The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Percy Johnson

I oppose this diversion for a number of reasons:

Walls from that sediment project could fail and flood us out.

Wildlife habitat will be lost.

St. Rosalie cemetery is a historical site it will be impacted.

This community has been fighting for just about everything from running water to paved streets. WE ARE ALWAYS LOOKED OVER. THIS parish needs to stop prioritizing contracts and money over people especially the people of Ironton. Recognize this community as a historic community that it is

---

**Concern ID: 62496**

**The commenters requested that state and federal officials work with residents of Ironton for Project impacts on the St. Rosalie cemeteries. These are sacred sites to the people of Ironton because the graves of their ancestors are buried there. The Final EIS should include a discussion about the fact that the proposed MBSD Project would impact community visitation to these sacred sites at St. Rosalie by creating a large physical separation between the community of Ironton and the St. Rosalie sites.**

**Response ID: 16454**

As indicated in Chapter 4, Section 4.24 Cultural Resources of the Draft EIS, with input from the Section 106 consulting parties, the USACE and LA SHPO have determined that the St. Rosalie Plantation Cemetery (identified as Site 16PL280) and Ironton Cemetery would not be impacted by construction or operation of the proposed MBSD Project. The cemeteries are currently and would continue to be on private property. Residents of Ironton currently have access to the cemeteries via LA 23 and would continue to have access to the St. Rosalie cemeteries via LA 23 during and after the proposed Project is constructed. During the 5-year construction phase of the proposed Project, two-way traffic on LA 23 would be maintained. Northbound traffic would utilize the two existing southbound lanes, maintaining the existing two-lane capacity. Southbound traffic would utilize the shoulder, reducing southbound roadway capacity from two lanes to one. This reduction in capacity may cause delays for southbound traffic over a 1.5-year period during the duration of construction (see the Draft EIS, Chapter 4, Section 4.22.3.1 Construction Impacts).

To clarify potential impacts on Ironton, Section 4.15 Environmental Justice has been revised to highlight information about potential impacts on the community of Ironton in the Final EIS. For a summary of public outreach efforts related to the EIS refer to Chapter 7 of the Final EIS and for restoration planning see Section 1.8 of the LA TIG's Draft Restoration Plan.

CPRA held a public meeting in the community of Ironton. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. A summary of these public engagement meetings can be found in Chapter 7 of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a Section 10/404 permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62777**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).**

**Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63957**

**Commenters expressed concern that walls from the diversion structure could fail and flood out the local communities.**

**Response ID: 16011**

As described in Chapter 2, Section 2.8, Action Alternatives Carried Forward for Detailed Analysis of the Draft EIS, the proposed Project design includes earthen guide levees that would be constructed along both sides of the diversion conveyance channel. The portion of the guide levees on the protected side of the New Orleans to Venice Levee system (NOV-NF-W-05a.1) would be designed and built as hurricane and storm damage risk reduction against storm surges that may enter the diversion channel. A gated control structure would also be built on the Mississippi River side of the conveyance channel, and the gate would be closed prior to and during storm events. In addition, because the proposed MBSD Project would use, occupy, and/or alter the Mississippi River Levee, the New Orleans to Venice Levee, and the Mississippi River Navigation Channel, which are USACE projects, CPRA has requested permission under 33 U.S.C. Section 408 to construct and operate the proposed MBSD Project. The USACE Section 408 Review process includes a review of the technical adequacy of the proposed MBSD Project design to alter the Mississippi River and NOV-NFL levees and to deliver appropriate flood risk reduction in place of those levees, including all appropriate technical analyses, including geotechnical, structural, hydraulic and hydrologic, construction, safety and operations and maintenance requirements. A Section 408 permission would not be granted unless the proposed modifications to the USACE projects

would not limit the ability of the USACE project to function as authorized and would not compromise any authorized USACE project purposes.

---

**Concern ID: 64130**

**Commenters suggested the Draft EIS is insufficient in terms of its definition and analysis of affected communities, particularly low-income and communities of color. The analysis would be improved by a discussion of historical context and systemic inequities to describe the existing barriers (that is, economic hardships, educational background, language barriers) these communities, particularly Ironton, must deal with.**

**Response ID: 16301**

The issues raised by the commenters were considered in the Draft EIS. The EIS Chapter 3, Section 3.15 Environmental Justice and Chapter 2 of Appendix H1 Socioeconomics Technical Report discusses existing barriers faced by populations in the Project area affected by the proposed Project, including economic hardships, and describes specific communities with low-income and minority populations. Chapter 2 of Appendix H1 Socioeconomics Technical Report, also provides information regarding historical context and systemic inequities affecting these communities. Chapter 4, Section 4.15 in Environmental Justice describes potential impacts on low-income and minority populations from construction and operation of the proposed Project. In the Final EIS, Chapter 4 Section 4.15.5.1 Environmental Justice, a summary of impacts to the Ironton community has been added to facilitate access to that information. Information concerning additional outreach to communities with environmental justice concerns has also been added.

---

Jon Dijkhuizen

Dear Mr. Laborde and Mr. Landry:

I love this state and place. I moved here from the Netherlands almost 27 years ago and can not imagine living anywhere else. I watched New Orleans flood during Katrina and although we rebuilt overtime, we will never get back everything that was lost. I understand firsthand the consequences of inaction when it comes to coastal restoration.

I grew up in a country where water management is second nature. To keep what you love and to keep living in places like Southern Louisiana and Holland, bold action, ingenuity and working with nature is a necessity. I believe that decades of science is telling us that the Mid-Barataria Sediment Diversion is not only the right thing to do for protecting our coastal communities but also the only way that we can once again have a functional and productive delta.

I built my business, life and home here and want it to stay here not only for myself but for future generations.

Please select the preferred alternative in the DEIS for the Mid-Barataria Sediment Diversion and fund the project using the BP oil spill funds.

Thank you,

Jon Dijkhuizen

New Orleans, LA

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:40302**

Tommy Adams

Use one of the spillways that is already in place, The Morganza!! The creation of this spillway will literally destroy the fishing industry in Lafitte. Shrimpers and crab fisherman of the area would be out of business. Tourists that come here from out of town to fish these fertile waters for trout, flounder, redfish and other saltwater species would start going elsewhere. Charter fishermen of the area would be out of business. On the other hand Cocodrie is in need of sediment from the river. They have been begging for the Morganza to be opened. The reason it's not being used as it should be is because of the high profile people that have land and hunting clubs in the area that would get flooded at times when it's in use.

---

**Concern ID: 61902****Consider opening the Morganza Spillway instead of implementing the proposed MBSD Project.****Response ID: 15995**

The Morganza Spillway, operated by USACE for emergency flood control, discharges into the Atchafalaya Basin. The scope of this EIS is the Barataria Basin and the Mississippi River birdfoot delta, which is the defined proposed Project area. This suggested alternative would not meet the purpose and need to reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin. The LA TIG identified the Barataria Basin in the SRP/EA #3 as the location for the proposed Project because within Louisiana, the Barataria Basin suffered the most severe and persistent oiling from the DWH oil spill. This suggestion would not provide any land-building benefits in the Barataria Basin because it is located outside of the basin. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Villere Reggio III

I am a homeowner in the Myrtle Grove Marine subdivision. My concerns are property values and flooding. I understand something needs to be done to rebuild our coastal marsh, but at what expense to the property owners around the diversion site. As I understand it (as the EIS states ) the neighborhood I live in will be flooded at least 3 or more months out the year making it impossible too get to my home. We already flood when we have a strong south wind for several days. The property values in my neighborhood are already being affected due to the threat of the river diversion. At some point we may be offered a buy out. If that would happen, the property values would already have been driven down and I don't think we would be offered a fair offer for our property. I am not saying I want to sell my home. I have been at this address for 17 years and plan to stay as long as I can, but this will destroy property values and the ability to live in Myrtle Grove. I think that this diversion is being pushed on the people of Plaquemines Parish unfairly and it will destroy livelihoods and property values. Thanks, Villere Reggio III. MYRTLE GROVE PROPERTY OWNER.

---

**Concern ID: 62013**

**The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.**

**Response ID: 16210**

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy

---

Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62224**

**Communities like Happy Jack, Lake Hermitage and Myrtle Grove, some of which have homes that are not above the new base flood elevation, already experience some degree of flooding which would be made worse by the diversion. This would affect the ability of residents to access and enjoy their homes and communities.**

**Response ID: 15757**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discuss the anticipated increased flooding impacts outside of federal levee systems to be caused by the operation of the diversion. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes, which would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the

affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62778**

---

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures

---

are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63096**

**Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).**

**Response ID: 16699**

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the

purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances. Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

To whom it concerns this is a horrible idea and sacrifices Mississippi waters and conservation efforts. It destroys our waterways and if preceded the State should immediately file a lawsuit based on Mississippi wildlife and its residents quality of life in dealing with the pollution and destruction of our waterways again to support La and New Orleans. ACE has demonstrated before that it will destroy the habitat in an attempt to save another just look at Spillway issues as well as Everglades in Florida or Mosquito Lagoon. Mississippi should file lawsuit immediately to stop this plan from ever seeing the light of day

---

**Concern ID: 62786**

**Multiple commenters expressed concern with the impacts of diverted waters on the economy and natural environment of the State of Mississippi.**

**Response ID: 16368**

The proposed Project is not anticipated to have discernable effects on resources outside of the Project area, which is limited to Louisiana, and particularly the Barataria Basin and the Mississippi River birdfoot delta (as defined in Chapter 3, Section 3.1.1 in Introduction and the subsections entitled Area of Potential Effects for each resource heading in Chapter 4 Environmental Consequences). Because these resource-specific areas of potential effects were determined based on the anticipated limits of discernable impacts, negligible to no impacts on the natural or human environment are anticipated in the State of Mississippi from the construction and operation of the proposed MBSD Project.

Cassandra Wilson

It would be fair if you would meet with the People of Ironton. We are People in Ironton not Animals so treat us like People, treat us fair. Just because we are a Small Black Community that should not matter. It is not about color we are still People. Put it where their no People.

---

**Concern ID: 61865**

**Commenters asked why the location was chosen as the site for the proposed MBSD Project, since it so close to and impacts the Myrtle Grove Subdivision.**

---

**Response ID: 15936**

Chapter 2, Section 2.4.1 Evaluation of Location Alternatives under Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow in the Draft EIS, detailed the evaluation of alternatives based on geographic location and the reasoning for selecting the proposed location for the MBSD Project. Consideration for the location of the proposed MBSD Project took into account the proximity of the diversion intake to a point bar in the Mississippi River that could serve as a continuous, long-term sediment source for the diversion in combination with the outfall location and receiving basin being well suited to gain benefits from a sediment diversion, the potential for accretion of sediment in the Barataria Basin, and the creation, maintenance, and sustainability of existing and future wetlands and marshes. In addition, previous studies have considered several general locations for a sediment diversion from the Mississippi River into the Barataria Basin, including the upper, middle and lower parts of the basin and were used in the evaluation in the EIS. The impacts of the proposed MBSD Project and its alternatives, particularly on Myrtle Grove, can be found in Chapter 4 Environmental Consequences under each of the Project's resources.

---

**Concern ID: 61932**

**Communities with environmental justice concerns, which include all communities who are vulnerable to racial, ethnic, economic, and ecological violence, should be "meaningfully involved" in "the development, implementation, and enforcement of environmental laws, regulations, and policies" during the proposed MBSD Project.**

---

**Response ID: 16285**

As discussed in Chapter 1, Section 1.6 Scope of the EIS, and Chapter 4, Section 4.15 Environmental Justice, the EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance to identify the impacts that would likely occur if the proposed Project were to be approved. USACE, the LA TIG, and CPRA have engaged communities with environmental justice concerns in development of the EIS. Examples of public outreach provided by USACE for the EIS include special public notices for the permit application, the scoping process and scoping meetings, and public review of and public meetings regarding the Draft EIS. Material and information related to the Draft EIS were made available through Federal Register notices, press releases, social media, the New Orleans District website, newspapers, mail outs to distribution lists, and provision of hard copies of the Executive Summary and other materials to local libraries and community centers.

USACE and the LA TIG also coordinated with the SELA Voice organizations to understand the needs of the local communities, including communities with environmental justice concerns, regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan and during the public comment period.

Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the joint virtual public meetings on the Draft EIS and the LA TIG's Draft Restoration Plan. Also, the Public Notice to announce the Draft EIS Notice of Availability, the Executive Summary for the Draft EIS, and the Executive Summary for the LA TIG's Draft Restoration Plan were translated into Spanish and Vietnamese. The consolidated pre-recorded public meeting presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage.

CPRA has engaged in public outreach meetings with the communities projected to be impacted by the MBSD to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts undertaken to better understand and address potential impacts on communities with environmental justice concerns, including low-income and minority populations, such as cultural impacts, are discussed in Chapter 7 of the Final EIS. Refer to the Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61961**

**Request that CPRA, USACE, and NOAA/TIG work with Plaquemines Parish Councilmember of District 7, Councilmember LaFrance, Sr. to hold community**

---

**meetings with District 7 communities, such as Ironton, Myrtle Grove and Wood Park, and engage in a question-and-answer session from community.**

**Response ID: 15906**

Concurrent with issuance of the Draft EIS, CPRA has held several public meetings with the communities projected to be impacted by the proposed MBSD Project, including communities south of the diversion from Myrtle Grove south to Grand Bayou and Happy Jack, to solicit input on mitigation and stewardship strategies. Although the EIS indicates that the proposed MBSD Project would not have more than moderate impacts on Ironton, CPRA also held a public meeting in the community of Ironton.. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. CPRA will continue to coordinate regarding these meetings with the Plaquemines Parish government. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Piece of Meat

Leighann Smith

Dear Mr. Laborde and Mr. Landry:

As a restaurant owner, a small business owner and a resident of New Orleans, Louisiana I am writing to express my strong support for the Mid-Barataria Sediment Diversion. This project is crucial for protecting coastal communities, including New Orleans, our local economies and the wildlife that is so important to our culture here.

Without action, the ecosystem in the Barataria Basin is at great risk of collapse and along with it our natural resources including storm protection and our fisheries. This area was one of the hardest hit by the 2010 BP oil spill and the settlement funds should be spent on this project, not only to restore the damage caused by the spill but to also benefit the entire northern Gulf Mexico ecosystem by ensuring we have healthy and stable wetland habitat for the fish and wildlife that depend on it.

This project will restore the natural processes that built Southern Louisiana by reconnecting the Mississippi River to the surrounding sediment starved areas. It will also enhance and extend the life span of other nearby restoration projects, maximizing our efforts and limited dollars. This is the only way that we can hope to keep pace with sea level rise, buffer ourselves from more frequent and stronger storms and adapt to climate change.

Constructing the diversion will not only create new jobs and positive economic impacts for communities south of New Orleans, but it will protect industries all over the coast, including the New Orleans restaurant and hospitality industry.

I also recognize that the bold action necessary to save our coast will not come without cost. Planned mitigation and stewardship efforts should be centered on community needs and input. We will not be truly successful in this if we knowingly leave our most vulnerable communities behind.

I believe what the scientific community overwhelmingly agrees on, this project and others like it are the best long-term solution for the challenges that we face. I support the selection of the preferred alternative in the DEIS for the Mid-Barataria Sediment Diversion.

Thank you,

Leighann Smith

New Orleans, LA

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach

---

efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63332**

**A large number of commenters expressed general support for the proposed Project.**

**Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

Sierra Club

Alan Drake

More flexibility in operations (mainly water releases) should be enshrined in the EIS.

Some examples:

- Water releases should be varied with tides, perhaps (based upon operational experience) to keep salinity within optimal levels in oyster beds and areas known to bred large numbers of shrimp and finfish.

- Excessively wet or dry years upstream - or thick or minimal snowpacks before spring thaw - would optimally require changes in water releases. A priori guidance may set overall guidelines, but ad hoc decision making, guided by experience and scientific assessments, should make the final annual decisions.

- When a strong hurricane poses the potential of driving a storm surge up the Mississippi River, maximum releases in advance might lower river levels slightly and reducing the surge. This goal, reducing upstream storm surges, should be the highest priority when a strong hurricane threatens.

-Even a couple of inches rise in local sea level will change the hydrology of Barataria Bay. Again, based upon experience, releases should be able to be modified without a lengthy EIS procedure.

Given the above, the maximum flow allowed should be increased somewhat.

Also, I noted no design features to extend lifespan operations after significant sea level rise. Given the potential for the Diversion structure to remain functional, directly adding sediment as sea level rises, the design should be modified to allow continued use even after, say, a meter of sea level rise.

The future levels of sea level rise may vary widely, impacted by future actions of humanity. A slower than expected sea level rise could allow a modified Diversion structure to deposit sediment at a rate roughly comparable to sea level rise over a wide area. But this feature needs to be designed in from the beginning.

Also the design horizon is too short and too limited. I worked on a hydroelectric project in Iceland with a design lifetime of 400 years and an expected glacial melt of 2/3rds of the current total. The penstock should be replaced at 200 years, and provisions to do so were designed and built in.

Comparable design goals should be used here.

---

**Concern ID: 61917**

**Commenters expressed concerns over CPRA's potential for mishandling of the operation and long-term maintenance of the proposed MBSD Project, particularly pointing to CPRA's past inadequate operations and maintenance of other diversions.**

**Response ID: 16004**

CPRA would operate the proposed MBSD Project as detailed in the Operations Plan, which is found in Appendix F2 Preliminary Operations Plan in the Final EIS. In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance. In the context of the

---

proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated proposed Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 64020**

**A comprehensive plan for operating the diversion is lacking. Diversion operations should not be based solely on when flows in the Mississippi River exceed 450,000 cfs or only operate at maximum capacity when Mississippi River flows reach 1,000,000 cfs, but instead should rely on multiple factors for determining when to operate the diversion. The comprehensive plan should also include some flexibility in operations including triggers for water releases and for closing the diversion. The design should be modified to allow continued use after significant sea-level rise.**

**Response ID: 16012**

---

CPRA would operate the proposed MBSD Project in accordance with the Operations Plan which can be found in Appendix F2 Preliminary Operations Plan of the Final EIS. Chapter 2, Section 2.4.2 in Step 2: Evaluation of Operational Alternatives – Location, Operational Trigger, Capacity, and Base Flow of the Draft EIS described the evaluation of various operational triggers during the alternatives analysis. It was determined that the 450,000 cfs operational trigger would best meet the purpose and need and would be the standard operations trigger (see Chapter 2, Section 2.4.2.1 Application of Additional Considerations to On/Off Trigger Scenarios). Additionally as stated in Chapter 2, Section 2.4.3.2 Application of Additional Considerations to Capacity Alternatives, flow in a sediment diversion is variable. When the diversion is operating, the flow rate through a diversion is controlled by the difference in water surface elevation between the Mississippi River and the Barataria Basin (the head differential). When the Mississippi River flow and stage are high, this high head differential would push a higher volume of water and sediment through the diversion into the Barataria Basin. When the Mississippi River flow and stage are low, there would be less energy to push water and sediment through the diversion. Thus, depending upon the flow rate in the Mississippi River and the head differential, flow in the diversion would be variable, up to a defined maximum capacity.

The diversion is designed for passive operation rather than active operation. Once opened, the head differential determines the flow rather than pumps or another active feature.

Full operations (with the exception of a base flow up to 5,000 cfs) would cease when the river discharge falls below 450,000 cfs or when certain emergency triggers are met (such as in advance of hurricanes or when a spill of hazardous substances occurs in the river).

Triggers for closing the structure when river discharge is above 450,000 cfs include spills and other hazardous discharges, navigation impediments, climatic conditions such as tropical depressions or named storms, diversion structure damage or emergency, and public safety.

As stated in the Chapter 4, Section 4.4.4.2.4 Sediment Transport in Section 4.4 in Surface Water and Coastal Processes, sediment transported by the Mississippi River is primarily comprised of fine sediments, with higher river flows (typically occurring in the spring) suspending more coarse-grained sediment that are important in delta building (see Chapter 3, Section 3.4 Surface Water and Coastal Processes). Fine-sediment transport through the diversion would be generally proportional to water flow in the river. The intake channel was modeled and designed to divert a high sediment-to-water ratio while minimizing energy loss (to maintain flow and sediment transport through the diversion complex) and impacts on the river. The amount of sediment carried through the diversion would vary by year, depending on flow rates in the river and the corresponding variation of diversion operations. The operation plan allows for diversion operations that capture the high sediment loads associated with rapidly rising river discharges and effectively addresses relative sea-level rise.

If the proposed Project is implemented and once operational, CPRA would consider potential ways to optimize diversion operations based on Project performance and success as part of the adaptive management and monitoring process. Refer to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS.

The Project MAM Plan in the Final EIS Appendix R2 provides examples of possible outfall management actions, such as spoil bank gapping or construction of water-directing features, that CPRA may consider in the future as potential adaptive management actions aimed at

improving Project effectiveness and limiting ecological and/or human impacts when possible. This will be based on assessment of Project performance and monitoring data and recommendations of the CPRA's Project Adaptive Management Team to CPRA's Project Operations Management Team.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61916**

**The proposed Project should have a design life beyond 50 years.**

**Response ID: 16003**

The proposed Project design life would extend beyond 50 years. This is not to be confused with the 50-year analysis period used in the EIS. The 50-year analysis period corresponds with the Delft3D Basinwide Model simulations, which were run over 5 decades (beginning in 2020 and run through 2070). USACE typically uses a 50-year period of analysis for its water resources projects. The EIS analyzes operational impacts resulting from operation and maintenance of the alternatives during the 50-year analysis period. Analysis of potential impacts past 50 years was determined to be too speculative to assist in understanding or decision making regarding the proposed Project.

---

**Correspondence ID:40318**

Daniel Smithson

While the name Barataria suggests west of the Mississippi River, Plaquemines Parish is the the extreme delta. Historically jetties have benefited not only Louisiana but the also the United States. Mississippi fisheries could be affected and federal compensation would not be unfair

---

**Concern ID: 63145****Mississippi fisheries should also be included in mitigation compensation.****Response ID: 16527**

Chapter 3, Section 3.1.1 Project Area of the Draft EIS identifies the analysis area for the EIS. This is the area in which the Project is anticipated to have discernable effects. For Commercial Fisheries, the Project area includes two basins (the Barataria Basin and a portion of the Mississippi River Basin). The proposed Project is not anticipated to have discernable effects on aquatic resources outside of the Project area. Mississippi was not included in the analysis because no more than negligible impacts were projected to occur for Mississippi resources. See Chapter 3, Section 3.14 Commercial Fisheries of the EIS. All measurable impacts of the Project, both beneficial and adverse, are anticipated to occur in Louisiana and within Louisiana coastal waters. As a result, CPRA has not included mitigation for impacts to fisheries in Mississippi coastal waters in the Mitigation and Stewardship Plan (Appendix R1 to the EIS).

Commercial fishers that travel to Barataria Basin to fish for species that would be adversely affected, particularly shrimp and oysters, could also be adversely affected by the proposed Project. The Final EIS has been revised to acknowledge this in Section 4.14.4.2 Commercial Fisheries. The Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) provides a suite of mitigation and stewardship strategies applicable to fishers that may be impacted by the Project. Those mitigation and stewardship programs would be equally available to any impacted fisher who relies on fisheries in the Barataria Basin, regardless of whether or not they reside in the Basin.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any

---

particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

City of New Orleans, Office of Resilience and Sustainability

## Commenter

- The City of New Orleans supports the Mid-Barataria Sediment Diversion (MBSD) and supports the use of dollars from the State of Louisiana's Deepwater Horizon natural resource damages settlement to fund the project.
- The land loss crisis in the Mississippi River Delta must be met with proportional action and urgency. The MBSD is both innovative and intensely studied; it is also the state's best chance to protect and enhance the Mississippi River Delta and the people, environment, and economy that depend on it by building land. Without intervention in the form of restoration projects such as the MBSD, coastal erosion will only accelerate. While the MBSD is not without its shortcomings, as detailed in the Draft EIS, reintroducing the Mississippi River and its sediment-building power to the Gulf in the form of a major diversion is currently the best large-scale restoration tool we have.
- Orleans Parish is a coastal parish on the frontlines of climate change and has a vested interest in the implementation of large-scale coastal restoration projects such as the MBSD - particularly those that mimic or restore the Mississippi River's natural processes. The City of New Orleans supports the "Multiple Lines of Defense" approach to risk reduction across coastal Louisiana. While projects like dredging for marsh creation and barrier island creation are vital components of that approach, they do not possess the land-building power that the MBSD does and are unable to keep pace with sea level rise.
- We are encouraged by land-building success in areas such as Mardi Gras Pass, and have high hopes for similar results with the MBSD. We are likewise encouraged by the largely positive assessment that the Army Corps of Engineers has granted the MBSD project in the Draft EIS.
- The Draft EIS shows that in addition to building land, the MBSD has the potential to provide protection for coastal communities, stimulate regional economic activity, and restore natural habitats for wildlife and marine life.
  - o We regret the risks posed to wildlife and marine life, such as bottlenose dolphins, brown shrimp, and oysters, and any loss – cultural, economic, or otherwise – to these species and those whose livelihoods depend on them. We believe that the benefits of the land creation potential of the MBSD provide a heavy counterweight to the possible change in the fishery landscape, and note that even without the MBSD, commercial fisheries and the oyster industry would likely experience adverse impacts due to habitat loss and changing salinity.
  - o We support measures to protect and invest in those communities, industries, and species that will be impacted by the construction of the MBSD either directly or indirectly. These mitigation measures will be a crucial counterpart to the issues regarding potential adverse impacts to certain coastal communities and industries raised in the Draft EIS. Community needs should be centered in planned mitigation and stewardship efforts

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63342**

**Other natural or man-made diversions have successfully built land, such that the proposed MBSD Project would also be expected to build land.**

**Response ID: 16302**

The commenter's support for the proposed Project is noted. Consistent with the comment, Chapter 4, Section 4.2.3.2 in Geology and Soils indicates that the proposed Project is anticipated to build land in the Barataria Basin (with smaller amounts of land loss projected in the birdfoot delta). To facilitate comparisons between the proposed Project and other natural or man-made diversions, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

---

**Concern ID: 63384**

**Orleans Parish is on the frontlines of climate change and has a vested interest in the implementation of large-scale coastal restoration projects such as the proposed MBSD Project, and particularly those that mimic or restore the Mississippi River's natural processes. The City of New Orleans supports the "multiple lines of defense" approach to risk reduction across coastal Louisiana. While projects like dredging for marsh creation and barrier island creation are vital components of that approach, they do not possess the land-building power that the proposed MBSD Project does and are unable to keep pace with sea-level rise.**

**Response ID: 16346**

The commenter's support for the proposed Project is noted. The commenter correctly notes that the proposed Project is intended to reestablish the Mississippi River's natural deltaic processes, and that many alternatives considered in Chapter 2 Alternatives of the Draft EIS (such as marsh or barrier island creation) would not reestablish those processes. If approved, the proposed Project, in conjunction with the range of restoration projects across the Louisiana coastline, would reflect a multiple lines of defense approach to protecting Louisiana's resources, including New Orleans and Orleans Parish. Also, Chapter 4, Section 4.25 Cumulative Impacts considers other past, present and reasonably foreseeable projects together with the action alternatives, including the proposed Project.

Myrtle Grove Homeowners Association

JoAnn Hebert

I am extremely against the Mid Barataria Diversion. My home is in Myrtle Grove Estates and faces Wilkersen Canal. As the water floods from the diversion my home will be the first off of the Wilkersen Canal to receive the flood waters and with the silt accumulating in the Canal it will make the flood waters higher. I will not be able to get to my home from the flooding waters. We have a boat shed/lift that if we cannot use the Canal because of the silt will be useless. We bought the property for the convenience of just putting the boats down in the water not having to trailer our boats to another marina. We can now fish, shrimp and crab from our yard, but the diversion will kill the fish, shrimp and crab so that enjoyment will be taken away from us. Also the damaging of the Dolphins is completely unacceptable. They come up into the Canal and will go past our home. These homes in the Myrtle Grove Estates are from \$500,000 to over \$1 million in property values. My home is worth over \$800,000. The home across the Canal from us cost over \$1.2 million. These are NOT \$50,000 to \$100,000 fishing Camps.

The Diversion will be ruining my way of life!

JoAnn Hebert

---

**Concern ID: 62013**

**The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.**

**Response ID: 16210**

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in

---

Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62778**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy

---

Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62986**

**The Project would drive decreases in salinity that would reduce the overall health, survival, and reproduction of bottlenose dolphins that reside in the Barataria Basin, a species that was negatively affected by the Deepwater Horizon oil spill (NMFS, 2013). Some commenters felt that because of this, the Project should either not move forward or its operation should be altered.**

**National Marine Fisheries Service (NMFS). 2013. Roy Crabtree (NMFS) to Elizabeth Davoli (CPRA). <https://s3.documentcloud.org/documents/726710/national-marine-fisheries-service-comments-on.pdf>**

**Response ID: 16701**

The concerns raised by the commenters about the projected decreases in salinity and resulting effects on Barataria Bay dolphins were considered in the Draft EIS. More specifically, Chapter 4, Section 4.11.5.2 in Marine Mammals of the EIS acknowledges that the proposed Project would likely have significant, adverse impacts to Barataria Basin dolphins, a species that suffered significant impacts from the DWH oil spill. This section also discusses the physiological changes caused by exposure to low-salinity water, the duration of those changes that leads to mortality, and the anticipated mortality of a large portion of the dolphin population in the Barataria Basin within the first decade. These sections of the EIS provide a more in-depth analysis of potential impacts to dolphins than the letter cited by the commenter.

The concerns raised by the commenters were also considered in the LA TIG's Draft Restoration Plan (see Section 3.2.1.5 [Collateral Injury]); the Final Restoration Plan has been edited consistent with changes made to the Final EIS and see below regarding new, related content included in Appendix R.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources, like dolphins, that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl.

---

These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible (if it is possible), the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins in Louisiana (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if

one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63099**

**Commenter expressed concern that they will not be able to access their property due to flood waters caused by operation of the Project and the that the Project will kill fish, shrimp, and crab that they enjoy from their property.**

**Response ID: 16709**

The commenter's concern regarding the impacts of the proposed Project on access to certain properties due to increased water levels was considered in Chapter 4, Section 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS, and the impacts of the proposed Project on aquatic species and recreational and subsistence fishing were considered in Sections 4.10.4.5 Key Species in Aquatic Resources, 4.13.5.6 Community Cohesion and 4.16.5.2 Applicant's Preferred Alternative in Recreation and Tourism.

Recognizing these potential impacts, CPRA engaged the communities potentially impacted by the proposed Project through public meetings to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. The Final EIS Mitigation and Stewardship Plan (Appendix R1) was expanded and refined since the Draft EIS based on this community input. CPRA's Final Mitigation and Stewardship Plan includes structural measures that CPRA plans to implement to address and offset some impacts of the proposed Project. For example, CPRA plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce incidence of tidal flooding in Myrtle Grove compared to future conditions without the Project. CPRA is also planning to provide property owners from Woodpark south to Grand Bayou and Happy Jack with funds to elevate docks and boat houses, and to mitigate the effects of the proposed Project on boat access from Myrtle Grove and Woodpark to the basin. See the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) for additional details.

Structural measures such as raising roads or improving bulkheads in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

---

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Draft EIS also addressed how changes in the proposed Project area both with and without implementation of the proposed Project would potentially impact aquatic species Chapter 4, Section 4.10 Aquatic Species and recreational fishing Chapter 4, Section 4.6 Recreation and Tourism. In response to public comments and resource agency input, CPRA has expanded and refined the fisheries mitigation and stewardship measures since the release of the Draft EIS. CPRA's mitigation and stewardship strategies and expenditures focus on establishing sustainable fisheries. The final fishery mitigation plan can be found in the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

Jessica

I have spent years doing research in New Orleans, learning about Louisiana history, culture, and geography. I love Louisiana, New Orleans, and the communities that live in this land but I know that coastal erosion threatens those communities and the ecosystems that thrive there.

The Mid-Barataria Sediment Diversion is an excellent coastal restoration project that uses the power of the river to build and maintain land. The project will build and maintain thousands of acres of vital wetlands to protect people from flooding from more intense hurricanes and sea level rise. Without action, some communities will see increased vulnerability to floods, continued loss of wetlands, and a collapse of key fisheries.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

Spring Gaines

In Support of the Mid-Barataria Sediment Diversion:

Louisiana loses a football field of land every hour. This is a line I have heard many times over as a student growing up in St. Bernard. It is a line I have repeated many times to students and adult volunteers as wetlands educator. It also remains as true today as ever. The Louisiana people see on a map has not changed since the 1930s. However, our state has lost 2,000 square miles since then, an area the size of Delaware. Wetlands change at a much faster rate than most people know. Over the next 50 years, our coastline is projected to lose an additional 4,000 square miles if we do not try to restore it. That is almost 2,000,000 football fields! This is one of the highest rates of loss on the planet. I have seen this rate of change firsthand by running and participating in restoration projects in the marshes of Lower St. Bernard and Plaquemines. Nowhere is this land loss more prevalent than in Plaquemines. In fact, the National Oceanic and Atmospheric Administration has delisted more than 30 place names from Plaquemines Parish alone since 2011.

This means that a project to restore land such as the Mid-Barataria Sediment Diversion (MBSD) is desperately needed in a place like the Barataria Basin, which is experiencing one of highest rates of land loss in the world. As a recent law school graduate, I have attended meetings and read material related to this ground-breaking restoration project, one that is primary to our Coastal Master Plan. The comparison the opposition gives to the Caernarvon diversion is a false analogy. A freshwater diversion like Caernarvon is a narrow channel created to shunt freshwater into an area to combat rising salinity levels due to saltwater intrusion. The MBSD is a sediment diversion, which is a wider channel designed to shunt sediment from the river into a desired area, much like the river is designed to do by nature. As a resident of coastal Louisiana, I desire to back this science-based method to fill in the ever-growing spaces in our basins.

We know that our coastline experiences land loss at an expedient rate. We need bold, dynamic, long-term solutions to protect, build, and maintain the thousands of acres of the vital wetlands we are lucky to call home. We need a project like the MBSD, the single largest ecosystem restoration project in the history of the U.S.! Without it, we stand to lose 428 square miles of land over the next 50 years in the Barataria Basin alone. Our wetlands are our first line of defense from ever-intensifying hurricanes and sea level rise. Without action, our coastal communities will become even more vulnerable to floods, continue to lose wetlands, and in the long term, our key fisheries will collapse. A project like this will work in concert with our continuing dredge and fill efforts to positively extend ecological and economic impacts in an area that quite frankly needs a boost in both. As a community, we can monitor and adapt our management of this project. We can actively mitigate and ensure that we receive the projected benefits in a way to reduce harms to area wildlife and livelihoods in the long-term.

I ask that you please select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. Our scientists and engineers agree that this project is the best long-term solution we have to fight the coastal challenges we face in Southeast Louisiana. This diversion is our best shot. Please take it.

Respectfully,

Spring A. Gaines, J.D./LL.M.

---

**Concern ID: 63334**

**The proposed MBSD Project would maintain and restore coastal lands and should move forward.**

**Response ID: 16291**

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

**Concern ID: 63385**

**A commenter noted that some opposed to the proposed Project compare it to freshwater diversions, like the Caernarvon Diversion, which introduce fresh water to combat rising salinity levels due to saltwater intrusion. The proposed MBSD Project is a sediment diversion, which is designed to shunt sediment from the river into a desired area, much like the river is designed to do by nature.**

**Response ID: 16347**

The commenter is correct that a sediment diversion would have different goals and impacts from freshwater diversion projects that have been previously implemented. A summary of select natural and man-made diversions in southeastern Louisiana, including the Caernarvon Diversion, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

RE: Mid-Barataria Sediment Diversion EIS

The following set of comments is hereby submitted from Gulf Coast Resource Coalition, Inc., a Louisiana nonprofit corporation operating under IRS guidelines 501(c)(4). We - along with our official partners the Commissioners Court of Cameron County, TX (under official Cooperative Endeavor Agreement and Resolution), Port Arthur, TX Shrimp Association and Texas Shrimp Association - wish to have these comments related to the Mid-Barataria Sediment Diversion Draft Environmental Impact Statement fully considered as sufficient notice under any current or future Federal legislation for the purpose of claims, and would also request that comments so noted (Section 4) be considered new and/or significant information requiring Supplement under 39 CFR 775.11(f)(1)(ii).

1) Merits of the Alternatives

It is our strongly held position that the merits of the alternatives discussed and considered in the Draft Environmental Impact Statement are wholly inadequate and create a misleading benefit incentive from the proposed project. The entirety of Chapter 2 is, at best, laughable in the face of regulatory requirements for consideration of alternatives. In addition, problems involved with the alternatives discussed and considered include:

(a) As stated on page 2-4, to comply with NEPA, CEQs regulations require that the EIS rigorously explore and objectively evaluate all reasonable alternatives (40 CFR 1502.14), and that [r]easonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant. (CEQ 40 FAQ, Q. 2a [CEQ 1981]). It continues with the applicable regulation statement & the EIS should analyze a reasonable range of alternatives that capture the potential environmental consequences of actions capable of meeting the purpose and need (CEQ 40 FAQ, Q. 1b [CEQ 1981]).

(b) Almost the entirety of the denoted CWA paragraph on pages 2-4 and 2-5 incredibly illuminate the inherent problems in the alternatives considered in the draft EIS.

All the scoping comments from stakeholders opposed to this project - including Governing Authorities of affected Parishes in Louisiana - and the draft EIS itself outline the environmental and economic impacts the proposed project and applicants preferred alternative will have. The stated purpose and need as outlined on page 1-9 and 1-10 is to & restore for injuries caused by the DWH oil spill and [t]he proposed project is needed to help restore habitat and ecosystem services injured in the northern Gulf of Mexico as a result of the DWH oil spill. The overriding - and not to be ignored - concern is the natural resources and brackish/saline marsh destruction this project will cause. If the list of damages this

project will cause (as outlined by the DEIS and opponent stakeholders scoping comments) is held against the list of damages caused by the DWH oil spill, the lists are utterly alike, to include the devastation of shrimp, oysters, and dolphins and the destruction of the brackish/saline habitat that is naturally occurring in the Barataria basin.

With that being said, along with the NEPA and CWA paragraphs as mentioned above, any disregard for other alternatives in addition to No Action (including dredging, forested ridges developed with dredging [which was conducted in Plaquemines Parish, properly evaluated and shown to reduce storm surge by 5ft and was recognized by FEMA as flood protection], and beneficial use of dredged material projects) is wholly inadequate to meet the requirements of proper alternative evaluation. It is critical to consider the following with regard to the claim that the alternative selections were wholly inadequate:

a) The third-party contactor, in preparing the DEIS, clearly states that the basis for alternatives outlined in chapter 2 comes from, in large part, various preparations, groups and outlines in which the applicant - the LA CPRA - was involved in. This is an obvious conflict of interest and disregards the NEPA requirements of reasonable alternatives that include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant. (CEQ 40 FAQ, Q. 2a [CEQ 1981]).

b) The Corps of Engineers itself is currently involved in a multiple year beneficial use of dredged material project which has created as much land in 10 years as the proposed project is estimated to produce over 50 years. This multi-year project has also cost only 1/5th of the \$2 Billion the proposed project will cost. This falls solidly within the NEPA Implementation Procedures for the USACEs Regulatory Program (33 CFR App. B Part 325) which requires USACE not only consider a No Action alternative, but also functional (project substitutes) alternatives.

c) The applicant continues to deliberately hyper-inflate the cost of dredging for use in cost/benefit analyses of the proposed project, as evidenced by the aforementioned project in (b) above as well as other projects that have recently been completed and that the applicant itself engages in for the furtherance of Louisiana Master Plan projects. The applicant also continues to use average figures of years-old, past Louisiana-contracted dredging projects which fails to take into account mobilization and demobilization costs which the applicant could easily affect through Louisiana legislation as evidenced by their influencing performance throughout State Legislative sessions over the past decade. One could reasonably ask whether these figures were incorporated into LA-TIG evaluations of potential alternatives which is a LARGE basis of project priority as stated in the DEIS.

d) According to the footnote on page 1-9 of the DEIS, in January 2018, the LA TIG (of which the applicant is a member) submitted the change to the purpose and need of the project application which now includes to restore for injuries caused by the DWH oil spill by implementing a large-scale sediment diversion. This change to the purpose and need was agreed to by USACE in a meeting on January 25, 2018 with LA TIG, representatives of the Council for Environmental Quality (CEQ) and representatives of FPISC. This change, &by implementing a large-scale sediment diversion, seemingly was designed to limit alternatives. One would naturally ask if there were recordings of the January 25, 2018 meeting, or at least recorded minutes to be able to review the discussion that led to the approval of the change in purpose and need, especially since Scoping under NEPA was conducted a full 6 months

before this change. These scoping meetings included information presented (as outlined in graphics at the scoping meetings (<https://www.mvn.usace.army.mil/Portals/56/docs/regulatory/permits/EIS/graphi20panels20portrait20wbleed.pdf>) that stated - SPECIFICALLY - Alternatives: The proposed MBSD Project will be compared to a no-action alternative and other alternatives that may be considered in the EIS. The scoping process is a chance for the public to suggest alternatives for USACE to consider. This obviously could have affected stakeholder comments which otherwise may have adamantly demanded alternatives other than No Action be considered with factual information from existing projects that they had knowledge of (including local governing authority representatives who were in attendance).

## 2) Problems with Third-Party Contractor Development of DEIS

a) Too numerous to cite, the DEIS is filled with statements that attempt to soften the blow of extremely negative impacts of the proposed project and preferred alternative. It lists negative impacts in a scientifically sound manner, then continues with statements that either utilize semantics to soften the negative information, or cites alternative information that is always highlighted by the applicant in its public statements and meetings about the project. This is totally unacceptable and will require extreme diligence on the part of the reviewing Lead Agency.

b) There is grave concern of an extreme Conflict of Interest with the third-party contractor which prepared the DEIS. As outlined in the Federal Agency MOU dated September 11, 2017, the Third Party Contractor MOU provided in the applicants Request for Proposal 2503-16-23, and the Federal/State MOU dated January 25, 2018 (which happens to be the date of the meeting approving the change of purpose and need of the project), it was of utmost importance to ensure no conflicts of interest, preserve impartial decision-making, and to prevent impropriety, undue influence or the appearance thereof, in order to maintain the integrity of the EIS process.

Most concerning with regard to this stated primary purpose is that the former Chairman of the LA CPRA (the applicant), Mr. Johnny Bradbury, departed the CPRA and became President of the Third Party Contractor firm in 2018. This is most concerning especially because Mr. Bradbury, while serving as Chairman of the CPRA (the applicant), instituted a board resolution actually threatening Plaquemines Parish Government with withholding coastal protection projects and/or funds if they did not issue a letter of No Objection to the Mid-Barataria Diversion project (June, 2018 CPRA Board Meeting, Video Archive). This was following the Plaquemines Parish Governing Authority passing an Ordinance against any local permitting of the Mid-Barataria diversion project.

## 3. Flaws in the Land-building Benefits of the Proposed Project

a) There are multiple existing Mississippi River diversions on the east and west bank of the Mississippi River - Caernarvon, Fort St. Philips, and Davis Pond as examples. There is no evidence of a net land gain or conservation within the sites after the diversions began. There was sometimes a dramatic land loss after diversion implementation/start that has not reversed. (Couvillion 2017, [www.sciencebase.gov/catalog/item/5a67a8cde4b06e28e9c57150](http://www.sciencebase.gov/catalog/item/5a67a8cde4b06e28e9c57150), USCOE 2004, Suir et al. 2014, Kearney et al. 2011, Underwood 1994, La. Dept. of Nat. Resources Coastwide Reference Monitoring System [CRMS])

b) The computer modeling used to predict land gain is not validated by reproducing the results from existing diversions. Also, the uncertainties in the model are described in Appendix E of the DEIS, and specifically state that it is an incompletely calibrated model. Most specifically, the West Bay diversion was used for model verification, which is - at best - flawed since the West Bay diversion goes into deeper water and mineral soils versus the shallow water covered with emergent vegetation inhabiting organic soils. And finally, the DEIS concludes that the proposed project will create land gain of approximately 2-4% which, given the disclaimer provided in Appendix E, is a guess at best since the land gain area estimated is so small that the model would more than likely have to be highly accurate to predict such a change.

c) Sea Level Rise (SLR) used in the EIS is inadequate given current GOM. The low has already been exceeded, and the high is too conservative (Sweet et al. 2017). If even low estimates of accelerated SLR levels were used in the modeling, the model would predict ZERO land gain by 2070.

#### 4. Inadequate Economic and Community Impact Scoping and Review )\*\*\*NEW AND/OR SIGNIFICANT INFORMATION

Most critical to this section of the provided comments is the failure of the DEIS to address extended economic and community impact of this project. The proposed project will not only affect localized Louisiana concerns (of which scoping was conducted), but will impact no less than three other Gulf Coast states. Information is as follows:

##### a) TEXAS

The economic impact to Texas due to the destruction of shrimp resources will be well over \$100 million annually (monetary figures verified through Texas Shrimp Association in conjunction with Texas state agencies). Based on highly established science (NOAA Technical Memorandum NMFS-SEFC-78), it has long been established that shrimp which depend on the Barataria basin for development exit the basin, migrate west and become a substantial part of Texas shrimp landings. In addition, Texas seasons are varied from Louisiana openings, and Texas vessels fish Louisiana waters when applicable and will affect Texas landings/retail multiplication values.

##### b) MISSISSIPPI

Mississippi will also be impacted by loss of landings from shrimp vessel use of Louisiana waters, processing, distribution, and any tourism/restaurant shortage of product given the decimation of seafood resources. Figures need verification through Mississippi entities.

##### c) ALABAMA

Alabama economic losses need to be explored in the area of their seafood processing and distribution industries which are HEAVILY reliant on Louisiana seafood production which the proposed project will destroy as indicated in the DEIS.

##### d) LOUISIANA

More economic impact work needs to be produced for Louisiana as a whole and the locally impacted Parishes from the proposed project. This should include all of the state-wide economic issues that will result from the loss of natural resources which are heavily marketed as a basis for the industries of tourism, hospitality, restaurants, etc. Any failure to consider

the complete economic impact of the destruction of seafood is inadequate given the nature of this project and the natural resource results actually delineated in the DEIS.

---

**Concern ID: 61832**

**Commenters expressed concern that the uncertainties of the model were not quantified or identified in the model results. For example, with respect to the projections of land change, the ranges of potential acres to be created/lost along with a confidence level that each range is accurate were not provided. Commenters noted that the model predicted a net land gain of only 2 - 4 percent of the total land area within the Project area over the 50-year analysis period and questioned whether the model is sensitive enough and accurate enough to predict such a slight change.**

**Response ID: 16479**

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft3D Basinwide Modeling, Section 8.0 Model Limitations and Uncertainties. The land-change uncertainty bounds were not included in the summary in Section 4.1.3.3. In response to this comment, the USACE has added a summary of land-change uncertainty to that section in the Final EIS. Where the model's quantitative results are presented, the EIS identified the model uncertainties. A footnote has been added to the Executive Summary and to Table 4.2-6 in Section 4.2 Geology and Soils of the Final EIS providing the uncertainty bounds for land-change projections.

As part of developing the EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

---

**Concern ID: 61842**

**Commenter is concerned about the accuracy of the sea-level rise projections used in the Delft3D Basinwide Model to predict land changes. In particular, the commenter suggests that if updated sea-level rise rates (as provided in Sweet et al. 2017 and Church et al. 2014) were applied, the modeling would project no land-gain benefits from the diversion.**

**Response ID: 16480**

Large variability in projected relative sea-level rise does introduce corresponding uncertainty into land-loss and land-gain projections. The literature provided by the commenters has been reviewed. Measured and projected relative sea-level rise rates vary substantially by location, and using projections at a station in Florida, such as Cedar Key, are not useful for projections in the central Gulf Coast. Citing the USACE and NOAA sea-level projection tool (USACE 2019d), the MBSD Project Modeling Work Group chose a sea-level rise scenario based on the 2017 Coastal Master Plan "moderate" scenario, which is slightly higher than the USACE's "Intermediate" rate for the Barataria Basin water level station at Grand Isle, LA, as shown in Chapter 4, Figure 4.1.3 of the Draft EIS. The USACE rate reflects sea-level rise data

---

collected at Grand Isle over the period 1947 to 2007. The MBSD Project Modeling Work Group determined that the use of that 2017 Coastal Master Plan Intermediate Sea-Level Rise curve was an appropriate choice at the time the modeling was conducted in 2019.

The sea-level rise value used in the Delft3D Basinwide Model simulation for the Draft EIS considered “intermediate” at the time of the modeling, is close to the low projection (0.3 m Global Mean Sea Level) given by Sweet et al. (2017) for Grande Isle. The commenter’s suggestion of the Church et al. 2014 reference, which provides useful information, has been added as a reference in the Final EIS in Chapter 4, Section 4.1.3.2 Sea-Level Rise. Use of a different sea-level rise rate would affect the impact projections of all the alternatives considered in the EIS, including the No Action Alternative. If the relative sea-level rise rate used in the model is an underestimate, the effect on model results was mitigated, but not eliminated, by the use of a “No Action Alternative compared to Action Alternatives” comparison method. (In other words, if sea-level rise was underestimated, it was underestimated for all alternatives, including No Action Alternative. The impacts of the proposed Project presented in the Draft EIS are the net difference in impact magnitude between the No Action Alternative and the proposed Action Alternatives). Chapter 4, Section 4.1.3.2 Sea-level Rise states that higher sea-level rise rates would reduce anticipated land creation. However, in light of the commenters’ concern, the USACE has amended the last sentence of the next to last paragraph of that section in the Final EIS to say, “If actual sea-level rise is higher (as is predicted by Sweet et al. 2017) than the value used in the Delft3D Basinwide Model, water levels would be higher and loss rates and land gains would be different than what the Delft3D Basinwide Model projects.”

---

**Concern ID: 61843**

**The Delft3D Basinwide Model results are flawed because the model was not calibrated to data from the Fort St. Philip, Davis Pond, and Caernarvon Diversions. Instead the model was calibrated to the unsuccessful West Bay Diversion, which has not produced any land in 20 years of operation (other than that created by the deposit of dredged material). Calibration to West Bay is not appropriate because the West Bay Diversion outfall area is comprised of deeper water and mineral soils, while the outfall area of the proposed MBSD Project diversion is comprised of shallow water covered with emergent vegetation inhabiting organic soils.**

**Response ID: 16481**

The Delft3D Basinwide Model was not calibrated to Fort St. Philip because it is a naturally-occurring crevasse rather than an engineered diversion. The Davis Pond and Caernarvon Diversions are freshwater diversions intended to reduce salinity through the introduction of fresh water and were not designed to channel sediments from deep in the river.

The West Bay Sediment Diversion is a large, uncontrolled diversion with a discharge of 20,000 to 50,000 cfs. Constructed in 2003, the goals for the project included: 1) increase land:water ratio; 2) increase mean elevation in the wetland; and 3) promote marsh habitat. To date, the restoration actions have successfully restored a portion of the land and habitat previously present in West Bay. (McQueen et al., 2020). Because the modelers considered the West Bay Sediment Diversion to be a reasonable analog to the proposed Project and in accordance with professional standards, they validated the Delft3D Basinwide Model to the West Bay Sediment Diversion. The accretion rate of inorganic sediment was also validated

---

using data from the Big Mar Lake adjacent to the Caernarvon Diversion. The Delft3D Basinwide Model is a public-domain, physics-based model in which water depth and consolidation of underlying soils are accounted for by appropriate equations. The consolidation feature of the model is described in the below reference, which was included in Chapter 10 (References) and cited in Chapter 2 (Alternatives) of the Draft EIS. Therefore, differences in water depth and underlying soils are accounted for in the model's physics-based calculations.

Uncertainties associated with the validation using West Bay were assessed using sensitivity tests and were considered in the analysis by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in Appendix E (Delft3D Modeling) and incorporated into the Draft EIS conclusions throughout Chapter 4 Environmental Consequences.

CPRA. 2011. Myrtle Grove Delta Building Diversion Modeling Effort in Support of the LCA Medium Diversion at Myrtle Grove with Dedicated Dredging Project: Data Collection, Preliminary Design, and Modeling Initiative. Available online at: <https://www.lacoast.gov/reports/project/4900753~1.pdf>.

As part of developing the EIS, the USACE, together with the members of the LA TIG (including cooperating agencies and CPRA), reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

---

**Concern ID: 61845**

**The Delft3D Basinwide Modeling for the EIS projects positive results when existing evidence from nearby sites in Louisiana show the opposite results. Commenter stated that the model does not incorporate important biological drivers such as the effects of flooding, nutrients, and resistance to erosion, and consequently questioned the accuracy of the model.**

**Response ID: 16483**

Comparing observed effects of various diversions has limited value, since diversions and receiving environments often exhibit unique attributes or behaviors that correlations do not account for. For that reason, the Delft3D Basinwide Model, even with its limitations and uncertainties, is a better predictor than anecdotal comparison to Fort St. Phillip or other sites where diversions were designed to divert primarily water, not land-building sediment.

The Delft3D modeling did incorporate flooding, nutrients, and resistance to erosion in its results. Flooding, nutrients, and resistance to erosion are described in Appendix E. See generally Figure 5-1 regarding model module interaction, Section 5.2 Morphodynamics Module and 5.4 Vegetation Module in Appendix E for additional information.

Uncertainties associated with the validation using West Bay were assessed using sensitivity tests and were considered in the analysis by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in Appendix E (Delft3D Basinwide Model) and incorporated into the Draft EIS conclusions throughout Chapter 4 Environmental Consequences.

---

The references provided by the commenter were considered and incorporated into the EIS. Couvillion et al. 2017 is included in Chapter 3, Section 3.2 Geology and Soils and Section 3.6 Wetlands and Waters of the U.S., Kearney et al. 2011 is cited in Chapter 2, Section 2.4.1.3.3 Lower Barataria Basin, and Underwood 1994 is cited in Appendix R2 Monitoring and Adaptive Management Plan of the EIS. Suir et al. 2014 was added to Chapter 2 Alternatives, Table 2.3-1 of the Final EIS.

Couvillion, B.R., H. Beck, D. Schoolmaster, and M. Fischer. 2017. Land area change in coastal Louisiana 1932 to 2016: U.S. Geological Survey Scientific Investigations Map 3381, 16 p. pamphlet. Available online at: <https://doi.org/10.3133/sim3381>.

Kearney, MS, JCA Riter, and RE Turner. 2011. Freshwater river diversions for marsh restoration in Louisiana: Twenty-six years of changing vegetative cover and marsh area. Geophysical Research Letters, Vol. 38, L16405, doi:10.1029/2011GL047847m August 26, 2011.

Suir, GM, WR Jones, AL Garber, JA Barras. 2014. Pictorial account and landscape evolution of the crevasses near Fort St. Philip, Louisiana. Mississippi River Geomorphology and Potamology Program, MRG&P Report 2. U.S. Army Corps of Engineers, Mississippi Valley Division, Vicksburg, Mississippi

Underwood, AJ. 1994. On beyond BACI: sampling designs that might readily detect environmental disturbances. Ecological Applications 4: 3–15

As part of developing the EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

---

**Concern ID: 61874**

**It seems that the change to the purpose and need for the proposed Project was designed to limit alternatives. This change was done 6 months after scoping, when scoping was the opportunity for the public to suggest alternatives and could have affected those comments.**

**Response ID: 15830**

CPRA provided a purpose and need statement for the Project in its June 22, 2016 Joint Permit Application for the proposed Project. In that application, CPRA stated that the purpose of the Project is “to reconnect and reestablish the natural or deltaic sediment deposition process between the Mississippi River and the Barataria Basin” and that the proposed Project “is needed as a long-term resilient, sustainable strategy to reduce land-loss rates and sustain DWH injured wetlands through the delivery of sediment, freshwater, and nutrients.” CPRA’s stated Project purpose and need was shared with the public during scoping meetings held during July 2017. During scoping, USACE indicated that CPRA’s purpose and need for the Project would be considered in the development of USACE’s purpose and need statement. USACE developed a draft purpose and need after taking into consideration the purpose and need from CPRA’s Joint Permit Application, input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities of the EIS), and input from public scoping.

USACE's initial formulation of the EIS purpose and need was included in a draft Chapter 1 Introduction and Purpose and Need of the Draft EIS, which was circulated to the LA TIG and cooperating agencies for review and comment from May to October 2017. In October 2017, after the LA TIG finalized its draft Strategic Restoration Plan, the LA TIG requested that USACE re-visit the Draft EIS purpose and need. In January 2018, the LA TIG submitted a proposed revised statement of purpose and need in the form set forth in the Draft EIS. During a joint meeting between USACE, the Applicant (CPRA), the LA TIG, representatives of the Council for Environmental Quality (CEQ), and representatives of the FPISC held on January 25, 2018, the participants discussed proposed changes to the purpose and need. The CEQ and FPISC representatives were supportive of the changes to the proposed Project EIS purpose and need and USACE agreed to the change. Subsequently, CPRA submitted a revised Joint Permit Application to USACE on March 16, 2018 containing a revised purpose and need statement for the proposed Project that tracked the revised purpose and need statement for the EIS. Although the purpose and need changed, the Alternatives Working Group (AWG) (formed to identify alternatives to be evaluated in the EIS and consisting of representatives from USACE, representatives from the LA TIG, including the Applicant (CPRA), and representatives from NOAA, NMFS, USEPA, USFWS, USDOJ, and USDA, and the third-party contractor), continued to consider functional alternatives that are not diversions in the EIS. Chapter 2 Alternatives of the EIS explains how numerous functional alternatives did or did not meet the proposed Project purpose of reconnecting and reestablishing sustainable deltaic processes between the Mississippi River to Barataria Basin through the delivery of sediment, fresh water, and nutrients. The public, commenting agencies, and stakeholders had the opportunity to comment on the revised purpose and need during the public comment period on the Draft EIS. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

In preparing its Restoration Plan, the LA TIG developed the goals and objectives for the proposed Project through an iterative restoration planning process, beginning with the restoration goals in the Final PDARP/PEIS then developing SRP/EA #3 for the restoration of habitat and ecological services in the Barataria Basin, and ending with Project-specific goals. The proposed MBSD Project has been developed to address the specific goals of the wetlands, coastal, and nearshore habitats restoration type; it would restore a variety of interspersed and ecologically connected coastal habitats, restore for injuries to habitats in geographic areas where the injuries occurred while considering approaches that provide resilience and sustainability, restore habitats in appropriate combinations for any geographic area, and restore the ecological functions provided by those habitats. Tiering off of the PDARP/PEIS, the LA TIG evaluated various restoration alternatives in SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed MBSD Project evaluated in the Restoration Plan.

Louisiana Trustee Implementation Group (LA TIG). 2018a. Final Strategic Restoration Plan and Environmental Assessment #3: Restoration of Wetlands, Coastal, and Nearshore Habitats in the Barataria Basin, Louisiana. ---

**Concern ID: 61879**

**Commenters questioned why other alternatives are not being considered other than No Action and a sediment diversion with various levels of flow rates. CEQ's regulations require that the EIS rigorously explore and objectively evaluate all reasonable alternatives, which is a requirement that the Draft EIS does not meet. Consider analyzing a range of other alternatives, options, and tools that better preserve and protect the environment and minimize the severe impacts to Louisiana fisheries, the communities, and the entire Gulf Coast ecosystems.**

**Response ID: 15835**

The range of reasonable alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2 of the Draft EIS (Alternatives), an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

---

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in its SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in its Restoration Plan. The LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

---

**Concern ID: 62019**

**The Draft EIS fails to address extended economic and community impacts of this proposed Project. The proposed MBSD Project would not only affect localized Louisiana concerns, but would impact no less than three other Gulf Coast states including Texas, Mississippi, and Alabama.**

**Response ID: 16215**

EIS Chapter 3, Section 3.1.1 Project Area identifies the area of analysis for the EIS which includes the Barataria Basin and portions of Mississippi River birdfoot delta. For socioeconomic impacts, the EIS identifies the area of potential impacts as the 10-parish Project area due to indirect socioeconomic impacts. Most impacts would likely be concentrated in Plaquemines, Lafourche, and Jefferson Parishes, Louisiana. For commercial fisheries, the proposed Project area includes two basins (the Barataria Basin and a portion of the Mississippi River Basin birdfoot delta). The proposed Project is not anticipated to have discernable effects on aquatic resources outside of the Project area. Commercial fishermen that travel to Barataria Basin to fish for species that would be adversely affected, particularly shrimp and oysters, could also be adversely affected by the proposed Project. Chapter 4, Section 4.14.4 Operational Impacts in Commercial Fisheries in the Final EIS has been revised to acknowledge this.

In response to one commenter's request for supplemental environmental review to consider potential impacts of the Project on the Texas shrimp fishery, the NOAA Technical Memorandum cited in support of that request has been reviewed. The technical memo does not confirm the comment that shrimp from the Barataria Basin migrate to Texas. While that memo does report that tagged brown shrimp released in Louisiana were recovered in Texas, those recovered shrimp were released in offshore waters south of Calcasieu Lake. Tagged

---

shrimp that were released in the Caillou Lake estuary, which is in the Terrebonne Basin (on the western side of the Barataria Basin) were not recovered in Texas.

---

**Concern ID: 62810**

**The Draft EIS exhibited bias by listing negative impacts in a scientifically sound manner, then softening the negative information through use of semantics or alternative information that is always highlighted by the Applicant in its public statements and meetings about the proposed Project. This is totally unacceptable and would require extreme diligence on the part of the reviewing lead agency.**

**Response ID: 16383**

The analyses in the Draft EIS acknowledged the potential impacts of the proposed Project and indicated the anticipated overall results based on a given analysis. The USACE has developed the EIS, together with the members of the LA TIG (including cooperating agencies and CPRA), considering the best information and data available to them and based on best professional judgment with respect to the potential impacts of the proposed Project. Additionally, the third-party contractor supporting preparation of the EIS was required to execute an Organizational Conflict of Interest Certification specifying that the contractor does not have financial or other interest in the outcome of the permit application process.

With specific regard to the concerns regarding former CPRA Board Chairman Johnny Bradberry, who is now President of Gulf Engineers and Consultants (“GEC”), the third-party contractor supporting preparation of the EIS, the Louisiana Board of Ethics, in an opinion dated February 18, 2019, Docket No. 2019-136, recognized the Conflict Mitigation Plan GEC has in place to avoid any conflict of interests, including prohibiting Mr. Bradberry from any involvement in the preparation of this EIS or in deriving any compensation from the preparation of the EIS. The prohibitions in that Conflict Mitigation Plan have been adhered to by GEC throughout this process.

---

**Concern ID: 63601**

**The basis for alternatives development involved various groups including the Applicant which is a conflict of interest and disregards NEPA requirements for reasonable alternatives that are practical or feasible.**

**Response ID: 15839**

As explained in Chapter 2, Section 2.2 Steps Taken to Identify and Evaluate Reasonable Alternatives of the EIS, the alternative development process was conducted by an Alternatives Working Group (AWG) led by USACE in coordination with LA TIG (comprised of federal and state agencies, including the Applicant CPRA), and cooperating federal and state agencies. The USACE is the lead federal agency in preparing the EIS and coordinates with other agencies with jurisdiction by law or special expertise acting as cooperating agencies (see EIS Chapter 1, Section 1.8 Agency Roles and Responsibilities of the EIS). The USACE as the lead federal agency is primarily responsible for implementing the NEPA process for the EIS. The LA TIG will also use the EIS to inform the NRDA decision under OPA regarding funding the construction of the proposed MBSD (see EIS Chapter 1, Section 1.6.1, in Scope of the EIS). A Memorandum of Understanding (MOU) between the USACE and the federal and state cooperating agencies established the Project Federal Coordination Team (NOAA, NMFS, USEPA, USDOJ, and USDA) and allowed the integration of the State, including CPRA, significantly into the environmental review and authorization process to the extent

authorized by law. NOAA's National Marine Fisheries Service and DOI's United States Fish and Wildlife Service retained independent discretion to make regulatory decisions under their respective statutory authorities. Refer to Appendix D1 Alternatives Working Group Summary of the EIS for additional details on the AWG.

The AWG collaborated to identify a reasonable range of alternatives to be carried forward for detailed analysis in the EIS that met the requirements for the NEPA review process associated with each federal action (Section 10/404 and Section 408 for USACE; NRDA funding for LA TIG). The AWG worked to refine and conduct the alternatives screening process to evaluate a wide range of alternatives, taking into consideration feasibility, practicability, location, design, and operation in an objective and transparent manner. The screening process was a multi-agency review process and considered information available from previous studies, decision making needs of the lead agency (USACE) and cooperating agencies, NEPA requirements (for example, 40 CFR 1502.14), NRDA restoration planning efforts, information and modeling input provided by CPRA, and public and agency scoping comments.

---

**Concern ID: 64060**

**The proposed MBSD Project would result in a financial impact on the surrounding communities that support the coastal community. More work needs to be produced to address the economic impacts for Louisiana as a whole and the locally impacted parishes from the proposed Project. This should include all of the state-wide economic issues that would result from the loss of natural resources which are heavily marketed as a basis for the industries of tourism, hospitality, restaurants, etc. Any failure to consider the complete economic impact of the destruction of seafood is inadequate given the nature of this proposed Project and the natural resource results actually delineated in the Draft EIS.**

**Response ID: 16231**

The Draft EIS considered the potential socioeconomic impacts of the Project; thus, no related changes have been made to the Final EIS. More specifically, the EIS acknowledges in Chapter 3, Section 3.14.7 in Commercial Fisheries that the seafood industry represents a major source of jobs and income in Louisiana, which includes commercial harvesters, seafood processors and dealers, seafood wholesalers and distributors, restaurants, tourism, and retail sales. Chapter 4, Section 4.14 Commercial Fisheries considers regional economic impacts and community impacts projected to result from the proposed Project on the shrimp, oyster, crab, and finfish fisheries, noting that communities with a high reliance on these landings may be most heavily impacted, and that indirect effects may include impacts to fish license holders, crew, dealers, suppliers, and seafood processors. While availability of shrimp and oysters from the Basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, though potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's Preferred Alternative than under the No Action

---

Alternative. This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

---

**Concern ID: 64183**

**The stated purpose and need for the proposed Project is to restore for injuries caused by the DWH oil spill; however, if the damages this proposed Project would cause, as outlined by the Draft EIS and stakeholders scoping comments opposing the Project, are compared to the damages caused by the DWH oil spill, the impacts are utterly alike, to include the devastation of shrimp, oysters, and dolphins and the destruction of the brackish/saline habitat that is naturally occurring in the Barataria Basin.**

**Response ID: 16400**

As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the proposed Project is to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts. As described throughout Chapter 4, Section 4.10 Aquatic Resources of the EIS, operation of the proposed Project would affect the existing flora and fauna of the Barataria Basin in both beneficial and adverse ways, with the overall impacts to a given species being dependent on that species habitat preferences and tolerances. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

The LA TIG's Restoration Plan discusses how the DWH oil spill resulted in the oiling of more than 1,100 kilometers of wetlands, nearly all of which were located in coastal Louisiana (DWH NRDA Trustees 2016). The heaviest oiling occurred in the Barataria Basin, resulting in substantial injuries to natural resources in the basin (DWH NRDA Trustees 2016).

Recognizing that the resulting loss of marsh productivity affected resources throughout the northern Gulf of Mexico ecosystem, the State of Louisiana and the federal Trustees that negotiated the DWH Natural Resource Damages settlement allocated \$4 billion, almost half of the total settlement amount, to restoring Louisiana's wetland, coastal, and nearshore habitats.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources injured by the spill. See Executive Summary and Chapter 3, Section 3.2.1.5 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan. The intended restoration of fresh water flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin. The proposed Project will not stop all of that marsh loss; however, it is projected to create and maintain approximately 9,800 acres more than the No Action Alternative at year 2070 (see Table 4.6-4 of the EIS).

For its Restoration Plan decision, the LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Chapter 3, Section 3.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan for a discussion of how

---

the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG has found that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem. The LA TIG selected the proposed Project because the LA TIG has found it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

In its Strategic Restoration Plan for Barataria Basin (March 2018), the LA TIG evaluated the potential and extent of collateral injury for a range of restoration techniques. Unfortunately, almost all large-scale restoration comes with potential for collateral injury. The LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54. In the LA TIG's Final Restoration Plan, the LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. Again, see Chapter 3, Section 3.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan for a discussion of how the LA TIG came to its decision.

In recognition of the potential for collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA would implement a suite of stewardship measures in recognition of the collateral injury that is anticipated to result from the implementation of the proposed Project. See Section 3.2.1.1.5 (Associated Stewardship Measures) of the LA TIG's Restoration Plan, and Appendix R1 (Mitigation and Stewardship Plan) of the Final EIS. The LA TIG is also committed to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances

where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Commenter

Please do not create another diversion. There is ample proof when man made controls to the Mississippi River are put into place the outcome is disastrous. From backwater flooding to the destruction of marine life from excess freshwater, man gets it wrong. The Caernarvon Freshwater Diversion has completely altered the ecosystem for the worse. A new diversion will likely have the same consequences. Please, no more diversions.

---

**Concern ID: 62784**

**Prior or proposed diversions and diversion-like projects (including the Caernarvon Diversion, MRGO, Mardi Gras Pass, Maurepas Bonnet Carré Spillway openings) did not work or caused adverse impacts on area resources.**

**Response ID: 16366**

The commenter's concern regarding the effectiveness and adverse impacts of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the Caernarvon Diversion, MRGO, Mardi Gras Pass, and Bonnet Carré Spillway, is available in Appendix U of the Final EIS. The Maurepas Diversion is subject to an ongoing NEPA analysis, which is anticipated to be finalized in 2022.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The referenced projects all had unique goals, and, where goals existed, each of those projects have achieved their goals. Those achievements increase confidence in the ability of the LA TIG to set goals and select approaches appropriate for achieving those goals. The proposed Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the current geomorphological features of the Lower Mississippi River, as well as data and knowledge gained from the referenced projects.

Clifford Rabalais

Diversions of the Mississippi River have been tried a number of times since the 1800's. They always result in a serious negative impact on the Gulf Coast. The oyster beds have been killed off numerous times. The fish, shrimp, porpoise, and other marine life habitats have been significantly altered.

The levee system along the Mississippi River has changed the River dynamics such that all of the sedimentation which used to deposit in the farm lands of Louisiana & Mississippi is now carried to the mouth of the River then drops out there when the water velocity slows. This is the major contributor to silting of the River.

The "Record High" river levels in the spring of most years is a result of trying to keep the River contained to it's normal banks. The Corps of Engineers purchased the right to flood much of the land in central La. in the late 1920's when they started the levee "Flood Control" project (Morganza spillway). Those areas DO NOT get flooded, instead the water is released via the Bonne Carre spillway, which adversely affects the Mississippi Gulf Coast and the Lake Ponchartrain areas.

Another project to divert water from the river will be another failure. The track record of the Corp of Engineers demonstrates that they should be fired from the job of River Management.

It is my opinion that their focus should be identifying the problems their projects have created, and trying to correct those, not adding more patches to a system they broke.

Clifford Rabalais

---

**Concern ID: 62363**

**USACE should identify the river management problems their projects have caused and correct those, not adding more patches to the system it broke.**

**Response ID: 15876**

The proposed Project is not a USACE project. The State of Louisiana through CPRA is the permit Applicant and would construct and operate the diversion. The combined effects of USACE's past, present and reasonably foreseeable projects, in combination with the MBSD Project, were considered in Chapter 4, Section 4.25 Cumulative Impacts of the Draft EIS.

Charles Moore

I live on the MS Gulf Coast and fish the waters of the Mississippi Sound, Lake Borgne and the Louisiana marsh and I have witnessed first hand the destruction of the Oyster fisheries and the fisheries in these areas every time the Mississippi River has been diverted through the Bonne Carre Spilway. I routinely walk the beach in Pass Christian and have counted hundreds of dead fish, dozens of turtles, dolphins and sea birds every time the MS river is diverted and runs into the MS Sound. I am opposed to the Mid-Barataria Sediment Diversion because it will destroy the marine environment and kill the oyster habitat and fisheries that hundreds of thousands of people depend on for their livelihood and cause mass destruction of everything the diversion touches. Thanks

Elizabeth Veglia

Diverting part of the Mississippi river into the Mississippi sound through the various estuaries and lakes, which provide the food, the financial sustainability and the lifestyle that we are committed to here in Mississippi is the wrong way to approach the problem of sediment in the Mississippi river. Diverting polluted water into the Mississippi sound and beyond is not a good idea.

Our economy is here are built on tourism which will plummet as the water dies along with the sea life and our own way of life here on the Mississippi gulf coast. Certainly the Corps of Engineers can come up with a more equitable solution for the problem of flooding and diversion of sediment from the Mississippi River. The Corps of Engineers has allowed levees to be built all around New Orleans which will strongly impact Mississippi in storms to come.

The Corps can create living shorelines in Louisiana, such as we have in Mississippi to reestablish our marshlands.

My answer is a resounding NO! Do not do this inequitable solution to effect the greater whole. Later will be too late to rectify it.

Elizabeth Veglia

Bay Saint Louis, Mississippi

---

**Concern ID: 61976**

**Instead of the diversion, consider using berms or living shorelines along the coast line to help reduce coastal flooding. The berms would hold back the soils and help build the land behind them.**

**Response ID: 15976**

The Draft EIS considered a shoreline protection alternative (including berms and living shorelines) as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.3 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS.

---

**Concern ID: 62786**

**Multiple commenters expressed concern with the impacts of diverted waters on the economy and natural environment of the State of Mississippi.**

**Response ID: 16368**

The proposed Project is not anticipated to have discernable effects on resources outside of the Project area, which is limited to Louisiana, and particularly the Barataria Basin and the Mississippi River birdfoot delta (as defined in Chapter 3, Section 3.1.1 in Introduction and the subsections entitled Area of Potential Effects for each resource heading in Chapter 4 Environmental Consequences). Because these resource-specific areas of potential effects were determined based on the anticipated limits of discernable impacts, negligible to no impacts on the natural or human environment are anticipated in the State of Mississippi from the construction and operation of the proposed MBSD Project.

---

**Correspondence ID:40337**

Commenter

Sounds like we just really need a sedimentation filter on the river. The old sedimentation filter was taken out of service by the levee system - the areas of Arkansas, Mississippi & Louisiana known as "The Delta". Rather than trying to create more swamp near Barataria - to deal with a mistake made years ago; go back and correct the mistake. Allow the river to spread out and deposit the sedimentation where it used to. Yes those areas will get flooded; that is why those areas have such rich farmland.

Side effect will be lower river levels in the lower regions of the river.

Admit a mistake & correct that- Don't continue along a failing path.

---

**Concern ID: 61888**

**Consider the alternative of allowing the levees to sink, erode, and collapse down to a normal height with annual widespread overflow distribution of the sediments in the historic and gentle way that would not have the sudden, disruptive impacts as seen with existing and planned diversions. Restoration of natural processes is the best way to replenish and preserve our renewable natural resources.**

**Response ID: 15983**

This alternative of removing levees and restoring natural processes is not feasible and was not considered further because levees are necessary for flood risk reduction for the communities and industries that line the Mississippi River in Barataria Basin. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

---

**Correspondence ID:40338**

Benson Tucker

My name is Benson Tucker, and I was raised in Myrtle Grove, LA and have seen first hand just how much land can be lost in a short period of time due to coastal erosion. There is no question that something has to be done to combat coastal erosion, but the plan for this diversion is totally unacceptable and unfair to the families that call this area home. We were told that this diversion would raise the water levels in the area an additional 2 feet, which will put my neighborhood and home of Myrtle Grove underwater making it accessible only by boat. The rise in water level will greatly reduce the value of my family's property in Myrtle Grove, which will be a slap in the face to my parents who worked so hard to be able to have a place like this to raise me. Unless something is done such as raising the infrastructure of our neighborhood in Myrtle Grove, this project is totally unacceptable. The way of life in Myrtle Grove should in no way be collateral damage to this diversion. I strongly oppose this project unless the plan calls for raising the infrastructure of the communities affected by the rising water levels that the diversion will bring.

---

**Concern ID: 62778**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property

---

owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose

---

and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63102**

**Commenters expressed concern that they will not be able to use their property if the Project proceeds. Commenters believe that the amount of funds proposed for mitigation is insufficient.**

**Response ID: 16640**

The commenters' concern regarding the adequacy of the funding for mitigation measures was considered by CPRA and the LA TIG in developing CPRA's Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included proposals to address and partially offset some of the projected impacts of the Project on surrounding communities outside levee protection, including potential mitigation measures to address increased water levels due to the Project. In response to comments, CPRA further expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The mitigation and stewardship measures would vary by community. In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the Project. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and the utilities of those communities. Also in these communities, CPRA plans to acquire Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances. Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:40339**

Gary Michel

I am a full time resident in the Myrtle Grove Estates and do not want any part of this diversion in my subdivision for the simple reason you could go further down the Hwy and do the same thing and it would not effect us as much as it is going to do with your present plan. You will destroy our chosen right to reside in a peaceful neighborhood that the residents of Myrtle Grove has worked their whole lives to accomplish. You are going to destroy our right to live a peaceful and happy life living on the waters that we fish and hunt with no regard to how it will effect our Holmes and the people that make a living out of these waters. I think politics and greed are what standing in the way of doing the right thing for our community. The right thing to do is help us get a flood gate across the Canal and you can accomplish your goal without affecting the residents of our community.

It is the right thing to do!!!

Totally against your project !!!

---

**Concern ID: 61865**

**Commenters asked why the location was chosen as the site for the proposed MBSD Project, since it so close to and impacts the Myrtle Grove Subdivision.**

**Response ID: 15936**

Chapter 2, Section 2.4.1 Evaluation of Location Alternatives under Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow in the Draft EIS, detailed the evaluation of alternatives based on geographic location and the reasoning for selecting the proposed location for the MBSD Project. Consideration for the location of the proposed MBSD Project took into account the proximity of the diversion intake to a point bar in the Mississippi River that could serve as a continuous, long-term sediment source for the diversion in combination with the outfall location and receiving basin being well suited to gain benefits from a sediment diversion, the potential for accretion of sediment in the Barataria Basin, and the creation, maintenance, and sustainability of existing and future wetlands and marshes. In addition, previous studies have considered several general locations for a sediment diversion from the Mississippi River into the Barataria Basin, including the upper, middle and lower parts of the basin and were used in the evaluation in the EIS. The impacts of the proposed MBSD Project and its alternatives, particularly on Myrtle Grove, can be found in Chapter 4 Environmental Consequences under each of the Project's resources.

---

**Concern ID: 62778**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and

Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations.

The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62794**

**This poorly planned and executed proposed Project is being pushed forward for the financial gain of politicians and contractors because taxpayer dollars are being used. Private investment dollars would entail more deliberation and a full impact study, including more natural options with less risk and more overall benefits.**

**Response ID: 16375**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance and constitutes a full impact analysis. A variety of alternatives assessed in the EIS are identified in Chapter 2 Alternatives. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

The LA TIG's Restoration Plan evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG has selected Alternative 1 as the LA TIG's Preferred Alternative.

---

**Concern ID: 63103**

**Commenter suggests that a floodgate across the canal would be a better solution and would not harm property.**

**Response ID: 16641**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) outlined the mitigation measures proposed by CPRA to address and offset the projected impacts of Project operations on surrounding communities, including providing mitigation for increased water levels due to the Project. In response to comments, CPRA has expanded and refined the Final Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

As part of developing the Final Mitigation and Stewardship Plan, CPRA considered the possibility of installing a flood gate for the Myrtle Grove Marina Estates Subdivision. CPRA decided not to pursue this option for several reasons. While some property owners in Myrtle Grove have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the Barataria Basin. CPRA has proposed instead other structural mitigation measures to address the projected impacts of the Project on water levels and boat accessibility in the Mitigation and Stewardship Plan.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:40344**

Randy Gegenheimer

As per an article in the New Orleans Advocate dated June 1, 2021 "Diversion aims to starve off loss of coast" state there are uncertainties with the diversions. The diversion will ruin the livelihood of many fisherman and businesses that rely on the fisheries in the Bartaria Basin even though there are uncertainties what the diversion will do. Need to spend additional time to study the diversion and what it will do to the basin.

---

**Concern ID: 62785**

**This type of freshwater and sediment diversion project is unproven and there are uncertainties with respect to what the diversion would do (that is, if it would work and, if so, to what extent).**

**Response ID: 16367**

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties have been incorporated into the EIS impact conclusions and were briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties.

Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or as predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the projected changes for the No Action Alternative.

In addition to the modeled data, Chapter 4 Environmental Consequences of the EIS includes additional analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in drafting the EIS. In response to public comments, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The LA TIG recognizes and acknowledges that a controlled sediment diversion of this scale has not been constructed in Louisiana previously. However, a sediment diversion at this location has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Chapter 3, Section 3.2.1.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan). The proposed Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management [MAM] Plan, Appendix R2 of the EIS).

---

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:40345**

Alan Drake

Has any consideration been given to aerial seeding of black mangrove in order to stabilize newly formed "land" from other hurricanes and storms? Even if a frost kills seeded trees every decade or so, the dead trees will still stabilize new soil. And more can be seeded the next year.

I would like to add a red mangrove as a species to seed, potentially by a shallow draft boat, to stabilize newly formed land. This species currently exists in extreme southern Louisiana but floating seeds are unlikely to reach the project site in numbers.

Again frost may kill it once a decade, but dead trees still stabilize land & they can be reseeded (by boat in this case per my understanding).

One devastating path for a Cat 4 or 5 hurricane is straight up the Mississippi River. The hurricane shoves storm surge up the river. Standard operating plans should include diverting as much water as possible from the MS River when such a storm approaches. This would reduce loss of life & damage to property.

I am appalled at the 50 year design life. I have worked on a hydroelectric project in Iceland with a 400 year design life! Steel headrace linings would be replaced every 250 years - and design provision was made to do so.

This project should have a design life of at least 125 years - when sea level rise should overwhelm it.

Provisions should be made for adjusting flows based upon real world experience rather than computer models. I really question the "round number" of 5,000 cfs minimum flow. Tides & wind should require adjustments in flow - as well as sea level rise.

I suggest performance criteria with "an estimated flow of roughly 5,000 cfs average" rather than a strict 5,000 cfs.

The same is true for other flows as well.

Addendum to 50 year design life: There is little question that this diversion structure and associated auxiliary structures will be in service beyond 50 years.

Larger silt or river sand particles will be more stable and provide more enduring new land. On the other hand they typically settle closer to the diversion.

Larger particles tend to be deeper in the river.

Does the proposed structure capture at least some of the water from deeper in the river, seeking to capture these larger particles?

May I suggest getting at least 10,000 cfs from deeper in the river - creating the option of getting all the minimum flow water from deep in the river with larger particle sizes.

How will operations and goals change as sea level rises in the future?

At what level of sea level rise will the structure become useless?

When will the structure be operational? What year?

---

**Concern ID: 61781**

**The commenter questioned whether modeling was conducted for the Draft EIS to determine where sand would settle in the basin, whether it would settle out near the**

---

**diversion channel, and whether dredging would be required to remove the sand. Another commenter questioned whether water from the bottom of the river, where sediments are coarser, would be diverted to the basin.**

**Response ID: 16411**

The issues raised by the commenter were considered in the Draft EIS. The Delft3D Basinwide Modeling conducted by the Water Institute of the Gulf for CPRA for the EIS distinguishes the types of sediment that would be deposited in the basin. Yes, sands were included in the modeling. Table 5.2-1 in Appendix E Delft3D Modeling of the EIS lists the sediment classes included in the model. The model's physics-based computations showed that the coarser sands would settle out before the finer classes, as the commenter suggests. The model reproduces the natural process of delta building in which successive waves of sediment push farther out, either forming land/marsh or creating a base upon which land/marsh can be formed (without a need to move it by dredging and placement). CPRA plans to dredge specific areas within the proposed Project limits and within Barataria Basin as needed to operate and maintain the proposed Project, as described in Section 3.2 of EIS Appendix F MBSD Design Information and in EIS Appendix R2 Monitoring and Adaptive Management (MAM) Plan. Likewise, dredging of navigation channels would be assessed and managed through CPRA's MAM Plan (Appendix R2 to the EIS). Dredging in the Barataria Basin is expected to maintain certain dredged navigation channels but not the emerging deltaic front. However, the MAM Plan (Appendix R2) does include consideration of additional measures should they be necessary.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

---

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61892**

**Consider including in the design of the diversion the planting of black, red, and white mangroves to create and sustain land in the Barataria Basin, as well as planting bald or related species cypress trees to aid in the retention of land. Even dead trees would stabilize the soils.**

**Response ID: 15986**

The Draft EIS acknowledged impacts on wetland vegetation and terrestrial vegetation due to the proposed MBSD Project in Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S. and Section 4.9 Terrestrial Wildlife and Habitat, respectively. While mangroves can provide areas of soil retention, their relative lack of cold tolerance does not currently allow growth throughout the entire coast of Louisiana. Red or white mangroves are not currently found in Louisiana because they are not as cold tolerant as black mangrove, although as the climate changes, CPRA recognizes that dedicated plantings of black mangrove and exploratory plantings of other mangrove species are a potential option in areas that are not currently suitable. Cypress trees are a viable option today and have been used (along with willows) to stabilize newly deposited sediments at the outfalls of existing diversions. CPRA would consider these options in the outfall area as part of future adaptive management efforts, especially to the extent base flows would provide suitable freshwater habitat, as well as to increase sediment stabilization and retention.

---

**Concern ID: 61912**

**CPRA should consider alternative flow triggers, designs, and features in the operations plan and design of the proposed MBSD Project in order to minimize impacts. CPRA should also consider adjusting diversion design elements such as triggers, peak flows, volumes, and nutrient loads over the first years of operation to minimize impacts. These adjustments could minimize impacts to dolphins, oysters, brown shrimp, and other aquatic organisms. Some commenters suggested limits be imposed by USACE, others suggested an operating plan that is tied to specifics, while others emphasized flexibility tied to real-world experiences. CPRA should also consider alternative methods of operating the proposed MBSD Project, such as operating the diversion during winter when water levels in the basin are lower and can accept high volumes of water from the diversion.**

**Response ID: 15999**

The proposed MBSD Operations Plan can be found in Appendix F2 Preliminary Operations Plan of the Final EIS. As stated in the Chapter 4, Section 4.4.4.2.4 Sediment Transport in Chapter 4 Surface Water and Coastal Processes, sediment transported by the Mississippi River is primarily comprised of fine sediments, with higher river flows (typically occurring in the spring) suspending more coarse-grained sediment that are important in delta building (see Chapter 3, Section 3.4 Surface Water and Coastal Processes). Fine-sediment transport through the diversion would be generally proportional to water flow in the river. The intake channel was modeled and designed to divert a high sediment-to-water ratio while minimizing energy loss (to maintain flow and sediment transport through the diversion complex) and impacts on the river. The amount of sediment carried through the diversion would vary by

year, depending on flow rates in the river and the corresponding variation of diversion operations. As explained in Chapter 2, Section 2.8.1.3 Project Operations in Action Alternatives Carried Forward for Detailed Analysis, the Mississippi River discharge of 450,000 cfs would be the standard operations “trigger to open the diversion for flow (above the base flow)”. Operations (with the exception of a base flow up to 5,000 cfs) would cease when the river discharge falls below 450,000 cfs or when certain emergency triggers are met (such as in advance of hurricanes or when a spill of hazardous substances occur in the river). When the Mississippi River flows exceed 450,000 cfs, the gates would be fully opened (above base flow). At river flows of 450,000 cfs, the diversion flow would be approximately 25,000 cfs, and flows would increase proportionally as the river flow increases. This ramp would continue up to maximum diversion capacity flow of 75,000 cfs when the river reaches a flow of 1,000,000 cfs.

An alternative related to operational triggers specific to sediment concentration was considered but determined not to be technically feasible or reasonable because data and technology do not currently exist to support this operational regime (refer to the Eliminated Alternatives Matrix in Appendix D2 of the EIS). According to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS, as part of the adaptive management and monitoring process, CPRA would consider potential ways to optimize diversion operations based on Project performance and success and would assess potential operational changes that may minimize impacts to basin resources where practicable after sufficient operational data become available for analysis.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG’s funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61915**

**Standard operating plans should include diverting as much water as possible from the Mississippi River when a category 4 or 5 storm approaches to reduce loss of life and damage to property.**

**Response ID: 16002**

As stated in Draft EIS Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis, the Operations Plan for the proposed MBSD Project calls for the diversion structure to be closed when the relationship between the water levels in the Mississippi River and the Barataria Basin would create a reverse flow or when other stop triggers or “Emergency Operations” are met, including spills and other hazardous discharges, navigation impediments, climatic conditions such as tropical depressions or named storms, diversion structure damage or emergency, and public safety as described in the Applicant’s Operations Plan. Regarding climatic conditions, the Operations Plan states that CPRA will close the diversion gates and suspend all flows through the diversion when tropical activity (depression or named storm) is forecasted to impact the Barataria and Mississippi River Basins. The structure would be closed in advance of storm impact to avoid affecting water levels in the Mississippi River or the Barataria Basin. After passage of an event and without unnecessary, unexpected impacts, operations would resume per the Operations Plan. Refer to Appendix F2 Preliminary Operations Plan of the Final EIS for further details on the Operations Plan.

---

**Concern ID: 61916**

**The proposed Project should have a design life beyond 50 years.**

**Response ID: 16003**

The proposed Project design life would extend beyond 50 years. This is not to be confused with the 50-year analysis period used in the EIS. The 50-year analysis period corresponds with the Delft3D Basinwide Model simulations, which were run over 5 decades (beginning in 2020 and run through 2070). USACE typically uses a 50-year period of analysis for its water resources projects. The EIS analyzes operational impacts resulting from operation and maintenance of the alternatives during the 50-year analysis period. Analysis of potential impacts past 50 years was determined to be too speculative to assist in understanding or decision making regarding the proposed Project.

---

**Concern ID: 64702**

**The commenter questioned whether proposed Project operations would change as sea-level rises in the future. The commenter also questioned at what level of sea-level rise would the proposed Project become useless.**

**Response ID: 16424**

The issue raised by the commenter was considered in the Draft EIS. Sea-level rise and subsidence were explicitly accounted for in the Delft3D Basinwide Model over a 50-year analysis period, as described in the Draft EIS Appendix E Delft3D Modeling, Sections 3.2.4 and 3.2.3, respectively. Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology and Section 4.6 Wetland Resources and Waters of the U.S. show in detail how long wetland and land-building benefits of the proposed Project would endure during the 50-year analysis period. Section 4.4.4 Hydrology and Hydrodynamics discusses in detail how long bathymetric (water bottom) benefits would endure during the 50-year period of analysis. As explained in

---

the Draft EIS Appendix F2 Operational Plan and summarized in Chapter 2, Section 2.8.1.4 Project Operations, operations would follow the standard operational procedures and emergency operations put forth in Appendix F2 until the water levels in the Barataria Basin exceed those in the Mississippi River, at which time the structure would be closed.

For the diversion to become useless (defined for this discussion as no longer diverting sediment), sea level would have to rise by about 9 feet. At that level there would be insufficient water level difference between the Mississippi River and the Barataria Basin to push water, sediment, and nutrients through the structure. The USACE currently projected “High” rate of sea-level rise at Grand Isle, Louisiana, ([https://cwbi-app.sec.usace.army.mil/rccslc/slcc\\_calc.html](https://cwbi-app.sec.usace.army.mil/rccslc/slcc_calc.html); [https://cwbi-app.sec.usace.army.mil/rccslc/slcc\\_calc.html](https://cwbi-app.sec.usace.army.mil/rccslc/slcc_calc.html)) would produce a rise of 6.75 feet in 2100 (the last allowable year in the prediction tool). An unofficial extrapolation of the USACE’s High and Low curves suggests that 9 feet of relative sea-level rise would occur at Grand Isle some time between 2120 and 2300.

As explained in the Draft EIS in Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology and Section 4.6 Wetland Resources and Waters of the U.S., although the amount of wetlands and land that the Project would build and sustain after the first 30 years of operation would diminish, the wetlands and land created or sustained by the Project would become a larger percentage of the total wetlands and land remaining in the basin, as the basin is overwhelmed by sea-level rise and subsidence. Further, throughout the 50-year analysis period of the EIS, the Project would continue to provide a suite of ecosystem service benefits including but not limited to nutrient input and increased freshwater habitat (for freshwater species and SAV) as discussed in the EIS Chapter 4, Section 4.10 Aquatic Resources and in the Restoration Plan, Section 3.2.1.6 Benefits Multiple Resources.

---

**Concern ID: 65187**

**Commenter inquired as to what year the proposed MBSD Project is planned to be operational.**

**Response ID: 16695**

Construction would not commence until after the USACE decision on the Section 10/404 permit and Section 408 permissions request. As described in EIS Chapter 2, Section 2.8.1.4 Project Construction Activities in Action Alternatives Carried Forward for Detailed Analysis, once begun, the proposed Project would require 3 to 5 years of construction which would occur in several phases.

**Correspondence ID:40346**

Thomas Halko

I am curious as to whether the Park Service, that now owns 5000+ acres on the East side of Bayou Barataria, has issued a view point related to this project. Additionally, I am interested in knowing as to whether Jefferson Parish Council, the Lafitte Area Independent Levee District and the Town of Jean Lafitte have taken positions on the project. And, if so, what are their respective positions?

Is there historical information as to Oyster Beds in the Barataria Basin? If so, can you cite specific references?

I am a property owner in lower Lafitte. It represents my home and business. I am an environmentalist arm chair historian and believe in the concept of living w/water. I am particularly concerned about mitigation. I will reserve my viewpoint.

---

**Concern ID: 62186**

**The commenter would like to know the view point of the National Park Service, Jefferson Parish Council, Lafitte Area Independent Levee District and Town of Lafitte on the proposed Project.**

**Response ID: 15765**

Comments on the Draft EIS submitted by Mayor Kerner of the Town of Lafitte can be found in Appendix B2 (DEIS Public Review and Public Meetings) of the Final EIS. No formal comments on the Draft EIS were submitted by the National Park Service, Jefferson Parish Council or the Lafitte Area Levee District. All comments received have been fully considered and incorporated into this public comment and response appendix and all original comments received are included in the Final EIS.

---

**Concern ID: 62730**

**Historical information on oyster beds in the Barataria Basin should be included and cited in the EIS.**

**Response ID: 16108**

Historical information on oyster beds in the Barataria Basin is included in Chapter 3, Section 3.10.5.2 (Key Fish and Shellfish Species in the Barataria Basin) of the EIS. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

---

**Concern ID: 63886**

**A commenter expressed that they believe in living with water, and that mitigation is important and they are concerned about it.**

**Response ID: 16578**

The Draft EIS considered how communities in the Project area have “lived with water” and adapted to evolving conditions due to sea-level rise, subsidence and storm events in Chapter 3, Section 3.20 (Public Health and Safety) and Chapter 4, Section 4.20 (Public Health and Safety). Further, CPRA’s Mitigation and Stewardship Plan (Appendix R1) included with the Draft EIS included potential measures to address the projected impacts of Project operations on water levels and inundation in the communities near the Project outfall outside levee protection. Since publication of the Draft EIS and LA TIG’s Draft Restoration Plan, CPRA has expanded and refined the Mitigation and Stewardship Plan based on community and resource

agency input to include additional detail regarding the measures planned to address increases in water levels. The Final Mitigation and Stewardship Plan is included in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:40347**

Lalise Mason

Can you describe how the three major referenced Barataria projects (including MBSD) are complementary? IE: As it pertains to the earlier Lake Hermitage resident's query about dredge projects versus river diversion, the point might be more clearly made in the public forum that diversion sediments ideally serve to nourish and maintain local constructed marsh restoration projects over time, just as they do for native marsh. It is not just "we are doing both"...

Excellent project.

---

**Concern ID: 61848**

**Commenters expressed the opinion that the Mid-Barataria Sediment Diversion Project would help support and enhance the lifespan of other coastal restoration and protection projects.**

**Response ID: 16462**

The commenters correctly note that, as discussed in Chapter 4, Section 4.25.6 Cumulative Impacts, Wetland Resources and Waters of the U.S., "Cumulative impacts on wetland accretion from operation of the reasonably foreseeable future projects combined with operation of the MBSD Project action alternatives would likely result in fewer losses in wetlands in both the Barataria Basin and birdfoot delta, but most notably in the Barataria Basin, where implementation of the MBSD Project action alternatives would prevent the loss of an additional 26,000 acres."

---

**Concern ID: 63332**

**A large number of commenters expressed general support for the proposed Project.**

**Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:40348**

Darlene McGarry

Who will be responsible for maintaining/dredging the navigation channels in the areas the diversion will affect?

I live in Happy Jack and am very concerned about the oil sediment that will be disturbed by this project. Has this been addressed in the draft?

---

**Concern ID: 61826**

**Commenters expressed concern that proposed Project operations would disturb existing oil sediment (from the DWH oil spill) in Barataria Bay.**

**Response ID: 16431**

As explained in Chapter 4, Section 4.4.4 in Surface Water and Coastal Processes, significant scour potential exists in the immediate outfall area of the diversion structure in the basin, which could disturb oiled sediments on water bottoms. However, based on surveys conducted during remediation efforts in the Barataria Basin in response to the DWH oil spill, oiling exposure did not occur in this area, as illustrated in Chapter 3, Section 3.10 Aquatic Resources, Figure 3.10-1 of the Draft EIS. With regard to DWH oiling exposure identified in remediation surveys throughout the rest of the Barataria Basin, proposed Project operations would deposit sediments on water bottoms, which would bury any oiled sediments. Where oiled sediment exists in the birdfoot delta, bed elevations are projected to decrease by 0.2 foot by 2070 as compared to the No Action Alternative (see Figure 4.4-3 in Section 4.4.4 in Surface Water and Coastal Processes) due to reduced sediment load reaching the delta in areas observed to be impacted by oil. Bed elevations in the birdfoot delta are projected to decrease under the No Action Alternative as well. Therefore, proposed Project operations are expected to negligibly disturb existing oil sediment from the DWH oil spill. Clarification has been added to Chapter 4, Section 4.5.5.10.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS.

