after the release of the Draft EIS, the presentation was based on data that were fully considered in the Draft EIS, including as part of the Expert Elicitation. Along with other relevant data (for example, BBES tagging studies), the analysis contained in the Draft EIS determined that there would be a significant, adverse, permanent impact on the BBES Stock. Further, the analysis in the Draft EIS concluded that if the 75,000 cfs Alternative were implemented, impacts would be immediate and only a remnant population would be likely to exist near the barrier islands after 50 years of operation.

After release of the Draft EIS, at the request of the Marine Mammal Commission, the National Marine Mammal Foundation and University of St. Andrews released a population impact projection based on the information presented in the Draft EIS (including annual survival rates from Garrison et al. 2020) coupled with an updated population model for BBES dolphins (Schwacke et al.2022, Thomas et al. 2021). This new, additional analysis has been incorporated into the Final EIS in Chapter 4, Sections 4.11.5.2 Barataria Bay Estuarine Stock and supports the original determination in the Draft EIS of major, permanent, adverse impacts on the BBES dolphin population. The research presented in the McClain et al. (2020) study cited by commenters was considered in the Draft EIS [cited at the time as McClain et al. (in prep)]; the research presented by Duignan et al. (2020) is consistent with the established literature and does not change the conclusions of the Draft EIS, but this study has been incorporated in Chapter 4, Section 4.11.5.2.2.1 General Effects on Dolphin Health of the Final EIS. Similarly, the information included in the Deming and Garrison presentation was considered in the Draft EIS, is consistent with the conclusions of the Draft EIS, and the presentation has now been cited in Section 4.11.5.2.2.

Since release of the Draft EIS and the LA TIG’s Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response

---

actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include specific marine mammal response triggers that may affect Project operation mitigation efforts; see Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63070**

**A recent study suggests that the proposed Project would not only prevent the recovery of the BBES Stock, but it would result in the functional extinction of dolphins in the West, Central, and Southeast strata of the stock area (Thomas et al., 2021). The only dolphins remaining in the basin would live adjacent to the barrier islands, and even this group would become severely reduced over the 50-year planning horizon of the proposed Project. Additionally, an expert elicitation (Booth and Thomas, 2021) building on previous studies (Garrison et al., 2020; Schwacke et al., 2017; Thomas et**

---

al., 2021) suggests that while dolphins can endure some periods of exposure to low salinity, the period of tolerable exposure shortens for dolphins exposed to acute changes in salinity, and the median time to death is 22 days with continuous exposure to water with salinity levels below 5 ppt.

Booth, C., and L. Thomas. 2021. An expert elicitation of the effects of low-salinity water exposure on bottlenose dolphins. *Oceans* 2(1):179-192.

Garrison, L.P, J. Litz, and C. Sinclair. 2020. Predicting the effects of low salinity associated with the Mid-Barataria Sediment Diversion Project on resident common bottlenose dolphins (*Tursiops truncatus*) in Barataria Bay, Louisiana. NOAA Technical Memorandum NOAA NMFS- SEFSC-748. 97 pages.

Schwacke, L.H., L. Thomas, R.S. Wells, W.E. McFee, A.A. Hohn, K.D. Mullin, E.S. Zolman, B.M. Quigley, T.K. Rowles, and J.H. Schwacke. 2017. Quantifying injury to common bottlenose dolphins from the Deepwater Horizon oil spill using an age-, sex- and class-structured population model. *Endangered Species Research* 33:265-279.

Thomas, L., Marques, T., Booth, C., Takeshita, R., and L. Schwacke. 2021. Predicted population consequences of low salinity associated with the proposed Mid-Barataria Sediment Diversion Project on bottlenose dolphins in the Barataria Bay Estuarine System Stock.

**Response ID: 16593**

The Draft EIS included an analysis of the impacts to marine mammals, including BBES dolphins in Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock. This analysis incorporated the Booth and Thomas (2021), Garrison et al. (2020), and Schwacke et al. (2017) studies, and the Final EIS includes additional analyses that were completed by Thomas et al. (2021) after the Draft EIS was released for public comment. The impact conclusions in the Draft EIS were based in large part on Garrison et al. (2020), which predicts that only a remnant population of dolphins would continue to exist in Barataria Basin after diversion operations commenced. The conclusion of major, permanent, adverse impact to bottlenose dolphins is also supported by Thomas et al. (2021), which built on these earlier studies and concludes that, after 1 year of operation of the Applicant's Preferred Alternative, there would be 61 percent fewer dolphins in the Central stratum than under the No Action Alternative, 35 percent fewer in the West stratum, 12 percent fewer in the Southeast stratum, and 2 percent fewer in the Island stratum, with 25 percent fewer overall. Thomas, et al. further concluded that after 10 years of operation, there would be 100 percent reduction in the populations of dolphins in the Central and West strata, an 82 percent reduction in the population of the Southeast stratum dolphins, and a 34 percent reduction in the population of the Island stratum dolphins as compared against the No Action Alternative, with an overall difference in population of 78 percent. (Note that Thomas, et al. 2022 slightly refined some of these projections.) After 50 years of operation, in three out of the four strata, dolphins are predicted to be functionally extinct (defined as less than or equal to dolphin in Thomas, et al. 2022) under the Applicant's Preferred Alternative, with the remaining Island stratum being 85 percent lower [95 percent CI -28 -- -99] under the Applicant's Preferred Alternative than under the No Action Alternative. Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the Applicant's Preferred Alternative is projected to be 143 dolphins (95 percent CI 11-706) compared to a predicted 3,363 dolphins (95 percent CI 2,831-4,289)

---

predicted to inhabit the Barataria Bay under the No Action Alternative. In other words, the BBES dolphin stock is projected to be 96 percent smaller (95 percent CI -80 -- -100) under the Applicant's Preferred Alternative than the No Action Alternative. Chapter 4, Section 4.11 Marine Mammals of the Final EIS has been updated to reflect the results of Thomas et al. (2021).

Booth and Thomas (2021) evaluated multiple scenarios with different salinity changes, and in one of those scenarios' where bottlenose dolphins experience a change in salinity within 0 to 5 days from typical salinity environment (that is, mean 15 to 25 ppt) down to an atypical environment with salinity below 5 ppt for an extended period, the median time to death would be 22 days.

---

**Concern ID: 63182**

**Proposed mitigation is insufficient and not guaranteed, and the amount of funding for mitigation is not clearly stated.**

**Response ID: 16559**

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

---

10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63726**

**Some commenters felt that the amounts allocated for mitigation were insufficient, while others felt that no amount of mitigation would suffice, for example for the more senior fishers who won't be in a good position to adapt to the changing environment.**

**Response ID: 16702**

The Draft EIS considered how changes in the commercial fisheries, both with and without implementation of the proposed Project, would impact more senior fishers in Chapter 4, Section 4.14.4 in Commercial Fisheries. In response to public comments and resource agency input about the proposed mitigation efforts, CPRA has expanded and refined its fisheries mitigation and stewardship measures. CPRA's mitigation and stewardship strategies and associated expenditures would focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for fisheries in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to fisheries in the early years of the Project's operational life. The provisions of the fishery mitigation and stewardship plan, valued at approximately \$54 million, would help to achieve that goal and to mitigate the impacts of the proposed Project on oyster fishers. While not mitigation for the Project impacts, examples of other restoration/fishery improvement actions include: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, CPRA's allocation of \$2 million in adaptive management funding to support off-bottom oyster culture, the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery and the LA TIG's allocation of \$38 million in recreational use funds to support subsistence and recreational fisheries. The Final Mitigation and Stewardship Plan is included in Appendix R1 to the Final EIS.

The comments of more senior fishers who expressed concern about their ability to adapt to changing fishery conditions are acknowledged. If permitted by USACE and funded by the LA TIG, it would take CPRA approximately 5 years to complete construction of the proposed Project and to begin operations. This relatively long period provides those affected with the time and opportunity to decide how they want to go forward, ranging from taking advantage of

---

the adaptation opportunities offered through the Mitigation and Stewardship Plan (Appendix R1 to the EIS) to transitioning out of the fishing industry or retiring.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 61873**

**The proposed Project's impacts are in contradiction with the Project's stated purpose and need to restore habitat and ecosystems damaged by the DWH oil spill given the permanent adverse impacts on fisheries, marine mammals, and water quality. The proposed Project is incompatible with both a healthy environment and healthy economy.**

**Response ID: 15829**

USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities), and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. If implemented, the proposed Project would deliver sediment, fresh water, and nutrients into the Barataria Basin. While there would be short- and long-term, adverse and beneficial impacts to physical, biological, and socioeconomic resources in the Project area due to the proposed Project, the sediment, fresh water, and nutrients are expected to restore habitat and ecosystems services injured in the northern Gulf of Mexico as a result of the DWH oil spill.

**Correspondence ID:32149**

Stuart Guey, Jr.

Comments to Mid-Barataria Sediment Diversion EIS dated March 2021.

My name is Stuart J. Guey, Jr., a native, resident and outdoorsman of Plaquemines Parish, a practicing dentist for the last 46 years and presently serving on the Plaquemines Council representing District 4.

The directive established for the project is to make recommendations for a sediment diversion to address and correct impacts from the Deep Water Horizon Oil Spill. The Oil Pollution Act is a driving force to establish the funding and restoration of the area impacted by an oil spill and bring it back to its pre-spill condition. To my knowledge the Deep Water Horizon Oil Spill directly impacted the lower Barataria Basin and led to not only severe impacts to humanity and wildlife but also to the destruction of land. The upper Barataria Basin saw no oil. Yet, the area most negatively impacted by the Mid-Barataria Sediment Diversion Project will be the upper basin. According to the EIS this area will be impacted by the diversion resulting in severe negative impacts culturally, topographically and ecologically. There is no need to elaborate further since these negative impacts are clearly stated in the EIS. If the Oil Pollution Act is designed to restore areas impacted by an oil spill to its original condition, there seems to be a disconnect since the EIS facts do not support this rule when considering the upper Barataria basin.

Since sediment diversion is the main criteria and main emphasis in the directives established for this project, there seems to be a narrow interpretation regarding the definition of sediment diversion. All the alternatives for this project are similar with the various size of water flow through the diversion being the common thread. All of the alternatives also have the commonality of river water being free-flowing into the Barataria basin with the positive result of building land and the well stated and well defined negative effects to our economy, area residents, economy, culture and wildlife.