---

**Concern ID: 62283**

**The commenter questioned who would be responsible for maintaining/dredging the navigation channels in the areas impacted by proposed diversion operations.**

**Response ID: 16445**

As stated in the Draft EIS in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the Project area during Project operations. Other non-federal channels and facilities (for example, marinas, anchorages) near these channels would be expected to also experience increased sedimentation (see Section 4.21.5.2 in Navigation).

CPRA plans to mitigate the effects of the Project on boat access from Myrtle Grove and Woodpark to the basin as explained in Appendix R1 Mitigation & Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final

Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62968**

**If operation of the diversion causes infill of various canals used to access surrounding communities, who will be responsible for dredging to maintain access? For example, if Wilkinson Canal is filled with silt then the canal cannot be used and waterfront property owners with boat lifts in Myrtle Grove will not be able to get out using their boats; the EIS does not require a remedy or provide a funded maintenance plan for this issue (including who would pay for dredging).**

**Response ID: 16642**

The impacts raised by the commenters were considered in the Draft EIS. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the Project area during Project operations.

In acknowledgement of commenters' concerns regarding maintenance of non-federal navigation channels and canals impacted by sedimentation of the proposed diversion, the Mitigation and Stewardship Plan includes measures to mitigate impacts on navigation resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS

---

Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. **Correspondence ID:40349**

Rosina Philippe

Question about land building and land loss during the day to day operation of Mid-BS-Diversion...will we continue to lose more land that the diversion is proposing to build (per day)? Not if we do or if we don't do.

---

**Concern ID: 62152**

**The commenter questioned whether the basin would lose more land than what the proposed MBSD Project diversion would create on a day-to-day basis.**

**Response ID: 16179**

The commenter's concern regarding the rates of land loss and land projected to be built during diversion operations was considered in the Draft EIS. To further clarify, further discussion has been added of currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

---

**Correspondence ID:40350**

Valerie Ramirez

I am a college student, will there be any internships in the future working on this project?

I get that the sediment diversion will be channels that lead to rivers. But has there been any discussions about building a man made river? The man made river might also help with flooding if constructed right.

What are the statistics of Louisiana citizens that are aware of this project? What is the total amount of the project along with the time frame of this project?

What are the companies that will be associated with this project?

---

**Concern ID: 61853**

**The amount of acres of habitat that would be restored through the preferred alternative would not justify its high cost. Given Louisiana's annual coastal habitat loss rate, investing in a nearly \$2 billion Project that would provide relatively little benefit compared to this annual loss is not justifiable.**

**Response ID: 16618**

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless it is relevant to the agency's decision. USACE generally assumes that a permit applicant has conducted its own economic evaluation of the costs of a proposed Project. USACE will conduct a public interest review as part of its permit decision-making process, which weighs the anticipated harms of a project against its anticipated benefits.

As part of the OPA analysis, LA TIG considered the cost to carry out the Project consistent with the Restoration Plan alternatives evaluation criteria, 15 CFR §990.54. The cost to carry out the Project was evaluated in Section 3.2.1.2 Cost to Carry Out the Alternative of the LA TIG's Draft Restoration Plan. The Project would reestablish deltaic processes that deliver sediment, fresh water, and nutrients; improve the function of existing habitats; and successfully develop deltaic habitats that connect nearshore and offshore ecosystems. Wetlands are one component of a restored ecosystem to be achieved. The LA TIG expects that the Project would result in the creation of a maximum of 17,300 acres of land in the Barataria Basin by year 30 of operations; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 [Alternative 1 Description] of the Restoration Plan). The creation of marsh habitat would provide substantial benefits to nearshore marine ecosystems, water column resources (including fish and invertebrates), birds, terrestrial wildlife, and offshore marine ecosystems (see Section 3.2.1.6 [Benefits Multiple Resources] of the Restoration Plan). Given the high rates of erosion and land loss, the land created by the Project would become even more important to the coastal ecosystem over time.

---

**Concern ID: 61899**

**Consider building a man-made river instead of implementing the proposed MBSD Project.**

**Response ID: 15993**

---

This suggestion is not inherently different than the proposed Project which consists of a man-made conveyance structure. The proposed MBSD Project would provide a controlled riverine connection to the Barataria Basin. No edits have been made to the Final EIS.

---

**Concern ID: 61955**

**Commenters are concerned that all those that are impacted may not be aware of the proposed Project, its impacts, or potential mitigation. There are many people that may not have the knowledge, time, or resources to be deeply involved in these issues, but who also have a stake in what is happening. Consider the needs of these people in making a decision about moving this proposed Project forward. If this proposed MBSD Project and similar projects move forward consider opportunities to better engage people across Louisiana's coast in the value of projects like these and why they are crucial to the future of our region.**

**Response ID: 15900**

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan. Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration Plan and the Draft EIS in its decision-making process. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

USACE and the LA TIG conducted public outreach and provided public comment opportunities throughout the development of the Draft EIS and the LA TIG Draft Restoration Plan. Details on USACE's and the LA TIG's outreach activities and the opportunities provided for public participation can be found in Chapter 7 Public Involvement in the Final EIS.

Examples of public outreach provided by USACE for the EIS include providing special public notices for the permit application, the scoping process, and for the Draft EIS through Federal Register notices, press releases, newspapers, mail outs to distribution lists, and provision of hard copies of the Executive Summary and other materials to local libraries. USACE and the LA TIG also coordinated with the SELA Voice organizations to understand the needs of the local communities regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan and during the public comment period.

Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the virtual public meetings on the Draft EIS and the LA TIG's Draft Restoration Plan. Also, the Public Notice to announce the Draft EIS Notice of Availability, the Executive Summary for the Draft EIS, and the Executive Summary for the LA TIG's Draft Restoration Plan, were translated into Spanish and Vietnamese. The consolidated pre-recorded public meeting presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage.

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process.

Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area, in an effort to reach out to community groups to gather information related to the proposed MBSD Project. Throughout the public comment period and concurrent with the preparation of the Final EIS and LA TIG's Final Restoration Plan, CPRA has engaged the public through meetings with the communities and groups projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups.

This included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented.

Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts. In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

It is imperative that the operational plan includes continual adaptive mitigation of unavoidable impacts to critical habitat in the Breton and Mississippi Sound areas.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

**Concern ID: 67233**

**It is imperative that the operational plan includes continual adaptive mitigation of unavoidable impacts to critical habitat in the Breton and Mississippi Sound areas.**

**Response ID: 16953**

As discussed in Sections 3.12 and 4.12 (Threatened and Endangered Species) of the EIS and Appendices O-3 and O-4, ESA designated critical habitat for the loggerhead sea turtle and piping plover is within the Project area, as is proposed critical habitat for the red knot. However, the Project would have no effect on these designated or proposed areas of critical habitat.

Plaquemines Parish School Board

Niko Tesvich

I recently read an article in the New Orleans Times Picayune that stated in 2070, projections with the Diversion show about 133 square miles of wetlands will remain from the 509 square miles of wetlands currently in the Barataria Basin. To put it another way, even with the Mid-Barataria project, the basin will still lose about 75% of its wetlands. This makes me question the project in its current state, especially when you consider the \$1B price tag attached to it, along with the impacts it will make to the basin and the communities around the basin.

My biggest concern is that the Mid-Barataria River Diversion will not restore more land than we expect to lose. I've put this in quotes because a recent opinion published by our governor states exactly that. I've heard this same thing paraphrased several times by others who are in support of the project as it is currently designed. How can we spend this amount of one-time funds and support a project that may only slow down the rate of attrition over the long term? Also, consider that in the short term, it will be ruinous for the current ecosystem in the Barataria basin, as it will change a brackish system into a completely fresh one. Flora and fauna will die en masse once the spillway gates are opened and river water fills the estuary from the Diversion site to the Gulf of Mexico. Of course, over time, other species will inhabit the area, but how long will that take? How much land will wash away once the saltwater marsh that holds it together dies? What other projects are in place to make sure that if land is created by this project, it stays there?

In my opinion, a controlled system of dredging to create dry land coupled with a system to contain sediment-infused river water in specific areas outside of the levee protection system would be most beneficial to create a more land exactly where we need it. I believe Lt. Governor Nungesser suggested a project similar to this. Was a project like this ever vetted as an option?

A project that restricts the amount of freshwater introduced into the basin would allow for the fishing industry to continue. It will reduce flood risks to exposed communities in the basin. It will not significantly impact the dolphin population. It will not introduce invasive species to the basin. Overall, a project like this would help to ensure the survival of the communities in southern Plaquemines, Lafourche, and Jefferson Parishes. Negative impacts on the fishing communities of these parishes would be a deathblow to these areas.

Respectfully, I believe that the Louisiana CPRA has not fully explored and vetted all the options available to them to spend these coastal restoration funds in the best interests of all stakeholders in the region. Public funds in these amounts don't come along very frequently...or maybe ever again. Our state cannot miss when spending funds of this magnitude. Please reconsider this project in its current state and make adjustments to the project itself, not restitution/mitigation measures to address known impacts.

---

**Concern ID: 61895**

**Commenters suggest using a sediment diversion to selectively build land by directing sediment to a contained area, such as a colmates system or large-scale marsh creation containment area. A controlled system of dredging to create dry land coupled with a system to contain sediment-infused river water in specific areas outside of the levee**

---

**protection system would be most beneficial to create more land exactly where it's needed.**

**Response ID: 15988**

This method of sediment transport and/or sediment containment and land building would not meet the proposed Project's purpose and need of reconnecting and reestablishing sustainable deltaic process between the Mississippi River and the Barataria Basin. A colmate or other means of large-scale marsh creation using dewatered sediment would allow for sediment to be transported from the Mississippi River to the Barataria Basin and deposited into a location confined by containment berms, which would create an impoundment where the suspended sediment would settle out of the water column over time to create a marsh platform. Once the area dewatered and the platform stabilizes at an appropriate marsh elevation, the berms would be degraded or gapped to allow fish passage and hydrologic exchange. While this type of system would create marsh, it would not be a passive system and would require active management and maintenance, including potentially pumps to ensure sediment transport, mechanical gapping/degrading of the retention berms and periodic lifts to combat the effects of subsidence. It would not reestablish natural deltaic processes. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

---

**Concern ID: 62665**

**Commenters suggested that the proposed Project would achieve some benefits relative to the No Action Alternative, but that even if the modeling is correct (which it probably is not), the projected benefits provided by the Project would be very small compared to amount of habitat that is expected to be lost in the Barataria Basin over 50 years. If the models used for the EIS turn out to be accurate, more than 43 percent of the land in the Barataria Basin will have disappeared even with the Project in 30 years. During that time, 105,000 acres of land will be lost, with the Project sustaining only 17,300 more acres than the No Action Alternative (5 percent of the basin's current land area). Because of this background of large land loss, the proposed Project could only be considered a stop-gap measure. Further, commenters cited sources indicating ongoing debate about the effectiveness of large-scale sediment diversions as a land-building strategy and recommended those uncertainties be addressed in the Draft EIS (Blaskey, 2020; Blum and Roberts, 2009; Chamberlain et al., 2018; DeLaune et al., 2013; Suir et al., 2014; Turner et al., 2019).**

**Response ID: 16624**

The issues raised by the commenters were considered in the Draft EIS. For example, the proposed Project's long-term influence on land building and wetland creation has been modeled extensively through engineering and design and the impacts (beneficial and adverse) are described in Sections 4.2 (Geology and Soils), 4.4 (Surface Water and Coastal Processes) and 4.6 (Wetland Resources and Waters of the U.S.) of the EIS. With regard to modeling conducted to determine impacts of the proposed Project, the Delft3D Basinwide Model projections of Project impacts include uncertainties. Uncertainties are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 (Model Limitations and Uncertainty), and in detail in Appendix E (Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties). Uncertainty in model results is recognized in Table 4.2-4 found in Section 4.2.3.2.2.1 Geology, which indicates that land areas are considered accurate within +/- 200 acres and that the error in land gains is +/-300 acres.

As part of developing the EIS, the USACE, together with members of the LA TIG (including cooperating agencies and CPRA), reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives. The cited studies were reviewed and included in relevant analyses in the Draft EIS.

The LA TIG acknowledges the commenters' concerns. As described in the LA TIG's Draft Restoration Plan, the Project would reestablish deltaic processes that deliver sediment, fresh water, and nutrients; improve the function of existing habitats; and develop deltaic habitats that connect nearshore and offshore ecosystems. The LA TIG expects that the Project would result in the creation of a maximum of 17,300 acres of land in the Barataria Basin by year 30 of operations; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 [Alternative 1 Description] of the Restoration Plan). The LA TIG agrees that, with or without the Project, coastal Louisiana and the Barataria Basin would experience tremendous land loss. However, the LA TIG believes this background of large land loss makes the habitat created by the proposed Project even more important. Relative to other types of incremental approaches (for example, marsh creation through the application of dredged sediment), the Project would reconnect and reestablish sustainable deltaic

---

processes and support the long-term viability of existing and planned coastal restoration efforts. All citations referenced by the commenters were included in the Final EIS and thus were considered by the LA TIG in the Final Restoration Plan.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63064**

**Marsh flora and fauna would die once the proposed Project operation begins and river water fills the estuary. Clarify how long it would take for other species to inhabit the area and how much land would wash away once the saltwater marsh that is currently present dies.**

**Response ID: 16070**

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. indicated that the fresh water transported by the diversion may result in the loss of some wetlands in the immediate outfall area due to inundation during the initial period following commencement of operations; however, those impacts would be offset by marsh building in the delta formation area. However, salt- and brackish marsh vegetation would not be adversely affected by the lower salinity of transported water. Chapter 4, Section 4.6.5.1.2.4 Land Accretion of the Final EIS has been revised to include additional analysis regarding the extent and timing of wetland changes in the immediate outfall area.

As summarized in Chapter 4, Section 4.10.5 in Aquatic Resources of the EIS, the proposed Project would have both adverse and beneficial impacts on the flora and fauna of the Barataria Basin, based on the specific life history and habitat preferences of a given species.

---

**Concern ID: 63241**

**The commenter questioned what other projects are in place to help retain land created by the proposed MBSD Project.**

**Response ID: 16475**

Other reasonably foreseeable projects that would retain the land created by the proposed MBSD Project include, but would not be limited to, the Large-Scale Marsh Creation and Component E- Planning Project, the Grand Bayou Ridge and Marsh Restoration Project, the Bayou L'Ours Marsh Terracing Project, and others. These projects were considered in the

Draft EIS in Chapter 4, Sections 4.25.2 and 4.25.6 in Cumulative Impacts, which discusses the beneficial and adverse impacts of other projects in the proposed MBSD Project area on sustaining wetlands and retaining land created by the proposed MBSD Project. While the restoration projects described in these sections are not specifically designed to retain the land created by the proposed MBSD Project, these restoration projects would contribute to land retention.

Water Collaborative of Greater New Orleans

Jessica Dandridge

Dear Mr. Laborde and Mr. Landry:

As a native New Orleanian, my entire life has been shaped by water. I was born in this city, whose culture and way of life are intricately connected to our water and natural coastal resources.

Like so many others, my family lost everything in Hurricane Katrina, which struck on my 16th birthday. Fast forward to last year, when we experienced the most active hurricane season on record. That terrified so many of us, and the science tells us that storms are only going to get more intense with every passing year. My life with water continues, now as the executive director of the Water Collaborative. I work every day with partners across the city and the region to create and support solutions for all impacted by flood risk by focusing on equitable practices to sustainably live and thrive with water.

We owe the iconic Mississippi River Delta on which we live to the the water and sediment from the river itself, which built our coast and wetlands while simultaneously shaping our culture and economy. That very same water is also threatening our livelihoods.

Between sea-level rise, rapid land loss, and the impending threat of storm surge, Louisiana's distinctive coastal culture, and the communities that line our coast are at stake. Water impacts us all, and we all have a responsibility to act now for a more sustainable future. Strategic water management and working with nature, both inside and outside the levees, is the best vehicle to address climate change, urban and economic development, and environmental justice simultaneously.

We need to do a better job of restoring and protecting our natural defenses - the wetlands that act as barriers from storm surge – and we need to recognize that it is Black, Indigenous, and other communities of color that are most at risk when that environment is threatened or damaged.

We have an opportunity right now to really change the tide on our land loss crisis which is why I support the preferred alternative in the DEIS for the Mid-Barataria Sediment Diversion and urge that the project be funded with the settlement dollars from the BP oil spill. Decades of research have led us to this project which uses the natural land building power of the river to build and sustain the land. This project will build more wetlands than any other individual restoration project in history and it is at this scale that we must act to protect our coastal communities, including New Orleans, and our way of life. This is our moment to shape a more resilient future for our city and state – one that uses water to our advantage.

The water isn't going anywhere, we must all learn to live and work with it - harnessing its good to build and sustain wetlands that will protect us for generations to come.

Thank you,

Jessica Dandridge

The Water Collaborative

New Orleans

---

**Concern ID: 63340**

---

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

---

**Concern ID: 64130**

**Commenters suggested the Draft EIS is insufficient in terms of its definition and analysis of affected communities, particularly low-income and communities of color. The analysis would be improved by a discussion of historical context and systemic inequities to describe the existing barriers (that is, economic hardships, educational background, language barriers) these communities, particularly Ironton, must deal with.**

**Response ID: 16301**

The issues raised by the commenters were considered in the Draft EIS. The EIS Chapter 3, Section 3.15 Environmental Justice and Chapter 2 of Appendix H1 Socioeconomics Technical Report discusses existing barriers faced by populations in the Project area affected by the proposed Project, including economic hardships, and describes specific communities with low-income and minority populations. Chapter 2 of Appendix H1 Socioeconomics Technical Report, also provides information regarding historical context and systemic inequities affecting these communities. Chapter 4, Section 4.15 in Environmental Justice describes potential impacts on low-income and minority populations from construction and operation of the proposed Project. In the Final EIS, Chapter 4 Section 4.15.5.1 Environmental Justice, a summary of impacts to the Ironton community has been added to facilitate access to that information. Information concerning additional outreach to communities with environmental justice concerns has also been added.

---

---

**Concern ID: 61935**

**Commenters noted that the MBSD Project would have positive environmental justice outcomes, as the Project goes forward, over time. The proposed MBSD Project is actually part of the larger suite of projects outlined in the Coastal Master Plan. In concert, these projects will provide very significant long-term storm surge and sustainability benefits for communities in Plaquemines and Jefferson parishes, whether within or without structural storm risk reduction systems. Each of these benefits would be particularly helpful over time to those who depend on subsistence fishing and those who live in particularly flood prone areas that, because of historic**

---

**discriminatory settlement patterns, is made up of disproportionately poor members of minority groups.**

**Response ID: 16290**

The EIS evaluated anticipated impacts of the action alternatives and a No Action Alternative over a 50-year analysis period. The Delft3D model production runs also projected conditions over a 50-year period. Anticipated impacts beyond that timeframe were not evaluated in the EIS.

As discussed in Chapter 4, Section 4.15 Environmental Justice, the EIS acknowledges that low-income and minority populations in areas north of the diversion and inside of federal risk reduction levees would experience some beneficial impacts related to additional protection from storm hazards due to reduced storm surge and wave heights as a result of the Project's land building. Low-income and minority populations within 10 miles to the north and 20 miles to the south of the diversion outside federal risk reduction levees would experience increased tidal flooding relative to the No Action Alternative, particularly in the first 2 decades of operations. Low-income and minority populations south of the diversion and outside federal risk reduction levees would experience increased risk of storm surge. In addition, negligible to minor, adverse impacts related to increased risk of levee overtopping during certain 1 percent storm events south of the immediate outfall area may occur, which may impact the community of Ironton.

Low-income and minority populations that depend on subsistence fishing activities may experience both beneficial and adverse impacts depending on the specific resources and areas where subsistence activities are practiced, as discussed in Chapter 4, Section 4.15.4.2. With regards to other restoration and flood risk reduction projects, Chapter 4, Section 4.25 Cumulative Impacts discusses other restoration and flood risk reduction projects in concert with the proposed Project. The operations of those reasonably foreseeable projects combined with the MBSD Project have the potential to result in minor to moderate, adverse and minor, long-term or permanent, beneficial impacts on low-income and minority communities in the Barataria Basin.

---

**Correspondence ID:40354, 39972**

Lisa Halili

I am writing you to voice my opinion on the Mid-Barataria Sediment Diversion (MBSD).

My name is Lisa Halili, and I represent several corporations that hold oyster leases in Louisiana, Texas, Mississippi, and Florida. Prestige Oysters Company is among one of the largest wholesalers of fresh oysters in the Gulf Coast. They have been in the fishery industry since 2001. Over the years, as a growing industry, our company has encountered many devastating events-from major hurricanes, long summer droughts, hill country floods to man-made disasters, including oil, gas, and other chemical spills. Throughout the years, we have found that the government plays a huge role in controlling the environment when damages occur to our bays, estuaries, and along the Gulf, including those manmade.

The government can prevent widespread of economic or environmental losses by imposing higher restrictions on State and Federal permits issued to companies asking for permission for dredging of canals, diverting construction projects, or the oil/gas expedition drilling within the State and Federal waters. With all the new restrictions, nothing stopped the biggest manmade disastrous oil spill from the BP explosion on April 20, 2010.

The disasters caused by water cannot be controlled due to Mother Nature or an act of God. In some cases, hurricanes can actually help the environment, but it is devastating to the people and businesses along the Gulf Coast that experience flooding. Hurricanes bring in a saltwater mixture which helps flush out the bay of Dermo diseases, such as *Perkinsus marinus* or *Dermocystidium marinum*, that's associated with extensive oyster mortalities in some areas of the bays estuaries where the Dermo is most present. Oyster farmers call these hurricanes blessing waters as this salty freshwater flushes out the bay system and helps rejuvenate new oysters spat sets.

Tropical storms typically bring a high amount of rain and not enough saltwater, so this can also flush out the bay, but can also impact oyster reefs. The freshwater impact can kill oyster reefs due to freshwater shock. When too much freshwater lowers the salinity levels, in some cases it can result in more than a 50 percent death of an entire oyster reef.

The most catastrophic environmental event was the 2010 BP Oil Spill which caused the release of trillions of gallons of freshwater to help push the oil back but took the life of the environment by killing the marsh islands, wetlands, crabs, white/brown shrimp, oysters, dolphins, all types of finfish, and many species of birds. The oyster beds were trapped between oil slick water that's mixed in with freshwater, and chemicals used to clean up the oil. Thus, the environment along with oyster reefs had no chance to survive.

The second biggest catastrophe was the double opening of the Bonnet Carre Spillway in 2019. The 128,000 trillion gallons of freshwater took the lives of oyster farms causing a 50 to 100 percent deathbed for the oyster reefs. This also killed large populations of the brown/white shrimp, crabs, finfish, and dolphins. The green slime that silted around the creeks, marshes, inlets, outlets, docks, harbors, bays, and bayous eventually traveled to the Gulf of Mexico to our industry that is now known as the DEAD ZONE.

The 2019 Bonnet Carre event was devastating to the seafood industry and totally wiped out oyster farmers. The oyster farmers do not compare to other fisheries because the oyster farmers need to cultivate and plant clutch, provide substrate material such as limestone, river rock, oyster shells, and crushed concrete to grow oysters. For Prestige Oysters to grow

sizeable oysters for market sales, it requires 18 to 36 months. We are then prepared to sell these fully developed oysters nationwide. With the 2019 Bonnet Carre event, freshwater death release was not once, but twice that year. The poor oysters swallowing up the trillions of gallons of freshwater did not stand a chance. Right before our eyes all that hard work of planting and cultivation of oyster reefs was totally wiped out, all because the release of the Mississippi rising flood waters ending down stream into the southern state of Louisiana.

Now we have come to wonder with the MBSD on the heels of our oyster industry, how will this affect the oyster farmers in the seafood industry? How do we survive this new invention of a manmade diversion of the MBSD? The oyster industry already knows that by releasing trillions of gallons of freshwater like from the aftermath of 2010 BP oil spill and 2019 Bonnet Carre event, what will happen.

The seafood industry experienced the 2010 and 2019 death of freshwater drowning out from the brackish saltwater environment that oyster reefs can only survive in. What will the future hold for the world of oysters, brown/white shrimp, crabs, finfish, and dolphins?

The world is now aware of the importance of oysters. Just look at how many of the East Coast states see their mistakes made by the manmade destruction of allowing over permitting of canals, allowing over dredging ship channels, dredging spoiled material being pumped into bay waters and allowing heavy population. All these factors have led to the destruction of the ecosystem in many Eastern seaboard states.

The highest price tag that comes when man somehow forgets what Mother Nature provides-free healthy ecosystems-comes from the filtration of oysters. The natural filter feeders filter up to 50 gallons of water per day. Oysters are now being placed to repair/clean the estuaries, bays, and harbors along the East Coast and in different parts of the world.

USACE is more aware of the environmental impacts due to the loss of oyster reefs than 50 years ago. Shell dredging that was used for development of channels, canals, and waterways, did horrible damages to the oyster reefs in many of the states along the Gulf and Eastern Coasts.

USACE is requiring more mitigation than the past 50 years. The findings with little or no live oyster reefs, the USACE discovered the cost of reduction of those oyster reefs has placed a huge price tag on the Federal Government.

That is why the benefits of this MBSD do not improve, but rather exacerbate, our current situation that the southern state of Louisiana has been fighting for over 50 years. The MBSD must demonstrate that the goals can be achieved with means showing what is being proposed to divert 75,000 cubic feet of water per second. This long-term huge master plan of changing a saltwater environment with the intake of freshwater diversions does not allow fisheries to adapt to new freshwater. The MBSD must show that the environment will adapt to these catastrophic changes. MBSDs huge master plan must show how it will not fail or fall short of the continuation of the Economic and Environmental Benefits of Oyster Reefs.

Type of Benefit:

Oyster Harvest

Oysters generate revenue for the commercial oyster industry and support thousands of jobs. Across the Gulf, oyster shuckers and seafood processors hold 30 to 50 percent of seafood industry-related jobs.

### Marine Habitat

Oyster reefs are the condominiums of the sea providing nooks and crannies of habitat for dozens of marine resident species. One acre of oyster reef increases fisheries catch values by \$4,200 annually. Oysters are at the foundation of the food chain that supports a \$2.4 billion fishing industry and more than 200,000 jobs.

### Water Filtering

Each individual oyster filters up to 1.5 gallons per hour providing a service otherwise carried out by expensive wastewater treatment plants. This removes excess nitrogen that contributes to marine dead zones. Each acre of oyster reef provides \$6,500 in de-nitrification services annually. Filtering suspends allow sunlight to reach the underwater floor and facilitates growth of marine grasses necessary to hold the wetlands in place. Clean, clear water is important for recreation and tourism-an industry worth more than \$20 billion in the Gulf Coast.

### Shoreline Protection

Oyster reefs stabilize bottom sediments, reduce wave energy, and prevent erosion. Thus, they fortify wetlands to serve as horizontal levees that provide \$23 billion worth of storm protection annually to Gulf Coast business and communities. This protection extends to the nearby valuable oil and gas pipeline infrastructure, which ensures economic and energy security for the entire United States.

With regards to the MBSD, this diversion of freshwater from the Mississippi River water to saltwater supposedly to restore existing marsh islands and provide enough sediment to rebuild existing estuary marsh islands. However, the startup of building new marsh islands for a habitat for crabs, brown/white shrimp, finfish, oysters, Bottle Nose dolphins, and other types of species living along the diversion pathway and the pre-existing marshes of the surrounding coastal areas of the southern state of Louisiana will be affected. The designers of the MBSD are saying that the environment can survive living in freshwater or the environment will readapt to the new freshwater ecosystem.

Without the oyster reefs, how will you filter the ecosystem? Do you really believe you are going to achieve this goal of restoring and rebuilding marsh lands/estuaries without the oyster reefs natural filter feeders? Anyone who claims that oysters can readapt living in an environment of freshwater versus saltwater, is ignoring science. Freshwater oyster are a pipe dream. This has already been proven by the MR-GO diversion that provided only freshwater intake without saltwater intake and the Lake Borgne area has become a freshwater bay not allowing the oyster reefs to regenerate.

If you look at the history of the southern state of Louisiana, it is sinking under its own weight, but why? In the past 50 years in all the presentations and all the data collected throughout the years, why can it not be proven, that by adding more volume of freshwater intake will not stop the southern state of Louisiana from sinking? Marsh islands, sand dunes, and estuaries provide protection of the shoreline from erosion, but even that alone will not stop the southern state of Louisiana from sinking. As the Gulf continues to rise, the question becomes how to solve the problem?

In all honesty, you cannot stop the southern state of Louisiana, with a current population of 2,000,000, from continuing to sink as its population continues to grow. Looking back 50 years ago, the southern state of Louisiana was more marsh island/wetlands, but with all the new

developments, oil/gas explorations, more housing construction, sewage treatment and water usage, you cannot say that man is not playing a huge role in the sinking of the southern state of Louisiana.

Today, the southern state of Louisiana has more open water and less marsh islands/wetlands than fifty years ago, and this is not from saltwater. The southern state of Louisiana continues to take on more freshwater, but the question becomes how much of this freshwater is bringing in sediment? Some experts say that more than 50 percent less sediment is halted at the rivers waters in upper states.

The billion-dollar question becomes: Where does MBSD get the sediment to rebuild the southern state of Louisiana and keep it from sinking? How will the new sediment sustain itself from sinking when you are adding more freshwater? Land subsidence is well documented with impacts ranging from changing drainage patterns, and increasing flooding, to the destruction of critical infrastructure. That these infrastructure creations of earth fissures are opening ground fractures. This forms into unconsolidated sediments as the result of tensional stresses associated with land subsidence. Giant desiccation cracks from in fine-grained sediment clays, is a result of drought. Land subsidence is the downward movement or sinking of the earths surface.

Everyone wants the wetlands marsh islands rebuilt, but the MBSD will not stop the problem of rising sea levels and the continuations of losing wetland marsh islands. This will continue, as it is no secret that for fifty plus years the southern state of Louisiana has been researching ways to fix the problem, but 50 years later there are no answers, but why?

Maybe the problem the southern state of Louisiana is facing is the continuation of allowance of downward fall of flood waters off the Mississippi river bottoms.

The survival for the southern state of Louisianas sinking problem, is sediment that is not coming down stream. The river waters from up-states dams prevent sediment from reaching the lower rivers. The MBSD is potentially calling for 75,000 cubic feet of freshwater, but how much sediment?

Now the question becomes with the 2019 opening of the Bonnet Carre Spillway, how much was sediment and how much was water? Where is the sediment of the 2019 Bonnet Carre spill having 128,000 trillion gallons of fresh water-what happened to the sediment?

This analogy should be used if this sediment exists and indeed did come during the double flooding of the 2019 Bonnet Carre spill. Was the sediment used in repairing marsh island/wetlands from the 2019 flooding?

The predictions from the huge master plan of MBSD should show the extraction of sediment from the fresh water being released. This huge master plan should show how much sediment is to be predicted and will this be enough sediment to rebuild or replace 28 square miles of loss of marsh islands and wetlands? Do not count sand sediment, you must have hard core clay and other core river bottom rocky soil.

The huge master plan of MBSD ignores the situation of the northern states dams holding back the harder substrate. This substrate is needed to recreate marsh islands and replace/repair estuaries with sediment that is not being released. So how will the MBSD get the sediment? From the river waters that are currently held back by dams? The thought process behind the MBSD diversion to saturate the marsh islands/estuaries with this over-

abundance amount of freshwater makes me wonder how this plan will allow the marsh islands/estuary to survive?

Receiving just some soft sediments from the high volume of freshwater as predicted in the huge master plan of the MBSD, the area looking to be rehabilitated will not be stable enough to hold. Jeopardizing the entire population of seafood, estuary, marine life, economics of commercial fishing, sport fishing for the 28 square miles of wetland, which will continue to sink despite the MBSD.

Not too long ago, Louisiana started requiring oil/gas companies to fill the empty holes abandoned below water-bottoms within the states water. Is their reporting done to check into the southern state of Louisiana as to how many of these mass amounts of sink holes on the water-bottoms are filled? Can this be the reason of the earth beneath the southern state of Louisiana is slowly sink off into the Gulf?

Under current law, before permitting is issued by USACE requiring examination of the bottoms with sonar, a technique used to sound propagation checking on the stability of these water-bottoms-has the USACEs encouragement of all the parties promoting this MBSD to conduct very hardcore samples of the earth? Regarding the earths patterns of the water bottoms underneath the detection flow route that are being predicted-will the earths water bottoms under the surface allow more river waters to travel through without causing more damage to the already submerging underwater water-bottoms?

The only reason this is a USACE project is that the levees that are cut through are Federal levees, so with that being the case, can the USACE play a bigger role in diverting this MBSD? Why is the USACE not looking at other option diversions through more than one water shed?

Whats wrong with diverting some of the water off to the state of Georgia? The Supreme Court just ruled against Florida in the continuation for the battle of freshwater. Florida bays are in dire need of fresh water. Not having enough fresh water will cause environmental impacts. Just having too much freshwater is an environmental impact. The USACE could require Georgia to participate in the MBSD diversion, and this would take pressure off the southern state of Louisiana. Another outlet, Lake Texarkana-can the USACE use Texas to take some of that river-water? Shreveport is another route for diversion to Texas. Remember if the BP Oil spill never happened, where would this money come from?

Environmentalists say the money is there and we need to act quickly, but the money needs to be used wisely and planned out without jumping into something and getting your feet wet before you know you can fix the problem.

This has been the 50 years, 50-billion-dollar question. Spending more money and still no marsh, no barrier islands, nothing for protection has been successful in over 50 years to stop the Gulf waters during storms as the beach erosion in the state is sinking.

Breakwater has become one of the many ideas thats used in other parts of the world. Breakwaters built into rock islands is a protection. Plans to protect shorelines used often in other portions of the US and Europe make huge break walls out in the Gulf, before the surge hits land.

USACE should divert some of the money to be used to help protect the shoreline rather than the MBSD plan thats adding volumes of water annually, when the world says the melting pot of global warming is here. The next huge storm surge might not leave a shoreline, so can the

MBSD master plan protect the shoreline? Is this in consideration to the huge MBSD master plan-to divert all these river waters?

With a diversion on top of a hurricane, what you're really looking to do is to sink the southern state of Louisiana even more. This MBSD diversion from only one watershed is really not practical, considering how much money has been spent just in the designing mode. MBSD probably could have built many rock islands in the Gulf. The Middle East can pump enough sand to build a city aka Vegas in the sand Dubai and has many islands that provide tourists homes that are some of the tallest buildings in the world.

The protection is needed for the over two million Americans that reside in America and these wetlands are important. There are so many who live in close proximity to the coastline of the southern Louisiana. The existing wetlands, marsh islands, and sand dunes are buffers used to protect these citizens and their communities from storm surge.

One huge factor of this MBSD plan with this being a Federal Project, what role will the USACE have in this project? Since the project is calling for removal of part of the Federal levee, what more protection is the Federal government going to implement on higher restrictions of the harmful nutrients? Including fertilizer that causes low-oxygen DEAD ZONE poisonous pesticides, and pharmaceuticals disposed in the river from sewage treatment plants. The seafood industry believes this will outweigh any benefits expected from the outcome of the MBSD project.

Will the Federal government enforce harder restrictions on these river waters released by the MBSD that the environmentalists are focused on? How will this benefit the environment by releasing 75,000 cubic feet of freshwater? How will this outweigh its detrimental effects on all the commercial and recreational fisheries, and wildlife like bottlenose dolphins, and loss of oyster reefs, that cannot escape the DEAD ZONE?

An area of interest being closely focused on is the freshwater effects on the wetlands water of Breton Sound that is home to many commercial species like oysters, crabs, white/brown shrimp and so many finfish species. The environmentalists are saying they'd rather let the harmful nutrients into the state's water rather than go into the Gulf.

Are the environmentalists saying they'd rather divert them with MBSD into our precious marshes, islands/wetlands, the nursery for the estuary for the planet's most productive fisheries?

One question, specifically asked by those like me in the oyster industry, with high spending of huge sums of money on this project, will the environmentalists and government agencies guarantee that the state can be certain that what is being proposed with MBSD will last more than a few decades?

Your master plan is not just asking for permission to rebuild a freshwater environment, from the billions of dollars being allocated for this diversion, but will this MBSD have enough funding before the project is finished? Can the MBSD guarantee funds allocated will be enough to not only finish the project but have funding for long term maintenance money set aside? Whose responsibility is this for the next 15-20 years?

Although the environmentalists say, no tax dollars will be used on the MBSD because it is self-funded by the 2010 BP Oil Spill, what are the consequences if this project fails? Creators

of this MBSD are promising to protect sportsmans paradise and the commercial industry of fisheries, but if this project fails who will compensate the losers?

In regard to the losers of millions of state money from tourism and Louisiana seafood industry: they are not focused on the losers and the trillions of dollars in the State revenue. The environmentalists talk of compensating shrimpers by providing refrigeration and cages for oyster farmers.

Currently the state of Louisiana has 400,000 commercial private oyster farmers funding the growing of oysters off the states water-bottoms. Oysters need the right amount of brackish water. Without this environment, oysters will not survive in a freshwater environment. For those who think that just to relocating the oyster beds-this is not practical. How can one expect private oyster farmers like us to survive, who have put millions of private funds and years of blood, sweat and tears of building these oysters reefs?

Louisiana is unique in that most of the oysters that are produced come off private commercial oyster leases. Prestige Oysters purchases from over 40,000 acres of private commercial oyster leases that were purchased from previous oyster leased holders, held by Louisiana Corporations:

American Bay, Inc., Bay Antoine, Inc., Bay Blanc, Inc., Bayou Sabre, Inc., Johnnys Oyscers, Johnnys Oyscers No.2, Inc., Johnnys Oyscers No.3, Inc., Karankawa Bay, Inc., RH Trust Oysters, Inc., RH Trust Oysters No.2, Inc., Tambour Bay. Inc., The Diplomat, Inc., Lawson Bay, Inc., Bel Pass Bay, Inc., Bayou Dominique, Inc., Bay Gardane, Inc., Bay Crabe, Inc., and Aguste Bay, Inc. Together these companies hold 40,068 acres of private oyster beds.

These companies currently lease submerged land from the state of Louisiana and the corporations own expense has made major investments from 2012 until present. These companies have invested in planting over 182,600 tons of river rock, crushed concrete, limestone, and oyster shells. Oysters must have a mix of salt and freshwater to survive. The MBSD has made mention of oyster farmers converting to off bottom floating oyster cages. These companies did not make this huge investment of buying existing oyster leases for millions of dollars to convert into something thats not even in comparison. To try and replace oyster reefs from bottom fishing, is not our way of farming; this is not even a practical comparison of what the private oyster farmers have invested. One acre to completely rebuild is approximately \$250,000 dollars and still on bottom or on top of the water. The theory that the method of caged oyster farming will survive in a freshwater environment is false.

The biggest industry at risk in survival of the MBSD diversion is the Louisiana seafood industry. Louisiana landed the most shrimp and menhaden in the country, with the states 1.1 billion pounds of menhaden comprising more than half of the menhaden in the United States and generating \$94 million. Whats going to happen when all this freshwater diversion results in killing the Louisiana seafood industry?

Louisiana plays a vital role in the economic infrastructure of the USA. Ports carry 20 percent of waterborne commerce and provides 26 percent of the commercial fishery landings measured by weight and 18 percent of our nations oil. If this fails, our nations energy economic security would be devastated. Louisiana wetlands provide habitats for five million migratory waterfowl during the winter months. Other migratory birds depend on the natural habitats of wetlands, marsh islands, estuary crabs, white/brown shrimp, oysters, finfish species and oysters.

Louisiana is a valuable landscape to millions of citizens, making it a working coast for both sportsmen and the commercial fisheries industry. This master plan must be able to show that it will improve the reduction of economic losses from storm surge, provide sustainable coastlines for residential, public, industry and commercial fisheries.

I envision a coastal ecosystem, natural source of energy you can control and used to protect what is now living and stable in a brackish saltwater environment for habitats of commercial and recreational activities coastwide. The economy of seafood in Louisiana is a vital part of the states economy. It provides jobs, income, and tax revenue, but also generates innovations that protect our coastlines and help keep our waters pristine.

One out of every 70 jobs in Louisiana are related to the seafood industry, which as a whole, has an economic impact of over \$2.4 billion annually for Louisiana. Many of these jobs are in family-owned-operated companies that have worked for generations to bring the finest seafood to the tables of the world. Louisiana seafood is an American community and way of life.

The MBSD Master Plan is not focused on the seafood industry or the environmental aspect. The master planner used minor to major impact throughout the entire Executive Summary, but the truth of the matter is what will be lost for the state of Louisiana affecting the sportsmans paradise and commercial fisheries? Nearly one-third of all the seafood consumed in the United States is Louisiana seafood. For centuries, the seafood from Louisiana has been the second largest provider of seafood in the nation.

Highest risk will be the impact of the Seafood Industry:

#### SHRIMP

Shrimp accounts for 15,000 jobs and an annual impact of \$1.3 billion for Louisiana.

#### OYSTERS

Seventy percent of the oysters caught in the US are from the Gulf Coast.

Louisianas commercial oyster industry, which accounts for almost 4,000 jobs, has an economic impact of \$317 million annually.

#### CRABS

Crabs from Louisiana generate an annual economic impact of \$293 million and more than 3,000 jobs.

#### CRAWFISH

Louisiana has more than 1,000 crawfish farmers, plus more than 800 commercial fishermen who catch wild crawfish.

The 110 million pounds of crawfish harvested each year have an annual economic impact of \$120 million.

#### ALLIGATORS

313 wild and farmed alligators are harvested per year in Louisiana.

Alligator harvests have a total annual economic impact of \$104 million.

We now look upon our Federal government to make the right choices and stop another environmental catastrophic man-made event that will cause tremendous amounts of suffering to the wildlife. The world will never experience a more devastating event as to what is about

to happen. We can only pray that the USACE will take into careful consideration before the MBSD diversion permits are issued. The question is: can you risk the entire southern state of Louisiana by adding 75,000 cubic feet of freshwater for 28 square miles of what might not ever be developed?

Texas has learned a lot about freshwater during hurricanes: Harvey flooding from Corpus Christie all the way to Orange, Texas caused 240 billion gallons of rainwater to fall on Harris County and an abundance amount of fresh water traveled into the Gulf. Hurricane Harvey polluted coral reefs more than 100 miles offshore. Those are not reefs that we typically would think are in danger of being affected by floodwaters from the land, said Rice University researcher Adrienne Correa. It was a big surprise. About 80% percent of the coral is dying and the sponge we tested found human waste in them. The sponges, which act as natural water filters, had bacteria from human wastewater. That was when we made this jolting connection that floodwaters could make it out that far. Previously, research has been focused on the impact of floodwaters on ecosystems closer to shore. A study by the Galveston Bay Dolphin Research Program, for example, found that dolphins in upper Galveston Bay developed skin lesions after flooding from Hurricanes Harvey impacted water quality. Correa said given that climate change is increasing the intensity of storms, it worries her that polluted floodwaters can reach marine areas farther away than previously thought. There is the potential that we could have more flooding and more significant runoff events, leading to problems out on the reef, she said. This brings to question what is brought into the bays will not only kill off the environment of the state waters but add to the already ongoing problems the Gulf has with the DEAD ZONE.

NOAA has proposed: This technical note is intended to accompany the Community Model Template constructed under the Ecosystem Management and Restoration Research Program. That template includes a community model for the American oyster {Crassostrea Virinica} which can be used to quantify the ecological benefits of an oyster reef in an ecosystem restoration project. This technical note describes additional benefits to consider in planning a restoration project.

Oyster reef restoration has become an important component of coastal district projects at U.S. ARMY Corps of Engineers (USACE) Districts.

Reefs provide both ecological and economic benefits. Ecological benefits result from the water quality, erosion prevention and stabilization, and habitat services provided by reefs (Wilber 2002). Economic benefits result from economic services provided by oyster reefs, and are related to the harvest of oysters, fish and crab from the reefs or adjacent areas, increased recreational use from cleaner water, and cost-saving for bank stabilization and dredge material disposal. Local sponsor and stakeholders often express an interest in the economic value of oyster harvest, but other economic values should also be considered, along with the ecological benefits. The intent of this report is to provide information to Corps planners on the economic benefits provided by oyster reef restoration, so that the full range of benefits can be considered when planning and evaluating oyster restoration projects. Benefits may occur at the project site accrued within the watershed or beyond. It is the responsibility of the Corps to make an effort to account for all the ecological and economic benefits resulting from restoration efforts, monetary and non-monetary (U.S. Army Corps of Engineers 2000). The economic services reviewed in this paper and water quality, commercial harvest, recreation (fishing, swimming, boating), and erosion protection and bottom stabilization-provided by

oyster reefs. This information provides the basis for including monetary considerations in evaluating Corps oyster restoration projects. Source:

[https://www.researchgate.net/publication/228406621\\_Economic\\_values\\_associated\\_with\\_construction\\_of\\_oyster\\_reefs\\_by\\_the\\_Corps\\_of\\_Engineers](https://www.researchgate.net/publication/228406621_Economic_values_associated_with_construction_of_oyster_reefs_by_the_Corps_of_Engineers)

What is the main purpose of the Oyster Reef? Oyster reefs habitats forage fish, invertebrates, and other shellfish. They also provide a safe nursery for commercially valuable species including anchovies and blue crabs. What role can oyster reefs play in coastal land loss? Oyster reefs help limit wave to coastal development and marshes on most calm days. Therefore, having oyster reefs nearby can also protect and benefit marshes. Less waves hitting the marsh means less water submerging the marsh, resulting in less sediment being lost by erosion. Mass habitat colorful extinctions, diverse and highly visible ecosystems such as tropical rain forests and coral reefs come to mind. Approximately half of global shallow water coral reefs and forests have been lost in the last few hundred years. Deforestations are declining and some corals have shown resilience to stress from climate change. A far less visible ecosystem crisis occurred relatively recently beneath the oceans surface.

A study revealed that 85% of global oyster reefs have been lost during the last 150 years. Of those remain in g, over one-third are so depleted that they no longer function as ecosystems, particularly those in Europe, North America, and Australia. Only a few healthy oyster reefs remain in South America, and even these are not producing their prior abundance, making oyster reefs one of the most threatened habits on Earth. Oysters are "ecosystem engineers" like corals- they create three-dimensional structures as they entitle and grow on each other. Left undisturbed, these oyster reefs provide a habitat for an incredible biodiversity of organisms, serving as a food source, nursery ground sand refuge for many species, and boosting fish stocks. Oysters also have an incredible ability to clean saltwater. A single oyster can filter almost 200 liters of saltwater daily, eating the phytoplankton and organic matter suspended within it. Oysters improve water quality and clarity, preventing large scale algal blooms and the potential consequences of mass fish mortality and dead zones due to depleted oxygen.

Removing oyster reefs increases wave energy and erosion of salt marshes and the corresponding coastline. Just as tropical coral reefs protect mangroves forests, oyster reefs provide coastal protection for important temperature ecosystem such as seagrass and saltmarshes. As climate change and pollution destroy marine life, the need for vast oyster reefs has never been greater. Sadly, this vital habitat is at its nadir when we have almost no living memory of its natural state. Humans have been harvesting oysters since the Stone Age and cultivating them since Roman times. But oyster extraction reached fantastic proportions from the mid-1800s as mechanized fishing replaced older fleets. Destructive fishing that exceeds reproduction rates and removes habitat is the main cause of this ecosystem's demise, but pollution, climate change, invasive species and shellfish diseases have further decimated remnant oyster stocks. It's clear that active intervention is needed to tum the tide for oysters.

USACE needs to bring together the environmentalists of MBSD to take in the awareness of a forgotten ecosystem. Future spatial analysis of most suitable areas for oyster reef creation and restoration should include additional data, not investigated in this MBSD study, such as temperatures, bottom conditions, water mixing, and diversion modeling.

MBSD is calling for 75,000 cubic feet per second to be diverted for the magnitude of flood events in the Mississippi basin. These floods by combining of river engineering and climate change. Throughout the basin 40 to 90 percent of the land has developed and almost every river has been dammed, leveled, and/or constricted, including Upper Mississippi itself.

Almost the entire Upper Mississippi River watershed has also been developed to enhance agricultural productivity including extensive use of a drainage system used to load water off landscapes as quickly as possible. This development exacerbates flood damages by preventing the landscape from naturally retaining and slowing the release of rainfall and impacts the river's ability to filter pollution, such as nitrogen and phosphorus. Poor water quality can seriously harm drain water supplies, and can make fishing, swimming, and boating dangerous. Urbanized areas, including those located behind levees, are at particular risk. These risks often fall disproportionately on low-income communities due to ongoing institutional injustices, like redlining. Even today, the most effective flood risk reduction solutions, like home buyouts, are not offered to communities of low-income populations. Flood management decisions throughout the basin are piecemeal and soloed manner. Individuals, cities, counties, drainage districts and states all act in near isolation to protect themselves during flood events, with little to no regard for the possible impacts on their neighbors.

More than 12.7 million pounds of toxic chemical such as nitrates, arsenic, benzene, and mercury were dumped into the Mississippi River in 2010, according to a report released recently by the advocacy group Environment Missouri. It's extremely dangerous to swim in the Mississippi River, the river huge and the currents are strong, even right at the waters' edge. The water is totally toxic and it's a massive, boba ride toxic cesspool. The Mississippi River, maybe the nation's best-known waterway, but also happens to be one of the filthiest. Thanks to the obscene amount of pollution that gets dumped into it, according to scientists at the University of California-Santa Barbara who performed the first integrated farms that flow down the Mississippi River to the Gulf of Mexico. It is responsible for the most tainted coastal ecosystem in the world and most polluted river in the country. Every summer, nutrients from Mississippi pour into the Gulf algae blooms that starve the water of oxygen and kill sea life. Over 125 million pounds of toxics were released into waterways' tributary to the Mississippi in 2010- more than half the total released in the entire United States. Since one gallon of oil weighs about 7 pounds by the way of comparison, the solitary oil spill lost 217,000 pounds of oil into the Mississippi. In other words, every year we dump approximately 576 times more toxic pollution into the Mississippi, and nobody cares. That is a truly colossal amount of pollution, much of it more toxic than oil. A lot of it is fertilizer runoff from hundreds of miles of adjacent farmland the river traverses and yes, it's the nitrate-rich stuff causing the giant dead zone in the Gulf of Mexico. The Mississippi is pretty much a nonstop flowing pollute-a thon every day of the year.

In other words, the MBSD will bring 75,000 cube feet of the most deadly waters that will tum southern Louisiana into a "Dead Zone." Since the 1800s, Louisiana has had a thriving commercial seafood industry in which the catching and selling of crabs, shrimp, oysters both freshwater and saltwater finfish, alligator and crawfish has supported the livelihood of many families and communities. Louisiana seafood products are enjoyed worldwide by the nation's second-largest seafood provider to restaurants and homes across the country. For the dedicated fishermen who work in Louisiana waters, seeking out their catch is a craft that's been generating in the making. It is estimated that by the year 2050 the world population will

reach 10 billion, and seafood, especially cultured shellfish, will play a major role in feeding these populations. Shellfish are a very popular and nutritious food source worldwide and their consumption continues to rise globally. Because of their unique nature as compared with beef and poultry, shellfish have their own distinct aspects of harvest, processing, and handling. Guaranteeing shellfish quality and safety is critical for protecting public health as well as for marketing seafood products. The shellfish industry's goal is to maintain and improve shellfish safety and eating quality. Unfortunately, we will not have made it to this prediction of the years 2050 when the world population will reach 10 billion.

MBSD will wipe out the southern state of Louisiana and will have sunk all money allocated by environmentalists who did not care enough to think the process through. This will be the world's largest death kill to the seafood industry. Environmental pollution and the water will be so full contamination that you will not be able to live among the southern state of Louisiana as it will be the lost city beneath the earth. Prayers that this is held up and USACE will put forth heavy discussions before someone just starts punching holes in the Federal levee.

My hopes and prayers are that this solves the problem and stop southern Louisiana from sinking.

---

**Concern ID: 61812**

**Commenters expressed concern that the proposed Project would have adverse water quality impacts in the Barataria Basin due to the introduction of nitrate and phosphate from the Mississippi River. Several commenters questioned whether the proposed Project would create harmful algal blooms and hypoxia in the Barataria Basin similar to the hypoxic “dead zone” in the Gulf of Mexico that exists due to nutrients in Mississippi River waters. One commenter expressed concern that the EIS does not adequately assess the potential for the proposed Project to create algal blooms and hypoxia in the basin, other than acknowledging it.**

**Response ID: 16425**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA's Mississippi River/Gulf of Mexico Hypoxia Task Force "Hypoxia 101" webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone "water near the bottom of the

---

Gulf contains less than two parts per million of dissolved oxygen” (<https://www.epa.gov/ms-htf/northern-gulf-mexico-hypoxic-zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.>)

Dissolved oxygen concentrations associated with the Applicant’s Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model’s dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.5.2 Applicant’s Preferred Alternative in Surface Water and Sediment Quality of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section is included in Section 4.5.5.3 in Surface Water and Sediment Quality and has been added to Section 4.5.5.4.2 Applicant’s Preferred Alternative of the Final EIS. Finally, the EIS acknowledges the potential for major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) if warranted, in the Barataria Basin during Project operations to guide CPRA’s management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in

instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61852**

**The cost per acre of marsh creation by the diversion is far higher than a corresponding alternative of marsh creation through the use of dredged material. Marsh creation through a diversion takes 50 years unlike marsh creation through dredging. In addition, brackish/salt marshes (which would be created by dredging) are more resilient than freshwater marshes, and thus marsh created through dredging would be a more sound investment of restoration funding than a sediment diversion.**

**Response ID: 16617**

The timing of marsh benefits created by the proposed diversion was considered in the Draft EIS in Chapter 4, Section 4.6.5 Wetland Resources, Operational Impacts. In response to these comments, additional detail has been added regarding the resiliency of fresh marsh compared to brackish marsh in the Final EIS, Sections 4.6.5.1.2.3 Soil Shear Strength and 4.6.5.1.2.4 Land Accretion. Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

While the commenters suggest that marsh creation through dredging would cost less than the proposed Project, the LA TIG does not believe that comparing the costs of a sediment diversion to marsh creation projects using dredged material is relevant for several reasons. Most importantly, as explained in the LA TIG's Restoration Plan, the goal of the Project is to create a long-term sustainable ecosystem through the reestablishment of deltaic process. Marsh creation through the use of dredged material would not bring fresh water or nutrients to the basin on an ongoing basis. The benefits of marsh created with dredged material would diminish over time without maintenance in the form of additional pumping events due to subsidence and sea-level rise; thus, the temporal nature of Project benefits in the absence of periodic maintenance would also be very different. The costs and benefits of the Project were

---

fully considered by the LA TIG and are discussed in the Draft Restoration Plan in Section 3.2.1.2 Cost to Carry Out the Alternative.

---

**Concern ID: 61859**

**Commenter inquired as to what role the USACE would have in the proposed MBSD Project.**

**Response ID: 15885**

USACE is currently conducting NEPA and other evaluations of the proposed Project for its permitting decisions under the CWA Section 404 and Rivers and Harbors Act (RHA) of 1899 Sections 10 and 14 (33 USC Section 408). USACE is neither a proponent nor an opponent of the proposed Project. If USACE permits the Project, the LA TIG funds the Project and CPRA implements the Project, as a regulating agency, USACE would have continuing authority to ensure that CPRA complies with the conditions of its permit, including inspections as necessary. Because portions of the MBSD Project would alter, occupy, and replace portions of USACE flood risk reduction projects, specifically the Mississippi River Levee and the Plaquemines NOV-NFL Levee, for those portions of the proposed Project, USACE would have construction oversight responsibilities and USACE and CPRA would need to enter agreements governing their respective responsibilities.

---

**Concern ID: 61903**

**Divert some of the Mississippi River water off to other states and areas.**

**Response ID: 15996**

The proposed MBSD Project purpose and need is to reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin. The LA TIG identified the Barataria Basin in the SRP/EA #3 as the location for the proposed Project because within Louisiana, the Barataria Basin suffered the most severe and persistent oiling from the DWH oil spill. This suggestion would not meet the purpose and need because it would not connect the Mississippi River to the Barataria Basin. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

---

**Concern ID: 61930**

**The proposed MBSD Project is an inequitable use of public funds because its negative impacts fall most directly on marginalized ethnic groups, including African American, Native American, Latin American, Asian American, Canary Islander American (Islenos), and Croatian American and unjustly places the burden on Louisiana's coastal fishers. Risks often fall disproportionately on low-income or minority communities due to ongoing institutional injustices. These low-income and minority communities, including homes, cultures, and livelihoods of Indigenous people and other people of color are often sacrificed for the benefit of the "greater good", particularly for the larger tax bases upstream of the proposed MBSD Project. For example, when the levee breached at Mardi Gras Pass, nothing was done to re-protect the mostly African American oyster farmers and fishers whose oyster farms in Breton Sound were destroyed by the fresh water from Mardi Gras Pass. But a levee breach anywhere else along the Mississippi River would be quickly rebuilt and the impacted people would be indemnified. Also, the most effective flood risk reduction solutions, like home buyouts, are not offered to low-income populations in areas south of New Orleans.**

---

**Both the Draft EIS and the LA TIG's Draft Restoration Plan would benefit from additional reflections on the natural and human history of the Project geography that resulted in such fundamental changes to the landscape and set us on the course of the land-loss crisis that Louisiana faces today. The EIS should describe historic, systemic inequities affecting communities with environmental justice concerns in the Project area to provide authentic and more complete context for the discussions.**

**Response ID: 16281**

The Draft EIS (including Section 4.15 Environmental Justice and Appendix H, Socioeconomics Technical Report at Chapter 2) included a discussion of communities with low-income and minority populations, including information about factors that have contributed to historic and systemic inequities in southeast Louisiana. As discussed in the EIS, the Project may have disproportionately high and adverse, long-term impacts on some low-income and minority populations in communities engaged in commercial and subsistence fishing and dependent on adversely impacted fisheries, as well as communities located near the immediate outfall area (within approximately 10 miles north and 20 miles south) and outside of federal levee protection. In addition, negligible to minor, adverse impacts related to increased risk of levee overtopping during certain 1 percent storm events south of the immediate outfall area may occur, which may impact the community of Ironton. Commenters also raised concerns about Mardi Gras Pass; however, the closure of Mardi Gras Pass is outside of the scope of the EIS.

CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

---

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61997**

**A commenter suggested that USACE consider looking at other options including diversions through more than one watershed.**

**Response ID: 16013**

The geographic scope of this EIS is the Barataria Basin and the Mississippi River birdfoot delta. The purpose and need for the proposed MBSD Project is specific to the Barataria Basin and a diversion outside of the basin would not meet that purpose and need. CPRA and the LA TIG targeted Barataria Basin for restoration because, in addition to the high rates of erosion occurring in the basin, wetlands in the Barataria Basin experienced some of the heaviest and most persistent oiling and associated response activities from the DWH oil spill. CPRA is currently seeking a DA permit for another large-scale sediment diversion in the Breton Sound Basin, the Mid-Breton Sediment Diversion (see Chapter 4, Section 4.25 Cumulative Impacts).

---

**Concern ID: 62030**

**Louisiana plays a vital role in the economic infrastructure of the USA. Ports carry 20 percent of waterborne commerce and provide 26 percent of the commercial fishery landings measured by weight and 18 percent of our nation's oil. If the proposed Project should fail, our nation's energy economic security would be devastated.**

**Response ID: 16226**

The EIS considers impacts on Public Services and Utilities in Chapter 4, Section 4.13 Socioeconomics. Chapter 3 also provides background information on the importance of regional mineral resources and fisheries. As described, most public services and utilities infrastructure are located inside flood protection, though a few facilities are not. Beneficial impacts on public service infrastructure and utilities are expected in areas distant from the diversion and to the north associated with decreases in storm hazards with the proposed Project as compared to the No Action Alternative. Additionally, the LA TIG finds that restoration of the coastal environment is intended to build resiliency, including security for infrastructure.

---

**Concern ID: 62034**

**Louisiana is a valuable landscape to millions of citizens, making it a working coast for both sportsmen and the commercial fisheries industry. This Coastal Master Plan must be able to show that it will improve the reduction of economic losses from storm surge, provide sustainable coastlines for residential, public, industry and commercial fisheries.**

**Response ID: 16228**

While the proposed MBSD Project is part of the Louisiana Master Plan, the focus of this EIS is the proposed Project and not the entire Master Plan. The purpose of the proposed MBSD Project is to reconnect the Barataria Basin and the Mississippi River through the delivery of sediment, fresh water and nutrients to support the long-term viability of existing

---

and planned coastal restoration efforts. This is necessary to help restore habitat and ecosystem services injured as a result of the DWH oil spill. CPRA is considering various coastal restoration strategies in its Coastal Master Plan.

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take

advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62077**

**The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.**

**Response ID: 16242**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS

---

acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as

conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62078**

**The proposed MBSD Project would cause the loss of Louisiana shrimp, oyster, crab and finfish production which would impact the seafood based supply chain of southern Louisiana, including corresponding impacts on restaurants in New Orleans and southern Louisiana.**

**Response ID: 16243**

The impacts raised by the commenters were considered in the Draft EIS. The EIS acknowledges in Chapter 3, Section 3.14.7 in Commercial Fisheries that the seafood industry represents a major source of jobs and income in Louisiana, which includes commercial harvesters, seafood processors and dealers, seafood wholesalers and distributors, and retail sales. Chapter 4, Section 4.14 Commercial Fisheries discusses regional economic impacts and community impacts on the shrimp, oyster, crab, and finfish fisheries, noting that communities with a high reliance on these landings may be most heavily impacted, and that indirect effects may include impacts to fish license holders, crew, dealers, suppliers, and seafood processors. While availability of shrimp and oysters from the basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's Preferred Alternative than under the No Action Alternative. This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)

- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62079**

**Commenters are concerned that impacts similar to those caused by the fresh water from Bonnet Carré Spillway openings would affect fisheries in the Barataria Basin with the proposed MBSD Project.**

**Response ID: 16244**

---

The Project area for the MBSD EIS includes the Barataria Basin and the Mississippi River birdfoot delta. Existing operations and influences of rivers and diversions, including but not limited to the Bonnet Carré Spillway, were incorporated into the baseline conditions of the No Action Alternative and action alternatives assessed in the Draft EIS, Chapter 4 Environmental Consequences, Sections 4.2 through 4.24. Reasonably foreseeable future (but not existing) diversions, such as the Mid-Breton Diversion, were analyzed for impacts in combination with existing diversions and the proposed MBSD diversion in Chapter 4, Section 4.25 Cumulative Impacts.

A summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and to discuss their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS. Note that the Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological purposes.

---

**Concern ID: 62103**

**The Draft EIS does not fully address the anticipated destruction of multiple components of the commercial oyster fishery, including oyster habitat, off-bottom oyster farms, and the oyster hatchery at Grand Isle resulting from impacts to water quality and changes in salinity.**

**Response ID: 16258**

Impacts of the proposed Project on eastern oysters are discussed in the Aquatic Resources section of the EIS in Chapter 4, Section 4.10.4.5, Key Species. The section identifies that most adverse impacts on oysters are anticipated at mid-basin locations, while some beneficial impacts may occur in the lower basin, including the Grand Isle area. The off-bottom and hatchery components of the oyster fishery would not be affected by the Project, or may benefit from it. Specifically, the only significant off-bottom oyster fisheries in Barataria Basin occurs in the lower basin. As indicated in Chapter 3, Section 3.14.6, Aquaculture, the Mike Voisin Oyster Hatchery in Grand Isle is the only commercially available source of oyster larvae and seed. These areas could benefit from the Project. Final EIS Chapter 4, Section 4.14 Commercial Fishing has been revised to discuss these effects.

CPRA's Mitigation and Stewardship Plan includes measures to increase funding for the development of broodstock reefs, enhancing public and private oyster areas, creating a new public oyster seed ground and to further develop alternative oyster culture methods, including off-bottom oyster culture. See the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required

---

by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62166**

**New developments, oil/gas explorations, housing construction, sewage treatment, and water usage are playing a huge role in subsidence in south Louisiana.**

**Response ID: 16184**

The commenter's concerns related to ongoing regional subsidence and factors that have played a role in subsidence were considered in the Draft EIS. To further recognize these concerns, an additional background description of regional subsidence has been added to Chapter 3, Section 3.4.1.1 Relative Sea-level and Subsidence of the Final EIS.

---

**Concern ID: 62168**

**The commenter questioned how the new sediment would sustain itself from sinking when more freshwater is added from the proposed diversion given that land subsidence is well documented with impacts ranging from changing drainage patterns and increasing flooding, to the destruction of critical infrastructure.**

**Response ID: 16185**

The commenter's concerns related to ongoing land subsidence were considered in the Draft EIS. Sea-level rise and subsidence were explicitly accounted for in the Delft3D Basinwide Model over a 50-year analysis period, as described in the Draft EIS Appendix E Delft3D Modeling, Sections 3.2.4 and 3.2.3, respectively. Chapter 4, Section 4.2 Geology and Soils explains how long land-building benefits of the proposed Project would endure during that 50-year period against the background of ongoing subsidence. Section 4.6 Wetland Resources and Waters of the U.S. discusses how sediment transported by the proposed diversion to the basin would not only create new wetlands, but also sustain existing and newly created wetlands. To further recognize concerns related to land subsidence, additional background description of regional subsidence has been added to Chapter 3, Section 3.4.1.1 Relative Sea-level and Subsidence of the Final EIS. To further clarify, a discussion has also been added to explain in more detail currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

---

**Concern ID: 62169**

**The EIS should discuss how much sediment (not sand sediment, but hard core clay and other core river bottom rocky soil) would be brought to the basin through the proposed MBSD Project diversion. The discussion should include a comparison of that with the amount of sediment needed to rebuild or replace 28 square miles of marsh islands and wetlands.**

**Response ID: 16186**

The commenter's concerns related to the composition and size distribution of sediments projected to be transported by the diversion were considered in the Draft EIS; therefore, no related edits have been made to the Final EIS. Creating and sustaining marshes requires the full range of sediment sizes from sand to fine sediment, and the proposed Project would transfer both sand and fine sediment into the basin from the river via the diversion channel. The EIS describes the anticipated size distribution of sediments projected to be transported into and retained in the Project outfall area in the Barataria Basin under the Applicant's Preferred Alternative in Chapter 4, Section 4.2.3.2 Operational Impacts in Geology and Soils. Chapter 3, Section 3.2 Geology and Soils describes existing sediment size distributions in the Barataria Basin, including both sand and fine-sediment components.

---

**Concern ID: 62171**

**The commenter questioned whether water bottoms in the Barataria Basin would be damaged or submerged due to the river water entering the basin from the diversion. The commenter further questioned whether CPRA conducted very hardcore samples of the state water bottoms (in lieu of requiring examination of the bottoms with sonar).**

**Response ID: 16405**

The issues raised by the commenter were considered in the Draft EIS. Geotechnical borings were undertaken for the proposed Project throughout the Mid-Barataria Basin in 2015. Results of the geotechnical surveys were used by the Water Institute to develop the Delft3D Basinwide Model, which was used to assess proposed Project impacts on water bottoms in the Barataria Basin. The geotechnical survey reports were reviewed to characterize the geology and soils in the Project area in Chapter 3, Section 3.2 Geology and Soils. As described in the Bed Elevations section in Chapter 4, Section 4.4.4.2 in Surface Water and Coastal Processes, Operational Impacts, scour potential exists in the immediate outfall area as the diverted flow enters the marsh. However, as this section describes, CPRA engineered an outfall transition feature that would reduce the depth of the potential scour hole in the outfall area to no more than approximately 10 feet below the existing marsh bottom. Also described in Section 4.4.4.2, the proposed Project would have permanent, major (measurable and widespread) beneficial impacts on land building through raised bed (water bottom) elevations in the Barataria Basin, with the largest increases occurring within 10 miles of the diversion structure outlet (see Figure 4.4-3 and Table 4.4-3). No related edits have been made to the Final EIS.

---

**Concern ID: 62196**

**Commenter asked whether the Federal Government would enforce harder restrictions on harmful nutrients since the Project would remove part of a Federal levee.**

**Response ID: 15743**

---

USACE regulates the discharge of dredged or fill material into waters of the United States under Section 404 of the Clean Water Act (CWA) and USACE is evaluating whether to grant a CWA Section 404 permit for the proposed Project. As part of its Section 404 permitting process, USACE evaluates whether the proposed discharge meets the USEPA's CWA Section 404(b)(1) Guidelines. Under the Guidelines, no discharge of dredged or fill material may be permitted if (among other things) the nation's waters would be significantly degraded. In its 404(b)(1) analysis, USACE evaluates a proposed discharge's effects on several components of water quality, including physical, chemical and biological characteristics. The CWA Section 404(b)(1) evaluation is not related to the proposed removal of a portion of the Mississippi River Levee and USACE's evaluation will comply with applicable laws and guidance. In addition, the Project is subject to applicable water quality standards through the CWA Section 401 water quality certification, which is administered by the LDEQ.

USACE and the LA TIG are not aware of current laws or regulations that would require harder water quality restrictions or requirements for the proposed Project due to its removal of a section of river levee to divert flow from the river into an adjoining basin. The EIS evaluates the impacts of diversion of Mississippi River water on water quality in the Barataria Basin, (see Chapter 4, Section 4.5.5 in Surface Water and Sediment Quality).

CPRA's Monitoring and Adaptive Management (MAM) Plan for the proposed Project includes water quality monitoring for nutrients and other water quality parameters. This monitoring data would inform future Project management decisions aimed at improving Project effectiveness and/or limiting ecological and/or human impacts when possible. Details regarding the MAM Plan are found in Section 4.27 Mitigation Summary of the Final EIS, and Appendix R2 (Monitoring and Adaptive Management Plan).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62261**

**The commenter expressed concern that excessive nutrients in fresh water diverted to the basin during proposed diversion operations could runoff into the Gulf during flooding events and storms. The commenter reported that this occurred in Texas during Hurricane Harvey, when storm-induced flooding inland caused polluted fresh water to travel to coral reefs more than 100 miles offshore in the Gulf. The commenter expressed concern that excess nutrients brought into the Barataria Basin from the Mississippi River via the diversion could add to the already ongoing problems of the hypoxic zone in the Gulf due to runoff events during flooding and storm events, which are becoming more frequent and intense because of climate change.**

**Response ID: 16437**

The issues raised by the commenters were considered in the Draft EIS. As discussed in Chapter 4, Section 4.5.5.5 in Surface Water and Sediment Quality, the proposed Project is not projected to cause monthly dissolved oxygen concentrations to fall below the water quality criterion of 5 mg/L during the 50-year analysis period throughout the Barataria Basin. In fact, dissolved oxygen concentrations associated with the Applicant's Preferred Alternative are projected to generally increase during the analysis period compared to projections for the No Action Alternative modeled by the Delft3D Basinwide Model. The Delft3D Basinwide Model accounts for the influence of algal growth on nutrient and dissolved oxygen concentrations. The Delft3D Basinwide Model results do not suggest that a significant hypoxic zone would form in the Barataria Basin due to proposed Project implementation. Language to this effect has been added to Section 4.5.5.5.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS.

As explained in Section 4.25.5.2 in Cumulative Impacts, Surface Water and Sediment Quality, the combined impact of several Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

---

**Concern ID: 62282**

**Diversion impacts, including land loss in the birdfoot delta, would make lower Plaquemines more vulnerable to storms.**

**Response ID: 15805**

Draft EIS Chapter 4, Section 4.6.5 in Wetlands and Waters of the U.S. described the projected acceleration of wetland loss in the birdfoot delta caused by the proposed Project and Section 4.20.4.2 in Public Health and Safety acknowledged lower Plaquemines' increased vulnerability to storm hazards that would result from operation of the proposed Project. While the Draft EIS acknowledged the role that land loss plays in increased storm hazards, it did not explicitly acknowledge the role this accelerated land loss in the birdfoot delta could play in increased storm hazards. Section 4.20.4.2.2.2 in Public Health and Safety has been edited in the Final EIS to include acknowledgement that this accelerated loss

---

of wetlands in the birdfoot could increase storm hazard vulnerability depending on the storm path and intensity.

In the LA TIG's Draft Restoration Plan, the LA TIG recognized the potential collateral injuries associated with the Project, including potential land loss in the birdfoot delta. In selecting the Applicant's Preferred Alternative, the LA TIG evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide what it believed to be the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7, 3.2.1.5, and 3.2.2.5 of the Final Restoration Plan for more information about the LA TIG's selection of the Applicant's Preferred Alternative.

---

**Concern ID: 62298**

**Flood management decisions throughout the basin are piecemeal by varied agencies.**

**Response ID: 15811**

Draft EIS Section 3.20 Public Health and Safety acknowledged the varied entities responsible for federal and non-federal storm and flood risk reduction infrastructure, as well as state and local government roles in emergency response and evacuations, and local land use decisions (such as zoning) that affect flooding risks faced by homeowners and businesses.

---

**Concern ID: 62414**

**The government can prevent widespread economic or environmental losses by imposing higher restrictions on state and federal permits issued to companies asking for permission for dredging of canals, diverting construction projects, or the oil/gas expedition drilling within the state and federal waters. With all the new restrictions, nothing stopped the biggest man-made disastrous oil spill from the BP explosion on April 20, 2010.**

**Response ID: 15860**

Comment noted, but is outside the scope of this EIS. This EIS is focused on evaluating and disclosing the potential environmental impacts associated with the proposed Mid-Barataria Sediment Diversion Project.

---

**Concern ID: 62430**

**Almost the entire Upper Mississippi River watershed has also been developed to enhance agricultural productivity including extensive use of a drainage system used to load water off landscapes as quickly as possible. This development exacerbates flood damages by preventing the landscape from naturally retaining and slowing the release of rainfall and impacts the river's ability to filter pollution, such as nitrogen and phosphorus.**

**Response ID: 15863**

Comment noted, but is outside the scope of this EIS. The scope of this EIS is limited to areas in which the Project is expected to have more than negligible effects on the environment, particularly the Barataria Basin and the Mississippi River birdfoot delta in Louisiana.

---

**Concern ID: 62544**

---

**The commenter expressed concern that adding more volume of fresh water from the Mississippi River into the Barataria Basin would not stop south Louisiana from sinking. Marsh islands, sand dunes, and estuaries provide protection of the shoreline from erosion, but even they would not stop south Louisiana from sinking. The commenter questioned how to solve this problem of subsidence as sea levels continue to rise in the Gulf.**

**Response ID: 16408**

The commenter's concerns related to ongoing regional subsidence were considered in the Draft EIS in Chapter 3, Section 3.2 Geology and Soils. To clarify, an additional background description of regional subsidence has been added to Chapter 3, Section 3.4.1.1 Relative Sea-level and Subsidence of the Final EIS. While subsidence would continue during Project operations, the Project would help offset some of its impacts. Sea-level rise and subsidence were explicitly accounted for in the Delft3D Basinwide Model over a 50-year analysis period, as described in the Draft EIS Appendix E Delft3D Modeling, Sections 3.2.4 and 3.2.3, respectively. Chapter 4, Section 4.2 Geology and Soils explains and illustrates in detail how long land-building benefits of the proposed Project would endure during that 50-year period against a background of ongoing sea-level rise and subsidence.

---

**Concern ID: 62660**

**Commenters stated that the proposed Project will not provide the benefits described in the Draft Restoration Plan and EIS. The proposed Project will not stop the problems of sea-level rise and marsh erosion.**

**Response ID: 16633**

How sea-level rise and marsh erosion would affect the proposed diversion's land-building capability has been considered in the Draft EIS in Chapter 4, Section 4.2.3.2 Operational Impacts in Geology and Soils. In addition, sea-level rise and subsidence are explicitly accounted for in the Delft3D Basinwide Model projection of Project impacts, as described in Sections 3.2.4 and 3.2.3, respectively, of EIS Appendix E (Delft3D Modeling).

The potential benefits of the Project and how those benefits relate to sea-level rise and marsh erosion have also been considered in the LA TIG's Draft Restoration Plan. The LA TIG agrees that the Project would not stop sea-level rise, subsidence or other erosive forces that result in marsh erosion. However, the Project is designed to counteract these forces by transporting sediment from the Mississippi River to create thousands of acres of marsh that would be sustained over decades, even in the face of erosion and rising sea levels (see Section 3.2.1.6 [Benefits Multiple Resources] in the Restoration Plan).

---

**Concern ID: 62661**

**The Mississippi River is currently not capable of building land as it used to, in part because it does not carry as much sediment as it used to, and thus the proposed Project will fail. If it were capable of building land, there would be a large land mass at its current outlet.**

**Response ID: 16634**

The capability of the Mississippi River to support land building has been considered in the Draft EIS. For example, Chapter 3, Section 3.4.2.5 Sediment Transport discusses the available sediment in the Mississippi River, noting that studies had shown downward trends in

---

sediment supply in the river through the 1990s, but that since then the volume of sediment (coarse and fine) in the water column has remained fairly constant. The river still carries a massive sediment load, but not as massive as before. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes as described in the EIS in Chapter 3, Section 3.4.2.5 Sediment Transport. The EIS takes this diminished sediment load into account when computing the sediment load that would be delivered to the Barataria Basin via the proposed diversion. This is described in detail in Section 5.2.2 (River Discharge and Sediment Rating Curve) of Appendix E (Delft3D Modeling) to the EIS.

The LA TIG acknowledges the comment and understands the commenters' concern, and this was considered in the LA TIG's Draft Restoration Plan. The Mississippi River does carry a large plume of sediment into the Gulf of Mexico each year. A large delta exists at the mouth of the river, often requiring dredging to maintain navigation. Crevasses have been used to supplement land building in the birdfoot delta, confirming the ability of the river to build and maintain land. The size of the delta is limited by a number of factors, including the depth of the water at the mouth of the Mississippi River and the constant erosive forces affecting the Gulf of Mexico. By comparison, the Project is proposed to be constructed at RM 60.7 of the Mississippi River because this location is capable of capturing and retaining the sediments transported into the Barataria Basin by the Project (see EIS Chapter 2, Section 2.4.1.3 Application of Additional considerations to Potential Alternative Locations in Upper, Middle, or Lower Barataria Basin). As noted above, these issues and analyses are included in the EIS, and are also considered by the LA TIG in its identification of its Preferred Alternative in the Restoration Plan.

---

**Concern ID: 62671**

**The Project benefits may last only a few decades.**

**Response ID: 16629**

The potential duration of Project benefits was considered in the Draft EIS. For example, the Project's long-term influence on land building and wetland creation are modeled extensively and the impacts (beneficial and adverse) are described in Sections 4.2 (Geology and Soils), 4.4 (Surface Water and Coastal Processes) and 4.6 (Wetland Resources and Waters of the U.S.) of the EIS.

The potential duration of Project benefits has also been considered in the LA TIG's Draft Restoration Plan. For example, as described in 2.3 (Screening for a Reasonable Range of Alternatives) of the Restoration Plan, the LA TIG determined that a sediment diversion is the best way to achieve a self-sustaining marsh ecosystem in the Barataria Basin. Compared to other restoration methods (for example, marsh creation through the placement of dredged material), sediment diversions offer the greatest long-term sustainability. The Project would reconnect and reestablish sustainable deltaic processes and support the long-term viability of existing and planned coastal restoration efforts.

---

**Concern ID: 62689**

**Commenters noted the breadth of the injury from the fresh water released to help push back oil from the DWH spill on Louisiana's resources, including marsh islands, wetlands, crabs, white and brown shrimp, oysters and oyster reefs, dolphins, finfish and many species of birds.**

**Response ID: 16504**

The impacts of freshwater releases during the DWH response were considered in the Draft EIS. More specifically, Chapter 3, Section 3.14.3 (Oyster Fishery) and Section 3.10 (Aquatic Resources) of the EIS acknowledge the impact of the oil spill response on aquatic resources, including SAV, shrimp, oyster fisheries, and fish.

The LA TIG agrees with the commenters that the impacts of the DWH, including the oil spill and the response actions, were an ecosystem-level injury affecting multiple resources and species. This includes the impacts from the releases of fresh water from Caernarvon and Davis Pond to push oil out of estuaries to reduce oil impacts to these habitats and the species that reside in them. Unlike the proposed Project, however, the release of fresh water in response to approaching oil was not planned in a way that allowed for a functional transition to a restored ecosystem. The LA TIG's Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin, which would benefit multiple resources. Injured resources not addressed in this Restoration Plan have either been addressed by previous restoration plans or are intended to be the focus of future restoration plans issued by the LA TIG.

---

**Concern ID: 62708**

**The release of polluted river water into the Barataria Basin would create harmful algal blooms and/or large areas of low dissolved oxygen that could negatively affect aquatic fauna including mortality of adults and juveniles that may not be able to escape impacted areas.**

**Response ID: 16086**

As discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS, the input of nutrients from the Mississippi River is generally anticipated to be beneficial to the food web, although there is an acknowledged potential for harmful algal blooms. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and well-mixed by wind and tidal action, such that it is not typically prone to stratification that promotes hypoxic (dissolved oxygen of less than 2 to 3 mg/L) conditions. Further, as discussed in Section 4.10.4.4 in Aquatic Resources, the Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below 5 mg/L on an average monthly basis; therefore, although sporadic and limited areas of low dissolved oxygen may occur, mainly in the summer months, no large or prolonged periods/layers of low dissolved oxygen are projected by the Delft3D Basinwide Model, nor anticipated based on the Barataria Basin's identification as a largely well-mixed estuary. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to Project implementation has been added to Section 4.5.5.5.2 in Dissolved Oxygen of the Final EIS.

The Monitoring and Adaptive Management (MAM) Plan (Appendix R2), which has been updated for the Final EIS in response to public comments, includes CPRA's plan to implement a monitoring program for phytoplankton species composition, including harmful cyanobacterial/algal bloom species (and associated toxins) (see Sections 3.7.3.10 and 3.7.3.11 of Appendix R2 of the Final EIS).

---

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62709**

**The 2019 opening of the Bonnet Carré Spillway caused significant impacts to aquatic fauna from the release of river water, and resulted in a declared fisheries disaster of at least \$58 million.**

**Response ID: 16087**

A summary of select natural and man-made diversions in southeastern Louisiana, including the Bonnet Carré Spillway, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment, including area fisheries. This summary is available in Appendix U of the Final EIS. However, it is important to note that the Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological purposes. The anticipated impacts of the proposed Project on aquatic fauna from the release of river water is discussed in detail in Chapter 4, Section 4.10 Aquatic Resources.

---

**Concern ID: 62763**

**While there are positive effects of flood pulses associated with hurricanes that help flush the bays and estuaries of oyster diseases, massive freshets, such as those from high amounts of rain water (including tropical storms) or the proposed Project, can cause elevated levels of oyster mortality.**

**Response ID: 16141**

---

Consistent with the commenter's statements, there would be both positive and negative effects on oysters from the salinity changes projected to occur during operation of the proposed Project, with the overall impact of freshwater input on oysters anticipated to be major and adverse. The effects of altered salinities, including prolonged decreases in salinity, on oysters are further discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

---

**Concern ID: 62764**

**The diversion is intended to restore and rebuild marsh, but would affect the existing flora/fauna in the basin during operations, which the designers say could adapt and survive in the modified environment.**

**Response ID: 16142**

As described throughout Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS, operation of the proposed Project would affect the existing flora and fauna of the Barataria Basin in both beneficial and adverse ways, with the overall impacts to a given species being dependent on that species habitat preferences and tolerances.

---

**Concern ID: 62765**

**Without the oyster reefs, which would die in the fresh water, the commenter questioned how the ecosystem would be filtered.**

**Response ID: 16143**

As described in Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S. of the Draft EIS, wetlands improve water quality by removing organic and inorganic toxic materials, suspended sediments, and nutrients via plant uptake and sedimentation. Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. identifies a projected maximum wetland gain of 17,100 acres associated with the proposed Project at year 2060 before dropping to 12,700 acres at year 2070 in the Barataria Basin. The increase in wetlands, when compared to the No Action Alternative, would continue to filter the ecosystem. In addition, Section 4.10.4.2.2 in Benthic Resources of the Final EIS has been supplemented to describe the increase in freshwater filter feeders that would also work to partially offset the water filtration capacity lost due to the decrease in oyster abundance.

---

**Concern ID: 62766**

**A community model for oysters can be used to quantify the ecological benefits of an oyster reef in an ecosystem restoration project. This technical note describes additional benefits to consider during restoration planning: <https://erdc-library.erdc.dren.mil/jspui/bitstream/11681/4023/1/TN-EMRRP-ER-01.pdf>.**

**Response ID: 16144**

The benefits of oyster reefs are qualitatively discussed in Chapter 3, Section 3.10.5.2.11 Eastern Oysters. This section has been supplemented in the Final EIS with the identified reference to further clarify the benefits of oyster reefs. However, the stated intent of the referenced study is to provide information to planners on the economic benefits provided by oyster reef restoration, so that the full range of benefits can be considered when planning and evaluating oyster restoration projects. Restoration processes beyond assessment of the proposed delta restoration are outside the scope of this EIS.

---

**Concern ID: 62767**

**Reefs provide both ecological and economic benefits. Ecological benefits result from the water quality, erosion prevention and stabilization, and habitat services provided by reefs (Wilber 2002).**

**Response ID: 16145**

The benefits of oyster reefs are qualitatively discussed in Chapter 3, Section 3.10.5.2.11 Eastern Oysters; however, this section has been supplemented in the Final EIS with the identified reference (Wilber 2002) to further clarify the benefits of oyster reefs.

---

**Concern ID: 62768**

**USACE needs to conduct a spatial analysis of future suitable areas for oyster reef creation and restoration, which should include additional data, not investigated in this MBSD study, such as temperatures, bottom conditions, water mixing, and diversion modeling.**

**Response ID: 16146**

As discussed in Chapter 1, Section 1.6 Scope of the EIS, the EIS was developed to assess the environmental and socioeconomic impacts of the proposed Project. The Mitigation and Stewardship Plan (Appendix R1), which has been revised for the Final EIS in response to public comments, describes CPRA's mitigation and stewardship measures, including those measures proposed to partially offset some of the anticipated adverse impacts on oysters. Those mitigation and stewardship measures rely upon further sampling once the diversion begins operations (if permits are issued) to understand the most suitable locations for restoring oyster reef areas. Implementation of mitigation and stewardship measures would be led by CPRA. USACE would not participate in oyster mitigation measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

---

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

---

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62785**

---

**This type of freshwater and sediment diversion project is unproven and there are uncertainties with respect to what the diversion would do (that is, if it would work and, if so, to what extent).**

**Response ID: 16367**

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties have been incorporated into the EIS impact conclusions and were briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties.

Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or as predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the projected changes for the No Action Alternative.

In addition to the modeled data, Chapter 4 Environmental Consequences of the EIS includes additional analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in drafting the EIS. In response to public comments, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The LA TIG recognizes and acknowledges that a controlled sediment diversion of this scale has not been constructed in Louisiana previously. However, a sediment diversion at this location has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Chapter 3, Section 3.2.1.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan). The proposed Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management [MAM] Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or

---

adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62813**

**The waters of the Barataria Basin would be so full of contamination that no one would be able to live there.**

**Response ID: 16386**

As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality of the EIS, the Mississippi River water quality subsegment LA070301\_00 at the diversion intake structure location fully supports its designated uses. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. The LDEQ's water quality assessment indicates that regulated substances are not present in concentrations that would cause a water quality impairment at the Mississippi River location of the intake structure. Language has been added to Chapter 4, Section 4.5.5.11 Hazardous Spills in the Mississippi River in Surface Water and Sediment Quality of the Final EIS to clarify this.

---

**Concern ID: 62970**

**Commenters suggested that alternative off-bottom oyster culture is not a viable mitigation strategy for the oyster fishers who will be harmed by the diversion.**

**Response ID: 16536**

Off-bottom culture is not intended to fully offset impacts on oysters from the Project. Rather, CPRA would fund alternative culture techniques as one piece of a multi-pronged strategy for establishing a long-term, sustainable oyster fishery. This would allow for individual decisions with regard to strategies that are most effective in a particular area. See the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS

---

Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62983**

**There will be ongoing and continuing costs to maintain the structure. Will there be sufficient funds to maintain the Project into the future? Commenters questioned who would have responsibility for the Project's maintenance throughout its operation.**

**Response ID: 16621**

As the Project Implementing Trustee, CPRA would ensure that there is sufficient funding to operate and maintain the Project into the future. Roles and responsibilities regarding the Project are set forth in the EIS in Sections 2 and 3 of Appendix R2 Monitoring and Adaptive Management Plan. CPRA has primary responsibility for the operations, maintenance, and monitoring of the Project.

---

**Concern ID: 63027**

**Saltwater grasses and marsh would die when exposed to (or inundated by) fresh water, and would cease protecting the public.**

**Response ID: 16035**

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS acknowledges that the fresh water transported by the diversion may result in the loss of some wetlands in the immediate outfall area due to inundation during the initial period following commencement of operations; those impacts would be offset by later marsh building in the area. While saline and brackish species are associated with salinity ranges of greater than 18 ppt and between 18 and 5 ppt, respectively (see Chapter 3, Section 3.6.1.2 in Estuarine Wetlands of the EIS), brackish marsh can fluctuate from fresh to saline conditions depending on tidal movement, and species such as *Spartina alterniflora* are common in both salt and brackish marsh (Connor and Day 1987). Salt is a stressor affecting osmosis and cell structure. Plants occurring in saline and brackish marshes have developed adaptations to either exclude uptake or excrete salt; however even salt marsh species grow better at lower salinities (Mitsch and Gosselink 2000; Teal et al. 2012). Therefore, salt and brackish marsh

vegetation would not be subjected to direct mortality due to the lower salinity of transported water. Chapter 3, Section 3.6.2.1 of the EIS was revised to include additional information regarding the salinity tolerance of brackish and salt marsh vegetation.

**Concern ID: 63061**

**Identify the amount of water and sediment diverted during the 2019 Bonnet Carré Spillway opening and describe the creation/restoration of wetlands from those diverted sediments.**

**Response ID: 16067**

The Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological response. A summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes additional discussion on the Bonnet Carré Spillway, is available in Appendix U of the Final EIS.

---

**Concern ID: 63067**

**The majority of the bottlenose dolphin population of this area will be destroyed... not just killed but sentenced to a horrific death. Freshwater releases at Bonnet Carré Spillway in 2019 resulted in an unusual mortality event (UME), demonstrating the harm that freshwater releases can cause to dolphins. A study by the Galveston Bay Dolphin Research Program also found that dolphins in upper Galveston Bay developed skin lesions after flooding from Hurricane Harvey. Additional studies further support the harm that the diversion could cause by demonstrating negative impacts to dolphins from exposure to low-salinity conditions (Deming and Garrison, 2021; Duignan et al., 2020; McClain et al., 2020).**

Deming, A., and L. Garrison. 2021. 2019 Northern Gulf of Mexico bottlenose dolphin unusual mortality event. Marine Mammal Commission meeting/webinar on “Effects of Low Salinity Exposure on Bottlenose Dolphins,” 23 March 2021. Oral presentation. <https://www.mmc.gov/events-meetings-and-workshops/other-events/effects-of-low-salinity-exposure-on-bottlenose-dolphins-webinar/>

Duignan, P.J., N.S. Stephens, and K. Robb. 2020. Fresh water skin disease in dolphins: a case definition based on pathology and environmental factors in Australia. *Scientific Reports* 10:21979.

McClain, A.M., R. Daniels, F.M. Gomez, S.H. Ridgway, R. Takeshita, E.D. Jensen, and C.R. Smith. 2020. Physiological effects of low-salinity exposure on bottlenose dolphins (*Tursiops truncatus*). *Journal of Zoological and Botanical Gardens* 1:61-75.

**Response ID: 16590**

The Draft EIS included an analysis based on extensive literature and soon-to-be published data (now published) demonstrating the impacts of low-salinity conditions on dolphins. These data were considered as part of an Expert Elicitation (a garnering of expert opinions to determine or quantify an unknown) that resulted in dose-response curves (Booth et al. 2020) and summarized in Chapter 4, Section 4.11.3 (Marine Mammals - Overview of Impact Analysis Approach) of the EIS. While Deming and Garrison (2021) was presented after the release of the Draft EIS, the presentation was based on data that were fully considered in the

---

Draft EIS, including as part of the Expert Elicitation. Along with other relevant data (for example, BBES tagging studies), the analysis contained in the Draft EIS determined that there would be a significant, adverse, permanent impact on the BBES Stock. Further, the analysis in the Draft EIS concluded that if the 75,000 cfs Alternative were implemented, impacts would be immediate and only a remnant population would be likely to exist near the barrier islands after 50 years of operation.

After release of the Draft EIS, at the request of the Marine Mammal Commission, the National Marine Mammal Foundation and University of St. Andrews released a population impact projection based on the information presented in the Draft EIS (including annual survival rates from Garrison et al. 2020) coupled with an updated population model for BBES dolphins (Schwacke et al. 2022, Thomas et al. 2021). This new, additional analysis has been incorporated into the Final EIS in Chapter 4, Sections 4.11.5.2 Barataria Bay Estuarine Stock and supports the original determination in the Draft EIS of major, permanent, adverse impacts on the BBES dolphin population. The research presented in the McClain et al. (2020) study cited by commenters was considered in the Draft EIS [cited at the time as McClain et al. (in prep)]; the research presented by Duignan et al. (2020) is consistent with the established literature and does not change the conclusions of the Draft EIS, but this study has been incorporated in Chapter 4, Section 4.11.5.2.2.1 General Effects on Dolphin Health of the Final EIS. Similarly, the information included in the Deming and Garrison presentation was considered in the Draft EIS, is consistent with the conclusions of the Draft EIS, and the presentation has now been cited in Section 4.11.5.2.2.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include specific marine mammal response triggers that may affect Project operation mitigation efforts; see Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement.

Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63810**

**Commenters raised concerns about the consequences if the Project fails and who will pay to compensate those harmed by a failed project, including the tourism and seafood industries.**

**Response ID: 16653**

Each of the Alternatives analyzed in the EIS, except for the No Action Alternative, are expected to meet the purpose and need of the Project, and uncertainties in the quantum of impacts of the Project, both beneficial and adverse, are incorporated into the analyses included in Chapter 4, Environmental Consequences of the EIS. More specifically, salinity impacts of the Project are assessed using the Delft3D Basinwide Model, and this model's projections of future conditions include uncertainties. Uncertainties are incorporated into the EIS impact conclusions and are briefly summarized in the EIS in Chapter 4, Section 4.1.3.3 Model Limitations and Uncertainty, and in detail in Appendix E Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties. Uncertainties related to the Marine Mammals impact analysis are summarized in detail in Chapter 4, Section 4.11.3.1 Marine Mammals, General Caveats to Impact Analysis Approach.

The LA TIG expects the proposed Project to succeed for several reasons, which are discussed in Chapter 3, Section 3.2.1.4 (Likelihood of Success – Alternative 1) of the Restoration Plan.

With regard to fisheries impacts, the LA TIG notes that major, adverse impacts to shrimp and oyster fisheries are anticipated with or without the proposed Project. While the timing of those impacts may be somewhat accelerated with the proposed Project, major adverse impacts to shrimpers and oyster harvesters are likely regardless of whether the Project is constructed.

CPRA, as a member of the LA TIG, has chosen to focus its mitigation strategies and expenditures on establishing sustainable fisheries for oysters and shrimp rather than on compensating individual shrimpers or oyster harvesters for their particularized economic losses. The LA TIG believes that the provisions of its fishery mitigation plan, valued at

---

approximately \$54 million, along with other restoration actions being funded by the LA TIG, as well as other programs funded by the State through LDWF, would help to achieve that goal and address the impacts of the proposed Project.

CPRA's fishery mitigation plan can be found in the Mitigation and Stewardship Plan included as Appendix R1 to the EIS. Although not being implemented to mitigate the effects of the MBSD, examples of separately funded restoration/fishery improvement actions include: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, CPRA's allocation of \$2 million in adaptive management funding to support off-bottom oyster culture, the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery, and the LA TIG's allocation of \$38 million in recreational use funds to support subsistence and recreational fisheries.

Expected Project impacts on recreation and tourism are summarized in Table 4.16-5 (Summary of Potential Impacts on Recreation and Tourism from Each Alternative) of the EIS. The Mitigation and Stewardship Plan (Appendix R1 to the EIS) includes funding to increase access to recreational fishing sites.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63853**

---

**Louisiana wetlands provide habitat for 5 million migratory waterfowl during the winter months. Other migratory birds depend on the natural habitats of wetlands, marsh islands, estuary crabs, white/brown shrimp, finfish species, and oysters.**

**Response ID: 16203**

Chapter 3, Section 3.9.2.1 in Terrestrial Wildlife and Habitat of the Draft EIS identified the importance of area habitats and resources to migratory, and other, birds in the Barataria Basin. In addition, Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S. and 4.9 Terrestrial Wildlife and Habitat, discussed the benefits of the additional wetland creation that would be anticipated with the proposed Project, including the benefits of those wetlands on waterfowl. There would be both adverse and beneficial impacts on the food resources listed for migratory birds, including adverse impacts on brown shrimp, oysters, and some finfish, and beneficial impacts on blue crab, white shrimp, and certain finfish, as discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources.

In addition, the potential benefits of the proposed Project to multiple resources in the Gulf are described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan.

---

Michael McIver

Our surroundings need to be considered part of our responsibility, Alternative 5 provides this at best and 1 secondly. We should consider much more than economic, or social concerns, but also those values which will last till the end of time. Nature will only be integrated with human living through conscious effort to do so.

---

**Concern ID: 61871**

**Alternative 5, Variable Flow up to 150,000 cfs, should be chosen for implementation because it provides substantially greater benefits at the higher flow, with only marginally increased adverse effects, most of which could be mitigated by the same measures being proposed for the 75,000 cfs Applicant's Preferred Alternative.**

**Response ID: 15944**

CPRA submitted a joint Section 10/404 permit application and Section 408 permission request to USACE for the construction, operation, and maintenance of a 75,000 cfs sediment diversion (Applicant's Preferred Alternative). The EIS evaluates the Applicant's Preferred Alternative and five additional action alternatives as well as the No Action Alternative in order to inform USACE's permit and permission decisions and the LA TIG's NRDA decision in compliance with the statues, orders, and policies outlined in EIS Chapter 5 Consultation and Coordination.

In the Restoration Plan, the LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54, and made every effort to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. As noted in the LA TIG's Restoration Plan, while the 150,000 cfs Alternative was projected to provide greater ecological benefits than the LA TIG's Preferred Alternative, it was also expected to cause greater collateral injury and greater risks to public health and safety. See Chapter 3, Section 3.2.4 of the Final Restoration Plan for a discussion of how the LA TIG came to its decision. Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

The Mitigation and Stewardship Plan (Appendix R1 to the EIS) has been designed by CPRA to mitigate the projected impacts of the 75,000 cfs sediment diversion (Applicant's Preferred Alternative). Different or additional mitigation could be needed to address the projected impacts of the proposed Project if a large capacity diversion (150,000 cfs) were to be selected.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the

final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:40356**

Luke Butler

I would like to know if the water that sediment and water that will be running off will be cleared of the runoff fertilizer in the river. It would suck to do all of this and then completely over fertilize the plants in that area that are necessary to hold the sediment in place.

---

**Concern ID: 62867**

**The Final EIS should not be published unless there are commitments to monitor the following parameters at the diversion site or in Barataria Bay: Project operations, the flow and quality of the water flowing through the diversion, wetland type coverage over time, water surface elevation, water quality in the basin, salinity, contaminant concentrations in diverted sediments, fish and shellfish abundance, oyster reef parameters, benthic community composition and abundance, SAV coverage, finfish and oyster contaminant concentrations, and shellfish harvest restrictions. These same data should also be collected in two reference basins.**

**Response ID: 16676**

Basin-side monitoring of water surface elevation, water quality in the basin, salinity, fish and shellfish abundance, and benthic community composition and abundance to evaluate how the Project is meeting Project objectives were included in the Monitoring and Adaptive Management (MAM) Plan of the Draft EIS (Appendix R2 ). Riverside monitoring parameters include river discharge, suspended sediment concentrations, nutrient concentrations in water conveyed to the Barataria Basin, sedimentology of the Alliance South sand bar, and Mississippi River sediment load were also included in the MAM Plan of the Draft EIS. Additionally, in the Fish and Wildlife Coordination Act Report (CAR) section of Chapter 5 (Consultation and Coordination) of the Draft EIS, CPRA accepted USFWS' recommendation on pre- and post-construction periodic sampling of Contaminants of Concern in fish, shellfish, and wildlife from the outfall area and the Mississippi River (see Section 3.7.3.23 of the MAM Plan [Appendix R2 to the EIS]). Therefore, no changes were made in the Final EIS on these issues. The Louisiana Department of Health will continue to monitor shellfish harvest restrictions. Additionally, the majority of the parameters above are collected via the State's System Wide Assessment and Monitoring Program that will allow comparison of the Project variables within and among other estuarine basins across the Louisiana coast.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section

---

10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Matthew Roberts

Thank you for the opportunity to comment. As a resident of New Orleans, I suggest the adoption of Alternative 5, with Alternative 1, the Preferred Alternative, as a second choice. Alternative 5 provides for more land-building and would restore a larger area.

---

**Concern ID: 61871**

**Alternative 5, Variable Flow up to 150,000 cfs, should be chosen for implementation because it provides substantially greater benefits at the higher flow, with only marginally increased adverse effects, most of which could be mitigated by the same measures being proposed for the 75,000 cfs Applicant's Preferred Alternative.**

**Response ID: 15944**

CPRA submitted a joint Section 10/404 permit application and Section 408 permission request to USACE for the construction, operation, and maintenance of a 75,000 cfs sediment diversion (Applicant's Preferred Alternative). The EIS evaluates the Applicant's Preferred Alternative and five additional action alternatives as well as the No Action Alternative in order to inform USACE's permit and permission decisions and the LA TIG's NRDA decision in compliance with the statues, orders, and policies outlined in EIS Chapter 5 Consultation and Coordination.

In the Restoration Plan, the LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54, and made every effort to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. As noted in the LA TIG's Restoration Plan, while the 150,000 cfs Alternative was projected to provide greater ecological benefits than the LA TIG's Preferred Alternative, it was also expected to cause greater collateral injury and greater risks to public health and safety. See Chapter 3, Section 3.2.4 of the Final Restoration Plan for a discussion of how the LA TIG came to its decision. Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

The Mitigation and Stewardship Plan (Appendix R1 to the EIS) has been designed by CPRA to mitigate the projected impacts of the 75,000 cfs sediment diversion (Applicant's Preferred Alternative). Different or additional mitigation could be needed to address the projected impacts of the proposed Project if a large capacity diversion (150,000 cfs) were to be selected.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact

determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Harley Winer

The claims of benefits are greatly exaggerated and the potential harm is minimized. The land created could be large but it could also be eradicated by tropical storms. The Barataria Estuary, while continuing to erode is a very productive estuary and that productivity will be greatly diminished by this proposed project.

I am a retired Corps of Engineers engineer and was chief of the Coastal Engineering Section. My opinion is that the sediment delivery function of the Mississippi River needs to be separated from the navigation function of the Mississippi River (which is extremely important indeed) . I wrote a 2006 paper in which I proposed "A New Paradigm for Managing the Lower Mississippi River." I hope that you will read this paper give consideration to its arguments.

**Concern ID: 61831**

**The commenter questioned the level of certainty of land-loss estimates under the No Action Alternative over the 50-year period of analysis. Commenter further questioned how that level of certainty compares to the level of certainty of some of the adverse impacts that are projected to occur from the proposed Project.**

**Response ID: 16478**

It is correct that the Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties were incorporated into the Draft EIS impact conclusions and are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in (Model Limitations and Uncertainty), and in detail in Appendix E (Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties). Hurricanes were not modeled as part of the Delft3D Basinwide Model; they were, however, modeled as part of the ADCIRC modeling conducted for the Draft EIS, Chapter 4, Section 4.20 Public Health and Safety, Including Storm and Flooding Risk Reduction. The rationale for that omission and explanation of how it was accounted for are provided in Appendix E Delft3D Basinwide Modeling, Section 8.1. The land-change uncertainty bounds were not included in the summary in Section 4.1.3.3. In response to this comment, a summary of land-change uncertainty has been added to that section in the Final EIS. The USACE and LA TIG agree that the model uncertainties should be clearly stated in the EIS with respect to the Model's quantitative results. A footnote has been added to the Executive Summary and to Table 4.2-6 in Section 4.2 Geology and Soils of the Final EIS providing the uncertainty bounds for land-change projections. Uncertainties related to the Marine Mammals impact analysis are summarized in detail in Chapter 4, 4.11.3.1 (Marine Mammals, General Caveats to Impact Analysis Approach).

As part of developing the EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

**The commenter requested that the sediment delivery function of the Mississippi River be separated from the navigation function of the Mississippi River and requested that the USACE review the article:**

**Harley S. Winer, 2007. A New Paradigm for Managing the Lower Mississippi River, Coastal Engineering 2006, World Scientific Publishing Co., Inc. Hackensack, NJ. pp. 2000-2011.**

**Response ID: 16446**

The USACE has reviewed the Winer (2007) article and agrees that reengineering the Mississippi River's water and sediment delivery system to allow more land and marsh building in Atchafalaya Bay is an innovative concept. However, the proposed Project would not have more than negligible impacts on the Atchafalaya Bay, and the EIS analysis is centered on the Project area (where more than negligible impacts of the Project would occur), particularly on the Barataria Basin and the birdfoot delta, as described in Chapter 1, Purpose and Need of the EIS. Therefore, the recommendation in the article is outside the scope of the MBSD Project. No related edits have been made to the Final EIS.

James Marlowe

To whom it may concern.

My name is Jim Marlowe and I live at [REDACTED] Waveland MS.

I live 3 houses from the beach I have resided there for 35 years.

The MS Gulf Coast is a great place to raise kids. I raised all 3 here. They all learned how to fish here. They love it as much as me.

It has not been that long since they corps opened up the spillway. The coast has still not completely recovered from it. It stinks when you wake up every morning and look off your porch to see the poison river water kill everything. The impact on oysters, fish, and Dolphin was staggering. It was especially upsetting to see so many die. Worst was to see one swimming around another dead one while it is about to die too. Very Upsetting.

The proposed Breton Diversion will be like having the slipway all year long!

Why spend so much money for such small results for Louisiana land building? There are many other ways to do this that are environmentally friendly. If they build it it will devastate the MS Gulf Coast. My grad-kids will not be able to enjoy it and all of the property values will plummet. Why does MS not have a seat at the table or a voice in this as it will effect us the most. Even Louisiana LT Governor Billy Nungesser is opposed to the diversions in his 6/2/2021 letter.

Please do not destroy our coast. Y'all got plenty of money to do your land building in an environmentally safe way.

Thank you.

James E Marlowe

**Concern ID: 62367**

**The Mid-Breton Sediment Diversion would have devastating impacts to the Mississippi Gulf Coast, similar to the opening of the Bonnet Carré Spillway.**

**Response ID: 15898**

The focus of this EIS is the proposed Mid-Barataria Sediment Diversion. The impacts of the proposed Mid-Breton Sediment Diversion are considered in this EIS as part of the cumulative impacts analysis, which analyzes the incremental impacts of the proposed Project when added to other past, present, and reasonably foreseeable future actions (see Chapter 4, Section 4.25 Cumulative Impacts). However, there would be an opportunity for the public to provide comments on the proposed Mid-Breton Sediment Diversion at such time the USACE releases the Draft EIS for that proposed project.

The proposed Project is not anticipated to have measurable impacts on ecological resources within the State of Mississippi, including distributaries of the Mississippi River.

---

**Concern ID: 62786**

---

**Multiple commenters expressed concern with the impacts of diverted waters on the economy and natural environment of the State of Mississippi.**

**Response ID: 16368**

The proposed Project is not anticipated to have discernable effects on resources outside of the Project area, which is limited to Louisiana, and particularly the Barataria Basin and the Mississippi River birdfoot delta (as defined in Chapter 3, Section 3.1.1 in Introduction and the subsections entitled Area of Potential Effects for each resource heading in Chapter 4 Environmental Consequences). Because these resource-specific areas of potential effects were determined based on the anticipated limits of discernable impacts, negligible to no impacts on the natural or human environment are anticipated in the State of Mississippi from the construction and operation of the proposed MBSD Project.

Kristy Wallisch

The Mid-Barataria Sediment Diversion is a crucial component in restoring the Gulf Coast and in protecting both habitat and human life. Although homes and businesses will undoubtedly be adversely impacted by this project and the people involved should certainly be recognized and compensated, this is a case where the few will be required to sacrifice for the many and the present will be required to sacrifice for the future. Rejecting the diversion project will not mean that things will continue as they are at this moment; it will mean continued loss of coastal land, continued hardship for the people of Louisiana, and disaster down the road. We must act quickly and we must think big.

I urge the adoption of Alternative 5 since it will restore a larger area of land. If it is determined that Alternative 5 is not feasible, I urge the adoption of Alternative 1, the preferred alternative.

Thank you for requesting comments on this important issue.

Mllton Grishman

I'm concerned about the potential negative environmental effects this project will have on the waters of the Mississippi Sound. The natural salinity levels may be altered to an extent that dolphin and other species will be negatively impacted. I don't think enough study has been done on the long-term impacts of this project.

Thank you for considering my views.

---

**Concern ID: 63072****The EIS should include an analysis of the potential impacts of the proposed Project on bottlenose dolphins in the Mississippi Sound.****Response ID: 16595**

While Figure 3.11-1 of the Draft EIS showed the distribution of bottlenose dolphin stocks in southeast Louisiana, including the Mississippi Sound Stock, it was not meant to imply that all depicted stocks would be affected by the Project. The figure has been updated to clarify this point in the Final EIS. The Project would divert fresh water, sediment, and nutrients into the Barataria Basin on the western side of the Mississippi River. The Barataria Basin has no hydrological connection to Mississippi Sound, and the Mississippi Sound Stock does not extend into the Barataria Basin, or any other area that would be affected by the Project. Therefore, the Mississippi Sound Stock is not included in the analysis of the impacts of the Project.

Re: Mid-Barataria Sediment Diversion (MBSD) Draft Environmental Impact Statement - Restoration Systems, LLC Comments

Dear Sir/Madam:

I am writing on behalf of Restoration Systems, LLC, a leading environmental restoration and mitigation banking firm, to provide comments on the Mid-Barataria Sediment Division (the "MBSD") Draft Environmental Impact Statement ("DEIS"). We support the Coastal Protection & Restoration Authority of Louisiana's ("CPRA") efforts to restore habitat and ecosystem services impacted by the Deepwater Horizon oil spill by implementing a large-scale sediment diversion project in the Barataria Basin. However, the mitigation proposed by CPRA ("self-mitigation") is inconsistent with federal law and fails to consider and give priority to credits from mitigation banks.

For the reasons discussed below, we respectfully request that the U.S. Army Corps of Engineers (the "Corps") consider CPRA's mitigation plan and determine: (i) compensatory mitigation is required to offset the permanent, direct impacts to jurisdictional wetlands within the project's construction footprint; and (ii) these permanent, direct impacts to jurisdictional wetlands will be mitigated through the purchase of released in-kind and in-basin mitigation bank credits, which are available from Jesuit Bend Mitigation Bank. Any other decision by the Corps threatens the integrity of the compensatory mitigation policy that is vital to Louisiana's coast and people.

**BACKGROUND****A. Restoration Systems and Jesuit Bend Mitigation Bank**

Restoration Systems has more than ninety (90) mitigation banks and turn-key restoration sites in nine states, including Louisiana. Jesuit Bend Mitigation Bank, owned and operated by Restoration Systems, has available in-kind, in-basin credits. Jesuit Bend is located within the Barataria Basin near the proposed MBSD construction footprint, and currently has 89.85 acres/33.24 Average Annual Habitat Units ("AAHUs") of fresh-intermediate marsh credits available on the "RIBITS" Website. An additional 49.40 acres/18.28 AAHUs could be made available as early as 2023.

Jesuit Bend was constructed in 2015, where approximately 1.3 Million cubic yards of sediment was dredged from the Mississippi River, transported over five (5) miles, and deposited throughout an approximate 240-acre open water area. Vegetative plantings were also conducted along with the enhancement of an existing marsh and the protection of a high-

quality cypress swamp. The site is protected by a perpetual conservation servitude and to date, all success criteria have been met. If Jesuit Bend is successful – and threshold regulatory decisions do not undermine demand for properly conducted mitigation – Restoration Systems plans to expand the mitigation bank and explore additional opportunities to restore habitat and ecosystem services in coastal Louisiana.

**B. Mid-Barataria Sediment Diversion – Construction Impacts to Jurisdictional Wetlands and Proposed Compensatory Mitigation**

During the construction of the MBSD, jurisdictional wetlands in the construction footprint will be dredged or filled resulting in permanent loss of wetland function and area. DEIS, p. 4-211. These wetlands will not be restored following construction and will no longer provide ecosystem functions, including flood control, water quality improvement, and wildlife habitat. DEIS, p. 4-212. As a result, 182.9 acres of jurisdictional wetlands within the MBSD construction footprint and the functions they provide will be permanently lost as a result of the MBSD. *Id.*

It appears that CPRA is considering using some of the sediment dredged for construction of the MBSD for beneficial use placement and upland reuse (e.g., filling existing borrow pits). DEIS, App. R, p. 17. However, this dredged sediment would first be used for construction of the project components and only be used for beneficial reuse “if suitable” and “to the extent practicable.” DEIS, 4-973. CPRA acknowledges that “[b]ecause the amount of dredge material suitable for placement in the beneficial use sites is currently unknown, the benefits cannot be calculated or considered as a mitigation offset.” DEIS, p. 4-473.

CPRA takes the position that the MBSD is “self-mitigating” and no compensatory mitigation is required to offset the direct, permanent impacts to 182.9 acres of jurisdictional wetlands in the construction footprint. DEIS, p. 4-973.

**C. 1990 EPA-Corps Memorandum of Agreement**

In 1990, the Environmental Protection Agency (“EPA”) and the Corps entered into a Memorandum of Agreement to articulate the policy and procedures to be used in determining the type and level of mitigation necessary to demonstrate compliance with the Clean Water Act Section 404(b)(1) Guidelines (“the 1990 MOA”). The 1990 MOA restates the goal of achieving no overall net loss of values and functions to aquatic resources, and in particular wetlands, by striving to avoid adverse impacts and offset unavoidable impacts to existing aquatic resources. Appropriate and practicable mitigation is required. The 1990 MOA recognizes that the goal of no net loss may not be fully met “where the mitigation measures necessary to meet this goal are not feasible, not practicable, or would accomplish only inconsequential reductions in impacts.”

The 1990 MOA also reinforces the methods and sequence of evaluating Section 404 permit applications. The Corps will evaluate information about all aspects of a project, including potential compensatory mitigation, at the same time. The Corps will first make a determination that potential impacts have been avoided, to the maximum extent practicable, and remaining unavoidable impacts will be minimized and mitigated to the extent appropriate and practicable. The 1990 MOA recognizes that the Corps may deviate from this sequence under certain limited circumstances, including where “EPA and the Corps agree that the proposed discharge can reasonably be expected to result in environmental gain or insignificant environmental losses.”

#### D. The 2008 Final Rule

On April 10, 2008, the Corps and the Environmental Protection Agency (“EPA”) published a final rule for compensatory mitigation for losses of aquatic resources. 73 Fed. Reg. 19594 (Apr. 10, 2008) (the “2008 Final Rule”). The 2008 Final Rule was designed to create a uniform set of rules and create equal standards for all forms of compensatory mitigation. To reduce risk and uncertainty and help ensure that the required compensation is provided, the 2008 Final Rule established a preference hierarchy for mitigation replacing the on-site preference. Under the 2008 Final Rule, the preferred option is mitigation bank credits. Mitigation banks are the first priority because they involve the least risk and provide the opportunity to perform aggregate mitigation for damage done to aquatic resources in a watershed. Mitigation banks are also preferred because they decrease enforcement and monitoring costs and typically provide mitigation before the wetland impacts occur. The preference hierarchy established by the 2008 Final Rule is intended to ensure that a mitigation option is selected with the highest probability of delivering successful, high-quality mitigation among the available options.

Pursuant to the 2008 Final Rule, when evaluating compensatory mitigation options, District Engineers consider what would be environmentally preferable, taking into account the likelihood of ecological success and sustainability, the location of the compensation site relative to the impact site and their relative significance within the watershed, and the costs of the compensatory mitigation project. The District Engineers may only override the preference for mitigation banks in limited circumstances, and such decisions must be documented. The 2008 Final Rule allows District Engineers to override the preference hierarchy in situations where the reasons underlying the preference do not apply. For example, the preference may be overridden if an approved in-lieu fee program has released credits available or a permittee with a proven track record is proposing a compensatory mitigation project that will restore an outstanding resource based on rigorous scientific and technical analysis. In other words, District Engineers may override the preference for mitigation banks only if other compensatory mitigation options would involve less risk and uncertainty and provide greater ecological value to the watershed.

#### DISCUSSION

According to the 2008 Final Rule and for the reasons discussed below, “self-mitigation” is not an option, especially for the MBSD, and the Corps should require CPRA to purchase available in-kind and in-basin mitigation bank credits to offset the permanent, direct impacts to jurisdictional wetlands within the project’s construction footprint.

#### A. CPRA’s Proposed Mitigation Plan Fails to Comply with Federal Law and Policies.

Compensatory mitigation is a critical tool in helping the federal government to meet the longstanding national goal of “no net loss” of wetland acreage and function. The standards and requirements set forth in the 2008 Final Rule are not discretionary – they are mandatory: All compensatory mitigation projects must comply with the standards in this part, if they are to be used to provide compensatory mitigation for activities authorized by DA permits, regardless of whether they are sited on public or private lands and whether the sponsor is a governmental or private entity.

73 Fed. Reg. at 19673 (quoting 33 C.F.R. § 332.3(a)(3)).

1. The MBSD will result in a net loss of aquatic functions, and the timing and uncertainty of any environmental benefits as a result of the proposed discharge cannot justify deviating from the requirement that unavoidable impacts will be mitigated to the extent appropriate and practicable.

As discussed above, it is known and undisputed that: (i) during construction of the MBSD, jurisdictional wetlands will be dredged and filled; (ii) this will result in a permanent loss of wetland function and area; (iii) these wetlands will not be restored following construction and will no longer provide ecosystem functions; and (iv) as a result, 182.9 acres of jurisdictional wetlands within the MBSD construction footprint and the functions they provide will be permanently lost as a result of the MBSD.

In an attempt to avoid compensatory mitigation requirements, CPRA claims that the MBSD is “self-mitigating.” DEIS, p. 4-973. CPRA claims that there will be “no net loss” of wetlands because wetland losses during construction would be offset by the anticipated creation of wetlands during operation of the MBSD. Draft EIS, p. 4-212. The uncertainty and timing of these environmental benefits cannot justify disregarding the Clean Water Act’s longstanding and well-established requirement that unavoidable impacts be minimized and mitigated.

Notwithstanding a project may have net beneficial effects on jurisdictional wetlands, the permittee must still provide compensatory mitigation that complies with the requirements of 2008 Final Rule to offset permanent impacts to jurisdictional wetlands. The Corps acknowledges that Section 404 of the Clean Water Act requires compensatory mitigation:

After consideration of all enforceable avoidance and minimization measures outlined in this section, Section 404 requires CPRA to offset any remaining unavoidable impacts on jurisdictional wetlands or special aquatic sites with compensatory mitigation.

Draft EIS, p. 4-973. There is nothing that justifies the Corps deviating from this requirement. The permanent loss of 182.9 acres of jurisdictional wetlands and the functions they provide is not an insignificant loss. It’s a significant loss whether viewed in isolation or the context of the MBSD. Further, based on the uncertainty and timing surrounding the anticipated environmental benefits of the MBSD, these benefits cannot be reasonably expected to offset the significant losses of jurisdictional wetlands and their functions within the construction footprint.

CPRA’s proposed plan to mitigate the permanent impacts of 182.9 acres of jurisdictional wetlands is to rely on the MBSD project itself pointing to the projected overall benefits associated with accretion and deltaic land-building processes over the a 50-year period. CPRA, however, concedes that these “projected” benefits will evolve over time. Draft EIS, p. 4-231. As shown in Table 4.6-5 of the DEIS, the project will not have net positive effects on jurisdictional wetlands until 2040, and that’s assuming that the project works as modeled. There is no compensatory mitigation proposed before or concurrent with the impacts as required by the 2008 Final Rule. Rather, CPRA claims that sometime in the next 50 years (potentially 2040 or later) fresh and intermediate marsh is anticipated to be established, and this will mitigate the known, immediate, permanent loss of 182.9 acres of jurisdictional wetlands. CPRA does not dispute that there will be a significant temporal loss of aquatic function. This temporal lag in the creation of wetlands (even assuming that the MBSD works as projected, which is highly uncertain) cannot justify deviating from compensatory mitigation requirements. As required by the 2008 Final Rule, this temporal loss must be addressed,

quantified and mitigated through the purchase of available in-kind and in-basin mitigation bank credits or other well-established mechanisms.

Not only would there be a long temporal lag in any environmental benefits of the MBSD, such benefits are highly uncertain. As acknowledged by CPRA, CPRA's proposed self-mitigation involves a high degree of uncertainty. The Delft3D Basinwide Model was used to analyze five decades of MBSD operations from 2020 to 2070 by simulating changes in hydrodynamics, sediment transport, water quality, and vegetation within the Mississippi River Delta and its estuaries. The model was used to assess impacts of the project alternatives in the Barataria Basin and the Birdfoot delta from implementation of the project alternatives, including the no action alternative. CPRA recognizes the uncertainties associated with modeling a dynamic system over a long-period of time, stating:

Uncertainty in models comes from many sources – uncertainty in the observed data used for model calibration, validation, and initialization; assumptions and numerical averaging in the computer model; and sensitivity to model parameters. These uncertainties can impact model results, changing where and by what amount impacts are projected.

Draft EIS, p. 4-13. Uncertainties are not limited to the model itself; additional uncertainties exist with model inputs and model boundary conditions, including, but not limited to, regional sea level rise, subsidence, rainfall, wind field, hydrographs of the Mississippi River and other rivers, freshwater hydrograph from other diversions, sediment load, nutrient load, parameters used to simulate vegetation growth and mortality, and landscape evolution. Draft EIS, App. E, pp. 39-40. Typically, scientific literature is used to quantify the uncertainties associated with these modeling inputs, but in the case of such a complex project such as the MBSD, "the scientific knowledge of these phenomena is constantly evolving." Draft EIS, App. E, p. 40. These uncertainties significantly increase when forecasting several decades or more into the future. Draft EIS, App. E, p. 43. As CPRA recognizes, "there is no way to accurately predict future conditions." Draft EIS, p. 4-211.

To account for uncertainty, CPRA relies on an adaptive management plan. Draft EIS, App. R, Draft Mitigation and Stewardship Plan, p. 25 ("[G]iven the dynamic conditions of any estuarine system, and the uncertainty around future conditions, some of the mitigation measures will rely on data from the MBSD Adaptive Management Plan to appropriately site and scale the measures based upon post-operational conditions."). Thus, not only will the "self-mitigation" not occur before or concurrent to the impacts, it is uncertain to happen at all. Rather, CPRA takes the position that it cannot be predicted how MBSD will work, but mitigation, if necessary, will be determined decades after the impacts occur.

The MBSD involves a high degree of risk and uncertainty and unknown and undefined self-mitigation, if any, decades after the impacts occur. This is not sufficient to override the requirement for compensatory mitigation. There will be a net loss of jurisdictional wetland values and functions, and these losses must be mitigated through the purchase of available in-kind and in-basin mitigation bank credits or other well-established mechanisms.

2. Mitigation of the permanent impacts to jurisdictional wetlands in the construction footprint of the MBSD is feasible, practicable and appropriate and will result in consequential reduction in impacts.

The purchase of mitigation bank credits (or mitigation through some other well-established mechanism) is feasible, appropriate and practicable. The purchase of in-kind and in-basin

mitigation bank credits will offset the values and functions of the impacted jurisdictional wetlands. It should also be undisputed that the purchase of such credits is practical. It is capable of being done after considering “cost, existing technology, and logistics in light of overall projects purposes.” See 40 C.F.R. § 230.3(l). The costs of compensatory mitigation must be considered in the context of the known unavoidable impacts. The cost of in-kind and in-basin credits is de minimis relative to the MBSD costs and scale and scope of impacts. CPRA is proposing to construct an unprecedented large-scale diversion project (estimated construction costs exceeding \$2 billion), which will permanently destroy 182.9 acres of jurisdictional wetlands within the MBSD construction footprint.

3. It is inappropriate to compare the MBSD to “typical” marsh creation projects.

Although under certain circumstances the Corps has the limited discretion to not require compensatory mitigation when a proposed discharge is reasonably expected to result in environmental benefits, the anticipated benefits of the MBSD cannot justify the Corps exercising this discretion.

The MBSD is different than a typical marsh creation project where the Corps sometimes determines that compensatory mitigation is not required. First, unlike a typical marsh creation project, the impacts to jurisdictional wetlands in the construction footprint will not be a result of sediment discharge, but will be more permanent. These wetlands will be filled with concrete. Second, the areal extent of impacts (182.9 acres associated with the construction footprint) is much larger than a typical marsh creation project. Third, unlike a typical marsh creation project and as discussed above, the environmental benefits associated with the MBSD are highly uncertain. The MBSD is unprecedented and modeling a highly dynamic system over decades results in a high degree of uncertainty. Fourth, unlike a typical marsh creation project and perhaps most importantly, any environmental benefits of the MBSD will not be realized until decades after the impacts occur.

Exercising its discretion to not require compensatory mitigation to offset the impacts to 182.9 acres of jurisdictional wetlands in the construction footprint would violate the Clean Water Act and its implementing regulations and would set an alarming precedent.

4. “Self-mitigation,” as proposed by CPRA, is not an option under the 2008 Final Rule and is unlawful.

The 2008 Final Rule provides three mechanisms to mitigate unavoidable impacts to jurisdictional wetlands: (1) mitigation bank credits; (2) in lieu fee program credits; and (3) permittee-responsible mitigation. The 2008 Final Rule establishes a hierarchy for these mitigation alternatives with mitigation bank credits the preferred option. “Self-mitigation” is not an option.

5. CPRA’s proposed “self-mitigation” must comply with the requirements of the 2008 Final Rule.

The 2008 Final Rule clearly requires that compensatory mitigation be implemented before the activity causing the authorized impacts.

Implementation of the compensatory mitigation project shall be, to the maximum extent practicable, in advance of or concurrent with the activity causing the authorized impacts. The district engineer shall require, to the extent appropriate and practicable, additional

compensatory mitigation to offset temporal losses of aquatic functions that will result from the permitted activity.

33 C.F.R. § 332.2(m) (emphasis added). CPRA acknowledges that “implementation of the compensatory mitigation should be in advance or concurrent with the impacts.” Draft EIS, App. R, Draft Mitigation and Stewardship Plan, p. 6. Within CEMVN’s district, a Section 404 permit will not be issued unless the permittee has an approved compensatory mitigation plan that complies with the Clean Water Act and its implementing regulations. Further, the Corps is mandated to require “additional” mitigation when temporal losses to aquatic function will result.

Despite this requirement, CPRA is proposing to permanently destroy 182.9 acres of jurisdictional wetlands. CPRA’s proposed plan to mitigate these permanent impacts is to rely on the MBSD project itself pointing to the projected overall benefits associated with accretion and deltaic land-building processes over the a 50-year period. CPRA and the Corps, however, concede that these “projected” benefits will evolve over time. Draft EIS, p. 4-231. As shown in Table 4.6-5 of the DEIS, the project will not have net positive effects on jurisdictional wetlands until 2040, and that’s assuming that the project works as modeled.

Each of the mitigation mechanisms set forth in the Final 2008 Rule, including permittee-responsible mitigation, must also comply with mitigation plan requirements.

After addressing any comments provided by the district engineer, the permittee must prepare a final mitigation plan, which must be approved by the district engineer prior to issuing the individual permit. The approved final mitigation plan must be incorporated into the individual permit by reference. The final mitigation plan must include the items described in paragraphs (c)(2) through (c)(14) of this section, but the level of detail of the mitigation plan should be commensurate with the scale and scope of the impacts. As an alternative, the district engineer may determine that it would be more appropriate to address any of the items described in paragraphs (c)(2) through (c)(14) of this section as permit conditions, instead of components of a compensatory mitigation plan. For permittees who intend to fulfill their compensatory mitigation obligations by securing credits from approved mitigation banks or in-lieu fee programs, their mitigation plans need include only the items described in paragraphs (c)(5) and (c)(6) of this section, and the name of the specific mitigation bank or in-lieu fee program to be used.

73 Fed. Reg. at 19677 (33 C.F.R. § 332.4(c)(1)(i)) (emphasis added). CPRA’s proposed “self-mitigation” fails to comply with these requirements.

The 2008 Final Rule requires a description of the legal arrangements and instrument, including site ownership, that will be used to ensure the long-term protection of the compensatory mitigation project site. 73 Fed. Reg. at 19678 (33 C.F.R. § 332.4(c)(4)). The 2008 Final Rule provides:

(a) Site protection. (1) The aquatic habitats, riparian areas, buffers, and uplands that comprise the overall compensatory mitigation project must be provided long-term protection through real estate instruments or other available mechanisms, as appropriate. . . .

33 C.F.R. § 337(a)(1). The goal of the 2008 Final Rule is to ensure permanent protection of all compensatory mitigation project sites. Although the 2008 Final Rule provides flexibility in how this protection is secured, it requires some form of long-term protection. The purpose of the 2008 Final Rule’s long-term protection requirement is to ensure that the conservation

objectives of the mitigation project are not compromised by incompatible uses. It is reasonable to expect that the Corps will require long-term protection of created or restored areas when they support ecological gains and receive credit for compensatory mitigation.

CPRA intends to rely on the projected creation or restoration of approximately 13,000 acres of marsh as a result of the project. Despite the requirements of the 2008 Final Rule, CPRA and the Corps do not address whether a single acre of this land will be provided long-term protection. Not only is there no guarantee that the project will successfully result in the creation of these acres, even if the project is successful, there is nothing in place to prevent the conservation objectives of the project being compromised by incompatible uses. As a result, the proposed mitigation for the MBSD is not in compliance with the 2008 Final Rule requirements and is unlawful.

Further, the 2008 Final Rule requires that the mitigation plan describe the number of credits to be provided, including a brief explanation of the rationale for this determination. 73 Fed. Reg. at 19678 (33 C.F.R. § 332.4(c)(7)). As set forth CEMVN's Compensatory Mitigation Standard Operating Procedures, the amount of required compensatory mitigation cannot be determined until "an appropriate assessment of the project site wetlands has been completed." Because CPRA has not prepared a mitigation plan in compliance with the 2008 Final Rule's 12-step analysis, it is not possible to calculate the required mitigation credits.

The 2008 Final Rule also requires that the mitigation plan establish ecologically-based performance standards that will be used to determine whether the compensatory mitigation project is achieving its objectives. 73 Fed. Reg. at 19678 (33 C.F.R. § 332.4(c)(9)). These performance standards "must be based on attributes that are objective and verifiable." 33 C.F.R. § 332.5(a). As discussed in more detail below, because there is so much uncertainty in the MBSD (both in modeling and input parameters), the Corps and CPRA have not adequately established performance standards.

The mitigation plan must also provide a description of the type and amount of financial assurances to be provided as necessary to ensure a high level of confidence that the compensatory mitigation project will be successfully completed, in accordance with its performance standards. 73 Fed. Reg. at 19678 (33 C.F.R. § 332.4(c)(13)); see also 33 C.F.R. § 332.3(n). CPRA has relied on contingent funding from the Deepwater Horizon Louisiana Trustee Implementation Group to purportedly satisfy financial assurance requirements. Contingent funding for the MBSD does not satisfy the financial assurance requirements of the 2008 Final Rule.

CPRA's proposed "self-mitigation" fails to comply with the requirements of the 2008 Final Rule and is unlawful.

6. If it's considered permittee-responsible mitigation, CPRA's "self-mitigation" is also inconsistent with CEMVN's Permittee-Responsible Mitigation Plan Template.

Prior to conducting permittee-responsible mitigation within CEMVN's jurisdiction, the permittee is required to prepare and execute permittee-responsible mitigation plan. The plan addresses a number of requirements for permittee-responsible mitigation, which are similar to requirements established for mitigation banks, including, but not limited to:

- To claim compensatory credits for a project, the claimed credits need to be base-lined, identified, graded, selected, approved in advance and protected by a perpetual conservation servitude placed on it by the landowner, who further agrees to keep the property lien-free;
- The permittee must assume the responsibility for the long-term management, maintenance, monitoring, and protection of the mitigation site;
- The permittee must assume the responsibility for maintaining all records, monitoring the Mitigation Site for success, conducting remedial action as necessary to ensure success, and providing this information to CEMVN in reports documenting mitigation site usage and the results of monitoring;
- The permittee must establish clear and merchantable title to the property;
- The permittee must provide detailed specifications and work descriptions for the proposed compensatory mitigation project;
- The permittee must provide a detailed description of what maintenance work will be required and schedule of required maintenance to insure the continued viability of the resource following initial construction and prior to long-term milestone;
- The permittee must incorporate the performance standards identified in the mitigation work plan templates used for mitigation banks for the habitat type intended to be restored;
- The permittee must incorporate the monitoring and reporting requirements identified in the mitigation work plan templates used for mitigation banks for the habitat type intended to be restored; and
- The permittee must provide financial assurances sufficient to ensure satisfactory completion for the work described in the mitigation plan and any future adaptive management plan(s).

CPRA has not complied with any of these requirements placed upon every other applicant who seeks to utilize a permittee-responsible mitigation plan. If the Corps provides CPRA a “free pass,” CPRA will not be the last applicant to request such favorable treatment. CPRA is required to mitigate the unavoidable impacts of the MBSD and such mitigation should be through the purchase of available in-kind and in-basin credits. If CPRA provides adequate justification to override the preference for mitigation banks (it cannot), its permittee-responsible mitigation plan should be held to the same standards as all other applicants.

7. “Self-Mitigation” for the MBSD is not environmentally preferable.

Not only does CPRA’s proposed “self-mitigation” not meet the requirements of the 2008 Final Rule or CEMVN’s requirements for permittee-responsible mitigation, it is not environmentally preferable. Mitigation bank credits are the preferred option under the 2008 Final Rule. There is no basis for the Corps to override the preference for compensatory mitigation through available in-kind and in-basin mitigation bank credits.

District Engineers may only override the preference for mitigation banks in limited circumstances, and such decisions must be documented. The 2008 Final Rule allows District Engineers to override the preference hierarchy in situations where the reasons underlying the preference do not apply. For example, the preference may be overridden if an approved in-lieu fee program has released credits available or a permittee with a proven track record is proposing a compensatory mitigation project that will restore an outstanding resource based on rigorous scientific and technical analysis. 73 Fed. Reg. at 19673. In other words, District

Engineers may override the preference for mitigation banks only if other compensatory mitigation options would involve less risk and uncertainty and provide greater ecological value to the watershed. These circumstances are not met by CPRA's proposed self-mitigation.

As acknowledged by CPRA and discussed above, CPRA's proposed self-mitigation involves a high degree of uncertainty. Draft EIS, p. 4-13 and App. E, pp. 39-40, 43. Not only are the environmental benefits of the MBSD uncertain, there is decades-long temporal lag. The project will not have net positive effects on jurisdictional wetlands until 2040, and that's assuming that the project works as modeled. Draft EIS, Table 4.6-5. There is no compensatory mitigation proposed before or concurrent with the impacts as required by the 2008 Final Rule.

The MBSD involves more risk, greater uncertainty and unknown and undefined mitigation decades after the impacts occur. This is not sufficient to override the preference for available in-kind and in-basin mitigation bank credits.

8. USFWS recognizes that "self-mitigation" is not an option under federal law and policies.

CPRA anticipates that the MBSD will result in the creation of approximately 13,000 marsh acres over a 50-ye

---

**Concern ID: 62191**

**The mitigation proposed by CPRA ("self-mitigation") is inconsistent with federal law and fails to consider and give priority to credits from mitigation banks; USACE should consider CPRA's mitigation plan and determine that compensatory mitigation is required for construction footprint impact through the purchase of released in-kind and in-basin mitigation bank credits, which are available from Jesuit Bend Mitigation Bank**

**Response ID: 16403**

The direct wetland impacts associated with the proposed Project are disclosed in the EIS and will be evaluated by USACE in accordance with 33 CFR §320.4(r) in its permitting decision. If compensatory mitigation were required, options consistent with 33 CFR Part 332, including banks within the appropriate watershed with available credits, would be considered. If a permit is issued, any potential compensatory mitigation requirements would be provided in the ROD.

The term "self-mitigating" was used in Chapter 4, Section 4.27.2.1 Compensatory Mitigation, Jurisdictional Wetlands and Waters of the U.S. to indicate that CPRA believes the marsh creation benefits of the Project would offset the wetland impacts. However, since publication of the Draft EIS, CPRA has committed to constructing wetlands within the designated beneficial use area with excavated material that, according to Wetland Value Assessment (WVA) modeling, would at minimum be equivalent to the identified Average Annual Habitat Units (AAHUs) lost from Project construction. Edits have been made to Final EIS Chapter 2, Section 2.8.1.1 Project Design Features to reflect this Project feature. Final EIS Section 4.6.5.3 Wetland Resources and Waters of the U.S., Wetland Value Assessment has been updated with the Interagency Habitat Evaluation Team's WVA calculation of the AAHUs that would be created in these beneficial use areas, and Section 4.27.2.1 Compensatory Mitigation, Jurisdictional Wetlands and Waters of the U.S. has been edited to summarize the

---

wetland impacts and describe the projected benefits that would be provided by these beneficial use marsh creation sites and other wetland benefits of the Project.

---

**Concern ID: 66934**

**It appears that CPRA is considering using some of the excavated material for construction of the MBSD for beneficial use placement and upland reuse (for example, filling existing borrow pits). However, this material would first be used for construction of the Project components and only be used for beneficial reuse “if suitable” and “to the extent practicable.” CPRA acknowledges that “[b]ecause the amount of dredge material suitable for placement in the beneficial use sites is currently unknown, the benefits cannot be calculated or considered as a mitigation offset.”**

**Response ID: 16861**

Since publication of the Draft EIS, CPRA has determined that it would construct a beneficial use component to the proposed Project and has submitted information concerning the design and location of the beneficial use sites such that the benefits in terms of acreage and Average Annual Habitat Units (AAHUs) can now be calculated. These beneficial use areas would be located near the proposed outfall transition feature. According to Wetland Value Assessment (WVA) modeling, these constructed wetlands would at minimum be equivalent to the identified AAHUs lost from Project construction. Edits have been made to Final EIS Chapter 2, Section 2.8.1.1. Project Design Feature) to reflect this Project feature. Final EIS Chapter 4, Section 4.6.5.3 Wetland Resources and Waters of the U.S., Wetland Value Assessment has been updated with the Interagency Habitat Evaluation Team’s WVA calculation of the AAHUs that would be created in these beneficial use areas, and Section 4.27.2.1 Compensatory Mitigation, Jurisdictional Wetlands and Waters of the U.S. has been edited to summarize the anticipated wetland impacts and anticipated benefits of the proposed Project that include these marsh creation sites and other wetland benefits of the Project.

---

**Concern ID: 66935**

**CPRA claims that there will be “no net loss” of wetlands because wetland losses during construction would be offset by the anticipated creation of wetlands during operation of the MBSD. The uncertainty and timing of these environmental benefits cannot justify disregarding the requirement that unavoidable impacts be minimized and mitigated. Based on the uncertainty and timing, these benefits cannot be reasonably expected to offset the significant losses of jurisdictional wetlands and their functions within the construction footprint.**

**Response ID: 16862**

CPRA has determined that it will construct wetlands within the designated beneficial use area with excavated material, which, according to Wetland Value Assessment (WVA) modeling, would at minimum provide equivalent Average Annual Habitat Units (AAHUs) to the identified AAHUs anticipated to be lost due to direct impacts from Project construction. The proposed Project beneficial use wetland creation feature would be constructed concurrently with overall construction of the proposed Project.

CPRA is not relying on diversion marsh creation performance to replace the permanent loss of wetlands that would result from Project construction. Because the beneficial use marsh creation Project feature would be constructed using typical marsh creation construction

---

methods, uncertainty regarding the success and environmental benefits of this Project feature would be minimized. Edits have been made to Final EIS Section 2.8.1.1. Project Design Features to reflect this Project feature. Final EIS Section 4.6.5.3 Wetland Resources and Waters of the U.S., Wetland Value Assessment has been updated with the Interagency Habitat Evaluation Team's WVA calculation of the AAHUs that will be created in these beneficial use areas, and Section 4.27.2.1 Compensatory Mitigation, Jurisdictional Wetlands and Waters of the U.S. has been edited to summarize the anticipated wetland impacts and benefits of the proposed Project to include these beneficial use marsh creation sites and other wetland benefits of the Project.

---

**Concern ID: 66936**

**CPRA claims that sometime in the next 50 years (potentially 2040 or later) fresh and intermediate marsh is anticipated to be established, and this will mitigate the known, immediate, permanent loss of 182.9 acres of jurisdictional wetlands. CPRA does not dispute that there will be a significant temporal loss of aquatic function. This temporal lag in the creation of wetlands (even assuming that the MBSD works as projected, which is highly uncertain) cannot justify deviating from compensatory mitigation requirements. As required by the 2008 Final Rule, this temporal loss must be addressed, quantified and mitigated through the purchase of available in-kind and in-basin mitigation bank credits or other well-established mechanisms.**

**Response ID: 16863**

CPRA is not relying on diversion marsh creation success to replace the anticipated permanent loss of 193.1 acres of wetlands resulting from Project construction. The permanent loss of 1193.1 acres of jurisdictional wetlands would be replaced through construction of at least 402 acres of marsh through beneficial use of excavated material concurrent with construction of the proposed Project.

---

**Concern ID: 66937**

**As acknowledged by CPRA, CPRA's proposed self-mitigation involves a high degree of uncertainty. To account for uncertainty, CPRA relies on an adaptive management plan. Thus, not only will the "self-mitigation" not occur before or concurrent to the impacts, it is uncertain to happen at all.**

**Response ID: 16864**

CPRA is not relying on diversion marsh creation success to replace the anticipated permanent loss of 193.1 acres of wetlands resulting from Project construction. The permanent loss of 193.1 acres of jurisdictional wetlands would be replaced through construction of at least 402 acres of marsh through beneficial use of excavated material concurrent with construction of the proposed Project.

---

**Concern ID: 66938**

**The purchase of mitigation bank credits (or mitigation through some other well-established mechanism) is feasible, appropriate and practicable. The purchase of in-kind and in-basin mitigation bank credits will offset the values and functions of the impacted jurisdictional wetlands.**

**Response ID: 16865**

---

Should compensatory mitigation be required, the purchase of mitigation bank credits and potentially other mitigation options would be considered in accordance with 33 CFR Part 332.

---

**Concern ID: 66939**

**It is inappropriate to compare the MBSD to “typical” marsh creation projects. Although under certain circumstances the Corps has the limited discretion to not require compensatory mitigation when a proposed discharge is reasonably expected to result in environmental benefits, the anticipated benefits of the MBSD cannot justify the Corps exercising this discretion.**

**Response ID: 16866**

CPRA has determined it would construct wetlands within the designated beneficial use area with excavated material that, according to WVA modeling, would at minimum produce sufficient AAHUs to replace the anticipated AAHUs that would be lost due to Project construction. USACE’s determination in its permitting decision whether to require compensatory mitigation would be made in accordance with 33 CFR §320.4(r), 33 CFR Part 332 and applicable USACE guidance, including the 1990 USEPA & USACE MOA Concerning the Determination of Mitigation.

---

**Concern ID: 66940**

**The Corps is mandated to require “additional” mitigation when temporal losses to aquatic function will result.**

**Response ID: 16867**

CPRA has determined that it would construct a beneficial use marsh creation component concurrent with Project construction. The WVA model considers the temporal losses to aquatic function in its calculations regarding Project impacts and marsh creation construction benefits.

---

**Concern ID: 66941**

**Despite the requirements of the 2008 Final Rule, CPRA and the Corps do not address whether a single acre of this land will be provided long-term protection. Not only is there no guarantee that the Project will successfully result in the creation of these acres, even if the Project is successful, there is nothing in place to prevent the conservation objectives of the Project being compromised by incompatible uses. As a result, the proposed mitigation for the MBSD is not in compliance with the 2008 Final Rule requirements and is unlawful.**

**Response ID: 16868**

Benefits to be derived from marsh reestablishment have been evaluated through the WVA model which considers temporal losses to and gains in aquatic function. The beneficial use of excavated material to create marsh is a component of the Project and would be constructed concurrently with proposed Project. USACE’s determination in its permitting decision whether to require compensatory mitigation would be made in accordance with 33 CFR §320.4(r), 33 CFR Part 332 and applicable USACE guidance. If compensatory mitigation were required, banks within the appropriate watershed with available credits would be considered.

---

**Concern ID: 66943**

---

**If the Project is considered permittee-responsible mitigation, CPRA’s “self-mitigation” is also inconsistent with CEMVN’s Permittee-Responsible Mitigation Plan Template.**

**Response ID: 16869**

The beneficial use component of the proposed Project is not considered permittee-responsible mitigation; it is a Project feature. USACE would not require that the marsh creation component to use the Permittee-Responsible Mitigation Plan Template. USACE’s determination in its permitting decision whether to require compensatory mitigation would be made in accordance with 33 CFR §320.4(r), 33 CFR Part 332 and applicable USACE guidance, including the 1990 USEPA & USACE MOA Concerning the Determination of Mitigation.

---

**Concern ID: 66945**

**“Self-Mitigation” for the MBSD is not environmentally preferable. Not only does CPRA’s proposed “self-mitigation” not meet the requirements of the 2008 Final Rule or CEMVN’s requirements for permittee-responsible mitigation, it is not environmentally preferable. Mitigation bank credits are the preferred option under the 2008 Final Rule. There is no basis for the Corps to override the preference for compensatory mitigation through available in-kind and in-basin mitigation bank credits.**

**Response ID: 16870**

The beneficial use component of the proposed Project is not considered permittee-responsible mitigation. USACE’s determination in its permitting decision whether to require compensatory mitigation would be made in accordance with 33 CFR §320.4(r), 33 CFR Part 332 and applicable USACE guidance. If compensatory mitigation were required, banks within the appropriate watershed with available credits would be considered.

---

**Concern ID: 66946**

**The USFWS recognizes that the anticipated marsh to be created by the Project would not “self-mitigate” for the indirect impacts the proposed Project would cause in the birdfoot delta and therefore has recommended that CPRA provide additional mitigation in the form of wetland creation through crevasse construction in the birdfoot delta. The Project’s direct impacts to 182.9 acres of jurisdictional wetlands should similarly be offset through wetland creation.**

**Response ID: 16871**

The anticipated direct impacts to 182.9 acres of jurisdictional wetlands due to Project construction would be replaced through construction of at least 400 acres of marsh through beneficial use of excavated material concurrent with construction of the proposed Project. Because the beneficial use marsh creation Project feature would be constructed using typical marsh creation construction methods, uncertainty regarding the success and environmental benefits of this Project feature would be minimized. CPRA has also agreed to the conservation recommendations of the USFWS, including the construction of crevasse projects that may include terracing to offset the indirect losses on the Delta NWR and the Pass A Loutre (PAL) WMA. Within 5 years of the commencement of Project operations, CPRA or the LA TIG will provide \$10 million of additional funding for wetland preservation and restoration work in the Delta NWR and the PAL WMA to offset modeled acres of indirect wetland losses in those areas. That funding may be accomplished through additional

---

restoration work sponsored by the LA TIG (for example, construction of the E&D work discussed in the DWH LA TIG's Restoration Plan and Environmental Assessment #7), or through a direct contribution for additional work. The funding will be proportioned between the Delta NWR and the PAL WMA based on the magnitude of the predicted wetland loss in each area.

---

**Concern ID: 66497**

**For the purpose of determining in-kind mitigation for degraded wetlands, one needs to determine the wetland habitat that existed prior to the degradation. The majority of emergent wetlands habitat that existed prior to degradation of wetlands within the Project's construction footprint was fresh/intermediate marsh. Emergent wetlands delineated within the Project footprint include soils associated with historic marsh, specifically Lafitte and Westwego soil series.**

**Response ID: 16872**

The comment is acknowledged. USACE's determination in its permitting decision whether to require compensatory mitigation would be made in accordance with 33 CFR §320.4(r), 33 CFR Part 332 and applicable USACE guidance. If compensatory mitigation were required, banks within the appropriate watershed with available credits would be considered.

---

Paula Flynn

Hello,

I am writing in support of Alternative 5. I believe it is the best plan for rebuilding our wetlands for the greater good of our area overall.

Thank you,

Paula Flynn

---

**Concern ID: 61871**

**Alternative 5, Variable Flow up to 150,000 cfs, should be chosen for implementation because it provides substantially greater benefits at the higher flow, with only marginally increased adverse effects, most of which could be mitigated by the same measures being proposed for the 75,000 cfs Applicant's Preferred Alternative.**

**Response ID: 15944**

CPRA submitted a joint Section 10/404 permit application and Section 408 permission request to USACE for the construction, operation, and maintenance of a 75,000 cfs sediment diversion (Applicant's Preferred Alternative). The EIS evaluates the Applicant's Preferred Alternative and five additional action alternatives as well as the No Action Alternative in order to inform USACE's permit and permission decisions and the LA TIG's NRDA decision in compliance with the statutes, orders, and policies outlined in EIS Chapter 5 Consultation and Coordination.

In the Restoration Plan, the LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54, and made every effort to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. As noted in the LA TIG's Restoration Plan, while the 150,000 cfs Alternative was projected to provide greater ecological benefits than the LA TIG's Preferred Alternative, it was also expected to cause greater collateral injury and greater risks to public health and safety. See Chapter 3, Section 3.2.4 of the Final Restoration Plan for a discussion of how the LA TIG came to its decision. Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

The Mitigation and Stewardship Plan (Appendix R1 to the EIS) has been designed by CPRA to mitigate the projected impacts of the 75,000 cfs sediment diversion (Applicant's Preferred Alternative). Different or additional mitigation could be needed to address the projected impacts of the proposed Project if a large capacity diversion (150,000 cfs) were to be selected.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review,

Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Another Gulf Is Possible

Jayeesha Dutta

It is imperative that the management plan for the river diversions being proposed include continual adaptive mitigation for unavoidable impacts to critical habitat of all aquatic species.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

---

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Edgewater Construction LLC

Lynwood Ridge Jr

We are writing in today to save our home in Myrtle Grove Marina Estates. We built it in 2004 to 2005, finishing just weeks before Hurricane Katrina. We followed all guidelines in place by our subdivision, parish, state and federal agencies. Our brand new home was substantially damaged. We rebuilt and raised our children in our home and have always been full time residents. Over the years, we went on experience several other high wind storms and flooding events and through it all we rebuilt and endured. Now a diversion is being proposed that will make the homes in our subdivision irreparable, unsellable and likely minimally insured or uninsurable. Not only will we have restricted access to and from our home during the high water times of the diversion, we will not be able to have family or friends to visit as they will not be able to access our home nor green space for our pets. We bought our lot and built our home with the opportunity to boat, fish and catch shrimp and crabs right from our home. The damages to the ecosystem will likely be ruined for rest of our lives. There have been many other land restoration projects that have proven land regeneration without the widespread and substantial devastation this diversion is going to cause. Why is the only land restoration plan being seriously considered one proposed by what appears to be the good old boy network once again. The people of Plaquemines and St. Bernard were sacrificed in the past to save New Orleans and Jefferson Parish and now you are proposing we be sacrificed again, along with the entire ecosystem and way of life for many people, in the name of an unproven land restoration project.

---

**Concern ID: 62778****Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.****Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels

due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62794**

**This poorly planned and executed proposed Project is being pushed forward for the financial gain of politicians and contractors because taxpayer dollars are being used. Private investment dollars would entail more deliberation and a full impact study, including more natural options with less risk and more overall benefits.**

**Response ID: 16375**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance and constitutes a full impact analysis. A variety of alternatives assessed in the EIS are identified in Chapter 2 Alternatives. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

The LA TIG's Restoration Plan evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG has selected Alternative 1 as the LA TIG's Preferred Alternative.

---

**Correspondence ID:40369**

Rábago Energy LLC

Karl Rabago

To the U.S. Army Corps of Engineers and the Louisiana Trustee Implementation Group (LaTIG) c/o of NOAA:

As someone who advocates for affordable energy in Louisiana, I also advocate for energy security. Power outages and hurricanes go hand in hand - a restored coast will help provide energy security through the protection it provides by weakening storms and lowering storm surge. A more protected power grid also means less repairs, which should translate to lower rates.

A crucial component to restoring the coast is reconnecting the Mississippi River to the surrounding marshes. I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and support funding the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

Centering community needs in planned mitigation and stewardship efforts should also be a priority. Plans to help communities deal with impacts of the projects should be clearly stated and fully funded.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH

restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63341**

**The coastal wetland system creates multiple lines of natural defense from hurricanes and storm surge, and the ongoing wetland loss resulting from the lack of riverine input into the basin has resulted in increased storm risks to local communities (including decreases in property values and impacts to the electrical grid).**

**Response ID: 16300**

The commenter's support for the proposed Project is noted. The commenter correctly notes that coastal wetlands are natural defense against hurricanes and storm surge, and the damage they cause to local communities and infrastructure, as discussed in Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S. of the Draft EIS. The causes of wetland loss in the proposed Project area were discussed in Section 3.6.2 of the Draft EIS, and included subsidence, levees, storms, canals/spoil banks, herbivory, and the DWH oil spill. Chapter 4, Sections 4.6 Wetland Waters and Resources of the U.S. and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS explained how the proposed Project would create and maintain wetlands in the Barataria Basin, and discuss the corresponding impacts on storm surge and flooding.

---

**Correspondence ID:40370**

Terri Timmcke

I am OPPOSED to this diversion project because it will destroy natural resources including fish, wildlife, and plants.

I would propose replacing sediment by dredging as a safer alternative.

[https://www.theadvocate.com/baton\\_rouge/opinion/article\\_062be400-bf1f-11eb-83c8-9fede5d3f370.html](https://www.theadvocate.com/baton_rouge/opinion/article_062be400-bf1f-11eb-83c8-9fede5d3f370.html)

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

**Correspondence ID:40371**

William Cooksey

As a lifelong sportsman, and especially as a Mississippi flyway duck hunter, I am writing today to express my support for the Mid-Barataria Sediment Diversion. Habitat loss in Louisiana is being felt by sportsmen throughout our nation, and we are behind those seeking to reverse this trend. Thank you for taking the time to read these comments.

---

**Concern ID: 63338**

**The proposed Project would bring back vital habitat along the Gulf Coast, including wetlands that would support a huge variety of birds and other wildlife.**

**Response ID: 16295**

The commenter's support for the proposed Project is noted. Chapter 4, Section 4.9 Terrestrial Wildlife and Habitat of the Draft EIS explained the beneficial (and adverse) impacts of the proposed Project on various avian and terrestrial species. As also explained in the LA TIG's Restoration Plan in Section 3.2.1.6, the proposed Project is intended to improve habitat for birds and other coastal and living marine resources.

---

**Correspondence ID:40372**

Morgan Wood

This is a poorly planned diversion. 2 Billion Dollars in spending requires more research into the effects than what has been done. I fully agree with Lt. Governor Billy Nungesser in saying that this money could be better spent. The effect on our fisheries will be devastating. If this diversion is so positive, then why are these questioning it being denied answers?

---

**Concern ID: 62779****Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.****Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62783**

**Commenters noted that the cost of designing and building the proposed MBSD Project is too high for the small amount of land anticipated to be built.**

**Response ID: 16365**

The commenter's opposition to the cost of the proposed Project is noted. Under NEPA, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that the permit applicant has conducted its own economic evaluation of a proposed project. Consequently, a cost-benefit analysis is not relevant to USACE's permitting decisions. As part of evaluating the proposed Project, the LA TIG considered the costs associated with developing, constructing, and managing the Applicant's Preferred Alternative consistent with the Restoration Plan alternatives evaluation criteria in 15 CFR §990.54. This discussion is in Chapter 3, Section 3.2.1.2 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan.

---

**Concern ID: 62789**

**The cost of designing and building the proposed MBSD Project is too high for a project that has undependable results.**

**Response ID: 16370**

The commenter's opposition to the proposed Project is noted. With respect to the dependability of the future benefits of the proposed Project, the Draft EIS acknowledged that the Delft3D Basinwide Model projections of future conditions includes uncertainties, which are incorporated into the EIS impact conclusions. These uncertainties are briefly summarized in the EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties. However, in addition to the modeled data, Chapter 4 - Environmental Consequences -includes analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in preparing the EIS. As part of developing the EIS, the USACE, together with the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the EIS impacts analysis of the alternatives.

Consistent with OPA regulations (15 CFR §990.54), the LA TIG's Restoration Plan evaluated multiple alternatives based on a number of criteria, including the cost of the alternative. For more information see Section 3 of the LA TIG's Final Restoration Plan. The costs associated with developing, constructing, and managing the Applicant's Preferred Alternative are discussed in Chapter 3, Section 3.2.1.2 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan.

Vanishing Paradise

Erin Brown

To whom it may concern,

I am writing today regarding the Mid-Barataria Sediment Diversion. I have been a resident and a sportsman of South Louisiana my entire life. I grew up with a father who was a commercial fisherman and is currently a wetland biologist. He showed me the beauty of South Louisiana, the marsh, and the bounty of what is in our backyard. I have seen so many changes over my lifetime. I have been working in the restoration world for the past 6 years, and understand what this diversion could mean to the Barataria Basin. We have and are currently losing so much of our rich fishery habitat, and I believe that with the proper management of this diversion, we could offset some of this loss. With proper management, we can sustain our fisheries and livelihoods that depend on them (shrimp, fish, oyster), while addressing the issues of coastal erosion and restoration for flood protection, and the fish and wildlife habitats that make Louisiana the "Sportsman's Paradise".

Thank You.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

**Correspondence ID:40374**

Antoinette Theriot-Heim

I appreciate the opportunity to provide comments on the Mid Barataria Sediment Diversion.

As a resident of Jefferson Parish and a life-long native of Louisiana's coast, I believe this return to using the river to return to a more natural system is what is needed to combat our devastating land loss and that is why I support the preferred alternative in the draft environmental impact statement for the Mid Barataria Sediment Diversion.

I understand and emphasize that some aspects of our coast will be negatively impacted in the short and long term, but a future without action is far more devastating. Both during and after construction, we should prioritize people of these coastal communities and provide robust solutions and mitigation measures to help alleviate these impacts.

Finally, I believe this is a proper expenditure of restoration dollars to help mitigate the damage from the 2010 oil spill, from which our coast will be forever impacted from and is still recovering. Making an investment in our coast such as the Mid Barataria Sediment Diversion is a true game changer for Louisiana.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63334**

**The proposed MBSD Project would maintain and restore coastal lands and should move forward.**

**Response ID: 16291**

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63337**

---

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

**Correspondence ID:40375**

Acme Management Group, inc./ dba Acme Oyster House

Paul Rotner

I oppose the Barataria diversion. This will destroy the fishies and wildlife habitats in the area with no proven science that it will even work. There is better ways proven to build land as in dredging or pumping sand without killing off the fisheries with massive amounts of freshwater full of contaminates.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPR and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62785**

**This type of freshwater and sediment diversion project is unproven and there are uncertainties with respect to what the diversion would do (that is, if it would work and, if so, to what extent).**

**Response ID: 16367**

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties have been incorporated into the EIS impact conclusions and were briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties.

Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or as predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the projected changes for the No Action Alternative.

In addition to the modeled data, Chapter 4 Environmental Consequences of the EIS includes additional analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in drafting the EIS. In response to public comments, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these

---

diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The LA TIG recognizes and acknowledges that a controlled sediment diversion of this scale has not been constructed in Louisiana previously. However, a sediment diversion at this location has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Chapter 3, Section 3.2.1.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan). The proposed Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management [MAM] Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

As executive director of the Hancock County

Chamber of Commerce, our members are deeply concerned about the impact of this project to the Mississippi Gulf Coast. We need assurance that it will not destroy our waters, our seafood industry and negatively impact our cities and county.

---

**Concern ID: 62786**

**Multiple commenters expressed concern with the impacts of diverted waters on the economy and natural environment of the State of Mississippi.**

**Response ID: 16368**

The proposed Project is not anticipated to have discernable effects on resources outside of the Project area, which is limited to Louisiana, and particularly the Barataria Basin and the Mississippi River birdfoot delta (as defined in Chapter 3, Section 3.1.1 in Introduction and the subsections entitled Area of Potential Effects for each resource heading in Chapter 4 Environmental Consequences). Because these resource-specific areas of potential effects were determined based on the anticipated limits of discernable impacts, negligible to no impacts on the natural or human environment are anticipated in the State of Mississippi from the construction and operation of the proposed MBSD Project.

Sara Wood

I am no one but a concerned Louisiana citizen and I am against the Mid-Barataria Sediment Diversion because it is a poorly researched and therefore will be a poorly executed plan that will have a devastating effect on our natural resources in Louisiana, while its proponents and cronies make bank. It is only because they are using \$1-2Billion of TAXPAYER dollars that the proponents are so haphazard and irresponsible because as sure as the day is long, we would not be to this point if it were solely a private investment. There would certainly be more deliberation and at a minimum be a full impact study and consideration of other more natural options with less risk and more beneficial to the area overall. According to the MS River Delta Organization, which is pro diversion, it admits "that there will be changes to the basin" but glosses over or fails to inform the public of the alarming loss of fisheries, including massive loss of dolphin life that are likely to result, plus the fact that the storm protection will be minimal and not long lasting. Typically, they use terms to confuse the public. "Freshwater" diversion is misleading when in fact, it will be a dirty river diversion, just consider the massive dead zone in the Gulf. Louisiana's economy relies heavily on the seafood industry not to mention tourism of which being a "Sportsman's Paradise" is key. The dirty water diversion will negatively affect our economy and thus trickle down to the quality of life here in Louisiana. Our lieutenant governor, Billy Nungesser is at the forefront of speaking out against the Mid-Barataria Sediment Diversion and I have read and heard the debate from both sides, and I agree with out Lt. Governor Nungesser.

[https://www.theadvocate.com/baton\\_rouge/opinion/article\\_062be400-bf1f-11eb-83c8-9fede5d3f370.html](https://www.theadvocate.com/baton_rouge/opinion/article_062be400-bf1f-11eb-83c8-9fede5d3f370.html)

I urge you to listen to the people who will be affected by your decision the most, the citizens of Louisiana, and I urge you to ignore the paid interests involved and reject the CPRA's application for the Mid-Barataria Sediment Diversion. Thank you.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider

public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

---

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62790**

**Diversion of polluted and nutrient-laden waters into the Barataria Basin would result in harmful algal blooms (HABs) and expansion of the dead zone.**

**Response ID: 16371**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA's Mississippi River/Gulf of Mexico Hypoxia Task Force "Hypoxia 101" webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L.

---

Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone “water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen” (<https://www.epa.gov/ms-htf/northern-gulf-mexico-hypoxic-zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.>)

Dissolved oxygen concentrations associated with the Applicant’s Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model’s dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.5.2 in Dissolved Oxygen of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section has been added to Sections 4.5.5.3.2 and 4.5.5.4.2 of the Final EIS. Finally, the EIS acknowledges the potential for up to major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful

cyanobacterial/algal bloom species) in the Barataria Basin during Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62794**

**This poorly planned and executed proposed Project is being pushed forward for the financial gain of politicians and contractors because taxpayer dollars are being used. Private investment dollars would entail more deliberation and a full impact study, including more natural options with less risk and more overall benefits.**

**Response ID: 16375**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance and constitutes a full impact analysis. A variety of alternatives assessed in the EIS are identified in Chapter 2 Alternatives. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

The LA TIG's Restoration Plan evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide

---

the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG has selected Alternative 1 as the LA TIG's Preferred Alternative.

---

**Correspondence ID:40378**

Davor Tomasevic

I am completely against freshwater diversion for Plaquemines parish and St. Bernard, it will destroy the fishing industry the sport fishing industry and recreational water activities .The toxins in the river water will destroy the marsh it would be a disaster for everyone that lives and works in this area. This is my opinion.

Davor

---

**Concern ID: 61819**

**Commenters expressed concern that the proposed Project would have adverse impacts on Barataria Basin's water quality, wetlands, fisheries, recreational uses, and eroding coastlines due to chemicals, oil and hazardous waste, and/or pollutants in the Mississippi River that would be routed to the Barataria Basin via the proposed diversion.**

**Response ID: 16429**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality of the Draft EIS, the segment of the Mississippi River where the proposed diversion river intake structure would be located (subsegment LA070301\_00) fully supports its designated uses. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. LDEQ's water quality assessment indicates that regulated substances are not present in concentrations that would cause a water quality impairment at the location of the intake structure. In response to this concern expressed by commenters, a new subsection has been added to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of nearby industrial facilities on river water routed to the basin during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills from Industrial Sites.

As described in the EIS, Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the

Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Patricia Williams

I would like to know more about this project and the areas that will essentially be included in the project, I will have to admit that I have not heard of this project before and I am not sure if it is associated under maybe a different name. Please send relevant information, pictures, or notices , thanking you in advance,

Patricia

---

**Concern ID: 62369**

**The commenter stated that they need more information on the Project to know what areas would be impacted.**

**Response ID: 15877**

Information on the proposed Project, including the Draft EIS and Draft Restoration Plan, has been made available through several venues, including Project websites (<http://www.mvn.usace.army.mil/Missions/Regulatory/Permits/Mid-Barataria-Sediment-Diversion-EIS/>; <https://www.gulfspillrestoration.noaa.gov/restoration-areas/louisiana>), media stories, and public libraries. For a summary of public outreach efforts related to the Draft EIS refer to Chapter 7 Public Involvement of the EIS and for restoration planning see Section 1.8 of the LA TIG's Restoration Plan. See Chapter 2 of the EIS for a description of the proposed Project and the Project footprint to better understand the areas that would be directly impacted by the Project's construction.

Zachary Elkins

My name is Zachary Elkins, I currently live at [REDACTED], Pass Christian, MS. I grew up in Bay St. Louis and spent countless hours in boating, fishing and camping at Cat Island, Biloxi Marsh and Chandeleur Islands with my brother and father. The time with them and the life lessons I learned while doing this were invaluable.

We also had a camp in Pointe à la Hache until the fishing there was devastated by the Mardi Gras Pass Diversion. The Breton Diversion will have the same devastating impacts on the places I grew up fishing.

The prolonged opening of the spillway was devastating to the MS Gulf Coast and to the Biloxi Marsh. The impact on the water ways I grew up on still have not completely recovered. The impact on oysters, fish and Dolphin was astonishing. I do not understand how dumping river water into the habitat of dolphin, porpoises, speckled trout, and countless other marine animals, as a means to build land is an option, it is truly staggering.

The proposed Breton Diversion will be similar to having the spillway open all of the time and will effectively destroy the marine life I was lucky enough to enjoy with my Father, brother and friends. It will literally rob me of the opportunity to do the same with my daughters.

Why does Mississippi not have a voice in this matter, ultimately our Gulf Coast will be impacted the most by this diversion. Property values will plummet, oyster beds and our fisheries will be destroyed but most importantly to me I will lose the opportunity to take advantage of this great resource as a source for raising my daughters. Please don't rob me of this opportunity.

Zachary Elkins  
[REDACTED]  
[REDACTED]

---

**Concern ID: 62367****The Mid-Breton Sediment Diversion would have devastating impacts to the Mississippi Gulf Coast, similar to the opening of the Bonnet Carré Spillway.****Response ID: 15898**

The focus of this EIS is the proposed Mid-Barataria Sediment Diversion. The impacts of the proposed Mid-Breton Sediment Diversion are considered in this EIS as part of the cumulative impacts analysis, which analyzes the incremental impacts of the proposed Project when added to other past, present, and reasonably foreseeable future actions (see Chapter 4, Section 4.25 Cumulative Impacts). However, there would be an opportunity for the public to provide comments on the proposed Mid-Breton Sediment Diversion at such time the USACE releases the Draft EIS for that proposed project.

The proposed Project is not anticipated to have measurable impacts on ecological resources within the State of Mississippi, including distributaries of the Mississippi River.

---

**Concern ID: 62786****Multiple commenters expressed concern with the impacts of diverted waters on the economy and natural environment of the State of Mississippi.****Response ID: 16368**

---

The proposed Project is not anticipated to have discernable effects on resources outside of the Project area, which is limited to Louisiana, and particularly the Barataria Basin and the Mississippi River birdfoot delta (as defined in Chapter 3, Section 3.1.1 in Introduction and the subsections entitled Area of Potential Effects for each resource heading in Chapter 4 Environmental Consequences). Because these resource-specific areas of potential effects were determined based on the anticipated limits of discernable impacts, negligible to no impacts on the natural or human environment are anticipated in the State of Mississippi from the construction and operation of the proposed MBSD Project.

---

**Correspondence ID:40381**

Frank Adair

To whom it may concern. My name is Carl Adair and I live at 423 Dewey Ave Ocean Springs MS, I live two blocks from the beach and have resided there for 6 years and 15 years on the coast. Access to the bountiful and beautiful gulf coast is the reason why I relocated from the DC metropolitan area to be able to raise my children with access to fishing, sightings of marine mammals and the overall abundance of life. It has not been long since the Corps of engineers opened the spillway which has wreaked havoc on the marine environment, killing dolphins, oysters and saltwater species of fish. The Breton sound diversion will make this an everyday occurrence and the Mississippi gulf coast will be devastated. Please find a more environment friendly way to rebuild land in Louisiana and do not ruin the Mississippi Gulf coast. Even Louisiana Lt Governor Nungesser is opposed to the Idea of the Breton Diversion, that says a lot!

---

**Concern ID: 62367****The Mid-Breton Sediment Diversion would have devastating impacts to the Mississippi Gulf Coast, similar to the opening of the Bonnet Carré Spillway.****Response ID: 15898**

The focus of this EIS is the proposed Mid-Barataria Sediment Diversion. The impacts of the proposed Mid-Breton Sediment Diversion are considered in this EIS as part of the cumulative impacts analysis, which analyzes the incremental impacts of the proposed Project when added to other past, present, and reasonably foreseeable future actions (see Chapter 4, Section 4.25 Cumulative Impacts). WILL THIS HELP MCCALL CREEK . IN THE LATE 1800 MCCALL CREEK MS WAS USED TO SHIP COTTON AND LUMBER TO THE MISSISSIPPI RIVER

---

**Concern ID: 62368**

**The commenter asked whether the proposed Project would help McCall Creek. This creek was used to ship cotton and lumber to the Mississippi River in the late 1800's.**

**Response ID: 15901**

McCall Creek is outside the area of influence, and thus the area of analysis, for the proposed Project. The Project is not intended to benefit McCall Creek. The scope of this EIS is limited to areas in which the Project is expected to have more than negligible effects on the environment, particularly the Barataria Basin and the Mississippi River birdfoot delta. The proposed Project is not anticipated to have measurable impacts on ecological resources within the State of Mississippi, including tributaries of the Mississippi River.

I support the Mid-Barataria sediment diversion and have previously submitted others comments stating same.

I have an idea for a component of mitigation to help people who have been negatively impacted by the diversion - - i.e. fishermen, shrimpers, oystermen, business owners and residents. One of the main concerns expressed by people belonging to this group is that future generations will not be able to follow in the same careers or live in the same homes, and while I support the diversion, I share this concern for future generations. It seems obvious that natural resources may one day run out and that because of climate change, places along our coast will cease to exist.

I am a former resident of Alaska, where political leaders had a similar concern in the 1970s during the boom years when a pipeline was built across that state. They recognized that a lot of oil worth a lot of money was flowing then, but that it wouldn't last forever and that this source of money for the state and its residents would dwindle away and one day disappear.

Through a constitutional amendment, they created what is known as the Alaska Permanent Fund, a stream of money set aside and then invested by a corporation that was created to manage it.

The fund grew very large, and eventually the state began paying a dividend to all Alaskans (adults and children). It's still paid to all Alaskans, but the amount fluctuates from year to year.

What I am proposing is something similar in Louisiana - - not to be created for all residents of the state, though, but only those facing the most negative impacts as a result of this diversion. I'm not sure how many people that would be, but presumably there would need to be some sort of a stringent screening process to ensure the disbursement of money is subject to fraud.

Let's say a chunk of mitigation money would be set aside - - \$40 million for the sake of example. It would be invested by an entity created to manage it. After the sediment diversion is completed (or perhaps at some other stage), people negatively affected by the diversion would fill out applications. For those that are approved, a check would come every year - - perhaps every year for many years. As is the case in Alaska, people who qualify for the funds would not necessarily \*always\* qualify for the funds; i.e., if you move away from Alaska, you no longer can legally collect a permanent fund dividend. Likewise, perhaps a person would no longer qualify if they move from coastal Louisiana to, say, Mississippi.

Through this strategy, the pot of money set aside for mitigation may help people now and for decades to come.

---

**Concern ID: 63332****A large number of commenters expressed general support for the proposed Project.****Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54

---

and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63946**

**Public comments asked to create a fund specifically for those impacted as a result of the diversion and develop a screening process where people can qualify each year to receive mitigation funds.**

**Response ID: 16586**

The Draft EIS evaluates how the Project would impact commercial, recreational, and subsistence fishers as compared to the No Action alternative in Chapter 4, Sections 4.10 (Aquatic Resources), 4.14 (Commercial Fisheries), 4.15 (Environmental Justice) and 4.16 (Recreation and Tourism).

In response to public comments and agency input about the proposed mitigation efforts, CPRA has expanded and refined the mitigation and stewardship measures. However, CPRA's mitigation and stewardship strategies do not include direct payments to fishers. Rather, CPRA's mitigation and stewardship strategies and expenditures focus on establishing sustainable fisheries rather than on compensating individual fishers for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for fisheries in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to fisheries in the early years of the Project's operational life.

The updated fishery mitigation plan, valued at approximately \$54 million, along with other restoration actions and programs being funded by the LA TIG and by the State through LDWF, address the impacts of the Project. The fishery mitigation plan can be found in the Mitigation and Stewardship Plan (Appendix R1 to the EIS). These measures utilize programs and techniques familiar to members of the fishing industry. CPRA and LDWF would develop eligibility criteria as part of finalizing the programs which focus on fishers of Barataria Basin.

These programs would also benefit businesses other than commercial fishers that are directly or indirectly dependent on a successful commercial fishery.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued.

---

Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:40391**

Commenter

I am against the diversions and favor berms along the coast line to help reduce coastal flooding. I believe the berms will hold back the soils and help build the land behind them.

---

**Concern ID: 61976**

**Instead of the diversion, consider using berms or living shorelines along the coast line to help reduce coastal flooding. The berms would hold back the soils and help build the land behind them.**

**Response ID: 15976**

The Draft EIS considered a shoreline protection alternative (including berms and living shorelines) as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.3 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS.

---

**Correspondence ID:40392**

Andrea Declouet

I have lived almost half my 62 years in Ironton, a 200 year-old African American community established by former slaves located on the west bank of Plaquemines Parish. My husband and I also work in this parish; have raised our children, and their children, who attend some of the best schools in the southeast region. I know all of my neighbors and their families. Our church is in the heart of this hamlet we call HOME.

We have survived the ravages of natural disasters such as Hurricane Katrina, Isaac, and others. Every storm has made us stronger and more resilient. I wish I could say the same for our coastline. And yet, I'm not convinced that building a fresh water diversion is the answer to restoring our coastal wetlands; It could become a detriment to our ecosystem and negatively impact our way of life geographically, environmentally, socially, and economically.

The losses outweigh the benefits. The creation of the diversion will forever change the map of Plaquemines Parish. According to the Comprehensive Master Plan for this region, that change seems intentional and part of a larger agenda. I'm just sayin'.

Furthermore, in the event of a possible 20-25ft. storm surge, there are NO GUARANTEES that Ironton will be protected and the diversion will only exacerbate the problem.

Therefore, I am totally against the construction of the Mid-Barataria Fresh Water Diversion. Come up with something better.

---

**Concern ID: 62292****Ironton will be at risk from storm surge which would be made worse by the diversion.****Response ID: 15810**

As described in the Draft EIS Chapter 2, Section 2.8 Action Alternatives Carried Forward for Detailed Analysis, the proposed Project design includes earthen guide levees that would be constructed along both sides of the diversion conveyance channel. The portion of the guide levees on the protected side of the New Orleans to Venice Levee system (NOV-NF-W-05a.1) would be designed and built as hurricane and storm damage risk reduction against storm surges that may enter the diversion channel. A gated control structure would also be built on the Mississippi River side of the conveyance channel, and the gate would be closed prior to and during storm events.

Draft EIS Chapter 4, Section 4.20.4.2 in Public Health and Safety provided projected changes in storm surge elevation due to the proposed Project, including increased storm surge elevation in the vicinity of the portion of the NOV-NFL Levee system which provides risk reduction to Ironton. Depending upon the strength and path of a given storm, storm surge could overtop the NOV-NFL Levee, both with or without the proposed Project; however, as described in Section 4.20.4.2, the proposed Project would increase the risk and volume of potential overtopping.

---

**Concern ID: 62778****Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures

contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures

---

contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:40393**

Ben Gegenheimer

I grew up fishing down in Plaquemines Parish as boy and teenager, from Myrtle Grove, to Happy Jack, Lake Hermitage, and Empire. I want for nothing more than the wetlands to be restored in and around those areas. But I do not believe that this project is the way to go about doing so. It will devastate too many lives and families in the immediacy of the project. I hope that other avenues will be explored instead of this expensive and devastating project.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

New Orleans, LA 70118

To Whom It May Concern,

The board and staff of Coastal Communities Consulting, Inc. (CCC), a 501(c)3 organization headquartered in Gretna, believe that the Mid-Barataria Sediment Diversion (MBSD) project can and should exemplify community leadership in restoration decision-making. The next decade is a significant opportunity for Louisiana to establish itself at the vanguard of community-level environmental adaptation planning and restoration mitigation. CCC feels strongly that our state government, elected officials, the Coastal Protection and Restoration Authority and other state agencies, and local jurisdictions must pivot to centering community expertise as they carry out the MBSD. This will open the door to creating a truly equitable restoration landscape; one where communities impacted by the MBSD and future coastal restoration projects are proactively engaged and consulted as restoration projects are planned, designed, and implemented. CCC is well positioned to be a valued partner to the State of Louisiana in charting a renewed path forward. We are pleased to submit these comments to the U.S. Army Corps of Engineers, New Orleans District, as part of the Draft Restoration Plan and Environmental Impact Statement: Mid-Barataria Sediment Diversion public comment period.

**About Coastal Communities Consulting and its Clients**

CCC supports the economic and environmental stability of coast-dependent small businesses in Southeast Louisiana. For a decade, we have provided technical assistance, economic development, environmental education, and continued disaster assistance to over 2,000 residents (fisherfolk, their families, and other coast-dependent businesses and individuals) of Orleans, St. Bernard, Plaquemines, Jefferson, Lafourche, and Terrebonne parishes. Our clients are members of Southeast Asian American, Central American, Black, Cajun, and Croatian communities whose homes and families and businesses overwhelmingly are located in low-income areas. Southeast Louisianas fisheries-dependent residents have endured more overlapping disasters in one generation than anyone can reasonably expect of a community. They have suffered the levee breaches of Hurricane Katrina, the Deepwater Horizon oil spills ongoing impacts on fish stock, the historic flood events of 2019, and COVID-19. Many of these same fishers have also survived forced refugee flight from Southeast Asia.

CCC understands the MBSD is designed to build land, and thus, increase the environmental and economic resilience of Southeast Louisiana to be sustainable through future disasters. As a non-profit dedicated to the futures of the regions commercial fisheries, however, we also understand that while restoration projects like the MBSD are discursively designed to protect fisherfolk and the ecosystems they depend on, in practice, the planning of these projects

often leave out the regions most vulnerable coast-dependent residents. We commend the efforts made by CPRA and other agencies to include fishers, at the behest of organizations like CCC, in meetings and discussions and planning processes. However, we would challenge all government agencies involved with MBSD to do more in order to overcome decades of rift and distrust between commercial fishers and policymakers.

We cannot emphasize enough that in spite of these tensions, commercial fishermen and coastal residents are not against restoration. CCCs clients have fought to defend their ecosystems, from resisting the land-wasting effects of exploratory oil drilling to working with agencies and academics to make their fishing techniques more environmentally sound. At the same time, they have cried out for coastal restoration for decades. The tension between fishers and coastal projects has always arisen not because of the projects intended goals, but given the processes used to develop and implement coastal restoration projects.

CCCs clients arent environmental justice communities; they are communities experiencing environmental injustice. Environmental justice demands that all communities who are vulnerable to racial, ethnic, economic, and ecological violence are not just considered, but meaningfully involved in the development, implementation, and enforcement of environmental laws, regulations, and policies. This is the purpose of NEPA, the DEIS, and ultimately, of the CPRA, whose mandate is to establish a safe and sustainable coast that will protect our communities, the nations critical energy infrastructure and our bountiful natural resources for generations to come . For years, fishers have watched CPRA and other agencies debate the merits of allowing the Mississippi River to inundate the fish, crab, shrimp, and oyster ecosystems they rely on. For them, it is clear that the diversion will make fishing more economically vulnerable in favor of building marsh land-a trade-off that makes their families particularly susceptible to poverty, environmental instability, and resettlement. Not surprisingly, fisherfolk are scared.

The Coastal Master Plan and MBSD are huge undertakings with a myriad of needs and best outcomes to consider. We get it! But this means little to a shrimper who is worried about what a devastated brown shrimp population will mean for his daughters finishing college or her ailing mother who has accrued acute healthcare costs. Fishing is not just our clients livelihoods-its their lives. In light of this, and coupled with rapidly moving disasters and environmental shifts, we believe that doing business as usual is no longer an option.

Therefore, we recommend an aggressive program of mitigation, adaptation support, and MBSD-adjacent coastal support. To carry out effective socioeconomic and place-based planning, we recommend that CPRA build coalitional partnerships across state agencies and parish governments. This includes partnering with community leaders to educate all agency partners about the current state of each fishery, what is being taken into consideration when designing mitigation measures, and the ways the mitigation measures forwarded in the DEIS will be implemented. It also means consistently sharing this information with impacted communities and community-based organizations, and collaborating with them to ensure that their needs are met in light of dynamic impacts to their lives and livelihoods.

In the eight years since our board and commercial fishing clients made us aware of the proposed sediment diversions in Barataria Bay and Breton Sound, CCC has listened to and followed Southeast Louisianas coast-dependent communities expertise. Through our daily work and engagement with fisher families and business owners, it was not difficult to locate where we could begin to proactively address the potential impacts of MBSDs design and

implementation on fishing-dependent communities. While commercial fishers don't like change, CCC has helped several families begin to adapt their businesses and lives ahead of MBSDs likely impacts to the industry. Our adaptation strategies include much of the DEIS and draft Restoration Plans mitigation and stewardship measures. As the MBSD moves forward, CCC looks forward to working with, educating, and engaging CPRA and others about effective adaptation. Together, we can effectively develop an equitable and just adaptation and mitigation program for not just MBSD, but ongoing restoration throughout the coast. In this collaborative effort, our organizations ultimate goal is to establish a comprehensive Community Master Plan that will be implemented alongside CPRAs Coastal Master Plan.

---

### CCC's Recommendations

Below, we have identified three primary areas of support that are necessary to equitably help fisheries and other coast-dependent communities adapt to the impacts of the proposed MBSD. Under each area, we offer specific programming and/or approaches that will allow for their effective implementation. We have identified these equitable mitigation measures in concert with the over 200 fishing-dependent residents in MBSDs impact zone who have submitted their own public comments, as well as a myriad of collaborators with expertise in community support, environmental change, and strategic planning.

#### I. MITIGATION PLAN

The mitigation measures proposed in the DEIS and draft Restoration Plan are a good first step. However, to equitably mitigate the impacts of the MBSD, it is important for vulnerable communities to contribute to how CPRA identifies and mitigates the diversions likely effects on their lives and livelihoods. This includes establishing dedicated and effective funding streams to support all communities, small businesses, and workers impacted by MBSD, from construction to regular operation. Importantly, if the MBSD has as little negative impact on commercial fisheries as possible, this funding is less likely to be exhausted or need to be refreshed regularly.

" Establish and maintain an MBSD Fisheries Mitigation Fund - Mitigation programs currently identified in the draft EIS and LA-TIG Restoration Plan include retrofitting boats, training in new fields, and training in marketing. Establishing funding for fishers to take advantage of these programs as it suits their needs is the most effective way of both spending much of the \$33 million currently identified for fisheries mitigation and supporting the industry through MBSDs impacts. Throughout the first five years of MBSDs operation, and with the option to extend its timeline, the Fisheries Mitigation Fund will pay out annually to fishery-dependent business owners and workers.

o Recipients of the funding will be able to identify how best to use this funding, be it for skills training or boat upgrades, at their discretion.

o Annual payments should be based on losses, as evidenced in fishers trip tickets-this information is collected by the Department of Wildlife and Fisheries.

" Adaptive management planning - MBSDs operations, management, and monitoring will critically shape how decisions are made regarding adaptation. To ensure both state transparency and the incorporation of valuable coastal expertise, fishery leaders must be contracted to participate in planning and executing the adaptive management of the MBSD.

" Identify equitable, future-looking approaches to home and business buyouts - Coast-dependent communities will experience diversion-induced flooding and other impacts to both their homes and businesses. To this end, mitigation measures should include establishing an equitable approach to assessing just compensation and buyout programs for homes and other structures throughout Southeast Louisiana-this process should allow residents to buy equivalent or better businesses and homes elsewhere. This funding should also ensure that every resident in the impact area can raise their homes without incurring personal cost.

" Identify for whom job buyouts might be necessary - In lower Plaquemines Parish, buyouts may be a bigger necessity than expected, especially for the families who rely on oyster work. We understand that CPRA has begun the process of relocating oyster leases. However, leaseholders represent a very small group of wealthy people that can easily relocate their businesses and homes. Their workers, who make up the bulk of the fisheries labor, cannot. For them, buyouts may be the only option. CPRA must consider job buyouts or other measures that justly compensate workers who rely on but have no economic control over their fishery.

" Create fisheries-specific grant and loan opportunities - This will help businesses and workers who will be impacted by MBSD adapt in anticipation of the diversion going live, as well as during its implementation.

" Support workforce development - This includes implementing policies that require contracting entities to hire local residents and fishermen to work on building and managing the MBSD.

- o Encourage and fund area colleges and universities to build out curriculums and train younger fishermen for new careers and job opportunities should they want to transition out of the industry. (CCC & Delgado have been running one such program for two years)

- o Develop scholarships to help pay for tuition.

- o Develop more opportunities for fishermen's wives to work and/or start small businesses to create an alternative income stream for their families.

- o Develop certifications and incentivize youth to choose water-base careers.

## II. ONGOING BUSINESS ADAPTATION PLANNING & SUPPORT

While the DEIS and draft Restoration Plan offer a series of mitigation measures to support fisheries, they do not comprehensively address the complex effects MBSD is likely to have on fishers and other vulnerable coast-dependent communities. As it is the first project of its kind, the true impacts of the MBSD will not be known until the structure begins operation. However, what is known today is that our fisheries and navigational waterways will absolutely be affected, and may be altered forever. While our fishing communities may continue to advocate against the MBSD, most understand that, historically, a project that the government puts this much money and effort into will happen.

For more than two years, CCC has collaborated with clients to create adaptation planning that reflects fishers' expertise of the land and water they rely on. The fact that fisheries-dependent families have already begun piloting the adaptation measures included below is evidence that CPRA and other agencies should allay impacted communities' fears by proactively funding such strategies. Most importantly, they should look to fishers to identify their own specific adaptation needs. To do this, CPRA should immediately begin partnering with community-

based organizations (CBOs), who have robust technical assistance and community service expertise, and who have been designing and implementing adaptation planning for several years. Federal and state agencies should partner with CBOs to carry out extant adaptation planning and programs. In this process, CBOs should be compensated for their adaptation work and the resulting adaptation plans should be funded by the state.

" Information Sharing and Education - In order to properly adapt and plan, CPRA and other agencies need to transparently collaborate with residents who will be impacted by the MBSD. This includes circulating consistent, up-to-date, and accessible information regarding the MBSDs progress-toward-implementation and its likely impacts to coast-dependent businesses and communities.

- o CPRA to develop a public relation/community outreach office within the agency.
- o Include community-based organizations (CBOs) in every stakeholder group that CPRA has created within its decision-making structure, and in regard to the MBSD in particular. This will make CPRAs approach to decision-making more equitable by ensuring that communities, not just large stakeholders, are represented throughout the Coastal Master Plan process.
- o Fund CBOs who have the respect and trust of their communities to do outreach and education regarding restoration. Conducting outreach and education includes designing community meetings, supporting community members in participating in decision-making processes, and elevating community expertise that has historically been overlooked.
- o Outreach materials, presentations, and meetings should be translated not only into several languages, but should be presented in plain language that is accessible to laypeople, whose stakes in understanding the MBSD are highest.

" Fund community engagement and adaptation planning; community-based organizations - CBOs like CCC devote the majority of their funding to make technical assistance (TA) accessible (linguistically, culturally, geographically, and financially) to the regions most vulnerable residents. While TA is essential to the MBSD rollout (see above), it has not historically been funded by agencies carrying out large-scale projects in vulnerable communities. As such, when they have reached out to communities to finalize extant plans, CPRA and others have not elicited the information they are looking for. However, CBOs know how to provide the direct assistance residents need to help them participate in surveys, understand programs, requirements, and processes, and complete applications to be awarded benefits and grants. They also know how to design and carry out effective adaptation planning. To address this, CPRA and LA-TIG can use a percentage of their mitigation budget to ensure that CBOs can continue to carry out extant adaptation planning and mitigation efforts that align with the DEIS. Additionally, this funding can and should address the gaps in community TA support throughout the MBSD impact area to ensure that all impacted residents have access to information and direct engagement.

" Pilot fisheries technology and innovation - To make fishers more adaptive, it is important that they have access to technologies that enhance their productivity and reduce the cost of their operations. Funding should be allocated for R&D dedicated to collaborating with fishers to innovate and change the way their operations work. This includes how harvesting is carried out, either by means of shrimp pots, lighter boats, additional refrigeration, and more. Additionally, salinity tanks for finishing oysters, mechanisms for

moving baskets of oysters away from flooding, and a bevy of other potential innovations can mitigate losses for commercial fisheries, improve the quality of the harvest, and may bolster the industry as a whole.

" Make broadband internet available coast-wide - COVID-19 has shown us that internet is not a luxury; it is a utility. Louisiana must make broadband accessible and low-cost for all residents. Fisherfolk who have never been required to use technology before have begun to both in light of the pandemic and to access more technical business and social support. It can do so by partnering with federal agencies and NGOs who are already implementing more robust rural broadband access in anticipation of the proposed US Infrastructure Bill.

" Invest in economic development - By investing in industry sectors, such as tourism/ecotourism and more, and further diversifying the regional economy, the state can help create jobs to support displaced fisherfolk and other coast-dependent workers. It will also enhance the cultural viability of the region, as fishers of varying backgrounds share their cultures and knowledge with tourists, who will in turn support communities maintaining their generational practices. Examples include cultural immersion fishing tours, recreational fishing and cooking classes, and tours designed to teach visitors about ecosystem change and restoration. This is a win for the job seeker and also for local parishes and the state as new revenues can be generated by new industries.

### III. MBSD-ADJACENT COASTAL SUPPORT

This area of support identifies actions that CPRA and other state and federal agencies can carry out to bolster fishing-dependent communities stability in the present and future. Applied concurrent to the MBSDs construction and operation, these approaches will ensure that the project is carried out justly and equitably overall.

" Establish governmental coalition-building and inter-agency education - To better develop and implement effective mitigation programs and adaptation support, CPRA should take the lead on educating and informing other inner state agencies about the MBSDs design, as well as its implications for and impacts on coast-dependent communities. Involving more agencies with a variety of expertise in implementing MBSD will mobilize a variety of resources to help CPRA effectively implement and mitigate the diversion. Whats more, this will make more resources available to help affected residents adapt and make use of more effective and equitable mitigation programs. Examples include partnering with LED to develop and offer fisheries-specific loan products, and ensuring that the Louisiana Department of Wildlife and Fisheries do not raise license fees up to 300%. Further, collaborating with HUD to help residents with raising homes as well as establishing a first- time home buyers program to assist with relocation.

" Address needed changes to fisheries permitting, licensing, and compliance - More than 80% of the states much larger skimmer fleet will experience a reduction in their catch due to the fresh water driven by the MBSD. In light of this, the Louisiana DWF and NOAA must make major changes in how they administer and regulate federal fishing permits and licenses. As MBSD promises to shift where shrimp and other species are in the basin, adapting to this will require most fishers to go out further from shore and/or further east or west than they currently do. To ensure that fishers have the best chance of maintaining their industries over the life of the MBSD, restrictions that prevent them from working in federal waters must be lifted.

- o The federal shrimp permit has been under moratorium since 2006. NOAA should lift the moratorium and grant open access to the permit and/or the state should extend the state line further from shore.
- o The majority of our states shrimp fleet are Asian American immigrants. While they are legal permanent residents, federal law prohibits anyone who is not a US citizen from operating a vessel outside state waters. Obtaining citizenship can take a year or more, making this rule incredibly restrictive for residents who work seasonally. Lifting this restriction is critical for immigrant fishers potential to maintain their fisheries as the MBSD begins operation.
- " Promote Louisiana seafood - While one-on-one marketing support is included in the DEIS, it is imperative that the state effectively supports and promotes its fisheries. To this end:
  - o Collaborate with LA restaurants, seafood distributors, farmers markets, and grocery stores to create a market for LA seafood.
  - o Actively enforce House Bill No. 335/Act 372: Restaurant Notice of Foreign Seafood, which requires restaurants to disclose the origin of the seafood they serve.
  - o Create a national network of LA seafood champions to promote LA seafood in major cities.
- " Carry out smaller coastal restoration projects
  - o Work with impacted parishes to build safe haven sites, which will protect boats against the potential impacts of the MBSD or other sudden disasters.
  - o Plaquemines Parish has lost fisheries business because many shrimp boats cannot easily or dependably get through canals or lock infrastructure. This forced shrimpers to take their catch elsewhere. To avoid this and other safety concerns, the state must dredge commercial fishing waterways going to and from docks and fishing grounds.
- " Provide other kinds of governmental support
  - o Create standards to control and/or cap the price of shrimp and other seafood paid to fishers at the docks.
  - o Provide diesel subsidies for working boats.

---

To conclude, the construction, implementation, and operation of the first large-scale river sediment diversion must meaningfully include and honor the generational and place-based knowledge of coast-dependent residents.

As an organization that has devoted itself to the economic, cultural, and environmental health of Southeast Louisianas fisheries, CCC believes that fisheries are a meaningful part of Louisianas present and future. The above mitigation, adaptation, and MBSD-adjacent governmental support strategies emerge directly from our clients own comments and the expertise they have shared with us for over a decade about the land and water they love. We want to make their lives more livable, and we look forward to working with CPRA, LA-TIG, and many other agencies to ensure this.

---

Please reach out to us with any questions regarding these comments. We look forward to hearing from you.