If land building is one of the main objectives, then let us start thinking about how we can build and sustain land without the negative impacts mentioned above. This is a directive we must strive to accomplish. Can we not use a sediment diversion to selectively build land by containing sediment and directing those land building efforts through innovative design?

Conceptually, the document prepared by Coastal Environments, Inc. of Baton Rouge, Louisiana in 1986 called Long-Term Management and Protection of Plaquemines Parish was commissioned by the Plaquemines Parish Commission Council and has components that are not new to the world of coastal engineering. The concept of management units to allow for sediment to be directed into a contained area for purposes of land building must be further studied as alternatives for this project.

Directing river sediment into designed containment locations being fed by a single major river diversion having the versatility of being able to change the direction of flow as needed into different zones would provide for needed land building and minimize those negative impacts stated above. Any damaging excess water overflow can be directed back to river from when it came and not into the Barataria ecosystem.

We live in the greatest country in the world. We have been able to place men on the moon, establish a space station, place a rover on Mars, split the atom and dissect the human genome. We have the scientists that can do just about anything when given the right

directive. Give them the directive to modify this landmark feat of engineering with a design that is not so narrow minded but opens us up to innovation that results in a win-win for everyone within the confines of available funds. A major hurdle will be the suppression of our egos so we can amicably and open-mindedly work together for our mutual common good.

Respectfully submitted,

Dr. Stuart J. Guey, Jr.

**Concern ID: 61895**

**Commenters suggest using a sediment diversion to selectively build land by directing sediment to a contained area, such as a colmates system or large-scale marsh creation containment area. A controlled system of dredging to create dry land coupled with a system to contain sediment-infused river water in specific areas outside of the levee protection system would be most beneficial to create more land exactly where it's needed.**

**Response ID: 15988**

This method of sediment transport and/or sediment containment and land building would not meet the proposed Project's purpose and need of reconnecting and reestablishing sustainable deltaic process between the Mississippi River and the Barataria Basin. A colmate or other means of large-scale marsh creation using dewatered sediment would allow for sediment to be transported from the Mississippi River to the Barataria Basin and deposited into a location confined by containment berms, which would create an impoundment where the suspended sediment would settle out of the water column over time to create a marsh platform. Once the area dewateres and the platform stabilizes at an appropriate marsh elevation, the berms would be degraded or gapped to allow fish passage and hydrologic exchange. While this type of system would create marsh, it would not be a passive system and would require active management and maintenance, including potentially pumps to ensure sediment transport, mechanical gapping/degrading of the retention berms and periodic lifts to combat the effects of subsidence. It would not reestablish natural deltaic processes. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

---

**Concern ID: 62664**

**The Project, instead of restoring coastal Louisiana, would accelerate its degradation. The Upper Barataria Basin, which was not affected by the DWH oil spill, would be negatively affected by the proposed Project in terms of cultural, topographic, and ecological impacts. Because the Oil Pollution Act is designed to restore areas affected by an oil spill to their pre-spill conditions, the proposed Project should not be funded because it does not achieve this goal.**

**Response ID: 16623**

The potential impacts of the proposed Project on affected ecosystems and communities were considered in the Draft EIS. For example, Chapter 3 Affected Environment of the EIS

describes existing conditions within the Project area and Section 3.1 Introduction provides an overview and history of the Project area. These existing conditions are factored into the impact analysis in Chapter 4 Environmental Consequences of the EIS. Further, Chapter 3, Section 3.6.2.2 in Wetland Resources and Waters of the U.S. notes the ongoing impact of the DWH oil spill on wetland loss, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 in Aquatic Resources provides an overview of the adverse impact of the oil spill on key aquatic species within the Barataria Basin.

The impacts raised by the commenters were also considered in the LA TIG's Draft Restoration Plan. As described in the Restoration Plan in Section 1.3 (Authorities and Regulations), the goal of the Oil Pollution Act of 1990, 33 USC 2701 et seq., is to make the environment and public whole for injuries to natural resources and services resulting from an incident involving a discharge or substantial threat of a discharge of oil. This goal is achieved through the return of the injured resources and services to baseline, and compensation for interim losses from the date of the incident until recovery. According to 15 CFR, Part 990.30, restoration is defined as "any action...to restore, rehabilitate, replace, or acquire the equivalent of injured natural resources and services", and 15 CFR, Part 990.53 (c) (2) specifies that compensatory restoration actions can include actions that provide natural resources and services of the same or comparable type and quality as the injured resources.

Considering the scale of impacts from the oil spill, the LA TIG also understands the importance of increasing the resiliency and sustainability of this highly productive Gulf ecosystem through restoration. As noted in the PDARP/PEIS, diversions of Mississippi River water into adjacent wetlands have a high probability of providing these types of large-scale benefits for the long-term sustainability of deltaic wetlands. As described in Section 2.3.3 (Proposed MBSD Project Location Alternatives) of the Restoration Plan, while a project in Lower Barataria Basin would provide restoration closest to where the heaviest oiling and associated injuries occurred, such a project would also require more time and more sediment to build land given the relatively deep open water in that area, and newly created marshes would be more quickly eroded by waves, tidal action, and storm surge. A project in the Mid-Barataria Basin is close to oiled shorelines but farther away from additional erosive forces found in the Lower Barataria Basin. The LA TIG selected the proposed Project location in the Mid-Barataria Basin because a project in this location would have the capacity to accept and disperse sediments and nutrients and would promote the long-term sustainability of existing and newly created marshes.

The LA TIG recognizes that the proposed Project would result in some adverse impacts to natural resources as described in Section 3.2.1.5 (Avoids Collateral Injury) of the Restoration Plan. However, these injuries occur primarily in the middle and Lower Barataria Basin, and the proposed Project would also restore natural resources that were injured by the DWH spill as described in Section 3.2.1.6 (Benefits Multiple Resources) of the Restoration Plan. The increase in wetland area under the Project is also expected to benefit communities on the West Bank, north of the diversion, by providing increased protection from storm surge (see Section 3.2.1.7).

Because the proposed Project would contribute to restoring natural resources injured by the DWH oil spill to their baseline conditions, the Project is consistent with OPA, the OPA NRDA regulations, the PDARP/PEIS, and the SRP. See Section 3 (OPA Evaluation of the

Alternatives) of the Restoration Plan for more details about the LA TIG's evaluation of the proposed Project and its alternatives.

The LA TIG has also funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 (Screening for a Reasonable Range of Alternatives) of the Restoration Plan provides a detailed discussion of the selection of the location for the LA TIG's Preferred Alternative in the Restoration Plan.

---

**Correspondence ID: 32150**  
Myrtle Grove Homeowners Association

## **Myrtle Grove Homeowners Association Comments on Draft Restoration Plan and Draft Environmental Impact Statement (“EIS”)**

CPRA recognizes the diversion will impact Myrtle Grove (and other communities)

- Draft Restoration Plan Page ES-2: “increases in intensity and duration of flooding impacts for next 50 years.”
- Draft Restoration Plan Page 3-16: \$268,318,000 budgeted for land acquisition
- Draft Restoration Plan Page 3-48: “diversion would serve to accelerate tidal flooding impacts.”
- EIS Page 4-453: “minor to moderate, adverse impacts upon housing and property values” followed by “impacts to Myrtle Grove would be more substantial.”
  - o Comment: How will the affected communities be compensated for the adverse impact of the diversion?

### **Water Levels**

December 18, 2019: Diversion Presentation by Brad Barth and Brian Lezina. Brian presented a graph showing maximum increase of water up to 2 feet. He also said it is a significant increase and it is being studied and will be addressed.

April 2020: In an article in the New Orleans Advocate. Brian Lezina stated the water level will increase 2.5 feet at the Wilkinson Canal and everything is on the table including elevation at the bulkheads and elevating roads if the diversion is built.

Early 2021: CPRA conducted meetings in Port Sulphur and had a continuous presentation showing the water levels will increase at Myrtle Grove .5 to 2 feet. CPRA stated they will assist property owners by:

- Elevating homes and structures on the property.
- Upgrade septic / sewer and other utilities.
- Elevating roadways and utilities; and

- Pay for losses in property value.
  - o Comment: CPRA, depending, on the presentation has different increased water levels in Myrtle Grove (see presentation to Myrtle Grove residents and a lower increase for Myrtle Grove at the presentation for Lake Hermitage residents).

EIS Executive Summary Page ES-8: Operational impacts on water levels in the Bartaria Basin from the project would be permanent, adverse, and range from major to minor, depending on the location in the Basin, with minimal increase of 1.1 feet in the immediate outfall area. Higher water levels would primarily occur when the diversion is flowing above base flow (greater than 25,000 cfs and up to 75,000 cfs).

EIS Executive Summary Page ES-14: The operation of the proposed project could lead to long term, minor to major, adverse impact on communities not protected by Federal Levees from acceleration of increase flooding and storm hazards.

EIS Table 4.20-2: Shows an increase of 119 days of more tidal flooding under Applicants Preferred Alternative in Myrtle Grove 2020-decade days with the project.

- Comment: 119 days is approximately one third of a calendar year. The result of the diversion will be that Myrtle Grove owners will only be able to enjoy the use of their property two-thirds of the year.

EIS page 4-694, Figure 4-20-3: Shows Myrtle Grove flooding twice as much in 2030 (inundated two-thirds of the year).

- Comments: These figures are inconsistent. What will be the actual impact upon Myrtle Grove?

### **Property Values**

EIS Page 4-554: There are 532 residential properties in the affected communities that had an assessed value of \$5.9 Million and this is the value for these properties.

Appendix H Table 2-6: Myrtle Grove has one marina, 76 homes and 231 undeveloped properties valued at \$52 million.

value for properties that rely on access to these channels could be adversely affected.

Loss of use of Wilkinson Canal (Appendix R page 19): If Wilkinson Canal impacted, CPRA **MAY** (emphasis added) take one or more actions such as adjust operations, conduct maintenance dredging, provide alternative boat access for Myrtle Grove. In EIS page 4-454, it states the loss of the Canal would result in “moderate, permanent adverse reduction in property values in Myrtle Grove.”

- Comment: Why is this not a duty for CPRA in the event Wilkinson Canal is impacted rather than just something CPRA **MAY** do?

### **Mitigation**

Appendix R Page 6.3.2 Property Impacts: CPRA is evaluating the area that could be exposed to project induction and researching regulatory and policy issues that pertain to powder lands and tidelands in the project area. A comprehensive inventory of the potentially affected properties and land services planning is progressing under an assumption that CPRA would mitigate for inundation

- Comments: Reconcile \$52 Million for Myrtle Grove and \$5.9 Million for Myrtle Grove and all the other affected communities
- Assessed value is not fair market value.