Sincerely,

Sandy Ha Nguyen

**Concern ID: 61929**

**Commenters expressed that southeast Louisiana’s fisheries-dependent residents have endured more overlapping disasters in one generation than anyone can reasonably expect of a community. They have suffered the levee breaches of Hurricane Katrina, the DWH oil spill’s ongoing impacts on fish stock, the historic flood events of 2019, and COVID-19. Many of these same fishers have also survived forced refugee flight from Southeast Asia. Fishing is not just their livelihoods-it’s their lives. One commenter suggested that at a very general level the Applicant’s Preferred Alternative should be implemented when low-income, vulnerable fishing communities see a rebound in their profitability to a point where they can financially prepare for the proposed MBSD Project.**

**Response ID: 16280**

As noted in the purpose and need, the proposed Project is intended to support coastal restoration projects. Such projects may reduce the impacts of tropical events such as hurricanes and associated flooding. Without the Project, adverse impacts on commercial shrimp, oyster, crab, and certain finfish fisheries are anticipated due to reduced marsh habitat and increased salinity over the long term (that is, 50 years), but more rapidly after 2050 for shrimp and oyster, as discussed in Chapter 4, Section 4.14 Commercial Fisheries. It is anticipated that as the coastal areas, including wetlands in the Barataria Basin, continue to erode, communities would be increasingly vulnerable to environmental disasters and the economic effects of declining fisheries. While the proposed Project would not stop subsidence and sea-level rise and associated impacts in the Barataria Basin, by 2070, the proposed Project is projected to create approximately 13,400 acres of land in the Barataria Basin and result in the loss of 3,000 acres of land in the birdfoot delta as compared to the No Action Alternative.

CPRA has expanded and refined its Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG’s Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61959**

**State government, elected officials, CPRA and other state agencies, and local jurisdictions must pivot to centering community expertise as they carry out the proposed MBSD Project. This would open the door to creating a truly equitable restoration landscape; one where those impacted by the proposed MBSD Project and future coastal restoration projects are proactively engaged and consulted as restoration projects are planned, designed, and implemented.**

**Response ID: 15905**

Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area, in an effort to reach out to community groups to gather information related to their concerns regarding proposed MBSD Project. More recently, CPRA has engaged the public through meetings with the communities impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities including fishers. This included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. A summary of these public engagement meetings and additional outreach can be found in Chapter 7 Public Involvement of the Final EIS. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. Refer to the Final Mitigation and

Stewardship Plan in Appendix R1 for mitigation and stewardship measures that CPRA states it would implement as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public

---

through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSB Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

---

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as

special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63132**

**Organizations, such as GNO, Inc., Coastal Communities Consulting, and community-based organizations should serve as connectors between CPRA, other state and federal agencies, and fishers and the seafood industry to plan and implement mitigation, and to ensure mitigation reflects environmental, economic, and community needs and changes over time. Mitigation should include funding for community-based organizations to provide this support in developing and carrying out mitigation.**

**Response ID: 16516**

CPRA engaged the fishing community potentially impacted by the Project through public meetings to solicit input on mitigation strategies. Further, CPRA engaged community-based organizations including Coastal Communities Consulting to assist in engaging minority fishers in reviewing and commenting on the Draft EIS, and soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded. CPRA also plans to create outreach materials in easy to read and understand formats for distribution to the public. This would include translated materials for members of the community who do not speak or read English.

CPRA's Mitigation and Stewardship Plan does not currently provide for use of community-based organizations to distribute mitigation funds or to implement mitigation and stewardship measures. However, community-based organizations have been engaged to assist in providing information to community members regarding available programs, to assist in developing eligibility criteria, and to assist in completing any application processes. CPRA will continue to coordinate with community-based organizations in implementing the Final Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS

---

Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63254**

**To ensure that fishers have the best chance of maintaining their industries over the life of the MBSD Project, restrictions that prevent them from working in federal waters must be lifted.**

**Response ID: 16530**

The federal moratorium will be up for renewal in 2025, and NOAA is committed to reviewing all relevant facts and circumstances at that time; however, adjustment to federal fishing moratoria is outside the purview of NRDA actions and USACE permitting actions.

---

**Concern ID: 63703**

**Commenters request that the agencies involved with developing the EIS meaningfully engage with affected EJ communities/organizations to inform the development of EJ mitigation measures. Specifically, it was requested that relevant materials are translated and presented in plain, non-technical language.**

**Response ID: 16508**

CPRA engaged the communities potentially impacted by the Project, including low-income and minority communities, through public meetings to solicit input on mitigation strategies. Further, CPRA engaged community-based organizations to assist in soliciting additional feedback from low-income and minority community members on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 of the Final EIS. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). CPRA will continue to engage with potentially impacted communities and organizations with EJ concerns concerning the implementation of the mitigation and stewardship measures.

---

Additionally, CPRA has and will continue to provide requested translation and provide key documents and information on the Project in English, Spanish, and Vietnamese.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Louisiana Wildlife Federation

Rebecca Triche

Louisianas coast is critical to not only the people who live, work, and recreate here, but to the entire nation. World-class fishing attracts people from all over the world. Our ports are a major player in international trade. The nations energy needs are largely supported by the oil and natural gas industry located along our coast.

Our coast is disappearing. It is vital that bold action is taken to help protect communities, businesses, and natural resources from the devastating effects of hurricanes, storm surge, and sea level rise. The single biggest thing that can be done to help mitigate some of this loss - and address this crisis - is to allow the Mississippi River to do what its done for thousands of years: build land with its sediment and nutrient-rich water.

Levees constructed along the river with the goal of flood protection and promoting easier navigation have cut off the rivers ability to sustain the delta, resulting in continued land loss - about 4800 square kilometers in less than 100 years, and almost a quarter of that was in Barataria Bay. Hurricane Katrina only compounded the problem. Additionally, in 2010, The Deepwater Horizon oil spill exacerbated our coastal crisis even further and severely impacted wildlife that depend on our estuaries. Approximately 95% of the marsh oiling along the Gulf occurred in Louisiana - the heaviest of that oiling was in the Barataria Basin. The basin was especially hard hit with land loss rates doubling or tripling after the oil spill. Since the 1930s, Barataria Basin has lost more than 276,000 acres of land; if nothing is done, that number will nearly double in just 50 years. Without the Mid-Barataria Sediment Diversion (MBSD) project, this basins estuary will collapse.

A problem of this magnitude requires innovation. The MBSD project is one of the largest environmental infrastructure projects in U.S. history. Leveeing of the Mississippi River resulted in a saltier Barataria Basin, causing saltwater species to make a northward shift; without restoration, these changes will continue, resulting in a loss of species that rely on productive freshwater and intermediate wetland habitats. Reconnecting the river to the basin will maintain vital wetlands and restore the health and vitality of the entire ecosystem.

Using diversions as a method of coastal restoration has been studied for over 35 years; the results of these studies over the last few decades has made it clear that reconnecting the river to the delta is the most viable option to combat coastal land loss. We dont have decades more to waste.

LWF supports the preferred alternative as outlined in the draft Environmental Impact Statement for the MBSD as well as the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

The Mid-Barataria Sediment Diversion is the cornerstone of Louisianas Coastal Master Plan - which LWF has always supported - and will help support and enhance the lifespan of other coastal restoration and protection projects. Combined with other proposed restoration projects, the MBSD would build and preserve more than 17,000 acres of wetlands over the next 30 years to restore critical wetland habitat injured by the oil spill. It is exactly the scale needed to address the very serious challenges facing Louisianas coast.

As the project advances, it is important that federal and state decision makers center community needs in planned mitigation and stewardship efforts. This project will have many positive, long-term benefits, including increased storm surge protection, job creation and regional economic impact during construction, and increased productivity of natural resources. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. The Trustees must work proactively and collaboratively with potentially impacted communities to develop and implement ideas and proposals for adaptation and mitigation, and be as detailed and transparent as possible throughout the process.

LWF encourages the development and implementation of a robust adaptive management program that incorporates knowledge gained from monitoring of the project over time and considers input from key stakeholders.

A future without the Mid-Barataria Sediment Diversion is a future we cannot afford, which is why LWF supports the preferred alternative outlined in the draft Environmental Impact Statement and the expenditure of Deepwater Horizon settlement dollars to pay for the projects construction and associated mitigation and stewardship activities.

The MBSD will be a game-changer for the long-term health of communities and wildlife habitat in the Mississippi River Delta, including places where alligators, crawfish, red drum and largemouth bass abound.

Our Sportsmans Paradise attracts people from all over the world with its fisheries, wildlife, and abundant natural resources. That paradise is in serious peril and needs large-scale restoration projects like the MBSD. This project is critical to turning the tide on the states land loss crisis and protecting vulnerable communities from hurricanes and sea level rise, while also ensuring the long-term health of the ecosystem and wildlife in the face of a changing climate and coast. Simply put, the Mid-Barataria Sediment Diversion is our best hope for a sustainable future.

Louisiana Wildlife Federation is a statewide conservation organization representing more than 6,500 members and 19 affiliate organizations supported by hunters, anglers, hikers, paddlers, birders, campers and other outdoor enthusiasts.

Sincerely,

Rebecca Triche

Executive Director

---

**Concern ID: 62157**

**Since the 1930s, the Barataria Basin has lost more than 276,000 acres of land; if nothing is done, that number will nearly double in just 50 years.**

**Response ID: 16180**

The commenter's concerns regarding the rates of land loss in the region were considered in the Draft EIS in Chapter 3, Section 3.1.4 Overview and History of the Project Area and in Section 3.2.1 Geology, Topography, and Geomorphology. To clarify, a discussion has been added to further explain currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This

---

discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

---

**Concern ID: 62675**

**Commenters noted that the impacts of the DWH oil spill on wetlands, wildlife, birds, communities, and land loss are still felt by this region and in particular, Barataria Basin where 95 percent of the oiling occurred. These impacts are exacerbated by decades of saltwater intrusion, sea-level rise, and subsidence.**

**Response ID: 16497**

The impacts of the DWH oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss of the EIS notes the ongoing impact of the DWH oil spill on wetlands, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species of the EIS provides an overview of the adverse impacts of the oil spill on key aquatic species within the Barataria Basin.

The LA TIG agrees with the commenters that the impacts of the DWH oil spill are significant in this region and thus the LA TIG is committed to continuing to plan and implement significant restoration projects like the LA TIG's Preferred Alternative in the Restoration Plan. The LA TIG's Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin. These habitats are critical components of the broader northern Gulf of Mexico ecosystem and suffered the greatest degree of oiling in Louisiana due to the DWH oil spill.

---

**Concern ID: 62732**

**Leveeing of the Mississippi River resulted in a saltier Barataria Basin, causing saltwater species to make a northward shift; without restoration, these changes will continue, resulting in a loss of species that rely on productive freshwater and intermediate wetland habitats.**

**Response ID: 16110**

The commenter correctly notes the impacts from the No Action Alternative, as discussed in Chapter 4, Sections 4.10.4.4 and 4.10.4.5 in Aquatic Resources of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter,

---

including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63052**

**Combined with other proposed restoration projects, the proposed MBSD Project would build and preserve more than 17,000 acres of wetlands over the next 30 years to restore critical wetland habitat injured by the DWH oil spill.**

**Response ID: 16058**

The Draft EIS disclosed the projected maximum wetland gains of 17,100 acres associated with the proposed Project at year 2060 before dropping to 12,700 acres at year 2070 in the Barataria Basin; these wetland gains over time are quantified in Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. and are consistent with the commenter's statement. When considered with other reasonably foreseeable future projects, cumulative wetland gains in the Barataria Basin could be greater, as presented in Section 4.25 Cumulative Impacts, Wetland Resources and Waters of the U.S. of the Draft EIS.

---

**Concern ID: 63337**

---

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

MGHOA

Melinda Guccione

My husband and I are homeowners and permanent residents of Myrtle Grove. It is an idyllic neighborhood with a small but diverse population. We fish and crab off of our docks, watch the wildlife, water fowl and bottlenose dolphins. Our boats are docked in our backyards. It is a lifestyle that you cannot put a "fair market value" on. We chose to live here and face mother nature. It can be a harsh environment at times. Hurricane season, high tides etc. It all comes with the territory, but manmade disasters are another matter.

The CPRA with the Army Corp of Engineer's blessing wants to ruin lifestyles, destroy protected species, ruin fishing, oyster harvesting and livelihoods, to restore 27 square miles over a 50 year period. So much more restoration could and should be done, so much further out and right now. Not over a 50 year period. We are expected to give up so much for so little. I don't support this in any way.

Sincerely,

Melinda Guccione

---

**Concern ID: 62013**

**The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.**

**Response ID: 16210**

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in

---

Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures

---

contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Commenter

The state's restoration plans are inadequate to meet the challenges of coastal restoration and the climate crisis. While the state dithers on real climate action, thousands of acres of our coast wash away each week. Though this diversion project will restore some crucial land, more attention should be paid to the political economy of coastal restoration, which serves corporate interests in the navigation and fossil fuel industries.

The Walton Family Foundation would like me to speak to those corporate interests, specifically in support of the preferred alternative in the Draft EIS and to encourage the use of Deepwater Horizon settlement funds. While I agree with both these priorities, the ability of corporate interests to tilt the agency's decision by flooding it with supportive public comments undermines the fairness, transparency, and ultimate success of this project. The Army Corps and NPS should be aware of the impacts of corporate-funded advocacy campaigns in support of this diversion.

Louisiana needs much more substantial protection to weather the crisis of climate change than the Mid-Barataria Sediment Diversion can possibly provide. The project is a stopgap, enabling oil and gas and navigation industries to extract every drop of value from this land and these communities before drowning them in the Gulf.

---

**Concern ID: 61958**

**The ability of corporate interests to tilt the agency's decision by flooding it with supportive public comments undermines the fairness, transparency, and ultimate success of this proposed Project. USACE and NPS should be aware of the impacts of corporate-funded advocacy campaigns in support of this diversion.**

**Response ID: 15904**

Comment acknowledged. Public participation is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

---

**Concern ID: 62665**

**Commenters suggested that the proposed Project would achieve some benefits relative to the No Action Alternative, but that even if the modeling is correct (which it probably is not), the projected benefits provided by the Project would be very small compared to amount of habitat that is expected to be lost in the Barataria Basin over 50 years. If the models used for the EIS turn out to be accurate, more than 43 percent of the land in the Barataria Basin will have disappeared even with the Project in 30 years. During that time, 105,000 acres of land will be lost, with the Project sustaining only 17,300 more acres than the No Action Alternative (5 percent of the basin's current land area). Because of this background of large land loss, the proposed Project could only be considered a stop-gap measure. Further, commenters cited sources indicating ongoing debate about the effectiveness of large-scale sediment diversions as a land-building strategy and recommended those uncertainties be addressed in the Draft EIS**

**Response ID: 16624**

The issues raised by the commenters were considered in the Draft EIS. For example, the proposed Project's long-term influence on land building and wetland creation has been modeled extensively through engineering and design and the impacts (beneficial and adverse) are described in Sections 4.2 (Geology and Soils), 4.4 (Surface Water and Coastal Processes) and 4.6 (Wetland Resources and Waters of the U.S.) of the EIS. With regard to modeling conducted to determine impacts of the proposed Project, the Delft3D Basinwide Model projections of Project impacts include uncertainties. Uncertainties are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 (Model Limitations and Uncertainty), and in detail in Appendix E (Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties). Uncertainty in model results is recognized in Table 4.2-4 found in Section 4.2.3.2.2.1 Geology, which indicates that land areas are considered accurate within +/- 200 acres and that the error in land gains is +/-300 acres.

As part of developing the EIS, the USACE, together with members of the LA TIG (including cooperating agencies and CPRA), reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives. The cited studies were reviewed and included in relevant analyses in the Draft EIS.

The LA TIG acknowledges the commenters' concerns. As described in the LA TIG's Draft Restoration Plan, the Project would reestablish deltaic processes that deliver sediment, fresh

---

water, and nutrients; improve the function of existing habitats; and develop deltaic habitats that connect nearshore and offshore ecosystems. The LA TIG expects that the Project would result in the creation of a maximum of 17,300 acres of land in the Barataria Basin by year 30 of operations; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 [Alternative 1 Description] of the Restoration Plan). The LA TIG agrees that, with or without the Project, coastal Louisiana and the Barataria Basin would experience tremendous land loss. However, the LA TIG believes this background of large land loss makes the habitat created by the proposed Project even more important. Relative to other types of incremental approaches (for example, marsh creation through the application of dredged sediment), the Project would reconnect and reestablish sustainable deltaic processes and support the long-term viability of existing and planned coastal restoration efforts. All citations referenced by the commenters were included in the Final EIS and thus were considered by the LA TIG in the Final Restoration Plan.

Charles Elkins

CCA Mississippi is opposed to this diversion project. We feel the immediate damage will far outweigh any potential benefit.

---

**Concern ID: 62634**

**The proposed Project would cause excessive harm to fisheries (for example, oysters and brown shrimp), dolphins, communities and recreational uses, which is unacceptable and would make its implementation a clear violation of OPA. OPA regulations states that proposed restoration actions should be evaluated by “the extent to which each alternative will prevent future injury as a result of the incident, and avoids collateral injury as a result of implementing the alternative”. Because the Project would injure species that were harmed by the Deepwater Horizon oil spill, it should not be implemented, even if it does benefit some habitats and species. Some commenters argued it was also inconsistent or in violation of the 2013 U.S. Court Consent Decree and the BP plea agreement relevant to the National Fish & Wildlife Foundation (NFWF) funds.**

**Response ID: 16650**

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is not evaluating the proposed Project for compliance with OPA and not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG’s Draft Restoration Plan, OPA, or NRDA processes represent solely the views of the LA TIG, not USACE.

The potential collateral injuries of the proposed Project were considered in the LA TIG’s Draft Restoration Plan.

OPA requires that Trustees develop and implement a plan for restoration, rehabilitation, replacement, or acquisition of the equivalent, of the injured natural resources under their trusteeship. See 33 U.S.C. § 2706(c). OPA further requires federal agencies to propose regulations for the “assessment of natural resource damages.” See § 2706(e). Under 2707(e)(2), any assessment of natural resource damages made in accordance with these regulations creates a rebuttable presumption on behalf of a Trustee in any administrative or judicial proceeding under the Act.

As required by OPA 2706(e), NOAA developed regulations outlining a process for the assessment of natural resource damages. These regulations (hereinafter “NRDA regulations” at 15 CFR Part 990) also include a process for restoration planning, including the development and evaluation of restoration alternatives.

The 2016 U.S. Consent Decree with BP provides that monies received under the settlement for natural resource damages will be spent as outlined in restoration plans adopted by the Trustees consistent with 15 CFR 990. See Paragraph 19, and Appendix 2. The LA TIG’s Restoration Plan is consistent with 15 CFR 990.

Title 15 CFR §990.54 of the regulations outlines a number of areas in which a reasonable range of alternatives should be evaluated to select the preferred alternative. Recognizing that almost all restoration comes with some potential for collateral injury, one factor for evaluation

---

is the extent to which each alternative will prevent future injury and avoid collateral injury. The potential for collateral injury does not preclude an alternative from selection, rather the Trustees must evaluate each alternative under multiple factors, and select a preferred alternative to meet the outlined restoration objectives.

The LA TIG, in selecting the Preferred Alternative in the Restoration Plan, evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 (Identification of a Preferred Alternative), 3.2.1.5 (Alternative 1 – Avoids Collateral Injury), and 3.2.2.5 (Alternatives 2–6 – Avoids Collateral Injury) of the Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems and necessarily entails reverting the current ecosystem to a more natural state that was altered when Mississippi River flows were cut off by construction of levees. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the Preferred Alternative in the Restoration Plan.

The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Alternative 1 – Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as the Preferred Alternative in the Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project would meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the spill.

The BP Plea Agreement as it applies to NFWF funds is not relevant here as the LA TIG is not authorizing the use of those funds for this Project. Even if it were applicable, the criminal plea agreement expressly contemplates the use of criminal penalties for sediment diversion in Louisiana.

John Cope

As a long-term resident of New Orleans with a science education and an appreciation of nature, I am philosophically aligned with the concept that guided natural processes be employed in the restoration of ecosystems disrupted in part, or wholly, by human activities. I have been following at arms length both the progress of the Restoration Plan and the debates focused thereon for some years, and have recently clarified my own thoughts on the subject. As stewards of Creation, we must, in my grandmothers words, put our best foot forward in our drive to maximize the value of our efforts in caring for what we are so fortunate to share.

Per the Plans title, attention is focused on the sediment delivery of 281,000,000 metric tons of sediment over its 50 year operational life, while the means to achieve that result is the throughput of 75,000 cfs of Mississippi River water for an average of 110 days each year (per Draft Phase I; Phase II provides no figure for days). Using a range of published sediment densities, I calculated an expected range of volume/volume ratios to determine the efficiency of this effort; the results range from 6200 ft<sup>3</sup> H<sub>2</sub>O per 1 ft<sup>3</sup> sediment, for a sediment composed of flowing mud (108 lb/ft<sup>3</sup>), to 6,840 H<sub>2</sub>O per 1 ft<sup>3</sup> sediment, for a sediment composed of wet sand (119 lb/ft<sup>3</sup>). To me, this is a Water Diversion which happens to sweep along a tiny proportion of sediment; a very inefficient result, particularly given that the negative repercussions from the diversion are driven by the effects borne by the water in terms of:

- 1) A salinity differential, impacting commercial and threatened species by its suddenness and magnitude;
- 2) Dissolved fertilizers and industrial effluent, which are known to have led to oxygen-depleting algal blooms even in less-restricted environs; and
- 3) Local rise in water level, creating a potential for infrastructure and human endangerment, especially during storm events.

A truly alternative design incorporates a means of separating a large proportion of the water from the sediment by capturing sediment in basins within the channel bottom, while curving the main channel back to the Mississippi River to return the majority of river water to the Mississippi, while delivering a more sediment-focused slurry to Barataria Bay via a separate outfall channel. A dredge operating in the basins, powered by river current, would move the captured sediment, under well-controlled conditions, the short distance from the basins to the outfall channel. If additional hydraulic head is needed to keep the sediment flowing Bayward, water from Barataria Bay can be pumped in, again using the Mississippi as a power source, and directed to promote flow toward the bay. Over time, as the Barataria ecosystem adjusts to decreased salinity, and documentation is made regarding the adjustment of species to changing conditions, determination can be made whether to increase the fraction of river water allowed to enter the Barataria system.

This scheme will minimize item 1)s salinity shock at the Projects outset, while allowing for the controlled variation of both the volume and salinity of outflow waters as deemed appropriate though observation of the attendant environmental impacts.

Regarding especially item 2) above, it appears that a political effort involving two Canadian Provinces and thirty-one of our United States (the Mississippi River watershed area) is required in order to provide for the understanding of each jurisdictions contribution to what are

essentially wasted resources which cumulatively result in the stunting of fisheries throughout the Gulf of Mexico, if not beyond. If undertaken soon, with an eye toward the value added: to the farmer, of conserving fertilizer; to industry, of identifying potential uses for another's byproduct; to fishers, of maintaining the abundance and predictability of their catches; and to all, of lowering acidity in, and removing reproductive disruptors from, aquatic ecosystems, there is an opportunity to improve the quality of the Mississippi's fresh water by the time it is appropriate to ramp up its addition to the Barataria basin.

The life-threatening effects of item 3) will also be minimized through the application of a more limited proportion of water vs sediment, since the local water level will not rise as much as under the current Plan, and therefore, shutoff of the outflow in preparation for a storm event will allow the Project areas water level to relax more quickly toward a normal state.

The current Plan expects a yield of about 18.2% sand-sized particles, with 81.8% combined silt- and clay-sized particles. Being denser, sand tends to stay in place better once it arrives in a calm environment. Also, the property of high cation exchange capacity (CEC) for clay minerals means that they adsorb other cations from their surroundings. This can benefit agriculture, as when fertilizers are added to the soil. However, it can also mean that clays can trap pollutants, such as heavy metals, and thus transport them as the lightweight clay particles are moved by the flow of water. It may behoove us to minimize the percentage of clay minerals in our sediment transfer to the Barataria Basin; it so happens that a well-designed system of basins will preferentially capture the denser fraction of the sediment, similar to the operation of a gold mining flume.

In addition, the overall project should involve the planting of a variety of soil-stabilizing plants. Willows, which are salt-tolerant and pollutant-extracting, as well as black mangroves, which develop fish nurseries, should be introduced as soon as practical after emergent land appears, and faster-growing species are established.

Lastly, thinking more regionally, some additional small siphons placed broadly to the north of this Diversion would allow for the gradual freshening of the overall Project area above and including Barataria Bay. This would provide a slowly moving salinity gradient, detectable by many inhabitant species which can then more easily adjust via a gradual migration.

In summary, I understand the temptation to create a large impact quickly using familiar practices. However, the downside risks can be minimized by creating a split system to capture and concentrate sediment in one stage, followed by a transfer of the captured sediment to a separate second stage which delivers that sediment with a reduced volume of water having a chosen composition in terms of salinity and nutrients.

---

**Concern ID: 61812**

**Commenters expressed concern that the proposed Project would have adverse water quality impacts in the Barataria Basin due to the introduction of nitrate and phosphate from the Mississippi River. Several commenters questioned whether the proposed Project would create harmful algal blooms and hypoxia in the Barataria Basin similar to the hypoxic "dead zone" in the Gulf of Mexico that exists due to nutrients in Mississippi River waters. One commenter expressed concern that the EIS does not adequately assess the potential for the proposed Project to create algal blooms and hypoxia in the basin, other than acknowledging it.**

**Response ID: 16425**

---

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA's Mississippi River/Gulf of Mexico Hypoxia Task Force "Hypoxia 101" webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone "water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen" (<https://www.epa.gov/ms-hf/northern-gulf-mexico-hypoxic-zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.>)

Dissolved oxygen concentrations associated with the Applicant's Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.5.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of

the EIS. A reference to this section is included in Section 4.5.5.3 in Surface Water and Sediment Quality and has been added to Section 4.5.5.4.2 Applicant's Preferred Alternative of the Final EIS. Finally, the EIS acknowledges the potential for major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) if warranted, in the Barataria Basin during Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62291**

**A commenter expressed concern that the amount of land building would be inefficient given increased water level and flood risk.**

**Response ID: 15807**

One objective of the Project is the delivery of fresh water, nutrients and sediment beyond the outfall area. The ability of a large-scale diversion to deliver sufficient amounts of sediment and nutrients to sustain existing and created marsh was a factor that led to its selection as the Applicant's Preferred Alternative. The EIS's evaluation of alternatives, which includes the potential impact of sea-level rise, is discussed in Chapter 2. As part of its decision, USACE

---

will conduct a public interest review, which weighs the probable harms that would be caused by a project against its prospective benefits.

See Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5, of the LA TIG's Restoration Plan for a discussion regarding the LA TIG's evaluation of the range of alternatives and identification of the LA TIG's Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54 and strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the Preferred Alternative.

---

**Concern ID: 62731**

**The acute and significant change in salinity resulting from Project operation would adversely affect commercial species.**

**Response ID: 16109**

The projected change in salinity from the proposed Project is discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS, which indicates that impacts on a particular species (whether commercially important or not) from salinity changes would be dependent on the salinity tolerance of that species, but that species intolerant of the lower salinities in the outfall area would likely shift their habitat usage to areas further south. The adverse impacts of decreased salinity on certain commercially-harvested species are discussed in Section 4.10.4.5 in Aquatic Resources; decreased salinity is noted as a driving factor of adverse impacts on brown shrimp and oysters, and would have a lesser effect on southern flounder. Other commercially important species, such as white shrimp, blue crab, bay anchovy, and Gulf menhaden, would likely experience overall beneficial effects from the Project, despite the projected changes in salinity. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

---

**Concern ID: 63121**

**The negative repercussions from the diversion are influenced by a salinity differential in the source and receiving waters, impacting threatened and endangered species by its suddenness and magnitude.**

**Response ID: 16272**

Chapter 4, Section 4.12 Threatened and Endangered Species of the Final EIS has been revised to discuss the potential impact of an acute change in salinity on special status species, as applicable. However, because the impacts on special status species discussed in the Biological Opinions are within the range of impact identified in the Draft EIS, no changes were warranted to the determinations provided in the Draft EIS.

---

**Concern ID: 64005**

**Consider an alternative that creates a split system to capture and concentrate sediment in one stage, followed by a transfer of the captured sediment to a separate second stage which delivers that sediment with a reduced volume of water having a chosen composition in terms of salinity and nutrients. This can be accomplished by**

---

**capturing sediment in basins within the channel bottom, while curving the main channel back to the Mississippi River to return the majority of river water to the Mississippi, and delivering a more sediment-focused slurry to Barataria Bay via a separate outfall channel. A dredge operating in the basins, powered by river current, would move the captured sediment, under well-controlled conditions, the short distance from the basins to the outfall channel.**

**Response ID: 15997**

This suggested alternative would not meet the goals and objectives as stated in the purpose and need as described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives. The purpose of the project is to reestablish sustainable deltaic processes between the Mississippi River and Barataria Basin through the delivery of sediment, fresh water, and nutrients from the Mississippi River into the Basin. Details as submitted by the commenter regarding this alternative are lacking making it difficult to evaluate. Based on the description provided by the commenter, it seems that this alternative would transport primarily coarse-grained sediments (for example, larger sediments and sand) collected in the Mississippi River and conveyance channel into the Basin, but, due to the collection method, would not convey substantial finer grained sediments (for example, clay and silt) that are necessary to sustain existing wetlands in the Basin. Also, with the significant reduction in fresh water transported into the Basin, this alternative would not transport sufficient fresh water or nutrients to meet the purpose and need. Further, it is unclear whether or how the proposed alternative would mobilize the collected coarser-grained sediments. As explained in Section 2.4.3.2 Application of Additional Considerations to Capacity Alternatives of the Final EIS, a sufficient volume of water is needed to mobilize and entrain coarser-grained sediments and transport them into the Basin. The commenter's description of the alternative suggests a significant reduction in the volume of water that would pass through the diversion channel. Absent diversion flows, the commenter did not explain how this alternative would transport these coarser sediments to the Basin other than to mention a "dredge operating in the basin." Marsh creation through dredging was evaluated in the Draft EIS and eliminated from detailed consideration. See Section 2.3.5 Large Scale Marsh Creation of the Final EIS. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

---

MGHOA

Ronald Guccione, Jr.

My wife and I are opposed to the Mid-Barataria Sediment Diversion. It's my thinking that the cost of 2 billion dollars to possibly gain 27 square miles of land is out of line. Seems that 27 square miles could be added by dredging in a much shorter period of time at a much lower cost. Dredging wouldn't affect our neighborhoods, the fisheries, etc. My wife and I worked our entire lives to be able to live in this development. Living here IS our retirement plan. In fact, we have lived on both sides of the Myrtle Grove community. Not sure how the CPRA can put a dollar value on both the property and a way of life. I DO NOT give permission to the Corp of Engineers to flood my property at their discretion! This diversion will have permanent and detrimental effects on my neighborhood.

Respectfully,

Ronald J. Guccione, Jr.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the

---

Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62013**

**The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.**

**Response ID: 16210**

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after

---

approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are

greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Matthew Matulich

The proposed "Sediment Diversion" is a State-funded psuedoscientific hoax to disposses Louisianans of their coastal properties all in the name of "Coastal Restoration." If the State were truly interested in preserving the integrity of our land and water, it would employ some of the REAL science applied by Viktor Schauberger to revolutionize the field of hydrodynamics, reduce coastal erosion, and increase the efficiency of vessel transport. Schauberger used to Nature of water to control it: the "Sediment Diversion" which fights water. It is an environmentally reckless venture which will, without a doubt, destroy the coastal ecosystem of South Louisiana.

Anyone endorsing this train wreck should consider their political career OVER in the State of Louisiana.

**If CPRA were truly interested in preserving the integrity of the land and water, it would employ some of the real science applied by Viktor Schauberger to revolutionize the field of hydrodynamics, reduce coastal erosion, and increase the efficiency of vessel transport.**

**Response ID: 16382**

Although the ideas of Viktor Schauberger (and the books later developed from his ideas) were not reviewed during the development of the EIS, the EIS analysis was developed using the best information and data available to USACE and the LA TIG at the time of writing and the EIS considers the beneficial and adverse impacts of the proposed Project. As noted in Chapter 2, Section 2.2 Steps Taken to Identify and Evaluate Reasonable Alternatives of the EIS, the proposed Project was identified in the 2017 Coastal Master Plan.

According to CPRA, the Coastal Master Plan used best information, data, and engineering available to it to work to achieve long-term sustainability of Louisiana's coast and ecosystem, relying where possible on natural processes and cycles. The projects identified in the Coastal Master Plan were the result of extensive public input, review, and vetting. The EIS and Coastal Master Plan generally incorporated more recent studies and publications than those ideas developed Viktor Schauberger during his life (1885-1958); therefore, no related edits to the Final EIS have been made.

I strongly urge you to vote NO to this

---

**Concern ID: 62782****A large number of commenters expressed general opposition to the proposed Project.****Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Dean Blanchard

Proposal for this diversion is certainly not agreed upon. To destroy any species natural habitat or any persons home or way of life is never an agreeable proposal.

Basically, by destroying an ecosystem of one place in order to sustain another is not only unfair and unjust but morally wrong.

---

**Concern ID: 62851****Destroying an ecosystem or place in order to sustain another is not only unfair and unjust but morally wrong.****Response ID: 16397**

Comment noted. Chapter 4 Environmental Consequences of the Draft EIS acknowledged the range of potential adverse and beneficial impacts on the assessed resources, including transition of portions of the ecosystem to different salinity regimes (see Chapter 4, Section 4.10 Aquatic Resources) and changes in the potential for tidal flooding in certain areas (see Chapter 4, Section 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction).

**Comments on the Draft Environmental Impact Statement and  
Louisiana NRDA Trustee Implementation Group  
Draft Phase II Restoration Plan #3.2: Draft Restoration Plan for the Mid-  
Barataria Sediment Diversion project  
Submitted by Healthy Gulf, June 3, 2021**

On behalf of Healthy Gulf I am submitting the following comments on the Draft Environmental Impact Statement (DEIS) and Louisiana Trustee Implementation Group (LA TIG) Draft Phase II Restoration Plan #3: Draft Restoration Plan for the Mid-Barataria Sediment Diversion project. Healthy Gulf's purpose is to collaborate with and serve communities who love the Gulf of Mexico by providing research, communications and coalition-building tools needed to reverse the long-pattern of over exploitation of the Gulf's natural resources. Healthy Gulf has members throughout the Gulf States, including Louisiana.

While we applaud the Project's purpose, Healthy Gulf has serious concerns regarding various aspects of the DEIS' analysis of the environmental impacts of the Mid Barataria Diversion and LA TIG Restoration Plan and Appendix R-2: Mitigation and Stewardship Plan for the Proposed Mid-Barataria Sediment Diversion (MBSD) Project.

**PURPOSE, NEED AND PROPOSE PROJECT**

The Army Corps of Engineers ("USACE") determined that the Project's purpose is to

restore for injuries caused by the Deep Water Horizon oil disaster ("DWH") by implementing a large-scale sediment diversion in the Barataria Basin that would reconnect and re-establish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts. The proposed Project is needed to help restore habitat and ecosystem services injured in the northern Gulf of Mexico as a result of the DWH oil disaster.

DEIS, pp. 1-9 to 1-10

We applaud the CPRA's ground-breaking approach to a long-standing problem. The Mid-Barataria Sediment Diversion is the first project-level attempt at systemic ecosystem restoration to one of the world's treasures, the Mississippi River Delta. The world's most river-dominated delta, the estuary cannot be sustained through 2067 without engaging the land-building processes that created it originally. Rather than a traditional Army Corps "Diversion" project, this is truly a "river restoration" project. Given the acceleration of sea level rise after 2040, more sediment modelling projects like this one are sorely needed. The future of the Gulf Coast, Louisiana, and

the Mississippi River & Tributary system, depends on the modeling and permitting decisions in projects like this. This type of approach is good not only for the Mississippi, but the Atchafalaya River and Floodway Project, and even ecosystems in the Texas Coastal Study, and the coast impacted by the Mobile Harbor projects.

Many of the benefits of the project, in terms of soil creation and microbial process, are not captured in the engineering of the modelling behind the DEIS, which has focused on the transport of heavy sands in order to avoid legal conflicts with the federal shipping channel. Many of the fine sediments transported by the diversion cannot be dredged, but are critical soil components. LA CPRA has outlined how projects are designed to work together<sup>1</sup>. But we have seen the immediate creation of viable habitat for fish, fowl, and insects in the wake of similar projects, such as the West Bay Sediment Diversion (MR-03), and the Delta Wide Crevasses project (MR-09), and many positive habitat benefits of crevasses like Mardi Gras Pass. We recognize that these ecological benefits do not appear as rapidly as do the effects of restoration projects from the placement of dredged river sands, however, we recognize that the benefits of reconnecting the river are critical to the sustainability of restored wetlands.

### **CHAPTER 3: THE AFFECTED ENVIRONMENT**

#### **The future without action is a future of increasing oil and gas leaks into the Barataria Basin.**

We believe that many or most of the ongoing environmental harms to the Barataria Basin are not mentioned in the DEIS. The DEIS mentions over 2,600 miles of hazardous liquid pipelines, and over 4,990 "unplugged", (Townsend-Small et al, 2016)<sup>2</sup>, inactive wells, 15,979 plugged wells, and 799 active wells. Many of these unplugged, unproductive wells are likely leaking methane into the upper atmosphere.

These pipelines and wells present a significant present risk to the natural resources of Barataria. According to a review of PHMSA pipeline incident data<sup>3</sup>, the rate of crude oil spills to water in coastal Louisiana is increasing-- 67 major crude spills from 1980-2000, and 142 since 2001, with the largest number in the year 2005. In the years since the DWH Disaster, over 516 barrels (21,672 gallons) of crude have leaked into coastal Jefferson and Plaquemines Parishes. According to National Response Center data<sup>4</sup>. There are roughly 20 major oil releases to the waters of

<sup>1</sup> Dredging and Diversions GAC.pdf 10-04-2016 Simoneaux, Rudy; Meselhe, Ehab GOVERNOR'S ADVISORY COMMISSION DIVERSION SUBCOMMITTEE

<sup>2</sup> Geophysical Research Letters Amy Townsend-Small, Thomas W. Ferrara, David R. Lyon, Anastasia E. Fries, Brian K. Lamb Emissions of coalbed and natural gas methane from abandoned oil and gas wells in the United States 20 February 2016 <https://doi.org/10.1002/2015GL067623>

<sup>3</sup> <http://phmsa.dot.gov/pipeline>, U.S. Pipeline Incident Analysis by Richard Stover, PhD online at <http://www.icogitate.com/~oildrop/>

<sup>4</sup> <https://nrc.uscg.mil/>, downloaded May 2021 via alerts.skytruth.org

Barataria annually, with annual averages increasing since 2012, and peaking in 2019. One company, Hilcorp, has spilled oil and produced waters into Barataria and the Mississippi River Delta 142 times since January 2012, for a total of over 10,000 gallons released. Hilcorp's oil can be seen covering over 9 miles of Barataria Bay in the July 25th, 2016 MODIS imagery.

Although most of these releases are claimed to have no environmental impact, no Natural Resource Damage Assessments has been completed. We would assert that these ongoing releases do indeed impact the health of the natural resources of the Barataria Basin, including marine mammals, fisheries, and endangered species. Yet, the DEIS discusses these releases in the context of its discussion of the potential impact of the continuing releases on the affected environment or in terms of their potential impact on the project.

- The Louisiana Coastal Planning and Protection Authority (CPRA) and the LA TIG must consider how existing oil and gas infrastructure and associated releases of pollution will impact the Project.
- CPRA and the LA TIG must also acknowledge that future projects and permits that excavate or oil marshes are inconsistent with the Project.

### **The ongoing legacy of oil and gas canals**

Barataria Basin is host to thousands of miles of unused oil canals, whose neglect has altered local hydrology to the detriment of marshes within 2 kilometers of the "spoil banks" constructed of the cast aside materials from canal excavation. The DEIS does not consider these hydrologic alterations as significant. However, in our experience the cumulative impact of small canal projects can be significant.

In our research in 2013, we found that spoil banks of inactive canals in Upper Barataria affected over 3,330 acres of marsh *directly*; restoration of inactive canals within the project area would likely have an indirect impact one order of magnitude beyond the direct footprint of the canals themselves.

- CPRA and the LA TIG should work with willing landowners and users on the closure of these canals, in order to increase the benefits of the Project locally.
- The CPRA and the LA TIG must consider how the existing oil and gas infrastructure harms the Project; and must acknowledge that projects and permits that excavate marshes are inconsistent with the Project.

## CHAPTER 4. ENVIRONMENTAL CONSEQUENCES

### Water Quality

According to the DEIS, nitrogen and phosphorus (resulting in potential algae blooms and low oxygen levels) from the Mississippi River will have “overall minor to moderate, permanent impacts” to the Barataria Basin. The models used in the DEIS show increases in both nitrogen and phosphorus in most areas of the basin, increasing with proximity to the proposed diversion.

Despite this, the potential impacts to the basin are understated. Yet, when fully acknowledged this finding could support proactive efforts at reduction of nutrients throughout the Mississippi River Basin. This in turn could result in a cleaner Mississippi River and Barataria Basin.

In order to get a good look at the potential impacts of increased nitrogen and phosphorus pollution in the project area, the DEIS, in part, relies on Louisiana Department of Environmental Quality (LDEQ) water quality criteria. This is problematic in 3 ways:

1. It is not explained how N:P ratios indicate the health of waters. While a portion of LDEQ’s narrative nutrient criteria calls for the maintenance of ‘natural’ N:P ratios, this does not account for the fact that while ratios might remain relatively constant, the loading of N and P will certainly increase. This will most likely result in increased algal growth, which could result in toxic algae blooms and hypoxic areas.
2. The DEIS only refers to a portion of LDEQ’s narrative nutrient criteria. For some reason, the DEIS only refers to the first two sentences of these criteria, leaving out “Nutrient concentrations that produce aquatic growth to the extent that it creates a public nuisance or interferes with designated water uses shall not be added to any surface waters.” (L.A.C 33:IX.1113.B.8) This DEIS authors have not done their due diligence, as they have ignored half of the criteria that LDEQ has set forth. Moreover, this portion of the criteria is arguably the most important, as it refers to the actual impacts of nitrogen and phosphorus pollution.
3. The DEIS also does not consider EPA or other proposed numeric criteria. The DEIS does not give the public a numeric threshold where nitrogen and phosphorus concentrations would be harmful to the Barataria Basin. While science regarding nutrient criteria is still evolving, EPA and other states have developed numbers that could guide decisions promoted by this DEIS. In order for the DEIS to adequately assess the impacts of nitrogen and phosphorus pollution, it must first determine the levels (loading and concentration) the state should strive for that would both allow for maximized sediment delivery and reduced nitrogen and phosphorus pollution.

While the DEIS does acknowledge that there will be minor to moderate permanent impacts due to nitrogen and phosphorus, it states that “it is unlikely that the impacts of the Applicant’s Preferred Alternative would result in non-attainment of the narrative nutrient criterion.” It is difficult to see

how the authors can make this conclusion, when no consideration was given to half of the narrative nutrient criteria and no numeric nitrogen and phosphorus goals are given.

### Water Resources and Waters of the United States (Wetlands)

The DEIS fails to fully consider the potential cumulative impact on the Project area and the Basin as a whole from the construction and operation of petrochemical facilities. There are numerous proposals, in the vicinity of the project and in surrounding communities, for petrochemical development, such as coal export, methanol export, LNG export, and crude oil export. All of the current oil and LNG export proposals come with new pipeline (crude oil, gas, or product) proposals, many of which would run through the project area from west to east, with attendant impacts on the wetlands of the Barataria basin.

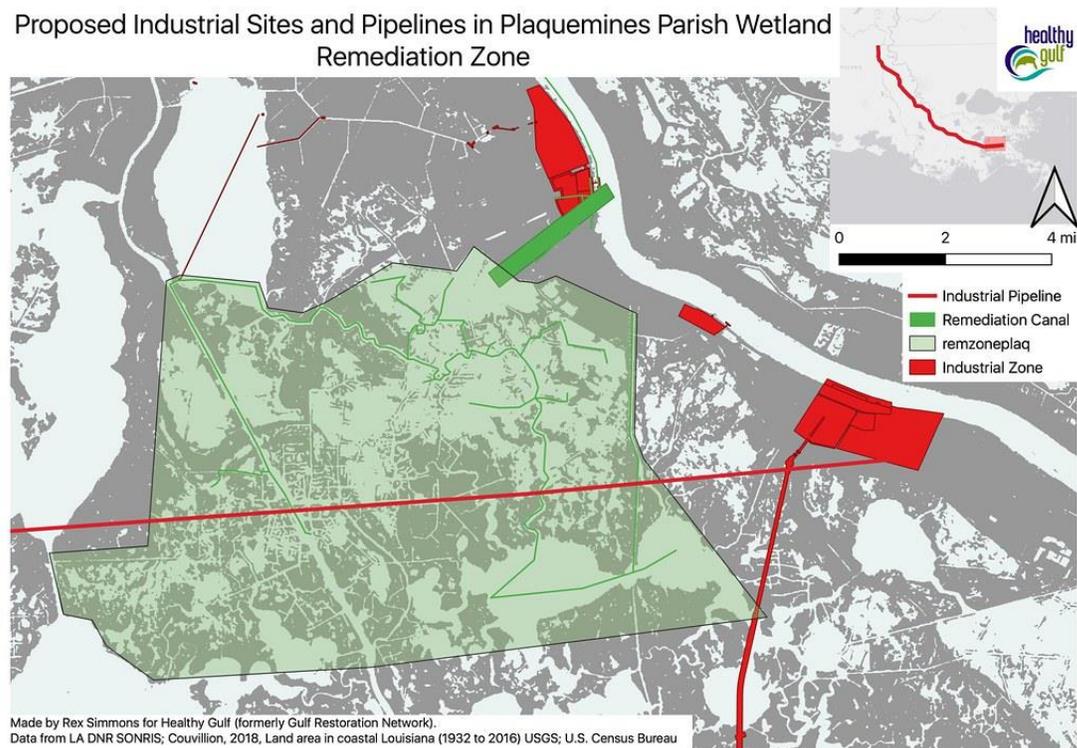

Figure 1. Proposed Industrial sites, along with a limited number of proposed pipelines associated with said facilities. Alliance Refinery is also included on this map.

For example, the previously proposed the RAM Coal export terminal, was projected to reduce the sediment-to-water ratio through the MBSD by 17%<sup>5</sup>. Although the DEIS has signed a new MOU on a new facility proposed for the same site, they admit that study is not complete. It is unclear

<sup>5</sup> RAM Terminal CFD Modeling Technical Memorandum, October 23, 2012

how the DEIS can fully assess and make conclusions about the impact of this one proposal on the Project until the sediment study is completed.

The Venture Global LNG Delta Express Project also proposes to impact the receiving marshes in major ways. It conceives of passing over 20 miles of marshes in the Project receiving area. The Venture Global LNG Gator Express Pipeline has been permitted to disturb 641.6 marsh acres in the Project area, all of which is considered "temporary." Given the long history of pipeline impacts to marshes in Plaquemines and Jefferson Parishes, we cannot rely on a system that permanently allows such "temporary" impacts.

These industrial projects will also cause major increases in emitted CO<sub>2</sub>; combined they exceed the largest source of carbon emissions in the state, CF Industries (EPA FLIGHT Data, 2019). The loss of wetlands combined with an increase in CO<sub>2</sub> is significant.

- The CPRA and the LA TIG must fully analyze how proposed and future oil and gas infrastructure will impact the project. In the future, CPRA must take the position that permits that excavate or oil marshes will impact Project success and are, therefore, inconsistent with the Project
- We request that CPRA and the LA TIG, as part of consistency with MBSD, include within the DEIS an analysis of the scale of the carbon dioxide emissions of current proposals for new petrochemical facilities and their associated infrastructure, to determine total level of emissions of CO<sub>2</sub> and the impact they on the Basin and the communities within it.

## **Marine Mammals**

### **Analysis of the impacts of the preferred alternative on BBES Dolphins seriously flawed**

In the discussion of impacts to BBES dolphins the DEIS authors posit a caveat to their analysis:

“The model results presented here consider impacts for any given year. It does not consider repeated annual exposure to low salinity waters for over many years, which could lead to higher individual mortality risk than in the first year from initial exposure. If this is the case, the approach utilized to address impacts will likely underestimate the population-level impacts, as the models only look at single years for each decade/alternative combination.”

(C4.11.3.1 General Caveat to Impact Analysis Approach – Chp. 4, p. 4-429.)

The failure to incorporate a discussion of repeated inter-annual exposures reveals a serious flaw in the DEIS that results in significant under-estimation of the potential impact of project operation on BBSE dolphins. A recent study entitled “Predicted Population Consequences of Low Salinity

Associated with the proposed Mid-Barataria Sediment Diversion Project on Bottlenose dolphins in the Barataria Bay Estuarine System Stock”, Len Thomas et al. , Centre for Research into Ecological and Environmental Modelling, University of St Andrews, National Marine Mammal Foundation (May 2021) looked at this issue. The authors conclude that “the project (based on the Applicant’s Preferred Alternative) *will not only prevent the recovery of the BBES Stock, but it will result in the functional extinction of dolphins in the West, Central, and Southeast strata of the stock area.* The only dolphins remaining in the basin would live adjacent to the barrier islands, and even this group will become severely reduced over the 50-year planning horizon of the MBSD project. “(Letter from Len Thomas at al. to the Marine Mammal Commission, May 2021) (emphasis added).

- The CPRA and LA TIG must revise their analysis of impacts on BBES dolphins in light of the new study.

**The State errs in its reading of section 20201(b) of the Bipartisan Budget Act of 2018 (Public Law 115-123) as exempting it from the MMPA**

The CPRA and LA TIG rely heavily on CPRA’s responsibility or lack thereof under the section 20201(b) of the Bipartisan Budget Act of 2018 (Public Law 115-123), that required that the Secretary of Commerce issue a waiver of the Marine Mammal Protection Act (MMPA) and that

(b) Upon the issuance of a [Marine Mammal Protection Act] waiver ... the State of Louisiana shall, in consultation with the Secretary of Commerce [as delegated to NMFS]: (1) To the extent practicable and consistent with the purposes of the projects, minimize impacts on marine mammal species and population stocks, and (2) Monitor and evaluate the impacts of the projects on such species and population stocks.

The CPRA, and LA TIG interpret this provision as exempting them from the need to take affirmative action to reduce impacts to marine mammals that would change CPRA’s preferred operation of the diversion and its achievement of maximum wetland restoration. In fact, within its Mitigation Plan, Appendix B, the State confirms its belief that consideration of mitigation measures that might affect the performance of the project are not required, stating “CPRA will examine operational strategies to minimize (to the extent practicable consistent with the purposes **and performance of the project**) the Project’s impact on bottlenose, Given the dynamic conditions in any estuarine system, and the uncertainty around future conditions, the minimization measures will rely on the MBSD Monitoring and Adaptive Management Plan to inform future implementation.” Mitigation Plan, p. R2-29.

The clear assumption from this language of the DEIS is that affirmative action to reduce impacts to bottlenose is not necessary because it would negatively impact project performance, whether or not the goals of the project can be achieved despite any changes in performance. This assumption pervades the DEIS and Mitigation plan. In fact, neither

the DEIS or the Mitigation Plan include any real discussion of how operational modifications might be used to mitigate impacts to BBES dolphins while still meeting the project purpose. The State's assumption in this regard is flawed -- totally ignoring the State's continuing obligation to comply with the MMPA within the constraints of Section 20201(b). As a result, the discussion of the need for mitigation to decrease the impacts to dolphins is flawed.

Section 20201(b) requires the State of Louisiana to mitigate impacts to marine mammal population stocks so long as that mitigation is practicable and consistent with the purposes of the project. An action is practicable when it "can be brought to fruition or reality without any unreasonable demands."<sup>6</sup> In this case that would mean any action that does not unreasonably burden achievement of the project purpose. As discussed within the DEIS, the underlying purpose and need for the project is:

Consistent with the LA TIG's Strategic Restoration Plan and Environmental Assessment #3 and the Louisiana Coastal Master Plan, the purpose is to restore for injuries caused by the DWH oil spill by implementing a large-scale sediment diversion in the Barataria Basin that will reconnect and re-establish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts. The proposed Project is needed to help restore habitat and ecosystem services injured in the northern Gulf of Mexico as a result of the DWH oil spill.

DEIS, pp. 1-9 to 1-10.

Nowhere does Section 20201(b) state that allowable mitigation can have no effect on performance of the project, it merely cannot interfere with construction and operation of the project needed to meet the project goal, namely re-establishing "deltaic processes ...to support long term viability of existing and planned coastal restoration efforts." Id.

This interpretation is supported by the statement made by the National Marine Fisheries Service (NMFS) in granting the waiver:

Nonetheless, separate from issuance of the waiver, Congress directed the State of Louisiana to minimize impacts on marine mammal species and stocks and to monitor and evaluate any impacts of the projects...

<sup>6</sup> The Law Dictionary Featuring Black's Law Dictionary Free Online Legal Dictionary 2nd Ed, thelawdictionary.org.

**NMFS looks forward to consulting with the State on ways to minimize impacts on the affected species and stocks and on measures to monitor and evaluate the impacts of the three projects on the affected species and stocks. (emphasis added)**

[https://media.fisheries.noaa.gov/dam-migration/mmpawaiver\\_decisionmemo\\_opr1.pdf](https://media.fisheries.noaa.gov/dam-migration/mmpawaiver_decisionmemo_opr1.pdf)

Additionally, the Marine Mammal Commission recommended “that NMFS seek agreement with the State or otherwise clarify that **“the requirements of section 20201(b) are ongoing responsibilities with consultations between the State and NMFS continuing as needed throughout all construction, operations, and maintenance activities.”**

[https://media.fisheries.noaa.gov/dam-migration/mmpawavierconsultation\\_mmccomments\\_12march2018\\_opr1.pdf](https://media.fisheries.noaa.gov/dam-migration/mmpawavierconsultation_mmccomments_12march2018_opr1.pdf)

In short, CPRA and the LA TIG’s analysis of impacts of the project on BBSE dolphins is inadequate, as is its consideration of actions that could be taken to reduce impacts to BBSE dolphins. Additional concerns about proposed mitigation of impacts to BBES dolphins will be included in our comments on the Mitigation Plan later in this document.

- The CPRA and LA TIG need to revisit their discussion of actions that could be taken to reduce impacts to BBES dolphins.

### **Endangered Species**

While the main goal of the Project is to build land and habitats, the DEIS does not adequately address adverse effects on Threatened and Endangered Species (“TES”). This oversight should be remedied in the final DEIS and a section be added to the Mitigation Plan addressing plans for mitigating the impacts, before the Project is approved and built. The Project should be built to benefit the most number of TES, to the highest degree possible, and adversely impact the least number. Where there are adverse impacts to TES, the Mitigation Plan should clearly state the action that will be intended to reduce those impacts.

The DEIS (sections 3.12.1-2) lists fourteen species that are either federally listed as Threatened or Endangered, or that have special status at the state level (Table 1). Of these, the DEIS determined that there are likely to be adverse effects to at least six species from construction and/or operation of the project. Specifically, the Project is likely to have minor to moderate adverse impacts on three different sea turtle species (Kemp’s Ridley, Green, and Loggerhead), moderate adverse impacts on the Pallid Sturgeon and the Saltmarsh Topminnow, and up to moderate adverse impacts on Bald Eagles. The Saltmarsh Topminnow is analyzed in the Draft Feasibility Report (section 3.2.1.6.2, p. 3-42), which concludes that the Project will have both beneficial and adverse

effects to this species; while the conclusion of the DEIS is that the Project will provide “minor to moderate benefits” to the Saltmarsh Topminnow. The findings of the DEIS and the Draft Feasibility Report should be reconciled. Moreover, CPRA must plan for different scenarios in terms of the balance of adverse and beneficial outcomes for the Saltmarsh Topminnow. Mitigation plans need to be in place for such a contingency.

While the DEIS considers the impacts of project alternatives on TES, there is no in-depth discussion of mitigation measures outside of passing references to best management practices in section 4.25.12.3-4 either in the DEIS or in the Mitigation Plan. The CPRA must prepare detailed plans to mitigate adverse effects to all endangered, threatened, and special-status species, including mitigation for impacts to the habitats of adversely affected TES species. Consideration of impacts must be given to all of the following species.

| <b>Species</b>                                                   | <b>Federal Status</b>         | <b>State Status</b>   |
|------------------------------------------------------------------|-------------------------------|-----------------------|

### **Socio-economics, Environmental Justice and Public Health and Safety**

The DEIS is insufficient in terms of its definition and analysis of affected communities, particularly low income and communities of color.

- ***Exclusion of Ironton Inappropriate***

The DEIS does not address the very real effects that the Project will have upon the community of Ironton. Yet, Ironton residents have legitimate concerns about the impacts of the construction and operation of the diversion on their community. They question whether the construction of the diversion will result in increased noise and traffic impacts. Also, how will the construction of a bridge over LA-23 be sequenced, in order to maintain a constant evacuation route during construction of the project? After construction, will Ironton Road provide access to the elevated portion of LA-23 and will the bridge impede bus and emergency services traffic? Additionally, concerns voiced by Ironton residents include, but are not limited to:

- (1) the potential for additional flood risks that a new large channel might present. In the past, hurricanes reversed storm surge in the river and overtopped the river levee in and around Ironton;
- (2) the effect the diversion will have on historic sites at St. Rosalie, including impacts to community visitation at the graves of ancestors buried there. It would appear that the MBSD will create a large physical separation between the community of Ironton and the St Rosalie sites but this is not discussed in the DEIS;
- (3) the loss of tree canopy from the MBSD footprint, as any trees provide wildlife habitat for viewing and hunting, but also provide an air quality buffer between the town and Alliance Refinery stacks and oil storage tanks; and

- (4) will the diversion's separation of Ironton from the Upper Parish create another "wall" that isolates Ironton from "the life of the Parish" and disincentivize flood protection and political and economic investment in the community?

Clearly, Ironton will be impacted by the Project and the DEIS must fully consider the potential impacts, as well as actions that can be taken to mitigate those impacts.

- **Must Include Fishers from Outside the Basin**

Similarly, it is unclear whether the DEIS' discussion of impacted fishermen, including low income and persons of color, is limited to those living in the Basin. For example, there may be Vietnamese fishermen or other fishers who reside outside the Basin but travel to the Barataria Basin to fish. Clearly these fishermen will be impacted by the Project. The state must clarify the inclusion of fishermen residing within and outside the Project boundary in both its impacts analysis and its discussion of potential mitigation for impacts to fisheries.

## **APPENDIX R2: MITIGATION AND STEWARDSHIP PLAN FOR THE PROPOSED MBSD PROJECT**

Section 6 of the Mitigation Plan addresses "Avoidance, Minimization, and Mitigation Measures," generally discussing potential mitigation measures that may be pursued by the CPRA to offset unavoidable adverse impacts resulting from construction and operation of the Preferred 1

Initially, we are concerned that the DEIS and draft Restoration Plan seem to indicate that CPRA and other entities will only begin mitigation when they have proof of impact, leaving fishers and affected communities at risk in the meantime. CPRA and TIG should presume impact and help communities begin to adapt throughout the diversion's construction so they are already in the process of adaptation as the MBSD begins operation

Additionally, we are concerned by the statement within the Mitigation Plan that "[t]he Purpose of this Mid-Barataria Sediment Diversion Mitigation and Stewardship Plan (Mitigation Plan) is to demonstrate how incidental adverse impacts of the Project will be avoided, minimized, or mitigated to the extent required under applicable federal law." (Appendix R-2: Mitigation and Stewardship Plan for the Proposed MBSD Project, p. R2-1) (emphasis added). Federal law is limited in its requirement for mitigation and, in many instances, will not cover the breadth of impacts to communities and resources that

We are also troubled by the CPRA's apparent desire, in both the DEIS and Mitigation Plan, to condition its obligation to mitigate impacts to properties and communities, through its continuing reference to the current vulnerability of those communities or the fact that those communities will become more vulnerable in the future even under the No Action alternative.

Although many areas outside levee protection are in fact vulnerable and may become more vulnerable as sea level rises and wetlands loss continues, many of those communities would not feel the full impacts for a decade or more absent the proposed diversion. Moreover, the causes of coastal wetlands loss can, at least in part, be attributable to the States' historic, and continuing, permitting of the destruction of coastal wetlands for pipeline and navigation canals, and the like. The state must ensure that it fully and fairly mitigates the impacts of this project on all affected communities.

What is clear is that neither the Mitigation Plan nor the LA TIG restoration plan makes any specific allocation of monies to mitigation. Presentations by CRPA and the LA TIG on the project discuss specific monies allocated to other mitigation topics (i.e. fisheries impacts and impacts to bottlenose dolphins.), but do not reference any specific amounts for impacted communities or other impacted resources. Although we understand that it is early in project planning, it is difficult for the public, particularly those that will be impacted by the project, to comment on the adequacy of mitigation if they are not informed of the range of funding that CPRA and/or the LA TIG intend to dedicate to this purpose. (For example, members of affected communities might have a far different belief in the adequacy of the State's mitigation if they intend to dedicate \$1 million to home elevation and storm proofing versus \$15 million.)

Combining the LA TIG Restoration Plan review with the DEIS, Mitigation and Stewardship Plan and MAMP review has created confusion. First, having two versions of the Mitigation and Stewardship Plan and MAMP with different Appendix numbers, etc. makes citation to the appropriate Appendix and various sections of the Mitigation Plan and MAMP complicated.

Additionally, there is significant confusion about funds available for mitigation versus monitoring and adaptive management. For example, when the DEIS was first issued several NGO's referenced a CPRA and the LA TIG's commitment to over \$300 million for mitigation. It is unclear where that number came from, but our presumption is that the MAM Plan proposed by the LA TIG, which commits over \$300 million to monitoring and adaptive management, was mistakenly interpreted as mitigation funding. Our reading of the MAM does not support that conclusion. In fact, the only reference we could find to funding for mitigation coming from the LA TIG was the statement in Section 8: Financial Assurances that "If the Deepwater Horizon Louisiana Trustee Implementation Group (LA TIG) decides to fund the project, that funding will include an allocation of funds adequate to ensure each component of this Mitigation Plan will be funded as part of the LA TIG's funding decision." This statement does not commit to any specific allocation of dollars.

Effective public participation and comment requires that the public be fully informed as to both the proposed actions needed, and the level of funding the CPRA feels is adequate, to fully implement its Mitigation Plan. Otherwise, the public cannot meaningfully comment on the adequacy of the proposed mitigation.

We will attempt to outline some proposals below.

### **Mitigation via Operational Changes**

Over many years, the CPRA has discussed<sup>7</sup> and modelled many alternatives to operation of the MBSD structures. Although the DEIS discusses why alternatives were rejected, it does not include any discussion of potential alternative methods of operation of the Preferred Alternative to reduce negative impacts. For example, in the past, CPRA has presented modeling on specific thresholds and triggers, but this is not discussed in the DEIS in the context of the Preferred Alternative. While we understand that thresholds change based on available data, CPRA must communicate those thresholds to the public on a regular basis.

Many of the impacts of the Project are more dramatic in the first decade of the project--after 2030, the discussion of benefits and impacts in the DEIS is based largely on a few model years. However, those model years do not acknowledge the increasing rainfall and river flooding of the past few years that can be expected to increase due to climate change. For example, it is foreseeable that a flood year like 2019 could become more normal over the next decade.

- The CPRA and/or the LA TIG must monitor sediment flow through the Project annually, particularly in the first, more critical decade of operation, in order to determine whether the goals of the project can be achieved with more efficient use of water flow in following years.
- The CPRA should communicate relevant thresholds and triggers for monitoring to the public on a regular basis.

### **Mitigating local employment losses**

We appreciate that the MBSD DEIS represents a move by CPRA away from the USACE's usual handful of dredging contractors. Expanding the field of potential contractors would allow for some price competition for coastal restoration. It would also expand the potential economic benefits of project construction. The CPRA should explore how expanding other fields of expertise, such as engineering firms or construction contractors, which could benefit achievement of project goals while also increasing the benefit of the project to local economies. For example, the CPRA should consider developing a program to employ locals to plant emergent riverine trees, like willows (*Salix nigra*), in emerging sand banks. Transplantation using local material and well-established methods could provide root material in new land in less time. Establishment of willow banks could also be strategically planned to prevent sediments from flowing into channels CPRA is trying to keep open. Willows are successful enough on new river sandbars that

<sup>7</sup> OPERATIONAL DESIGN Brad Barth | October 4, 2016 GOVERNOR'S ADVISORY COMMISSION DIVERSION SUB-COMMITTEE

Mississippi State is exploring using the plant for biomass production<sup>8</sup>- a potential additional benefit to the local economy.

Other opportunities lie in the DEIS and LA TIG discussion of Monitoring and Adaptive Management and in the Monitoring and Adaptive Management Plan. Since the Project will involve pre-construction and post-construction monitoring over decades, CPRA should work with local community and four-year colleges to prepare local graduates in these monitoring techniques. They should also select from monitoring contractors that can demonstrate the largest percentage of local, coastal hires.

### **Mitigating water quality impacts**

It is clear that pollution, especially nitrogen and phosphorus pollution, may have a negative impact on the project. We at Healthy Gulf have continually emphasized that in order to give the diversion the best chance of success, we must clean up the Mississippi River. Regretfully, levels of pollution in the Mississippi River have not gone down over the past few decades. This is largely due to the failure of states and federal agencies to prioritize nitrogen and phosphorus pollution reduction.

In order to mitigate increased nitrogen and phosphorus pollution in Barataria Bay due to additional loadings from the Mississippi River, the CPRA Mitigation Plan should prepare to mitigate those impacts by:

1. Fully funding Louisiana's *Nutrient Management and Reduction Strategy*,
2. Funding on the ground activities upstream (inside and outside of Louisiana) of the proposed project that will reduce nitrogen and phosphorus pollution in the Mississippi River,
3. Identifying and funding specific projects in other states, as identified within their nutrient reduction strategies, that would reduce nitrogen and phosphorus pollution loadings to the project area, and
4. Funding a harmful algae bloom (HAB) monitoring network in the Barataria Basin where algae blooms can be identified and monitored. It is critical that CRPA ensure systematic monitoring of algae blooms and their impacts in the Basin, both before and after project operation. Otherwise, it will be impossible to confirm CPRA's assertion that hypoxia and harmful algae blooms are an acceptable negative consequence to the Mid-Barataria Sediment Diversion.

## Mitigating Impacts to Property

Within the Mitigation Plan, CPRA states that “A comprehensive inventory of potentially affected properties is progressing under the assumption that CPRA would mitigate inundations caused by the Project to properties which could take the form of

- Monitoring and adaptive management of operations
- Assisting with elevation of homes and other structures on private property
- Property rights acquisition (flowage easements or fee acquisition) and
- Structural mitigation (elevating roadways, utility, etc.)

Mitigation Plan, p. R2-24. As discussed earlier, there is no reference to the level of funding that might be available or contemplated for mitigation. Moreover, CPRA qualifies its commitment to mitigation by stating that “in the absence of project, properties in the tidal floodplain are subject to high rates of land subsidence and sea level rise”. Id. The current state of risk for properties that will suffer impacts from the project is irrelevant. Whether or not properties are currently at some level of risk or might be impacted at some point in the future without the project should not limit funding for mitigation. For example, without the proposed project, a 60 year old homeowner could have lived in their home for another 20-30 years or the remainder of their lifetime. They should not be penalized by being denied the full cost of mitigating the impacts of the diversion when the State’s project instead makes that home uninhabitable in 10-15 year. If it is established that the project increases risk to properties more rapidly than would otherwise occur, property owners must be fully and fairly compensated for that increased risk. And, fair compensation, particularly with regard to low income and minority populations, cannot be limited by traditional notions of “fair market value” or “cost benefit analysis” employed in traditional state and federal eminent domain and hazard mitigation policies. Property owners that are forced to elevate or flood proof their homes or properties must be provided with compensation adequate to cover the full costs of those enhancements. Similarly, if property owners opt for voluntary buyouts or the states takes property by eminent domain, those property owners must receive monies sufficient to purchase a comparable home/property elsewhere. These consideration must apply to all communities outside flood protection, but particularly low-income and people of color communities, that will be subject to increase surface water elevations and/or tidal duration, including but not limited to Myrtle Grove, Woodpark, Suzie Bayou/Deer Range, Hermitage, Grand Bayou, and Happy Jack identified as impacted at pp. R2-20-21. Additionally, in mitigating the impacts to communities as a whole, the CPRA must comprehensively plan for, rather than piecemeal, improvements to roads, driveways, structures and property at grade in a manner that ensures that those communities remain fully functional/inhabitable during periods of extended inundation.

## **Mitigating Impacts to Fisheries**

Neither the DEIS, LA TIG Restoration Plan or the Mitigation Plan reference any dollar amount allocated to achieve mitigation for impacts to fisheries. Slides in a presentation by CRPA and LA TIG on the MBSD reference \$33 M for mitigation for project impacts to shrimp, particularly brown shrimp, and shrimpers, and \$40 M for impacts to dolphins but neither of these amounts appear in the Mitigation Plan or in the DEIS. And there is no explanation of how the CPRA and/or LA TIG arrived at these amounts. No similar figure is referenced for mitigation of impacts to oysters or oyster fishers or any other impacted resource. As discussed before, the public cannot comment on the adequacy of mitigation unless they are informed of what the CPRA proposes to allocate to mitigation and how they arrived at that dollar figure.

## **Mitigating Impacts to Oysters and Oyster Fisheries**

The DEIS and Mitigation Plan find that oyster resources, and the fishery, are expected to experience major, permanent adverse impacts under the Project, versus No Action, primarily because of project driven reductions in salinity. However, they opine that “project related changes in salinity structure in the lower basin may also allow for rehab of historic oyster growing areas that don’t currently support oysters, which could help mitigation impacts.” Mitigation Plan p. R2 p 25.

In terms of mitigation: CRPA assumes that any potential mitigation to the oyster resources will benefit the oyster industry and may mitigate for the potential effects of the Project. The mitigation proposed is, therefore, limited to

- Re-establishing a public oyster area in the Lower Basin.
- Providing cultch material for “resource enhancement” either on public or private growing areas.
- Possible establishment of brood stock reefs if monitoring establishes the need for them, to provide larval supply to areas either separated hydrologically or located in a salinity regime that does not result in an annual recruitment.
- Supporting adjusted techniques such as “Alternative Oyster Aquaculture”, including training, possible start up assistance, and restricting use of state water bottoms for AOA.
- Marketing

It is unclear how the proposed mitigation measures for oyster resources would adequately compensate oyster fishers who continue to pursue a traditional approach to oystering. For example, these mitigation measures do not address potential increased costs of traveling to reefs lower in the basin. Or, if the project renders leased areas unproductive, will the CPRA provide lease swaps or compensation to lease holders? To ensure adequate mitigation for all impacted oystermen, CPRA must use allocated mitigation funding to offset the negative outcomes of MBSD on coast-dependent businesses over the lifetime of the project. This should include

establishment of a program to mitigate the increase in operating costs resulting from operation of the MBSD and creation and maintenance of a 10-year loan program for coast-dependent small business owners to establish a secondary or alternative small business to generate income as their primary businesses are impacted by the operation of the MBSD.

Additionally, special approaches to mitigation should be tailored for different sectors of the oyster industry. For example, elderly fisherfolk will need support to maintain current businesses for the next 5-10 years until retirement. Specific programming should be aimed at maintaining the extant operations of elder small business owners who formally identify that they will leave coast-dependent industries within the next 10 years.

Finally, the CPRA includes a statement that “DEIS projected disproportionate impact to some low income and minority commercial oystermen, CPRA is considering options to tailor these measures to ensure they reach those populations.” To accomplish this goal and ensure that measures are truly meaningful and reach these populations, CPRA must be willing to use community expertise, especially the expertise of Community Based Organizations (CBOs) to co-design effective community-specific adaptation programs for those impacted, but particularly to ensure that disparately impacted communities are able to effectively respond to MBSD’s impacts in the near- and long-term.

### **Mitigating Impacts to Shrimp**

The CPRA concludes that the project will have major adverse permanent impacts on brown shrimp and, as a result, moderate to major permanent adverse impacts to the commercial shrimp fishery. Understandably, the state is focusing mitigation strategies at the fishery, rather than the resource. Proposed mitigation strategies include:

- Grants to offset the cost of purchase and installation of vessel refrigeration
- Marketing to help increase market share of domestic shrimp; and
- Grants to offset cost of rigging vessels with different types of gear or substitute gear to increase efficiency and lower cost

R2.p 28. Sadly, the proposed mitigation is unlikely to be sufficient to address the impact to shrimp fishers of the loss of their historical catch of brown shrimp. First, although vessel refrigeration would assist with the need to transport shrimp caught lower in the Basin or in other areas, this presumes that impacted fishers have vessels large enough to house refrigeration units. This program would not mitigate impacts to fisher owners of smaller vessels. Consideration must be given to how to compensate these vessel owners. The same is true for funding for gear improvements.

Finally, it does not appear that the proposed mitigation is really intended to address the potential loss of virtually all brown shrimp catch in the Basin. The loss of brown shrimp will not increase

the availability of white shrimp or, more importantly, reduce the competition for white shrimp. If anything it will increase competition and possibly reduce catch of individual shrimpers. Access to refrigeration, gear modification and marketing will not address this impact on the fishery.

We would propose that CPRA consider the following mitigation measures proposed by potentially impacted fishers, including allocating mitigation funding to support true community adaptation, including but not limited to

- Establishing and maintaining a fund to offset the negative outcomes of MBSD on shrimp-dependent businesses over the lifetime of the project.
- Establishing a program to provide grants to shrimpers need to increase the size of vessels to be able to employ needed refrigeration and gear modifications.
- Mitigating the increase in coast-dependent businesses' operating costs in light of the MBSD.
- Creating and maintaining a 10-year loan program for coast-dependent small business owners to establish a secondary or alternative small business to generate income as their primary businesses are impacted by the operation of the MBSD; and
- Developing a program to support elderly fisherfolk in maintaining current businesses for 5-10 years until retirement. Specific programming aimed at maintaining the extant operations of elder small business owners who formally identify that they will leave coast-dependent industries within the next 10 years.

The CPRA includes a generic statement that the DEIS projected disproportionate impact to some low income and minority commercial oystermen, CPRA is considering options to tailor these measures to ensure they reach those populations.” As previously stated in reference to oysters, to accomplish this goal and ensure that measures are truly meaningful and reach these populations, CPRA must be willing to use community expertise, especially the expertise of Community Based Organizations (CBOs) to co-design effective community-specific adaptation programs for those impacted, but particularly to ensure that disparately impacted communities are able to effectively respond to MBSD’s impacts in the near- and long-term.

### **Mitigating Impacts to Marine Mammals.**

As previously discussed in these comments, the DEIS fails to fully assess the impacts of the Project on BBES dolphins. Absent action to mitigate significant reductions in salinity in multiple years, the BBES will become functionally extinct. Despite the “waiver” contained within Section 20201(b), the CPRA cannot simply sit back and let this happen because to do otherwise might affect Project performance.

Although within the mitigation plan the CPRA states that it will examine operation strategies to minimize, to the extent practicable, the impacts on BBES dolphins, the State does not discuss any

alternative operational strategies, such as reductions in diversion flow during critical months, or particular salinity thresholds, which might reduce impacts to bottlenose dolphins. Yet, as discussed earlier, there is a continuing obligation on the part of CPRA to consult with NMFS throughout construction and operation on potential mitigation strategies. This must include a focus on changes in planned operation of the project that would allow achievement of Project goals without resulting in the functional extinction of BBES dolphins.

The three strategies proposed as mitigation, while laudable in terms of Gulf bottlenose dolphin populations as a whole, will have no effect in reducing impacts to BBES dolphins. Funding for a Statewide Stranding Program, might have positive impacts on other dolphin survival in other Louisiana Coastal waters, however, even if a BBES dolphin were to strand live, if released back to the Basin during Project operation, its survival would be questionable. So at most, funding of a stranding network will only allow collection of data on cause of death of BBES dolphins. This is equally true of the proposal that funding will be provided to allow enhanced response to Unusual Mortality Events.

Similarly, reducing human interaction/anthropogenic stressor reduction will not reduce or address impacts of the project on BBES dolphins. At best it may benefit bottlenose dolphin populations outside the Barataria Basin.

Accordingly, we would argue that the proposed mitigation fails to meet the obligation imposed on CPRA by the MMPA, even in the face of Section 20201(b), to identify mitigation that will reduce impacts to BBES dolphins. We would assert that there are potential actions that, if taken, could reduce impacts to BBES without interfering with the purpose and goals of the Project.

- ***Constructed Rims or Ridges for 'salinity deflection'***

CPRA should be working with scientists to explore the effect of restoration of natural features, such as ridges, on reducing impacts to salinity in some parts of the Basin, such as Caminda Bay. There is also the potential for other, strategic restoration of wetlands in the lower Basin with the goal of slowing the movement of fresh water and providing refuge for BBES dolphins. This is being seriously considered by the State of Mississippi to reduce the negative impacts of freshwater from the Bonne Carre' Spillway ("BCS") on Mississippi's coastal resources. They feel that restoration of the rim of Three Mile Bay from oil and gas canal damage (P20041525 Meridian Resources) would likely have the effect of limiting freshwater flows into the more distal estuary from the Pearl River and BCS, and create more salinity-days above an 8ppt or 5ppt threshold in more marsh areas. There are likely similar opportunities to restore oil and gas extraction damages in Barataria in a way that preserves the salinities in marsh areas for estuarine dolphins. This restoration would also likely mitigate for other fisheries damages--if Barataria Bay were as intact as it was before oil extraction, there would be more marsh platform to take advantage of the freshwater and sediment inputs, and constrain salinity changes. The main four

passes out of Barataria Bay still pass much more water than is contemplated by the MBSD, so directing freshwater flow toward those outlets shouldn't have adverse impacts.

Although this would require investment in scientific studies focused on the potential effect of these approaches in reducing impacts of freshwater on BBES dolphins, we believe that the NRDA Trustees have a responsibility to invest in this research on "salinity deflection" by created rims or ridges to fulfill their mandate to use NRDA funds, particularly funds allocated under the BP Settlement to the various TIGs for dolphin restoration.

- ***Displacement of the Menhaden fishery away from BBES islands and passes***

Another measure CPRA and LA TIG should consider is moving Menhaden fisheries further from islands and passes where BBES dolphins hunt<sup>9</sup>. The bycatch of BBES dolphins is likely, but usually unmonitored, in state and federal waters off Louisiana. If the Menhaden fleet was pushed further from shore, dolphins caught in Menhaden nets would more likely be of coastal or oceanic stock, reducing pressures on BBES.

Condrey, Richard, 1996. Dolphin recovered by Menhaden nets in Mississippi Sound.

This measure should be complemented with a Menhaden bycatch monitoring program with the capacity to identify which stocks of dolphins are affected by the fishery.

<sup>9</sup> The Gulf of Mexico Ecosystem: A Coastal and Marine Atlas;Page 94 Menhaden Purse Seine Net Density 2006-2009 <https://oceanconservancy.org/wp-content/uploads/2017/05/gulf-atlas.pdf>

- ***Default monitoring of pods after large oil spills***

Another method to mitigate for impacts to BBES would be to respond to large oil spills in Barataria Basin on the assumption that the oil spilled affects dolphins. Larger oil spills in Barataria should be assumed to impact dolphin health, and stranding teams should also be mobilized to survey known pods after larger spills, to detect any changes in behavior. Offenders should be held as Responsible Parties under OPA to supplement the funding from the MBSD mitigation program.

Whether or not the CPRA feels compelled to affirmatively act to reduce impacts on BBES dolphins, we would argue that the LA TIG's trust duties require that they do so. Under OPA, responsibility for protection of natural resources falls with Federal, State, and Tribal Trustees. This is because no one individual "owns" a natural resource; rather, they are held in trust for the public – EPA, Natural Resource Damages: A Primer <https://www.epa.gov/superfund/natural-resource-damages-primer#nrt>.

Under this trust responsibility, the Deep Water Horizon NRDA Trustees cannot sit idly by while one of the resource, BBES dolphins, most seriously impacted by the BP disaster is driven to functional extinction by a project they are funding to restore impacts to another trust resource. Instead, it is incumbent upon the Trustees to act in the public interest to protect public resources (BBES dolphins) by investing in (1) research that explores all possible mitigation actions that will reduce impacts to BBES dolphins, and other trust resources; and (2) if proved efficacious, investing in those restoration projects.

### **Mitigating Environmental Justice Populations**

The DEIS and Mitigation Plan conclude that that project will have minor to major impacts to populations near the Project outfall outside of levee protection due to increases in tidal flooding. “These impacts may be disproportionately high and adverse for some low income and minority populations to the extent these populations are uniquely vulnerable to tidal flooding and storm hazards or engaged in commercial or subsistence fishing and dependent on adversely impacted fisheries.” Mitigation Plan, p. R2 p.33.

To mitigate for disproportionately high and adverse impacts to subsistence oyster and brown shrimp fishing, as well as recreational fishing, “CPRA will provide public access opportunities which will primarily involve (1) the provision of public shoreline access’ and watercraft launching around the project,” R2 p. 30. The proposed mitigation ignores the challenges facing many subsistence fishers. Providing access points farther down in the basin will not address increased costs to subsistence fishers of fuel or additional wear and tear on vessels associated with travel to access points lower in the basin. As defined, subsistence fishing

broadly speaking, ...can be characterized by 1) a dependence on fishing for survival, 2) having little to no other source of income, 3) living close to the resource, 4) harvesting fish to eat or sell in order to meet basic food requirements, 5) using low-technology gear (as part of traditional or cultural practice), and/or 6) relying on the harvest to meet nutritional needs.

<https://sites.duke.edu/fishingforfood/research/rop/>

The mitigation measures currently proposed by CPRA will not address the additional challenges that subsistence fishers will face as a result of the Project. We would again propose that, to develop effective mitigation measures for subsistence fishers, CPRA use community expertise, especially the expertise of CBOs to co-design effective community-specific adaptation programs to ensure that disparately impacted communities are able to effectively respond to MBSD's impacts in the near- and long-term.

### **Mitigating Impacts to Cultural Resources**

The CPRA states that the project will have impacts on 4 historic properties (archaeological sites) and discusses the mitigation of impacts to those and other cultural resources. However, consultation on acceptable mitigation of cultural resources is limited to federally recognized tribes. While we understand that the federal government's legal obligation to consult with Native tribes is limited to those that have been federally recognized, the tribes consulted in this instance have little or no connection to the area impacted. There are several state recognized tribes in the project area, including members of the Houma Nation, and several other tribal entities that are acknowledged to exist but are not state or federally recognized. However, the MBSD is a state sponsored project and is not, therefore controlled by federally established limitations on the need to consult tribes whose cultural resources may be adversely impacted by the Project. As the very least, it is incumbent on the State to consult with State recognized tribes to identify measures to avoid, minimize and mitigate the impacts to their cultural resources it seeks to mitigate for impacts to cultural resources. We would assert that all tribal entities whose cultural resources may be impacted should be consulted.

There will be a new disconnection made between Ironton and the St Rosalie Plantation, the first of its kind. CPRA should consider working with Ironton, including descendants of people buried at St Rosalie, on a project to maintain access to these critical cultural sites after the construction of a channel in between.

Additionally as stated above, the Project sponsors must consider how the small but multitudinous canals and pipelines in the Project area affect the hydrology of local marshes, which often include cultural resources. One federal project making significant planning progress in this area is

"Lagniappe for the working coast", awarded an NEP grant in 2020.<sup>10</sup> The CPRA and LA TIG must consider how this project, which is already underway, can be better, fully, or additionally funded to mitigate for any loss of marshes, changes in water level, or loss of access to cultural sites.

The impacts to Grand Bayou are conspicuously part of an eastern area that will be negatively impacted by water level, and yet not likely to receive land-building benefits. CPRA should consider enhanced compliance for companies like Shell and Gulf that worked this oilfield, in order to effect restoration of the entire Magnolia oilfield sub basin--this oilfield damage seems to be the root cause of this conflict.

If residents of the Basin, particularly tribes, feel that strategic hydrologic restoration, such as weirs, ridges, marsh platform creation, or backfilling of canals, will assist with protection of cultural resources, CPRA should investigate opportunities to work with the tribes to fund and complete that restoration.

Subject:

RAM Terminal CFD Modeling Technical Memorandum

---

### 1. Introduction

This memorandum summarizes the results of Computational Fluid Dynamics (CFD) simulations used to analyze the transport of sediment to the proposed diversion channel at Myrtle Grove and to evaluate the flow patterns due to the proposed construction of the RAM terminal facility. To help with the analyses, numerical simulations of flow from River Mile (RM) 56.0 to RM 62.7 were carried out with the commercial CFD program known as **FLOW-3D** ([www.flow3d.com](http://www.flow3d.com)). This program was previously used by The Water Institute to carry out hydrodynamics and sediment transport analysis in lower Mississippi near Myrtle Grove (Meselhe et al, 2011).

The results of the analyses described herein were used to evaluate the effect of the proposed construction of the RAM facility on the sediment transport to the proposed Myrtle Grove delta diversion.

### 2. Approach

A three dimensional CFD model of the proposed RAM terminal facility with vessels combined with river bathymetry and proposed diversion channel was used to analyze sediment transport and to evaluate flow patterns approaching the facility and the diversion channel. This model was constructed within the framework of the **FLOW-3D** software package and was based on previous work carried out by The Water Institute (Meselhe et al, 2011).

The primary objectives of this study are to examine potential changes to the flow patterns near the intake of the proposed diversion and in the vicinity of the proposed RAM facility, and to determine the potential impact on the amount of sediment (sediment/water ratio) transported to the proposed diversion channel due to the presence of the RAM terminal facility placed upstream of the diversion.

The following describes the model setup in **FLOW-3D**.

### Geometry

The model was created using **Rhino** pre-processing software. The model included the river bathymetry, proposed diversion channel, RAM terminal facility, and barge and ship. The river bathymetry and diversion channel was obtained from the previous study (Meselhe et al, 2011). The river bathymetry extends from River Mile (RM) 56.0 to RM 62.7 (Figure 1). CAD drawings of the terminal facility and barge and ship were provided by Lanier & Associates Consulting Engineers, Inc. The drawings were used to create geometries of the terminal facility and barge and ship, and combined with the river bathymetry (Figure 2).

### Boundary Conditions

For consistency reasons, the boundary conditions used in this analysis are the same as those used in the previous modeling effort. The boundary conditions used in this study are as follows:

- Solid boundaries including river bed, diversion channel, barge and ship were specified. Standard Wall functions were used to compute the shear stress at the no-slip boundary.
- The terminal structures were modeled as porous planes to emulate the effect of the piers on the water flow. Twelve porous planes (baffles in **FLOW-3D**) were used to model the structures (Figures 3 and 4). Porosity and loss coefficients of the baffles are summarized in Table 1.
- The water surface was modeled as a sharp, free surface allowing accurate representation of the water/air interface.

### Mesh Generation

Creating an appropriate computational mesh is an important aspect of every numeric modeling. The flow field is discretized into a number of small elements (cells) for solving the governing equations of fluid flow. The cell size must be small enough to capture the flow features of interest. In this study, the computational mesh used in the simulation is the same from the previous model to be consistent with the

analyses. Additional refinements to the mesh near the RAM facility and the intake of the proposed diversions were made. These refinements (horizontal grid spacing reduced from 15 meter to 2.5 meters) were made to enhance the ability to capture the details of the flow field.

### **3. Simulations**

Several simulations were carried out in this study - all for a 700,000 cfs river flow. A description of these runs is provided below:

- Run #1 – Baseline condition. The model included only the river bathymetry and the proposed diversion channel (no facility, no barge and no ship).
- Run #2 – The model included the river bathymetry, proposed diversion channel, loading barge, and ship at - 40 feet draft (no facility).
- Run #3 – The model included the river bathymetry, proposed diversion channel, loading barge, ship at - 40 feet draft, and the terminal facility.
- Run #4 – The model included the river bathymetry, proposed diversion channel, loading barge, ship at - 9 feet draft, and the terminal facility.
- Run #5 – The model included the river bathymetry, proposed diversion channel, loading barge, ship at - 40 feet draft, terminal facility, and a guide vane at the entrance of the diversion.
- Run #6 – The model included the river bathymetry, proposed diversion channel, loading barge, and the terminal facility (no ship and no guide vane).

### **4. Results**

Simulation results are presented both qualitatively and quantitatively. Qualitative results, appearing in Figures 5 through 16, show the trajectory of streamlines and velocity contours in the vicinity of the facility and entrance of the diversion channel. Streamlines were back calculated from the diversion channel to show where water entering the diversion came from. Velocity contours were used to show flow separation behind the ship.

Figures 5, 6, 7, 8, 9, and 10 show streamlines entering the diversion from different heights in the water column for Run #'s 1, 2, 3, 4, 5 and 6; respectively.

Figures 11, 12, 13, 14, 15, and 16 show velocity contours at elevation 4.1 feet (NAVD88) for Run #'s 1, 2, 3, 4, 5 and 6; respectively.

Sediments were represented by five different sizes of particles (32 microns, 63 microns, 96 microns, 125 microns, and 250 microns). Figure 17 shows the distribution of particles for Run #3 as an example. Particles were released upstream of the facility after obtaining a converged solution of flow fields.

Quantitative results of the sediment analysis are summarized in Table 2.

## **5. Closing Remarks and Preliminary Conclusions**

The analysis presented in this letter-report provides a summary of the 8-week modeling effort performed to assess the potential impact of the RAM facility on the flow field in the vicinity of the facility and the intake of the proposed sediment diversion at Myrtle Grove, and on the efficiency of the proposed diversion to capture sediment from the main river channel.

The following are closing remarks and preliminary conclusions:

1. Figure 2 shows the presence and relative-size of the RAM facility near the intake of the proposed sediment diversion. Navigation concerns should be fully investigated to assess the potential impact on vessel traffic generated by the RAM facility with the presence of the cross-flow generated by the proposed Myrtle Grove sediment diversion. The investigation of navigational concerns was not part of the scope of the analysis presented here.
2. During the course of this analysis, it was indicated that barges would pass in front of the proposed diversion intake and park immediately downstream of the intake and along the right descending bank of the Mississippi River. Safety concerns for these vessels should be fully investigated due to the cross-flow generated by the proposed Myrtle Grove sediment diversion. Typically "ship-simulators" are used to address these safety concerns. The investigation of safety concerns was not part of the scope of the analysis presented here.
3. Figures 5 through 16 show the impact of the presence of the facility, barges and ship on the flow field near the intake of the proposed diversion. The difference in the flow pattern is visually detectable in these figures. These changes influence the location from which water is being drawn into the outfall channel and affect the water-sediment ratio.
4. Special emphasis should be placed on Run#1 and Run#3, representing the base case and the RAM facility presence. The Sediment-Water ratio was reduced by nearly 17%. A reduction in the sediment-water ration results in a loss of sand load diverted through the outfall channel. For an assumed pulse lasting 30 days per year, such a loss of sand load diverted through the outfall is summarized in Table 2. Nearly 500,000 tons of Sand will be lost in a decade due to the presence of the RAM facility. Despite the uncertainty present in any numerical model, the results of all the

simulations performed here showed persistent reduction of sediment load captured in the outfall channel due to the presence of the RAM facility. Additional simulations might narrow the range of variability stated in this comment, however the impact is likely to persist.

5. The streamlines shown in Figures 5 through 10 indicate that debris and dust generated during the loading process would be captured in the outfall channel and transported into the marsh areas potentially causing environmental issues. The investigation of water quality was not part of the scope of this analysis, but should be investigated to assess such environmental impact.
6. There is limited number of lateral bars in the Lower Mississippi River (downstream of River Mile 90 Above Head of Passes) and they are targeted as a resource to restore coastal Louisiana. Some of these bars are designated as a resource for the earthen sill needed during drought conditions. That further reduces the number of lateral bars available for coastal restoration. The existence of the RAM loading facility on top a lateral bar would severely limit the ability to harness the available sand directly through dredging or using other agitating techniques to increase the amount of sediment diverted toward the outfall channel.
7. The existence of the RAM loading facility upstream of the diversion intake may pose hazard to the foundation and pilings of the loading facility. Field measurements at West Bay shows several feet of erosion occurring upstream of a diversion.

## 1.0 INTRODUCTION

This report describes the hydraulic, sediment transport and morphological analysis performed using numerical models to evaluate the effect of the proposed Plaquemines Liquids Terminal (PLT) project on the performance of the Mid-Barataria Sediment Diversion (MBSD) project. FTN Associates, Ltd. (FTN) performed the study as a member of the Design Team (DT) led by the AECOM Technical Services (AECOM). The DT is providing the Engineering and Design (E&D) services for the MBSD project to the Coastal Protection and Restoration Authority (CPRA) of Louisiana. The DT is currently performing the 30% Level E&D analysis. Royal HaskoningDHV Consultants (RHDHV) provided the Independent Technical Review (ITR) of this study.

The proposed PLT facility is situated about 1,500 ft upstream of the MBSD intake on the west bank of the Mississippi River (MR) and 2500 ft downstream of the existing Cenex Harvest States Inc. (CHS) grain terminal.

## **2.0 PURPOSE, SCOPE AND LIMITATIONS**

The purpose of the modeling study is to add the proposed PLT facility to the numerical models developed for the MBSD and evaluate the effects on the water level, velocity, discharge and sediment transport in the MR and in the diversion canal.

The modeling study is limited to the MR segment in the vicinity of the diversion structure, i.e., about 5 miles upstream and downstream of the diversion intake which is the approximate extent of the primary model domains. The effect of the Mid-Breton diversion proposed at approximately RM 68 on the east bank of the MR is not considered in this study.

The models are not setup to provide information for the design of the structural components of the PLT facility. The MBSD E&D is currently at the 30% level and the numerical model geometry incorporate diversion components designed at this level. Further E&D efforts are underway, and the models and results are subject to change.

## 3.0 METHODOLOGY

The modeling method is described in the flow-chart shown on Figure 3.1. A combination of two-dimensional (2D) and three-dimensional (3D) Delft3D models along with the 3D FLOW-3D Computational Fluid Dynamic (CFD) model is used to simulate the effects of PLT on the MBSD as shown in the Figure 3.1.

### 3.1 General Approach

The 3D FLOW-3D model included a segment of the MR with- and without-PLT, the intake headworks and a portion of the conveyance channel (CC). This model was primarily used to simulate the non-hydrostatic flow field (water level and velocity) and energy losses in the system through steady-state (SS) runs.

The 3D Delft3D (hydrostatic) model covered the similar model extent and was calibrated using SS runs to the energy losses provided by the FLOW-3D model. This model was primarily used to simulate the MR morphology, sediment transport and the discharge and sediment load through the diversion. The production runs were performed using one-year MR hydrograph.

The 2D Delft3D model (hydrostatic) covered the above model domain with the addition of the entire diversion channel and the Barataria Basin up to the Gulf of Mexico. It was calibrated using SS to the energy losses provided by the FLOW-3D model. The purpose of this model was to provide realistic water level (WL) boundaries to the partial conveyance channel (CC) segment represented in the 3D models. Performing 3D model simulations with the entire conveyance channel and the Barataria Basin would have been prohibitively costly and time consuming without any added accuracy to the study.

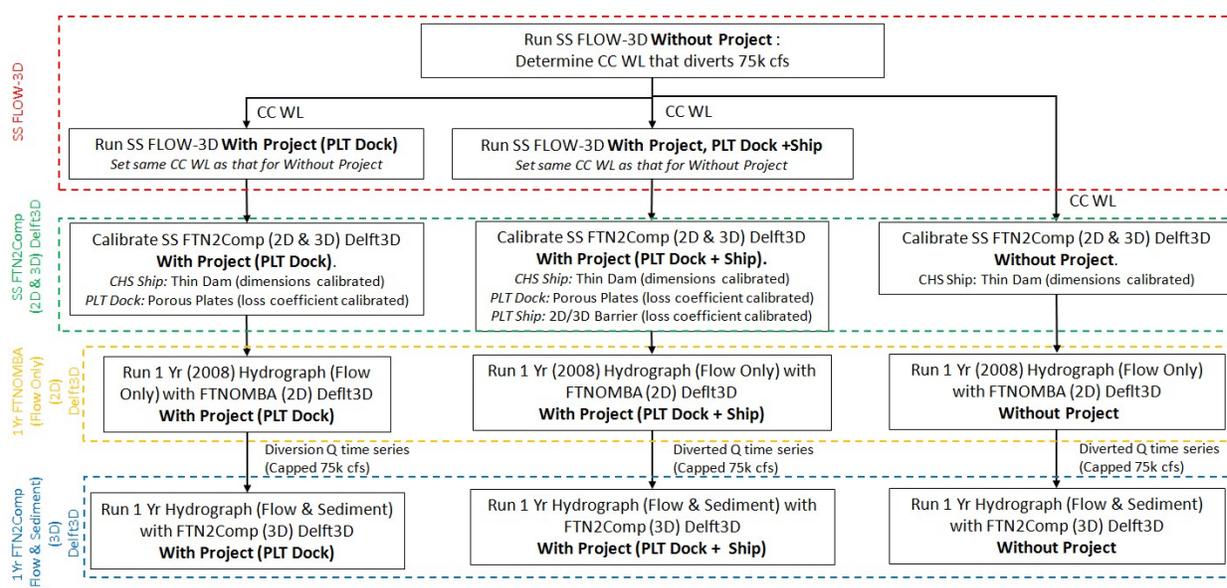

Figure 3.1. Flow-chart showing sequence, purpose, and setup of the various models used in this study.

### 3.2 Modeling Programs

Considering the important hydraulic processes and the previous work by the Water Institute of the Gulf (WI) and CPRA, two multi-dimensional modeling programs were selected, namely, FLOW-3D and Delft3D. The modeling programs are briefly described below in the following sections.

### 3.3 FLOW-3D Modeling

Several CFD models exist that can be used to model the MBSD diversion. In this application, it is imperative that the model has the ability to efficiently solve for the spatial and temporal variations in water levels as well as the turbulent three-dimensional near-field flow velocities produced as a result of fluid structure interaction at the intake. The FLOW-3D three-dimensional (3D) CFD software licensed from Flow Science, USA (Flow Science, 2018) was selected as the appropriate modeling tool for the near-field hydrodynamic and the suspended sediment transport modeling. FLOW-3D was used previously by CPRA/WI to model the flow and suspended sediment through sediment diversions during the planning phase (Meselhe et al., 2012). It was proven to be able to capture the complex 3D flow field in the vicinity of the

diversion as well as quantify the spatial distribution of the suspended sediment on the lateral bar near the diversion. FLOW-3D was also used in the study by HDR Engineering as described in the 30% design report (HDR, 2014) for screening of diversion alternatives. FLOW-3D is currently the only available commercial CFD model capable of simulating suspended sediment in free surface flows over complicated river bathymetries, irregular banks and intake structure using structured grids (Allison et al., 2017). Since FLOW-3D solves the complete 3D Reynolds-Averaged Navier-Stokes equations with turbulence closure, it is inherently non-hydrostatic and gives more accurate vertical flow profiles than models that are based on the shallow water equations. However, the model is computationally intensive, with relatively long computational times for this application. Therefore, the FLOW-3D analysis was only applied to selected steady-state flow conditions, which are representative snapshots from a typical river hydrograph. The model was used to determine the energy loss through the system and the Sediment-Water Ratio (SWR, described later) using a discrete particle tracking model. One limitation of FLOW-3D is that, at this time, it does not include a validated and efficient model for simulating sediment transport together with morphology change (i.e., the bed level change due to erosion and deposition of sediment) near the diversion. Therefore, the morphology change analysis was performed using another modeling software called Delft3D described later in this report.

### **3.3.1 Model Geometry**

A FLOW-3D model named FTNMSDI was developed to model the hydrodynamic effects of the PLT dock structure and the ship on the MBSD diversion intake. The FLOW-3D model geometry extended in the MR from River Mile (RM) 58.1 downstream to RM 65 upstream (All river miles referenced are relative to the Head of Passes which is at RM 0). The details of the domain extent and the mesh blocks are shown on Figure 3.2.

The FTNMSDI model is being used currently for E&D of the MBSD project. One of the key improvements made to the FTNMSDI model developed here over the previous FTNMSDI model, was that the upstream boundary in the current FTNMSDI model has been extended further north upstream to RM 65.0 from the RM 62.7 location in the previous FTNMSDI model.

This was done after initial model runs with the PLT Dock showed that the previous boundary location in the FTNMSDI model was too close to the PLT location and showed upstream boundary effects on the calibration results at the transect crossing near the proposed PLT location. Moving the boundary approximately 2 miles upstream in the updated FTNMSDI model resolved this issue. Note that the choice of the FTNMSDI boundary at RM 62.7 is still appropriate for the MBSD modeling results (without the PLT) because the upstream boundary effects are negligible at the MBSD intake for either choice of the upstream locations, i.e., the flow from the upstream is already developed when it reaches the MBSD location. The upstream boundary extension is only required in the current FTNMSDI model since the study site of interest (PLT Dock and Ship) which is approximately 1500 ft upstream of the MBSD location is also affected by the CHS terminal which is about a mile upstream of MBSD, an extension of the upstream boundary captures the combined effect of all these features in the model. A second change made to the model was the inclusion of the CHS terminal into the updated FLOW-3D FTNMSDI model which is approximately 0.5 mile upstream of the PLT location and whose effect cannot be neglected when modeling hydrodynamic effects at PLT.

The bathymetry for the river portion of the model was generated by combining multibeam survey data from US Army Corps of Engineers (USACE). The 2012 USACE channel survey (published in 2013) was used for the main channel and the 2017 USACE revetment surveys were used for the revetment portions in the river. The bathymetry for the MBSD intake and conveyance channel used the latest design by the DT for CPRA.

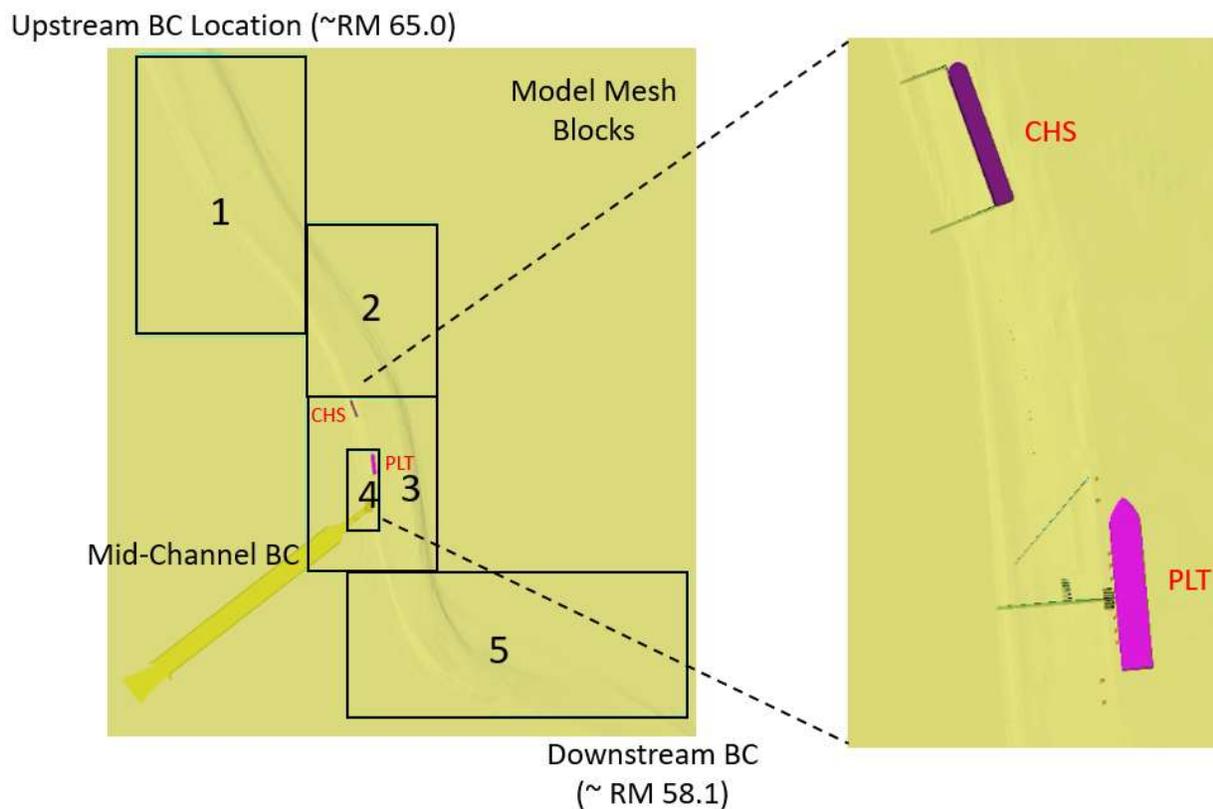

Figure 3.2. Model domains, mesh blocks and boundary locations of the FTNMSDI FLOW-3D model and their relation to the CHS and PLT terminals.

### 3.3.2 PLT model setup

The structural drawings for the proposed PLT Dock structure and ship, while docked at the PLT Dock, were provided by Tallgrass Energy. All underwater structures with possible hydrodynamic impacts (e.g., the ship, the barge deflector, the access-way, the fire-water intake platform, the liquid loading platform, and the breasting and mooring dolphins) were identified for distinct representation in the model. The PLT ship is modeled as a solid body. The ship is assumed to be loaded up to approximately half its full draft (modeled as having a mean draft of 28 ft), and is assumed to be present for the entire operational period of the diversion for the one year hydrograph period simulated.

Figure 3.3 and Table 3.1 show the details of the PLT structures and the ship as represented in the FLOW-3D model. The individual piles and dolphins are too small to be

resolved at the individual fluid-structure interaction scale, using the river reach-scale model grid. Instead they were represented by sub-grid scale drag effects of the structures by mesh planes, which can be appropriately parameterized to extract energy from the main flow, without the need to resolve the individual wake of each pile structure in detail. This approach has been used before in Meselhe et al. (2012) and is also used here to model drag effects of the pile arrays (access-way, barge deflector, fire-water and liquid loading platforms), truss and individual dolphins (which are too small to be resolved independently but still have non-negligible drag effects on the global flow) by porous mesh planes. The group of barges with a uniform 3 ft draft arranged continuously on top of the barge deflector pile group is represented by a solid mesh plane (negligible width). The ship at the PLT Dock can be fully resolved at the model grid scale and is modeled as a solid body. Explanations of the choice of model coefficients for the porosity, linear loss coefficient and the quadratic loss coefficient for the mesh planes are provided in the following paragraphs. These coefficients were carefully chosen to parameterize complex drag effects of the major structural configurations based on the theoretical and empirical studies found in the literature.

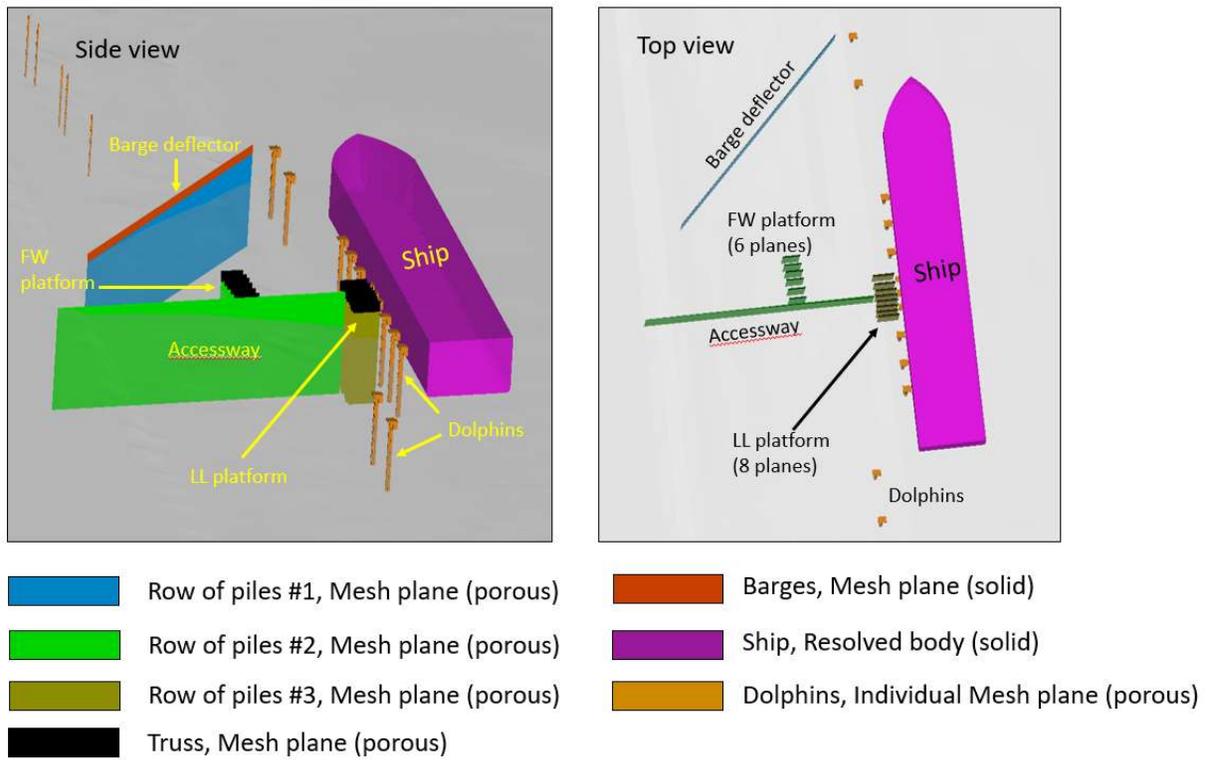

Figure 3.3. Illustration of the PLT structures in the FTNMSDI FLOW-3D model.

Table 3.1. Modeling details of the PLT components in FLOW-3D.

| PLT structures                                  | Mesh plane type                      | Vertical extent                                                           | Porosity ( $\epsilon$ ) | Linear loss coefficient (KBAF1) | Quadratic loss coefficient (KBAF2) |

The drag induced by a mesh plane on the main flow is represented by a pressure drop term in the Reynolds-Averaged Navier-Stokes (RANS) equations for incompressible flow. The pressure drop in FLOW-3D is calculated using a Darcy-Forchheimer type equation (FlowScience 2018) as given below:

$$\Delta p = \rho \cdot (KBAF1 \cdot u + KBAF2 \cdot u|u|) \quad (1)$$

Where,  $\Delta p$  is the pressure drop in the flow direction per unit length,  $\text{kg/m}^2/\text{s}^2$ ;  
 $\rho$  is the density of water,  $\text{kg/m}^3$ ;  
 $u$  is the subgrid scale (within pile array) velocity,  $\text{m/s}$  with the following equation.

$$u = \frac{U_{bulk}}{\epsilon} \quad (2)$$

Where,  $U_{bulk}$  is the velocity at the resolved scale of the bulk flow,  $\text{m/s}$ ;

$\varepsilon$  is the porosity which a measure of the void space in the structure.  
 $KBAF1$  is the linear loss coefficient, 1/s, with the following equation:

$$KBAF1 = \frac{\nu}{k} \quad (3)$$

Where,  $\nu$  is the kinematic Viscosity of water,  $m^2/s$ ;  $k$  is the permeability,  $m^2$ ;  
 $KBAF2$  is the quadratic loss coefficient, 1/m;  
For approximation of the pressure drop across a row of piles, Chamsri et al., 2015 proposed the following equation

$$k = \frac{2\pi\varepsilon^2}{(1-\varepsilon)R_e C_d} \quad (4)$$

Where,  $\varepsilon$  is the porosity;  $r$  is the diameter of the pile, m;  $R_e = uD/\nu$  is the Reynold's number based on individual pile diameter (D);  $C_d$  is the drag coefficient for the individual pile.

Table 3.2. Reynolds number for different cylindrical piles used in PLT Dock components. (DAV is Depth-Averaged Velocity).

| Structure             | Pile Diameter (D) (ft) | Porosity | MR Flow (cfs)         | Estimated MR DAV at PLT (ft/s) | Estimated Local DAV in Pile Array (ft/s) | Pile Reynolds Number (Re) |
|-----------------------|------------------------|----------|-----------------------|--------------------------------|------------------------------------------|---------------------------|
| Accessway Piles       | 1.5                    | 0.90     | 1,000,000 (High Flow) | 4.0                            | 4.4                                      | 6.2 E5                    |
|                       |                        |          | 600,000 (Low Flow)    | 2.0                            | 2.2                                      | 3.1 E5                    |
| Barge Deflector Piles | 4.0                    | 0.96     | 1,000,000 (High Flow) | 4.0                            | 4.2                                      | 1.5 E6                    |
|                       |                        |          | 600,000 (Low Flow)    | 2.0                            | 2.1                                      | 7.7 E5                    |
| Breasting Dolphins    | 9.0                    | 1.00     | 1,000,000 (High Flow) | 4.0                            | 4.0                                      | 3.3 E6                    |
|                       |                        |          | 600,000 (Low Flow)    | 2.0                            | 2.0                                      | 1.7 E6                    |

Achenbach's (1971) pile drag coefficient variation (Figure 3.4) versus the pile Reynolds number chart was used to determine the  $C_d$  for an individual pile. The Reynolds number computations at high and low flows for the various cylindrical members are shown in Table 3.2. Equations 2 through 4 were used to derive the values for the linear loss coefficient for the different pile arrays. As an example of how the linear loss coefficient for the accessway piles is calculated, consider the accessway pile array which has piles with diameter of 1.5 ft spaced apart 15 ft across the streamwise direction. The porosity ( $\epsilon$ ) for the accessway pile structure in the streamwise direction thus is 0.9 ( $=1-1.5/15$ ). For MR flow ranging from 600,000 cfs to 1,000,000 cfs, the depth-averaged velocity (DAV) in the bulk flow ( $U_{bulk}$ ) around the PLT dock structure varies approximately between 2 to 4 ft/s. With the porosity of 0.9, the local sub-grid scale DAV around the piles ( $u$ ) can vary from 2.2 to 4.4 ft/s as given by Equation 2 above. This yields a pile Reynolds number range from  $3.1 \times 10^5$  to  $6.2 \times 10^5$  (Table 3.2). Figure 3.4 highlights this range and assuming a pile roughness ( $k_s/D$ ), where  $k_s$  is the Nikuradse's roughness length and  $D$  the pile diameter, of  $1$  to  $5 \times 10^{-3}$  for typical rough piles, the drag

coefficient of a single cylindrical pile,  $C_d$  can be estimated to be between 0.9 to 1.2. Applying equation (4), the permeability  $k$ , is calculated to be between  $4.8$  to  $9.6 \times 10^{-6} \text{ m}^2$ . The KBAF1 from equation (3) thus varies between  $0.1$  /m to  $0.22$  /m. For simplification, a mean of  $0.16$  /m was used in the model. As is shown in Table 3.1, the structure of rows of piles in the accessway, fire-water platform, liquid-loading platform and barge deflector was thus approximated with a linear loss coefficient of  $0.16/\text{m}$ .

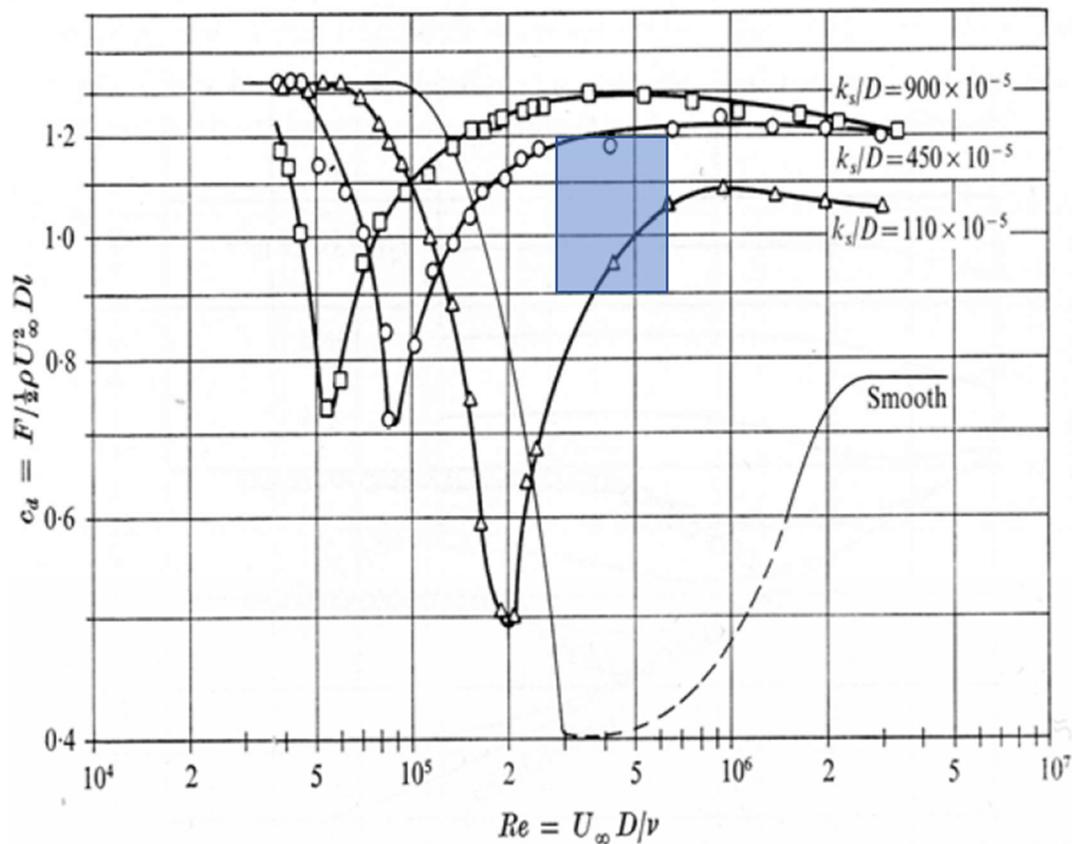

Figure 3.4. Individual cylindrical pile drag ( $C_d$ ) variation with pile Reynolds number (Achenbach 1971).

The truss structures for the liquid-loading platform and fire-water platform are approximated with a quadratic loss coefficient (Blevins, 1984). This approach is similar to the method of representing truss drag effects by the quadratic drag law that was used by the WI (Meselhe et al., 2012). Figure 3.5 shows the table from Blevins (1984) which provides values for

empirical quadratic drag coefficients for open frame at different solidarity ratio ( $1-\epsilon$ ) and Reynold's number. With a solidarity ratio of 0.22 and Reynolds number greater than  $5 \times 10^5$ , the quadratic drag coefficient is determined to be 0.9 and is chosen for the mesh planes representing the firewater and liquid loading platform trusses for this study.

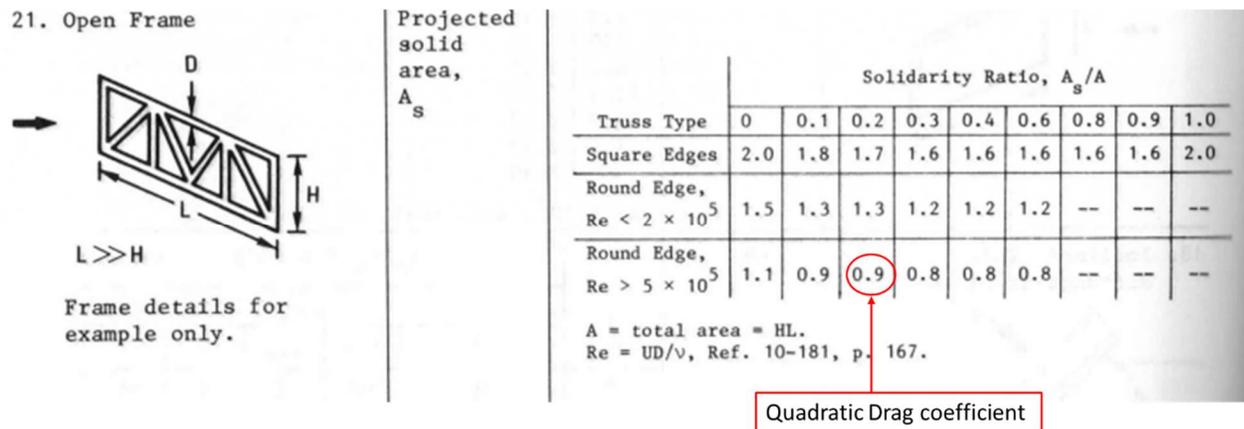

Figure 3.5. Quadratic drag coefficients for various solidarity ratios and Reynolds number range (Source: Table 10-19 from Blevins, 1984)

The barge section, which forms the top of the barge deflector, with a 3 ft draft below the water surface is considered impermeable by setting the porosity to 0 for that mesh plane; this leads FLOW-3D to disregard equations 1 to 3 and instead treat the mesh plane as a solid body that blocks the flow through it. The PLT ship is fully resolved as a solid body in the model with a no-slip boundary condition at the solid surface. The ship draft was held constant at 28 ft below the water surface over various river flows as the mean draft of the ship provided by Tallgrass Energy. Thus, the vertical position of the ship bottom was set at different elevations based on the different water surface elevation for the high and low flow runs. The water surface from the 'Without-Project' run was used as the guidance to set the ship bottom elevation for the 'With-Project' (PLT Dock+ Ship) runs.

In addition, a ship, anchored to the river bed and moored at the CHS terminal, was modeled by a fully resolved solid body. The dimensions of the CHS ship were obtained from the outline of an image of an actual ship moored at this location shown in a recent Google Earth

image (2018) from a recent period as the calibration period. This ship was included in all the runs (without PLT, PLT Dock and PLT Dock+Ship). The CHS Dock structure was represented by three mesh planes, two perpendicular to the flow and one along the flow, as seen on Figure 3.2.

Since the main goal of the study is to model the effects at the MBSD intake with- and without-PLT project conditions over the entire period of modeling (1 year), the development of an acceptable invariant background condition over that entire period (same 1 year) is important. The following factors are unknown within the period when the observed data were recorded:

- Whether a CHS ship was parked at the CHS terminal,
- The exact CHS ship draft,
- Presence or absence of additional barges along the right descending bank downstream of CHS, or
- The exact structural details of the CHS dock itself.

Therefore, it is reasonable to assume that once the model is calibrated/validated for a given setup, it can be considered as an acceptable background condition for the entire duration of the run. For the purposes of this study, this invariant background (Without-Project) condition, against which With-Project conditions can be evaluated for all the results presented, is considered to be the particular CHS setup against which the FTNMSDI model is calibrated against, i.e., which includes the effect of the CHS terminal and the anchored ship only.

### **3.3.3 Meshing and Boundary Conditions**

Figure 3.6 show the extents of the mesh blocks and Table 3.3 shows the grid sizes within the five different mesh blocks. In order to better resolve the flow features near the PLT Dock, the FTNMSDI mesh that is used for the MBSD analysis was updated with enhanced local refinement (mesh block # 4) spanning from 150 ft upstream of PLT and to include the entire headwork of the MBSD diversion. Figure 3.6 shows both horizontal and vertical mesh grid sections near the PLT structure.

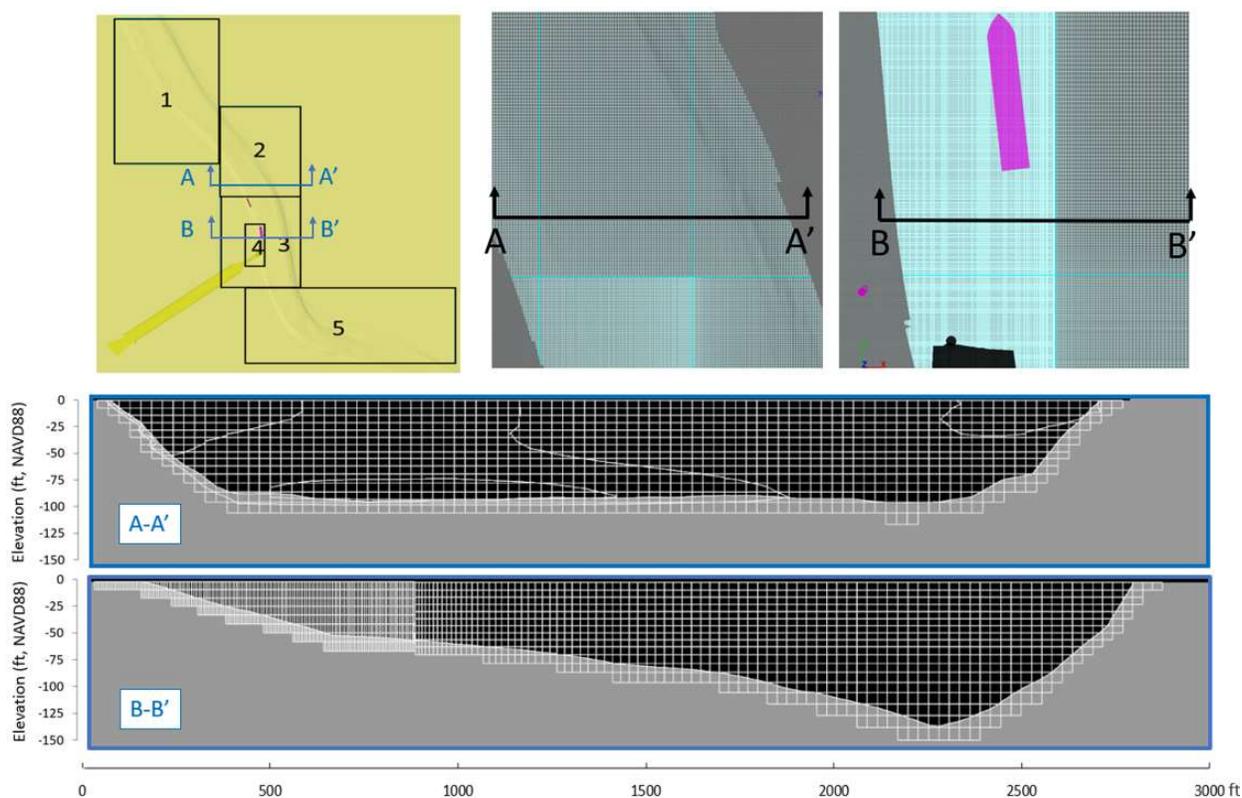

Figure 3.6. Illustration of the FLOW-3D horizontal mesh resolution and vertical resolution at two transects, A-A' and B-B'.

Table 3.3 Mesh sizes for the five mesh blocks in FLOW-3D.

| Block No. | $\Delta x$ (m) | $\Delta y$ (m) | $\Delta z$ (m) |
|-----------|----------------|----------------|----------------|
| 1         | 10             | 10             | 1.8-3.5        |
| 2         | 8              | 5-10           | 1.8-3.5        |
| 3         | 2-8            | 3-8            | 1.8-3.5        |
| 4         | 1.3            | 1.3            | 1.8            |
| 5         | 5-8            | 5-8            | 1.8-3.5        |

A total of 11 run cases (2 runs for calibration/validation and 9 runs for production) were investigated as shown in Table 3.4. The MR upstream is specified by a discharge boundary condition as specified in Table 3.4. The MR downstream and mid-channel are set with a water level boundary condition. At MR flow at 1,000,000, 600,000 and 450,000 cfs, the corresponding water levels at downstream were set to 7.81 ft, 3.48 ft and 2.85 ft, based on stage-discharge (Q-H) relations determined from Delft3D runs under current (without MBSD) conditions. Note

that a slight drawdown in the water levels (approximately 1 ft maximum at high flows) in the river is expected due to the diversion operations. However, this cannot be determined apriori in the FLOW-3D model before ascertaining the diverted discharges through the diversion, which can only be determined from the Delft3D model including the basin effects, which in turn has to be first calibrated for PLT Dock and ship losses with FLOW-3D.

Hence, use of the existing condition (Without-Project) water levels in the FLOW-3D model may slightly overestimate the water level in the river compared to those determined from the Delft3D production runs that will be presented later in Section 5.3 and which includes the basin effects. The Delft3D production runs, particularly the sediment transport runs, use diverted discharge boundary condition at the mid-channel and thus include more accurate basin induced river drawdown effects.

For the purposes of FLOW-3D modeling it is appropriate to use boundary conditions without the slight ( $< 1$  ft) drawdown effects in river water level due to the basin, as the main goal of the FLOW-3D runs is to develop data against which the Delft3D model can be calibrated later for losses at the PLT Dock and the ship. For the FLOW-3D model, the water levels at the channel-side boundary was set to 6.99 ft, 3.02 ft and 2.62 ft, respectively. These water levels, determined during the ongoing 30% E&D Level MBSD modeling study, allow the target diversion discharges (75,000, 48,000, 34,000 cfs respectively at 1,000,000 cfs, 600,000 cfs and 450,000 cfs MR flows) for the Without-Project cases.

For consistency, the same water levels were used for With-Project cases as well to study the hydrodynamic impact of the PLT structure. Therefore, the diverted discharge values from the FLOW-3D model, With- and Without-Project condition, are not true discharges as they neglect the basin effect and thus were not investigated. The role of the FLOW-3D model results is to simply provide hydrodynamic calibration data to the Delft3D models for PLT Dock and Ship induced energy loss effects on the MBSD.

Table 3.4. FLOW-3D model scenarios simulated.

| Run # | MR discharge (cfs) | CHS Dock + Ship | Diversion Structure | PLT Dock | PLT Dock + Ship | Remark                                 |
|-------|--------------------|-----------------|---------------------|----------|-----------------|----------------------------------------|
| 1     | 1,060,000          | Yes             | No                  | No       | No              | Calibration, existing conditions       |
| 2     | 617,000            | Yes             | No                  | No       | No              | Validation, existing conditions        |
| 3     | 1,000,000          | Yes             | Yes                 | No       | No              | Diversion Open, existing conditions    |

### 3.4 Delft3D Modeling

The Delft3D model (Deltares, 2018), solves the hydrostatic shallow water equations either in 2D or 3D mode (with sigma co-ordinates for the representation of vertical layers) and is suited for long term simulations over large spatial scales. The advantage of Delft3D is its ability to model morphology change with sediment transport (suspended and bedload) that is coupled with the hydrodynamics. Note that while FLOW-3D model is always used in 3D mode, the Delft3D model can be implemented both in 2D and 3D model. The Delft3D model was used extensively as the most reliable model for the long-term morphology and sediment transport modeling tasks by CPRA/WI during the planning phase (Meselhe et al., 2012a; Meselhe et al., 2015; Gaweesh et al., 2016; McCorquodale et al., 2016; Meselhe et al., 2017). It will remain as the model of choice for the MBSD project for long-term and large-scale simulation runs where the hydrostatic assumptions are valid. For the present modeling tasks, Delft3D will be used to

inform the hydraulic and sediment transport in the diversion channel, evaluate deposition/erosion in the MR, and develop flow rating curves.

### 3.4.1 Model Geometry and Boundary Conditions

Figure 3.7 shows the domains of the three models used in this study, along with the boundary conditions for each. The connection between the models and the hierarchy of their use is explained in the flowchart shown on Figure 3.1. The FTNMSDI FLOW-3D model presented in the previous section is shown in the right most panel for comparison. The two Delft3D models, the FTNOMBA (2D) and the FTN2Comp (3D) are shown in the left and middle panels.

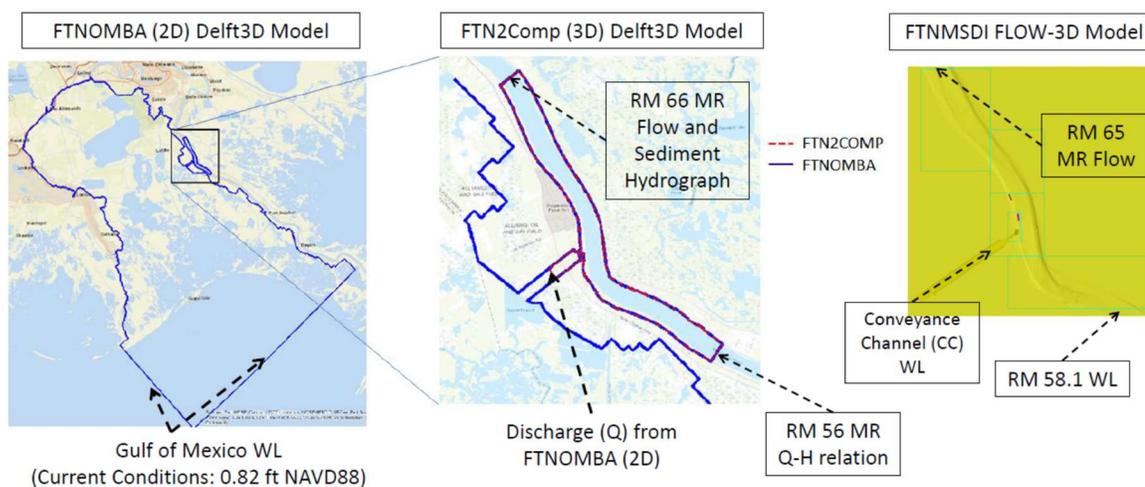

Figure 3.7. Model domains and boundary conditions: Delft3D model domains (left panel is the 2D FTNOMBA and mid-panel the 3D FTN2Comp), along with the FLOW-3D model domain (in right panel and as shown in Fig. 3.2 before).

Figure 3.8 shows the water discharge and sediment load hydrographs imposed at the upstream MR (RM 66) boundary for the 1-year production run. The 2008 hydrograph is selected as it is a good representative hydrograph of the last 15-year period (2004-2018). This hydrograph was also selected by Meselhe et al. (2017) to represent the period 2004-2013 in the WI Basin-wide model runs. The model data is post processed from the period when the MR discharge reaches 450,000 cfs (the trigger flow for diversion operation) in the rising limb up to the point when the MR discharge again falls just below 450,000 cfs in the falling limb. The

actual model run starts a few days earlier when the river is still below 450,000 cfs to allow enough time to overcome the initial conditions. The discharge at RM 66 is obtained from the Belle Chasse USGS gage daily historical data. The total sediment load is estimated from the Hysteresis Sediment Rating Curve (HSRC) developed by WI (Esposito et al., 2017) and the sand load from the Traditional Sand Rating Curve (TSRC) at Belle Chasse developed by Allison et al., (2012). The use of Belle Chasse (RM 73) data to set up the boundary condition at RM 66 thus implies that effect of Mid-Breton diversion (RM 68) is not considered in this study. The cross-section averaged concentrations of sand and fines in the MR were specified in the model by dividing the sediment load by the discharge. The concentrations of silt and clay were specified as 75% and 25% of the total fines, respectively. The total sand was divided into 30% of 250  $\mu$  (medium sand), 37.5% of 125  $\mu$  (fine sand) and 32.5% of the 83  $\mu$  (very fine sand) median diameter size class fractions based on analysis done for the MBSD. The van Rijn (1993) sediment transport formulation is used for non-cohesive (sand) transport. The Partheniades-Krone (1965) formulation is used for modeling cohesive (silt and clay) erosion and deposition.

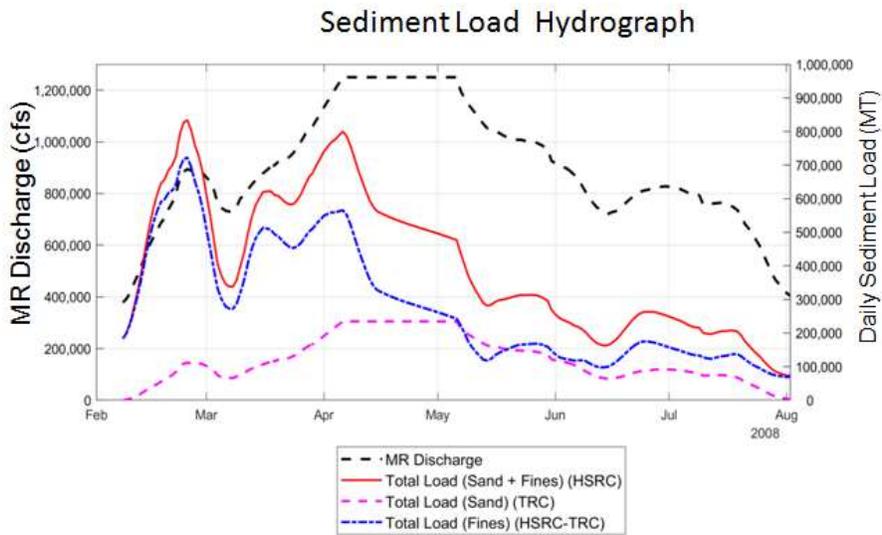

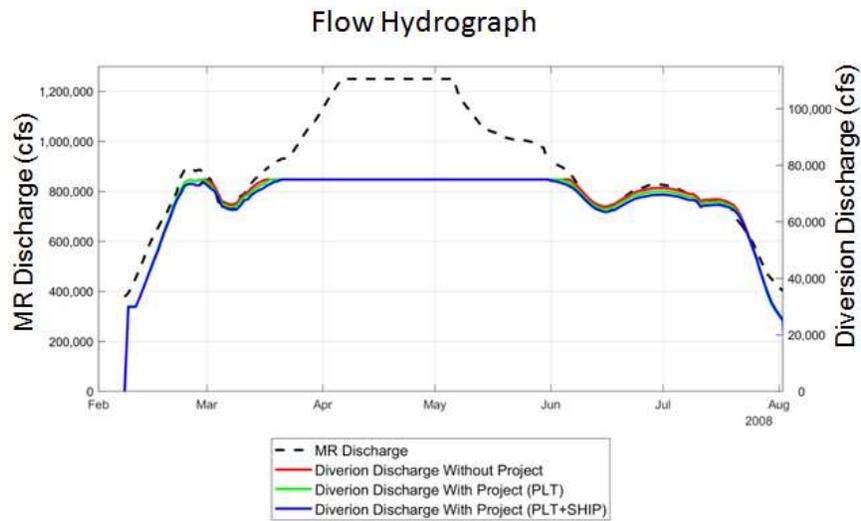

Figure 3.8. Flow and sediment load hydrographs for the 2008 diversion operation period.

Figure 3.9 shows the downstream Q-H relation used in the model. This relation is obtained by weighted averaging of the water level data over the last 10 years (2008-2018) from gages upstream and downstream of this location. The upstream is the USACE Alliance gage at RM 62.5 and the downstream gage is the USACE West Pointe a la Hache gage at RM 48.7.

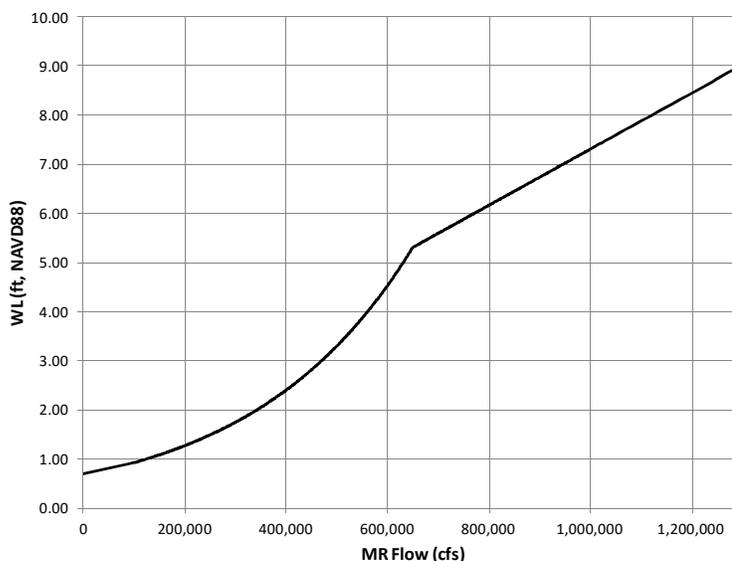

Figure 3.9. Q-H relationship used for the downstream (RM 56) boundary condition.

### 3.4.2 Model Setup

Figure 3.10 shows the setup of the FTN2Comp Delft3D model in 3D mode used for this study. As shown in the figure, similar to FLOW-3D, porous plates are used to model the PLT Dock barge deflector and the access way structures. Unlike FLOW-3D, Delft3D only allows for definition of porous plates along the grid directions ( $\xi$ ,  $\eta$  represent curvilinear grid directions) at the center of a cell. The drag is quantified as a momentum sink terms in the horizontal grid directions in the momentum balance equation. The momentum loss terms for a porous plate are given by the following equations (Deltares, 2018):

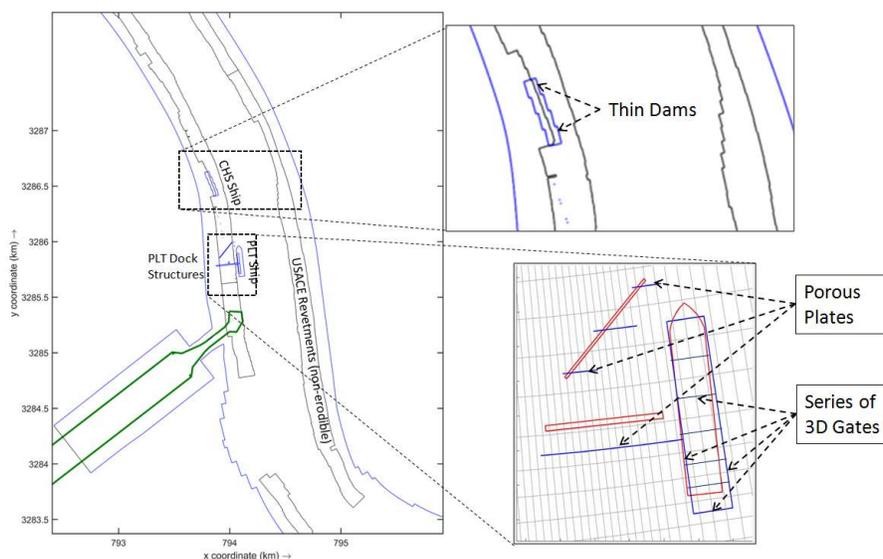

Figure 3.10. FTN2Comp (3D) Delft3D model setup for CHS Ship, PLT Dock and PLT Ship representations.

$$M_{\xi} = -\frac{c_{\text{loss-u}}}{\Delta x} u \sqrt{u^2 + v^2},$$

$$M_{\eta} = -\frac{c_{\text{loss-v}}}{\Delta y} v \sqrt{u^2 + v^2},$$

In the above equations,  $c_{\text{loss-u}}$  and  $c_{\text{loss-v}}$  are calibration coefficients and for simplicity they are considered to be the same for this study. The value of this coefficient will be calibrated to match FLOW-3D results for diverted discharge, water level, and velocities. The velocities in the X and Y directions are  $u$  and  $v$  respectively and the grid spacing is represented as  $\Delta x$  and  $\Delta y$ .

Thin dams are used to represent the effect of the CHS ship, assumed to be anchored to the river bed. The CHS dock structure was not found to be needed to be resolved due to the effects at CHS being already captured by the anchored ship unlike in the FLOW-3D model.

A series of 3D gates, placed in both grid directions and forming a rectangular floating body were used to represent the ship at PLT. The gate depth extended down to the third sigma layer from the water surface and the gate sill was located at an elevation of roughly -20 to -25 ft, NAVD88 over the hydrograph based on the variable water level and local depth. This treatment was found reasonable as the mean draft of the ship is 28 ft and meant that the bottom of the ship would vary between  $\sim$ -19 ft (-28 ft draft +  $\sim$ 9 ft, NAVD88 WL at 1.25M cfs ) and  $\sim$ -25.5 ft

(-28 ft draft + ~2.5 ft, NAVD88 WL at 450K cfs) over the hydrograph. The 2D FTNOMBA model used a 2D barrier, covering the entire water depth and with a calibrated coefficient for the quadratic loss term, similar to the porous plate, instead of the 3D gates.

The diversion sediment capture efficiency is quantified by two main factors:

1. Total sediment load diverted, with particular emphasis on the sand load component of the total diverted sediment load
2. The Cumulative Sediment Water Ratio: Cumulative Sediment Water Ratio (CSWR) is defined in consistence with the past studies done by CPRA and is expressed as (Liang et al, 2017),

$$\begin{aligned}
 \text{CSWR} &= \frac{\text{Cumulative Sediment Load Diverted in the Diversion Channel} / \text{Cumulative Sediment Load in the River}}{\text{Cumulative Water Discharge Diverted in the Diversion Channel} / \text{Cumulative Water Discharge in the River}} \\
 &= \frac{\int_{t=0}^T \text{Instantaneous Sediment Load Diverted in the Diversion Channel}(t) / \int_{t=0}^T \text{Instantaneous Sediment Load in the River}(t)}{\int_{t=0}^T \text{Instantaneous Water Discharge Diverted in the Diversion Channel}(t) / \int_{t=0}^T \text{Instantaneous Cumulative Water Discharge in the River}(t)}
 \end{aligned}$$

The CSWR is calculated for each (n<sup>th</sup>) sediment class as well as for the total sediment load.

$$\text{CSWR}_{\text{total}} = \frac{\int_{t=0}^T \sum_{n=1}^N \text{Instantaneous Sediment Load Diverted in the Channel}(t) / \int_{t=0}^T \sum_{n=1}^N \text{Instantaneous Sediment Load in the River}(t)}{\int_{t=0}^T \text{Instantaneous Water Discharge Diverted in the Diversion Channel}(t) / \int_{t=0}^T \text{Instantaneous Water Discharge in the River}(t)}$$

Figure 3.11 shows the reference planes used for the CSWR calculations. The MR Reference Plane: Upstream records the river sediment loads as well as volume of water passing. The Mid-Channel Plane records the diverted sediment loads and volume of water diverted.

The CSWR can be calculated for the entire 1-year hydrograph or for specific range of MR discharges (e.g., every 100,000 cfs) within the hydrograph depending upon the quantity of interest. For example, while the annual CSWR provides an estimate of the net efficiency during a representative year, the CSWR calculated over several intermediate ranges of MR discharges provides insight into the variation of the sediment capture efficiency with the various flows within a hydrograph.

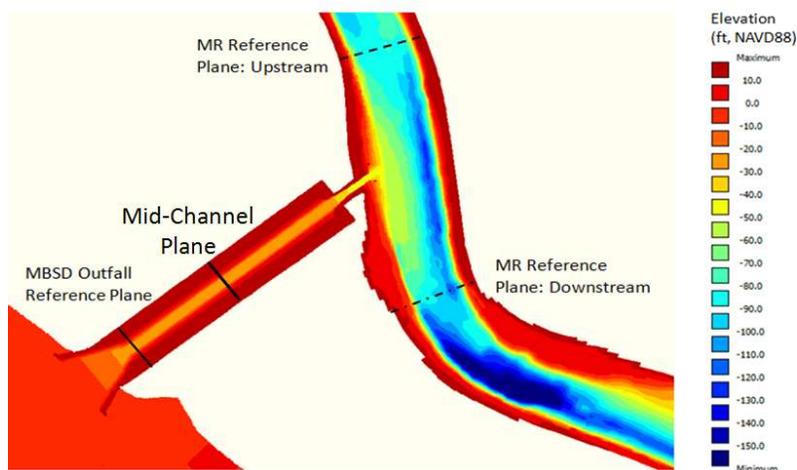

Figure 3.11. Location of reference planes for SWR and CSWR. For the SWR or CSWR computations from the FTN2Comp (3D) Delft3D model, the *Mid-Channel Plane* is used for computation of *diverted* water volume and sediment load while the *MR Reference Plane: Upstream* is used for the *MR* water volume and sediment load. Discharge rating curve from FTNOMBA (2D) Delft3D model is generated from data collected at the MBSD Outfall Reference Plane and the MR Reference Plane: Upstream.

### 3.5 Model Scenarios

Table 3.5 shows the model scenarios performed using the Delft3D (3D) model. The Delft3D model runs with the FTN2Comp model were run under three difference scenarios for each of the three Without- and With-Project Conditions. Five underlying stratigraphy layers were defined for all the runs. The first set (Runs 3, 4 and 5) for diversion open scenarios were conducted with no morphology change (non-erodible bed) but with bed composition update active, representative of short term (intra-annual) scale river effects when the bed level is not known to change much. The purpose is to understand suspended sediment movement without the complexity of bed change. Note that since all the models were started after creating a live bed by running the model initially for two months at high flow (until bed composition attained a steady state) and the fact that the bed composition was active during the production run period also means that the bed can still actively exchange sediment with the suspended flow and the diverted load into the river can still have both wash load and bed material load components. The second set of runs (Runs 6, 7, and 8 for diversion open and 9, 10, and 11 for diversion closed) were run

with morphology update active (as well as bed composition update active) but with no erodible stratigraphy under the initial bed. This meant that the model could deposit and erode over the initial bed only and allowed for the variation in short term (typically a scale of few years when deposition is known to happen on the bar) bed levels and diverted sediment loads due to the erosion of deposited sediment reserves (generated at low flows) at higher flows. These model results also are able to predict deposition extent and depths in the vicinity of the PLT and the MBSD intake. The third set of runs (Runs 12, 13 and 14) were run with an erodible bed below the initial bed as well as with morphology on for the With-Project (PLT Dock + Ship) scenario only. This run was initiated with 5 stratigraphy layers made up of medium sand. The main goal of this test was to understand the possible implications of the ship on the native sand bar river response.

Table 3.5. Delft3D (3D) Model scenarios.

| Run No. | MBSD Diversion Open/ Closed? | PLT Dock? | PLT Ship?                     | Purpose                                                                                  |

## 4.0 FLOW-3D MODEL RESULTS: WATER LEVELS AND VELOCITY

### 4.1 Calibration and Validation

The field survey data by CPRA/WI (Allison et al., 2018) in the MR was used for calibration and validation of the FLOW-3D model under existing conditions. The CHS ship was modeled as one solid body and the associated dock structures were modeled with three porous planes. The porosities and linear loss coefficients were adjusted during calibration. The final porous mesh planes porosity was set to 0.95 and the linear loss coefficient was set to 0.78.

Figure 4.1 shows the depth-averaged velocity profile comparisons at three transects (PP01, PP02 and PP03, see Figure 5.4 for location of transects) at MR flow of 1,060,000 cfs. The blue dashed lines show the 15% PLT project model results which are without the CHS terminal and with the upstream boundary located at RM 62.7. It is observed that the right-descending bank velocities were heavily over predicted. The near bank velocity in the current model is much improved, especially at PP01 which is immediately downstream of the CHS terminal. Figure 4.2 shows the validation results at MR flow of 617,000 cfs. The simulation results agree well with the observations.

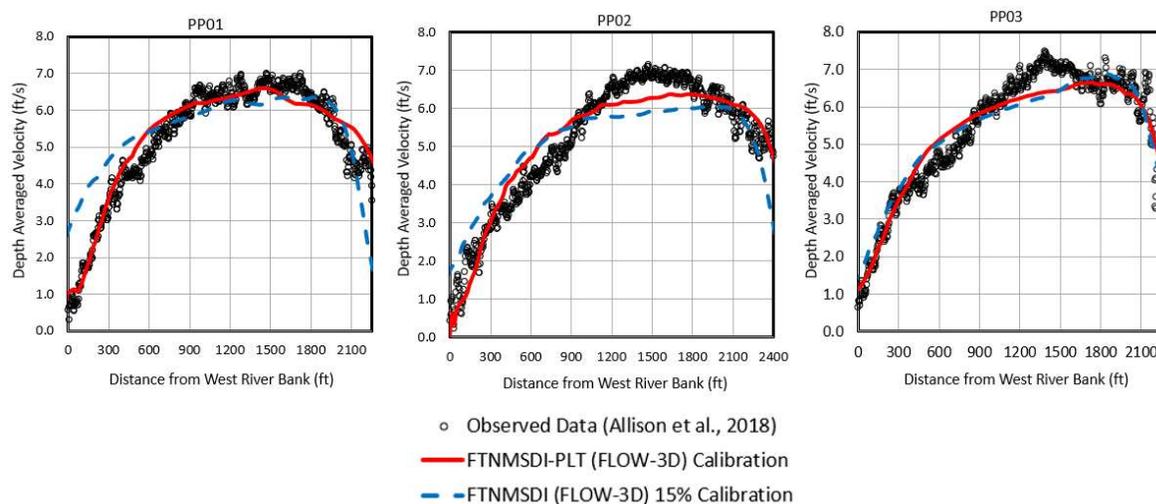

Figure 4.1. Calibration results. comparison of modeled and observed river cross-sections velocity magnitudes at three locations at MR Flow of 1,060,000 cfs.

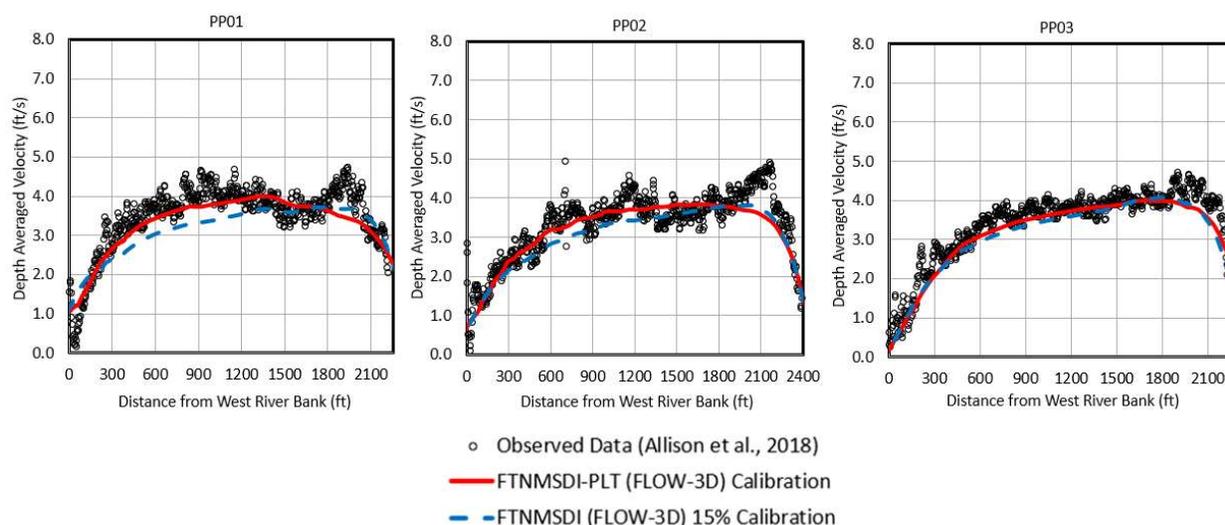

Figure 4.2. Validation results. comparison of modeled and observed river cross-sections velocity magnitudes at three locations at MR Flow of 617,000 cfs.

#### 4.2 FLOW-3D Results: The hydrodynamic impact of PLT

Figures 4.3, 4.4, and 4.5 show the effect of the PLT dock and ship by comparing the contour plot, flow trajectories and vector plots between with and without-project cases. From the results, it is clearly seen that the existence of the PLT project changes the near-field flow dynamics around the diversion intake. The flow along the sandbar, upstream of diversion near the Right Descending Bank (RDB, looking downstream) has been disrupted. An increase in the wake region downstream of CHS was observed with the depth averaged velocity reduced by up to 2 ft/s under high flow condition. The flow trajectories show that the upstream flow streamlines pass around the PLT structure and are not able to recover to the Without-Project conditions before they reach the diversion intake. A low velocity reverse flow wake zone just downstream of the CHS structure was identified which was further influenced by the PLT project as shown on Figure 4.5. This is a potential area of deposition.

Figure 4.6 and 4.7 show the comparison of the depth averaged velocities at five transects for MR flow at 1,000,000 cfs and 600,000 cfs. In the order of the flow direction, the five transects were named PP00, PP01, PP1.5, PP02 and PP03. They are at the same locations in the 2018 survey performed by WI. From the results, it is observed that both the with-project cases are shown to have different degrees of reduction in DAV near the right descending bank. The

most significant reduction is at the transect PP1.5 which is immediately downstream of the PLT structure. For the with-PLT dock and ship case, there is about 4 ft/s reduction in DAV at high flow and 2 ft/s reduction at low flow. The reduction of DAV for the with-project cases at PP02 location is concerning since it may affect the sediment capture capabilities of the diversion by reducing the sediment transport potential. Also, DAV values falling below 3 ft/s may induce sand deposition at high flows when the river sand concentration is generally high. The PP03 location seems to have the least impact from the PLT project since it is farthest from the PLT location. By comparing the two figures, at the lower MR flow, the PLT project seems to have less impact.

Figure 4.8 and 4.9 show the depth-averaged velocity, water surface elevation and total energy head along the bank line for high flow and low flow scenarios for with and without-project cases. Consistent with the findings from Figure 4.6 and 4.7, the depth-averaged velocity has been reduced along the bank line by the addition of the PLT project. In addition, the water surface elevation and total energy head also show significant reduction caused by the PLT project. The less head available near the diversion may also cause issues with the diversion discharge.

Figure 4.10 and 4.11 shows the centerline plots of depth-averaged velocity, water surface elevation and total energy head for MR flow at 1,000,000 cfs and 600,000 cfs for the without-project case, the first with-project case (PLT dock only) and the second with-project case (PLT dock and ship). As mentioned earlier, the two with-projects cases show less total energy head available at the start of the U-Frame.

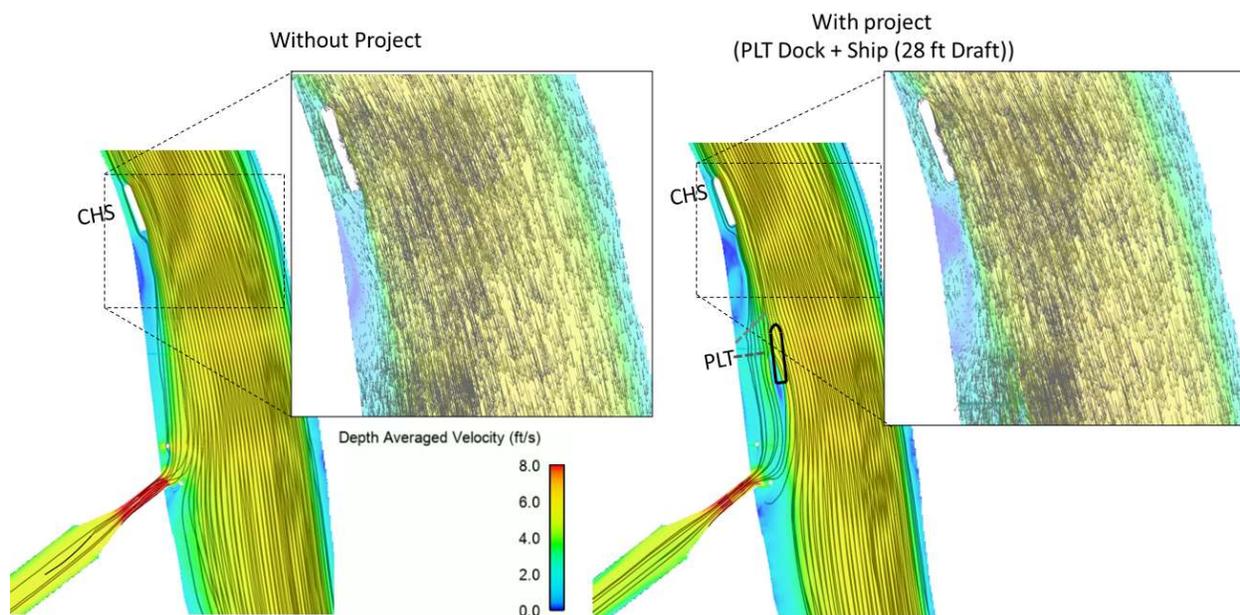

Figure 4.3. Comparison of the depth-averaged velocity contours, flow trajectories and vector plots between without-project case and with-project case (PLT dock and ship) at high flow (1,000,000 cfs).

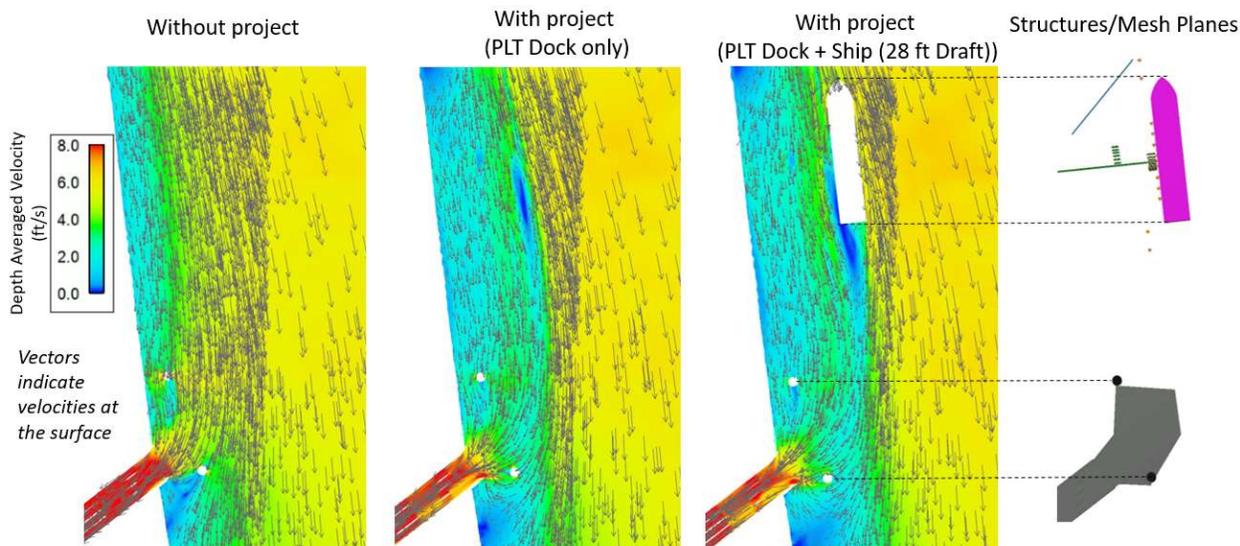

Figure 4.4. Close-up of flow-field near the diversion intake. Comparison of the depth-averaged velocity contours and vector plots between without-project case and with-project case (PLT dock and ship).

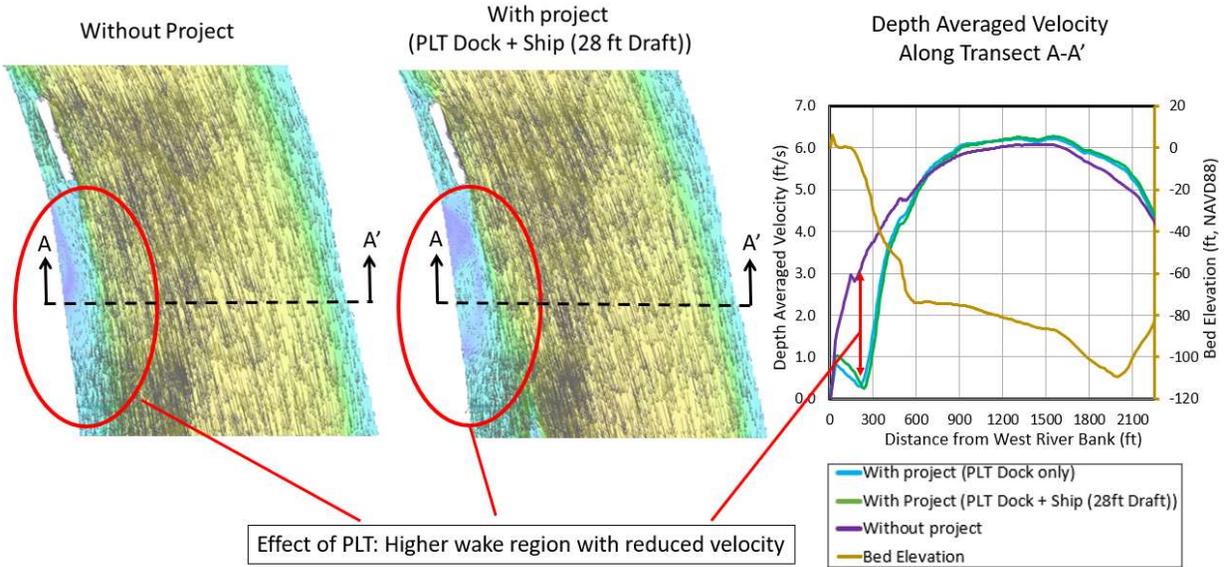

Figure 4.5. Hydrodynamics downstream of CHS and upstream of PLT: Comparison of the depth-averaged velocity profiles (right panel) at high flow (1,000,000 cfs) at transect PP00 (location on Figure 4.6) for the without-project case. The left and mid-panels show the corresponding flow patterns.

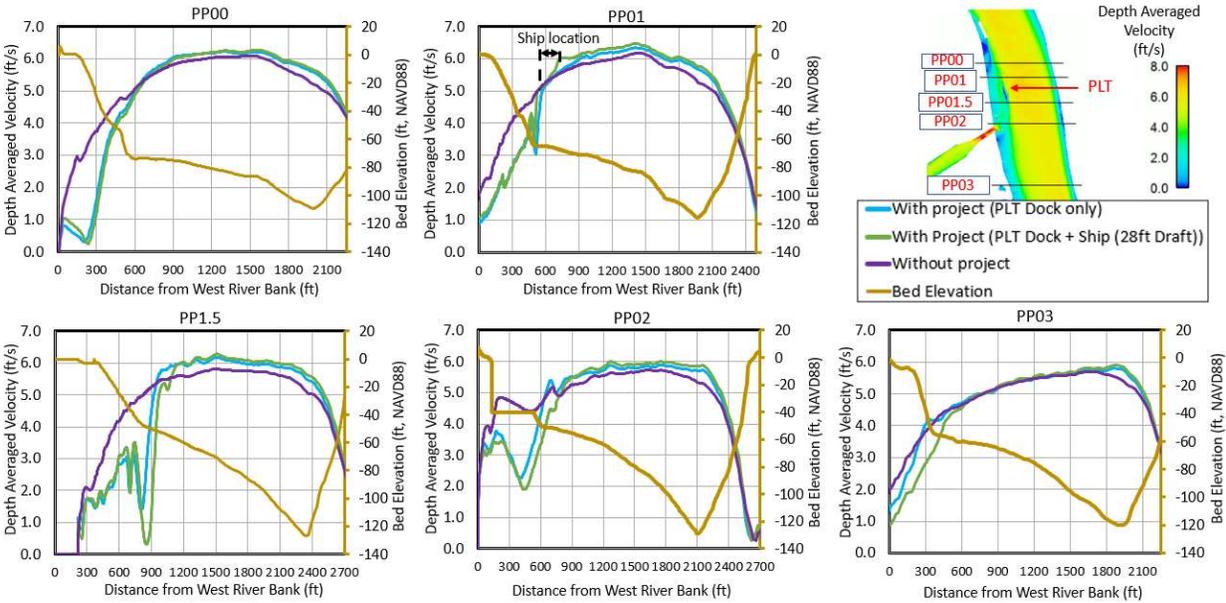

Figure 4.6. Comparison of the depth-averaged velocity profiles between With- and Without-Project conditions are shown at MR flow of 1,000,000 cfs at five transects marked in the top right inset.

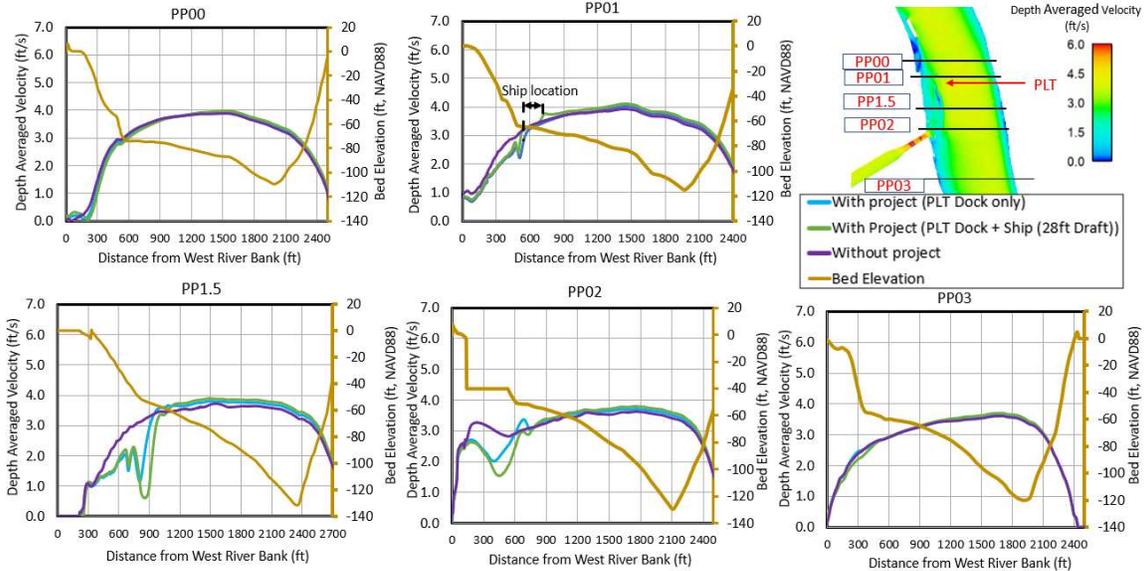

Figure 4.7. Comparison of the depth-averaged velocity profiles between With- and Without-Project conditions are shown at MR flow of 600,000 cfs at five transects marked in the top right inset.

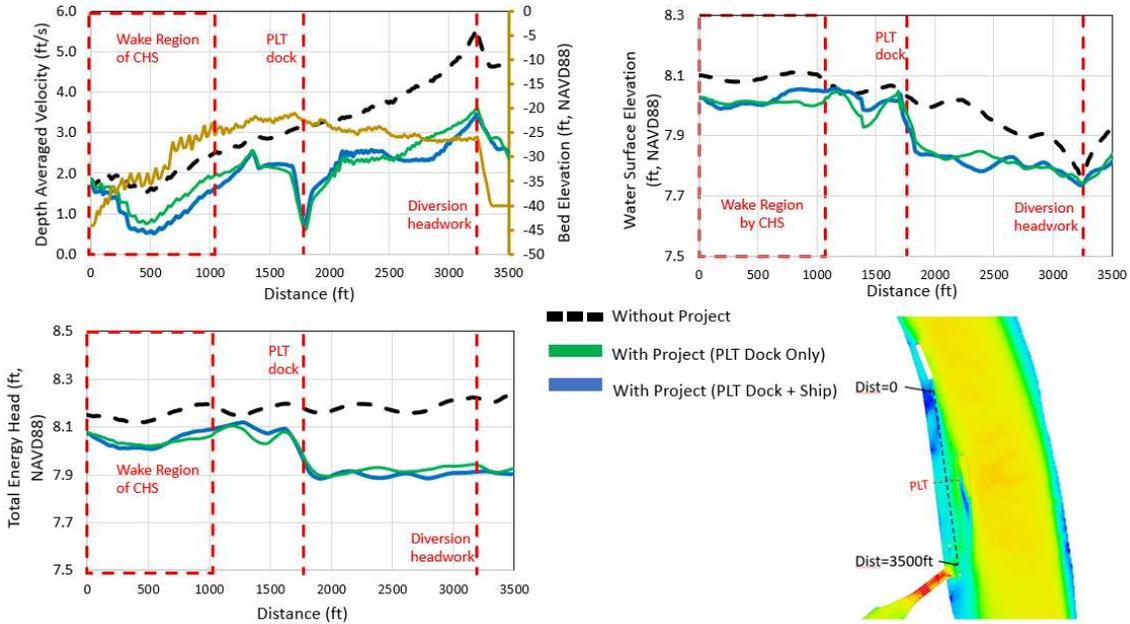

Figure 4.8. Comparison of depth-averaged velocity, water surface elevation and total energy head at MR flow 1,000,000 cfs the along a transect aligned with the RDB (inset bottom right) for the with and without-project cases.

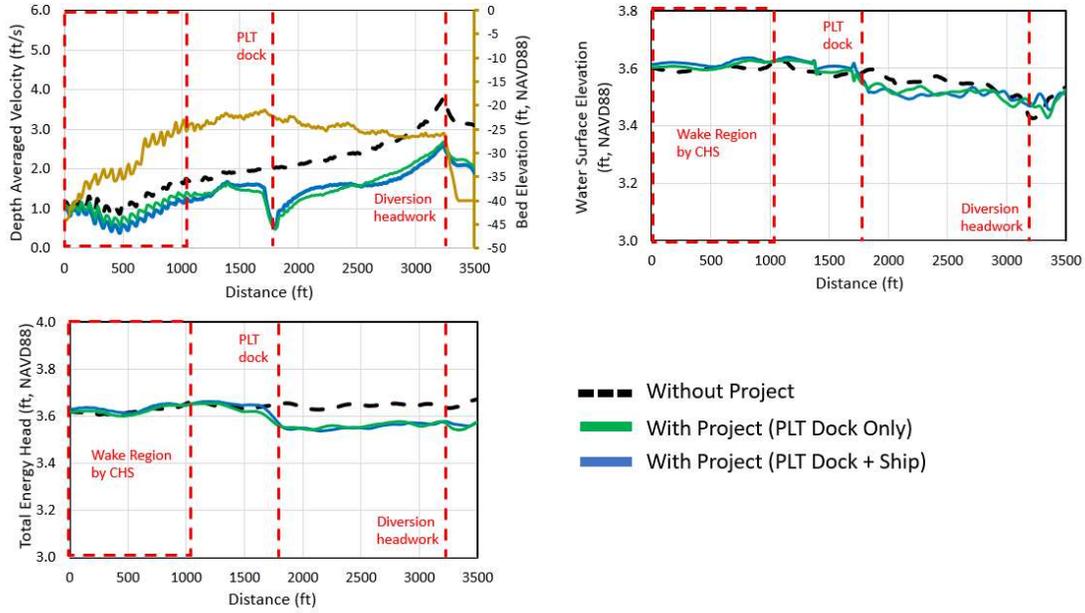

Figure 4.9. Comparison of depth-averaged velocity, water surface elevation and total energy head at MR flow 600,000 cfs the along a transect aligned with the RDB (inset bottom right) for the with and without-project cases.

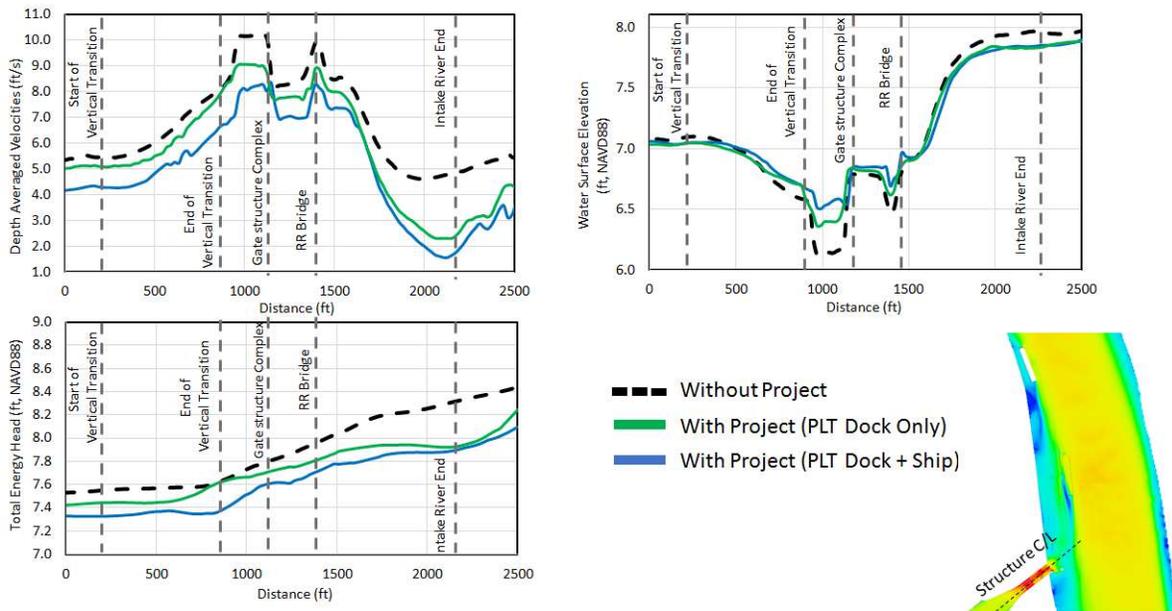

Figure 4.10. Centerline plots (line shown in inset bottom right figure) of depth-averaged velocity, water surface elevation and total energy head through the MBSD intake headworks, for MR flow 1,000,000 cfs for With- and Without-Project conditions.

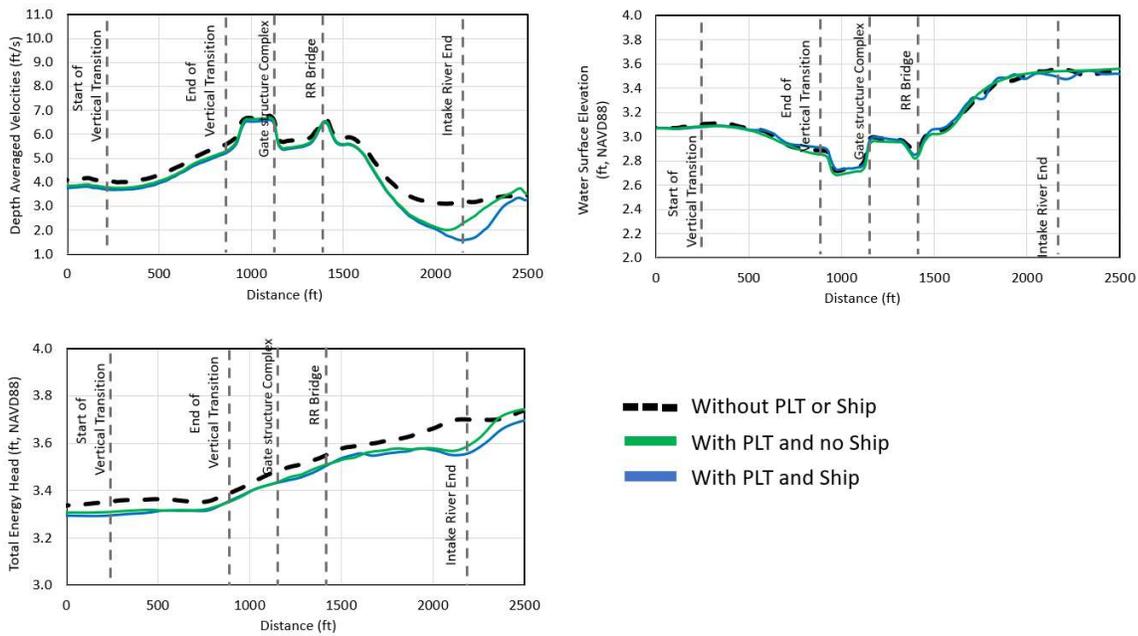

Figure 4.11. Centerline plots (along the same line as shown in inset of Fig. 4.10) of depth-averaged velocity, water surface elevation and total energy head through the MBSD intake headworks, for MR flow 600,000 cfs for With- and Without-Project conditions.

## 5.0 DELFT3D MODEL RESULTS

### 5.1 Delft3D Calibration/Validation with observed data

Extensive calibration and validation of the hydrodynamics and sediment transport model for the FTNMS (3D) Delft3D model, which is the river domain in the FTN2Comp (3D) Delft3D model (i.e., without the diversion, PLT Dock and Ship), under current conditions was conducted for the MBSD efforts. The sediment transport model was calibrated for the 2018 MR survey period and again re-validated for the 2008-2011 period. Only important figures from the MBSD modeling relevant to the current study are presented here as information to the reader.

Figure 5.1 shows the location of the sediment and velocity sampling locations in the MR survey conducted in the 2008-2011 period (Allison, 2011). The model calibration and validation for the vertical profiles for the velocity magnitude are shown on Figures 5.2 and 5.3. Overall the model results are within the acceptable range of error in the field observations and match the velocities at the RDB (near the proposed diversion) well.

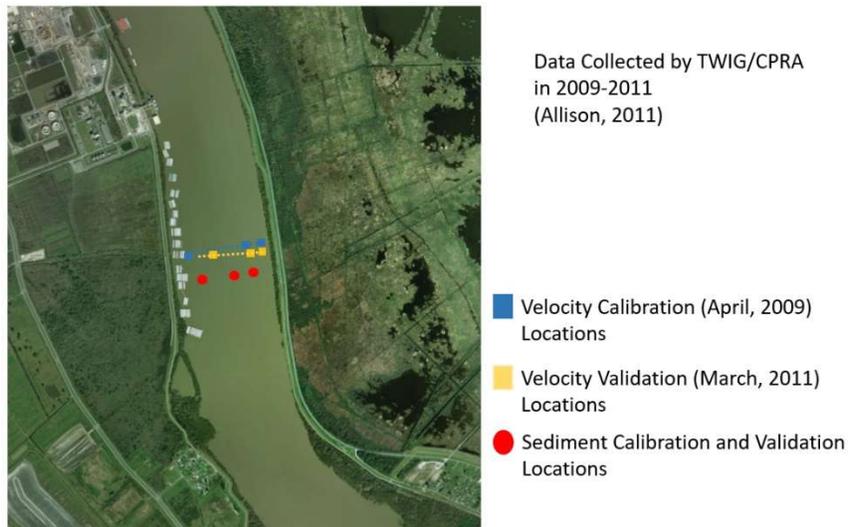

Figure 5.1. Velocity and sediment sampling locations for the 2008-2011 MR survey (Allison, 2011).

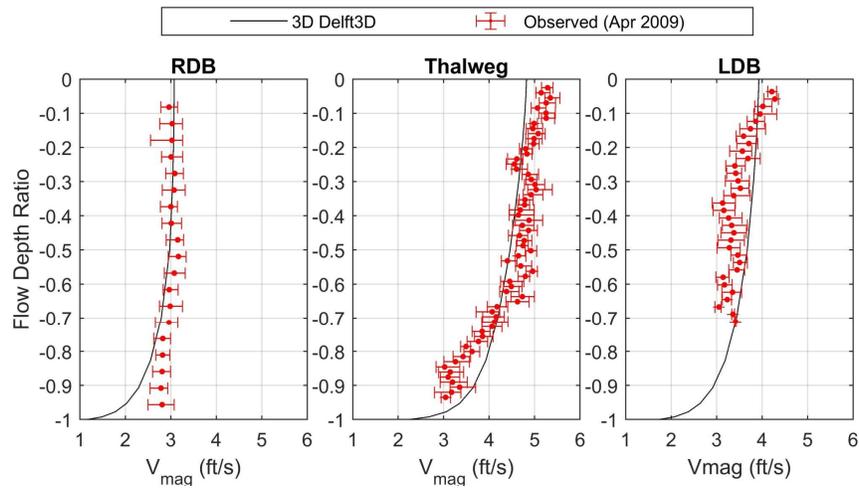

Figure 5.2. Model calibration (Apr 2009 event, MR flow 742,000 cfs): Velocity profiles compared with field observations from CPRA’s 2008-2011 MR survey, at the three locations shown on Figure 5.1.

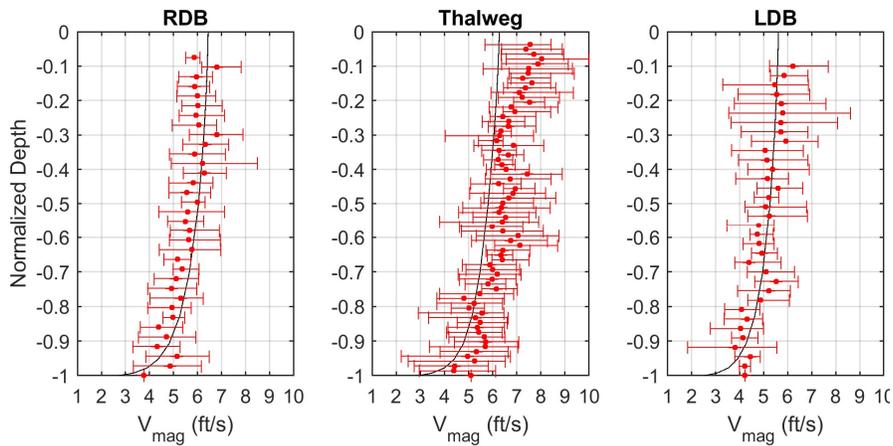

Figure 5.3. Model validation (March 2011 event, MR flow 966,000 cfs): Velocity profiles compared with field observations from CPRA’s 2008-2011 MR survey, at the three locations shown on Figure 5.1.

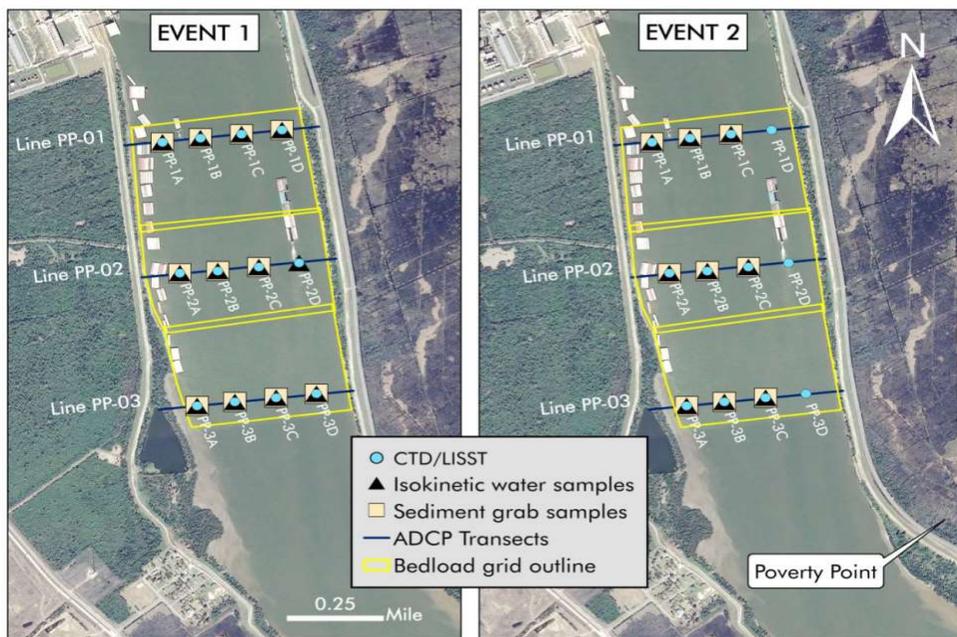

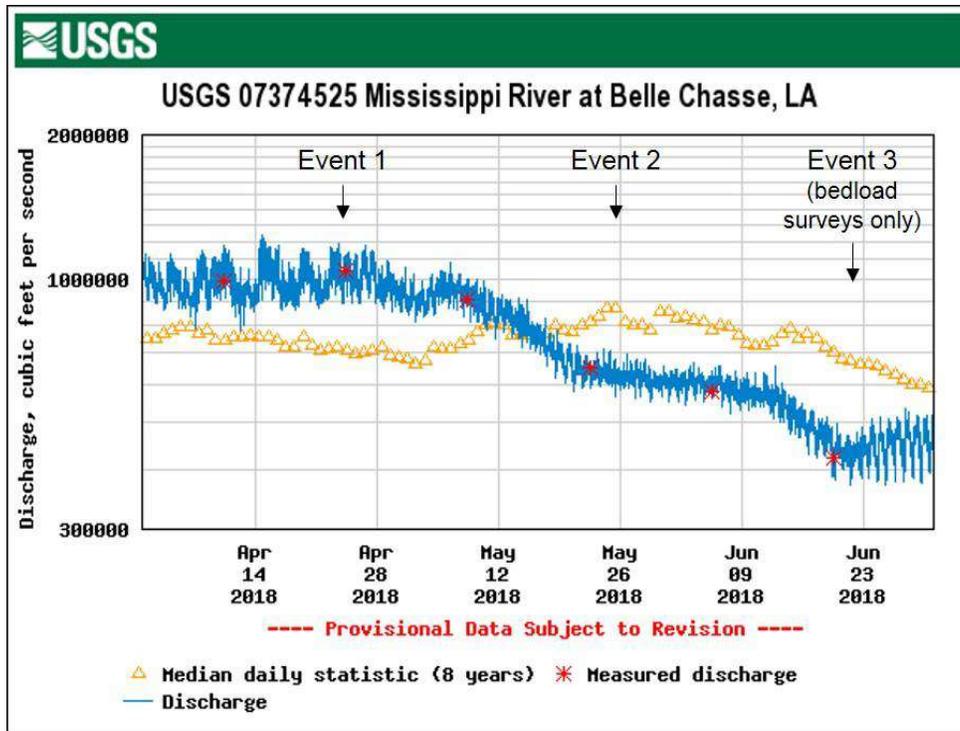

Figure 5.4. Top Panel: 2018 MR Survey Events. Bottom Panel: 2018 MR Survey cross-sections and sediment survey locations (figures reproduced from Allison et al., 2018).

The MR survey conducted in 2018 revealed the need to include the CHS terminal effects on the velocity near the proposed PLT location (PP-01) on Figure 5.4, particularly at the high flow (~1,000,000 cfs) event (Event 1). The model was revised to include the CHS terminal and model results for cross-sectional velocity distribution as shown on Figure 5.5.

The hydrodynamics and sediment transport model were originally calibrated and validated for two events (2009 and 2011). After additional data was available in 2018, the model was re-calibrated and re-validated for the 2018 period, including the effect of the CHS terminal. The comparison of the total sediment (sand) load with observed data for the 2018 period are shown on Figure 5.6 and for the 2008-2011 period on Figure 5.7.

Vertical profiles of suspended sand and fines concentration compared with observed data for the 2009 and 2011 events are shown on Figures 5.8 and 5.9. For the 2018 period the vertical profiles of suspended sand concentration are compared with observed data as on Figures 5.10 and 5.11.

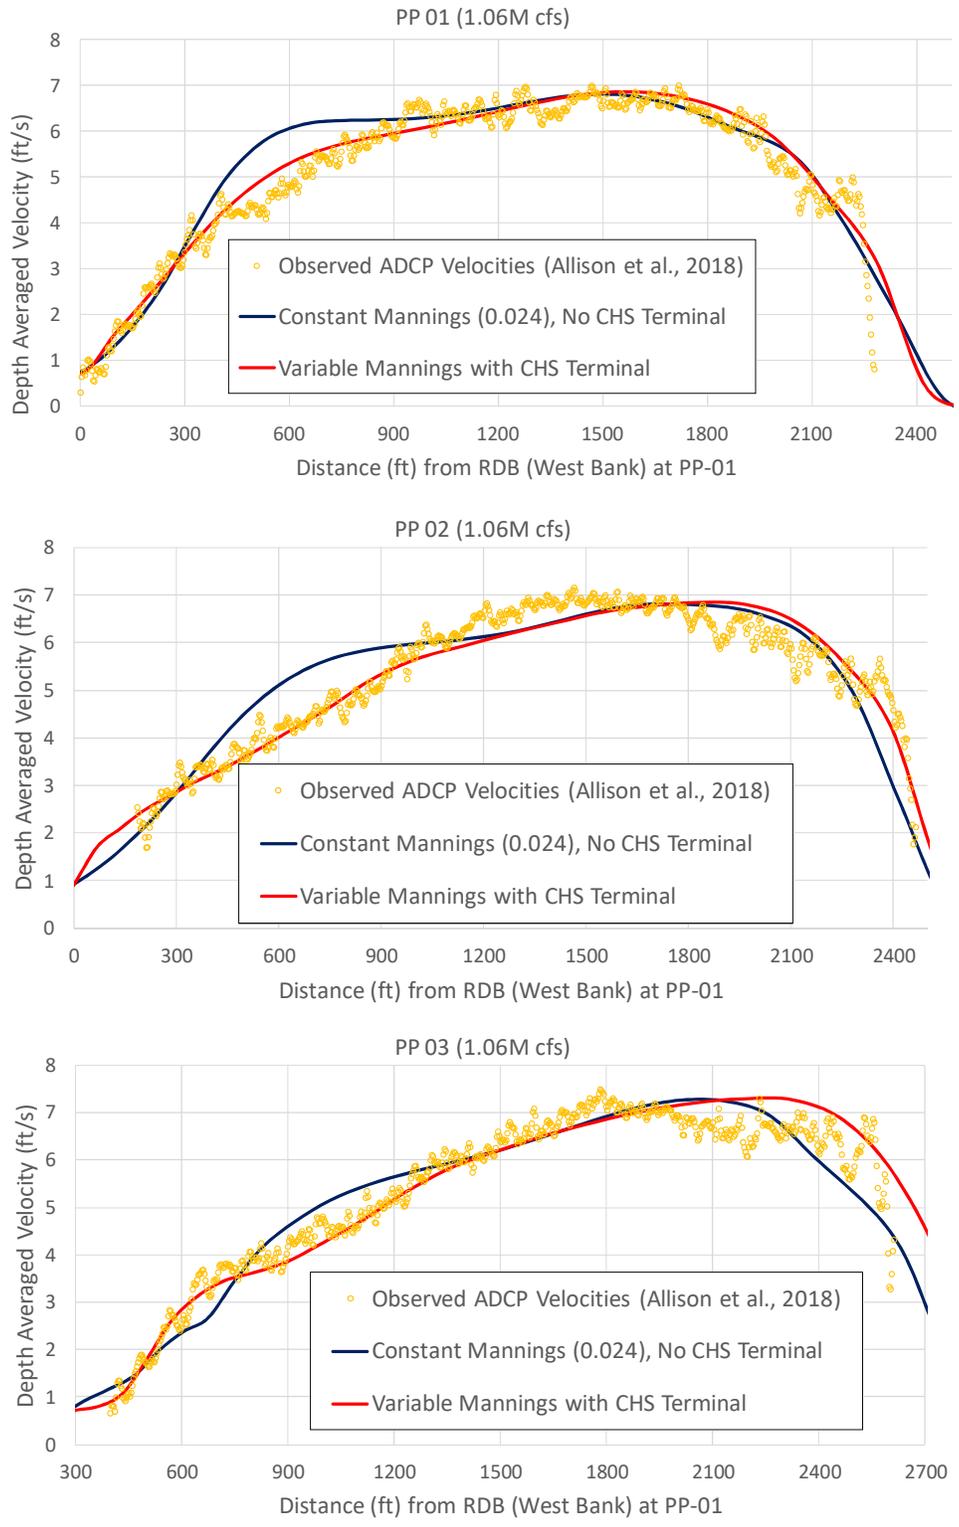

Figure 5.5. 2018 MR Survey Event 1 model results including CHS terminal shown in red line.

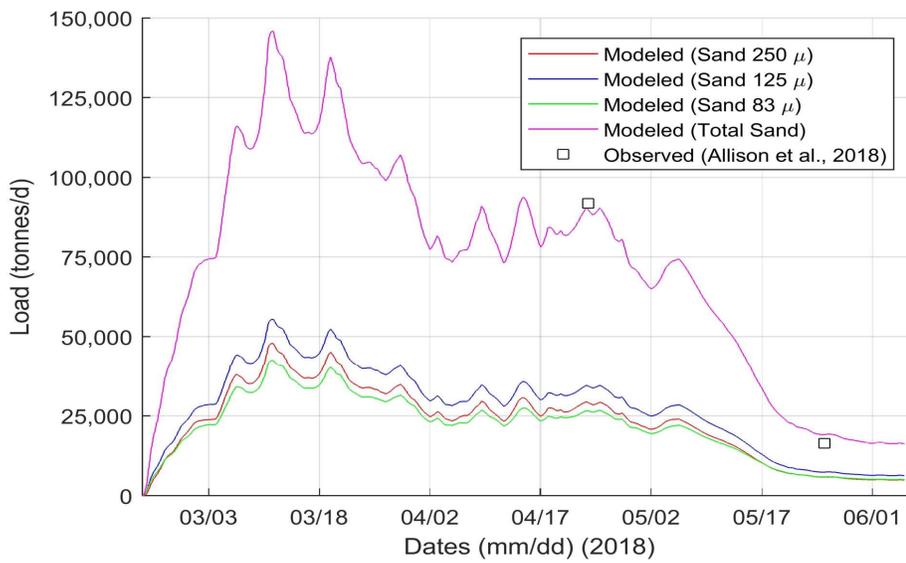

Figure 5.6. Calibration (Event 1) and Validation (Event 2) of 3D Delft3D model for total sand loads for the 2018 MR survey.