Appendix H Page 125: Impacts of the diversion:

- The operation of the project under Applicants Preferred Application is expected to have permanent, moderate, adverse impacts on land use and property values.
- Operation of the project is expected to increase the frequency and duration of tidal flooding in communities outside of the flood protection in and near the outfall.
- These temporary more frequent occurrence in flooding may lead to reduction in property values over time.
- As a result, operation of the project is expected to have permanent, minor, adverse impacts on the land uses and property values in the outfall area.

Chapter 4 4.13.3.3 Sedimentation: If additional dredging is not undertaken adverse impacts in addition property

caused by the project to properties which could take the forms of:

- Monitoring and adaptive management of operations
- Assisting property owners to elevate homes and other structures on private property.
- Property right acquisition (e.g., Flowage Easement fee acquisition, or others) CPRA would prefer to acquire easement rather than acquiring full ownership of affected properties.
- Structural mitigation (e.g., elevation public roadways, utilities, water control structures or other structural measures to offset additional induction
- The draft EIS for the Upper Barataria Bay has a Real Estate Plan for the affected communities.
  - o Comment: Why is there not a Real Estate Plan for Myrtle Grove and the other affected communities?
- Site selection mitigation could occur at the site of the impact, or other locations where structural measures would reduce inundation, or through property rights agreements.
  - o Comment: Every Flowage Easement found on the Corps of Engineers website contains an express prohibition against human habitation (homes) in the Flowage Easement. How can this be a preferred remedy since it would result in no one being able to live in Myrtle Grove and the other affected communities?

### **Land Building**

Executive Summary Page ES-10: The project is expected to cause moderate, permanent, adverse impacts on the wetlands in the Birdfoot Delta where wetlands would be lost due to reduced sediment and freshwater inputs. By year 2070, wetlands in Birdfoot Delta reduced to 3,510 acres without the project Birdfoot Delta 2070 would be 6,410.

EIS Figure 4.2-6: This graph shows in 2030 Basin acres is 300,000 acres including < 10,000 acres created. In 2070, total acres in the Basin will be 60,000 acres with just a little more than 10,000 acres.

- Additional Comments: This information contradicts what was shown in the amount of land created by

2070 in the December 18, 2019 presentation.

- The EIS does not have a reduction in land building in the event of hurricanes which can have a significant impact on any build-up of land.

### **Diversion Operation**

EIS Table 4.1-1: Shows the rivers in first decade of operation 158 days above 450,000 cfs and by 2070 224 days above 450,000 cfs.

EIS Page 4.13.3.3 Sedimentation: Operation of the Diversion would lead to an increase in sedimentation in channels and canals in outfall area that are important to both recreational boaters and commercial fishers.

EIS Appendix H 3.6.2 Construction Impacts: Construction of the project is expected to cause negligible impact on non-federal maintained canals.

EIS Appendix H 3.6.3 Operational Impacts: Because of uncertainties associated with DELFT and GIS modeling results and the number of variables need to estimate cost of dredging a range of cost were estimated to dredge only the Wilkinson Canal.

### **Dolphins**

EIS Appendix N provides all the marine species affected by the diversion but does not cover dolphins. While it is recognized that a waiver was obtained for the dolphins, the dolphins should have been studied and the adverse effects published to allow an appeal of the waiver due to the harm to dolphins. We believe the knowledge regarding the number of dolphins to be killed because of the diversion will result in a public outcry.

### **Additional Comments on the EIS**

- Throughout the EIS, it states multiple times the project will cause permanent, minor to major adverse impacts to the land use and property values and commercial fisheries in the Barataria Basin.
- With Global Climate Change the EIS used river

hydrology information from as early as 1964 and no later than 2011. Current information was not used. The EIS should contain a hydrology report and the report should be based upon recent data.

- From several resources (CPRA presentation, newspaper articles, EIS) increased water levels range from .5 to 2.5 feet. The information is not consistent on water levels.
- The only alternatives in the EIS are diversions at different flow rates. They have not listed other possible methods on building land in the Basin. One alternative is to study the creation of barrier islands and compare the result with the diversion.
- The purpose of the diversion is to build land. However, the EIS Figure 4-2.6 is a graph showing the Barataria Basin has 300,000 acres with less than 10,000 acres created and 2070 with 60,000 acres with just over 10,000 acres created. This does not justify the cost of the diversion.

## **CONCLUSION**

CPRA is condemning the property in Myrtle Grove and other communities outside the levee protection for the benefit of the State of Louisiana. While understandable from a State's perspective, the owners in Myrtle Grove and the other affected communities need to be fully compensated for the taking of their property (i.e., paid fair market value for their property and homes)

---

**Concern ID: 61772**

**The commenter pointed out that Figure 4.2-6 in Chapter 4, Section 4.2 Geology and Soils indicates that by 2070, total acres created by the Project in the basin would be about 10,000 acres. The commenter expressed concern that this contradicts the amount of land created by the Project as stated in the December 18, 2019 presentation by CPRA to the Myrtle Grove Homeowners Association.**

**Response ID: 16173**

The total acres projected to be created by the proposed Project were considered in the Draft EIS. The EIS contains projections derived from the most recent modeling efforts available by the Water Institute of the Gulf, and these projections may differ from those of earlier modeling efforts. A detailed overview of the modeling conducted to project land creation and land-loss impacts of the proposed MBSD Project is provided in Appendix E Delft3D Modeling of the EIS. To help further address these concerns, a discussion to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

---

**Concern ID: 61787**

**The EIS used river hydrology information from as early as 1964 and no later than 2011. Current information was not used. The EIS should contain a hydrology report and the report should be based upon recent data.**

**Response ID: 16417**

The issue raised by the commenter was considered in the Draft EIS. The Mississippi River hydrologic boundary conditions used in the Delft3D Basinwide Model included continuous 50-year historical Tarbert Landing records from 1964 to 2013. For the Delft3D Basinwide Model hydrodynamic simulations, representative hydrographs were selected to represent each decade. The selection was the product of a statistical analysis performed by the Water Institute of the Gulf, as described in Draft EIS Appendix E Delft3D Modeling, Section 5.1.1. In addition, four additional Mississippi River annual hydrographs were selected to represent specific statistical characteristics including the 2011 hydrograph, as the commenter mentioned. It was selected because it represented a particular type of hydrograph - a high discharge, late spring flood. Later years, including those available when the modeling was performed, were considered but did not meet the selection criteria. No related edits have been made to the Final EIS.

---

**Concern ID: 61853**

**The amount of acres of habitat that would be restored through the preferred alternative would not justify its high cost. Given Louisiana's annual coastal habitat loss rate, investing in a nearly \$2 billion Project that would provide relatively little benefit compared to this annual loss is not justifiable.**

**Response ID: 16618**

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless it is relevant to the agency's decision. USACE generally assumes that a permit applicant has conducted its own economic evaluation of the costs of a proposed Project. USACE will

conduct a public interest review as part of its permit decision-making process, which weighs the anticipated harms of a project against its anticipated benefits.

As part of the OPA analysis, LA TIG considered the cost to carry out the Project consistent with the Restoration Plan alternatives evaluation criteria, 15 CFR §990.54. The cost to carry out the Project was evaluated in Section 3.2.1.2 Cost to Carry Out the Alternative of the LA TIG's Draft Restoration Plan. The Project would reestablish deltaic processes that deliver sediment, fresh water, and nutrients; improve the function of existing habitats; and successfully develop deltaic habitats that connect nearshore and offshore ecosystems. Wetlands are one component of a restored ecosystem to be achieved. The LA TIG expects that the Project would result in the creation of a maximum of 17,300 acres of land in the Barataria Basin by year 30 of operations; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 [Alternative 1 Description] of the Restoration Plan). The creation of marsh habitat would provide substantial benefits to nearshore marine ecosystems, water column resources (including fish and invertebrates), birds, terrestrial wildlife, and offshore marine ecosystems (see Section 3.2.1.6 [Benefits Multiple Resources] of the Restoration Plan). Given the high rates of erosion and land loss, the land created by the Project would become even more important to the coastal ecosystem over time.

---

**Concern ID: 61970**

**The only alternatives in the EIS are diversions at different flow rates. The EIS has not listed other possible methods on building land in the Barataria Basin. One alternative is to study the creation of barrier islands and compare the result with the diversion alternative. Also consider fortifying the barrier islands with sheet piles, boulders, and rocks, and dam all pipeline canals and washed-out marsh openings with concrete dams.**

**Response ID: 15972**

The Draft EIS considered barrier islands as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.4 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS. While barrier islands play a critical role in reducing land loss, they are not intended or designed to transport sediment, fresh water, or nutrients.

Past investments through a multitude of restoration programs have resulted in the restoration of every major barrier island in the Barataria Basin. CPRA's Coastal Master Plan includes programmatic barrier island restoration to support future maintenance of the restored islands. However, CPRA has stated that fortifying barrier islands with hard structures is not feasible.

---

**Concern ID: 62010**

**Sediment transported by the diversion into the basin would cause the main waterways to have increased shoaling, become too shallow to pass through, and would require dredging in order to access personal properties. This plan should address the potential loss of access for homes, camps, and businesses due to the increased shoaling.**

**Response ID: 16208**

The impacts raised by the commenters were considered in the Draft EIS; therefore, no related edits have been made to the Final EIS. The EIS describes impacts on marine transportation and maintenance dredging in Chapter 4, 4.21 Navigation. This section also describes potential impacts on access due to delays when dredging. In addition, refer to Section 4.13 Socioeconomics for a discussion of socioeconomic impacts due to potential sedimentation in Barataria Basin navigation channels and canals. The proposed Project would have moderate, intermittent but permanent, adverse impacts on marine traffic efficiency and safety for shallow-draft vessels. The proposed Project would also cause minor to moderate, permanent, adverse impacts in dredging requirements for portions of the Mississippi River Navigation Channel and the birdfoot delta due to Project-induced changes to typical shoaling patterns and locations. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the proposed Project area during Project operations. In acknowledgement of commenters' concerns regarding sediment and shoaling impacting navigation, the Mitigation and Stewardship Plan in Appendix R1 in the Final EIS includes measures to mitigate impacts on navigation in the basin resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62016**

---

**Commenter inquired as to why CPRA is not required to adjust operations, conduct maintenance dredging, or provide alternative boat access for Myrtle Grove if Wilkinson Canal is impacted.**

**Response ID: 16213**

The impacts on channel and canal navigation raised by the commenters were considered in the Draft EIS. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the proposed Project area during Project operations.

In acknowledgement of the commenters' concerns regarding maintenance of non-federal navigation channels and canals impacted by sedimentation of the proposed diversion, CPRA has supplemented the Final Mitigation and Stewardship Plan with measures to mitigate impacts on navigation in the basin resulting from operation of the Project, including monitoring and dredging or other measures for certain federal and non-federal navigation channels including the Barataria Waterway and Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project..

---

**Concern ID: 62150**

**The land-building results of the Project presented in Chapter 4, Section 4.2 Geology and Soils should include consideration of potential reductions in land building due to hurricanes, which can have a significant impact on any build-up of land.**

**Response ID: 16178**

---

The commenter's concerns related to the effects of hurricanes and tropical storms on projected future land loss were considered in the Draft EIS; therefore, no related updates have been made to the Final EIS. The EIS includes extensive ADCIRC/SWAN modeling of storm surge and wave height elevation simulations based on historical hurricanes and tropical storms over the Project area for the 50-year analysis period. The details of these modeling efforts and the assumptions involved are provided in Chapter 4, Section 4.20 Public Health and Safety, including Flood and Storm Hazard Risk Reduction and in Appendix P (Flood and Storm Hazards Evaluation). Additional analysis regarding the potential impact of hurricanes on the extent of wetlands in the proposed Project area during operations is included in Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS.

---

**Concern ID: 62236**

**The commenter asserts that information provided in several sections of the Draft EIS and in presentations are inconsistent and would like to know what the actual impact to Myrtle Grove would be.**

**Response ID: 15822**

The USACE acknowledges the commenters' concerns regarding the consistency and accuracy of the reported projections. USACE is the lead agency for development of this EIS, which contains the results from the Delft3D Basinwide Model regarding the projected effects of the Project on water levels in Barataria Basin, including areas close to the diversion outfall (within a 20-mile radius). The estimated flooding impacts in Myrtle Grove are described in Chapter 4, Sections 4.20.4.2.1.2 and 4.20.4.2.2.2 in Public Health and Safety. USACE is not familiar with other numbers that may have been reported by CPRA. Readers of the EIS should not consider the model outputs as absolute values or predictions of actual future conditions. Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future conditions. Uncertainties are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 (Model Limitations and Uncertainty), and in detail in Appendix E (Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties).

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to

comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63047**

**The proposed MBSD Project would cause increased loss of wetlands in the birdfoot delta when compared to the No Action Alternative.**

**Response ID: 16053**

As indicated by the comment, the Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S. of the Draft EIS disclosed the increased wetland losses in the birdfoot delta when compared with the No Action Alternative.

---

**Concern ID: 63069**

**The Draft EIS did not include detailed information about the potential impacts of the proposed Project on bottlenose dolphins.**

**Response ID: 16592**

The Draft EIS included an analysis of the impacts to marine mammals, including bottlenose dolphins, in Chapter 4, Section 4.11 (Marine Mammals). The EIS quantifies the impact on dolphin survival rates (the percentage of existing dolphins that would survive from one year to the next year) for different populations of dolphins (Table 4.11-5) from the most pronounced stressor, salinity, but also includes a qualitative assessment on other impacts such as wetland shifts, prey species impacts, HABs, water temperature, and other impacts. The Final EIS includes the incorporation of additional population impact analysis that was completed by Thomas et al. (2021) after the Draft EIS was released for public comment.

---

**Concern ID: 63092**

**Further development of the Mitigation Plan is needed for properties that would be impacted by flooding caused by Project operations. Multiple commenters made specific requests for how their property should be handled (for example, through sales or easements), while others wondered why a more detailed, "real estate plan" for impacted communities was not available.**

**Response ID: 16511**

The Draft Mitigation and Stewardship Plan included with the Draft EIS (Appendix R1) included CPRA's initial framework for mitigation and stewardship measures to assist property owners in these communities impacted by increased tidal flooding and to address the Project impacts of Project operations on water levels. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

CPRA states that it is interested in assisting affected communities to remain in place as long as they would like. Mitigation would include a combination of structural measures (for example, raising roads, boat houses, docks and utilities) and non-structural measures. Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

---

Where the proposed Project would cause increased water levels and/or increased incidence of flooding, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to purchasing a flowage servitude, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property (rather than a servitude) would be made on a case-by-case basis depending on the particular circumstances.

A complete listing of the mitigation and stewardship measures that CPRA would implement if the proposed Project is approved and funded is included in CPRA's Mitigation and Stewardship Plan included in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63096**

---

**Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).**

**Response ID: 16699**

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations.

---

The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

# United States Department of the Interior

OFFICE OF THE SECRETARY  
Office of Environmental Policy and Compliance

IN REPLY REFER TO:

May 18, 2021

9043.1  
ER 21/0089

Mr. Brad LaBorde  
U.S. Army Corps of Engineers  
New Orleans District  
7400 Leake Ave,  
New Orleans, LA 70118

**RE: Draft Environmental Impact Statement for the U.S. Army Corps of Engineers  
Proposed Mid-Barataria Sediment Diversion Project, Plaquemines Parish,  
Louisiana.**

Dear Mr. LaBorde:

The Department of the Interior (Department) has reviewed the Draft Environmental Impact Statement (EIS) for the Coastal Protection and Restoration Authority of Louisiana's (CPRA) Proposed Mid-Barataria Sediment Diversion Project, Plaquemines Parish, Louisiana.

## Background Information

CPRA submitted a Joint Permit Application on June 23, 2016, to the U.S. Army Corps of Engineers (USACE), New Orleans District (CEMVN) for a Department of the Army (DA) permit under Section 10 of the Rivers and Harbors Act of 1899 (33 United States Code [U.S.C.] 403 and Section 404 of the Clean Water Act (CWA) (33 U.S.C. 1344) and submitted a Section 408 Permission Request Letter (33 U.S.C. 408) to CEMVN on January 13, 2017 for activities related to the construction, operation, and maintenance of the proposed Mid-Barataria Sediment Diversion Project (MBSD Project). The proposed project consists of a multi-component river diversion system intended to convey sediment, freshwater, and nutrients from the Mississippi River to the mid-Barataria Basin at River Mile (RM) 60.7 near the town of Ironton, Plaquemines Parish, Louisiana.

## Fish and Wildlife Resources

The following comments and recommendations are submitted pursuant to the authority of, and in accordance with, the provisions of the National Environmental Policy Act of 1969 (83 Stat. 852, as amended P.L. 91-190, 42 U.S.C. 4321 et seq.), and the Fish and Wildlife Coordination Act of 1956 (48 Stat. 401, as amended; 16 U.S.C. 661 et seq.).

Coastal marshes are considered by the U.S. Fish and Wildlife Service (Service) to be aquatic resources of national importance due to their increasing scarcity and high habitat value for fish and wildlife managed by the Service (i.e., migratory waterfowl, wading birds, other migratory birds, threatened and endangered species, and interjurisdictional fisheries). Upon review of the Draft EIS, the Service finds it addresses all impacts and benefits, including those related to fish and wildlife resources, coastal wetlands, and threatened and endangered species.

The Preferred Alternative would directly impact 182.9 acres of jurisdictional wetlands and 266.3 acres of vegetated shallows (submerged aquatic vegetation or SAV) and other waters of the U.S. Additionally, because Mississippi River sediments would be diverted up river of the Birdfoot Delta, the Delta would experience a projected indirect loss of 2,891 acres of wetlands by 2070 when compared with the No Action alternative, of which 926 acres would be indirectly lost on the Delta National Wildlife Refuge (Delta NWR) and 37 acres on Pass-A-Loutre Wildlife Management Area (Pass-A-Loutre WMA). The indirect wetland losses to Delta NWR and Pass-A-Loutre WMA would be offset by the construction of crevasse projects as described in Recommendation #1 of the Draft Fish and Wildlife Coordination Act Report for the MBSD Project. The MBSD project anticipates a net benefit of 13,151 acres of marsh (3,848 AAHUs) near the outfall over the 50-year period of analysis. Overall, there would be positive net benefits to wetland resources in the project area, with the creation and preservation of emergent wetland habitat of high value to fish and wildlife resources.

The Service has continually been involved throughout the planning and evaluation process for the MBSD Project. The CEMVN and CPRA have been responsive to all our data needs, questions, comments, and concerns. Because of our extensive coordination, and the positive net benefits to wetland resources, all of our comments and suggestions have been sufficiently addressed at this time and the Service has no further comment.

We appreciate the cooperation of your staff on this project and look forward to our continued coordination to further protect fish and wildlife resources. If you need additional assistance or have questions regarding this report, please contact Cathy Breaux ( [REDACTED] ) of this office.

Sincerely,

John Nelson  
Regional Environmental Officer

**Concern ID: 62959**

The Department of the Interior (Department) has reviewed the Draft Environmental Impact Statement (EIS) for the Coastal Protection and Restoration Authority of Louisiana's (CPRA) Proposed Mid-Barataria Sediment Diversion Project, Plaquemines Parish, Louisiana.

The following comments and recommendations are submitted pursuant to the authority of, and in accordance with, the provisions of the National Environmental Policy Act of 1969 (83 Stat. 852, as amended P.L. 91-190, 42 U.S.C. 4321 et seq.), and the Fish and Wildlife Coordination Act of 1956 (48 Stat. 401, as amended; 16 U.S.C. 661 et seq.).

Upon review of the Draft EIS, the Service finds it addresses all impacts and benefits, including those related to fish and wildlife resources, coastal wetlands, and threatened and endangered species.

The Applicant's Preferred Alternative would directly impact 182.9 acres of jurisdictional wetlands and 266.3 acres of vegetated shallows (submerged aquatic vegetation or SAV) and other waters of the U.S. Additionally, because Mississippi River sediments would be diverted up river of the Birdfoot Delta, the Delta would experience a projected indirect loss of 2,891 acres of wetlands by 2070 when compared with the No Action Alternative, of which 926 acres would be indirectly lost on the Delta National Wildlife Refuge (Delta NWR) and 37 acres on Pass A Loutre Wildlife Management Area (Pass A Loutre WMA). The indirect wetland losses to Delta NWR and Pass- A-Loutre WMA would be offset by the construction of crevasse projects as described in Recommendation #1 of the Draft Fish and Wildlife Coordination Act Report for the proposed MBSD Project. The proposed Project anticipates a net benefit of 13,151 acres of marsh (3,848 AAHUs) near the outfall over the 50-year period of analysis. Overall, there would be positive net benefits to wetland resources in the proposed Project area, with the creation and preservation of emergent wetland habitat of high value to fish and wildlife resources.