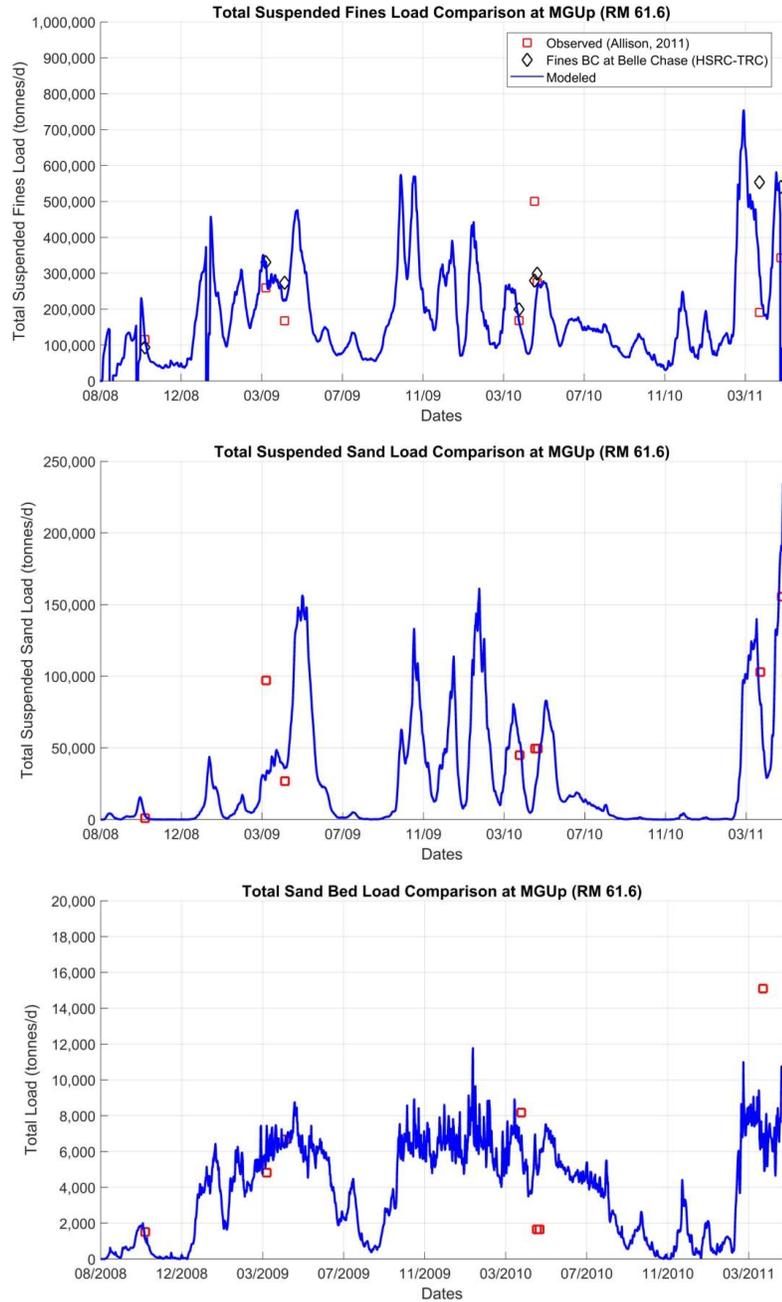

Figure 5.7: Validation of the 3D Delft3D model for the 2008-2011 period hydrograph. Comparison of modeled and observed fines (silt and clay) are shown in the top panel, suspended sand loads in the middle panel, and bed load in the bottom panel at the proposed MBSD location (RM 61.6)

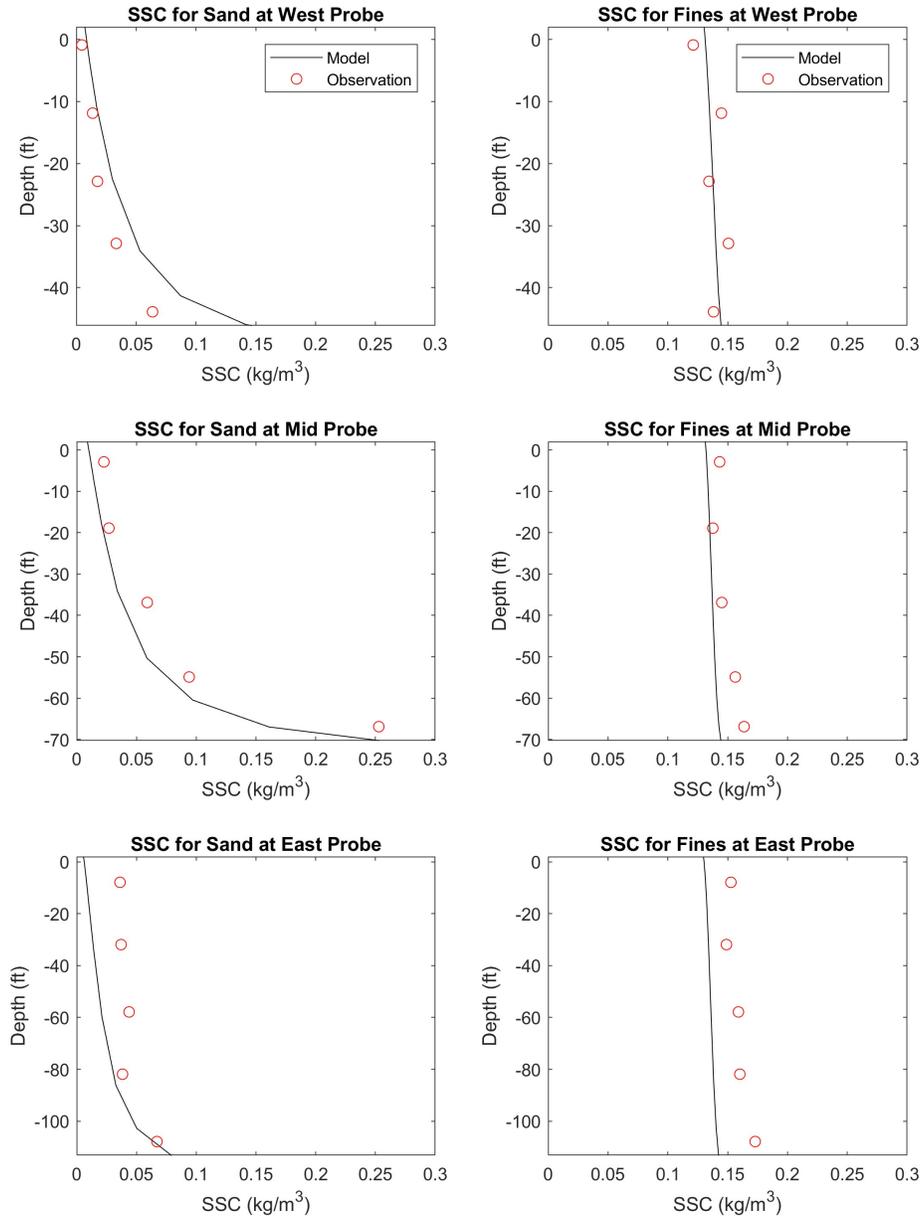

Figure 5.8. Model calibration (Apr 2009 event, MR flow 742,000 cfs): Vertical profiles of suspended sand concentration (left column) and suspended fines concentration (right panel). Probe locations shown on Figure 5.1.

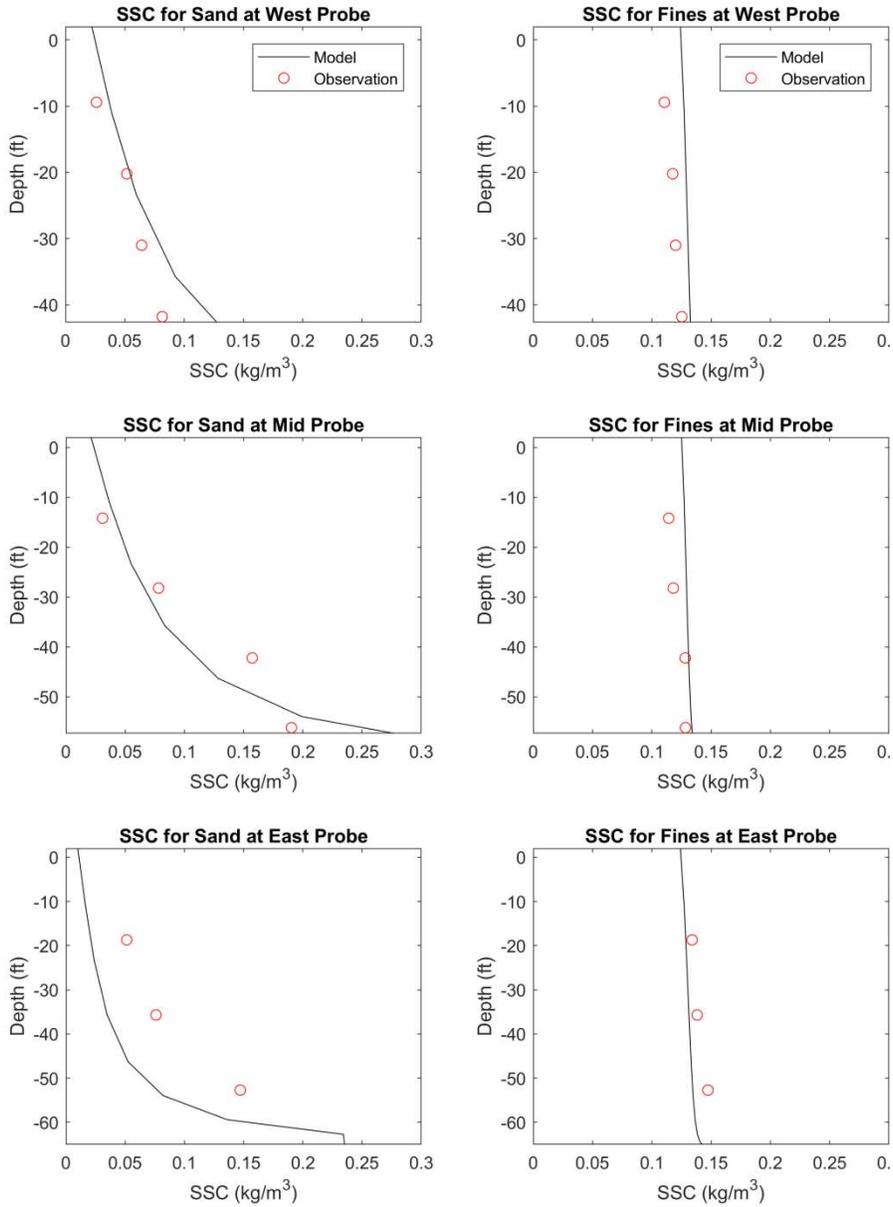

Figure 5.9. Model validation (March 2011 event, MR flow 966,000 cfs): Vertical profiles of suspended sand concentration (left column) and suspended fines concentration (right panel). Probe locations shown on Figure 5.1

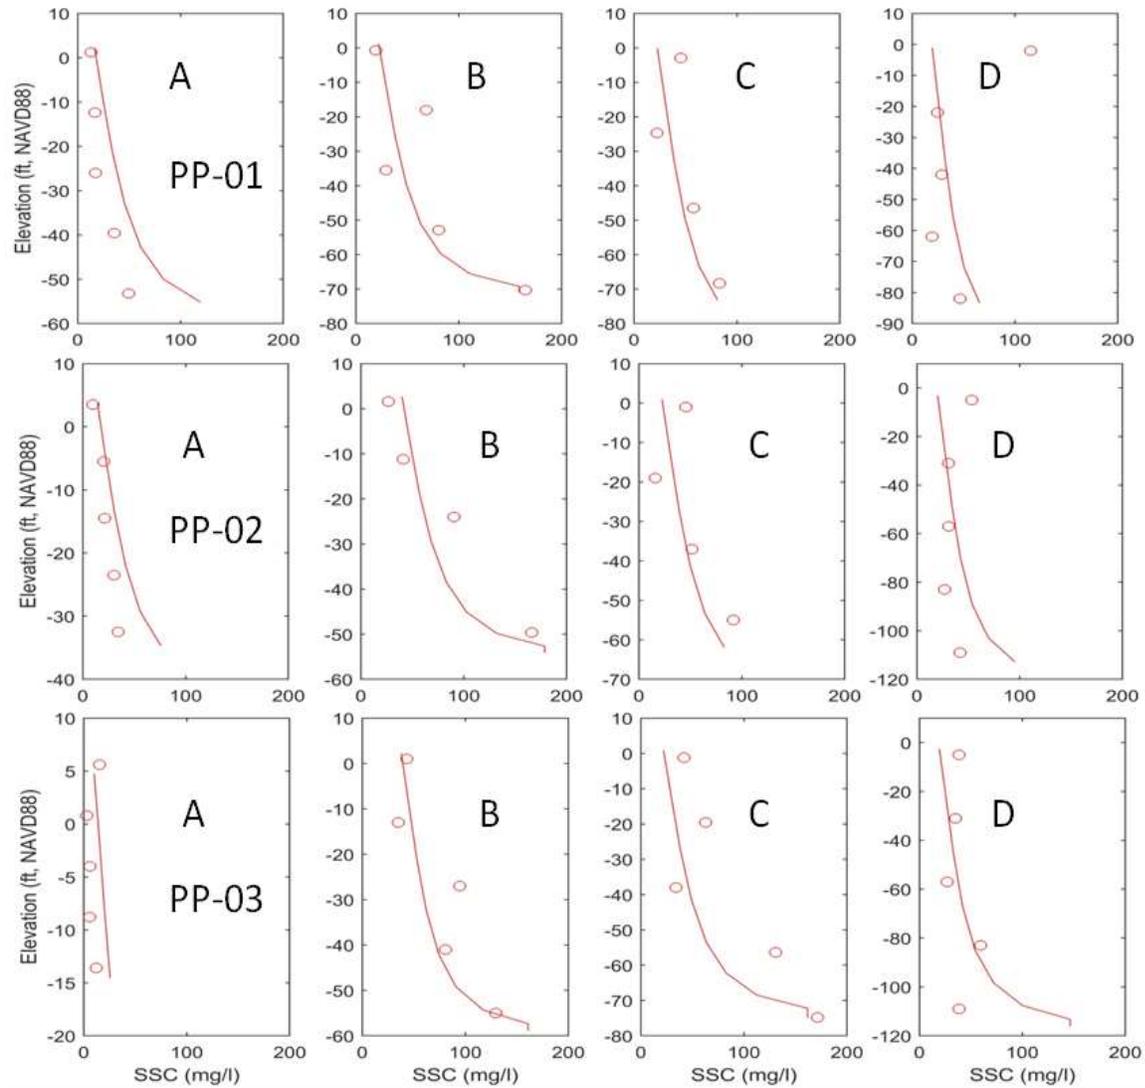

Figure 5.10. Model calibration (Event 1, 1,060,000 cfs MR flow) 2018 MR Survey: Comparison of vertical profiles of suspended sand concentration at locations marked in Fig. 5.4

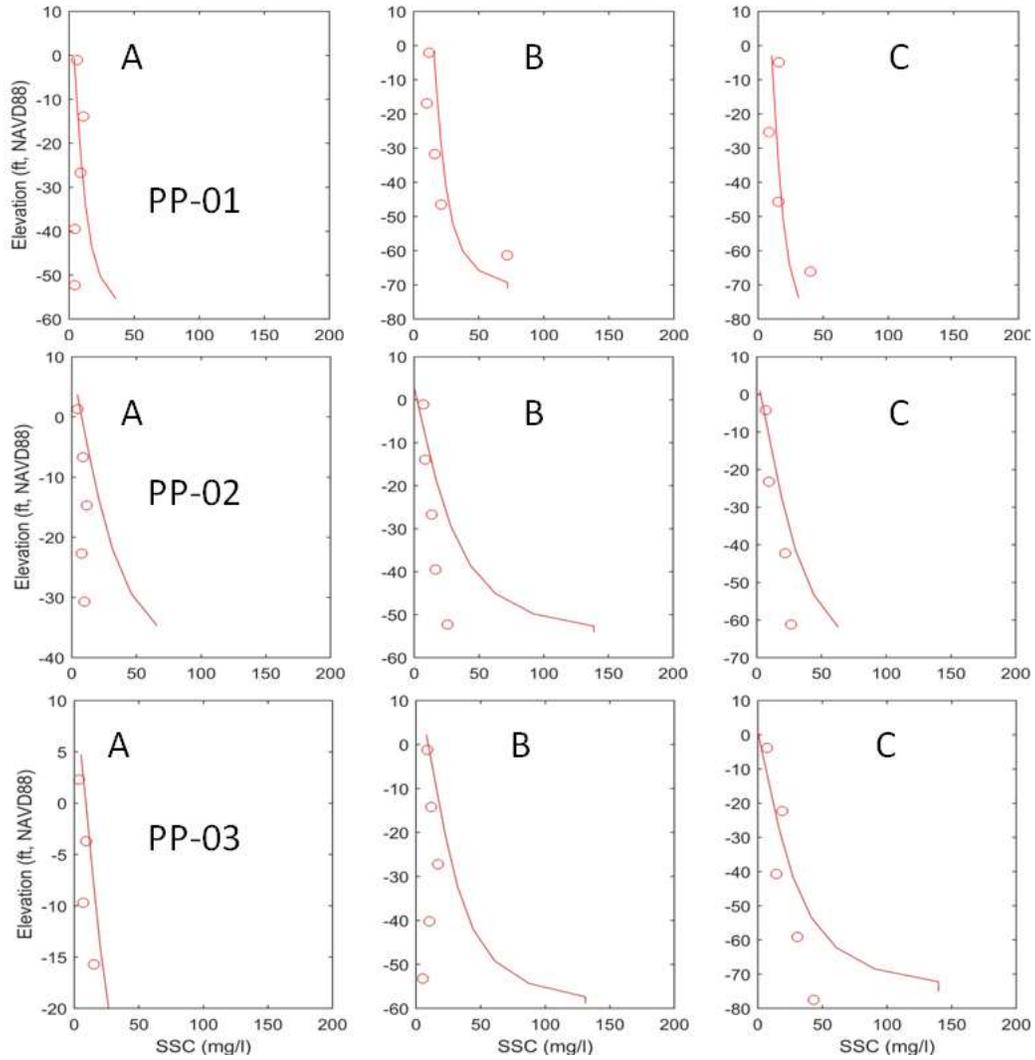

Figure 5.11. Model validation (Event 2, 620,000 cfs MR flow) 2018 MR Survey: Comparison of vertical profiles of suspended sand concentration at locations marked in Fig 5.4.

Figure 5.12 shows the comparison of modeled and observed cross-sectional contour plots of suspended sand concentrations at the three locations surveyed in 2018 (Figure 5.4). As seen from the figure, the 3D Delft3D model simulates the spatial distribution of the sand across the river section on the sand bar relatively well when compared to the observed data.

The calibrated FTNMS model is used to setup the FTN2Comp Delft3D model used for the PLT study and subsequently is calibrated with FLOW-3D model results as described in the following sections.

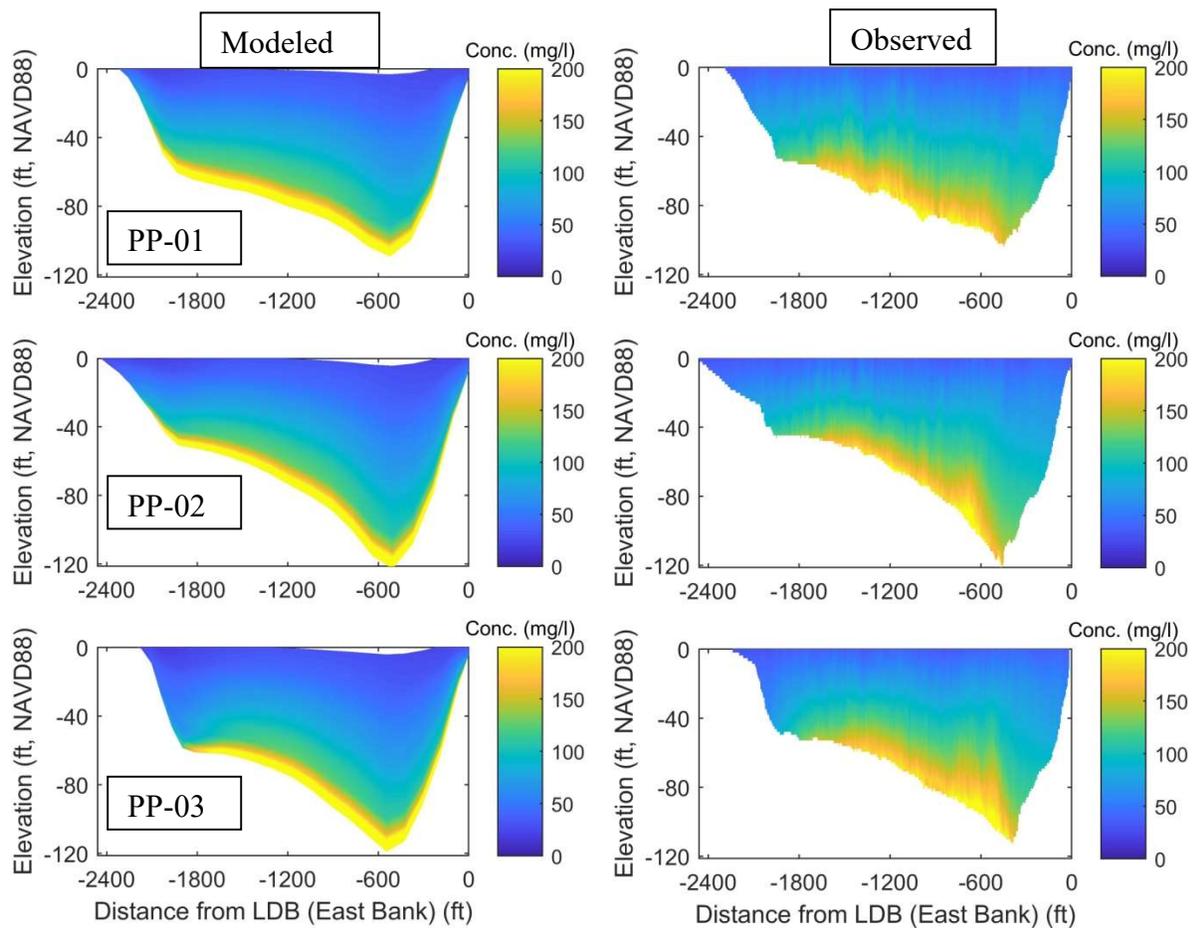

Figure 5.12. Comparison of modeled sand concentration with observed values at the three locations PP01, PP02 and PP03 for Event 1. The observed values were obtained from backscatter data of the ADCPs.

## 5.2 Delft3D Calibration with FLOW-3D

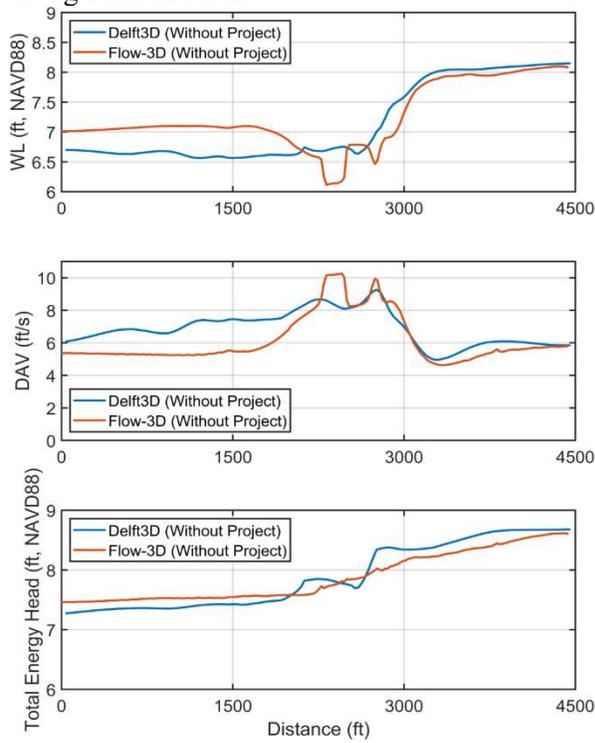

Table 5.1 shows the comparison of Delft3D FTN2Comp model predicted diverted discharge with the FLOW-3D FTNMSDI results. The boundary conditions for the two models were the same and the only value calibrated was the coefficients ( $C_{loss}$ ) of the porous plates representing the PLT Dock structure. For simplicity all the plates were set to have the same coefficient as it was found that variation of coefficient values between the plates affected little the velocity and discharge at the diversion intake. A calibrated value of 0.9 in the Delft3D model matched well both the diverted discharge as well as the water level, depth-averaged velocity and total energy head profiles (shown later in Figs 5.13-5.15 from the Delft3D model with the FLOW-3D model).

Figures 5.13 (Without-Project), 5.14 (with-project, PLT Dock only) and 5.15 (With-Project, PLT Dock + Ship) show the comparison of Delft3D FTN2Comp and FLOW-3D FTNMSDI model profiles after calibration of the porous plate coefficients. Water Level (WL) (upper panel), the Depth-Averaged Velocity (DAV) (mid-panel) and the Total Energy Head (TEH) (bottom panel) were compared along two transect locations as shown in the bottom of Figure 5.13.

Table 5.1. Comparison of calibrated Delft3D model diverted discharge with the FLOW-3D model along with calibration coefficients tested. A value of 0.9 was selected which gave the best comparison with the FLOW-3D diverted discharge.

| Case                           | MR Flow (cfs) | Diverted Discharge (cfs) |         | Percent Difference in Delft3D discharge from FLOW-3D (%) | FTN2Comp Delft3D Calibration Coefficients ( $C_{loss}$ ) |
|--------------------------------|---------------|--------------------------|---------|----------------------------------------------------------|----------------------------------------------------------|

Along Structure C/L

Along MR RDB

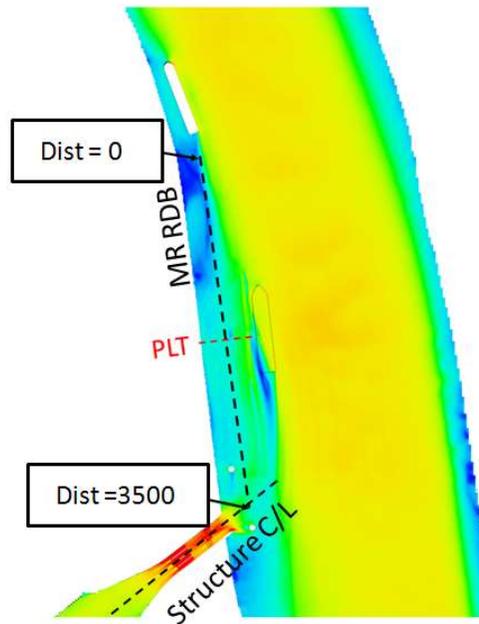

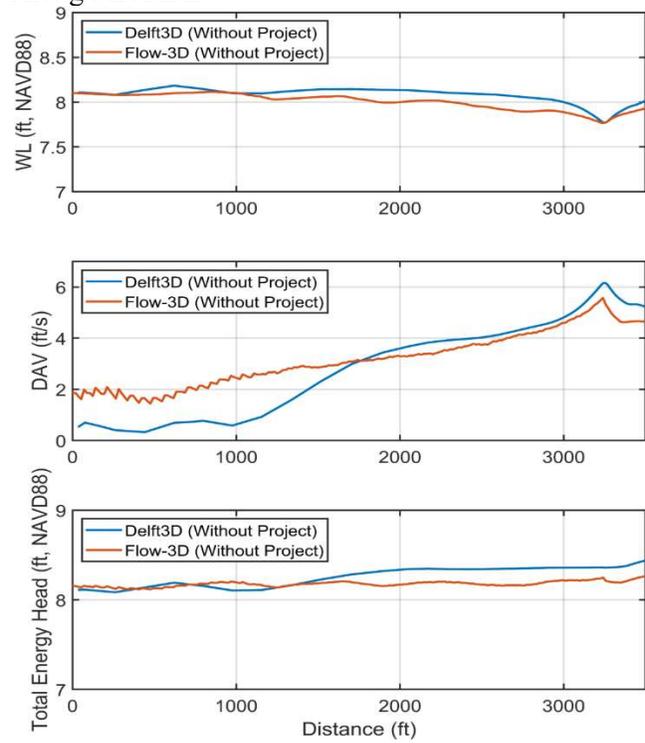

Figure 5.13. Without Project: Delft3D FTN2Comp (3D) and FLOW-3D FTNMSDI modeled water level, depth-averaged velocity and total energy head comparisons along two lines, along the RDB and the structure centerline (shown in bottom). MR Flow is 1,000,000 cfs.

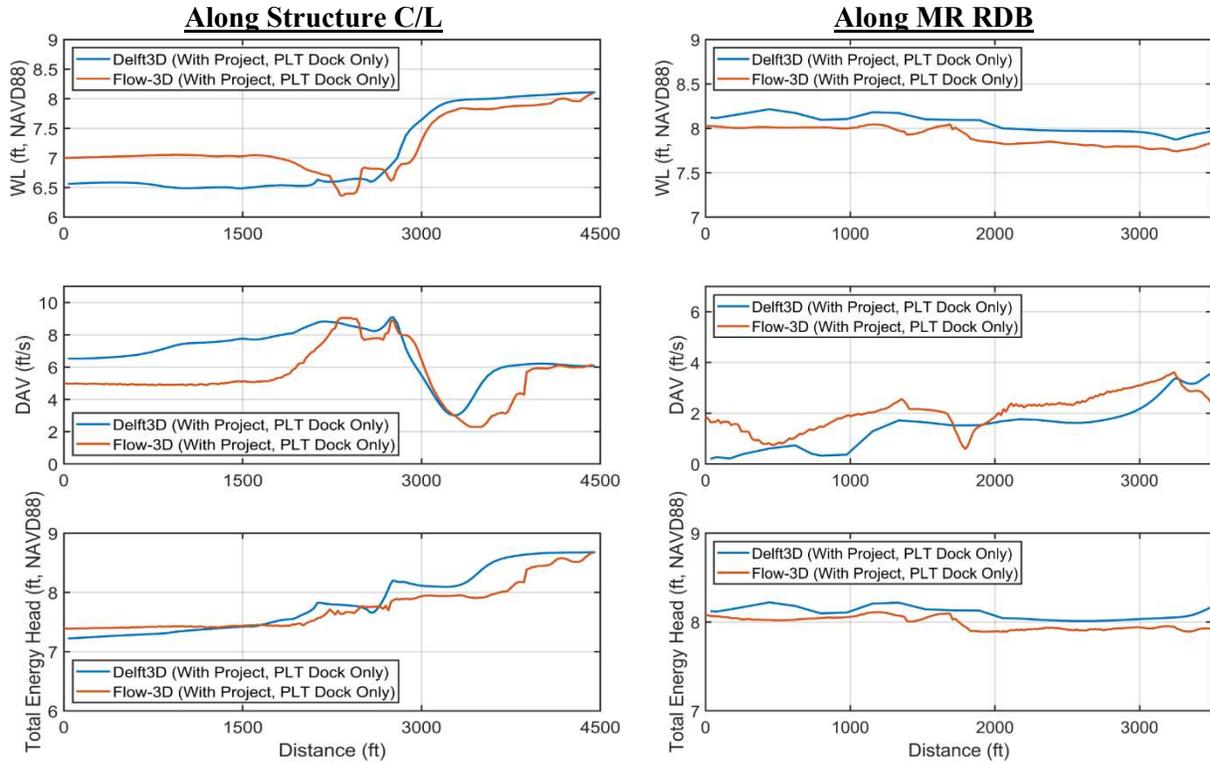

Figure 5.14. With-Project (PLT Dock Only): Delft3D FTN2Comp (3D) and FLOW-3D FTNMSDI modeled water level, depth-averaged velocity and total energy head comparisons along two lines, along the RDB and the structure centerline (same locations shown as in bottom of Figure 5.1). MR Flow is 1,000,000 cfs.

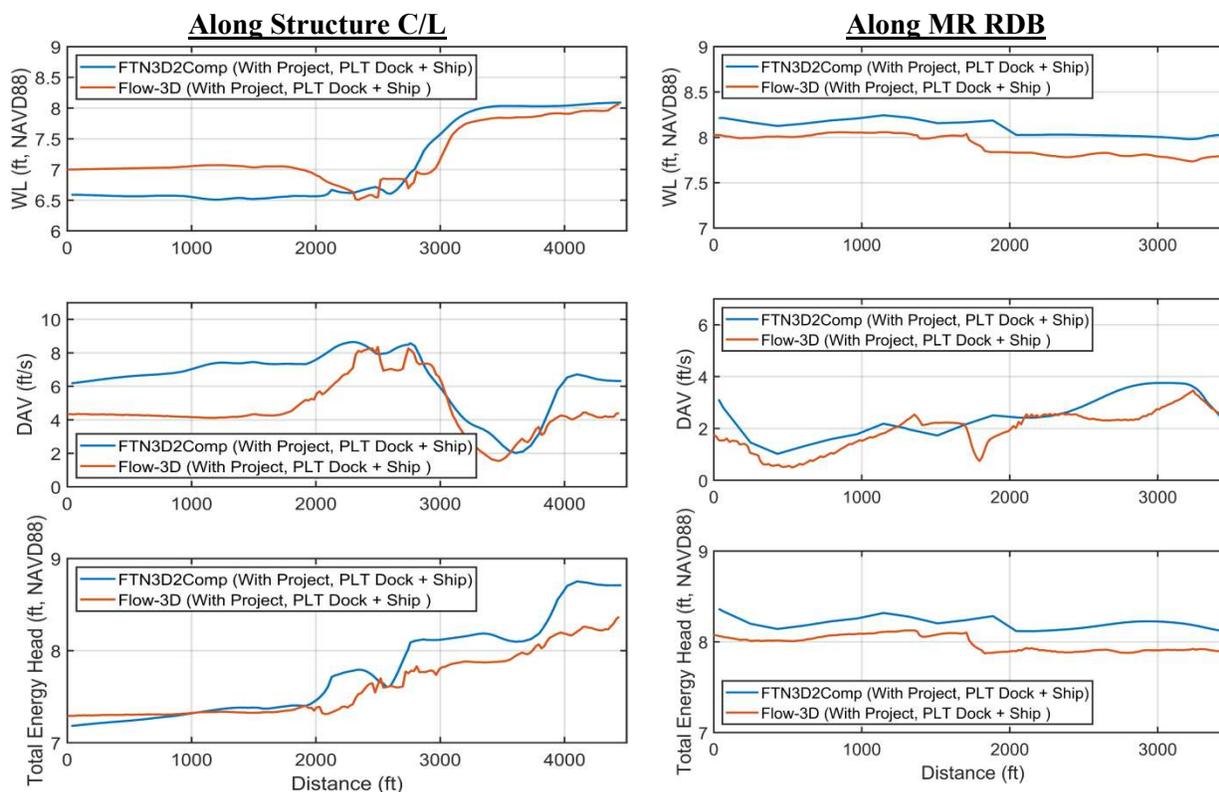

Figure 5.15. With-Project (PLT Dock + Ship): Delft3D FTN2Comp (3D) and FLOW-3D FTNMSDI modeled water level, depth-averaged velocity and total energy head comparisons along two lines, along the RDB and the structure centerline (same locations shown as in bottom of Figure 5.1). MR Flow is 1,000,000 cfs.

Figure 5.13 shows comparison of Delft3D and FLOW-3D model profiles after calibration along the structure centerline and along the RDB. The bottom figure shows the location of the lines along which the model results were compared, one along the Mid-Barataria Sediment Diversion (MBSD) structure centerline (C/L) and another along a line passing roughly parallel to the river along the RDB starting about 3,500 ft upstream of the intake C/L and ending at the intake. These two locations are chosen due to the importance of the hydrodynamics in the vicinity of the intake and the RDB where the PLT project is proposed. Note that this bottom plot is a generic figure showing the PLT Dock and Ship and is meant to simply signify the relative location of the lines with respect to project features under consideration, the specific case results shown here are from Without-Project (i.e., no PLT Dock or Ship) conditions. Overall both the models predict similar water level and DAVs. One of the differences observed in the models is

the zone immediately downstream of the CHS terminal where the DAVs are predicted less (~1 ft/s) in Delft3D compared to FLOW-3D (~2 ft/s).

Figure 5.14 shows the comparisons between the two models, under With-Project (PLT Dock only) of modeled WLs, DAVs and TEHs along the same line locations as on Figure 5.13. It is seen that while the overall trend between the two models match well for both water level and total energy head, some spatial variation in the velocities along the RDB is evident due largely to the different treatment of the porous planes in the two models. In general, the Delft3D model tends to slightly overpredict the water level (by  $< 0.25$  ft) and consequently underpredict the velocities (by  $< 1$  ft/s) along the RDB. Velocity predictions improve as one moves down the RDB towards the intake.

Figure 5.15 shows the comparison between the two models under With-Project (PLT Dock + Ship) condition. The profiles agree well within the two models with consistent variations shown in Figures 5.13 and 5.14, due to slightly different water level predictions between the models.

### **5.3 Delft3D Model Results: Discharge and Sediment Transport**

Once the Delft3D FTN2Comp (3D) model porous plate coefficients for the PLT structure components were calibrated, the same setup was used to run the FTNOMBA (2D) Delft3D model to generate basin boundary conditions (which will later be used as input at the mid-channel location into the FTN2Comp 3D sediment model) for sediment transport modeling shown in the next section. The 3D gate representation for the ship was changed to a 2D barrier with a loss coefficient of 0.9 for the 2D model. A comparison of 2D and 3D FTN2Comp model runs with the 2D barrier representation of the ship for the former and a 3D gate for the latter, under With- and Without-Project conditions indicated that the 2D barrier representation as an acceptable form of representation of the ship dynamics in a 2D version of the model. Note that the main purpose of the 2D model is to get comparative head losses and generate mid-channel discharge boundary conditions for the sediment modeling using the FTN2Comp (3D) model; the choice of this difference has no implication on sediment modeling which is still run in the 3D Delft3D model with the 3D gate representation of the ship.

Figure 5.16 shows the comparison of With- and Without-Project condition profiles at the same two transect locations as in Figs. 5.13-5.15 from the FTNOMBA 2D model. An important aspect to note here is that this is the first time in this study that the Delft3D model was run with influence of basin conditions included (full basin modeled) and with a downstream MR Q-H relation, the interaction of the basin WL, downstream WL in the river results in a draw-down in the river which is evident as a reduced water level ( $\sim 7.1$  ft, NAVD88) in these runs versus the previous calibration runs ( $\sim 8$ - $8.1$  ft, NAVD88) which were run without the basin. Note that the effect of the change in the boundary does not affect the calibration of the barrier coefficients which are intrinsic properties of the structures themselves and Reynolds number ranges (Section 3.3.2) which still remain invariant.

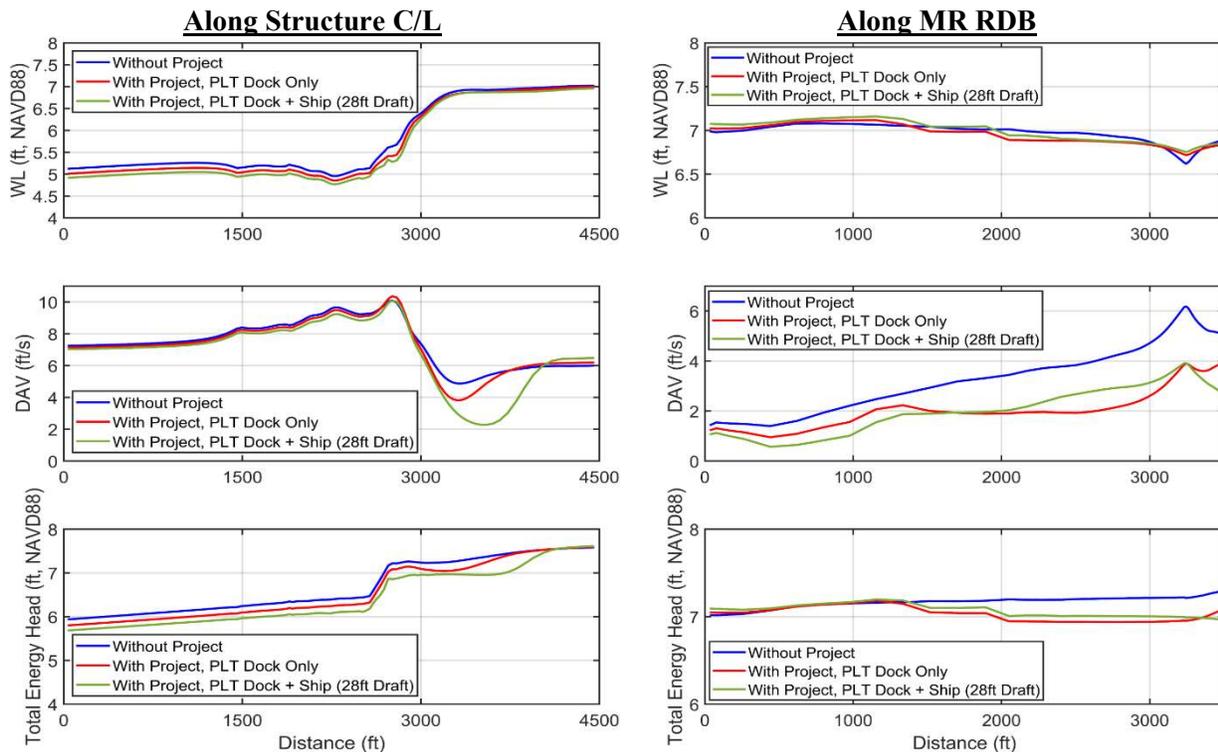

Figure 5.16. With- and Without-Project Delft3D FTNOMBA model comparisons: FTNOMBA (2D) Delft3D predicted profiles under With- and Without-Project conditions, including basin water level effects. MR Flow is 1,000,000 cfs.

To quantify the variation in diverted discharge with river discharge over a variety of river flows, for With- and Without-Project conditions, the FTNOMBA (2D) Delft3D model was run

for the 2008 hydrograph period for the interval when the river flow ranged from 450,000 cfs on the rising limb to 450,000 cfs on the falling limb (proposed operational period of diversion). The resulting Q-Q plot (MR discharge versus Diversion Discharge) is shown on Figure 5.17. Separate best fit curves are drawn between flow ranges below and above 700,000 cfs to distinguish the trends in the data. It can be seen that the reduction in diverted discharge between the With- and Without-Project conditions increase with increasing river discharge, primarily because of increasing drag losses at the PLT Dock structure and ship due to increasing river velocity with flow.

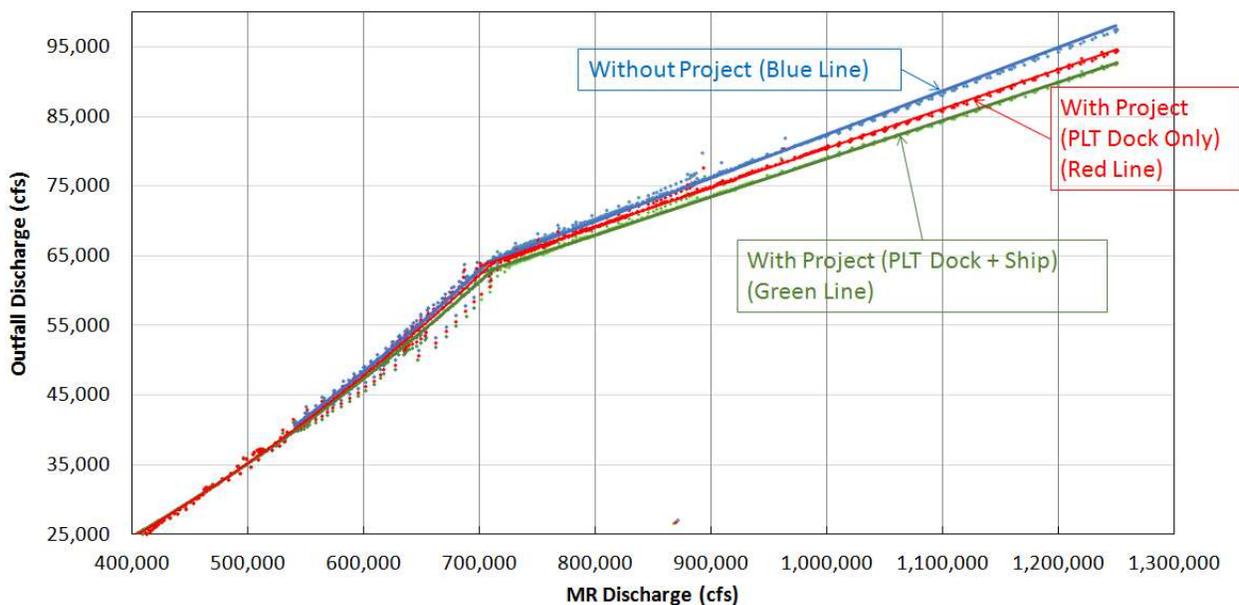

Figure 5.17. MR Discharge versus Outfall Discharge Plot for the three cases (Without-Project, With-Project –PLT Dock Only and With-Project – PLT Dock + Ship).

Table 5.2 shows the diverted discharge variation at specific MR flows (High, Medium, Low and Trigger flows) as well as the relative reduction due to the dock and the ship. At high flow, the reduction due to the PLT Dock alone is estimated to be about 2.4% and that due to the combined effect of the PLT Dock+Ship is estimated to be about 4.3%, suggesting that the additional 1.9% can be attributed due to the ship. The reduction, as noted before, decreases with decreasing river flow and is negligible at the trigger flow. Note that even though the diversion flow is shown to reach above 75,000 cfs in this table and Figure 5.17, in reality the diversion flow will be capped at 75,000 cfs using the gates. Thus, the presence of the PLT facility and the

PLT facility with the ship reduces the inlet flow capacity or the efficiency of the sediment diversion on the order of about 2 - 4 %. As a result of the reduced flow, fine sediments will be reduced somewhat proportionately, as shown later in the section, on the order of about 1 to 5%.

Table 5.2. Comparison of diverted discharge from FTNOMBA (2D) Delft3D model at Trigger (450,000 cfs), low (600,000 cfs), medium (800,000 cfs) and high (1,000,000 cfs) MR flow and relative percent reduction compared to the Without-Project scenario.

| MR Flow                    | Without Project | With Project (PLT Dock Only) | With Project (PLT Dock + Ship, 28 ft Draft) | Percentage flow reduction due to Ship (28 ft draft) only |
|----------------------------|-----------------|------------------------------|---------------------------------------------|----------------------------------------------------------|
| 1,000,000 cfs (High Flow)  | 82,400          | 80,400 (-2.4%)               | 78,900 (-4.3%)                              | 1.9%                                                     |
| 800,000 cfs (Medium Flow)  | 69,900          | 69,100 (-1.2%)               | 67,900 (-2.9%)                              | 1.7%                                                     |
| 600,000 cfs (Low Flow)     | 48,350          | 47,800 (-1.1%)               | 47,300 (-2.2%)                              | 1.1%                                                     |
| 450,000 cfs (Trigger Flow) | 30,000          | 30,000 (0%)                  | 30,000 (0%)                                 | 0.0%                                                     |

The FTN2Comp (3D) Delft3D sediment model was run using the discharge boundary conditions at the mid-channel location using the output from the FTNOMBA (2D) Delft3D model results for the same operational period of the diversion (450,000 cfs in the rising limb to 450,000 cfs in the last falling limb) for the 2008 hydrograph year. The discharge time series was capped at 75,000 cfs for the sediment runs. Figure 5.18 shows the histogram plots representing the variation in Total Sand and Fines load and SWR separately, under Without-Project (Run # 3), With-Project (PLT Dock only, Run # 4) and With-Project (PLT Dock + Ship, Run # 5) scenarios with MR flow. No morphology change is modeled in these runs. Mean values averaged over an interval of 100,000 cfs MR flow bins are plotted. The percent reduction in the sediment loads and SWR are also shown. The vertical bars ( $\pm$ Standard Deviation about the Mean) indicate the range of variability in the diverted sediment load and SWR due to the variation in the sediment load in the MR as a result of the hysteresis effect inherent in the fines and sand load distribution in the rising and falling limb. The sand load increases monotonically with increasing discharge with little variability while the fines load exhibits a more complex trend due to the hysteresis effect.

The percentage reduction in sand load is seen to be higher at MR flows exceeding 900,000 cfs with values ranging about ~15% due to the PLT Dock only and ~40-45% due to the combined effect of the PLT Dock and the Ship. The ship is seen to have a disproportionate additional impact on the sand load diverted. The fines load reduction is mostly less than ~5%. As a dedicated sediment diversion, whose primary purpose is to divert as much sand as possible (the fines being well distributed in the water column and are expected to be diverted with the flow anyway), the reduction in sand load was investigated further. The main reason for sand load reduction can be identified by tracking the dominant path ways of high near-bed Suspended Sand Concentration (SSC) which is the main source of the diverted sand in the river at four distinct river flows, namely, 1,250,000 cfs, 1,000,000 cfs, 800,000 cfs, 600,000 cfs and 450,000 cfs as shown on Figures 5.19 through 5.22.

Figure 5.19 shows the near-bed SSC spatial distribution along with velocity vectors under the three scenarios (Runs 3, 4 and 5 with no morphology change) at 1,250,000 cfs MR flow. A distinct bypassing effect of the high concentration RDB sand is seen under With-Project conditions as compared to that in the Without-Project. When the ship is not present, even though the dock is affecting the sand flow, sand is still able to bypass the PLT Dock and get diverted into the intake somewhat. On the other hand, when a ship is present a major percentage of the main sand plume, feeding the diversion, is now blocked either directly by the ship or is affected by its wake region. The blocked sand bypasses the diversion as mostly suspended load through two zones, a small portion between the PLT Dock and Ship and a major portion around the ship along with the main river flow bypassing the diversion, which in turn increases the concentrations slightly downstream of the diversion. This explains the disproportionate effect of the PLT Ship in reducing the diverted sand load versus the effect of the PLT Dock alone. Figures 5.20 to 5.22 show similar phenomenon with the exception that the near-bed cross-river concentration gradient along the RDB is lower at Medium and Low flows and explains the lower reduction effects seen at these flows than at the higher flows (>900,000 cfs).

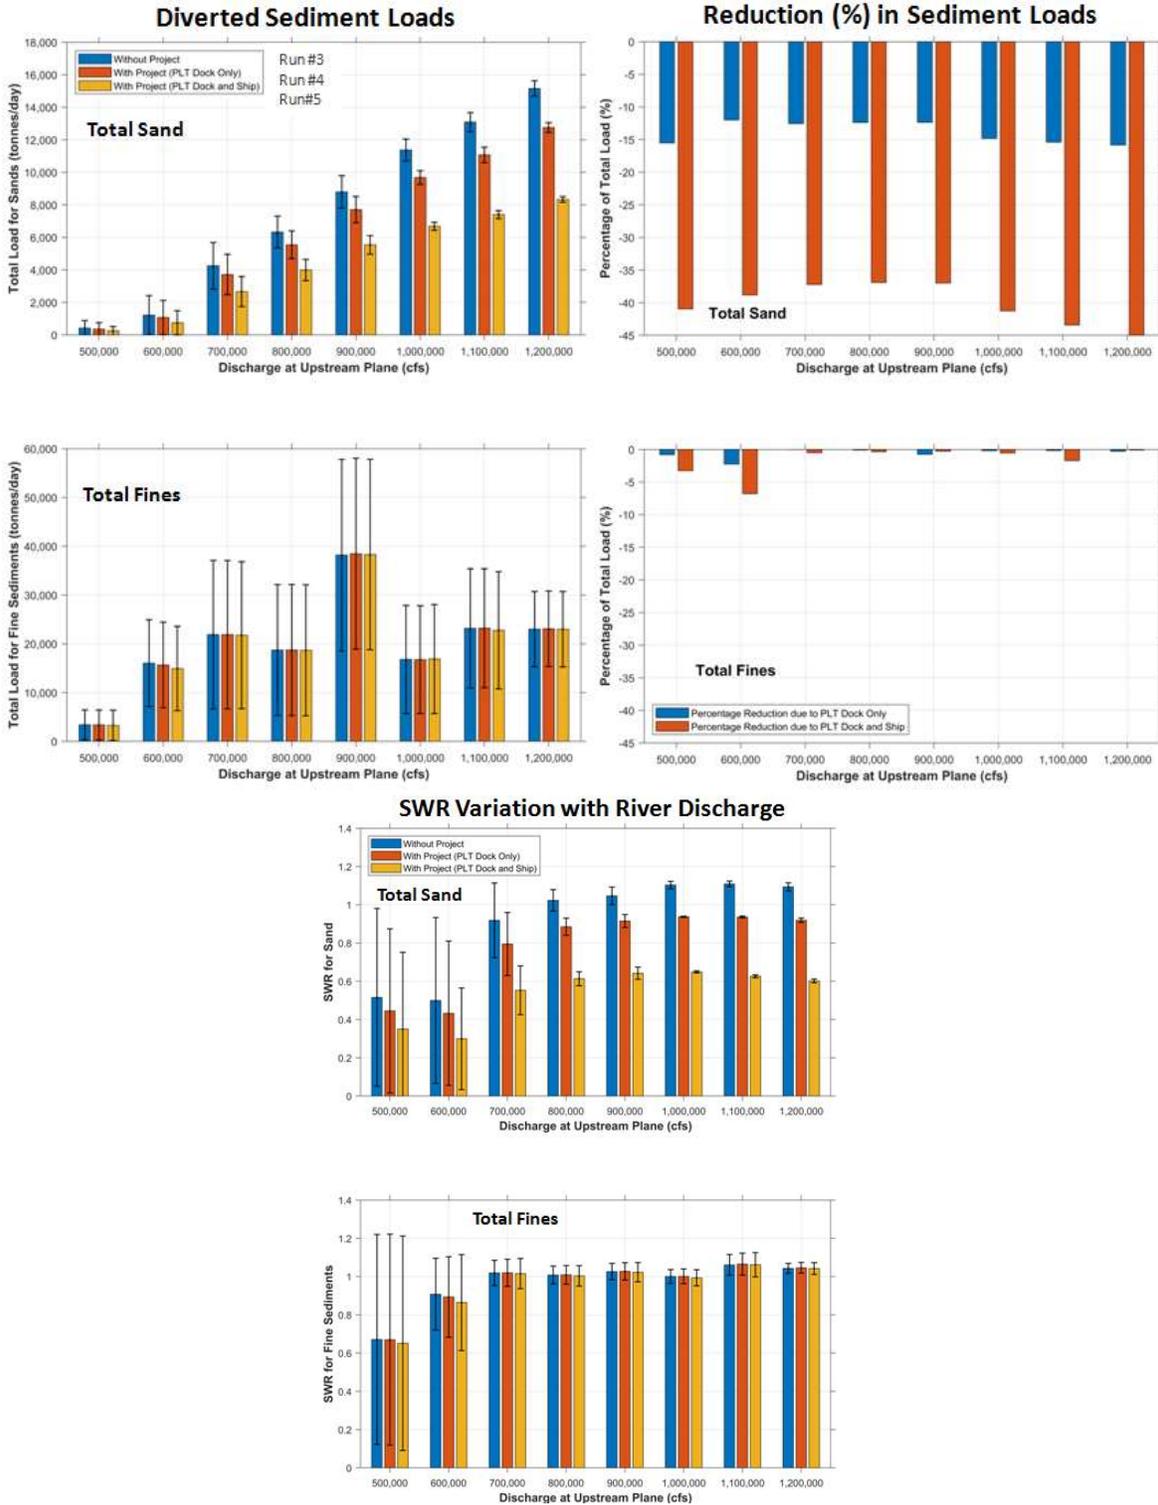

Figure 5.18. No Morphology Change (Runs 3, 4 and 5): Variation of Total Sand and Fines loads (upper left panel) and percent reduction from Without-Project scenario with MR flow. Bottom panel shows the variation in SWR of Total Sand and Fines. Model run was using the 2008 hydrograph year for the entire operational period.

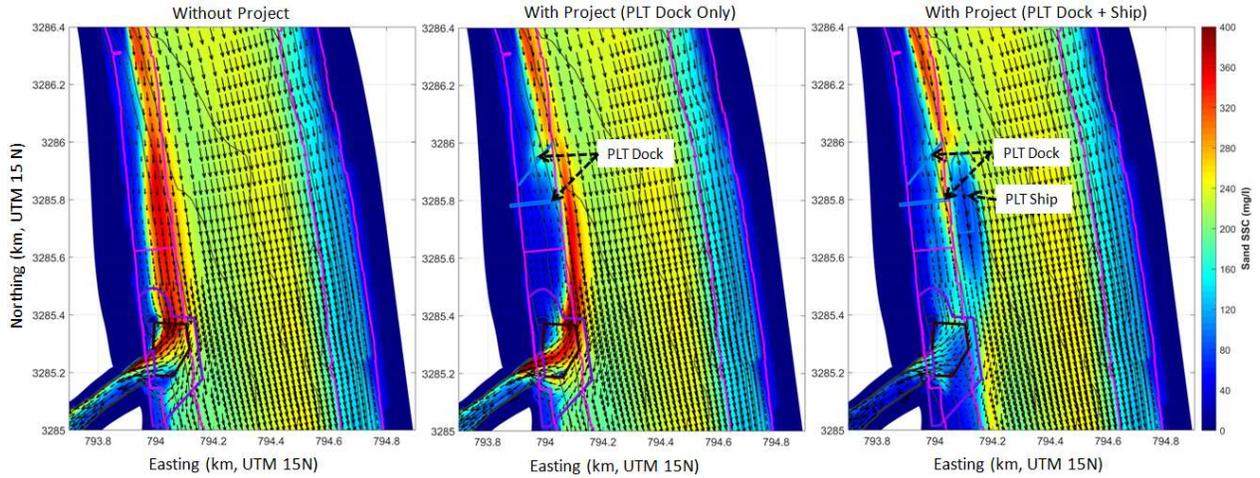

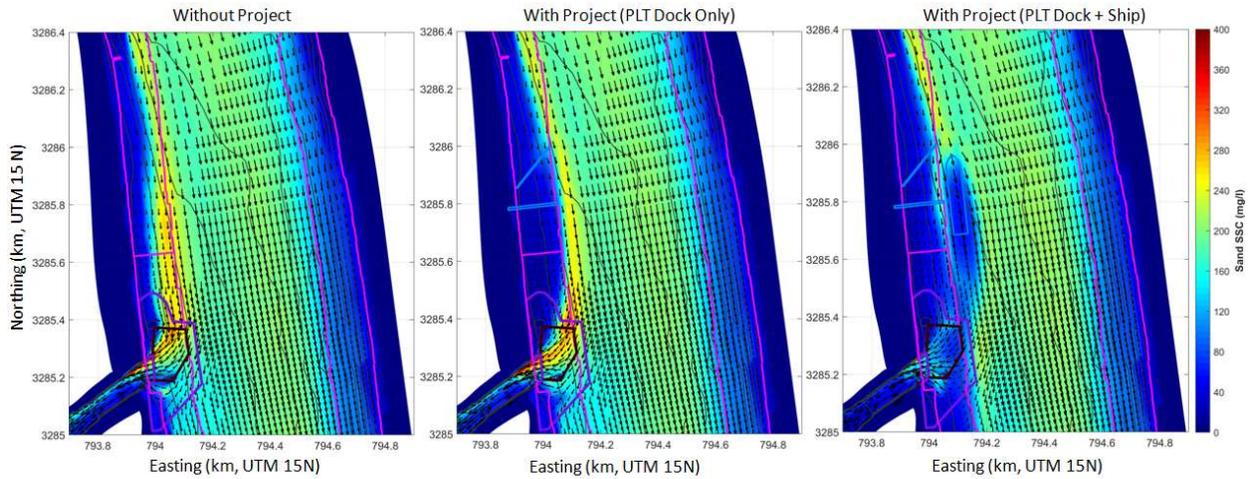

Figure 5.19. No Morphology Change: Near-bed Suspended Sand Concentration (SSC) at 1,250,000 cfs MR flow.

*Initial (USACE 2012) Bed Elevation Contours in ft, NAVD88 (Black lines) are shown at 20ft interval. DAV vectors are at 50ft interval. Revetment extents are shown by magenta lines, proposed rip-rap extents by purple line*

Figure 5.20. No Morphology Change: Near-bed Suspended Sand Concentration (SSC) at 1,000,000 cfs MR flow.

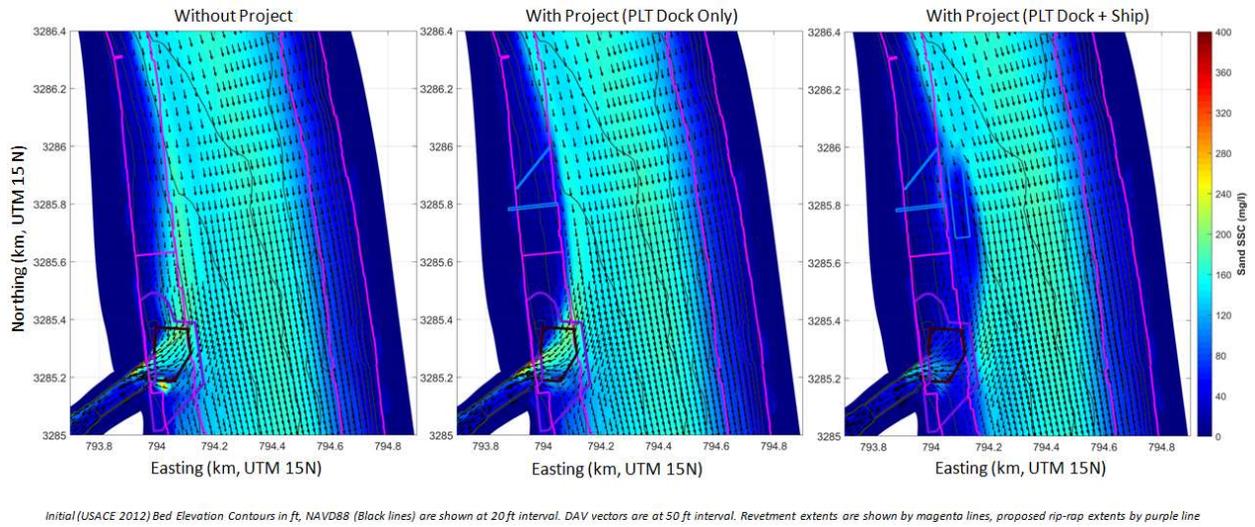

Figure 5.21. No Morphology Change: Near-bed Suspended Sand Concentration (SSC) at 800,000 cfs MR flow.

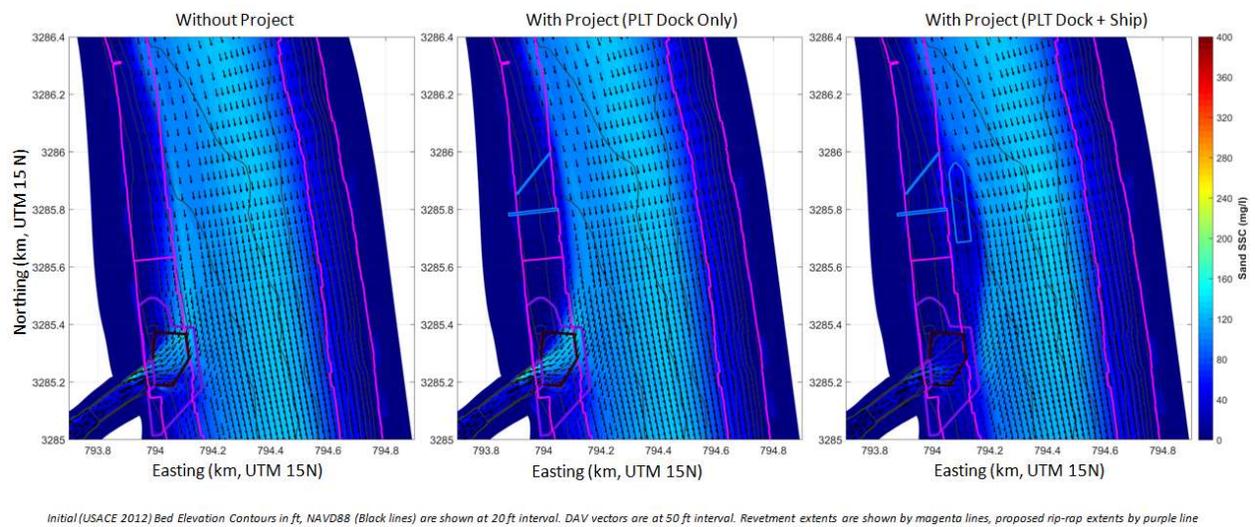

Figure 5.22. No Morphology Change: Near-bed Suspended Sand Concentration (SSC) at 600,000 cfs MR flow.

Figure 5.23 shows the variation of the diverted total sediment (Sand+Fines) load and corresponding CSWR (over 100,000 cfs discharge bins) with MR discharge. The reduction, under With-Project condition, as percentage of the Without-Project condition is also shown. Since the fines have a comparatively lesser reduction than the sand and the because fines load area about 2-3 times higher than the sand load in the river, the net reduction effect in the total sediment is less compared to that of sand alone. While total sediment loads and changes in them,

are reported, it should be noted that, the total fines captured, is reduced in approximately similar proportion as the reduction in diverted discharge due to the effects of the PLT Dock and/or the ship. This is because, the fines are well-mixed in the water column. Therefore, the critical sediment impact efficiency parameter is the reduction in sand load in addition to the hydrodynamic impact efficiency parameter of the reduction in diverted discharge. However, the reduction of the total sediment due to the presence of the PLT ship at MR flows greater than 900,000 cfs is higher (15-20%) compared to that at flows lesser than 900,000 cfs flows (5-10%).

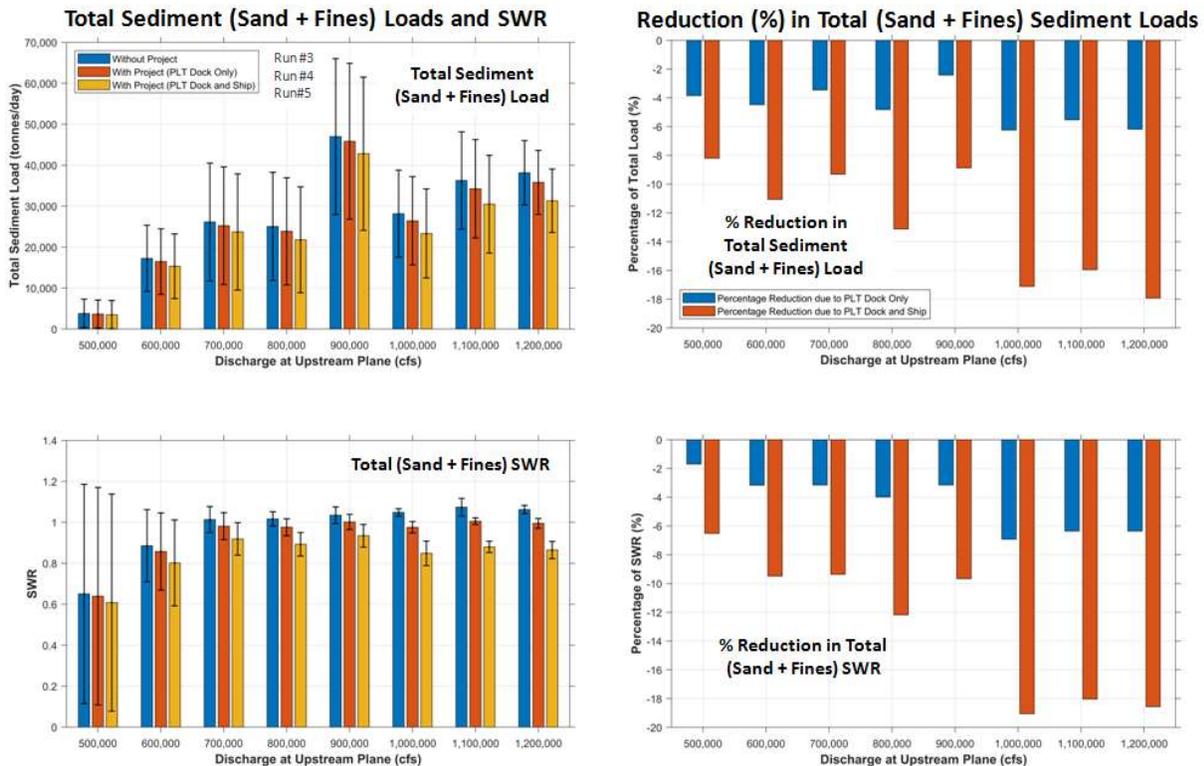

Figure 5.23. No Morphology Change: Variation of Total Sediment (Sand+Fines) and Total SWR (left panel) and percent reduction from Without-Project scenario of Total Sediment and Total SWR (right panel) with MR flow. Model run was using the 2008 hydrograph year for the entire operational period.

Figures 5.24 and 5.25 present model results from the with-morphology-change (but with non-erodible initial bed) runs (Runs 6, 7 and 8) and quantify effects of the PLT Dock and PLT Dock+Ship separately on the net reduction, similar to Figures 5.18 and 5.23. The main difference from the no-morphology-change runs is that these model runs take into consideration the temporal change in bed level and the effect of the bed material load supply to the diverted

sediment load, which can be locally deposited and eroded into the diversion, depending on the flow. Thus, the diverted loads are slightly higher at the higher flows (when sediment deposited at lower flows is available for transport) and lower at the lower flows (where the sediment being deposited in the river reduces the diverted load). Nevertheless, the reduction in the range of variation in the presence and absence of the ship is seen to be higher (30-45%) at MR flows exceeding 900,000 cfs than at lesser flows (15-20% reduction).

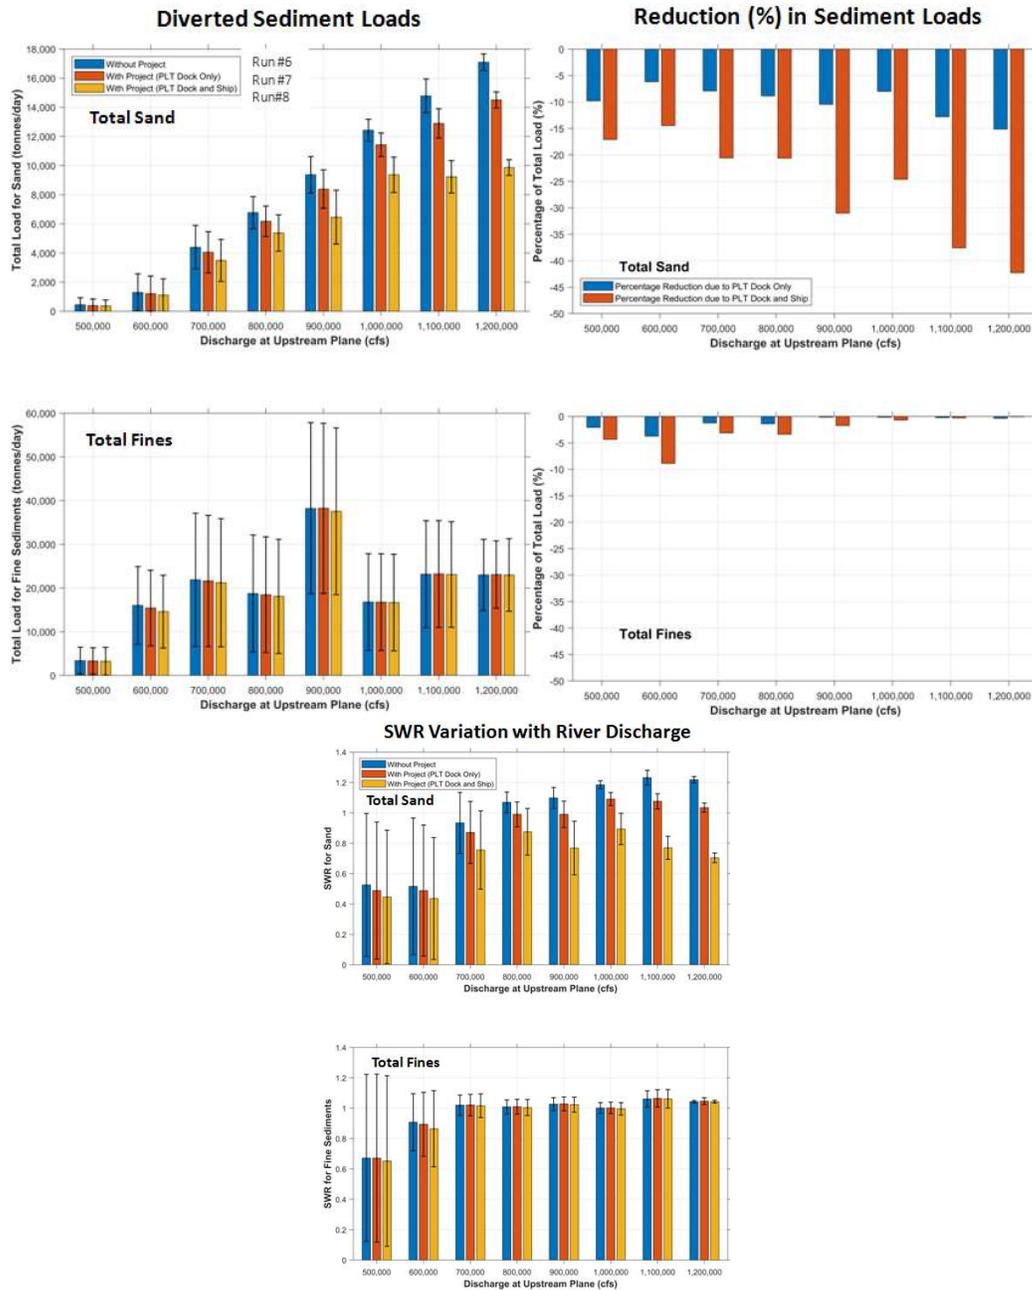

Figure 5.24. With morphology-change, non-erodible initial bed: variation of Total Sand and Fines loads (upper left panel) and percent reduction from-Without-Project scenario with MR flow. Bottom panel shows the variation in SWR of Total Sand and Fines. Model run was using the 2008 hydrograph year for the entire operational period.

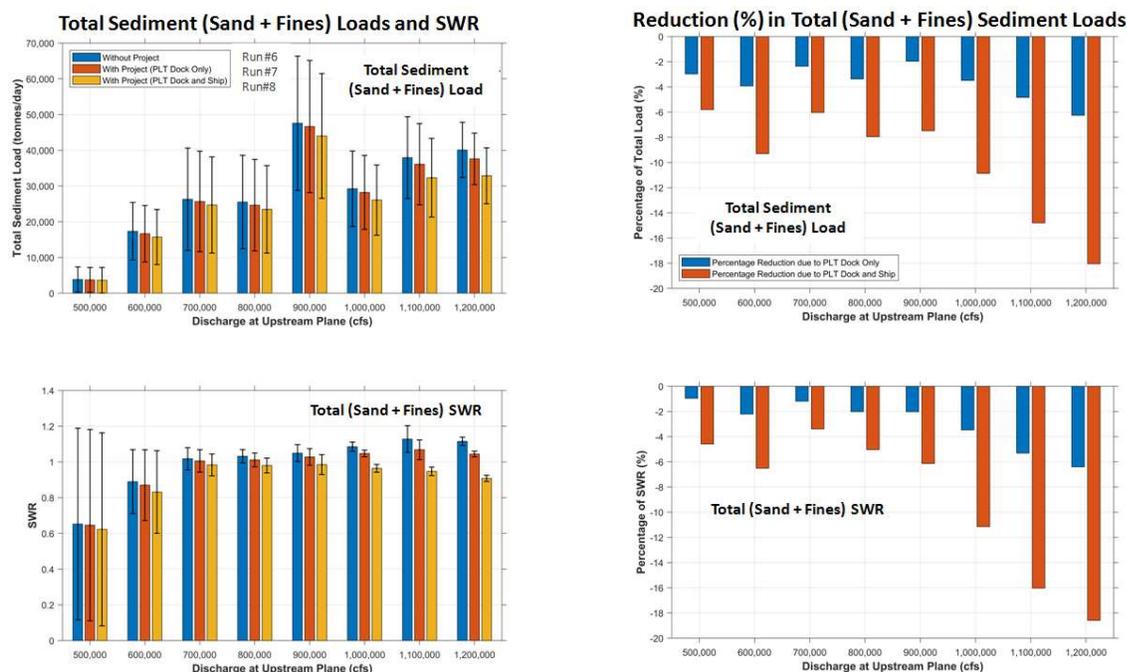

Figure 5.25. With-morphology-change, non-erodible initial bed: variation of Total Sediment (Sand+Fines) and Total SWR (left panel) and percent reduction from Without-Project scenario of Total Sediment and Total SWR (right panel) with MR flow. Model run was using the 2008 hydrograph year for the entire operational period.

Tables 5.3 and 5.4 show the annual estimations of diverted sediment loads, water volume, CSWR along with reduction percentages under with-structure scenarios with respect to the without-structure scenario. The upper panels in Table 5.3 and 5.4 respectively show the total annual water volume and sediment load diverted as well as that passing the river section, for the No-Morphology-Change (Runs 3,4 and 5) and With-Morphology-Change (Runs 6, 7, and 8) scenarios. The lower panel in the two tables shows the percent reduction under the With- Project scenarios. It is seen that the percent reduction in the sand load varies between ~11-15 % due to the PLT Dock only and between ~30-45% due to the combined effect of the PLT Dock and the Ship. Estimated reduction in fines load is less than 1% due to the PLT Dock only and between 1-5% due to the combined effect of the dock and the ship. The reduction in total sediment load is between 4-5% due to the PLT Dock only 11-14% due to the combined effect of the PLT Dock and the ship. The lower and upper ranges of the reduction are based on whether the model is run with or without morphology change and provide modeling results variability expected from the differing assumptions.

Table 5.3. No Morphology Change (Runs # 3, 4 and 5). Upper Panel: Sediment Loads and CSWR. Lower Panel: Percent Reduction for each With-Structure scenario compared to the Without-Structure scenario.

| Case                                 | Total Sand Load Diverted (MMT) (A) | Total Fines Load Diverted (MMT) (B) | Total Sediment Load Diverted (MMT) (C) | Total Sand Load in River (MMT) (D) | Total Fines Load in River (MMT) (E) | Total Sediment Load in River (MMT) (F) | Total Water Volume Diverted (TCF) (G) | Total Water Volume in River (TCF) (H) | Sand CSWR (-) (A/D)÷(G/H) | Fines CSWR (-) (B/E)÷(G/H) | Total CSWR (-) (C/F)÷(G/H) |

### 5.4 Delft3D Model Results: Morphology

Figure 5.26 shows the deposition extents and depths at the end of 1 year, diversion open and under Without-Project, With-Project (PLT Dock only) and With-Project (PLT Dock + Ship) scenarios. It is seen that the zone immediately downstream of the CHS terminal shows deposition as expected based on the hydrodynamic results shown on Figure 4.5 This region tends to deposit even without the presence of the PLT project. In presence of the PLT Dock only, deposition is seen to extend along the RDB under the Dock and immediately upstream of the diversion on the USACE revetment. It is recommended that any expected deposition on the USACE revetment be included in the structural stability calculations of the revetment around the diversion. The presence of the ship tends to reduce the deposition under the dock as well as immediately downstream of the ship mainly due to the increased velocities (see Fig. 5.32 later for flow velocities) under and around the ship. However, the presence of the ship is seen to increase deposition at the MBSD intake within the river as well as downstream of the intake on the USACE revetment.

Initial (USACE 2012) Bed Elevation Contours in ft, NAVD88 (Black lines) are shown at 20 ft interval. Revetment extents are shown by Green lines.

Figure 5.26. With-morphology-change, non-erodible initial bed diversion open (Runs 6, 7 and 8): deposition extents and depths at the end of 1 year of diversion operations, after immediate opening of the diversion under Without-Project, With-Project (PLT Dock only) and With-Project (PLT Dock+Ship) scenarios.

Figure 5.27 shows the difference of deposition depths at the end of 1 year between the With- and Without-Project conditions. As explained before on Figure 5.26, it appears that the existence of the PLT dock would induce deposition under the dock. In presence of the ship additional deposition is seen at the diversion intake and downstream of the diversion along the RDB.

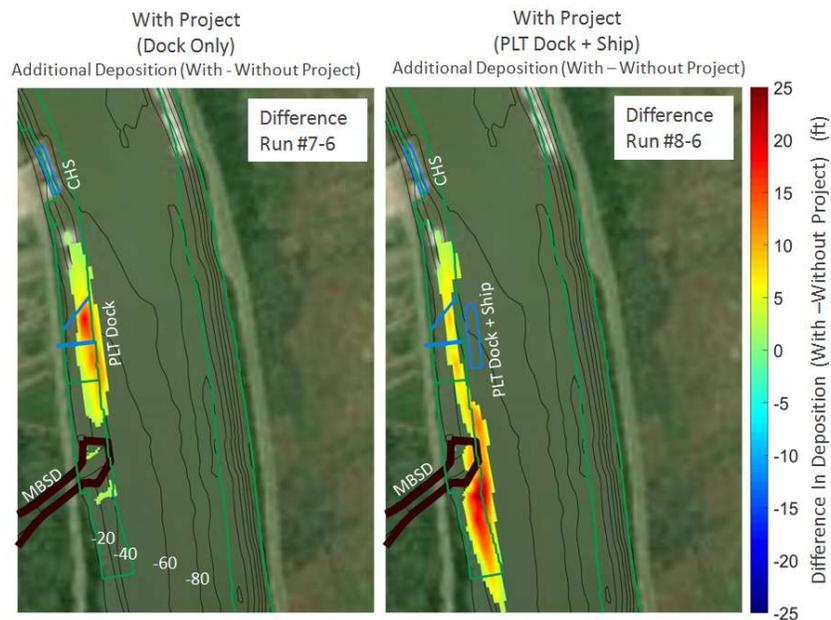

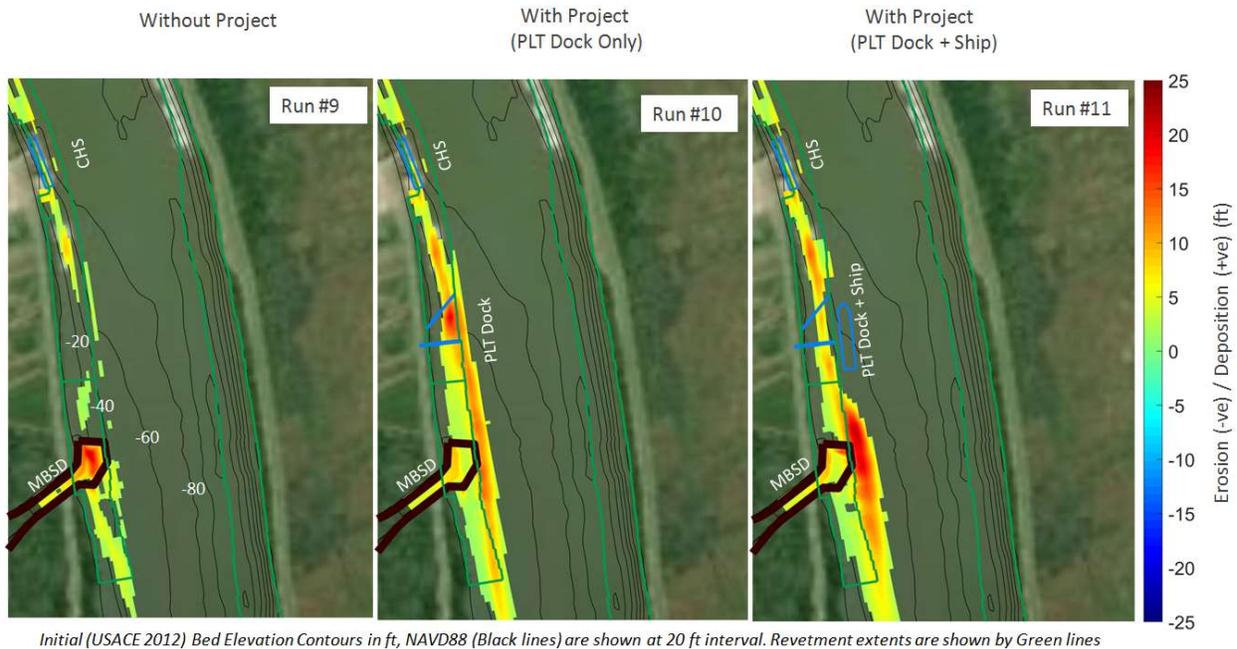

Figure 5.27. With-morphology-change, non-erodible initial bed, diversion open: difference in deposition depths (With – Without Project) at the end of 1 year of diversion operations, after immediate opening of the diversion.

Figure 5.28 shows the deposition depths and extents at the end of the same 1-year period but when the diversion is closed. Difference between the diversion open and closed deposition depths is shown in Figure 5.30. Results indicates that enhanced deposition occurs at the intake as well as between the -40 ft and -50 ft, NAVD88 contours in the river immediately in front of the intake in the presence of the ship. An interesting insight from this figure is that downstream of the diversion, the diversion open condition results in greater deposition along the shallower parts of the revetment than the diversion closed condition. This is because, when the diversion is open, the flow tends to bring the sand up on the shallower depths which otherwise remain free of deposits when the diversion is closed and the river flow is unaffected by the diversion flow.

Initial (USACE 2012) Bed Elevation Contours in ft, NAVD88 (Black lines) are shown at 20 ft interval. Revetment extents are shown by Green lines

Figure 5.28. With-morphology-change, non-erodible initial bed diversion closed (Runs 9, 10 and 11): deposition extents and depths at the end of 1 year under Without-Project, With-Project (PLT Dock only) and With-Project (PLT Dock+Ship) scenarios.

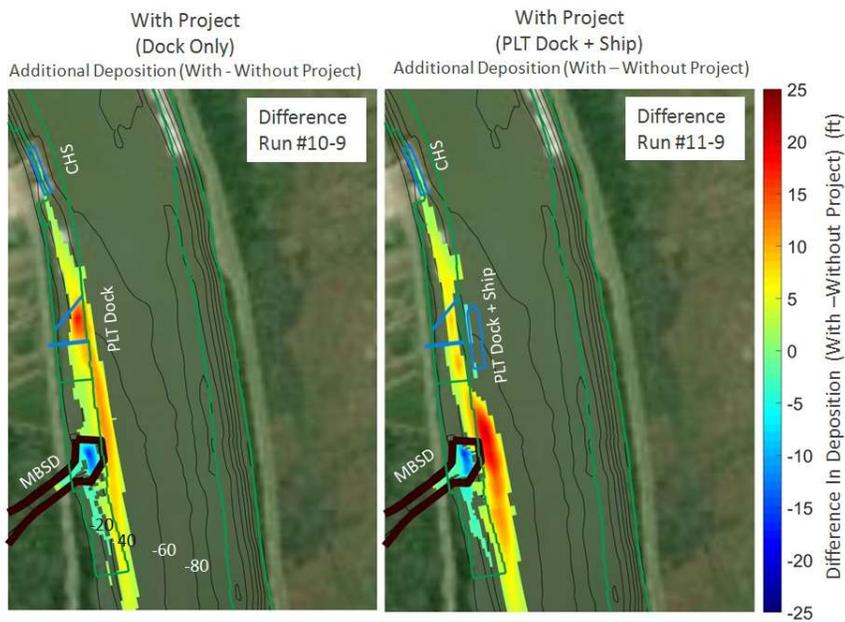

Figure 5.29. With-morphology-change, non-erodible initial bed diversion closed: Difference in deposition depths (With – Without Project) at the end of 1 year.

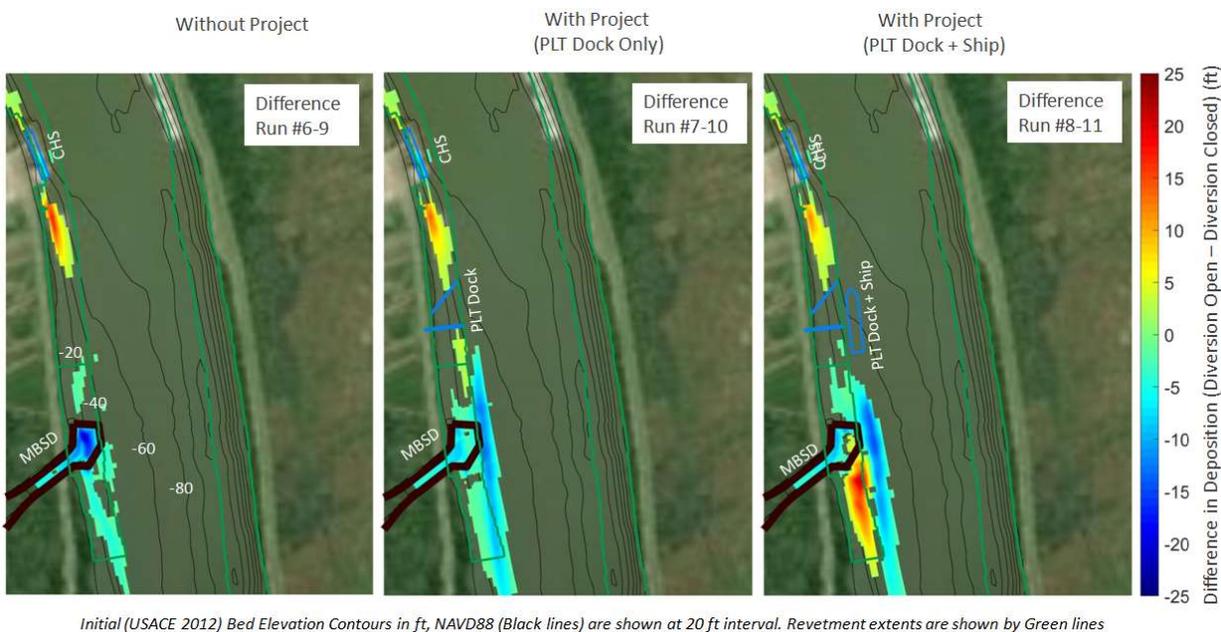

Figure 5.30. With-morphology-change, non-erodible initial bed difference in deposition depths under diversion open and closed scenarios (Open – Closed) at the end of 1 year.

Figure 5.31 shows the deposition and erosion results for the With-Project (PLT Dock + Ship) scenario at the end of 1 year. These results indicate that sandbar erosion under the ship is possible, even when a locally erodible stratigraphy is considered. It is to be noted that these results are largely qualitative because the Delft3D model is not calibrated to predict sand bar erosion rates for this study. Further investigation and verification of ship induced sand bar scour is recommended using ship scale fluid-structure interaction numerical models and/or with physical modeling. Additional stratigraphy information of sand bar using geotechnical information is also recommended to be incorporated into modeling.

Figure 5.32 shows the comparison of velocity profiles between the FLOW-3D and the Delft3D model under ‘No Morphology Change’ case. It is seen that except the location immediately downstream of the ship head, both models predict the velocity with good agreement indicating that the Delft3D model can be reliably taken to represent the flow under the ship. While velocities are less than 4 ft/s upstream of the ship near the bed, they increase to 4-6 ft/s under the ship due to flow constriction. It is therefore possible that the increased velocity, particularly near the bed, can thus cause erosion under the ship as predicted by the erodible bed runs.

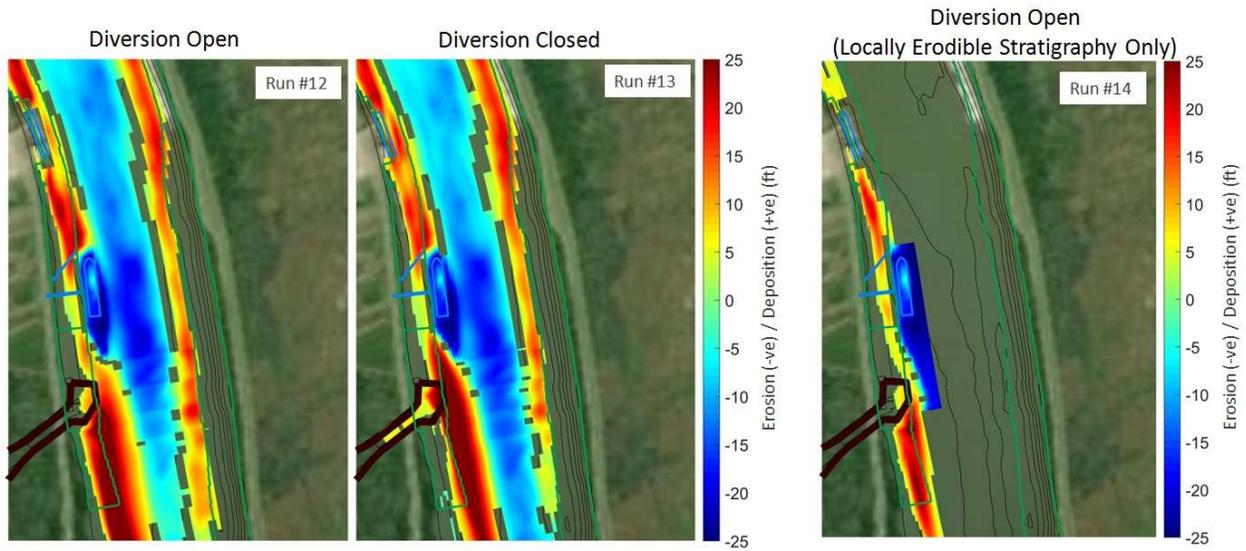

Figure 5.31. With-morphology-change, erodible initial bed (Runs 12, 13 and 14): deposition or erosion depths and extents at the end of 1 year under With-Project (PLT Dock + Ship) scenario. Left two panels are with entire river stratigraphy set as erodible with diversion open in the first panel and the diversion closed in the second. The right panel is for a model run with a locally erodible stratigraphy under the ship only.

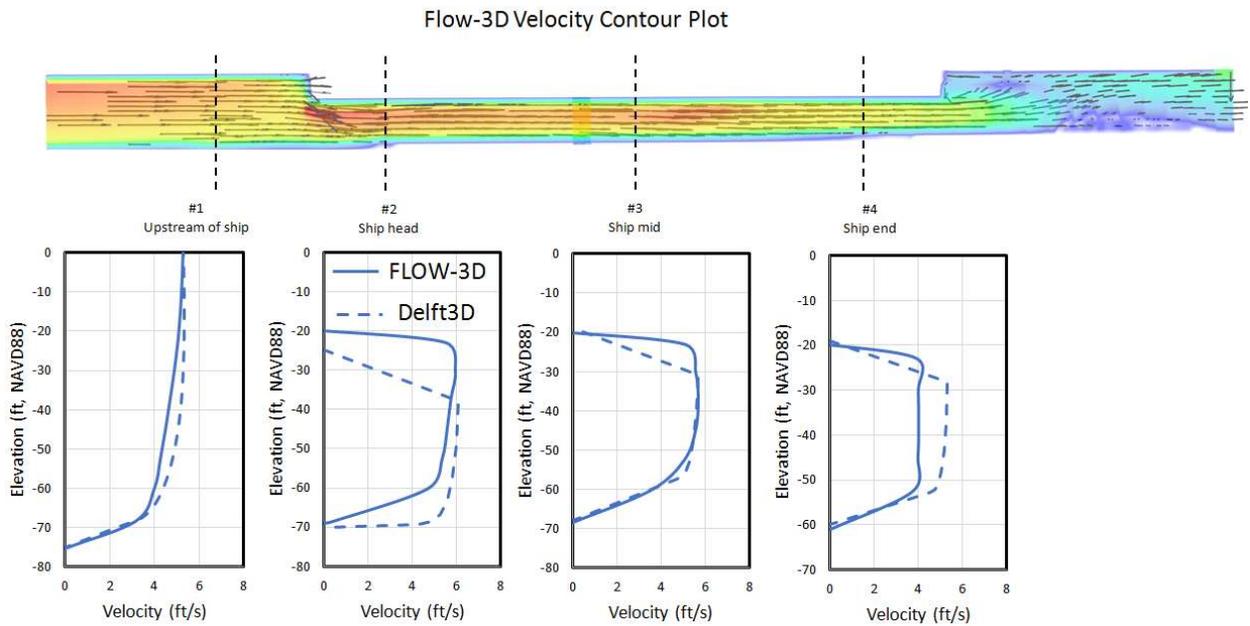

Figure 5.32. Comparison of vertical profile of velocity magnitude under the ship from FLOW-3D and Delft3D.

## 6.0 SUMMARY AND CONCLUSIONS

FLOW-3D and Delft3D models were developed to model the effect of the PLT Dock and Ship on the discharge capacity and the diverted sediment loads for MBSD.

Both models were calibrated/validated with observed data. In addition, the Delft3D model was calibrated with the FLOW-3D model results for hydrodynamics and diversion discharge to account for the energy losses resulting from the presence of the PLT Dock and Ship and the near-field effect of the velocity field at the intake.

The PLT Dock structure was represented as porous mesh planes following existing modeling methodology by CPRA (Meselhe et al., 2012). The porosity and drag coefficients were based on values in published literature and empirical studies and depend on the structural resistance to flow for portions of the dock that are under water.

The Delft3D (3D) sediment transport model was run to evaluate effect on diverted loads, SWR as well as short term morphology change in the vicinity of the diversion and the PLT Dock. Morphology and sediment transport model results are representative of the *immediate effect in one year* of diversion opening in response to a historical (2008) hydrograph. The effects of PLT Dock and Ship on diversion sediment capture efficiency and subsequent morphological response of the river in the vicinity of the intake and along the RDB were evaluated.