The Service has continually been involved throughout the planning and evaluation process for the proposed MBSD Project. The CEMVN and CPRA have been responsive to all our data needs, questions, comments, and concerns. Because of our extensive coordination, and the positive net benefits to wetland resources, all of our comments and suggestions have been sufficiently addressed at this time and the Service has no further comment.

**Response ID: 15887**

Thank you for your comments. USACE solicited review according to 40 CFR Part 1503.1. If a permit is issued, CPRA would be required to obtain all applicable federal, state, and local permits before starting construction of the proposed MBSD Project.

The Bishop's Environmental Commission Episcopal Diocese of Louisiana

Rev. Joseph Clavijo

I am writing in support of the Draft Resolution Plan and Environmental Impact Statement: Mid-Barataria Sediment Diversion. This plan, in my opinion represents the best set of options that decision makers can consider when responding to coastal erosion now facing the potential for rapid, irreversible ecological change. How we chose to address the impacts of climate change is complicated to say the least, and there are impacts that we will not be able to foresee.

What I can do as a person of faith is to come along side and stand with the people who will be adversely effected by the diversion and to voice their needs forward. I ask that you listen carefully to those voices and to commit sufficient funding and resources necessary to sustain their lives and livelihood throughout the diversion process. Based on the science, I believe that those impacted in the short term, will end up benefitting in the long term and that we just have to make sure that we see those communities through. We have an important job to do in making sure that the dollars set aside to mitigate the negative impacts are spent in ways that benefit those most marginalized.

Respectfully submitted,

Rev. Joseph M Clavijo

Chair - The Bishop's Environmental Commission

The Episcopal Diocese of Louisiana

---

**Concern ID: 61956**

**Commenters suggested [USACE and/or CPRA] carefully listen to those impacted by the diversion and have constructive dialogue between stakeholders and CPRA. They recommended to commit sufficient funding and resources necessary to those impacted to sustain their lives and livelihood throughout the diversion process.**

**Response ID: 15902**

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan. Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration Plan and the Draft EIS in its decision-making process. USACE and LA TIG each provided public outreach and comment opportunities throughout the development of the EIS and the LA TIG's Restoration Plan. Details on this outreach can be found in Chapter 7 Public Involvement in the Final EIS.

Since the release of the Draft EIS and the LA TIG's Draft Restoration Plan, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. This included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style

meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

**Concern ID: 63930**

**Public comments asked to ensure mitigation dollars are set aside to help the most marginalized communities and provide an equitable allocation of resources.**

**Response ID: 16579**

CPRA's Draft Mitigation and Stewardship Plan included in the Draft EIS (Appendix R1) set forth numerous measures that CPRA could undertake to mitigate Project impacts. CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The Final Mitigation and Stewardship Plan contains additional details on the various mitigation and stewardship measures specifically designed and targeted to assist low-income and minority individuals and communities including reserving a portion of some mitigation and stewardship programs for individuals from identified communities with environmental justice concerns that may be disproportionately impacted by the Project and engaging an outreach coordinator to assist community members with available programs and resources. A summary of the public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as

---

special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:32172**

Steven Lawrence

First and foremost, I am against the Mid-Barataria Sediment Diversion Project.

The negative impacts of the diversion outweigh the benefits. Residents of Plaquemines Parish will suffer the greatest negative impacts and receive the least number of benefits.

One of my major concerns is the increase in tidal range of the affected areas, specifically Myrtle Grove Estates. This is a residential neighborhood which has municipal services, such as sewer, electric, garbage, etc... I often hear the CPRA refer to the homes as "CAMPS". I would like you to know the homes in Myrtle Grove Estates (Phase I and Phase II) are not camps. Quite a few homeowners live there on a permanent basis. The increased tidal range will be detrimental to street flooding, preventing emergency service response time such as Ambulance, Fire, Police, Entergy, etc... The CPRA has stated that they have money set aside for remediation; however, the CPRA has not provided specifics on what type of remediation will be provided. I feel the EIS should have provided specifics on what remediation would be provided, along with cost estimates and guarantees.

Secondly, the EIS compares different flow rates as alternatives. The only other option is do nothing at all. A true study would have other alternatives, such as sediment dredging, berms, rock jetties, regulated flow type sediment diversion, where the same flow is distributed to multiple locations rather than being centralized in one area.

Another point I would like to make is the lack of inclusion by the CPRA. The CPRA held meetings, reached out to local communities throughout the process; however, the CPRA ignored most, if not all, of the input they received from the communities, shrimpers, crabbers, oyster fisherman, etc... I do not feel the CPRA were acting in good faith, rather than checking off a box on a requirement it had to fulfill.

In closing I would like to say that I feel all Plaquemines Parish Residents feel we need coastal restoration; however, the MBSD is not the right answer at this time. Putting all the sediment diversion in this localized area does not mimic what the mighty Mississippi River built naturally over hundreds of years. In fact, when the river overflowed before the current levees were built, all the areas got overflow water and sediment and it did not decimate a specific are.

Respectfully Submitted,

Steve Lawrence

---

**Concern ID: 61879**

**Commenters questioned why other alternatives are not being considered other than No Action and a sediment diversion with various levels of flow rates. CEQ's regulations require that the EIS rigorously explore and objectively evaluate all reasonable alternatives, which is a requirement that the Draft EIS does not meet. Consider analyzing a range of other alternatives, options, and tools that better preserve and protect the environment and minimize the severe impacts to Louisiana fisheries, the communities, and the entire Gulf Coast ecosystems.**

**Response ID: 15835**

The range of reasonable alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2 of the Draft EIS (Alternatives), an alternatives screening process was

conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in its SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in its Restoration Plan. The LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be

provided by the proposed MBSD Project. Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

---

**Concern ID: 61957**

**Commenters are concerned with the lack of inclusion by CPRA. The CPRA held meetings, reached out to local communities throughout the process; however, the CPRA ignored most, if not all, of the input they received from the communities, shrimpers, crabbers, oyster fisherman, and others.**

**Response ID: 15903**

Chapter 7 Public Involvement of the Final EIS includes a summary of meetings that CPRA held with the communities and groups projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities and groups. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. Refer to the Final Mitigation and Stewardship Plan in Appendix R1, which has been revised since the release of the Draft EIS in response to public input, for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62013**

**The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD**

---

**Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.**

**Response ID: 16210**

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of

---

structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62227**

**The diversion would flood access roads, damage vehicles, cause siltation/sludge, cause cancellation of flood insurance, inundate cemeteries, stress levees, impact provision of emergency services, and increase the cost to raise homes, slabs and wharves.**

**Response ID: 15820**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discusses the increased flooding impacts outside of federal levee systems, including road inundation and infrastructure damage, anticipated to be caused by the operation of the diversion. Sections 4.13.5.1.2.1 and 4.13.5.3.2.1 in Socioeconomics of the Final EIS has been updated to include potential impacts such as vehicle damage, accumulation of siltation and sludge, cemetery inundation and interruption of emergency services. Recognizing the potential for these impacts, CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Final EIS concludes that the proposed Project would not have impact on the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15

---

CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62951**

---

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove

---

Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department

of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Wil Hildebrand

Please do not put in the mid barataria sediment diversion project. I have been fishing that area for 50 years. Although the fishing is not what it used to be 30 years ago, it is still a good place for recreational sportsman to enjoy what Louisiana has to offer in the bounty of the saltwater Marsh.

That will all be destroyed by this diversion project. So will the brown shrimping which I personally enjoy very much. Not to mention all of the bottlenose dolphins that will lose their habitat.

There is no guarantee that you will build an acre of land with this project. No one knows, this is and experiment at the cost of losing the vital natural resources we have in place now.

It would be much better money spent to dredge material from the Mississippi and create land immediately. You could also dredge material from the Gulf of Mexico and create barrier islands in that direction also. All of this will create land immediately not 20 or 30 years from now which will be too late anyway.

What you are proposing is like a drop in the bucket compared to what mother nature did over centuries. The only way you could ever restore and rebuild the marsh is to knock down all of the levees on the Mississippi and let it flow.

Thanks for your time

Wil Hildebrand

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need

---

for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62777**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).**

**Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and

---

animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also

---

anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62785**

**This type of freshwater and sediment diversion project is unproven and there are uncertainties with respect to what the diversion would do (that is, if it would work and, if so, to what extent).**

**Response ID: 16367**

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties have been incorporated into the EIS impact conclusions and were briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of

---

Environmental Consequences, and in detail in Appendix E Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties.

Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or as predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the projected changes for the No Action Alternative.

In addition to the modeled data, Chapter 4 Environmental Consequences of the EIS includes additional analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in drafting the EIS. In response to public comments, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The LA TIG recognizes and acknowledges that a controlled sediment diversion of this scale has not been constructed in Louisiana previously. However, a sediment diversion at this location has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Chapter 3, Section 3.2.1.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan). The proposed Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management [MAM] Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

## Comments on the Mid Barataria Sediment Diversion EIS

I have studied freshwater diversions for most of my career, and while I believe that models can be useful tools, they are not as reliable as observations in the real world. Such observations reveal that the claimed projected benefits of the Diversion, based on model results, are unrealistic compared to real-world examples in Louisiana.

Even if such optimistic projections are realized, the total land area would steadily shrink from 389,000 acres to 69,100 acres over the project life of 50 years. Although this total is 10,400 acres more than with No Action (Table 4.2-4), it seems unlikely that such an increment would offer substantial protection from hurricanes. Even at the point of greatest projected benefit compared to No Action, the Diversion would result in only 17,300 acres more than No Action in 2050. This would be at a time when 43% of current wetland acreage had already disappeared with the Diversion in place. Although not as bad as the No Action scenario, it is clear that Louisiana will be much more vulnerable than it is now, even if the Diversion is built.

In addition, the area most likely to experience some increase in protection from hurricanes would be the area nearest to the projected land gain (see Figure 4.2-14). Yet this area would be subject to increased water levels from the Diversion, which could increase flooding risk in some circumstances (page 4-693). Impacts to fisheries in the project area are noted in the EIS as well. With regard to brown shrimp, the EIS states that the decrease in habitat suitability will be major, permanent, direct, and adverse. (page 4-378). Similarly, the EIS projects a permanent, direct, adverse, and major impact on oysters from operation of the proposed diversion. (page 4-410)

## Atchafalaya Bay

Given the fact that the Atchafalaya and Wax Lake Deltas in Atchafalaya Bay are the healthiest land-building areas in the state, I think it is fair to compare the observed land building to model projections for the Mid-Barataria Diversion.

The Atchafalaya River has been filling in the Bay since the 1950s. Its flow is kept at 30% of total latitude flow, with the other 70% going to the Mississippi, such that the Atchafalaya flow is equal to 43% of the Mississippi River flow. The proposed operation of the Mid-Barataria Diversion varies from 5.6 - 7.5% of the Mississippi flow only when the River is between 450,000 and 1,000,000 cfs, and is lower otherwise. The Diversion is expected to discharge more than 5,000 cfs for only 194 days per year (Table 4.1-1). Lets generously assume that the discharge averages 6% of River flow for discussions sake. Thus, the Diversion discharge will average about one seventh of the flow of the Atchafalaya River.

The EIS states that the Diversion will result in 17,300 acres more than No Action in 30 years, comparable to the amount of land built in Atchafalaya Bay since the 1950s (Pre-storm acreage was 17,500, Pers. Comm. Barras, 2009).

Several factors complicate the comparison: The Wax Lake Outlet, which receives approximately one third of the Atchafalayas flow and delivers it to the Wax Lake Delta, skims from the top of the water column, and the Atchafalaya Delta is compromised by the dredging of the ship channel. Also, some of the Atchafalaya River flow is lost to the marshes south of the Intracoastal. These factors would tend to reduce land building in the Bay.

Conversely, the Mississippi River is less sediment-rich than the Atchafalaya River (Blum and Roberts, 2009). In addition, Sea Level Rise is accelerating (Figure 4.1-3), and as a result future land building will be much slower than when the Deltas were forming. The Mid-Barataria Diversion maximum discharge of 75,000 cfs would be reached at 1,000,000 cfs, and would not increase with greater flows, when sediment loads are greater. These factors would tend to limit the rate of land creation/maintenance by the Diversion compared to the Deltas in Atchafalaya Bay.

In summary, the EIS states that the Mid-Barataria Diversion would create/maintain about the same amount of land as was built in Atchafalaya Bay with roughly one 7th the water flow, in about half the time, and with less sediment-rich water in an environment of accelerating SLR. Even considering the factors that limited land building in Atchafalaya Bay, the Diversion is unlikely to create/maintain land at roughly 14 times the rate observed in Atchafalaya Bay.

#### West Bay

The West Bay Sediment Diversion Project was constructed in 2003, originally designed to divert an average discharge of 20,000 cfs. By 2008, the flow had increased substantially, and in 2009-2011, measured flows were equal to 8.4-9.5 % of Mississippi River flows (Sharp, et al., 2013). Discharges into West Bay at moderate River flows of 551,000 cfs peaked in 2009 at about 42,000 cfs, and declined in the 2009-2014 period to about 24,700 cfs (Allison et al, 2017).

The operational plan as described in the EIS would result in a flow of about 34,000 cfs at the same moderate Mississippi River flow of 551,000 cfs, or about midway between the high and low West Bay discharges of 2009-2014.

A report produced by the State of Louisiana CPRA stated that while the West Bay project area gained a total of 557 acres from 2002-2014, much of that gain can be attributed to beneficially placed material. Approximately 665 acres of material had been placed within the land/water analysis boundary at the time of the 2014 survey, versus the 557 acres determined via land/water analysis (Plitch, 2017). This lack of land building by the diversion of river water into West Bay for 10 years took place even though Grand Pass is another important source of sediment to the bay (Kolker, 2012). Yet the Mid-Barataria EIS projects a land gain of 6,260 acres in the Barataria Basin relative to No Action in the first 10 years (Table 4.2-4), with rates of discharge comparable to the West Bay project.

I understand that the need to restore the Louisiana coast is urgent. I just think that the benefits of this project have been oversold. Statements like The Mid-Barataria Sediment Diversion will protect vulnerable communities from hurricanes and sea level rise, or ensure the long-term health of the ecosystem are often used by well-intentioned organizations to describe the project. In truth, even if the extremely optimistic models used for this EIS turn out to be accurate, after 30 years, 32% of the land in the Barataria Basin will have disappeared. 105,00 acres will be lost, 17,300 less than with No Action, in Barataria. An area equivalent to the deltas in Atchafalaya Bay would be created/maintained compared to No Action, a mere 5% of today's acreage. A look at an aerial photo of the Louisiana Coast shows how small those deltas are, revealing how little that acreage would do to protect vulnerable communities. And with this project in place, the Barataria Basin would continue to lose 78% of its land over the project life of 50 years (Tables 4.2-3 and 4.2-4). In addition, a

---

project that would cause major, permanent, direct, and adverse impacts to brown shrimp and oysters would not ensure the long-term health of the ecosystem.

**Concern ID: 62221**

**The Project would not provide substantial protection from hurricanes or storm surge, nor would storm surge protection be provided in a timely manner. The area most likely to experience some increase in protection would be subject to increased water levels from diversion operations. The current diversion Project needs to be reengineered to create meaningful storm surge protection. The Project is a misuse of funds based on what the diversion would do versus what it purports to do, in part due to the Mississippi River not having enough sediment to build substantial land.**

**Response ID: 15756**

While the proposed Project would impact storm surge, the purpose and need of the Project is not storm surge protection. As described in the Draft EIS in Chapter 1, Section 1.4 Purpose and Need, the purpose of the Project is to restore injuries caused by the DWH oil spill and help restore habitat and ecosystem services injured by the spill by reestablishing deltaic processes. However, as described in the Draft EIS in Chapter 4, Section 4.20.4 Public Health and Safety, the Project would have the ancillary benefit of storm damage risk reduction on communities north of the diversion due to the creation and maintenance of wetland habitat within the delta formation area; the increase in topography and land acreage would induce greater hydraulic friction and resistance, reducing the inland extent of storm surge and limiting wave heights in some communities north of the diversion, as compared to the No Action Alternative. The EIS acknowledges that storm surge and wave height reduction benefits for some communities north of the diversion would not be instantaneous, but that these benefits would increase over time as more land is created and maintained within the delta formation area. The EIS also acknowledges that some of the same communities that would experience

---

storm surge reduction benefits, such as Lafitte, would experience an increase in non-storm inundation frequency due to increased water levels from diversion operations. At the same time, operation of the Project would have permanent, minor to moderate, adverse impacts on storm hazards in communities south of the diversion, with anticipated increases in storm surge of up to 1.7 feet near Myrtle Grove (as compared to the No Action Alternative). Section 4.20.4.2.2.2 in Public Health and Safety of the Final EIS has been revised to include additional information and figures further explaining the impacts of the Project on storm surge and wave height.

The EIS recognizes the role of sediment load in land building. The river still carries a massive sediment load, but not as massive as it historically carried. As explained in Chapter 3, Section 3.4.2.5 in Surface Water and Coastal Processes, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes as described in Section 3.4.2.5 Sediment Transport. The Delft3D Basinwide Model used Mississippi River sediment loads when computing the sediment load that would be delivered to the Barataria Basin. This is described in detail in the EIS, Appendix E Delft3D Modeling, Section 5.2.2.

---

**Concern ID: 62639**

**The proposed Project is unlikely to succeed because similar types of projects have failed to build land, and have caused a range of other issues, like destroying habitat, exacerbating flooding, and reducing water quality. Specific examples of similar, problematic projects include the Mississippi River Gulf Outlet, Bonnet Carré Spillway, Caernarvon Freshwater Diversion, Davis Pond, West Bay, Baptiste Collette, Fort St. Philip, and Cubits Gap. In fact, data show that the Caernarvon Diversion in particular was unable to show sustained land gains in the face of Hurricane Katrina-driven losses in wetland habitat (Underwood 1994, Kearney et al. 2011). Davis Pond has seen increased land loss inside the diversion compared to a reference area (Couvillion et al. 2017). Fort St. Philip has lost large areas of wetlands (Suir et al. 2014). While the Atchafalaya River is building land in the Atchafalaya and Wax Lake Deltas, the Atchafalaya River carries more sediment than the Mississippi River does currently (Blum and Roberts 2009), and more of the Atchafalaya River is diverted to each of these deltas and marshes farther south. Additionally, one study identified poor performance of diversions due to many periods of inoperation due to socioeconomic uncertainties (Caffey et al. 2014).**

**Response ID: 16631**

The issues raised by the commenters were considered in the Draft EIS. The EIS states in Chapter 2, Section 2.1.1 Overview of Sediment Diversions, that CPRA considered information from other diversions in its assessment of the Project alternatives, but because the projects mentioned by the commenters had been designed to discharge primarily water, not sediment, they are not fully comparable to the proposed Project. As explained in the EIS Chapter 4, Section 4.1.3 (Environmental Consequences, Overview of Delft3D Basinwide Model for Impact Analysis), Delft3D Basinwide Modeling software was used to assess impacts of the Project on hydrology, land gains and losses, water quality, and vegetation in the Barataria Basin and birdfoot delta. Using standard professional practice, this physics-based model was validated to the West Bay Sediment Diversion. The West Bay Sediment Diversion is useful for validating the physical processes of erosion and deposition of sediment because it, like the proposed MBSD Project, is a sediment diversion that extracts relatively more sediment in the river. The other diversions cited were designed to primarily deliver water, not sediment, and are less useful comparisons.

The West Bay Sediment Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, "A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that diversions do not lead to appreciable sediment accumulation" (Kolker, A. S., Miner, M. D. and Weathers, H. D. 2012. Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, *Estuarine, Coastal and Shelf Science*, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005> ).

Comparing diversions outside of physics-based numerical modeling has limited value because diversions and receiving environments often exhibit unique behaviors that correlations do not account for. For that reason, the physics-based Delft modeling, even with its limitations and uncertainties, is a better predictor than anecdotal comparisons to Fort St. Phillip or other sites. Uncertainties associated with the validation and application of the Delft3D Basinwide Modeling conducted for the proposed Project were assessed by the West Bay application, sensitivity tests, and by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in EIS Appendix E Delft3D

---

Modeling and incorporated into the EIS conclusions throughout Chapter 4 Environmental Consequences. While most citations mentioned by commenters were already included in the Draft EIS, the Final EIS has been edited to include Caffey and Petrola (2014) to Chapter 4, Section 4.6.5.1.2.4 Land Accretion.