The following conclusions can be drawn from this modeling study:

1. Estimated changes in *hydrodynamics* due to the presence of PLT Dock Only are as follows:
  - a. ~2.4% reduction in diverted discharge at 1M cfs MR flow
  - b. ~0.1-0.3 ft of Total Energy Head reduction at MBSD intake at 1M cfs MR flow
  - c. Riverside intake velocities reduce from ~ 5 ft/s to ~2.5-4 ft/s at 1M cfs MR flow
2. Estimated change in *hydrodynamics* due to the presence of PLT Dock and Ship are as follows:
  - a. ~4.3% reduction in diverted discharge at 1M cfs MR flow
  - b. ~0.3-0.5 ft of Total Energy Head reduction at MBSD intake at 1M cfs MR flow

- c. Riverside intake velocities reduce from ~ 5 ft/s to ~1.5-2.3 ft/s at 1M cfs MR flow
3. Estimated reductions of sediment load due the presence of PLT Dock only are as follows:
  - a. ~11-15 % for diverted sand load
  - b. ~0-1 % for diverted fines load
  - c. ~4-5 % for diverted total load
4. Estimated reduction of sediment load due the combined presence of PLT Dock and Ship (moored during the entire operational period) are as follows:
  - a. ~30-45 % for diverted sand load
  - b. ~4-5 % for diverted fines load
  - c. ~11-14 % for diverted total load
5. The reduction in sediment loads estimated above in # 4 for PLT Dock and Ship scenario may be lower if intermittent ship operations are included in the analysis. However, the reduction, including intermittent ship operations, will still be greater than the reduction due to the PLT Dock alone mentioned in # 3.
6. Uncertainty in the reported reduction percentages include but are not limited to the following factors which are not considered in this study:
  - Nature of the MR Hydrograph
  - Long-term morphological impacts of the PLT Dock and/or ship
  - Frequency and timing of ship operations within the hydrograph period
  - Variation in ship draft
  - Local fluid-structure scale transient effects on the sediment transport and sand bar scour
  - Ship motion induced sediment transport and morphology change
  - Sensitivity of model to drag coefficients used to parameterize the structure losses
7. Deposition was noted under the PLT Dock, along the RDB and on the USACE revetment downstream of the diversion when the ship was present. Additional long-term numerical modeling and/or physical modeling is suggested to verify the evolution of this zone and its impact on sediment capture and hydrodynamics.
8. Increased deposition is noted at the diversion intake under diversion closed scenario due to the presence of the PLT Dock.

9. Presence of the stationary ship indicates some erosion of the native sand-bar due to the increased near-bed velocities under the ship. This model does not take into account the effect of ship movements on morphology. Additional numerical modeling at the fluid-structure interaction scale of the ship and/or physical modeling is recommended to verify this.
10. Dredging to maintain required ship draft at the PLT location can affect the stability of the sand-bar, which is the main platform over which sand travels towards the diversion intake and enables the intake to access the near bed high sand concentration zone.
11. The Delft3D model does not model head-cut propagation, bank collapse, scour under the revetment or rip-rap. Morphology results should be used with caution when using the absolute deposition/erosion depths for design.

**Concern ID: 61850**

**Commenters expressed concern that reasonably foreseeable industrial facilities like the Plaquemines Liquids Terminal and pipelines that may be built near the proposed MBSD Project structure or in the Barataria Basin would cause adverse impacts on the marsh ecosystem restored by the MBSD Project operations. One commenter expressed the opinion that industrial facilities that may be constructed near the proposed MBSD Project should be denied permit because they would be inconsistent with the objectives of the proposed MBSD Project.**

**Response ID: 16464**

The commenters' concern about the potential impact of future industrial development and activity on the habitat that would be created by the proposed Project was considered in Chapter 4, Sections 4.25.4 and 4.25.6 in the Cumulative Impacts section of the Draft EIS. These sections explain that reasonably foreseeable industrial facilities and infrastructure that may be constructed in the proposed MBSD Project area are expected to have negligible impacts on proposed Project-area resources because the facilities would be required to adhere to permit conditions imposed by regulating agencies such as wetland mitigation, SWPPP, and SPCC plans in order to be constructed and operated.

Furthermore, CPRA entered into a Memorandum of Understanding with the Plaquemines Port Harbor & Terminal District (PPHTD) and the Plaquemines Liquid Terminal, LLC (PLT) requiring PPHTD and PLT to perform sediment transport modeling and a navigation study to determine the impact, if any, that the PLT Project may have on the proposed MBSD Project, and to agree to certain terms and conditions, as needed, to ensure that the PLT, once constructed and operated, does not have unreasonable adverse impacts on the design, construction, or operation of the proposed MBSD Project. These steps would help ensure that the PLT Project remains consistent with the Louisiana Coastal Master Plan.

Since publication of the Draft EIS, the Tallgrass/PLT facility's sponsors PPHTD/PLT have withdrawn their Joint Permit application (Louisiana Department of Natural Resources Coastal Use Permit [CUP] number P20180379 and DA Permit number MVN-2012-0123-EPP), and terminated the Memorandum of Understanding (MOU) (originally dated April 24, 2019) between CPRA and PPHTD/PLT pertaining to the facility. A footnote has been added in Section 4.25.1.3.2 Reasonably Foreseeable Future Projects of the Final EIS to reflect the withdrawal of the PLT Project.

---

**Concern ID: 61912**

**CPRA should consider alternative flow triggers, designs, and features in the operations plan and design of the proposed MBSD Project in order to minimize impacts. CPRA should also consider adjusting diversion design elements such as triggers, peak flows, volumes, and nutrient loads over the first years of operation to minimize impacts. These adjustments could minimize impacts to dolphins, oysters, brown shrimp, and other aquatic organisms. Some commenters suggested limits be imposed by USACE, others suggested an operating plan that is tied to specifics, while others emphasized flexibility tied to real-world experiences. CPRA should also consider alternative methods of operating the proposed MBSD Project, such as operating the diversion during winter when water levels in the basin are lower and can accept high volumes of water from the diversion.**

**Response ID: 15999**

The proposed MBSD Operations Plan can be found in Appendix F2 Preliminary Operations Plan of the Final EIS. As stated in the Chapter 4, Section 4.4.4.2.4 Sediment Transport in Chapter 4 Surface Water and Coastal Processes, sediment transported by the Mississippi River is primarily comprised of fine sediments, with higher river flows (typically occurring in the spring) suspending more coarse-grained sediment that are important in delta building (see Chapter 3, Section 3.4 Surface Water and Coastal Processes). Fine-sediment transport through the diversion would be generally proportional to water flow in the river. The intake channel was modeled and designed to divert a high sediment-to-water ratio while minimizing energy loss (to maintain flow and sediment transport through the diversion complex) and impacts on the river. The amount of sediment carried through the diversion would vary by year, depending on flow rates in the river and the corresponding variation of diversion operations. As explained in Chapter 2, Section 2.8.1.3 Project Operations in Action Alternatives Carried Forward for Detailed Analysis, the Mississippi River discharge of 450,000 cfs would be the standard operations “trigger to open the diversion for flow (above the base flow)”. Operations (with the exception of a base flow up to 5,000 cfs) would cease when the river discharge falls below 450,000 cfs or when certain emergency triggers are met (such as in advance of hurricanes or when a spill of hazardous substances occur in the river). When the Mississippi River flows exceed 450,000 cfs, the gates would be fully opened (above base flow). At river flows of 450,000 cfs, the diversion flow would be approximately 25,000 cfs, and flows would increase proportionally as the river flow increases. This ramp would continue up to maximum diversion capacity flow of 75,000 cfs when the river reaches a flow of 1,000,000 cfs.

An alternative related to operational triggers specific to sediment concentration was considered but determined not to be technically feasible or reasonable because data and technology do not currently exist to support this operational regime (refer to the Eliminated Alternatives Matrix in Appendix D2 of the EIS). According to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS, as part of the adaptive management and monitoring process, CPRA would consider potential ways to optimize diversion operations based on Project performance and success and would assess potential operational changes that may minimize impacts to basin resources where practicable after sufficient operational data become available for analysis.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section

10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61933**

**Commenters expressed concern that the MBSD Project is going to cause a lot of problems for the community of Ironton and the neighboring communities. There is an alarming lack of detail and lack of analysis about how the MBSD Project would affect Ironton. Some specific concerns regarding Ironton include whether the MBSD Project would result in impacts on air quality, noise, traffic, emergency services, flood risks, and community cohesion.**

**Response ID: 16286**

The Draft EIS Chapter 4, Sections 4.7 Air Quality, 4.8 Noise; 4.13 Socioeconomics; 4.15 Environmental Justice; and 4.22 Land-Based Transportation identified potential air quality, noise, transportation, and flooding impacts specifically concerning the community of Ironton. In addition, Chapter 2 of Appendix H1 (Socioeconomics Technical Report) provides contextual information about the community. Section 4.15 Environmental Justice, has been revised to highlight information about potential impacts on the community of Ironton in the Final EIS. Also, in the Final EIS, Section 4.15.5.1 Environmental Justice has been added to provide a summary of impacts on the majority-Black community of Ironton, which is the closest community to the diversion, to assist understanding the projected impacts of the proposed Project on that community.

CPRA has engaged in public outreach meetings with the communities that would be impacted by the MBSD to solicit input on mitigation strategies, including reaching out to local non-profits to assist with and facilitate meetings with the communities projected to be impacted.

Outreach efforts to better understand community concerns regarding impacts, including cultural impacts, and mitigation and stewardship measures are discussed in Chapter 7 of the Final EIS. Refer to the Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement.

---

Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61940**

**Commenters found it unclear whether the Draft EIS discussion of impacted fishermen, including low-income and persons of color, is limited to those living in the Barataria Basin. For example, there may be Vietnamese fishermen or other fishers who reside outside the Barataria Basin but travel to the Barataria Basin to fish. Clearly these fishermen would be impacted by the Project. The State must clarify the inclusion of fishermen residing within and outside the Project boundary in both its impacts analysis and its discussion of potential mitigation for impacts to fisheries.**

**Response ID: 16299**

Fishermen who travel to Barataria Basin to fish for species that would be adversely affected, particularly shrimp and oysters, could also be adversely affected by the proposed Project. Chapter 4, Section 4.14.4 Operational Impacts in Commercial Fisheries of the Final EIS has been revised to acknowledge this.

The Mitigation and Stewardship Plan (Appendix R1 to the EIS) provides a suite of mitigation and stewardship measures applicable to fishers that may be impacted by the Project. Those measures would be available to any impacted fisher who relies on fisheries in the Barataria Basin, regardless of whether or not they reside in the basin.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures

---

are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62264**

**The commenter expressed concern that the Draft EIS understates the proposed Project's potential impacts on nitrogen and phosphorus in the Barataria Basin and requested that the Final EIS explain how nitrogen (N) to Phosphorus (P) ratios (N:P) indicate the health of waters. While a portion of LDEQ's narrative nutrient criteria calls for the maintenance of natural N:P ratios, this does not account for the fact that while ratios might remain relatively constant, the loading of N and P would certainly increase, likely resulting in increased algal growth (and potentially toxic algae blooms and hypoxic areas). The Draft EIS only refers to half of LDEQ's narrative nutrient criteria, leaving out the half stating that nutrient concentrations that produce aquatic growth that it creates a public nuisance or interferes with designated water uses shall not be added to any surface waters. (L.A.C 33:IX.1113.B.8). The commenter further explained that this portion of the criteria is arguably the most important, as it refers to actual impacts of nitrogen and phosphorus pollution. The commenter stated that the Draft EIS also fails to consider USEPA or other proposed numeric criteria. It is difficult to understand how the authors can make impact determinations when no consideration was given to half of the narrative nutrient criteria and no numeric nitrogen and phosphorus goals are given.**

**Response ID: 16438**

In response to this comment, the USACE has added the full narrative nutrient criteria statement to Chapter 3, Section 3.5.2.4 in Surface Water and Sediment Quality and to Chapter 4, Sections 4.5.5.3 and 4.5.5.4 in the Surface Water and Sediment Quality. As explained in Section 3.5.2.4, "the EPA generated sub-ecoregion reference condition metrics for total nitrogen (0.71 milligrams/liter[mg/L]) and total phosphorus (0.125 mg/L) for the Mississippi River and Barataria Basin concentrations (USEPA 2001). It is important to note that the reference metrics provide a numerical value to compare the Mississippi River and the Barataria Basin nutrient concentrations and are not intended to be used to evaluate waterbody status relative to the current narrative nutrient criterion." The USEPA reference metrics, however, are not enforceable criteria.

Proposed Project impacts associated with nutrient loading and algal blooms are addressed in Section 4.10.4.4 in Aquatic Resources of the Final EIS. A reference to Section 4.10 is included in Section 4.5.5.3 in Surface Water and Sediment Quality of the Draft EIS. A reference to Section 4.10 Aquatic Resources has been added to Section 4.5.5.4 (Phosphorus) of the Final EIS. Clarifying language has been added to Sections 4.5.5.3, 4.5.5.4, and 4.25.5.4 in Cumulative Impacts. Appendix R2 Monitoring and Adaptive Management (MAM) Plan includes proposed monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species), in the Barataria Basin during proposed Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62277**

**Many of the impacts of the proposed Project are more dramatic in the first decade of the proposed Project operations; after 2030, the discussion of benefits and impacts in the Draft EIS is based largely on a few model years. However, those model years do not acknowledge the increasing rainfall and river flooding of the past few years that can be expected to increase due to climate change. For example, it is foreseeable that a flood year like 2019 could become more normal over the next decade.**

**Response ID: 16484**

Climate change has altered rainfall and river flow patterns and may further do so in the future. Uncertainties regarding future conditions were summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in

---

Appendix E (Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties).

Uncertainties regarding climate change were considered and incorporated into the Draft EIS conclusions throughout Chapter 4 Environmental Consequences. No related edits have been made to the Final EIS.

The USACE, together with the members of the LA TIG (including cooperating agencies and CPRA), reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

---

**Concern ID: 62437**

**Commenters expressed concerns about potential increases in carbon dioxide emissions of the reasonably foreseeable industrial facilities that may be constructed and operated in the Project area of the proposed MBSD Project. One commenter requested that the Final EIS include an analysis of the scale of carbon dioxide emissions of reasonably foreseeable petrochemical facilities and their associated infrastructure in the proposed Project area.**

**Response ID: 16465**

The commenters' concerns about the air quality impacts of reasonably foreseeable petrochemical facilities in the Project area were considered in the air quality cumulative impacts analysis (see Section 4.25.7 Cumulative Impacts, Air quality).

Chapter 4, Section 4.25.7 Cumulative Impacts, Air Quality of the EIS addresses the air quality impacts of reasonably foreseeable future petrochemical facilities in the Project area. As noted in Section 4.25.1.1 Cumulative Impacts, air quality would only be negligibly impacted by operation of the MBSD Project action alternatives and therefore none would measurably contribute to cumulative air quality effects. While petrochemical and industrial facilities in the Project area may result in more than negligible individual or cumulative impacts on air quality during their operations, the Project alternatives would not contribute measurable impacts. Further, other petrochemical and industrial facilities in the Project area would be required to comply with applicable regulations and permitting requirements pertaining to air quality. Finally, the Project would result in permanent, indirect, minor, beneficial impacts on carbon sequestration and atmospheric GHG concentrations due to wetland creation and restoration within the Barataria Basin (see Chapter 4, Section 4.7.4.2 in Air Quality of the EIS).

---

**Concern ID: 62469**

**The commenter stated concern that the assessment in the Draft EIS of potential impacts of the reasonably foreseeable project Plaquemines Port Harbor & Terminal District/Plaquemines Liquids Terminal (PPHTD/PLT) on the proposed MBSD Project operations cannot be accurate without including results of the previously conducted assessment of PPHTD/PLT's potential impact on sediment capture of the proposed MBSD Project intake structure.**

**Response ID: 16474**

The Sediment Transport section in Chapter 4, Section 4.25.4.4 Cumulative Impacts in the Draft EIS acknowledged that, based on a sediment transport study conducted by AECOM (2019), the reasonably foreseeable PPHTD/PLT facility may have moderate, adverse,

---

permanent impacts on the sediment transport capability of the proposed MBSD Project. Since publication of the Draft EIS, the Tallgrass/PLT facility's sponsors PPHTD/PLT have withdrawn their Joint Permit application (Louisiana Department of Natural Resources Coastal Use Permit [CUP] number P20180379 and DA Permit number MVN-2012-0123-EPP), and terminated the Memorandum of Understanding (MOU) (originally dated April 24, 2019) between CPRA and PPHTD/PLT pertaining to the facility. A footnote has been added in Section 4.25.1.3.2 Reasonably Foreseeable Future Projects of the Final EIS to reflect the withdrawal of the PLT Project.

---

**Concern ID: 62496**

**The commenters requested that state and federal officials work with residents of Ironton for Project impacts on the St. Rosalie cemeteries. These are sacred sites to the people of Ironton because the graves of their ancestors are buried there. The Final EIS should include a discussion about the fact that the proposed MBSD Project would impact community visitation to these sacred sites at St. Rosalie by creating a large physical separation between the community of Ironton and the St. Rosalie sites.**

**Response ID: 16454**

As indicated in Chapter 4, Section 4.24 Cultural Resources of the Draft EIS, with input from the Section 106 consulting parties, the USACE and LA SHPO have determined that the St. Rosalie Plantation Cemetery (identified as Site 16PL280) and Ironton Cemetery would not be impacted by construction or operation of the proposed MBSD Project. The cemeteries are currently and would continue to be on private property. Residents of Ironton currently have access to the cemeteries via LA 23 and would continue to have access to the St. Rosalie cemeteries via LA 23 during and after the proposed Project is constructed. During the 5-year construction phase of the proposed Project, two-way traffic on LA 23 would be maintained. Northbound traffic would utilize the two existing southbound lanes, maintaining the existing two-lane capacity. Southbound traffic would utilize the shoulder, reducing southbound roadway capacity from two lanes to one. This reduction in capacity may cause delays for southbound traffic over a 1.5-year period during the duration of construction (see the Draft EIS, Chapter 4, Section 4.22.3.1 Construction Impacts).

To clarify potential impacts on Ironton, Section 4.15 Environmental Justice has been revised to highlight information about potential impacts on the community of Ironton in the Final EIS. For a summary of public outreach efforts related to the EIS refer to Chapter 7 of the Final EIS and for restoration planning see Section 1.8 of the LA TIG's Draft Restoration Plan.

CPRA held a public meeting in the community of Ironton. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. A summary of these public engagement meetings can be found in Chapter 7 of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures

---

contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a Section 10/404 permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62499**

**Several Indigenous Peoples of the State of Louisiana are already experiencing losses of important cultural sites and historic territories due to erosion. They should have been consulted. The commenter understands there is no legal obligation, but state-recognized Tribal Nations like the United Houma Nation, Pointe Aux Chien Indians, and the Isle de Jean Charles Band of the Biloxi-Chitimacha-Choctaw-Muskogee Creek Indians would be MOST affected by this sediment diversion; so it stands to reason that there is an ethical obligation to invite and collaborate with their council. The fact that the state has recognized many of these Native Nations even if the federal government does not implies an obligation to consult with all Indigenous Peoples in an area that would be impacted by a state-sponsored project.**

**Response ID: 16457**

The USACE acknowledges the commenter's concern about ensuring that all potentially affected Tribal Nations be invited to participate in the Section 106 consultation process. As indicated in Chapter 4, Section 4.24 Cultural Resources of the Draft EIS, cultural resources consultations have been conducted in accordance with Section 106 of the NHPA. Appendix K Cultural Resources Information of the EIS includes the PA negotiated between the Section 106 consulting parties regarding the proposed Project. The PA explains the outreach conducted by the USACE to Tribal communities, identifies the Tribal Nations that decided to participate in the Section 106 Process, and explains that the USACE has and would continue to consult with any interested Tribal Nation who may have not yet requested to consult.

---

**Concern ID: 62503**

**In the future, CPRA and the LA TIG must fully analyze how proposed and future oil and gas infrastructure would impact the Project and must take the position that permits**

---

**that excavate or oil marshes would impact Project success and are, therefore, inconsistent with the Project.**

**Response ID: 15769**

EIS Chapter 4, Section 4.25 Cumulative Impacts provides an analysis of the cumulative impacts of reasonably foreseeable future oil and gas infrastructure, including but not limited to the proposed NOLA Oil Terminal, Gulf Coast Methanol Complex, and Venture Global facility.

---

**Concern ID: 62507**

**Whether or not the CPRA feels compelled to affirmatively act to reduce impacts on BBES dolphins, the LA TIG's trust duties require that the LA TIG do so. LA TIG cannot allow one resource seriously impacted by DWH to be driven to functional extinction by a project intended to restore another resource.**

**Response ID: 15969**

The LA TIG recognizes the significant impacts the proposed Project would have on Barataria Basin bottlenose dolphins, as discussed in detail in both the EIS and the LA TIG's Restoration Plan. The DWH oil spill resulted in the oiling of more than 1,100 kilometers of wetlands, nearly all of which were located in coastal Louisiana (DWH NRDA Trustees 2016). The heaviest oiling occurred in the Barataria Basin, resulting in substantial injuries to natural resources in the basin (DWH NRDA Trustees 2016). Recognizing that the resulting loss of marsh productivity affected resources throughout the northern Gulf of Mexico ecosystem, the State of Louisiana and the federal Trustees that negotiated the DWH Natural Resource Damages settlement allocated \$4 billion, almost half of the total settlement amount, to restoring Louisiana's wetland, coastal, and nearshore habitats.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources injured by the spill. See the Executive Summary and Section 3.2.1.5 of the Final Restoration Plan. The intended restoration of fresh water flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows.

However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 of the Final Restoration Plan for a discussion of how LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 of the Final Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of

productivity also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project because they believe it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Consistent with the purposes of the proposed Project, the State of Louisiana has the duty, per the Budget Act, to minimize impacts on BBES dolphins. The MAM Plan (Appendix R2 to the Final EIS), the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), and Marine Mammal Intervention Plan (Appendix R5 to the Final EIS) include additional detail regarding the implementation of monitoring, stewardship, and adaptive management measures that would help mitigate potential impacts to bottlenose dolphins.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62508**

**The CPRA and LA TIG must revise their analysis of impacts on BBES dolphins in light of Marine Mammal Commission Study, and have incorrectly interpreted BBA18**

---

**language as exempting them from the need to take affirmative action to reduce impacts to marine mammals.****Response ID: 15970**

The Final EIS includes an analysis of the impacts of the proposed Project on marine mammals, including bottlenose dolphins, in Chapter 4, Section 4.11 Marine Mammals. This includes the incorporation of Booth & Thomas (2021); Garrison et al. (2020); Schwacke et al. (2017) and additional analyses that were completed by Thomas et al. (2021) after the Draft EIS was released for public comment. The BBES dolphin impact conclusion in the Draft EIS was based in large part on Garrison et al. (2020), which predicted that only a “remnant population” of dolphins would continue to exist in Barataria Basin after diversion operations commenced. Thomas et al. (2021), a new study that built on this previous research, found more specifically that an “immediate and severe population-level decline” of 23 percent (95 percent CI 3 to 55 percent) would occur in the first year of operations. Their findings are consistent with the EIS determination of major, permanent adverse impacts to bottlenose dolphins. After the planned 50 years of operation, dolphins in three out of the four strata are predicted to be functionally extinct under the Applicant’s Preferred Alternative, with the remaining Island stratum being severely reduced relative to the No Action Alternative (median predicted population size of Island stratum is 85 percent lower [95 percent CI 28-99] under the Applicant’s Preferred Alternative than under the No Action Alternative). Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the Applicant’s Preferred Alternative is 143 dolphins (95 percent CI 11-706) compared to 3363 (95 percent CI 2831-4289) under the No Action Alternative. In other words, the stock is predicted to be 96 percent smaller (95 percent CI 80-100) under the Applicant’s Preferred Alternative than the No Action Alternative.

CPRA states that it is aware of its responsibility to minimize impacts on marine mammal species and population stocks, to the extent practicable and consistent with the purposes of the proposed Project per Section 20201(b) of the Bipartisan Budget Act of 2018. In recognition of the potential for collateral injuries from the proposed Project and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA would implement a suite of stewardship measures. See Section 3.2.1.1.5 of the LA TIG’s Final Restoration Plan and Appendix R to the Final EIS. The LA TIG is also committed to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures

---

are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62662**

**The proposed Project is likely to succeed because other diversions have also built land and restored ecosystems. Specific examples of land-building projects include the Caernarvon Freshwater Diversion, Davis Pond, West Bay, Fort St. Phillip, the Jaws, Wax Lake, and Mardi Gras Pass. Many of the benefits of the Project, in terms of soil creation and microbial processes, are not captured in the engineering of the modeling. Many of the fine sediments transported by the diversion cannot be dredged but are critical soil components.**

**Response ID: 16635**

The benefits to land building of fine sediments transported by the diversion were addressed in the Draft EIS in Chapter 4, Section 4.2.3.2 Operational Impacts in 4.2.3 Geology, Topography, and Geomorphology. The Delft3D modeling conducted for the EIS distinguishes the types of sediment (sands and fine sediments) that would be deposited in the basin. Table 5.2-1 in EIS Appendix E Delft3D Modeling lists the sediment classes included in the model. As described in EIS Chapter 4, Section 4.4.4 Hydrology and Hydrodynamics, sand and fine sediments would contribute to land building in the basin in two ways - by being resuspended and transported elsewhere for deposition and by forming a base layer upon which future pulses of sediment could form marsh or land. The model's physics-based computations showed that the coarser sands would settle out before the finer sediment. As the sediment builds up, discharge velocities would increase over the previously deposited sediment and resuspend it, pushing it farther into the basin. Thus, the model reproduces the natural process of delta building in which successive waves of sediment push farther out, either forming land/marsh or creating a base upon which land/marsh can be formed without moving it by dredging and placement. In addition, Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology of the EIS discusses the geomorphic impacts of diversion operations, including the Wax Lake Outlet, the Caernarvon Freshwater Diversion, the Davis Pond Freshwater Diversion, the Bohemia Spillway, and Bonnet Carré Spillway, and Mardi Gras Pass.

The likelihood of the Project's success and its potential benefits were considered in the LA TIG's Draft Restoration Plan. As part of evaluating the Project and alternatives, the LA TIG

---

considered the likelihood that the Project would succeed and achieve the LA TIG's goals. Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the LA TIG's Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, these sections note that the knowledge gained through the projects noted by the commenters has been applied in designing the Project and evaluating whether and how the Project would restore and sustain critical marshlands. A full description of the range of benefits that would be provided by the Project is also included in Section 3.2.1.6 Benefits Multiple Resources of the Restoration Plan.

---

**Concern ID: 62863**

**Combining the LA TIG Restoration Plan review with the Draft EIS, Mitigation and Stewardship Plan and MAM Plan review has created confusion. For example, having two versions of the Mitigation and Stewardship Plan and MAM Plan with different appendix numbers makes it difficult to cite the appropriate documents.**

**Response ID: 16672**

Commenters' concern that the combined public review for the USACE Draft EIS and the LA TIG Restoration Plan may have caused confusion for some readers is noted.

The LA TIG wanted to ensure that the Restoration Plan contained all information relevant to Trustee decision making and thus included two documents in the LA TIG's Restoration Plan that were also appended to the EIS. All comments on the Monitoring and Adaptive Management (MAM) Plan and Mitigation and Stewardship Plan have been reviewed by both USACE and the LA TIG and have been responded to, whether commenters referred to Appendices in the Draft EIS or Draft Restoration Plan.

---

**Concern ID: 62864**

**There is significant confusion about funds available for mitigation versus monitoring and adaptive management. The EIS should clarify how much funding will be available for each.**

**Response ID: 16673**

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA

had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62874**

**CPRA should monitor sediment flow through the diversion annually, particularly in the first, more critical decade of operation. This will help determine whether the goals of the Project can be achieved with more efficient use of water flow in following years.**

**Response ID: 16681**

The sediment monitoring issues raised by the commenter were considered in Table 4.1-1 of the Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS); therefore, no changes were made to the Final EIS on sediment monitoring. This included monitoring the sediment-to-water ratio in the flows conveyed into Barataria Basin as well as the sediment volume conveyed into Barataria Basin. As noted in the MAM Plan, these parameters would be monitored each year for the life of the Project, including the first decade of Project operation. The sediment-to-water ratio would be evaluated biweekly during operational events and quarterly during base flows. For more information, refer to of the MAM Plan (Appendix R2 to the EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the

---

Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62875**

**CPRA should ensure systematic monitoring of algal blooms and their impacts in the basin, both before and after Project operation.**

**Response ID: 16682**

Sections 3.7.3.9-3.7.3.11 (Chlorophyll A, Phytoplankton Species Composition [including Harmful Cyanobacterial/Algal Bloom Species], and Harmful Cyanobacterial/Algal Bloom Toxins, respectively) in the Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS) have been revised. Proposed monitoring includes both pre-construction and post-construction monitoring for the potential development of phytoplankton blooms raised by the commenter. Chlorophyll A would be monitored hourly at in situ gages and daily through remote sensing. Additionally, all three parameters will be monitored monthly, with additional discrete sampling events dependent on observations, systematically using in situ sondes and/or remote sensing, with results determining when phytoplankton sampling would occur and, in turn, when sampling for harmful algal bloom toxins should occur.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

---

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62921**

**Commenters suggested that the State of Louisiana must comply with the MMPA waiver and minimize impacts to marine mammal population stocks in ways that are practicable and consistent with the purposes of the Project. This includes considering alternative actions and modifications to Project operations to reduce or mitigate impacts to BBES dolphins while still meeting the Project purpose. The Mitigation Plan incorrectly suggests that actions to reduce impacts to dolphins is not necessary because it would negatively impact Project performance. The Trustees should research all possible mitigation actions to reduce impacts to BBES and invest in the restoration projects that effectively reduce this impact. These may include alternative construction designs or operational strategies, such as reduced diversion flow or salinity thresholds, that would reduce impacts to bottlenose dolphins.**

**Response ID: 16703**

CPRA prepared a Mitigation and Stewardship Plan and a Monitoring and Adaptive Management (MAM) Plan. Chapter 3, Section 3.11.1 Marine Mammals in the Northern Gulf of Mexico of the Final EIS has been revised to discuss the Marine Mammal Protection Act waiver that was issued for the proposed Project.

There is no requirement in the Bipartisan Budget Act that CPRA evaluate alternatives other than the Project. The Bipartisan Budget Act of 2018, Section 20201 requires the State of Louisiana, in consultation with the Secretary of Commerce (delegated to NMFS), to the extent practicable and consistent with the purposes of the proposed Project to minimize impacts on marine mammal species and population stocks, and monitor and evaluate the impacts of the proposed Project on such species and population stocks.

CPRA's updated MAM Plan (Appendix R2 of the Final EIS) includes measures and frameworks for minimizing and monitoring impacts of the proposed Project on marine mammals. In addition, the LA TIG has developed a Marine Mammal Intervention Plan. As described in the Federal Register notice announcing issuance of the MMPA waiver, the State's consultation with NMFS will be ongoing to appropriately address the evolving Project planning and design for the construction, operation, and maintenance phases. This ongoing consultation is described in the MAM Plan as well as the Marine Mammal Intervention Plan (see below and Appendices R2 and R5 to the Final EIS for more details).

As described in the Draft EIS, the MAM Plan identifies potential ways in which the LA TIG may reduce impacts to dolphins. The MAM Plan in the Final EIS has been updated to provide more detail about the strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols. However, the

---

adaptive management strategies and actions are largely reliant upon data that would be collected during either the pre-construction monitoring period or once operations commence. Once operational data are available, they would be used to evaluate the potential Project modifications to further minimize impacts to marine mammals. There are limited minimization measures available that would reduce impacts on marine mammals and those limited measures would likely only benefit dolphins residing the furthest from the diversion structure (for example, the Island strata).

However, the LA TIG recognizes that despite these operational strategies, dolphins within Barataria Bay would likely experience significant impacts, as described in the EIS, given the purposes of the proposed Project. In response, the LA TIG has developed a Marine Mammal Intervention Plan that outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia (see Appendix R5 to the Final EIS).

While the more severe actions such as euthanasia may not offset the ultimate outcome of mortality, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, the Mitigation and Stewardship Plan and MAM Plan include actions that would occur prior to operations to improve understanding of the BBES dolphins as well as improvement of stocks across the state (see Appendices R1 and R2 to the Final EIS).

In arriving at the mitigation and stewardship actions included in the Mitigation and Stewardship Plan, the LA TIG worked with experts within NOAA with expertise on marine mammals to ensure the consideration of all potential mitigation actions. In terms of operational strategies to reduce marine mammal impacts, as noted above, those strategies cannot be further defined at this time as they are largely reliant upon data that would be collected during the pre-construction monitoring period or once operations commence. One goal of the proposed Project is to deliver sediment, fresh water, and nutrients into the basin and the design of all of the action alternatives would accomplish that goal. Alternative diversion designs that accomplish that goal on the desired scale would not address dolphin impacts, as those impacts are largely related to salinity changes, which are driven by the transmission of fresh water into the basin.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions,

would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62923**

**Commenter suggests monitoring of dolphin pods after any future large oil spill be required and that polluters be held liable as responsible parties under the Oil Pollution Act.**

**Response ID: 16542**

The LA TIG's investments in monitoring and adaptive management and stewardship of key resources through the proposed Project and other recent and future efforts by the Deepwater Horizon Natural Resource Trustees have and will continue to enhance the robust marine mammal response network across the Gulf of Mexico. The Mitigation and Stewardship and Monitoring and Adaptive Management (MAM) Plans (see Appendices R1 and R2 to the Final EIS) include additional dedicated monitoring and response efforts in the Barataria Basin and across Louisiana. These resources will enhance the ability of Trustee agencies to respond to all threats to marine mammals and facilitate data collection in response to future spills. Under OPA, the LA TIG is tasked with holding responsible parties accountable for the damages to natural resources injured through discharges and threats of discharge.

---

**Concern ID: 62926**

**Funding for a stranding program and UME response could be helpful for dolphins but will not help BBES dolphins.**

**Response ID: 16544**

Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock of the EIS and Section 3.2.1.5 (Avoids Collateral Injury) of the LA TIG's Restoration Plan acknowledge that a large number of dolphins would become ill and strand or die in Barataria Bay as a result of the Project. Funding for the stranding program and elevated stranding response for the Barataria Basin dolphins has been developed in recognition of the anticipated effects of the Project; those efforts would provide valuable data to inform adaptive management actions that CPRA could consider to further minimize adverse impacts on BBES dolphins while meeting Project goals. These investments are necessary to effectively implement the Marine Mammal Intervention Plan developed by the LA TIG and included in the Final EIS and Final Restoration Plan (see Appendix R5 to the EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions such as euthanasia may not offset the ultimate outcome of mortality, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

As described in the Draft EIS, the Monitoring and Adaptive Management (MAM) Plan identifies potential ways in which the LA TIG may reduce impacts to dolphins. The MAM Plan in the Final EIS has been updated to provide more detail about the strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols. However, the adaptive management strategies and actions are largely reliant upon data that would be collected during either the pre-construction monitoring period or once operations commence. Once operational data are available, they would be used to evaluate the potential Project modifications to further minimize impacts to marine mammals.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62929**

**Commenters suggested that the Project should consider moving the Menhaden Fishery to reduce interactions with BBES dolphins.**

**Response ID: 16545**

The location of the Menhaden fishery is outside of the authority of the USACE or LA TIG. The LA TIG suggests that existing fishery task forces within the State of Louisiana, including the Joint Fisheries Task Force Working Group within the Louisiana Department of Wildlife and Fisheries and the Finfish Task Force would be an appropriate forum to suggest the re-

---

examination of laws and policies related to the menhaden fishery, given the many factors involved in decision making around that fishery.

---

**Concern ID: 62933**

**Commenter suggests monitoring of dolphin pods after any future large oil spill be required and that polluters be held liable as responsible parties under the Oil Pollution Act.**

**Response ID: 16548**

The suggested actions are not within USACE's authorities.

The LA TIG's investments in monitoring and adaptive management and stewardship of key resources through the proposed Project and other recent and future efforts by the Deepwater Horizon Natural Resource Trustees have and will continue to enhance the robust marine mammal response network across the Gulf of Mexico. The Mitigation and Stewardship and Monitoring and Adaptive Management (MAM) Plans (see Appendices R1 and R2 to the Final EIS) include additional dedicated monitoring and response efforts in the Barataria Basin and across Louisiana. These resources will enhance the ability of Trustee agencies to respond to all threats to marine mammals and facilitate data collection in response to future spills. Under OPA, the LA TIG is tasked with holding responsible parties accountable for the damages to natural resources injured through discharges and threats of discharge.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 62938**

**CPRA should work with residents of Ironton and Tribes to protect cultural resources and maintain access to cultural sites, including those separated from Ironton by the diversion channel. Commenters suggest that the Project mitigate for any loss of access to cultural sites, using the Lagniappe for the Working Coast project as an example.**

**Response ID: 16655**

As indicated in Chapter 4, Section 4.24 (Cultural Resources) of the EIS, cultural resources consultations have been conducted in accordance with Section 106 of the National Historic Preservation Act (NHPA). The Section 106 Consulting Parties are comprised of the USACE (the lead federal agency), the State Historic Preservation Office, the Advisory Council on Historic Preservation, CPRA (the Applicant), federal agency members of the LA TIG, and federally recognized Tribal Nations who expressed historic ties to the Barataria Basin and who choose to participate. This consultation resulted in the development of a Programmatic Agreement that is included in Appendix K Cultural Resources Information of the EIS. The Alternative Mitigation Plan (see the Programmatic Agreement and its attachments in Appendix K), was developed to mitigate for the Project's adverse effects on historic properties in the Barataria Basin caused by the proposed Project. The Programmatic Agreement identifies the Tribal Nations that decided to participate in the consultation, and explains that the USACE would continue to consult with any interested federally recognized Tribal Nation who has not yet requested to consult.

As indicated in Chapter 4, Section 4.24.2.2 of the Cultural Resources section of the Draft EIS, the NHPA Section 106 Consulting Parties have developed Stipulations in the Programmatic Agreement that contain prescriptive steps and potential mitigation measures should any portions of the known historic properties (that is, archeological remains of St. Rosalie Plantation) within the Construction APE be identified as NRHP eligible by ongoing Phase II analysis. This section has been updated in the Final EIS to clarify that neither the St. Rosalie Cemetery, the Ironton Cemetery or visitation access to them would be impacted by construction or operation of the proposed MBSD Project. The cemeteries are currently and would continue to be on private property. Residents of Ironton currently have access to the St. Rosalie and Ironton cemeteries via LA 23 and would continue to have access to the cemeteries via LA 23 after the proposed Project is constructed. To clarify potential impacts on Ironton, Section 4.15 Environmental Justice has been revised to highlight information about potential impacts on the community of Ironton in the Final EIS.

Lagniappe for the Working Coast is a grant awarded by the National Estuary Program to a partnership between the Lowlander Center and state-recognized Tribes to mitigate erosion to areas, including archaeological sites, sacred to Louisiana's coastal Tribes through the backfilling of unused or abandoned canals excavated in coastal marshes. More information on National Estuary Program grants is available at <https://estuaries.org/initiatives/watershedgrants/>.

**Concern ID: 62943**

**The EIS should address mitigation measures for threatened, endangered (T&E) and special status species and their habitat, including adding a section to the Mitigation Plan that specifies the measures that will be taken to minimize impacts to T&E species.**

**Response ID: 16610**

Impacts to Threatened and Endangered Species (T&E species) were addressed in Chapter 4, Section 4.12 (Threatened and Endangered Species) of the Draft EIS. Those impacts are also subject to the ongoing consultation with the U.S. Fish & Wildlife Service and the National Marine Fisheries Service (collectively, the “Services”) under the Endangered Species Act (ESA). Appendix O of the EIS contains a Biological Assessment (BA) for T&E species. This BA discusses impacts to T&E species, as well as measures that would be taken to minimize impacts to T&E species.

For the species that the Project is “likely to adversely affect” (for example, pallid sturgeon), a request, along with the BA, was sent to the Services to initiate formal consultation regarding those species. The formal consultation resulted in Biological Opinions (BO) for those T&E species that includes specific measures to minimize the amount of take for the specified T&E species.

The USFWS BO on the proposed Project (included as Appendix O3 of the Final EIS) concludes the proposed Project would not be likely to jeopardize the continued existence of the pallid sturgeon and authorized the loss (by death or serious injury) of 48 pallid sturgeon per year. Section 5.2 of the USFWS’ BO requires that the diversion gate be opened or closed over a several hour period to allow fish sufficient time to migrate back to the river or away from the structure, that CPRA and the USACE coordinate with the USFWS to develop a Fish Monitoring and Removal Plan for pallid sturgeon, and conduct any cutterhead or suction dredging in the Mississippi River (if determined to be warranted at a later date) using operational parameters coordinated with the USFWS.

The NMFS’ BO on the proposed Project (included in the Final EIS as Appendix O4) concludes the proposed Project is not likely to jeopardize the continued existence of sea turtles and authorizes the incidental take of 783 sea turtles per year, including 370 Kemp’s ridley sea turtles (including up to 38 mortalities), 319 loggerhead sea turtles (including up to 10 mortalities), and 94 green sea turtles (including up to 9 mortalities). Section 8.3 of the NMFS’ BO requires that the federal action agencies ensure that the Project proponent monitor brown shrimp fishing effort in the action area; fund, implement, and annually report on a salinity monitoring program in Barataria Bay; and funds and implements a monitoring plan targeting the distribution, health, and habitat use of sea turtles in the Barataria Basin.

ESA consultation seeks to minimize impacts to T&E species. CPRA has updated its Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include a reference to Appendix O for T&E species. For State-listed and/or Special Status Species, potential impacts are identified in Chapter 4, Section 4.12.3 State-listed Threatened and Endangered Species of the Final EIS and conservation measures are discussed in the FWCAR (see Appendix T to the Final EIS).

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates,**

**and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the

landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62953**

**Many or most of the ongoing environmental harms to the Barataria Basin are not mentioned in the Draft EIS. Pipelines and wells present a significant present risk to the natural resources of Barataria Basin. Ongoing releases do indeed impact the health of the natural resources of the Barataria Basin, including marine mammals, fisheries, and endangered species. The Draft EIS discusses these releases in the context of its discussion of the potential impact of the continuing releases on the affected environment or in terms of their potential impact on the proposed MBSD Project.**

**Response ID: 15930**

The issues raised by the commenters were considered in the Draft EIS; therefore, no related edits have been made to the Final EIS. The EIS notes in Chapter 3, Sections 3.2 Geology and Soils and 3.23 Hazardous, Toxic, and Radioactive Waste and Chapter 4, Sections 4.2 and 4.23, the existing presence of oil and gas pipelines and wells within the Project area. The EIS determined that increased water flow and sedimentation due to operation of the proposed Project could potentially create exposure to existing contaminated sites and inadvertent releases of contaminants resulting in minor to major, short to long term, adverse impacts over time. However, as noted in Section 4.2 Geology and Soils, burial of pipelines due to sedimentation from the proposed Project may be beneficial in that it would reduce the exposure of these pipelines to wave energy or collision damage and resulting risk of petroleum spills.

---

**Concern ID: 62961**

**Project mitigation must adequately compensate impacts on the oyster industry, including financial compensation for economic losses. Commenters provided suggestions for mitigation such as compensating for increased costs of travel, providing direct financial payments to lease holders whose areas become unproductive, supporting new oyster leases or lease swaps, investing in research and development, using devices to move oysters to higher-salinity water, providing loans to oystermen to develop alternative income streams, providing support for elderly fisherfolk and buying out boats and businesses.**

**Response ID: 16532**

The Draft EIS evaluates how the Project would impact commercial, recreational, and subsistence fishers as compared to No Action conditions in Chapter 4, Sections 4.10 (Aquatic Resources), 4.14 (Commercial Fisheries), 4.15 (Environmental Justice) and 4.16 (Recreation and Tourism).

In response to public comments and resource agency input about the proposed mitigation efforts, CPRA has expanded and refined the oyster mitigation and stewardship measures. CPRA's mitigation and stewardship strategies and associated expenditures would focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to oyster fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for oysters in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to oyster fisheries in the early years of the Project's operational life. The revised mitigation and stewardship measures include allocating \$4 million to establish new public seed grounds, \$15 million to enhance public and private oyster grounds, \$4 million to enhance broodstock reefs and \$8 million for alternative oyster culture.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63063**

**Barataria Basin is host to thousands of miles of unused oil canals, whose neglect has altered local hydrology to the detriment of marshes within 2 kilometers of the "spoil banks" constructed of the cast aside materials from canal excavation. The Draft EIS did not consider these hydrologic alterations as significant. However, in the**

**commenter's experience, the cumulative impact of small canal projects can be significant.**

**Response ID: 16069**

The influence of canals and spoil banks on wetland losses in Barataria Basin can be found in Chapter 3, Section 3.6.2.2 in Wetland Resources and Waters of the U.S. in the EIS; however, Chapter 3, Section 3.6.2.2.4 Canals and Spoil Banks in the Final EIS has been updated to include additional technical references regarding the influence of canals on the existing environment in the Barataria Basin.

---

**Concern ID: 63069**

**The Draft EIS did not include detailed information about the potential impacts of the proposed Project on bottlenose dolphins.**

**Response ID: 16592**

The Draft EIS included an analysis of the impacts to marine mammals, including bottlenose dolphins, in Chapter 4, Section 4.11 (Marine Mammals). The EIS quantifies the impact on dolphin survival rates (the percentage of existing dolphins that would survive from one year to the next year) for different populations of dolphins (Table 4.11-5) from the most pronounced stressor, salinity, but also includes a qualitative assessment on other impacts such as wetland shifts, prey species impacts, HABs, water temperature, and other impacts. The Final EIS includes the incorporation of additional population impact analysis that was completed by Thomas et al. (2021) after the Draft EIS was released for public comment.

---

**Concern ID: 63070**

**A recent study suggests that the proposed Project would not only prevent the recovery of the BBES Stock, but it would result in the functional extinction of dolphins in the West, Central, and Southeast strata of the stock area (Thomas et al., 2021). The only dolphins remaining in the basin would live adjacent to the barrier islands, and even this group would become severely reduced over the 50-year planning horizon of the proposed Project. Additionally, an expert elicitation (Booth and Thomas, 2021) building on previous studies (Garrison et al., 2020; Schwacke et al., 2017; Thomas et al., 2021) suggests that while dolphins can endure some periods of exposure to low salinity, the period of tolerable exposure shortens for dolphins exposed to acute changes in salinity, and the median time to death is 22 days with continuous exposure to water with salinity levels below 5 ppt.**

**Booth, C., and L. Thomas. 2021. An expert elicitation of the effects of low-salinity water exposure on bottlenose dolphins. *Oceans* 2(1):179-192.**

**Garrison, L.P, J. Litz, and C. Sinclair. 2020. Predicting the effects of low salinity associated with the Mid-Barataria Sediment Diversion Project on resident common bottlenose dolphins (*Tursiops truncatus*) in Barataria Bay, Louisiana. NOAA Technical Memorandum NOAA NMFS- SEFSC-748. 97 pages.**

**Schwacke, L.H., L. Thomas, R.S. Wells, W.E. McFee, A.A. Hohn, K.D. Mullin, E.S. Zolman, B.M. Quigley, T.K. Rowles, and J.H. Schwacke. 2017. Quantifying injury to common bottlenose dolphins from the Deepwater Horizon oil spill using an age-, sex- and class-structured population model. *Endangered Species Research* 33:265-279.**

**Thomas, L., Marques, T., Booth, C., Takeshita, R., and L. Schwacke. 2021. Predicted population consequences of low salinity associated with the proposed Mid-Barataria Sediment Diversion Project on bottlenose dolphins in the Barataria Bay Estuarine System Stock.**

**Response ID: 16593**

The Draft EIS included an analysis of the impacts to marine mammals, including BBES dolphins in Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock. This analysis incorporated the Booth and Thomas (2021), Garrison et al. (2020), and Schwacke et al. (2017) studies, and the Final EIS includes additional analyses that were completed by Thomas et al. (2021) after the Draft EIS was released for public comment. The impact conclusions in the Draft EIS were based in large part on Garrison et al. (2020), which predicts that only a remnant population of dolphins would continue to exist in Barataria Basin after diversion operations commenced. The conclusion of major, permanent, adverse impact to bottlenose dolphins is also supported by Thomas et al. (2021), which built on these earlier studies and concludes that, after 1 year of operation of the Applicant's Preferred Alternative, there would be 61 percent fewer dolphins in the Central stratum than under the No Action Alternative, 35 percent fewer in the West stratum, 12 percent fewer in the Southeast stratum, and 2 percent fewer in the Island stratum, with 25 percent fewer overall. Thomas, et al. further concluded that after 10 years of operation, there would be 100 percent reduction in the populations of dolphins in the Central and West strata, an 82 percent reduction in the population of the Southeast stratum dolphins, and a 34 percent reduction in the population of the Island stratum dolphins as compared against the No Action Alternative, with an overall difference in population of 78 percent. (Note that Thomas, et al. 2022 slightly refined some of these projections.) After 50 years of operation, in three out of the four strata, dolphins are predicted to be functionally extinct (defined as less than or equal to dolphin in Thomas, et al. 2022) under the Applicant's Preferred Alternative, with the remaining Island stratum being 85 percent lower [95 percent CI -28 -- -99] under the Applicant's Preferred Alternative than under the No Action Alternative. Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the Applicant's Preferred Alternative is projected to be 143 dolphins (95 percent CI 11-706) compared to a predicted 3,363 dolphins (95 percent CI 2,831-4,289) predicted to inhabit the Barataria Bay under the No Action Alternative. In other words, the BBES dolphin stock is projected to be 96 percent smaller (95 percent CI -80 -- -100) under the Applicant's Preferred Alternative than then No Action Alternative. Chapter 4, Section 4.11 Marine Mammals of the Final EIS has been updated to reflect the results of Thomas et al. (2021).

Booth and Thomas (2021) evaluated multiple scenarios with different salinity changes, and in one of those scenarios' where bottlenose dolphins experience a change in salinity within 0 to 5 days from typical salinity environment (that is, mean 15 to 25 ppt) down to an atypical environment with salinity below 5 ppt for an extended period, the median time to death would be 22 days.

---

**Concern ID: 63091**

**The proposed mitigation to provide access points farther down the basin will not adequately address the impacts to subsistence fishers (for example, increased costs of fuel or additional wear and tear on vessels associated with the additional travel). CPRA should use community expertise to co-design community-specific adaptation**

programs to ensure that disparately impacted communities are able to effectively respond to Project near-term and long-term impacts.

**Response ID: 16514**

CPRA is including funding for additional access points within the basin as part of its Mitigation and Stewardship Plan (Appendix R1 to the EIS). As part of developing and evaluating this measure, CPRA engaged the subsistence fishing community potentially impacted by the Project through public meetings and utilized community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS.

Locations for the additional access points have not yet been selected, and CPRA would work with impacted subsistence fishers to ensure those access points are placed in appropriate locations. In addition, fishers would have access to other fisheries mitigation and stewardship measures, such as gear improvements and retraining, aimed at assisting them to adapt to changing conditions. See Sections 6.3.3 (Aquatic/Fisheries Impacts) and 6.3.8 (Environmental Justice) of the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63095**

**CPRA should communicate relevant thresholds and triggers for monitoring to the public on a regular basis.**

**Response ID: 16648**

As explained in the Monitoring and Adaptive Management (MAM) Plan, CPRA would develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. The dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operations.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63096**

**Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).**

**Response ID: 16699**

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship

---

Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the

final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63120**

**The Draft EIS and the LA TIG's Draft Restoration Plan (Section 3.2.1.6.2) should be reconciled with respect to determinations for the saltmarsh topminnow, with the Draft EIS indicating minor to moderate benefits and the Draft Feasibility Report indicating both beneficial and adverse impact.**

**Response ID: 16269**

The Draft EIS Chapter 4, Section 4.12.3.1 in Threatened and Endangered Species and the LA TIG's Draft Restoration Plan (Section 3.2.1.6.2 [Benefits to Water Column Resources]) consistently noted a combination of adverse and beneficial impacts on the saltmarsh topminnow, with an overall minor to moderate benefit anticipated from construction and operation of the proposed Project; therefore, no related edits have been made to the Final EIS or the LA TIG's Final Restoration Plan.

---

**Concern ID: 63127**

**The future without action is a future of increasing oil and gas leaks into the Barataria Basin. The commenters believe that many or most of the ongoing environmental harms to the Barataria Basin are not mentioned in the Draft EIS. The Draft EIS mentioned over 2,600 miles of hazardous liquid pipelines, and over 4,990 "unplugged" (Townsend-Small et al. 2016), inactive wells, 15,979 plugged wells, and 799 active wells. Many of these unplugged, unproductive wells are likely leaking methane into the upper atmosphere.**

**Response ID: 16188**

The EIS acknowledges that oil and gas development has affected the Barataria Basin (see Chapter 3, Section 3.2.3 in Geology and Soils and Section 3.23 Hazardous, Toxic, and Radioactive Waste Assessment of the EIS). In addition, literature provided by the commenter (Townsend-Small et al. 2016), has been reviewed and Chapter 3, Section 3.7.2.1 Climate Change and Greenhouse Gases in the Final EIS has been revised to include a discussion of

sources of GHG emissions in Louisiana, including oil and gas production identified in this reference, as well as other ongoing activities.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

**Concern ID: 63204**

**CPRA and State should work with willing landowners and users on closure of canals to increase proposed Project benefits.**

**Response ID: 16572**

CPRA and other LA TIG Trustees have a long record of implementing a variety of restoration projects, including closures of canals where appropriate and cost-effective for coastal restoration. These projects are consistent with the Coastal Master Plan, and CPRA anticipates that they will continue to be implemented in the future. Canal closures are not a feature of the proposed Project and were not evaluated in the Draft EIS. In response to comments from the community, however, CPRA's Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) evaluated canal closures as a possible mitigation measure and as a result the Final Mitigation and Stewardship Plan includes a funding allocation for canal closures in Grand Bayou.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63205**

**Potential basin impacts are understated; the proposed Project could support proactive efforts to create a cleaner Mississippi River and a cleaner Barataria Basin.**

**Response ID: 16573**

---

In response to comments, a discussion of the Gulf Hypoxia Action Plan has been added to Chapter 4, Section 4.25.5 (Cumulative Impacts - Surface Water and Sediment Quality) of the Final EIS. The Hypoxia Action Plan highlights the important role that sediment diversions can play in reducing nutrient loading into the Gulf of Mexico.

---

**Concern ID: 63206**

**Commenter expressed appreciation for CPRA's indication that it would move away from the USACE's handful of dredging contractors, and recommendations were made to explore expanding other fields of expertise such as engineering or construction firms, as well as focusing on the use of locals to benefit the economy.**

**Response ID: 16574**

The EIS does not address how CPRA would select contractors for the Project if the Project is approved and funded; topics such as contracting are beyond the scope of the NEPA review. CPRA is required to follow, and does follow, the provisions of the Louisiana Public Bid Law, including those contained in Title 39, Chapter 17 (the Louisiana Procurement Code) and in Title 38, Chapter 10 (Public Contracts). CPRA also conducts its procurement in accordance with the provisions governing the Hudson and Veteran's initiatives and the Louisiana First Hiring Act. CPRA has no authority to procure outside of these procurement statutes.

In furtherance of its work and mission, CPRA contracts for a variety of professional services (such as engineering services), consulting services, and construction work, all of which are procured in strict accordance with Louisiana law. As provided by law, CPRA makes all solicitations for work available to the public through the posting of public notices and advertisements for work, which are open to the public for competition.

---

**Concern ID: 63207**

**Water pollution, especially nitrogen and phosphorus, may negatively impact the Project. The Mitigation Plan should 1) Fund LA's Nutrient Management and Reduction Strategy; 2) Fund ground activities upstream to reduce pollution in the river; and 3) identify projects in other states to reduce pollution loading.**

**Response ID: 16575**

The Draft EIS considered the impacts that water pollution within the Mississippi River, including nitrogen and phosphorus, may cause in Chapter 4, Section 4.5.5 Operational Impacts in Surface Water and Sediment Quality. In response to comments, a discussion of the Gulf Hypoxia Action Plan has been added to Chapter 4, Section 4.25.5 Cumulative Impacts - Surface Water and Sediment Quality of the Final EIS. The Hypoxia Action Plan highlights the important role that sediment diversions can play in reducing nutrient loading into the Gulf of Mexico.

While the LA TIG's Final Restoration Plan is focused on wetland creation in Barataria Basin and not upland nutrient removal, Louisiana's Nutrient Reduction and Management Strategy highlights the important role that river diversions could play in reducing nutrient loads. See <https://deq.louisiana.gov/page/nutrient-management-strategy>. As stated in Section 4.25.5.2, the combined impact of several Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

---

While not part of this Project, the LA TIG is funding other restoration efforts on the ground to reduce nutrient pollution in the Mississippi River. Each of the 12 member states in the Gulf of Mexico Watershed Nutrient Task Force (Hypoxia Task Force) have nutrient reduction strategies that identify programs and projects to reduce nutrient loads to the Mississippi River and the Gulf of Mexico. These state strategies can be found at <https://www.epa.gov/ms-hf/hypoxia-task-force-nutrient-reduction-strategies>.

Federal agencies also provide financial and technical support and conduct scientific studies that support improvements in local water quality throughout the Mississippi River Basin and reduce nutrient loads to the Gulf of Mexico. Separate from this Project, other funding is available for nutrient reduction projects in other states.

---

**Concern ID: 63350**

**The Mid-Barataria Sediment Diversion is the first project-level attempt at systemic ecosystem restoration to one of the world's treasures, the Mississippi River Delta. The future of the Gulf Coast depends on the modeling and permitting decisions in projects like the proposed Project.**

**Response ID: 16312**

The commenter's support for the proposed Project is noted. Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives of the Draft EIS explained how the proposed Project is designed to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

The purpose of the proposed Project is also discussed in Chapter 3, Section 3.2.1.1 (Alternative 1 Description) of the LA TIG's Restoration Plan. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63575**

**The public should be fully informed about the level of funding that CPRA is proposing to fully implement its Mitigation Plan so that the public can meaningfully comment on the adequacy of the proposed mitigation.**

**Response ID: 15915**

Details regarding the funding that will be available for mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for certain measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of

---

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63697**

**Commenters request that the EIS and Mitigation Plan include more details about planned EJ mitigation measures for diversion operations.**

**Response ID: 16507**

The Draft EIS considered impacts to low-income and minority communities due to Project operations in Chapter 4, Section 4.15.4 Operational Impacts in Environmental Justice.

In addition, since completion of the Draft EIS and the LA TIG's Draft Restoration Plan, CPRA engaged the communities potentially impacted by the Project, including low-income and minority community members, through public meetings to solicit input on CPRA's mitigation strategies. Further, CPRA engaged community-based organizations to assist in soliciting additional feedback from low-income and minority community members on the proposed mitigation measures. A summary of these public engagement meetings and other outreach efforts is provided in Chapter 7 of the Final EIS. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (see Appendix R1). This includes additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project. CPRA will continue to engage with potentially impacted EJ communities and organizations concerning the implementation of the mitigation measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix

---

R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63703**

**Commenters request that the agencies involved with developing the EIS meaningfully engage with affected EJ communities/organizations to inform the development of EJ mitigation measures. Specifically, it was requested that relevant materials are translated and presented in plain, non-technical language.**

**Response ID: 16508**

CPRA engaged the communities potentially impacted by the Project, including low-income and minority communities, through public meetings to solicit input on mitigation strategies. Further, CPRA engaged community-based organizations to assist in soliciting additional feedback from low-income and minority community members on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 of the Final EIS. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). CPRA will continue to engage with potentially impacted communities and organizations with EJ concerns concerning the implementation of the mitigation and stewardship measures. Additionally, CPRA has and will continue to provide requested translation and provide key documents and information on the Project in English, Spanish, and Vietnamese.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and

---

Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63706**

**A commenter noted that traditional notions of fair market value might not be sufficient or fair compensation for low-income and minority populations affected by the diversion.**

**Response ID: 16509**

As part of any property acquisition to implement the Project, CPRA would compensate landowners for projected impacts to their properties caused by the Project in accordance with Louisiana and Federal law, including the Louisiana Constitution and the Fifth Amendment of the U.S. Constitution.

Recognizing the limitations on the degree of compensation permitted by federal and state law for property acquisition, CPRA's Mitigation and Stewardship Plan, Appendix R1 to the EIS, outlines numerous additional mitigation measures aimed at assisting low-income and minority populations potentially affected by the Project. In particular, CPRA's Final Mitigation and Stewardship Plan (EIS, Appendix R1) includes additional mitigation measures for the community of Grand Bayou, which is home to members of the Atakapa-Ishak Nation/Chawasha Tribe, including a ridge restoration canal backfilling project, and sidewalks and floating gardens. In addition, CPRA's Final Mitigation and Stewardship Plan prioritizes portions of funding from several of the mitigation and stewardship measures for low-income and minority community members.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures

---

contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63768**

**CPRA should work with local community and four-year colleges to prepare local graduates in project monitoring techniques. They should primarily use local contractors to carry out the monitoring work.**

**Response ID: 16685**

According to CPRA, it encourages the use of local contractors within the limitations allowed by law. CPRA uses several assistance programs to help ensure contractors have skilled local candidates available for employment. One example of such a program is the Coastal Science Assistantship Program (CSAP), which provides a stipend to local students to assist in CPRA's various coastal activities. These programs are not specific to the proposed Project and are not affiliated with the Project Monitoring and Adaptive Management (MAM) Plan.

---

**Concern ID: 63823**

**Commenters noted that the proposed mitigation will not actually reduce impacts on dolphins, and there is no way to mitigate those impacts. Commenters noted that reducing human interaction will not reduce or address impacts of the projects on the local population.**

**Response ID: 16550**

Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock of the EIS acknowledges that according to Thomas, et al. (2021) most of the approximately 2,300 dolphins within the Barataria Basin will perish within the first 10 years of start of operations of the proposed Project (comparing the anticipated Barataria Basin 2027 dolphin population [2,307 dolphins] to the projected 2038 population under the Preferred Alternative [644 dolphins] indicates that approximately 72 percent of the dolphins would perish). That section further acknowledges that the anticipated dolphin mortality would be due to reductions in salinity levels rather than

other stressors and that mitigation and stewardship measures that would not reduce the salinity impacts, would be unlikely to reduce the projected dolphin mortality.

With respect to the Restoration Plan, in Section 3.2.1.5 (Avoids Collateral Injury) the LA TIG acknowledges that a large number of dolphins would become ill and strand in Barataria Bay as a result of the Project. The Mitigation and Stewardship Plan also acknowledges that the proposed mitigation may not minimize impacts of the Project on dolphins (see Appendix R1 to the EIS). Measures described in the MAM and Mitigation and Stewardship Plan were developed in recognition of the anticipated effects of the Project and to provide valuable data to inform adaptive management actions that could be considered to minimize adverse impacts on BBES dolphins while being consistent with the Project's purpose (see Appendices R1 and R2 to the Final EIS).

The LA TIG does not agree that there is no effective mitigation for this Project but recognizes that the mitigation will be limited (that is, primarily for dolphins around Grand Isle), depending on how operations are managed. Similar to mitigation, the stewardship measures described in the Mitigation and Stewardship Plan will primarily benefit other Louisiana stocks of dolphins outside of the Barataria Basin, though they will provide some benefit to BBES dolphins. For example, minimizing dolphin feeding will protect dolphins from vessel interactions. As noted in Chapter 4, Section 4.11 (Marine Mammals) of the EIS, a remnant BBES dolphin population is expected to remain near the barrier islands. Efforts to reduce anthropogenic stressors other than those from the Project through the Stewardship and Mitigation Plan will benefit the existing and future population in the Barataria Basin and throughout the state. However, the LA TIG recognizes that the impacts of the Project will likely be significant on marine mammals even with the proposed mitigation and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63915**

**Grand Bayou would be negatively impacted by water level, and yet is not likely to receive land-building benefits. CPRA should consider mitigation activities that enhances compliance for oil companies to reduce the impacts of oil and gas activities in the area.**

**Response ID: 16616**

The impacts on Grand Bayou raised by the commenter were considered in Chapter 4, Sections 4.15.4 Operational Impacts in Environmental Justice and 4.20.4.2 Operational Impacts in Public Health and Safety of the Draft EIS and in CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS). In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes funding for improvements and other mitigation and stewardship measures in the Grand Bayou community, many of which are targeted at improvements requested by community residents. This includes funding for raising homes and roads, boardwalks, and floating gardens. In addition, CPRA would purchase Project servitudes from landowners in the Grand Bayou community whose property is projected to be impacted by increased water levels caused by during Project operations. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Details regarding these mitigation and stewardship measures are set forth in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that

---

USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

The Draft EIS recognizes causes and impacts of coastal land loss, including oil and gas activities (see EIS Chapter 3, Section 3.6.2 Wetland Loss). Enforcement related to other spills is not within the scope of the EIS or Restoration Plan. As explained in Section 4.2.4.2 (Mineral Resources - Operational Impacts) and depicted in Figure 4.2-5 of the Final EIS, operation of the Project is projected to infill canals within the basin near the Project outfall that were constructed as part of oil and gas production.

---

**Concern ID: 63965**

**The Trustees should begin mitigation and adaptation during construction before impact as opposed to waiting after impacts occur to initiate the process.**

**Response ID: 16588**

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) contained information on mitigation and stewardship measures, including measures that would be undertaken by CPRA before Project construction. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS, which now provides additional detail on several efforts that CPRA would undertake before Project construction, including funding for public and private oyster seed ground enhancement, marketing, shrimp vessel and facility improvements, workforce and business training, and subsistence fishing access (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

CPRA would be responsible for implementation of any mitigation actions and for monitoring and adaptive management associated with the proposed Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as

---

special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 64151**

**Commenter is concerned with the CPRA's apparent desire, in both the Draft EIS and Mitigation Plan, to condition its obligation to mitigate impacts to properties and communities, through its continuing reference to the current vulnerability of those communities or the fact that those communities would become more vulnerable in the future even under the No Action Alternative. Although many areas outside levee protection are in fact vulnerable and may become more vulnerable as sea-level rises and wetlands loss continues, many of those communities would not feel the full impacts for a decade or more absent the proposed diversion. Moreover, the causes of coastal wetlands loss can, at least in part, be attributable to the State's historic, and continuing, permitting of the destruction of coastal wetlands for pipeline and navigation canals, and the like.**

**Response ID: 15942**

**In the EIS, the No Action Alternative is evaluated to understand the anticipated changes in the environment that would occur irrespective of the proposed Project.**

**In addition, the Delft3D Basinwide Model was used to assess impacts of the No Action Alternative. For each resource in Chapter 4 Environmental Consequences, Sections 4.1 through 4.24, the analysis of the impacts for each Project action alternative is compared to the impacts under the No Action Alternative. The EIS acknowledges both the deteriorating conditions that are projected to occur under the No Action Alternative, as well as the degree to which the Applicant's Preferred Alternative and other action alternatives would alter those projected impacts, including in some cases by accelerating potential adverse impacts.**

**Additionally, the EIS acknowledges the influence of canals and spoil banks on wetland losses in Barataria Basin (see EIS Chapter 3, Section 3.6.2.2.4 in Wetland Resources and Waters of the U.S.), and the analysis in the Final EIS has been updated to include additional technical references regarding the influence of canals on the existing environment in the Barataria Basin. In addition, Chapter 1, Section 1.2.1 History of the Barataria Basin in Project Background and Chapter 3, Section 3.1.4 Overview and History of the Project Area in Introduction describes the historical reasons for coastal land loss within the Barataria Basin and notes that as a result of this coastal land loss, various agencies and non-governmental organizations have implemented coastal protection, restoration, and rehabilitation projects within the basin. These existing conditions have been factored into the analysis in the EIS.**

The mitigation and stewardship measures proposed by CPRA for proposed MBSD Project impacts described in Chapter 4, Section 4.27 Mitigation Summary of the Final EIS and in the Final Mitigation and Stewardship Plan (Appendix R1) are based on the understanding of anticipated impacts described in Chapter 4 Environmental Consequences, Sections 4.1 through 4.24. CPRA's Final Mitigation and Stewardship Plan provides details on the mitigation and stewardship measures CPRA would implement prior to the proposed Project beginning operations to ensure that the measure's benefits are in place in advance of the Project impacts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:40407**

Jenn Fair

To whom it may concern, please:

- - Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion
- - Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan
- - Center community needs in planned mitigation and stewardship efforts
- - Commit to developing a robust adaptive management program

thank you

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not

know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

Matthew Phillips

The state's restoration plans are inadequate to meet the challenges of coastal restoration and the climate crisis. While the state dithers on real climate action, thousands of acres of our coast wash away each week. Though this diversion project will restore some crucial land, more attention should be paid to the political economy of coastal restoration, which serves corporate interests in the navigation and fossil fuel industries.

The Walton Family Foundation would like me to speak to those corporate interests, specifically in support of the preferred alternative in the Draft EIS and to encourage the use of Deepwater Horizon settlement funds. While I agree with both these priorities, the ability of corporate interests to tilt the agency's decision by flooding it with supportive public comments undermines the fairness, transparency, and ultimate success of this project. The Army Corps and NPS should be aware of the impacts of corporate-funded advocacy campaigns in support of this diversion.

Louisiana needs much more substantial protection to weather the crisis of climate change than the Mid-Barataria Sediment Diversion can possibly provide. The project is a stopgap, enabling oil and gas and navigation industries to extract every drop of value from this land and these communities before drowning them in the Gulf.

---

**Concern ID: 62395**

**The state's restoration plans are inadequate to meet the challenges of coastal restoration and the climate crisis.**

**Response ID: 15920**

The intent of the Project is to restore injuries caused by the DWH oil spill and help restore habitat and ecosystem services injured by the spill. Other complementary coastal restoration strategies are being considered for implementation by CPRA in their Coastal Master Plan and the LA TIG in their restoration planning process.

---

**Concern ID: 62397**

**Though this diversion project will restore some crucial land, more attention should be paid to the political economy of coastal restoration, which serves corporate interests in the navigation and fossil fuel industries**

**Response ID: 15921**

Comment noted. The Project was included in CPRA's 2017 Coastal Master Plan and will complement other restoration projects being implemented in the area.

---

**Concern ID: 62398**

**The ability of corporate interests to tilt the agency's decision by flooding it with supportive public comments undermines the fairness, transparency, and ultimate success of this Project. The Army Corps and NPS should be aware of the impacts of corporate-funded advocacy campaigns in support of this diversion.**

**Response ID: 15922**

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan. All public comments

received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

Marcia St Martin

I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion Project.

I am a 73-year-old resident of Louisiana, who loves the beauty of nature and enjoy our states access to seafood. According to the US Geological Survey 2011 analysis, Louisiana loses roughly a football field per hour of coast. The coast is a vital productive ecosystem necessary for breeding and survival of fish, shellfish, and wildlife. It is estimated that over 75 percent of the state commercial and recreational fishing depends on the state' wetlands. As result, when wetlands are lost, so are the habitats that sustain our commercial and recreational fishing industry. Louisiana will no longer be known as a fisherman's paradise.

The Louisiana and the entire Gulf Coast have sustained numerous tropical storms and hurricanes which resulted in loss of life and significant lost of property. Man made decisions and actions have caused climate changes, which has increase both frequency and destruction. The loss of wetlands has greatly reduced our coast and allowed for more intense storm surges reaching further into our state.

The powerful Mississippi River and its tributaries north into Canada and South to the Gulf of Mexico provides drinking water, commercial and industrial economic vitality as it travels through America heartland. However, as a result of our man-made decisions on the use of fertilizer and disposal of waste the quantity of nutrients flowing into the Gulf of Mexico has resulted in the creation of a Dead Zone in the Gulf of Mexico.

The Mid-Barataria Sediment Diversion will create a vital tool in helping to rebuild our wetlands, protect our coast and help reduce the Gulf of Mexico Dead Zone through the use of nutrients as a positive rebuilding tool. Help Louisiana commercial fishing industry and insure Louisiana recreational legacy as a sportsman's paradise.

For the above reasons I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion Project.

---

**Concern ID: 62743**

**An estimated 75 percent of the state commercial and recreational fishing depends on wetlands. As result, when wetlands are lost, so are the habitats that sustain the fishing industry.**

**Response ID: 16121**

The commenter correctly notes the importance of wetlands to fisheries populations (and therefore the fisheries themselves), and the detrimental effect of wetland loss to many of those fisheries, as discussed in Chapter 3, Section 3.10.2 in Aquatic Resources and throughout Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS.

---

**Concern ID: 62984**

**Man-made decisions and actions have caused climate changes, which has increased both frequency and destruction [of storms]. The loss of wetlands has greatly reduced the coast and allowed for more intense storm surges reaching further into the state.**

**Response ID: 15797**

---

Draft EIS Section 3.6 Wetland Resources and Waters of the U.S. acknowledged the role that wetlands play in attenuating waves and storm surge, noting that communities sheltered by wetlands may sustain less damage from storm surge. This section also acknowledged that threats to wetland habitat include increased storm frequency and intensity associated with climate change. Draft EIS Chapter 4, Section 4.20.4.2 Public Health and Safety acknowledged that coastal wetland loss can lead to increased storm surge.

---

**Concern ID: 63332**

**A large number of commenters expressed general support for the proposed Project.**

**Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

**Correspondence ID:40410**

Rod Barthelemy

In reference to the article published in the May 4, 2021 issue of "The Plaquemines Gazette, according to the U.S. Army Corps of Engineers DEIS, when the proposed Mid Barataria Diversion is constructed and starts operating, Plaquemines Parish residents south of the diversion "could experience increased water levels, tidal flooding, and greater exposure to hurricane impacts."

Considering the above-mentioned impacts on lower Plaquemines Parish, will financial grants be made available to residents of Plaquemines Parish south of the diversion, inside the federal levee protection system, to elevate their residences in an attempt to mitigate the probable impacts?

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits

---

prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:40411**

Ben Broussard

I write to voice my objection to the Mid-Barataria Sediment Diversion. There will be irreparable loss to Louisiana fisheries because of the project. I do not want my tax dollars going toward something that will harm this vital industry.

---

**Concern ID: 62373**

**Commenter stated that they do not want tax dollars going toward a project that would harm Louisiana's commercial fishing industry.**

**Response ID: 15880**

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

As explained in the Restoration Plan, the LA TIG is the group responsible for restoring natural resources and services within Louisiana that were injured by the DWH oil spill. The LA TIG is comprised of state and federal Trustees of natural resources, and the LA TIG's decision to fund this Project would be based on the Project's ability to restore for injuries to natural resources from the DWH oil spill, including aquatic resources.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review,

Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Harrison Rainwater

To the U.S. Army Corps of Engineers and the Louisiana Trustee Implementation Group (LaTIG) c/o of NOAA:

As a proud Louisianan, avid hunter, fishermen, boater - I love Coastal Louisiana. For many generations in my family, the coast of Louisiana has provided countless memories and experiences. Unfortunately from generation to generation, there has been one common issues that persists - the degradation of our coast. My great grandfather, grandfather, father, brother and myself have witnessed the changes and land loss. I have seen the ability of rivers to build land, around places like the birds foot delta, and Atchafalaya Delta. The river has land building capabilities that must be utilized as a cost effective strategy to slowing coastal Land loss.

As a realtor in Louisiana, I have an interest in mitigating the vulnerability of our coastal communities. I've heard first hand the concern from many of my out of state clients regarding the future of our coasts. The ecological pressures created by the Mississippi River Levee System on coastal lands, make properties more vulnerable to hurricane damage, as well as potentially decreasing property values. The housing market is put at risk if we don't take bold action to restore the coast.

A crucial component to restoring the coast is reconnecting the Mississippi River to the surrounding marshes. I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and support funding the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan. I believe in this answer to natrually restoring our coasts. Please consider this legislation as soon as possible, as with each storm that makes landfall, we are put further and further to risk.

---

**Concern ID: 61737**

**The construction of levees along the Mississippi River precluded land-building sediments from entering Louisiana estuaries, which has caused a loss of Louisiana's coastal wetlands and other problems, such as making properties more vulnerable to hurricane damage and decreasing property values.**

**Response ID: 16024**

The impacts raised by the commenters were considered in the Draft EIS. Information about historic causes of land loss can be found in Chapter 3, Section 3.1.4 Overview and History of the Project Area and Section 3.6.2 in Wetland Resources and Waters of the U.S. The importance of maintaining wetlands for the protection of coastlines, coastal communities, and wildlife resources is discussed in Sections 3.6 Wetland Resources and Waters of the U.S. and 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the EIS. As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the Applicant's Preferred Alternative is to implement a large-scale sediment diversion in the Barataria Basin that would reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

---

---

**Concern ID: 62021**

**The ecological pressures created by the Mississippi River Levee System on coastal lands make properties more vulnerable to hurricane damage, as well as potentially decreasing property values. The coastal communities and housing market is put at risk if bold action is not taken to restore the coast.**

**Response ID: 16217**

The proposed MBSD Project is expected to reduce loss of coastal wetlands in Louisiana relative to the No Action Alternative. The EIS finds in Chapter 4, Section 4.13 Socioeconomics that the proposed Project would have minor, permanent, beneficial impacts on housing and property values as the land gained as a result of the proposed Project would decrease the risks of storm hazards, particularly in areas north of the diversion and in the west bank New Orleans area.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63354**

**The proposed MBSD Project is the most cost-effective way to address the current problems in a sustainable way.**

**Response ID: 16316**

The USACE and LA TIG acknowledge the commenter's support for the proposed Project. The LA TIG further notes that it strove to identify a preferred alternative that meets OPA's cost criteria and achieves the LA TIG's goals of comprehensive, integrated ecosystem restoration, through the creation of deltaic processes that supports an ecosystem that would be sustained over decades even in the face of rising sea levels and coastal erosion.

**Correspondence ID:40414**

Tamara Lockhart

This is Tamara Lockhart. I work with the Restore the Mississippi River Delta Coalition based out of New Orleans and I do fully support the funding of the Mid-Barataria Sediment Diversion, and, although the plan has its upside, there also some faults to it, like from the mitigation plan we can see that the turtle population may be harmed, the dolphin population may be harmed, and a vast array of impacts on the people that do live in coastal Louisiana close to the project, so I would suggest that the project have more funding for mitigation affects, not only for wildlife, but for the people there as well. I'm not from Louisiana but being, I guess Louisiana-adjacent in Mississippi, you know, people go hard for their place you know where they live so I do believe you should take the concerns of the community into better consideration, that way everybody's needs can be addressed and dealt with effectively but we appreciate all the work that the Army Corps of engineer does so if you take my comment into consideration in your final piece of planning that would be amazing. Alright

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63332**

**A large number of commenters expressed general support for the proposed Project.**

**Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Jenny Wolff

To the U.S. Army Corps of Engineers and the Louisiana Trustee Implementation Group (LaTIG) c/o of NOAA:

Living, working, spending time friends and family in the coastal city of New Orleans and in the surrounding wetlands has been invaluable. The coast has molded us as people and as a city - but now it's our time to remold the coast with the power of the Mississippi River. As people outside levee systems are forced out of their communities, people within the levee systems are next if no action is taken. The river has unmatched land building capabilities that must be utilized as a cost effective strategy to slowing down coastal Land loss. I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and support funding the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan. Centering community needs in planned mitigation and stewardship efforts should also be a priority. Plans to help communities deal with impacts of the projects should be clearly stated and fully funded.

Jenny Wolff

---

**Concern ID: 61870**

**If no action is taken, the resources may suffer even greater impacts in the future, along with the local ecology, economy, communities, and culture.**

**Response ID: 15941**

The concerns raised by the commenters were considered in the Draft EIS. The EIS evaluates anticipated conditions in the Barataria Basin if no action is taken. Within the EIS, the No Action Alternative enables a comparison of anticipated future conditions without the proposed Project to anticipated future conditions with the proposed Project and the alternatives. Refer to Chapter 4 Environmental Consequences of the EIS, for a description of anticipated conditions under the No Action Alternative for each of the resource areas evaluated. The Delft3D Basinwide Model was used to forecast conditions that would occur under the No Action Alternative which helped to inform the analysis in Chapter 4.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

Lynn Miller

Our marine animals are in great danger

Lynn Miller

Ocala, Fl

---

**Concern ID: 62777****Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).****Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:40419**

Colin Casciato

To whom it may concern,

My name is Colin Casciato, and I am a fisherman from New Orleans. I write in support of the planned Mid-Barataria Sediment Diversion. We desperately need the Mid-Barataria Sediment Diversion, along with the other proposed diversions.

We need the Mid-Barataria diversion to create new marsh land and protect Louisiana from hurricanes and storm surge. If we do not do something to reverse the trend of losing marsh land, we will eventually lose all of our marshes. Losing our marshes will have an extremely negative impact on fish and shellfish species.

The benefits of the Mid-Barataria diversion outweigh the costs.

Myself and my friends regularly fish in the areas that will be "affected" by the diversion. We fish out of Myrtle Grove, Port Sulphur, Lafitte, as well as Hopedale, Delacroix, and Golden Meadow. We support the diversion even though it will introduce fresh river water to these areas. The area around Mardi Gras Pass still has great fishing, and redfish are less impacted by the introduction of fresh water than other species.

While the diversion will lower the salinity of certain areas and impact oysters, shrimp, trout, and other fish, those areas never should have been that salty in the first place. If it was not for the levee system, the Mississippi River would naturally regularly overflow its banks, deposit sediment and fresh water, and create new distributaries. When people are against the diversions due to impacts on oysters and shrimp etc. they are really fighting to keep the river in an unnatural state and to keep the waters unnaturally salty. The areas that will be impacted by the diversions should not have been that salty in the first place. The diversions will actually be bringing the river towards a more natural state. The diversion is basically just a planned distributary. Before being penned in by the levees, the Mississippi river was constantly changing course, creating new distributaries, and building new land. That is what we need to get back to with the diversions.

All around the marsh you can see ghost cypress trees leftover from a time when that area was much more fresh, as it naturally should be.

The fishing will still be great even if the affected areas are less salty. There will still be redfish and there will be more bass. The fishing will still be world class. Bass have moved into the MRGO, Shell Beach, and Hopedale areas following the building of the rock dam on the MRGO, and the fisherman, including myself, think catching bass is a lot of fun.

We need to take drastic steps to save our coast and marshes. The benefits of the Mid-Barataria Sediment Diversion greatly outweigh any costs.

Sincerely,

Colin L. Casciato - A fisherman in support of the Mid-Barataria Sediment Diversion.

---

**Concern ID: 61870**

**If no action is taken, the resources may suffer even greater impacts in the future, along with the local ecology, economy, communities, and culture.**

**Response ID: 15941**

---

The concerns raised by the commenters were considered in the Draft EIS. The EIS evaluates anticipated conditions in the Barataria Basin if no action is taken. Within the EIS, the No Action Alternative enables a comparison of anticipated future conditions without the proposed Project to anticipated future conditions with the proposed Project and the alternatives. Refer to Chapter 4 Environmental Consequences of the EIS, for a description of anticipated conditions under the No Action Alternative for each of the resource areas evaluated. The Delft3D Basinwide Model was used to forecast conditions that would occur under the No Action Alternative which helped to inform the analysis in Chapter 4.

---

**Concern ID: 62662**

**The proposed Project is likely to succeed because other diversions have also built land and restored ecosystems. Specific examples of land-building projects include the Caernarvon Freshwater Diversion, Davis Pond, West Bay, Fort St. Phillip, the Jaws, Wax Lake, and Mardi Gras Pass. Many of the benefits of the Project, in terms of soil creation and microbial processes, are not captured in the engineering of the modeling. Many of the fine sediments transported by the diversion cannot be dredged but are critical soil components.**

**Response ID: 16635**

The benefits to land building of fine sediments transported by the diversion were addressed in the Draft EIS in Chapter 4, Section 4.2.3.2 Operational Impacts in 4.2.3 Geology, Topography, and Geomorphology. The Delft3D modeling conducted for the EIS distinguishes the types of sediment (sands and fine sediments) that would be deposited in the basin. Table 5.2-1 in EIS Appendix E Delft3D Modeling lists the sediment classes included in the model. As described in EIS Chapter 4, Section 4.4.4 Hydrology and Hydrodynamics, sand and fine sediments would contribute to land building in the basin in two ways - by being resuspended and transported elsewhere for deposition and by forming a base layer upon which future pulses of sediment could form marsh or land. The model's physics-based computations showed that the coarser sands would settle out before the finer sediment. As the sediment builds up, discharge velocities would increase over the previously deposited sediment and resuspend it, pushing it farther into the basin. Thus, the model reproduces the natural process of delta building in which successive waves of sediment push farther out, either forming land/marsh or creating a base upon which land/marsh can be formed without moving it by dredging and placement. In addition, Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology of the EIS discusses the geomorphic impacts of diversion operations, including the Wax Lake Outlet, the Caernarvon Freshwater Diversion, the Davis Pond Freshwater Diversion, the Bohemia Spillway, and Bonnet Carré Spillway, and Mardi Gras Pass.

The likelihood of the Project's success and its potential benefits were considered in the LA TIG's Draft Restoration Plan. As part of evaluating the Project and alternatives, the LA TIG considered the likelihood that the Project would succeed and achieve the LA TIG's goals. Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the LA TIG's Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, these sections note that the knowledge gained through the projects noted by the commenters has been applied in designing the Project and evaluating whether and how the Project would restore and sustain critical

marshlands. A full description of the range of benefits that would be provided by the Project is also included in Section 3.2.1.6 Benefits Multiple Resources of the Restoration Plan.

---

**Concern ID: 62738**

**The proposed Project would affect salinity in the basin, but there would still be red drum and there would be more bass**

**Response ID: 16116**

As identified in Chapter 4, Section 4.10, Table 4.10-6 in Aquatic Resources of the Draft EIS, the commenter correctly notes that the proposed Project is anticipated to have an overall beneficial effect on red drum and largemouth bass abundance through either direct or indirect effects of the decreasing salinity induced by Project operations.

---

**Concern ID: 63028**

**All around the basin there are ghost cypress trees left over from a time when that area was much more fresh, as it naturally should be.**

**Response ID: 16036**

Chapter 3, Section 3.6.2.2 in Wetland Resources and Waters of the U.S. of the EIS describes historic wetland losses in the Barataria Basin, as those losses relate to changes in salinity. Further, Chapter 3, Sections 3.1.4.1 Mississippi River and 3.1.4.2 Barataria Basin of the EIS address the deltaic processes that formed the Barataria Basin and birdfoot delta; however, Sections 3.1.4.2 and 3.2.1.1 Historical Context, have been supplemented in the Final EIS to further discuss historic conditions.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63378**

**The diversion would result in a return to a more natural state in which a delta existed in the Barataria Basin and the saltier waters required by many important fishery species were naturally further south.**

**Response ID: 16304**

The concerns raised by the commenter related to the proposed Project's role in connecting the Barataria Basin to the Mississippi River were considered in the Draft EIS. As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources, the proposed Project would impact salinity in the Barataria Basin, with salinity impacts benefiting some fishery species, such as bass and Gulf menhaden, and adversely impacting others, such as oysters and brown shrimp. Section

---

4.2 in Geology and Soils of the Draft EIS discussed the proposed Project's impacts on creating a delta in the basin. As identified in Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative and discussed throughout Chapter 4 Environmental Consequences of the EIS, the No Action Alternative is compared to existing conditions to understand the anticipated changes in the environment that would occur irrespective of the proposed Project. Thereafter, the anticipated environmental consequences of the proposed Project action alternatives are compared to the results of the No Action Alternative analysis. Section ES.1 Introduction and Authority of the Executive Summary has been revised to include this clarification. In addition, Chapter 3, Sections 3.1.4.2 Barataria Basin and 3.2.1.1 Historical Content have been supplemented in the Final EIS to further discuss historic conditions and the role that the diversion may play in the Mississippi River Delta cycle.

St. Mary Excel

Monica Mancuso

These comments are submitted by St. Mary Excel, a non-profit organization in St. Mary Parish.

Our organization does not hold technical expertise, but we offer these comments as residents in a coastal area.

St. Mary Excel is located in an area where sediment contributes to storm surge protection as the Atchafalaya and Wax Lake Delta are accretion forming.

Our hurricane protection includes the wetland areas to the south of the Morgan City/ Berwick area. The wetlands offer buffering before hurricanes impact inhabited areas.

This wetland protection positively contributes to our area sustainability within our location along the coast of the hurricane prone Gulf of Mexico.

The protection of the wetlands took many years to build, but the outcome of hurricane force wind reduction offered by the wetlands is immeasurable.

The area is now able to work on 100 year levee protection of the area and other coastal priorities to deal with sea level rise and subsidence.

We offer these comments as public input during the comment period on the impact of how the thoughtful use of sediment can be beneficial to people who live along the coast. Our area has benefitted from the hurricane force wind reduction offered by the deltaic wetlands.

We offer this testimony as part of the public comment period as leaders work for Mid-Barataria Restoration.

Monica Mancuso

Executive Director

St. Mary Excel

Morgan City, LA 70380

---

**Concern ID: 62233**

**Restoration of coastal habitat and the delta would provide protection from storm damage.**

**Response ID: 15752**

While the intent of the proposed Project is to reestablish deltaic processes to restore resources injured by the DWH oil spill, the Draft EIS Chapter 4, Section 4.20.4.2 Public Health and Safety described the ancillary benefit of storm damage risk reduction on communities north of the proposed diversion due to the creation and maintenance of wetland habitat and increases in topography and land acreage within the delta formation area. At the same time, operation of the Project would have permanent, minor to moderate, adverse impacts on storm hazards in communities south of the diversion, with anticipated increases in storm surge of up to 1.7 feet near Myrtle Grove (as compared to the No Action Alternative). Section 4.20.4.2.2.2 in Public Health and Safety of the Final EIS has been revised to include

---

additional information and figures further explaining the impacts of the Project on storm surge and wave height

---

**Concern ID: 62313**

**The wetlands to the south of Morgan City/Berwick are an example of where sediment contributes to storm surge protection as the Atchafalaya and Wax Lake Delta are accreting sediment.**

**Response ID: 15806**

Wetlands south of Morgan City/Berwick are outside of the scope of this EIS, which includes the Barataria Basin and the Mississippi River birdfoot delta. However, a summary of select diversions and diversion-like features in southeastern Louisiana was developed in response to public comments regarding how various diversions and diversion-like constructed or natural features have affected their receiving environments and their recorded impacts on the natural environment. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

**Correspondence ID:40423**

Charles Ballay

I am opposed to the Mid-Barataria Sediment Diversion Project for the following reasons: 1) Since we have lost a significant amount of our marshlands and estuaries already, it is imperative that we implement a plan that can build the most amount of marshland and estuaries and as fast as possible and feasible now. We do not have 50 yrs to build what we need. The MBSD will take too long to realize any significant land building and is an experimental project; 2) if this project had been implemented 50 or more yrs ago it would make sense since a lot of marsh areas would have still existed that could be saved and added to; 3) since the Miss River must be dredged in various locations between Baton Rouge and the Gulf for navigability and shipping purposes, the sediment that is removed for such should be pumped into the estuary areas of Plaquemines, St Bernard and Jefferson Parishes instead of other places (recently Congress appropriated \$245 million for this dredging work), and by doing so it would be saving money and creating marshland; 3) with the \$2 billion projected costs of the MBSD these funds could purchase two new dredges (at \$100 million each), dredge the Miss River, connect and pump the sediment thru 5 pipelines installed on the Westbank of Plaq Parish and 3 pipelines installed on the Eastbank of Plaq Parish; it would create substantial marshland in 5-10 years, at an annual operating costs of approx \$150 million a yr.; and 4) this would bring back the marsh/estuary areas that we have lost in the last 50-75 yrs and give us the much needed hurricane/tidal surge protection in 5-10 yrs in a much larger area than what the MBSD might possibly do.

Lastly I would suggest that a cost benefit analysis be performed on the MBSD project since we may never see \$2 billion available again for a single chance at saving our coast.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and

---

breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62374**

**Commenter is opposed to MBSD because it doesn't build land fast enough.**

**Response ID: 15949**

The commenter's opposition to the proposed Project is noted. The commenter is correct that the proposed Project would take approximately 30 years to create its maximum projected acreage of 17,300 acres; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 [Alternative 1 Description] of the Restoration Plan).

The commenter's concern regarding the timeline required for land building was considered in the Draft EIS in Chapter 4, Section 4.2 Geology and Soils. A discussion has been added to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Geology and Soils section of the Executive Summary and to Chapter 4, Section 4.2.3.2 Operational Impacts in Geology and Soils of the Final EIS.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018, page 3-32) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in this Restoration Plan. It is also worth noting that the LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

---

**Concern ID: 62375**

**This Project would have made sense 50 years ago because there would have been more marsh to save at that time.**

**Response ID: 15881**

Commenter's input is noted.

---

**Concern ID: 62376**

**A cost-benefit analysis should be performed since there may never be \$2 billion available again for saving the coast.**

**Response ID: 15948**

NEPA does not require that an EIS contain a cost-benefit analysis unless it is relevant to the agency's decision. USACE typically assumes that a permit applicant has done its own economic evaluation of a proposed project. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

Consistent with OPA regulations (15 CFR §990.54), the LA TIG's Restoration Plan evaluates multiple alternatives based on a number of criteria, including the cost of the alternative. For more information see Section 3 of the LA TIG's Final Restoration Plan.

---

**Correspondence ID:40426**

President, Plaquemines Parish Government

Kirk Lepine

This proposed Sediment Diversion will have a crippling impact on our residents, businesses, and heritage. We have been through so much adversity from hurricanes to an oil spill, and our residents continue to battle back stronger than ever. But this planned diversion is something we can rest assured would affect everyone here in Plaquemines. Our commercial seafood industry will be destroyed! Many generations of our seafood leaders will be left with nothing. Our communities will see a rise in tidal water like no other. Many investment properties will now be worthless. The Council passed a Resolution against the diversion and the EIS study, and the Administration strongly agrees! As Parish President it is my duty to protect all of Plaquemines residents and this diversion would not benefit anyone in Plaquemines Parish!

---

**Concern ID: 62778**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest

---

review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:40428**

Daniel Jackson

Dear Mr. Laborde and Mr. Landry:

As a restaurant owner, a small business owner and a resident of New Orleans, Louisiana I am writing to express my strong support for the Mid-Barataria Sediment Diversion. This project is crucial for protecting coastal communities, including New Orleans, our local economies and the wildlife that is so important to our culture here.

Without action, the ecosystem in the Barataria Basin is at great risk of collapse and along with it our natural resources including storm protection and our fisheries. This area was one of the hardest hit by the 2010 BP oil spill and the settlement funds should be spent on this project, not only to restore the damage caused by the spill but to also benefit the entire northern Gulf Mexico ecosystem by ensuring we have healthy and stable wetland habitat for the fish and wildlife that depend on it.

This project will restore the natural processes that built Southern Louisiana by reconnecting the Mississippi River to the surrounding sediment starved areas. It will also enhance and extend the life span of other nearby restoration projects, maximizing our efforts and limited dollars. This is the only way that we can hope to keep pace with sea level rise, buffer ourselves from more frequent and stronger storms and adapt to climate change.

Constructing the diversion will not only create new jobs and positive economic impacts for communities south of New Orleans, but it will protect industries all over the coast, including the New Orleans restaurant and hospitality industry.

I also recognize that the bold action necessary to save our coast will not come without cost. Planned mitigation and stewardship efforts should be centered on community needs and input. We will not be truly successful in this if we knowingly leave our most vulnerable communities behind.

I believe what the scientific community overwhelmingly agrees on, this project and others like it are the best long-term solution for the challenges that we face. I support the selection of the preferred alternative in the DEIS for the Mid-Barataria Sediment Diversion.

Thank you,

Daniel P Jackson

New Orleans, LA

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing

---

community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63332**

**A large number of commenters expressed general support for the proposed Project.**

**Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

**Concern ID: 63392**

**The proposed Project would also enhance and extend the life span of other nearby restoration projects, maximizing our coastal restoration efforts and limited funding.**

**Response ID: 16354**

The commenter's input is noted. The cumulative impacts of the proposed Project and other restoration projects were discussed in Chapter 4, Section 4.25 Cumulative Impacts of the Draft EIS, as applicable.

---

**Correspondence ID:40431**

Emily Vuxton

Hello,

I am the Policy Director of the Coalition to Restore Coastal Louisiana and have submitted comments in my official capacity, however, these comments are my own personal thoughts and not affiliated with CRCL. I come from a family whose ancestors have lived along the river road in Southeast Louisiana for almost 300 years. Those ancestors lived along the river when the Army Corps river levees didn't exist. They lived through extensive flooding of their homes for years before the current levee system was built. However, back then, we were not losing land at the rate we are currently losing land. My ancestors did not know that this coastal land would disappear by my lifetime, caused by the creation of these levees. Now it is the responsibility of my generation to try to undo the damage that these levees created, so that my descendents can continue to live here for another 300 years. I believe that the Mid-Barataria Sediment Diversion is the best shot we have to undo the extensive damage that these levee systems caused. If we do not have land, noone will be able to live here in 300 years. I believe that CPRA should do the best they can to mitigate for losses and damages that will be experienced by vulnerable communities, including the community of Ironton. CPRA should listen to these community members and commit to doing actions that are the best for them, as directed by them. Vulnerable communities' livelihoods should be protected, as should their culture.

I support the preferred alternative and urge the Army Corps to permit this project quickly. I also support the use of Deepwater Horizon settlement dollars to fund this project.

Thanks,

Emily Vuxton

---

**Concern ID: 62377****Commenter asserts that the proposed Project is the best hope for undoing the extensive damage that the levee systems caused, and that land building is essential.****Response ID: 15911**

The commenter's statement of support, which correctly notes that the purpose of the proposed Project is to reestablish and maintain deltaic processes in support of coastal Louisiana resources, is acknowledged. The EIS recognizes the role that Mississippi River levees have played as one factor in coastal land loss in the Barataria Basin. The EIS does not describe the proposed Project as a solution to fully reverse ongoing land-loss trends. The Draft EIS recognized that the proposed Project is projected to create and maintain only a portion of the wetlands that would otherwise be lost in the absence of the proposed Project over the next 50 years. See EIS Chapter 4, Section 4.2.3. Geology, Topography, and Geomorphology for the discussion of projected future land loss under the proposed Project as compared to the No Action Alternative.