The likelihood of success of the Project and information from other freshwater diversions was also considered in the LA TIG's Draft Restoration Plan, Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. The proposed MBSD Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the geomorphological features of the Lower Mississippi River as of 2012, including data from the referenced projects. All citations referenced by the commenters were included in the Final EIS and were considered by the LA TIG in the Final Restoration Plan.

---

**Concern ID: 62665**

**Commenters suggested that the proposed Project would achieve some benefits relative to the No Action Alternative, but that even if the modeling is correct (which it probably is not), the projected benefits provided by the Project would be very small compared to amount of habitat that is expected to be lost in the Barataria Basin over 50 years. If the models used for the EIS turn out to be accurate, more than 43 percent of the land in the Barataria Basin will have disappeared even with the Project in 30 years. During that time, 105,000 acres of land will be lost, with the Project sustaining only 17,300 more acres than the No Action Alternative (5 percent of the basin's current land area). Because of this background of large land loss, the proposed Project could only be considered a stop-gap measure. Further, commenters cited sources indicating ongoing debate about the effectiveness of large-scale sediment diversions as a land-building strategy and recommended those uncertainties be addressed in the Draft EIS (Blaskey, 2020; Blum and Roberts, 2009; Chamberlain et al., 2018; DeLaune et al., 2013; Suir et al., 2014; Turner et al., 2019).**

**Response ID: 16624**

The issues raised by the commenters were considered in the Draft EIS. For example, the proposed Project's long-term influence on land building and wetland creation has been modeled extensively through engineering and design and the impacts (beneficial and adverse) are described in Sections 4.2 (Geology and Soils), 4.4 (Surface Water and Coastal Processes) and 4.6 (Wetland Resources and Waters of the U.S.) of the EIS. With regard to modeling conducted to determine impacts of the proposed Project, the Delft3D Basinwide Model projections of Project impacts include uncertainties. Uncertainties are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 (Model Limitations and Uncertainty), and in detail in Appendix E (Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties). Uncertainty in model results is recognized in Table 4.2-4 found in Section 4.2.3.2.2.1 Geology, which indicates that land areas are considered accurate within +/- 200 acres and that the error in land gains is +/-300 acres.

As part of developing the EIS, the USACE, together with members of the LA TIG (including cooperating agencies and CPRA), reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives. The cited studies were reviewed and included in relevant analyses in the Draft EIS.

The LA TIG acknowledges the commenters' concerns. As described in the LA TIG's Draft Restoration Plan, the Project would reestablish deltaic processes that deliver sediment, fresh water, and nutrients; improve the function of existing habitats; and develop deltaic habitats that connect nearshore and offshore ecosystems. The LA TIG expects that the Project would result in the creation of a maximum of 17,300 acres of land in the Barataria Basin by year 30 of operations; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 [Alternative 1 Description] of the Restoration Plan). The LA TIG agrees that, with or without the Project, coastal Louisiana and the Barataria Basin would experience tremendous land loss. However, the LA TIG believes this background of large land loss makes the habitat created by the proposed Project even more important. Relative to other types of incremental approaches (for example, marsh creation through the application of dredged sediment), the Project would reconnect and reestablish sustainable deltaic processes and support the long-term viability of existing and planned coastal restoration efforts. All citations referenced by the commenters were included in the Final EIS and thus were considered by the LA TIG in the Final Restoration Plan.

---

**Models are useful tools but are not as reliable as real-world observations. Given the fact that the Atchafalaya and Wax Lake Deltas in Atchafalaya Bay are the healthiest land-building areas in the state, I think it is fair to compare the observed land building to model projections for the Mid-Barataria Diversion. The Atchafalaya River has been filling in the bay since the 1950s. Its flow is kept at 30 percent of total latitude flow, with the other 70 percent going to the Mississippi, such that the Atchafalaya flow is equal to 43 percent of the Mississippi River flow. The proposed operation of the Mid-Barataria Diversion varies from 5.6 to 7.5 percent of the Mississippi flow only when the river is between 450,000 and 1,000,000 cfs, and is lower otherwise. The proposed Project is expected to discharge more than 5,000 cfs for only 194 days per year (Table 4.1-1). Let us generously assume that the discharge averages 6 percent of river flow for discussion's sake. Thus, the diversion discharge would average about 1/7 of the flow of the Atchafalaya River. The EIS states that the proposed Project would result in 17,300 acres more than the No Action Alternative in 30 years, comparable to the amount of land built in Atchafalaya Bay since the 1950s (Pre-storm acreage was 17,500 [Pers. Comm. Barras 2009]). Several factors complicate the comparison: the Wax Lake Outlet, which receives approximately 1/3 of the Atchafalaya River's flow and delivers it to the Wax Lake Delta, skims from the top of the water column, and the Atchafalaya Delta is compromised by the dredging of the ship channel. Also, some of the Atchafalaya River flow is lost to the marshes south of the Intracoastal. These factors would tend to reduce land building in the bay.**

**Conversely, the Mississippi River is less sediment-rich than the Atchafalaya River (Blum and Roberts 2009). In addition, sea-level rise is accelerating (Figure 4.1-3), and as a result, future land building would be much slower than when the deltas were forming. The Mid-Barataria Diversion maximum discharge of 75,000 cfs would be reached at 1,000,000 cfs, and would not increase with greater flows, when sediment loads are greater. These factors would tend to limit the rate of land creation/maintenance by the proposed Project compared to the deltas in Atchafalaya Bay. In summary, the EIS states that the Mid-Barataria Diversion would create/maintain about the same amount of land as was built in Atchafalaya Bay with roughly 1/7 the water flow, in about 1/2 the time, and with less sediment-rich water in an environment of accelerating sea-level rise. Even considering the factors that limited land building in Atchafalaya Bay, the proposed Project is unlikely to create/maintain land at roughly 14 times the rate observed in Atchafalaya Bay. [References provided]**

**Blum, M.D., Roberts, H.H., 2009. Drowning of the Mississippi delta due to insufficient sediment supply and global sea-level rise. *Nature Geoscience* 2, 488-491.**

**Response ID: 16054**

While commenters have described real-world examples that by comparison suggest the proposed Project would not produce the land gains projected by the model, observed examples from other basins are not necessarily more reliable than numerical models. Multiple lines of evidence were used in development of the EIS, including professional field experience in coastal Louisiana, reviews of available scientific literature and the results of the Delft3D Basinwide Model, which are based on the site-specific conditions and design parameters of the proposed Project. These approaches have respective strengths and weaknesses such that they can be used in a complementary fashion to develop more reliable

---

results than any one method alone. That complementary use was employed in preparing the EIS. The literature cited by the commenters has been reviewed (specifically, Blum and Roberts 2009) and that reference was considered in development of the EIS. The Delft3D Basinwide Modeling accounts for Mississippi River sediment supply as described in Appendix E Delft3D Modeling of the EIS, Sections 5.2.2 and 8.

Further, the Delft3D Basinwide Model incorporates inundation depths in the critical vegetation parameters to simulate vegetation losses and gains as a result of the diversion, as well as other sources of inundation (such as subsidence and sea-level rise). A summary of select natural and man-made diversions in southeastern Louisiana, including those in Atchafalaya Bay, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes the cited reference, is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

The likelihood of success of the proposed Project and information from other freshwater diversions was considered in the LA TIG's Draft Restoration Plan; therefore, no related edits have been made to the Final Restoration Plan. Chapter 3, Sections 3.2.1.4 (Likelihood of Success - Alternative 1) and 3.2.2.4 (Likelihood of Success - Alternatives 2-6) of the LA TIG's Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The proposed MBSD Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer models used to analyze Project benefits fully consider the geomorphological features of the Lower Mississippi River, including data and knowledge gained from the referenced project.

---

**Concern ID: 63049**

**Models are useful tools but are not as reliable as real-world observations. The West Bay Sediment Diversion project was constructed in 2003, originally designed to divert an average discharge of 20,000 cfs. By 2008, the flow had increased substantially, and in 2009 to 2011, measured flows were equal to 8.4 to 9.5 percent of Mississippi River flows (Sharp et al. 2013). Discharges into West Bay at moderate river flows of 551,000 cfs peaked in 2009 at about 42,000 cfs, and declined in the 2009 to 2014 period to about 24,700 cfs (Allison et al. 2017). The operational plan for the proposed Project, as described in the EIS, would result in a flow of about 34,000 cfs at the same moderate Mississippi River flow of 551,000 cfs, or about midway between the high and low West Bay discharges of 2009 to 2014. A report produced by the State of Louisiana CPRA stated that while the West Bay project area gained a total of 557 acres from 2002 to 2014, much of that gain can be attributed to beneficially placed material.**

**Approximately 665 acres of material had been placed within the land/water analysis boundary at the time of the 2014 survey, versus the 557 acres determined via land/water analysis (Plitsch 2017). This lack of land building by the diversion of river water into West Bay for 10 years took place even though Grand Pass is another important source of sediment to the bay (Kolker 2012). Yet the Mid-Barataria EIS projects a land gain of 6,260 acres in the Barataria Basin relative to the No Action Alternative in the first 10 years (Table 4.2-4), with rates of discharge comparable to the West Bay project. **Response ID: 16055**

USACE notes that commenters have described real-world examples that by comparison suggest the proposed Project would not produce the land gains predicted by the model. USACE disagrees with the assertion that examples from other basins are more reliable than numerical models. Multiple lines of evidence were used in development of the EIS, including professional field experience in coastal Louisiana, reviews of available scientific literature and the results of the Delft3D Basinwide Model. However, the model is based on the site-specific conditions and design parameters of the proposed Project. These approaches have strengths and weaknesses such they can be used in a complementary fashion to develop more reliable results than any one method alone. That complementary use was employed in preparing the EIS. The USACE and the LA TIG have reviewed the literature cited by the commenters, including Allison et al. 2017, Kolker et al. 2012, Plitsch 2017, and Sharp et al. 2013 and those references have been added as applicable. A summary of select natural and man-made diversions in southeastern Louisiana, including the West Bay Sediment Diversion, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes the cited references, is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

The West Bay Sediment Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, "A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that diversions do not lead to appreciable sediment accumulation." (Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, *Estuarine, Coastal and Shelf Science*, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005>).

The likelihood of success of the proposed Project and information from other freshwater diversions was considered in the LA TIG's Draft Restoration Plan. More specifically, Chapter 3, Sections 3.2.1.4 (Likelihood of Success - Alternative 1) and 3.2.2.4 (Likelihood of Success - Alternatives 2-6) of the LA TIG's Restoration Plan address the likelihood of success of the

---

proposed Project and other action alternatives. The proposed MBSD Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer models used to analyze Project benefits fully consider the current geomorphological features of the Lower Mississippi River, including data and knowledge gained from the referenced project.

---

**Correspondence ID:32221**

Form Letter 20

The project would kill the livelihoods of the residents that work in the fishing industry. The waters from the Mississippi River doesn't mix with the species that lives in the salt water. Plaquemines Parish residents always seems to be having the short end of the stick, BP Oil Spill greatly affected the parish and got little to help from the State or BP. I don't even think the people of Plaquemines Parish are being heard by the state and CPRA.

They did smaller size test like opening the Bonne Carre Spillway for over 100 days and some of the people on boats found over 30 dolphins dead because of the fresh river water.

---

**Concern ID: 61957**

**Commenters are concerned with the lack of inclusion by CPRA. The CPRA held meetings, reached out to local communities throughout the process; however, the CPRA ignored most, if not all, of the input they received from the communities, shrimpers, crabbers, oyster fisherman, and others.**

**Response ID: 15903**

Chapter 7 Public Involvement of the Final EIS includes a summary of meetings that CPRA held with the communities and groups projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities and groups. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. Refer to the Final Mitigation and Stewardship Plan in Appendix R1, which has been revised since the release of the Draft EIS in response to public input, for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62077**

**The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.**

**Response ID: 16242**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRa has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRa has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62683**

**Commenters from Plaquemines Parish noted that they feel shortchanged; while the impacts of the oil spill are in their parish, they have not had the help from the State or BP.**

**Response ID: 16501**

An overview of the impacts of the oil spill on Plaquemines Parish can be found in Section 2.1 (Parish and Community Descriptions) of the Socioeconomics Technical Report (Appendix H1 to the EIS). Effects were most evident in ethnically diverse (for example, Black, Native American, Asian, and Cajun and Creole) south Plaquemines Parish, where the economy relies mainly on the oil industry and fisheries. The EIS evaluates the anticipated impacts of the proposed MBSD Project on the human environment (including ecological, economic, cultural, and social resource effects); that analysis includes looking at the existing conditions of various natural and socioeconomic resources that were affected by the DWH oil spill (see

---

EIS Chapter 3 Affected Environment and Appendix H1 Socioeconomics Technical Report). The EIS projects that the diversion would have both adverse and beneficial impacts on Plaquemines Parish resources affected by the oil spill (see EIS Chapter 4 Environmental Consequences and Appendix H1 Socioeconomics Technical Report). The state's or BP's post-spill assistance to the residents of Plaquemines Parish is beyond the scope of the EIS. The LA TIG acknowledges the commenters' concern that Plaquemines Parish has not received help after the impacts of the DWH oil spill. As described in the LA TIG's Restoration Plan, the LA TIG selected the location of the Project in the Mid-Barataria Basin in Plaquemines Parish because this location is close to oiled shorelines but farther away from additional erosive forces found in the Lower Barataria Basin.

**Concern ID: 63067**

**The majority of the bottlenose dolphin population of this area will be destroyed... not just killed but sentenced to a horrific death. Freshwater releases at Bonnet Carré Spillway in 2019 resulted in an unusual mortality event (UME), demonstrating the harm that freshwater releases can cause to dolphins. A study by the Galveston Bay Dolphin Research Program also found that dolphins in upper Galveston Bay developed skin lesions after flooding from Hurricane Harvey. Additional studies further support the harm that the diversion could cause by demonstrating negative impacts to dolphins from exposure to low-salinity conditions (Deming and Garrison, 2021; Duignan et al., 2020; McClain et al., 2020).**

**Deming, A., and L. Garrison. 2021. 2019 Northern Gulf of Mexico bottlenose dolphin unusual mortality event. Marine Mammal Commission meeting/webinar on "Effects of Low Salinity Exposure on Bottlenose Dolphins," 23 March 2021. Oral presentation. <https://www.mmc.gov/events-meetings-and-workshops/other-events/effects-of-low-salinity-exposure-on-bottlenose-dolphins-webinar/>**

**Duignan, P.J., N.S. Stephens, and K. Robb. 2020. Fresh water skin disease in dolphins: a case definition based on pathology and environmental factors in Australia. Scientific Reports 10:21979.**

**McClain, A.M., R. Daniels, F.M. Gomez, S.H. Ridgway, R. Takeshita, E.D. Jensen, and C.R. Smith. 2020. Physiological effects of low-salinity exposure on bottlenose dolphins (*Tursiops truncatus*). Journal of Zoological and Botanical Gardens 1:61-75.**

**Response ID: 16590**

The Draft EIS included an analysis based on extensive literature and soon-to-be published data (now published) demonstrating the impacts of low-salinity conditions on dolphins. These data were considered as part of an Expert Elicitation (a garnering of expert opinions to determine or quantify an unknown) that resulted in dose-response curves (Booth et al. 2020) and summarized in Chapter 4, Section 4.11.3 (Marine Mammals - Overview of Impact Analysis Approach) of the EIS. While Deming and Garrison (2021) was presented after the release of the Draft EIS, the presentation was based on data that were fully considered in the Draft EIS, including as part of the Expert Elicitation. Along with other relevant data (for example, BBES tagging studies), the analysis contained in the Draft EIS determined that there would be a significant, adverse, permanent impact on the BBES Stock. Further, the analysis in the Draft EIS concluded that if the 75,000 cfs Alternative were implemented,

---

impacts would be immediate and only a remnant population would be likely to exist near the barrier islands after 50 years of operation.

After release of the Draft EIS, at the request of the Marine Mammal Commission, the National Marine Mammal Foundation and University of St. Andrews released a population impact projection based on the information presented in the Draft EIS (including annual survival rates from Garrison et al. 2020) coupled with an updated population model for BBES dolphins (Schwacke et al. 2022, Thomas et al. 2021). This new, additional analysis has been incorporated into the Final EIS in Chapter 4, Sections 4.11.5.2 Barataria Bay Estuarine Stock and supports the original determination in the Draft EIS of major, permanent, adverse impacts on the BBES dolphin population. The research presented in the McClain et al. (2020) study cited by commenters was considered in the Draft EIS [cited at the time as McClain et al. (in prep)]; the research presented by Duignan et al. (2020) is consistent with the established literature and does not change the conclusions of the Draft EIS, but this study has been incorporated in Chapter 4, Section 4.11.5.2.2.1 General Effects on Dolphin Health of the Final EIS. Similarly, the information included in the Deming and Garrison presentation was considered in the Draft EIS, is consistent with the conclusions of the Draft EIS, and the presentation has now been cited in Section 4.11.5.2.2.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include specific marine mammal response triggers that may affect Project operation mitigation efforts; see Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would

be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Diane Kastel

Dear U.S. Army Corps of Engineers, New Orleans District,

Our family is in support of the "Mid-Barataria Sediment Diversion", the single-largest, ecosystem restoration project in the history of the U.S. Our family is telling the "U.S. Army Corps of Engineers" that we strongly support restoration of Louisiana's Barataria Basin.

Eleven years ago, the "Deepwater Horizon" exploded, killing 11 people, and, eventually, spilling millions of gallons of oil into the Gulf of Mexico. It became the largest environmental disaster in U.S. history that resulted in the deaths of as many as one million birds!

The oil spill exacerbated a dire, land-loss crisis. Since the 1930's, the Barataria Basin, an estuary in southeastern Louisiana, near New Orleans, has lost, nearly, 295,000 acres of land, displacing communities, threatening critical infrastructure and jobs, and devastating habitat for birds, and other wildlife. Forty percent of North America's migratory bird species depend on this, disappearing, habitat.

Barataria Basin was, also, ground zero for the oil spill, causing wetlands to disappear three times faster than the rest of the state. You, now, have an opportunity to restore some of the damaged habitat.

Wildlife, fisheries, and beautiful natural places are at risk of complete collapse without large-scale natural infrastructure restoration projects like the "Mid-Barataria Sediment Diversion". Natural infrastructure is engineering with nature-restoring, and, mimicking, natural, landscapes, like wetlands, to provide bird habitat, buffer coastal communities against flooding, and, absorb carbon pollution—a win-win-win for birds and people.

This project will build more wetlands than any other, individual, restoration project in the world. By reconnecting the Mississippi River with its marshes, the sediment, diversion will mimic the natural, spring floods that, once, replenished the marshes, benefiting birds, wildlife, and, fisheries.

This innovative project is a crucial first step in turning the tide on the state's land loss crisis and protecting vulnerable communities from hurricanes and sea-level rise, while also ensuring the long-term health of the ecosystem in the face of a changing climate and coast.

Our family is telling the "U.S. Army Corps of Engineers" that we strongly support restoration of Louisiana's Barataria Basin.

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The "Mid-Barataria Sediment Diversion" is essential to rebuild vital habitats on which these birds depend.

We support the preferred alternative as outlined in the draft "Environmental Impact Statement" for the "Mid-Barataria Sediment Diversion". We, also, support the proposal in the draft "Restoration Plan" to use funds from the "Deepwater Horizon Oil Spill" settlement to implement this project, which will help to restore the, overall, health of the ecosystem that was injured as a result of the oil spill.

With that in mind, we ask the following of the "U.S. Army Corps of Engineers" and the "Louisiana Trustee Implementation Group":

\*Select the preferred alternative in the "Draft Environmental Impact Statement" for the "Mid-Barataria Sediment Diversion".

\*Fund the project using "Deepwater Horizon" settlement dollars as outlined in the draft "Restoration Plan".

As the project advances, we urge federal and state decision-makers to consider the following:

\*Commit to developing a, robust, adaptive management program that incorporates knowledge gained from monitoring the project over time, and, also, considers input from key stakeholders.

\*Work, proactively, and, collaboratively, with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed, and, transparent, as possible, throughout the mitigation planning process.

Thank you for considering our import comments.

Sincerely,

DIANE KASTEL

Wheaton, IL 60189

---

**Concern ID: 61756**

**The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.**

**Response ID: 15891**