---

**Concern ID: 62878****The EIS and Mitigation Plan does not adequately consider or mitigate for impacts to Ironton. The EIS should include air pollution buffers for Ironton and flood protection easement areas for Ironton and other vulnerable communities outside of levee protection.**

**Response ID: 16505**

The concerns raised by the commenters were considered in the Draft EIS in Chapter 3, Section 3.7.2 Air Quality, Existing Conditions; and Chapter 4, Sections 4.8 Noise, 4.13 Socioeconomics, 4.15 Environmental Justice, 4.22 Land-Based Transportation and 4.25 Cumulative Impacts. Chapter 3, Section 3.7.2 Air Quality - Existing Conditions identifies the existing air quality in the proposed Project area and provides that Plaquemines Parish is designated as “unclassifiable/in attainment” for all criteria pollutants. The resource sections in Chapter 4 address potential air quality, noise, transportation, and tidal flooding impacts specifically concerning the community of Ironton. In addition, Chapter 2 of Appendix H1 Socioeconomics Technical Report to the EIS provides contextual information about the Ironton community.

CPRA committed to implementing best management practices (BMPs) to minimize construction impacts in the EIS in Chapter 4, Section 4.27.1 Avoidance and Minimization and Appendix R1 Mitigation and Stewardship Plan; additional information on BMPs is also included in the Mitigation Summary Table in Appendix R3. Construction emissions would be highly localized, and consequently the Project is only anticipated to impact air quality within 0.5 mile of the construction footprint; however, Ironton is located approximately 0.5 mile from the construction footprint (see EIS, Chapter 4, Section 4.7.1 Area of Potential Impacts). As stated in the EIS in Chapter 4, Section 4.15 Environmental Justice, populations in Ironton would experience minor to moderate, temporary adverse, impacts due to increased noise levels, dust, and transportation delays during the approximately 5-year construction period. During operations, air emissions would be negligible since the diversion structure would be electric-powered (see EIS Chapter 4, Section 4.7.4.2).

Beyond the near-term impacts of construction, operation of the Applicant’s Preferred Alternative may have impacts on Ironton. Because it is within the New Orleans to Venice (NOV) Non-Federal Levee (NFL) W-05a.1 (La Reussite to Myrtle Grove levee reach) levee system, Ironton is not expected to be impacted by increases in frequency and duration of tidal flooding due to Project operations (see Section 4.15.4.2.2 Storm Hazards and 4.20.4.2 Public Health and Safety). Further, guide levees constructed parallel to the diversion channel will be constructed to an elevation of approximately 15.6 feet and will serve as hurricane and storm damage risk reduction against storm surges. However, negligible to minor increases in risk of NOV-NFL Levee overtopping south of the immediate outfall area (following the delta formation in the outfall area) due to storm surge during certain 1 percent storms, may impact low-income and minority populations within Ironton. These potential impacts may be exacerbated to the extent that Ironton residents experience unique vulnerabilities.

To ensure that impacts on the community of Ironton have been adequately disclosed and to make that analysis readily accessible in one location within the EIS (rather than throughout the various resource sections), a section has been added to the Final EIS that provides a summary of impacts on the community of Ironton under the Applicant’s Preferred Alternative (see Chapter 4, Section 4.15.5.1 Environmental Justice).

CPRA is not proposing specific mitigation to address or offset the negligible to minor increased risk in levee overtopping that could affect the community of Ironton inside the NOV-NFL system because this potential increased risk does not accrue until Project operations have resulted in the development of a delta (wetlands and marsh) in the area outside the NOV-NFL Levee adjacent to Ironton (circa 2040), and because this risk was identified for only

one of the 100-year storm scenarios modeled. However, to help Ironton prepare for and mitigate flood risk from storms generally, CPRA would designate a liaison to work with residents in Ironton prior to commencing operations of the Project on community preparedness for storm-based flooding and damage.

CPRA has engaged in public outreach meetings with the communities projected to be impacted by the MBSD to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts were undertaken to better understand and address potential impacts on communities with environmental justice concerns, such as low-income and minority populations, that may be disproportionately impacted by the Project, as discussed in Chapter 7 of the Final EIS. This included meetings in the community of Ironton. CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project. CPRA will continue to engage with potentially impacted environmental justice communities and organizations concerning the implementation of the mitigation and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63337**

---

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:40432**

Paul Link

No substantial comment, just stating my support for the MBSD project. It has been sad watching the demise of the Barataria Basin in the 16 years I've been recreating there, and a large-scale sediment diversion is the only chance at slowing the loss.

Thanks,

Paul Link

---

**Concern ID: 63334****The proposed MBSD Project would maintain and restore coastal lands and should move forward.****Response ID: 16291**

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Jillian Bassman

I have lived in New Orleans since 2001 when I started Tulane University as a freshman. Although I grew up in the northeast, whenever I endeavored to move back I encountered the same issue as a lot of my fellow transplants: homesickness. New Orleans became my home. The culture and environment seeped into my blood when I wasn't paying attention. This place is my home now, and I am invested in keeping it my home both literally and figuratively.

I own a home here. I am enrolled in the LSU School of Nursing, because I want to do public health work with the underserved communities here. My dreams depend on New Orleans, and southern Louisiana being here in ten, twenty, and fifty years.

The time I have been fortunate enough to spend on the lakes, and rivers here and along the gulf is unmatched by anywhere I have ever been. I hope to be able to show the beauty in southern Louisiana to my friends from around the country and family members from around the world for years to come.

It is very important to me that the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion is selected. It makes the most sense to fund this project with the money from the Deepwater Horizon settlement, as the draft Restoration Plan outlines. Additionally I think we need to commit to developing a robust management plan for this issue. We need to focus on the needs of the community in doing this work.

Thank you for reading. Please do everything you can to help ensure that we can continue to love our state for everything it has to offer for years to come.

Sincerely,

Jillian Bassman

---

**Concern ID: 62378**

**Commenter notes that their future plans depends on New Orleans existing into the future.**

**Response ID: 15912**

Comment noted.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter,

---

including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project

---

alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

David Waggoner

After many years of study, with great investment of resources, we are at point of decision. It is time to implement the Mid-Barataria Sediment Diversion. Comments from opponents, primarily in St. Bernard and Plaquemines parishes, are worthy of consideration but insufficient to delay further action on this keystone project of the Coastal Master Plan. Without action the loss will be more extreme than it will be with action. Opponents are primarily opposed to the short term effects, which must be mitigated, in terms of species loss as well as impacts on fishermen. A few more years of income production do not justify the looming collapse of not only the natural resource but the possibility of inhabiting the coast with its cities and settlements.

Do we trust the scientists who have studied this for more than a decade? Why do we have a Coastal Protection and Restoration Authority and a Water Institute? What can we do to utilize the river resource and limit land loss? Though there might be a less hard, more green diversion channel one could design, the time expended already, the permit that is almost granted, mean that now is time to move forward with the Mid-Barataria Sediment Diversion.

---

**Concern ID: 61870**

**If no action is taken, the resources may suffer even greater impacts in the future, along with the local ecology, economy, communities, and culture.**

**Response ID: 15941**

The concerns raised by the commenters were considered in the Draft EIS. The EIS evaluates anticipated conditions in the Barataria Basin if no action is taken. Within the EIS, the No Action Alternative enables a comparison of anticipated future conditions without the proposed Project to anticipated future conditions with the proposed Project and the alternatives. Refer to Chapter 4 Environmental Consequences of the EIS, for a description of anticipated conditions under the No Action Alternative for each of the resource areas evaluated. The Delft3D Basinwide Model was used to forecast conditions that would occur under the No Action Alternative which helped to inform the analysis in Chapter 4.

---

**Concern ID: 62379**

**A few more years of income production do not justify the looming collapse of not only the natural resource but the possibility of inhabiting the coast.**

**Response ID: 15913**

Comment noted.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for**

---

**things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and

---

Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63379**

**After many years of study, with great investment of resources, it is time to implement the Mid-Barataria Sediment Diversion. Comments from opponents, primarily in St. Bernard and Plaquemines Parishes, are worthy of consideration but insufficient to delay further action on this keystone project of the Coastal Master Plan.**

**Response ID: 16341**

The commenter's statement of support is noted. The evaluation of the impacts of the Project in the EIS was developed using the best information and data available to USACE and the LA TIG. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. Revisions have been made to the Final EIS based on public comments received on the Draft EIS, input from cooperating agencies, and continued Project communications. Changes between the Draft and Final EIS are identified through markings along the margins on the applicable pages, as described in Chapter 1, Section 1.7 Public Involvement Summary. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63380**

**Though there might be a less hard, more green diversion channel one could design, the time has already been expended and the permit has almost been granted, such that now is time to move forward with the Mid-Barataria Sediment Diversion.**

**Response ID: 16342**

---

The commenter's support for the proposed Project is noted. USACE is neither a proponent nor an opponent of the proposed Project and has not made any decision with respect to the proposed Project.

Several design alternatives were considered as discussed in Chapter 2, Section 2.4.4 in Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow of the Draft EIS. The proposed design, with the hardened, open diversion channel, was designed as the most effective structure to meet the purpose and need of the action. As noted in Chapter 7, Section 7.6 Record of Decision of the EIS, the Final EIS is not a decision document. The USACE will issue its Record of Decision for the proposed Project after the close of the Final EIS public review period. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Merrel Holley

To the U.S. Army Corps of Engineers and the Louisiana Trustee Implementation Group (LaTIG) c/o of NOAA:

As someone who is from Morgan City, I have seen the ability of rivers to build land - growing up near the Atchafalaya delta and Wax Lake Outlet, the land building capabilities are clear. Also as someone invested in real estate in Louisiana, I have an interest in mitigating the vulnerability of our coastal communities. The pressures of the Mississippi River Levee System on coastal lands, make properties more vulnerable to hurricane damage, as well as potentially decreasing property values and making land inhospitable as levels sink.

A crucial component to restoring the coast is reconnecting the Mississippi River to the surrounding marshes. I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and support funding the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

---

**Concern ID: 62662**

**The proposed Project is likely to succeed because other diversions have also built land and restored ecosystems. Specific examples of land-building projects include the Caernarvon Freshwater Diversion, Davis Pond, West Bay, Fort St. Phillip, the Jaws, Wax Lake, and Mardi Gras Pass. Many of the benefits of the Project, in terms of soil creation and microbial processes, are not captured in the engineering of the modeling. Many of the fine sediments transported by the diversion cannot be dredged but are critical soil components.**

**Response ID: 16635**

The benefits to land building of fine sediments transported by the diversion were addressed in the Draft EIS in Chapter 4, Section 4.2.3.2 Operational Impacts in 4.2.3 Geology, Topography, and Geomorphology. The Delft3D modeling conducted for the EIS distinguishes the types of sediment (sands and fine sediments) that would be deposited in the basin. Table 5.2-1 in EIS Appendix E Delft3D Modeling lists the sediment classes included in the model. As described in EIS Chapter 4, Section 4.4.4 Hydrology and Hydrodynamics, sand and fine sediments would contribute to land building in the basin in two ways - by being resuspended and transported elsewhere for deposition and by forming a base layer upon which future pulses of sediment could form marsh or land. The model's physics-based computations showed that the coarser sands would settle out before the finer sediment. As the sediment builds up, discharge velocities would increase over the previously deposited sediment and resuspend it, pushing it farther into the basin. Thus, the model reproduces the natural process of delta building in which successive waves of sediment push farther out, either forming land/marsh or creating a base upon which land/marsh can be formed without moving it by dredging and placement. In addition, Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology of the EIS discusses the geomorphic impacts of diversion operations, including the Wax Lake Outlet, the Caernarvon Freshwater Diversion, the Davis Pond Freshwater Diversion, the Bohemia Spillway, and Bonnet Carré Spillway, and Mardi Gras Pass.

The likelihood of the Project's success and its potential benefits were considered in the LA TIG's Draft Restoration Plan. As part of evaluating the Project and alternatives, the LA TIG considered the likelihood that the Project would succeed and achieve the LA TIG's goals. Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the LA TIG's Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, these sections note that the knowledge gained through the projects noted by the commenters has been applied in designing the Project and evaluating whether and how the Project would restore and sustain critical marshlands. A full description of the range of benefits that would be provided by the Project is also included in Section 3.2.1.6 Benefits Multiple Resources of the Restoration Plan.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63341**

**The coastal wetland system creates multiple lines of natural defense from hurricanes and storm surge, and the ongoing wetland loss resulting from the lack of riverine input into the basin has resulted in increased storm risks to local communities (including decreases in property values and impacts to the electrical grid).**

**Response ID: 16300**

The commenter's support for the proposed Project is noted. The commenter correctly notes that coastal wetlands are natural defense against hurricanes and storm surge, and the damage they cause to local communities and infrastructure, as discussed in Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S. of the Draft EIS. The causes of wetland loss in the proposed Project area were discussed in Section 3.6.2 of the Draft EIS, and included subsidence, levees, storms, canals/spoil banks, herbivory, and the DWH oil spill. Chapter 4, Sections 4.6 Wetland Waters and Resources of the U.S. and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS explained how the proposed Project would create and maintain wetlands in the Barataria Basin, and discuss the corresponding impacts on storm surge and flooding.

Dana Honn

As New Orleans and Louisiana begin to reopen, we find ourselves standing on the precipice of a major project to help protect our land, our wildlife, our food, our communities, our economy, and our very way of life. The Mid-Barataria Sediment Diversion is the largest individual ecosystem restoration project in our country's history, which is fitting since the Barataria Basin is experiencing one of the highest rates of land loss on the planet. This innovative project seeks to harness the Mississippi River's naturally occurring sediment to rebuild our wetlands and protect us from increasingly extreme weather. It's a plan that the majority of scientists believe can work. But it doesn't come without costs, and much of that sacrifice rests squarely on the shoulders of our independent commercial fishers. The majority of the fishing community recognizes that doing nothing isn't an option. In order to move forward, we must work together. A big part of that means providing fishers with the monetary, technical, and regulatory resources and tools they need to make the transition as we move from passively watching our rapidly disappearing coastal estuaries to actively rebuilding a more fertile and certain future. Thank you for your time and consideration,

Sincerely,

Dana Honn

Jens Lorenz

Given the opposition of the governing authority of Plaquemines Parish to the Mid-Barataria Sediment Diversion project, and to get more value out of the improvements to be constructed, I would suggest that you add the following improvements to your project:

1. The proposed railroad bridge crossing the new diversion channel could also serve as a hurricane evacuation route out of the lower part of the Parish by embedding the rails in the deck, as is done with street car tracks, and adding safety curbs and vehicular accesses from the new bridge to Louisiana Hwy 23.
2. The upstream (northern) channel guide levee could serve as a roadway base for about one half of the distance to Lafitte from the River with the remaining half to be constructed as additional levee or as structure. This would provide an alternative to Louisiana Hwy 23 for traffic from Venice westbound and as a second hurricane evacuation route from the lower part of Plaquemines Parish.

---

**Concern ID: 67231**

**Consider adding improvements, such as using the proposed railroad bridge crossing and channel guide levees as hurricane evacuation routes to the Project, to get more value out of the Project.**

**Response ID: 16951**

1. Emergency Evacuations for Plaquemines Parish are coordinated with USACE-New Orleans District, LADOTD, Plaquemines Parish Sheriff's Department, GOHSEP, and other entities as needed. Evacuations through the Eastern Tie-In of the Hurricane and Storm Damage Risk Reduction System (HSDRRS) in Oakville, Louisiana are routed north via Louisiana Hwy 23. The proposed railroad bridge would have dual access for authorized personnel to cross the project from the Mississippi River Levee for railroad and project operations, maintenance, and flood fighting purposes.
2. The upstream or northern guide levee would serve as a guide levee for diversion flows from the Mississippi River to Barataria Basin. Additionally, the guide levee would serve as a flood risk reduction levee replacing a portion of and as part of the New Orleans to Venice (NOV) flood risk reduction levee. The proposed guide levees would allow access for authorized personnel to access the Project for operations, maintenance, and flood fighting purposes.

The proposed Project would relocate Louisiana Hwy 23 in kind (or equivalent to the existing roadway) maintaining the current evacuation route. An alternate evacuation route for Louisiana Hwy 23 is not part of the MBSD Project and would not advance the stated purpose and need as stated in EIS Chapter 1, Section 1.4 Purpose and Need.

Loretta Tesvich

Dear Sir,

I just wanted to voice my opinion on the Mid-Barataria Diversion project. Our state bird is the Brown Pelican and that is wonderful. If you go out in the Bay there are many to see. But to get those Pelicans to nest and reproduce, an island was made from Dredging material especially for them. Our seafood industry could use the same consideration. My husband is a commercial oyster fisherman. He has 1,250 acres of oyster leases in the Barataria area which will be severely impacted by this Diversion. The leases were purchased from a person that cultivated these oysters all of his life. In turn that person bought them from someone else. So these leases have been producing seafood for over a hundred years. By considering placing dredged material in some of these areas, our Oysters would not be impacted by the fresh water from the Diversion. Many families live here in Plaquemines Parish who are involved in one way or another with the Seafood Industry. Whether it's catching the seafood, building oyster leases to produce the seafood, or the taxes which are collected on the seafood, this is a very valuable commodity to this Parish and State. But don't forget the number of restaurants in the New Orleans area that are Proud to let their customers know the seafood they are ordering is from local fishermen. Many of those customers are tourists visiting our city and State spending their own dollars helping our economy. There are also a number of people in Plaquemines that depend on this seafood in our Bays and Bayous to put food on their table. That same seafood is also used for their income. If the seafood industry dies, the local economy suffers and people will move elsewhere. People that move elsewhere take their tax dollars with them.

Please consider the above when making your decision on the Permit for this project. Thank you for your time.

Sincerely,

Loretta Tesvich

---

**Concern ID: 61970**

**The only alternatives in the EIS are diversions at different flow rates. The EIS has not listed other possible methods on building land in the Barataria Basin. One alternative is to study the creation of barrier islands and compare the result with the diversion alternative. Also consider fortifying the barrier islands with sheet piles, boulders, and rocks, and dam all pipeline canals and washed-out marsh openings with concrete dams.**

**Response ID: 15972**

The Draft EIS considered barrier islands as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.4 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS. While barrier islands play a critical role in reducing land loss, they are not intended or designed to transport sediment, fresh water, or nutrients.

Past investments through a multitude of restoration programs have resulted in the restoration of every major barrier island in the Barataria Basin. CPRA's Coastal Master Plan includes

---

programmatic barrier island restoration to support future maintenance of the restored islands. However, CPRA has stated that fortifying barrier islands with hard structures is not feasible.

---

**Concern ID: 62029**

**The EIS describes immediate, major, and permanent adverse impacts on several critical species in the Barataria Basin, including shrimp and oysters. The health of commercial fisheries and the socioeconomic well-being of coastal communities are closely intertwined. Such impacts would inflict economic harm on businesses, families, and individuals.**

**Response ID: 16225**

The issues raised by the commenters were considered in the Draft EIS. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted. The EIS also acknowledges the importance of commercial fisheries to the Louisiana economy and communities, as described by commenters. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana and Section 4.14 Commercial Fisheries describes impacts to commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts to shrimp and oyster fisheries in the proposed Project area are anticipated under the Applicant's Preferred Alternative. Changes in abundance may exacerbate trends of aging fishers leaving the industry and would have adverse impacts on the overall fishery. Adverse impacts may be partially offset by changes in fisher behavior. Additional details on the regional and community level economic impacts on commercial fisheries due to the proposed MBSD Project can be found in Section 4.14 Commercial Fisheries.

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62078**

**The proposed MBSD Project would cause the loss of Louisiana shrimp, oyster, crab and finfish production which would impact the seafood based supply chain of southern Louisiana, including corresponding impacts on restaurants in New Orleans and southern Louisiana.**

**Response ID: 16243**

The impacts raised by the commenters were considered in the Draft EIS. The EIS acknowledges in Chapter 3, Section 3.14.7 in Commercial Fisheries that the seafood industry represents a major source of jobs and income in Louisiana, which includes commercial harvesters, seafood processors and dealers, seafood wholesalers and distributors, and retail sales. Chapter 4, Section 4.14 Commercial Fisheries discusses regional economic impacts and community impacts on the shrimp, oyster, crab, and finfish fisheries, noting that communities with a high reliance on these landings may be most heavily impacted, and that indirect effects may include impacts to fish license holders, crew, dealers, suppliers, and seafood processors. While availability of shrimp and oysters from the basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's

Preferred Alternative than under the No Action Alternative. This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently

contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61908**

**Commenters suggested that there will be detrimental impacts on the tourism economy and on restaurants, which are partly dependent on fisheries in the Barataria Basin. Commenters express concerns about adverse effects on Louisiana's attractiveness as a fishing area and place for swamp tours and authentic seafood.**

**Response ID: 16238**

EIS Chapter 4, Section 4.16.5.2 in Recreation and Tourism describes how the MBSD Project would impact the tourism economy that is dependent on fisheries. Relative to the No Action Alternative, the proposed Project would cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts on these species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips. As described in the EIS, these changes would not substantially impact the broad tourism economy, which includes more than fisheries.

While availability of shrimp and oysters from the basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's Preferred Alternative than under the No Action Alternative.

This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

**Correspondence ID:40442**

Jonathan Duhon

To the U.S. Army Corps of Engineers and the Louisiana Trustee Implementation Group (LaTIG) c/o of NOAA:

Coastal Louisiana is part of me as a person - I have worked and recreated along the coast, as my family has for generations. I have also witnessed the changes and land loss of Coastal Louisiana – it must be mitigated so my generation, and future generations can continue to enjoy the vitally important resources of the marshes, swamps, bays, lakes, and everything depending on them. The river has land building capabilities that must be utilized as a cost effective strategy to slowing coastal Land loss.

As someone who is invested in property in Louisiana, and works in the real estate industry of Louisiana, I have an interest in decreasing the vulnerability of our coastal communities. The coastal wetland system creates multiple lines of natural defense from hurricanes and storm surge. For too long, the Mississippi River Levee System has starved our coastal lands of sediment, leaving them decayed, and making the properties that my wellbeing depends on more vulnerable to hurricane damage. This issue has implications on property values. The housing market is put at risk if we don't take bold action to restore the coast.

A crucial component to restoring the coast is reconnecting the Mississippi River to the surrounding marshes. I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and support funding the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

Please consider taking the following actions for the sake of our state and our coast:

Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

Center community needs in planned mitigation and stewardship efforts.

Commit to developing a robust adaptive management program.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to

---

them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and

---

take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63341**

**The coastal wetland system creates multiple lines of natural defense from hurricanes and storm surge, and the ongoing wetland loss resulting from the lack of riverine input into the basin has resulted in increased storm risks to local communities (including decreases in property values and impacts to the electrical grid).**

**Response ID: 16300**

The commenter's support for the proposed Project is noted. The commenter correctly notes that coastal wetlands are natural defense against hurricanes and storm surge, and the damage they cause to local communities and infrastructure, as discussed in Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S. of the Draft EIS. The causes of wetland loss in the proposed Project area were discussed in Section 3.6.2 of the Draft EIS, and included subsidence, levees, storms, canals/spoil banks, herbivory, and the DWH oil spill. Chapter 4, Sections 4.6 Wetland Waters and Resources of the U.S. and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS explained how the proposed Project would create and maintain wetlands in the Barataria Basin, and discuss the corresponding impacts on storm surge and flooding.

Commenter

To the U.S. Army Corps of Engineers and the Louisiana Trustee Implementation Group (LaTIG) c/o of NOAA:

As someone who has lived all their life in the state of Louisiana and has visited Morgan City many times, I have seen the ability of rivers to build land and impact the livelihoods of those who reside near them. Also, as someone invested in Louisiana real estate, I have a personal interest in mitigating the vulnerability of our coastal communities. The pressures of the Mississippi River Levee System on coastal lands make properties more vulnerable to hurricane damage, as well as potentially decreasing property values.

If the Mississippi is not allowed to assume its natural course by diverting to the Atchafalaya, then some other course of action must to be taken to reconnect it to the surrounding marshes in order to help restore the coast.

Therefore I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and support funding the project using Deepwater Horizon settlement dollars as outlined in the proposed Restoration Plan.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area,

---

community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

ByWater Beachside LLC

John Helmers

As previously stated, I have valid concerns over the stated efficacy, size, location, and management of the Mid-Barataria Sediment Diversion and its potential negative impacts to crab, shrimp, oyster, and finfish fisheries, our seafood industry, and our hurricane protection system. The true costs and benefits of this diversion's implementation and operations should be determined, additional alternatives (dredging) should be considered, and a plan developed on how the negative implications will be addressed, with emphasis on those whose livelihoods will be at stake.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated

---

from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63185**

**Additional development of mitigation plans and accountability for mitigation commitments is needed.**

**Response ID: 16562**

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final

Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

---

**Concern ID: 66342**

**The cost of the diversion is not justified and the project is questionable.**

**Response ID: 16772**

The NEPA regulations do not require a cost-benefit analysis for the EIS unless such an analysis is relevant to an agency's decision. USACE generally assumes that a permit applicant has made its own economic evaluation regarding the costs of a proposed project. However, as part of its public interest review, USACE will weigh the harms that would be caused by the Project against its potential benefits.

In the LA TIG's Restoration Plan, the LA TIG considers the cost to carry out the Project consistent with the Restoration Plan alternatives evaluation criteria, 15 CFR §990.54.

---

Loreen Callais

I oppose the Mid-Barataria Sediment Diversion. I know this will destroy our seafood industry. I had oyster bedding grounds on the east bank of lower Plaquemines Parish and in the late seventies when the levees holding back the Mississippi River started deteriorating and the corps did not repair them fresh water entered the area and we were shut down. To date not one oyster has grown or harvested and the land that has been built is a joke, yes it's building (very little marsh) 40 YEARS LATER. We need to stop this diversion now. Our parish has served the state of Louisiana well from oil & gas to seafood, we deserve better, this will finish the only industry left and the businesses all over this state that depend on our seafood.

---

**Concern ID: 62779****Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.****Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions,

would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62784**

**Prior or proposed diversions and diversion-like projects (including the Caernarvon Diversion, MRGO, Mardi Gras Pass, Maurepas Bonnet Carré Spillway openings) did not work or caused adverse impacts on area resources.**

**Response ID: 16366**

The commenter's concern regarding the effectiveness and adverse impacts of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the Caernarvon Diversion, MRGO, Mardi Gras Pass, and Bonnet Carré Spillway, is available in Appendix U of the Final EIS. The Maurepas Diversion is subject to an ongoing NEPA analysis, which is anticipated to be finalized in 2022.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The referenced projects all had unique goals, and, where goals existed, each of those projects have achieved their goals. Those achievements increase confidence in the ability of the LA TIG to set goals and select approaches appropriate for achieving those goals. The proposed Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the current geomorphological features of the Lower Mississippi River, as well as data and knowledge gained from the referenced projects.

---

**Correspondence ID:40449**

New Delta, L. L. C

Gregory Meyer

I would like to state for the record that I am "FOR" Mississippi river sediment diversions. I am fifth generation in a home that was built in 1721 on the banks of the Mississippi River. Our home and family were here before the massive levees were built to cut the Mississippi river off from the estuaries. We are now in danger of devastation with the disappearing marsh Prairie and now living outside of the flood wall. I work on a daily basis in the new Delta being created by Mardi Gras pass and I see firsthand The massive amount of quick solid land building going on. I am in favor of river diversions as long as they run as designed and or not altered by special interests.

---

**Concern ID: 63342**

**Other natural or man-made diversions have successfully built land, such that the proposed MBSD Project would also be expected to build land.**

**Response ID: 16302**

The commenter's support for the proposed Project is noted. Consistent with the comment, Chapter 4, Section 4.2.3.2 in Geology and Soils indicates that the proposed Project is anticipated to build land in the Barataria Basin (with smaller amounts of land loss projected in the birdfoot delta). To facilitate comparisons between the proposed Project and other natural or man-made diversions, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

---

**Concern ID: 63390**

**The proposed Project would be beneficial as long it is run as designed and is not altered by special interests, and would help maintain wetlands that would minimize flood risks to the commenter's generational home, outside the levee system.**

**Response ID: 16352**

The commenter's support for the proposed Project is noted. Chapter 4, Section 4.6 Wetlands and Waters of the U.S. of the EIS discusses the extent of wetland maintenance and restoration that would be expected from the proposed Project, although Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction acknowledges the increased potential for flooding impacts outside of federal levee systems. Recognizing the potential for these impacts, CPRA has developed a number of mitigation and stewardship measures for infrastructure impacts, such as elevating public roadways. These measures, which have been revised in response to public comments since the release of the Draft EIS, are described in Appendix R1 (Mitigation and Stewardship Plan) of the Final EIS.

Structural measures such as raising roads or improving bulkheads in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if the permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

---

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the D EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. The USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 (Mitigation Summary) of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:40450**

Andree Duhon

To the U.S. Army Corps of Engineers and the Louisiana Trustee Implementation Group (LaTIG) c/o of NOAA:

Coastal Louisiana is part of me as a person - I have worked and recreated along the coast, as my family has for generations. I have also witnessed the changes and land loss of Coastal Louisiana – it must be mitigated so my generation, and future generations can continue to enjoy the vitally important resources of the marshes, swamps, bays, lakes, and everything depending on them. The river has land building capabilities that must be utilized as a cost effective strategy to slowing coastal Land loss.

As someone who has invested in property in Louisiana, I have an interest in decreasing the vulnerability of our coastal communities. The coastal wetland system creates multiple lines of natural defense from hurricanes and storm surge. For too long, the Mississippi River Levee System has starved our coastal lands of sediment, leaving them decayed, and making the properties that my wellbeing depends on more vulnerable to hurricane damage. This issue has implications on property values. The housing market is put at risk if we don't take bold action to restore the coast.

A crucial component to restoring the coast is reconnecting the Mississippi River to the surrounding marshes. I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and support funding the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63341**

**The coastal wetland system creates multiple lines of natural defense from hurricanes and storm surge, and the ongoing wetland loss resulting from the lack of riverine input**

---

**into the basin has resulted in increased storm risks to local communities (including decreases in property values and impacts to the electrical grid).**

**Response ID: 16300**

The commenter's support for the proposed Project is noted. The commenter correctly notes that coastal wetlands are natural defense against hurricanes and storm surge, and the damage they cause to local communities and infrastructure, as discussed in Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S. of the Draft EIS. The causes of wetland loss in the proposed Project area were discussed in Section 3.6.2 of the Draft EIS, and included subsidence, levees, storms, canals/spoil banks, herbivory, and the DWH oil spill. Chapter 4, Sections 4.6 Wetland Waters and Resources of the U.S. and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS explained how the proposed Project would create and maintain wetlands in the Barataria Basin, and discuss the corresponding impacts on storm surge and flooding.

---

**Concern ID: 63354**

**The proposed MBSD Project is the most cost-effective way to address the current problems in a sustainable way.**

**Response ID: 16316**

The USACE and LA TIG acknowledge the commenter's support for the proposed Project. The LA TIG further notes that it strove to identify a preferred alternative that meets OPA's cost criteria and achieves the LA TIG's goals of comprehensive, integrated ecosystem restoration, through the creation of deltaic processes that supports an ecosystem that would be sustained over decades even in the face of rising sea levels and coastal erosion.

---

**Correspondence ID:40451**

National Wildlife Federation

Emily Schatzel

I support the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and support funding the project using Deepwater Horizon settlement dollars as outlines in the draft Restoration Plan.

I am a proud Louisianian whose family roots in our beloved state can be traced back to the 1700s. Growing up in Terrebonne Parish left me with a childhood colored with memories fishing, boating, and enjoying our beautiful landscape. I want my children and grandchildren to be able to enjoy the same.

But as we all know, that will not be entirely possible. Our future coast will not look like the coast of the past.

Our landloss crisis is simply too far gone to fully restore and rebuild all that has been lost. Even in my lifetime, I've witnessed firsthand areas that were once marshy and have since turned into open water.

We are out of time, for both restoration and protection, when it comes to planning and studying. For both, more studies won't get it done. For restoration, dredging alone won't get it done. Every single other single project won't get it done alone either. For protection, levees alone are not enough.

We have to use what we have at our fingertips. That includes the knowledge we've already gleaned and verified over decades, the tons of land-building sediment that flows down and is lost off into the Gulf, and the unparalleled power of the river itself and we must move forward with the Mid-Barataria Sediment and restore our wetlands.

We must put the river to work, and the Mid-Barataria Sediment Diversion does just that. It will work in concert with nearby marsh creation projects to extend their longevity, which optimizes our investments. Not to mention the massive economic boon coming from the construction and sales related to the development of the project.

We have suffered for decades, with some of the most beloved parts of Louisiana falling off the map. Places where my ancestors traversed and treasured, fished and farmed and lived and loved.

We cannot let Louisiana fall off the map. Let's reverse the narrative and put Louisiana ON the map - literally and metaphorically. We can build land, innovatively and sustainably. We can model climate resiliency for coastal regions around the world. We have resources other vulnerable communities envy, with the ability to use nature itself to restore natural processes and build land.

The Mid-Barataria Sediment Diversion is the single largest ecosystem restoration project in the history of the U.S. This project will build more wetlands than any other individual restoration project in the world, and it is exactly the scale of project we need to address the very serious challenges we face.

Please keep this critical project moving forward, for all of us. I want my children and grandchildren. to be able to enjoy all that Louisiana has to offer, for years and generations to come. I want them to know that when the time came and we have available solutions on the table – we did the hard work, and we made Louisiana better.

Thank you.

---

**Concern ID: 63336**

**This proposed Project is absolutely crucial for the future of our coast and the safety and livelihoods of our coastal communities.**

**Response ID: 16292**

The commenter's support for the proposed Project is noted. The proposed Project, by reestablishing deltaic processes, is intended to build coastal resiliency and protection for the coastal communities behind Barataria Basin. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

See Sections 3.2.1.6 (Benefits Multiple Resources) and 3.2.1.7 (Public Health and Safety) of the LA TIG's Restoration Plan for a detailed discussion of the proposed Project's potential benefits and public health and safety impacts, respectively.

---

**Concern ID: 63339**

**The Mid-Barataria Sediment Diversion is the largest individual ecosystem restoration project in our country's history, which is fitting since the Barataria Basin is experiencing one of the highest rates of land loss on the planet. Large-scale projects like the Mid-Barataria Sediment Diversion are just the kind of bold actions that are needed if there is to be any hope of a truly sustainable coast.**

**Response ID: 16297**

The commenters' support for the proposed Project is noted. Land and wetland loss along coastal Louisiana is described in EIS Chapter 3, Sections 3.1.4.1 and 3.1.4.2 in Introduction.

---

**Concern ID: 63388**

**Commenters noted that the time for planning and studying has run out and the river must be put to work. The Mid-Barataria Sediment Diversion would do just that. It would work in concert with nearby marsh creation projects to extend their longevity, which optimizes our investments. In addition, there would be a massive economic boon coming from the construction and sales related to the development of the proposed Project.**

**Response ID: 16350**

The commenter's support for the proposed Project is noted. The cumulative impacts of the proposed Project and other restoration projects were discussed in Chapter 4, Section 4.25 Cumulative Impacts of the Draft EIS, as applicable. Further, the comment is consistent with Chapter 4, Section 4.13.4.2 in Socioeconomics of the Draft EIS, which identified major economic benefits within the Project area during construction of the proposed Project.

---

**Correspondence ID:40453**

Mark Hingle

Please do not destroy the recreational fishing revenue as well as the lives of commercial fisherman to save less land than the city of gretna.

---

**Concern ID: 62779****Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.****Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

---

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 66933**

**The Project would save less land than the city of Gretna.**

**Response ID: 16860**

The commenter's concern about the amount of land created or sustained by the Project was considered in the Draft EIS. As explained in Chapter 4, Section 4.2.3.2 Geology and Soils, Operational Impacts, the Project would increase the amount of land in the Barataria Basin by approximately 13,400 acres in 2070, but result in 3,000 less acres of land in the birdfoot delta in 2070 (see Chapter 4, Section 4.2.3.2.1 Geology, Table 4.2-4).

---

**Correspondence ID:40454**

Caleb Kergosien

My name is Caleb Kergosien and I currently live in Diamondhead, MS. I have lived on the MS Gulf Coast, specifically Bay St. Louis, my entire life. The majority of my fondest memories growing up included fishing along the Gulf Coast and LA Marsh with my dad and friends. Growing up on a bayou that led to the Jourdan River allowed us to quickly hop in the boat and head off for a day of fishing for our favorite speckled trout and redfish.

As I recall the prolonged duration of the spillway being opened, I look back and realize how significantly the abundance of fresh water flowing into our fisheries negatively impacted what I and so many others around me loved to do. The Breton Diversion will essentially produce the same results. I hope that all those who share the same passion for boating and fishing as I do have their voices heard. I greatly look forward to the day I can take my kids out and catch quality fish the way I was able to do with my father and expect this to not be taken away from others and myself.

I only hope Mississippi has its voice heard and a say so in this matter and that fishing on the Gulf Coast/ LA Marsh remains strong for all of those who participate recreationally and especially for those who use this resource as a means of making a living. Please do not wreck our coast.

Thank you.

---

**Concern ID: 62367**

**The Mid-Breton Sediment Diversion would have devastating impacts to the Mississippi Gulf Coast, similar to the opening of the Bonnet Carré Spillway.**

**Response ID: 15898**

The focus of this EIS is the proposed Mid-Barataria Sediment Diversion. The impacts of the proposed Mid-Breton Sediment Diversion are considered in this EIS as part of the cumulative impacts analysis, which analyzes the incremental impacts of the proposed Project when added to other past, present, and reasonably foreseeable future actions (see Chapter 4, Section 4.25 Cumulative Impacts). However, there would be an opportunity for the public to provide comments on the proposed Mid-Breton Sediment Diversion at such time the USACE releases the Draft EIS for that proposed project.

The proposed Project is not anticipated to have measurable impacts on ecological resources within the State of Mississippi, including distributaries of the Mississippi River.

---

**Correspondence ID:40455**

Debra Canatella

To the U.S. Army Corps of Engineers and the Louisiana Trustee Implementation Group (LaTIG) c/o of NOAA:

The Mid-Barataria Sediment Diversion project will be invaluable for birds, and for people like me who enjoy watching birds. The importance of Coastal Louisiana to people who bird watch is substantial because of the amount of opportunity it provides as a birding location, as well as key habitat for birds that migrate through our yards. The Barataria Basin was one of the most impacted areas during the 2010 BP oil disaster. The Mid-Barataria Sediment Diversion is an ecosystem-scale restoration project that will address oil spill injuries to the Barataria Basin and benefit the northern Gulf of Mexico ecosystem's fish and wildlife that rely on healthy wetlands.. I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and support funding the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

---

**Concern ID: 62892**

**The proposed MBSD Project would create wetlands supportive of birds (bald eagles, spring and fall migrants, waterbirds, and marsh birds) and other wildlife that are experiencing a high rate of coastal land (habitat) loss.**

**Response ID: 16191**

Chapter 4, Section 4.9.4.2 in Terrestrial Wildlife and Habitat of the Draft EIS, discussed the maintenance and creation of marsh that is projected to occur as part of the proposed Project, and identified that the net addition of wetlands would generally be beneficial to area birds. As identified in Section 4.12.3.2 in Threatened and Endangered Species of the Draft EIS, the creation and maintenance of wetlands could affect bald eagle aquatic foraging habitat and prey species, but would likely result in negligible effects on the bald eagle itself.

The potential benefits of the proposed Project to resources in the Gulf, including birds, are also described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from

the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:40456**

Kacie Wright

I have spent my career working on the coast. Planting trees, marsh grasses, talking to folks about the big problem of coastal land loss in Louisiana. But what we need most now, are big solutions to help slow down the crises before us. The river has potential to be that solution. I have seen the land building capacity of west bay diversion - - replicating the deltaic process further upstream is a good next step. I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and support funding the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

Since restoring the coast is about helping people, centering community needs in planned mitigation and stewardship efforts should also be a priority. Plans to help communities deal with impacts of the projects should be clearly stated and fully funded.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63342**

**Other natural or man-made diversions have successfully built land, such that the proposed MBSD Project would also be expected to build land.**

**Response ID: 16302**

The commenter's support for the proposed Project is noted. Consistent with the comment, Chapter 4, Section 4.2.3.2 in Geology and Soils indicates that the proposed Project is anticipated to build land in the Barataria Basin (with smaller amounts of land loss projected in the birdfoot delta). To facilitate comparisons between the proposed Project and other natural or man-made diversions, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

Louisiana Trustee Implementation Group (LaTIG) c/o of NOAA

Re: Mid-Barataria Sediment Diversion (MBSD) Draft Environmental Impact Statement (DEIS)

Dear Mr. Laborde and Mr. Landry:

My name is Samantha Carter and I support the selection of the preferred alternative: Alternative 1, Variable Flow up to 75,000 CFS for the Mid-Barataria Sediment Diversion and urge you to fund the project using the settlement dollars from the Deepwater Horizon oil spill, as outlined in the draft Restoration Plan. As a Louisiana resident I believe that project is integral to the future of our state.

We desperately need the Mid-Barataria Sediment Diversion to deal with the immense land loss problem at that we face. We must work with nature and the power of the Mississippi River to restore natural processes, rebuild wetlands, stop the encroachment of the sea and protect our coastal communities, economies and ecosystems. Using the river as a land building tool is the only way we can successfully restore our coast with the resources at hand. This project will let the river do the work for us and extend the lifespan of nearby marsh creation projects, maximizing our efforts and our limited dollars.

The long-term consequences of alternating our delta system for hundreds of years have finally arrived at our doorstep. The time for inaction is over and the time for easy solutions is past. This project will not come without costs and we must make sure that our most vulnerable communities are not left behind. I urge the USACE and the State of Louisiana to center its mitigation efforts on community needs, let community input lead that process from the beginning and focus on equity every step of the way. CPRA cannot do that alone, we must call on other state and federal agencies to help with workforce development, housing, loan programs and assistance, educational and training programs, mental health issues, subsidies for fisheries and anything else that the impacted communities identify as a need.

I encourage the state and federal agencies involved in fisheries management to take deep dive into how to help fishermen and women be successful in a restored, healthy and thriving delta. The fishing industry needs help with or without the diversion and the mitigation plans associated with the project could be the life line that many fishing families need to adapted to an ever-changing delta. There were oysters and shrimp (and dolphins) in Louisiana before the levees where ever even a thought and they will be here after sediment diversions are operational. We just need to help those that rely on the water get access to those resources that may be in new locations and help them to continue to adjust and transition to a hopefully much brighter future.

I moved to New Orleans in 2014 to work on coastal issues but this place has been in my heart for much much longer. Having lived all over the US in my life, I can say that there is truly no other place like southern Louisiana. I have invested my time, energy and resources into making a career, life and home here. The culture, the food, the music, the people, the landscape and the wildlife all come together to make a vibrant and unique way of life. It would be tragic to lose it all when we have the tools to save and protect it.

Louisiana may be one of the first to face such impacts from climate change but we will certainly not be the last. This is a huge moment for our state to become a global leader in climate change adaptation and create a robust restoration economy. Decades of world class science is overwhelmingly conclusive that sediment diversions are our best shot at a sustainable Mississippi River Delta. We mustn't let politics or a few very loud individuals jeopardize our ability to put the power of the river to work and save our coast. Through my work I have had the privilege of getting to know the science, policy and people in the coastal restoration world here and I am so proud to get to work on these issues as we make history.

Let's do this.

Samantha Carter

New Orleans, Louisiana

---

**Concern ID: 62401**

**Decades of world-class science is overwhelmingly conclusive that sediment diversions are crucial to a sustainable Mississippi River Delta. Politics or a few very loud individuals should not jeopardize putting the power of the river to work and save our coast.**

**Response ID: 15925**

The USACE developed a comprehensive EIS that evaluates the beneficial and adverse impacts of the proposed Project. Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan.

All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted**

---

**mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to

---

implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and

---

Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

**Concern ID: 63935**

**State and Federal agencies should collaborate with CPRA to help with mitigation efforts related to workforce development, housing, education and training programs, mental health, fisheries subsidies and access to capital for people to go into business for themselves.**

**Response ID: 16582**

According to CPRA, it is collaborating with the LA TIG federal agencies (NOAA, DOI, USEPA, USDA) through the LA TIG framework as well as other venues, in the development and implementation of the Mitigation and Stewardship Plan. CPRA anticipates working with other State agencies, such as Louisiana Economic Development, on the workforce development, education and training programs included in the Mitigation and Stewardship Plan (Appendix R1 to the EIS). Finally, the State of Louisiana has been working with, and will continue to work with, Louisiana Sea Grant on the Seafood Futures initiative, focused on ensuring a long term, sustainable fishing industry in spite of coastal changes. Louisiana Sea Grant, based at Louisiana State University, is part of the National Sea Grant Program, a network made up of 34 programs located in each of the coastal and Great Lakes states and Puerto Rico. Sea Grant Programs work individually and in partnership to address major marine and coastal challenges.

Loyola University New Orleans & First Grace United Methodist Church

Anne Daniell

Please choose the plan that will bring about the most land growth/land building. From what I understand, Plan 5 is the one that would bring about the most growth.

As you certainly are aware, Louisiana has been losing copious amounts of land, with coastal lands sinking into the sea. Louisiana needs a \*robust\* land-building process in motion ... as soon as possible!

We need the verdant lands for storm protection, in addition to habitat for the wildlife that Louisianians love so much.

Please help to bring back our beloved place, our home!

Sincerely, Anne Daniell

---

**Concern ID: 63353**

**The commenter strongly supports the Applicant's Preferred Alternative, but would prefer something larger. The commenter further notes that south Louisiana cannot afford to wait longer or accept lesser solutions because the coastline is sinking and local fisheries and wildlife habitat is washing into the Gulf. Fortunately, the Mississippi River offers a chance at salvation if the river is used correctly.**

**Response ID: 16315**

The commenter's support for the proposed Project is noted. The relative impacts, both beneficial and adverse, for the various capacity alternatives is explained throughout Chapter 4 Environmental Consequences of the EIS. Although the 150,000 cfs Alternative would result in the greatest degree of benefits (including the most land building), it also would result in the greatest degree of adverse impacts, particularly to marine mammals (see Section 4.11.5 in Marine Mammals), shrimp and oysters (see Section 4.10.4.5 in Aquatic Resources), and public health and safety (through increased water levels and inundation in areas closer to the immediate outfall, see Section 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction). The USACE has supplemented Section 4.10.4.5.3 in the Final EIS to further discuss the impacts of the 150,000 cfs Alternative to brown shrimp and oysters. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

The LA TIG's Restoration Plan evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54 and strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. While 150,000 cfs diversion would be expected to deliver more ecological benefits in terms of land creation and marsh building than the LA TIG's Preferred Alternative, it would also incur more collateral injuries and pose a greater risk to human health and safety; thus, it was not selected as the LA TIG's Preferred Alternative. See Section 3.2.4 (Overall OPA Evaluation Conclusions) of the Final Restoration Plan for a discussion of how the LA TIG came to its decision. In making its NRDA decision,

---

the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Matthew Derbes

My name is Matt Derbes, I'm from (Orleans, St. Bernard, and Plaquemines Parish). These are my comments on CPRA's and many others in charge of the trajectory concerning coastal restoration of our beloved state.

The people from where I reside are tired of feeling like our elected officials take them for granted. We are tired of feeling like we are having war waged against us by fake representatives. Our minds are blown on how a lot of situations are handled throughout our states history. CPRA is gravely misguided in my opinion. We fail to realize what we have. We fail to acknowledge the truth that only heavy intellectual reasoning and planning with actual members of the communities who are experts in their own rights (live and make money in the wilds/areas affected) with any changes made by the state other than sediment dredging by the U.S Army Corp of Engineers.

We have one of the most important ports in the world ninety and some odd miles above the mouth of the Miss. River that the Corps has managed since 1802. Throughout this process, I've gotten a gauge on how people feel semi locally and nationally. North of Covington and Baton Rouge most folks actually entertain the idea of the river running wild and beefing up the delta like back in the 1700's and are inconsiderate of the couple hundred thousand people that inhabit the land below New Orleans. We have our own culture and ways of life that must be protected. (And frankly, are under attack) But what's scary is the scientist at LSU and the misguided CPRA give people this confidence to have such stances. Their message is that everyone will have to adapt to these unreasonable changes. We know what it will take which seems impossible now, a nation wide effort (acknowledgement and support for starters) heavy dredging and protection rocks.

For example, even Kellogg cereal has and 8 billion dollar endowment not to mention such institutions as Harvard and Yale that make Kellogg look small. As mentioned above, where is the acknowledgment of our future. We're going to use that 8 billion once?? As we already found out after Katrina people have the stance we're not worth it. An endowment of that size could generate 300 to 400 million a year on our money. In my opinion the state can only do 400 to 800 million in dredging a year. We have dredging going on right now that is working but see people pretending that's not the answer.

Let's get down to the talking points.

The EIS shows the diversions in both sides are not a good move. Money being spent wrongly has already been discovered with the research of (millions spent) freshwater bivalves (goes to show how important) when the TRUTH is the the C. Virginica Oysters are the cornerstone of everything in our state. (Again realizing what we have) Tourism and everything that we hold dear from the sportsman paradise depends on the saltwater eastern oyster to survive. It's still the largest oyster fields in the world at the moment despite hanging on for dear life. The water surrounding the GNO and the Miss. Sound should always be 10 to 30 ppm salinity. One last note on the oysters. We want to remain real and authentic and we seen what happened when Chesapeake Bay was polluted, entrepreneurs were purchasing our seafood and calling it theirs. (Crabs and Oysters) So every state around Louisiana wins and we lose? No way.

We must also protect the other important fauna in our area. The dolphins, crabs, shrimp etc.

St. Bernard, Plaquemines, and other counties from Mississippi are against these diversions and the State doesn't seem to hear or care about them outside of these comment periods. Everyone I know has lost hope and I know the Corp will do the right thing in the end and protect this state. The freshwater flora that replaces the hearty saltwater flora is a dangerous thing when hurricanes come through. Water Lilly's are not land no matter what it looks like from a drones view.

We loudly say NO to the Mid-Barataria and the Mid-Breton diversions. We should close Mardi Gras Pass! That would take a little effort but can be done. Essayons!!!! The way things are going is discouraging. The recent vote (year or more back) went in favor of landowners and the public lost much water access. South Pass has silted in to where twenty foot boats are scared to traverse. That's ridiculous. So now I get the notion that the end game is less accessibility for John Q Public instead of fostering and having an air of stewardship where we do the right thing. All navigable channels should remain navigable. Do not cut two more holes in the levee ok?

High cfs water flows with little sediment is not the answer and that shouldn't be coming from me. Where are the top minds working on this? I will try to add to this and hope I conveyed the importance of stopping these diversions and showing the people of this state we are on the right path. The MRGO was a plan that was floated as the answer to a lot of problems but became one of the most regrettable endeavors that really only hurt. My dad spent his entire career keeping that open and his last job was building the dam to close it. We do not accept that our culture and way of life ruined for another experiment.

Sincerely,

Matthew Derbes

I forgot to add the the dangers of the pollution in the river! Smarter people than me are playing this off as if the river is a pure lifeblood the system needs. We need the saltwater bivalves the most.

---

**Concern ID: 61957**

**Commenters are concerned with the lack of inclusion by CPRA. The CPRA held meetings, reached out to local communities throughout the process; however, the CPRA ignored most, if not all, of the input they received from the communities, shrimpers, crabbers, oyster fisherman, and others.**

**Response ID: 15903**

Chapter 7 Public Involvement of the Final EIS includes a summary of meetings that CPRA held with the communities and groups projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities and groups. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. Refer to the Final Mitigation and Stewardship Plan in Appendix R1, which has been revised since the release of the Draft EIS in response to public input, for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of

---

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62302**

**The diversion would cause land loss, then create freshwater marshes which are more susceptible to saltwater impacts of storm surge and increasing future storm surge impacts.**

**Response ID: 15815**

Additional analysis regarding the potential impacts of conversion from saline marsh and brackish marsh to fresh and intermediate marsh and on susceptibility to hurricanes and saltwater inundation in the Project area during operations has been added to Chapter 4, Section 4.6.5.1 Wetland Types and Extent of the Final EIS.

---

**Concern ID: 62400**

**North of Covington and Baton Rouge most folks actually entertain the idea of the river running wild and beefing up the delta like back in the 1700's and are inconsiderate of the couple hundred thousand people that inhabit the land below New Orleans. Areas south of New Orleans have their own culture and ways of life that must be protected. Dredging works but people are pretending that's not the answer.**

**Response ID: 15924**

The EIS analyzes impacts throughout the Project area, including south of New Orleans.

Dredging was considered under the category of "marsh creation." Marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5, Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the

---

purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

USACE will consider all public comments received and will also conduct a public interest review, which considers various factors relevant to the proposed Project and weighs the projected harms of a proposed project against its projected benefits, before deciding whether to grant the permit and permission request.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://www.gulfspillrestoration.noaa.gov/restoration-areas/louisiana>).

---

**Concern ID: 62777**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).**

**Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

---

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62784**

**Prior or proposed diversions and diversion-like projects (including the Caernarvon Diversion, MRGO, Mardi Gras Pass, Maurepas Bonnet Carré Spillway openings) did not work or caused adverse impacts on area resources.**

**Response ID: 16366**

The commenter's concern regarding the effectiveness and adverse impacts of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the Caernarvon Diversion, MRGO, Mardi Gras Pass, and Bonnet Carré Spillway, is available in Appendix U of the Final EIS. The Maurepas Diversion is subject to an ongoing NEPA analysis, which is anticipated to be finalized in 2022.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The referenced projects all had unique goals, and, where goals existed, each of those projects have achieved their goals. Those achievements increase confidence in the ability of the LA TIG to set goals and select approaches appropriate for achieving those goals. The proposed Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the current geomorphological features of the Lower Mississippi River, as well as data and knowledge gained from the referenced projects.

---

**Concern ID: 63014**

**The commenter asserts that USACE should close Mardi Gras Pass. South Pass has silted in to where 20-foot boats are scared to traverse. All navigable channels should remain navigable.**

**Response ID: 15795**

Comment noted. Any proposed closure of Mardi Gras Pass is outside the scope of this EIS, which evaluates the potential impacts of CPRA's proposed Project.

---

**Concern ID: 63154**

**Oysters are the cornerstone of everything in Louisiana (tourism and industry) and oysters need salinities of between 10 and 20 ppm. The oyster fields in the greater New Orleans area and Mississippi Sound are the largest oyster fields in the world at the moment, despite hanging on for dear life.**

**Response ID: 16155**

The salinity requirements of oysters are discussed in Chapter 3, Section 3.10.5.2 in Aquatic Resources and impacts on oysters from salinity changes due to the proposed Project are discussed in Chapter 4, Section 4.10.5.5 in Aquatic Resources of the EIS. The importance of oysters to the commercial fishery is discussed in Chapter 3, Section 3.14.3 in Commercial Fisheries and impacts on these industries/activities are discussed in Chapter 4, Section 4.14.4.2 in Commercial Fisheries.

Overall, the eastern oyster fishery in the Project area is expected to experience major, permanent, adverse impacts under the Applicant's Preferred Alternative relative to the No Action Alternative, although it is possible that areas near the barrier islands could be used as seed grounds and growing areas for adults when salinities are too low throughout the rest of the Barataria Basin. This determination considers expected impacts on oyster abundance as well as the anticipated response from commercial fishers.

As indicated in Table 4.16-2 of the EIS, recreational oyster harvest accounts for a very small portion of overall recreational fishing effort in the Barataria Basin; therefore, impacts to recreation and tourism associated with changes to recreational harvest of oysters are expected to be negligible.

While availability of shrimp and oysters from the basin would decrease due to the Project relative to the No Action Alternative, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional imports would likely also occur. Under the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp, though the impact would likely occur sooner and be more significant under the Applicant's Preferred Alternative.

The proposed Project is not anticipated to have discernable effects on aquatic life outside of the Project area, which includes the Barataria Basin and the Mississippi River birdfoot delta (particularly for biological resources), as defined in Chapter 3, Section 3.1.1 in Introduction of the EIS; therefore, negligible to no impacts on aquatic life in the Mississippi Sound are anticipated from the construction and operation of the proposed MBSD Project. Because

---

these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

Anne Daniell

P. S.

I sent a longer comment a few moments ago. But I want to add something.

Plan 5 appears to me to be the best plan. However, a decent alternate would be plan 1.

Thank you, Anne Daniell

---

**Concern ID: 61871**

**Alternative 5, Variable Flow up to 150,000 cfs, should be chosen for implementation because it provides substantially greater benefits at the higher flow, with only marginally increased adverse effects, most of which could be mitigated by the same measures being proposed for the 75,000 cfs Applicant's Preferred Alternative.**

**Response ID: 15944**

CPRA submitted a joint Section 10/404 permit application and Section 408 permission request to USACE for the construction, operation, and maintenance of a 75,000 cfs sediment diversion (Applicant's Preferred Alternative). The EIS evaluates the Applicant's Preferred Alternative and five additional action alternatives as well as the No Action Alternative in order to inform USACE's permit and permission decisions and the LA TIG's NRDA decision in compliance with the statues, orders, and policies outlined in EIS Chapter 5 Consultation and Coordination.

In the Restoration Plan, the LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54, and made every effort to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. As noted in the LA TIG's Restoration Plan, while the 150,000 cfs Alternative was projected to provide greater ecological benefits than the LA TIG's Preferred Alternative, it was also expected to cause greater collateral injury and greater risks to public health and safety. See Chapter 3, Section 3.2.4 of the Final Restoration Plan for a discussion of how the LA TIG came to its decision. Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

The Mitigation and Stewardship Plan (Appendix R1 to the EIS) has been designed by CPRA to mitigate the projected impacts of the 75,000 cfs sediment diversion (Applicant's Preferred Alternative). Different or additional mitigation could be needed to address the projected impacts of the proposed Project if a large capacity diversion (150,000 cfs) were to be selected.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review,

Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Mark Cognevich

My name is Mark Cognevich. I am a councilman for District 9 in Plaquemines Parish. I am writing to say I am 100% against the diversion. I can prove it will not work. I do not need scientific data. I will show you with historical Data. The Jump in Venice was cut open to the river in 1850. It is the width and depth as the diversion will be. So if diversions worked. Where is the land behind Venice. I can share more about the history of it if you would like

Thank you

Mark Cognevich

District 9 Councilman

---

**Concern ID: 62782****A large number of commenters expressed general opposition to the proposed Project.****Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62784****Prior or proposed diversions and diversion-like projects (including the Caernarvon Diversion, MRGO, Mardi Gras Pass, Maurepas Bonnet Carré Spillway openings) did not work or caused adverse impacts on area resources.****Response ID: 16366**

The commenter's concern regarding the effectiveness and adverse impacts of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the Caernarvon Diversion, MRGO, Mardi Gras Pass, and Bonnet Carré Spillway, is available in Appendix U of the Final EIS. The Maurepas Diversion is subject to an ongoing NEPA analysis, which is anticipated to be finalized in 2022.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The referenced projects all had unique goals, and, where goals existed, each of those projects have achieved their goals. Those achievements increase confidence in the ability of the LA TIG to set goals and select approaches appropriate for achieving those goals. The proposed Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the current geomorphological features of

---

the Lower Mississippi River, as well as data and knowledge gained from the referenced projects.

RE: Mid Barataria Sediment Diversion

To Whom It May Concern:

I am writing in strong support of the Louisiana Coastal Protection and Restoration Authority's (CPRA) Mid-Barataria Sediment Diversion project proposed for Plaquemines Parish on the Louisiana coast.

As a native and resident of Louisiana and someone who has worked as an advocate and practitioner of coastal restoration and protection for over 20 years, I have seen the unravelling of our Working Coast here in Louisiana for decades.

That unravelling threatens far more than the few populated areas immediately in the footprint of the proposed Diversion structure and outfall area - it threatens all of Louisiana, our people, our culture, our infrastructure, and our economy. As such, the need to address this existential threat to our continued existence in Louisiana has to be tailored to the benefit of the most people and systems, not one or two narrow bands of people or industries.

Of the project alternatives explored in the Draft Environmental Impact Statement (DEIS), the preferred alternative provides the most appropriate, balanced, and valuable opportunity to set Louisiana's most consequential basin on a course of sustainability in the face of subsidence, sediment starvation, sea level rise and climate change for decades beyond when the funding runs out.

Louisiana's land loss crisis is fundamentally driven by the disconnection of the Mississippi River from the delta through the construction of the Federal river levee system greatly accelerating the subsidence and degradation of the Delta and exacerbated by other human interventions over centuries. The Mid Barataria Sediment Diversion affords us the opportunity to make the necessary intervention to preserve and protect this Delta in a way that works with and mimics nature as well as the natural environmental and fisheries conditions which were present in these communities just a few short generations ago.

This project has been conceived, studied, and carefully considered for three decades. In that time, the Barataria Basin has lost square miles of land, been deeply impacted by the Deepwater Horizon oil spill, and seen population migrations and vital economic infrastructure continue to be built in the communities along and protected by this Basin. The DEIS provides yet another robust accounting of the potential impacts of this proposed project, and it is clear that the benefits far outweigh the potential negative impacts – even without the robust suite of mitigation measures proposed in the mitigation measures proposed.

With respect to the mitigation measures proposed, up-front monetary allocations to commercial fishermen for offsetting increased fuel costs and gear should be implemented in addition to lifetime gear licenses granted to commercial and recreational fishermen whose business or residential address is within the outfall of the proposed diversion once a favorable Record of Decision is approved. Similarly, up front allocations for offsetting increased fuel costs as well as any additional gear upgrades, surface right leasing, marketing/promotions etc for charter fishermen should also be made on a similar timeframe as well as marketing funds directed through both the regional Convention Center and Visitors Bureaus and the Louisiana Seafood Marketing and Promotions Board to maintain and increase tourism, recreation and the charter fishing trade across the Barataria Basin. Additional mapping and residential nonstructural flood risk mitigation measures specific to individual properties should similarly be developed to best inform potentially impacted residents on a similar timetable.

The Barataria Basin is essential to the culture, communities, economy and character of Louisiana and the American South, which is why billions of dollars have already been spent from a variety of sources including oil and gas and mineral revenues, local, state and federal general fund dollars, Coastal Wetlands Planning, Protection and Restoration Act (CWPPRA) dollars, private industry and landowners, and Deepwater Horizon fines and settlement dollars to engineer, design and construct scores of projects utilizing alternative methods such as dredging, pumping, rock placement, terracing, siphons, small scale sediment diversions, Christmas tree cribs, etc.

One could say that the Barataria Basin and Plaquemines Parish in particular are at the heart of innovation in coastal restoration and the sandbox in which we learn how best to manage both the threats we face and the resources we have been blessed with. What we have learned through that long history of learning at both large and small scales is that funding sources will deplete, dredged sediments pumped and shaped into land subside often within a few decades, but the River will continue to flow for generations and the sediments, nutrients and fresh water continue to build land as long as we allow it to flow.

Similarly, Plaquemines Parish and the surrounding communities are also being afforded the opportunity with this project to further capitalize on well over \$1 billion in economic impact through the construction of the project, adding hundreds of higher than average wage jobs to their communities. These jobs also will allow these communities to build a workforce pipeline of talent to continue to perform civil construction, earthworks, environmental restoration and surveying work in complex and challenging environments – all disciplines and skill sets which provide stable, lucrative incomes for workers and their families and flow on benefits of vibrant communities and a stable tax base for local governments.

In short – the time for studies and delaying decisions should come to an end. The time for doing is now. Safely reconnecting the River in a manner which is carefully monitored and managed while still mimicking the natural processes which built the Delta will free the rest of our Working Coast from our dim, sediment and nutrient starved future – and will allow us all to continue to flourish for generations to come. I strongly urge you to approve the implementation of this project without delay, and to continue to encourage the CPRA to work in collaboration with communities, residents and impacted commercial and charter fishermen to develop additional granularity around mitigation measures proposed.

If you have questions or need clarification on any of the points raised in this correspondence, please feel free to contact me via email at: [REDACTED]

Sincerely,

Joni Tuck

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to

---

comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiessy, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that

USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63345**

**Local communities are being afforded the opportunity to capitalize on well over \$1 billion in economic impact through the construction of the proposed Project, adding hundreds of higher wage jobs to their communities. These jobs also would allow these communities to build a workforce pipeline of talent to continue to perform civil construction, earthworks, environmental restoration, and surveying work in complex and challenging environments, each of which would provide stable, lucrative incomes for workers and their families and that benefit would flow to the vibrant communities and add a stable tax base for local governments.**

**Response ID: 16306**

The commenter's support for the proposed Project is noted. The comment is consistent with the content of Chapter 4, Section 4.13.4.2 in Socioeconomics of the Draft EIS, which identified up to major economic benefits within the proposed Project area during construction of the proposed Project.

---

**Concern ID: 63346**

**Through a long history of coastal restoration, it has become clear that funding sources will deplete, and dredged sediments pumped and shaped into land subside often within a few decades; however, the river will continue to flow for generations and the sediments, nutrients, and fresh water will continue to build land as long as it is allowed it to flow.**

**Response ID: 16307**

The commenter's support for the proposed Project is noted. Consistent with the comment, Chapter 4, Section 4.2.3.2 in Geology and Soils of the Draft EIS discussed the long-term and

sustained source of sediment that would be provided by the proposed Project for the replenishment and restoration of lands (including wetlands) within the outfall area.

---

**Concern ID: 63347**

**The commenter strongly urges that the proposed Project be approved without delay, and that CPRA continue to work in collaboration with communities, residents, and impacted commercial and charter fishermen to develop additional granularity around mitigation measures proposed.**

**Response ID: 16309**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

CPRA engaged the fishing community potentially impacted by the Project through public meetings to solicit input on mitigation and stewardship strategies and engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures from affected fishers. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. In response to comments, CPRA has expanded and refined the Final Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated proposed Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

John Cope

As a long-term resident of New Orleans with a science education and an appreciation of nature, I am philosophically aligned with the concept that guided natural processes be employed in the restoration of ecosystems disrupted in part, or wholly, by human activities. I have been following at arms' length both the progress of the Restoration Plan and the debates focused thereon for some years, and have recently clarified my own thoughts on the subject. As stewards of Creation, we must, in my grandmother's words, "put our best foot forward" in our drive to maximize the value of our efforts in caring for what we are so fortunate to share.

Per the Plan's title, attention is focused on the sediment delivery of 281,000,000 metric tons of sediment over its 50 year operational life, while the means to achieve that result is the throughput of 75,000 cfs of Mississippi River water for an average of 110 days each year (per Draft Phase I; Phase II provides no figure for days). Using a range of published sediment densities, I calculated an expected range of volume/volume ratios to determine the efficiency of this effort; the results range from 6200 ft<sup>3</sup> H<sub>2</sub>O per 1 ft<sup>3</sup> sediment, for a sediment composed of flowing mud (108 lb/ft<sup>3</sup>), to 6,840 H<sub>2</sub>O per 1 ft<sup>3</sup> sediment, for a sediment composed of wet sand (119 lb/ft<sup>3</sup>). To me, this is a Water Diversion which happens to sweep along a tiny proportion of sediment; a very inefficient result, particularly given that the negative repercussions from the diversion are driven by the effects borne by the water in terms of:

- 1) A salinity differential, impacting commercial and threatened species by its suddenness and magnitude;
- 2) Dissolved fertilizers and industrial effluent, which are known to have led to oxygen-depleting algal blooms even in less-restricted environs; and
- 3) Local rise in water level, creating a potential for infrastructure and human endangerment, especially during storm events.

A truly alternative design incorporates a means of separating a large proportion of the water from the sediment by capturing sediment in basins within the channel bottom, while curving the main channel back to the Mississippi River to return the majority of river water to the Mississippi, while delivering a more sediment-focused slurry to Barataria Bay via a separate outfall channel. A dredge operating in the basins, powered by river current, would move the captured sediment, under well-controlled conditions, the short distance from the basins to the outfall channel. If additional hydraulic head is needed to keep the sediment flowing Bayward, water from Barataria Bay can be pumped in, again using the Mississippi as a power source, and directed to promote flow toward the bay. Over time, as the Barataria ecosystem adjusts to decreased salinity, and documentation is made regarding the adjustment of species to changing conditions, determination can be made whether to increase the fraction of river water allowed to enter the Barataria system.

This scheme will minimize item 1)'s salinity shock at the Project's outset, while allowing for the controlled variation of both the volume and salinity of outflow waters as deemed appropriate though observation of the attendant environmental impacts.

Regarding especially item 2) above, it appears that a political effort involving two Canadian Provinces and thirty-one of our United States (the Mississippi River watershed area) is

required in order to provide for the understanding of each jurisdiction's contribution to what are essentially wasted resources which cumulatively result in the stunting of fisheries throughout the Gulf of Mexico, if not beyond. If undertaken soon, with an eye toward the value added: to the farmer, of conserving fertilizer; to industry, of identifying potential uses for another's byproduct; to fishers, of maintaining the abundance and predictability of their catches; and to all, of lowering acidity in, and removing reproductive disruptors from, aquatic ecosystems, there is an opportunity to improve the quality of the Mississippi's fresh water by the time it is appropriate to ramp up its addition to the Barataria basin.

The life-threatening effects of item 3) will also be minimized through the application of a more limited proportion of water vs sediment, since the local water level will not rise as much as under the current Plan, and therefore, shutoff of the outflow in preparation for a storm event will allow the Project area's water level to relax more quickly toward a normal state.

The current Plan expects a yield of about 18.2% sand-sized particles, with 81.8% combined silt- and clay-sized particles. Being denser, sand tends to stay in place better once it arrives in a calm environment. Also, the property of high cation exchange capacity (CEC) for clay minerals means that they adsorb other cations from their surroundings. This can benefit agriculture, as when fertilizers are added to the soil. However, it can also mean that clays can trap pollutants, such as heavy metals, and thus transport them as the lightweight clay particles are moved by the flow of water. It may behoove us to minimize the percentage of clay minerals in our sediment transfer to the Barataria Basin; it so happens that a well-designed system of basins will preferentially capture the denser fraction of the sediment, similar to the operation of a gold mining flume.

In addition, the overall project should involve the planting of a variety of soil-stabilizing plants. Willows, which are salt-tolerant and pollutant-extracting, as well as black mangroves, which develop fish nurseries, should be introduced as soon as practical after emergent land appears, and faster-growing species are established.

Lastly, thinking more regionally, some additional small siphons placed broadly to the north of this Diversion would allow for the gradual freshening of the overall Project area above and including Barataria Bay. This would provide a slowly moving salinity gradient, detectable by many inhabitant species which can then more easily adjust via a gradual migration.

In summary, I understand the temptation to create a large impact quickly using familiar practices. However, the downside risks can be minimized by creating a split system to capture and concentrate sediment in one stage, followed by a transfer of the captured sediment to a separate second stage which delivers that sediment with a reduced volume of water having a chosen composition in terms of salinity and nutrients.

Best Regards,

John D. Cope

**Concern ID: 61782**

**Commenters expressed concern that there's not enough sediment in the river to achieve wetland and land creation goals of the proposed Project.**

**Response ID: 16412**

The commenter's concerns regarding the sediment load of the river and whether the river carries sufficient sediment to achieve the land projected to be built during diversion operation were considered in the Draft EIS. The Mississippi River carries much less sediment than it did in the past. It still carries a massive sediment load, but not as massive as before. As explained in Chapter 3, Section 3.4.2.5 Sediment Transport, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes. Quantifying the relative contributions of multiple factors to the diminished sediment load is beyond the scope of the Draft EIS. The Draft EIS (Appendix E Delft3D Modeling, Delft3D Modeling Section 5.2.2) takes this diminished sediment load into account when computing the sediment that would be delivered to the Barataria Basin. To help clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations, discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

---

**Concern ID: 61897**

**Consider alternatives that transport more sediment and sand and less water, such as a conveyor belt or barge and utilizing a processing plant that removes the sediment from the Mississippi River to filter and neutralize the sediment before transport.**

**Response ID: 15991**

This suggested alternative would not meet the goals and objectives as stated in the purpose and need as described in Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives. CPRA's intent is to reestablish sustainable deltaic processes between the Mississippi River and Barataria Basin through the introduction of fresh water, sediment, and nutrients from the Mississippi River into the Basin. Additionally, in light of the volume and nature of the material that would need to be transported, a conveyor belt is not feasible. In addition, as described in Chapter 2, Section 2.4 Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow the proposed Project is designed to maximize sediment bed load transport. Previous studies of the Mississippi River have documented the positive correlation between river discharge and sediment load, demonstrating that higher river discharge levels are generally correlated with higher sediment loads. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were

discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:40466**

Daphne Misuraca

I am stating that I am opposed to the Mid -Barataris Desiment Diverson. I am resubmitting an email from Sara Wood as I have the same exact opinion.:

I am no one but a concerned Louisiana citizen and I am against the Mid-Barataria Sediment Diversion because it is a poorly researched and therefore will be a poorly executed plan that will have a devastating effect on our natural resources in Louisiana, while its proponents and cronies make bank. It is only because they are using \$1-2Billion of TAXPAYER dollars that the proponents are so haphazard and irresponsible because as sure as the day is long, we would not be to this point if it were solely a private investment. There would certainly be more deliberation and at a minimum be a full impact study and consideration of other more natural options with less risk and more beneficial to the area overall. According to the MS River Delta Organization, which is pro diversion, it admits "that there will be changes to the basin" but glosses over or fails to inform the public of the alarming loss of fisheries, including massive loss of dolphin life that are likely to result, plus the fact that the storm protection will be minimal and not long lasting. Typically, they use terms to confuse the public. "Freshwater" diversion is misleading when in fact, it will be a dirty river diversion, just consider the massive dead zone in the Gulf. Louisiana's economy relies heavily on the seafood industry not to mention tourism of which being a "Sportsman's Paradise" is key. The dirty water diversion will negatively affect our economy and thus trickle down to the quality of life here in Louisiana. Our lieutenant governor, Billy Nungesser is at the forefront of speaking out against the Mid-Barataria Sediment Diversion and I have read and heard the debate from both sides, and I agree with out Lt. Governor Nungesser.

[https://www.theadvocate.com/baton\\_rouge/opinion/article\\_062be400-bf1f-11eb-83c8-9fede5d3f370.html](https://www.theadvocate.com/baton_rouge/opinion/article_062be400-bf1f-11eb-83c8-9fede5d3f370.html)

I urge you to listen to the people who will be affected by your decision the most, the citizens of Louisiana, and I urge you to ignore the paid interests involved and reject the CPRA's application for the Mid-Barataria Sediment Diversion. Thank you.

Best regards.

---

**Concern ID: 62779****Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.****Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the

Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. ---

**Concern ID: 62790**

**Diversion of polluted and nutrient-laden waters into the Barataria Basin would result in harmful algal blooms (HABs) and expansion of the dead zone.**

**Response ID: 16371**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA's Mississippi River/Gulf of Mexico Hypoxia Task Force "Hypoxia 101" webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water

---

meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone “water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen” (<https://www.epa.gov/ms-hf/northern-gulf-mexico-hypoxic-zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.>)

Dissolved oxygen concentrations associated with the Applicant’s Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model’s dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.5.2 in Dissolved Oxygen of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section has been added to Sections 4.5.5.3.2 and 4.5.5.4.2 of the Final EIS. Finally, the EIS acknowledges the potential for up to major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) in the Barataria Basin during Project operations to guide CPRA’s management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement.

The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62794**

**This poorly planned and executed proposed Project is being pushed forward for the financial gain of politicians and contractors because taxpayer dollars are being used. Private investment dollars would entail more deliberation and a full impact study, including more natural options with less risk and more overall benefits.**

**Response ID: 16375**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance and constitutes a full impact analysis. A variety of alternatives assessed in the EIS are identified in Chapter 2 Alternatives. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

The LA TIG's Restoration Plan evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG has selected Alternative 1 as the LA TIG's Preferred Alternative.

**Correspondence ID:40467**

Alan Mouton

To the U.S. Army Corps of Engineers and the Louisiana Trustee Implementation Group (LaTIG) c/o of NOAA:

As a Louisiana native, one of my greatest joys is spending time on my family's camp located in the wetlands of Lake Pontchartrain. Spending time friends and family at the camp, and in the surrounding wetlands is invaluable. This is still possible for us because the tragedy of coastal land loss has not washed us away - yet. Further south, people have been force out of their camps and homes, and I don't want that to happen to my family. I do not look forward to facing yet another hurricane season with a deteriorating coast. The river has unmatched land building capabilities that must be utilized as a cost effective strategy to slowing down coastal Land loss. I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and support funding the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63341**

**The coastal wetland system creates multiple lines of natural defense from hurricanes and storm surge, and the ongoing wetland loss resulting from the lack of riverine input into the basin has resulted in increased storm risks to local communities (including decreases in property values and impacts to the electrical grid).**

**Response ID: 16300**

The commenter's support for the proposed Project is noted. The commenter correctly notes that coastal wetlands are natural defense against hurricanes and storm surge, and the damage they cause to local communities and infrastructure, as discussed in Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S. of the Draft EIS. The causes of wetland loss in the proposed Project area were discussed in Section 3.6.2 of the Draft EIS,

---

and included subsidence, levees, storms, canals/spoil banks, herbivory, and the DWH oil spill. Chapter 4, Sections 4.6 Wetland Waters and Resources of the U.S. and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS explained how the proposed Project would create and maintain wetlands in the Barataria Basin, and discuss the corresponding impacts on storm surge and flooding.

---

**Correspondence ID:40468**

Andrea Murina

I do not feel that there is adequate science to support the use of freshwater diversion projects. The diversion of freshwater has occurred naturally with levee breaks in the past. This has not shown to subsequently increase land at a substantially fast pace. The east bank currently has diverted fresh water from the Mardi Gras pass which has not had an increase in marshland, and instead has had destruction of marine life. I am most concerned about the disruption to the coastal communities of Louisiana, Mississippi, and Alabama. This planned diversion would affect a large geographic region in terms of fisheries, and environmental impacts. Coastal erosion in south eastern Louisiana could be solved by dredging and the introduction of new innovative strategies to obtain sediment from the Mississippi river without the addition of large amounts of freshwater.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated

from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62639**

**The proposed Project is unlikely to succeed because similar types of projects have failed to build land, and have caused a range of other issues, like destroying habitat, exacerbating flooding, and reducing water quality. Specific examples of similar, problematic projects include the Mississippi River Gulf Outlet, Bonnet Carré Spillway, Caernarvon Freshwater Diversion, Davis Pond, West Bay, Baptiste Collette, Fort St. Philip, and Cubits Gap. In fact, data show that the Caernarvon Diversion in particular was unable to show sustained land gains in the face of Hurricane Katrina-driven losses in wetland habitat (Underwood 1994, Kearney et al. 2011). Davis Pond has seen increased land loss inside the diversion compared to a reference area (Couvillion et al. 2017). Fort St. Philip has lost large areas of wetlands (Suir et al. 2014). While the Atchafalaya River is building land in the Atchafalaya and Wax Lake Deltas, the Atchafalaya River carries more sediment than the Mississippi River does currently (Blum and Roberts 2009), and more of the Atchafalaya River is diverted to each of these deltas and marshes farther south. Additionally, one study identified poor performance of diversions due to many periods of inoperation due to socioeconomic uncertainties (Caffey et al. 2014).**

**Response ID: 16631**

The issues raised by the commenters were considered in the Draft EIS. The EIS states in Chapter 2, Section 2.1.1 Overview of Sediment Diversions, that CPRA considered information from other diversions in its assessment of the Project alternatives, but because the projects mentioned by the commenters had been designed to discharge primarily water, not sediment, they are not fully comparable to the proposed Project. As explained in the EIS Chapter 4, Section 4.1.3 (Environmental Consequences, Overview of Delft3D Basinwide Model for Impact Analysis), Delft3D Basinwide Modeling software was used to assess impacts of the Project on hydrology, land gains and losses, water quality, and vegetation in the Barataria Basin and birdfoot delta. Using standard professional practice, this physics-based model was validated to the West Bay Sediment Diversion. The West Bay Sediment Diversion is useful for validating the physical processes of erosion and deposition of sediment because it, like the proposed MBSD Project, is a sediment diversion that extracts relatively more sediment in the river. The other diversions cited were designed to primarily deliver water, not sediment, and are less useful comparisons.

The West Bay Sediment Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, "A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that diversions do not lead to appreciable sediment accumulation" (Kolker, A. S., Miner, M. D. and Weathers, H. D. 2012. Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, *Estuarine, Coastal and Shelf Science*, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005> ).

Comparing diversions outside of physics-based numerical modeling has limited value because diversions and receiving environments often exhibit unique behaviors that correlations do not account for. For that reason, the physics-based Delft modeling, even with its limitations and uncertainties, is a better predictor than anecdotal comparisons to Fort St. Phillip or other sites. Uncertainties associated with the validation and application of the

---

Delft3D Basinwide Modeling conducted for the proposed Project were assessed by the West Bay application, sensitivity tests, and by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in EIS Appendix E Delft3D Modeling and incorporated into the EIS conclusions throughout Chapter 4 Environmental Consequences. While most citations mentioned by commenters were already included in the Draft EIS, the Final EIS has been edited to include Caffey and Petrola (2014) to Chapter 4, Section 4.6.5.1.2.4 Land Accretion.

The likelihood of success of the Project and information from other freshwater diversions was also considered in the LA TIG's Draft Restoration Plan, Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. The proposed MBSD Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the geomorphological features of the Lower Mississippi River as of 2012, including data from the referenced projects. All citations referenced by the commenters were included in the Final EIS and were considered by the LA TIG in the Final Restoration Plan.

Marla Cooper

I've wondered why, in the 1000 plus pages of the Draft EIS, there is no mention anywhere of the Gulf Hypoxia Action Plan. Many of the federal agencies who are cooperators with the COE (and the COE) are part of the Hypoxia Task Force, and signatories to the Hypoxia Action Plan, as is the State of Louisiana, of course.

If the goals of the Action Plan were met, starting with achieving a 20% reduction in N and P loading to the Gulf by the year 2025 (and more thereafter), some of the concerns about impacts of the MBSD and any subsequent diversions could be alleviated, at least partly. That clearly isn't a priority, but the Hypoxia Action Plan could also be seen as a mitigation effort already in place at a large scale upstream to reduce the nutrient loads that would be conveyed into the Barataria Basin, with risks of hypoxia and HABs there. It also represents a commitment by the parties involved to try to reach its goals.

That makes the complete ignoring of the Hypoxia Action Plan in the Draft EIS all the more striking. Back to the mitigation issue, in that Chapter of the Draft EIS - the "Draft Mitigation and Stewardship Plan" - there may be an indication of why. On p. 6 of that Chapter, it states that under Clean Water Act Section 404, "compensatory mitigation is required to offset environmental losses from unavoidable impacts to waters of the U.S.", and that 404 Guidelines state that the Corps District Engineer will issue a 404 permit only upon determination that the applicant has complied with the necessary provisions, including those to "take all appropriate and practicable steps to avoid and minimize impacts. "

The Hypoxia Action Plan has been in place for 20 years - had it been fully carried out, the river would be far cleaner now in terms of nutrient loads (it's better because of what has been done than if nothing had been done). The State of Louisiana has done very little to assist the Action Plan or promote its implementation, despite having that opportunity during the past 20 years that they were planning and promoting diversions under the Coastal Master Plan.

They also made diversions the main feature of their State Nutrient Reduction Strategy under the Hypoxia Action Plan, despite the fact that no new ones would be completed before the 2025 Target N and P reduction date (not clear how many will be completed after either). The Louisiana Nutrient Reduction and Management Strategy isn't mentioned in the Draft EIS either.

So, maybe that's part of the reason for having no mention of the Hypoxia Action Plan - it's not a good one if that's the case. The MBSD is being promoted as an answer to coastal land loss, but it definitely has connections to the Hypoxia Action Plan, just from a cause and effect standpoint. Why the HAP wasn't considered as mitigation for some MBSD impacts - or acknowledged in the EIS sections on Nitrogen and Phosphorus, or in their short discussions of hypoxia, isn't clear at all. (Actions to reduce hypoxia also help reduce HABs, another concern from impacts of the MBSD.)

---

**Concern ID: 61817**

**Commenters stated that information about the Gulf Hypoxia Action Plan (Louisiana Hypoxia Working Group), which calls for a 20 percent reduction in nitrogen and phosphorus loading to the Gulf by 2025, is pertinent to the Draft EIS but is not mentioned. Commenters requested that the plan should be included in the Final EIS.**

---

**Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. 2008. Gulf Hypoxia Action Plan 2008 for Reducing, Mitigating, and Controlling Hypoxia in the Northern Gulf of Mexico and Improving Water Quality in the Mississippi River Basin. Washington, DC.**

**Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. 2013. Looking Forward, The Strategy of the Federal Members of the Hypoxia Task Force. Washington, DC.**

**Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. 2016. December 2016 Update, Looking Forward, The Strategy of the Federal Members of the Hypoxia Task Force. Washington, DC.**

**Response ID: 16428**

The USACE and the LA TIG agree that the Gulf Hypoxia Action Plan is relevant to the proposed Project area. Therefore, in response to these comments, a discussion about the Gulf Hypoxia Action Plan has been added to Section 4.25.5.4.4 Nitrogen and 4.25.5.4.5 Phosphorus in Cumulative Impacts of the Final EIS. The Hypoxia Action Plan has highlighted the important role that river diversions could play in reducing nutrient loads. In addition, substantial nutrient load reduction could be achieved through the measures being implemented by the other states and entities involved with the Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. These combined efforts could lessen the potential impacts of excess nutrient loads to Barataria Basin and the northern Gulf of Mexico.

---

**Concern ID: 62382**

**The State of Louisiana has done very little to assist the Hypoxia Action Plan or promote its implementation, despite having that opportunity during the past 20 years that they were planning and promoting diversions under the Coastal Master Plan.**

**Response ID: 15929**

USACE cannot speak to the state's assistance or promotion of the Hypoxia Action Plan. However, the USACE agrees that the Gulf Hypoxia Action Plan is relevant to the Project area. Therefore, the USACE has added a discussion about the Gulf Hypoxia Action Plan to Chapter 4, Section 4.25.5 Cumulative Impacts, Surface Water and Sediment Quality of the Final EIS.

---

**Concern ID: 62383**

**The Louisiana Nutrient Reduction and Management Strategy, which included diversions as the main feature, is not mentioned in the Draft EIS.**

**Response ID: 15934**

A discussion of the Louisiana Nutrient Reduction and Management Strategy has been included in the discussion of Gulf Hypoxia Action Plan which has been added to Chapter 4, Section 4.25.5 Cumulative Impacts, Surface Water and Sediment Quality of the Final EIS.

---

**Concern ID: 63190**

**Commenters recommend Hypoxia Action Plan be seen as a mitigation effort already in place and/or that its recommended actions be considered as part of the mitigation for Project.**

**Response ID: 16564**

---

The commenters accurately noted that the Gulf Hypoxia Action Plan is relevant to the Project area. In response to these comments, a discussion of the Gulf Hypoxia Action Plan has been added to Chapter 4, Section 4.25.5 (Cumulative Impacts - Surface Water and Sediment Quality) of the Final EIS. Similar text has been added to the LA TIG's Final Restoration Plan. The proposed Project is anticipated to reduce the amount of nitrogen and phosphorus that reaches the Gulf of Mexico through nutrient uptake in the marshes that would be created and/or sustained by the proposed diversion. Because the proposed Project is already anticipated to reduce the nutrients that contribute to the Gulf Hypoxia Zone (GHZ), further mitigation actions with respect to the GHZ for the proposed Project are not considered necessary. However, CPRA has committed to implement water quality monitoring for nitrogen and phosphorus (and other parameters) in the outfall area and to make the results of that monitoring available online to the public and interested parties in real time. Consequently, while the Hypoxia Action Plan would not be considered as mitigation for impacts associated with the Project, the anticipated reduction in nutrients reaching the Gulf through wetlands restoration and the water quality monitoring/access to water quality monitoring data would be consistent with the Hypoxia Action Plan.

Coastal Communities Consulting, Inc.

Sandy Ha Nguyen

To Whom It May Concern,

The board and staff of Coastal Communities Consulting, Inc. (CCC), a 501(c)3 organization headquartered in Gretna, believe that the Mid-Barataria Sediment Diversion (MBSD) project can and should exemplify community leadership in restoration decision-making. The next decade is a significant opportunity for Louisiana to establish itself at the vanguard of community-level environmental adaptation planning and restoration mitigation. CCC feels strongly that our state government, elected officials, the Coastal Protection and Restoration Authority and other state agencies, and local jurisdictions must pivot to centering community expertise as they carry out the MBSD. This will open the door to creating a truly equitable restoration landscape; one where communities impacted by the MBSD and future coastal restoration projects are proactively engaged and consulted as restoration projects are planned, designed, and implemented. CCC is well positioned to be a valued partner to the State of Louisiana in charting a renewed path forward. We are pleased to submit these comments to the U.S. Army Corps of Engineers, New Orleans District, as part of the Draft Restoration Plan and Environmental Impact Statement: Mid-Barataria Sediment Diversion public comment period.

#### About Coastal Communities Consulting and its Clients

CCC supports the economic and environmental stability of coast-dependent small businesses in Southeast Louisiana. For a decade, we have provided technical assistance, economic development, environmental education, and continued disaster assistance to over 2,000 residents (fisherfolk, their families, and other coast-dependent businesses and individuals) of Orleans, St. Bernard, Plaquemines, Jefferson, Lafourche, and Terrebonne parishes. Our clients are members of Southeast Asian American, Central American, Black, Cajun, and Croatian communities whose homes and families and businesses overwhelmingly are located in low-income areas. Southeast Louisiana's fisheries-dependent residents have endured more overlapping disasters in one generation than anyone can reasonably expect of a community. They have suffered the levee breaches of Hurricane Katrina, the Deepwater Horizon oil spill's ongoing impacts on fish stock, the historic flood events of 2019, and COVID-19. Many of these same fishers have also survived forced refugee flight from Southeast Asia.

CCC understands the MBSD is designed to build land, and thus, increase the environmental and economic resilience of Southeast Louisiana to be sustainable through future disasters. As a non-profit dedicated to the futures of the region's commercial fisheries, however, we also understand that while restoration projects like the MBSD are discursively designed to protect fisherfolk and the ecosystems they depend on, in practice, the planning of these projects often leave out the region's most vulnerable coast-dependent residents. We commend the efforts made by CPRA and other agencies to include fishers, at the behest of organizations like CCC, in meetings and discussions and planning processes. However, we would challenge all government agencies involved with MBSD to do more in order to overcome decades of rift and distrust between commercial fishers and policymakers.

We cannot emphasize enough that in spite of these tensions, commercial fishermen and coastal residents are not against restoration. CCC's clients have fought to defend their

ecosystems, from resisting the land-wasting effects of exploratory oil drilling to working with agencies and academics to make their fishing techniques more environmentally sound. At the same time, they have cried out for coastal restoration for decades. The tension between fishers and coastal projects has always arisen not because of the projects' intended goals, but given the processes used to develop and implement coastal restoration projects.

CCC's clients aren't environmental justice communities; they are communities experiencing environmental injustice. Environmental justice demands that all communities who are vulnerable to racial, ethnic, economic, and ecological violence are not just considered, but "meaningfully involved" in "the development, implementation, and enforcement of environmental laws, regulations, and policies" . This is the purpose of NEPA, the DEIS, and ultimately, of the CPRA, whose mandate is to "establish a safe and sustainable coast that will protect our communities, the nation's critical energy infrastructure and our bountiful natural resources for generations to come" . For years, fishers have watched CPRA and other agencies debate the merits of allowing the Mississippi River to inundate the fish, crab, shrimp, and oyster ecosystems they rely on. For them, it is clear that the diversion will make fishing more economically vulnerable in favor of building marsh land—a trade-off that makes their families particularly susceptible to poverty, environmental instability, and resettlement. Not surprisingly, fisherfolk are scared.

The Coastal Master Plan and MBSD are huge undertakings with a myriad of needs and best outcomes to consider. We get it! But this means little to a shrimper who is worried about what a devastated brown shrimp population will mean for his daughter's finishing college or her ailing mother who has accrued acute healthcare costs. Fishing is not just our clients' livelihoods—it's their lives. In light of this, and coupled with rapidly moving disasters and environmental shifts, we believe that doing business as usual is no longer an option.

Therefore, we recommend an aggressive program of mitigation, adaptation support, and MBSD-adjacent coastal support. To carry out effective socioeconomic and place-based planning, we recommend that CPRA build coalitional partnerships across state agencies and parish governments. This includes partnering with community leaders to educate all agency partners about the current state of each fishery, what is being taken into consideration when designing mitigation measures, and the ways the mitigation measures forwarded in the DEIS will be implemented. It also means consistently sharing this information with impacted communities and community-based organizations, and collaborating with them to ensure that their needs are met in light of dynamic impacts to their lives and livelihoods.

In the eight years since our board and commercial fishing clients made us aware of the proposed sediment diversions in Barataria Bay and Breton Sound, CCC has listened to and followed Southeast Louisiana's coast-dependent communities' expertise. Through our daily work and engagement with fisher families and business owners, it was not difficult to locate where we could begin to proactively address the potential impacts of MBSD's design and implementation on fishing-dependent communities. While commercial fishers don't like change, CCC has helped several families begin to adapt their businesses and lives ahead of MBSD's likely impacts to the industry. Our adaptation strategies include much of the DEIS and draft Restoration Plan's mitigation and stewardship measures. As the MBSD moves forward, CCC looks forward to working with, educating, and engaging CPRA and others about effective adaptation. Together, we can effectively develop an equitable and just adaptation and mitigation program for not just MBSD, but ongoing restoration throughout the coast. In

this collaborative effort, our organization's ultimate goal is to establish a comprehensive Community Master Plan that will be implemented alongside CPRA's Coastal Master Plan.

---

### CCC's Recommendations

Below, we have identified three primary areas of support that are necessary to equitably help fisheries and other coast-dependent communities adapt to the impacts of the proposed MBSD. Under each area, we offer specific programming and/or approaches that will allow for their effective implementation. We have identified these equitable mitigation measures in concert with the over 200 fishing-dependent residents in MBSD's impact zone who have submitted their own public comments, as well as a myriad of collaborators with expertise in community support, environmental change, and strategic planning.

#### I. MITIGATION PLAN

The mitigation measures proposed in the DEIS and draft Restoration Plan are a good first step. However, to equitably mitigate the impacts of the MBSD, it is important for vulnerable communities to contribute to how CPRA identifies and mitigates the diversion's likely effects on their lives and livelihoods. This includes establishing dedicated and effective funding streams to support all communities, small businesses, and workers impacted by MBSD, from construction to regular operation. Importantly, if the MBSD has as little negative impact on commercial fisheries as possible, this funding is less likely to be exhausted or need to be refreshed regularly.

- Establish and maintain an MBSD Fisheries Mitigation Fund — Mitigation programs currently identified in the draft EIS and LA-TIG Restoration Plan include retrofitting boats, training in new fields, and training in marketing. Establishing funding for fishers to take advantage of these programs as it suits their needs is the most effective way of both spending much of the \$33 million currently identified for fisheries mitigation and supporting the industry through MBSD's impacts. Throughout the first five years of MBSD's operation, and with the option to extend its timeline, the Fisheries Mitigation Fund will pay out annually to fishery-dependent business owners and workers.
  - o Recipients of the funding will be able to identify how best to use this funding, be it for skills training or boat upgrades, at their discretion.
  - o Annual payments should be based on losses, as evidenced in fishers' trip tickets—this information is collected by the Department of Wildlife and Fisheries.
- Adaptive management planning — MBSD's operations, management, and monitoring will critically shape how decisions are made regarding adaptation. To ensure both state transparency and the incorporation of valuable coastal expertise, fishery leaders must be contracted to participate in planning and executing the adaptive management of the MBSD.
- Identify equitable, future-looking approaches to home and business buyouts — Coast-dependent communities will experience diversion-induced flooding and other impacts to both their homes and businesses. To this end, mitigation measures should include establishing an equitable approach to assessing just compensation and buyout programs for homes and other structures throughout Southeast Louisiana—this process should allow residents to buy equivalent or better businesses and homes elsewhere. This funding should also ensure that every resident in the impact area can raise their homes without incurring personal cost.

- Identify for whom job buyouts might be necessary — In lower Plaquemines Parish, buyouts may be a bigger necessity than expected, especially for the families who rely on oyster work. We understand that CPRA has begun the process of relocating oyster leases. However, leaseholders represent a very small group of wealthy people that can easily relocate their businesses and homes. Their workers, who make up the bulk of the fisheries' labor, cannot. For them, buyouts may be the only option. CPRA must consider job buyouts or other measures that justly compensate workers who rely on but have no economic control over their fishery.
- Create fisheries-specific grant and loan opportunities — This will help businesses and workers who will be impacted by MBSD adapt in anticipation of the diversion going live, as well as during its implementation.
- Support workforce development — This includes implementing policies that require contracting entities to hire local residents and fishermen to work on building and managing the MBSD.
  - o Encourage and fund area colleges and universities to build out curriculums and train younger fishermen for new careers and job opportunities should they want to transition out of the industry. (CCC & Delgado have been running one such program for two years)
  - o Develop scholarships to help pay for tuition.
  - o Develop more opportunities for fishermen's wives to work and/or start small businesses to create an alternative income stream for their families.
  - o Develop certifications and incentivize youth to choose water-base careers.

## II. ONGOING BUSINESS ADAPTATION PLANNING & SUPPORT

While the DEIS and draft Restoration Plan offer a series of mitigation measures to support fisheries, they do not comprehensively address the complex effects MBSD is likely to have on fishers and other vulnerable coast-dependent communities. As it is the first project of its kind, the true impacts of the MBSD will not be known until the structure begins operation. However, what is known today is that our fisheries and navigational waterways will absolutely be affected, and may be altered forever. While our fishing communities may continue to advocate against the MBSD, most understand that, historically, a project that the government puts this much money and effort into will happen.

For more than two years, CCC has collaborated with clients to create adaptation planning that reflects fishers' expertise of the land and water they rely on. The fact that fisheries-dependent families have already begun piloting the adaptation measures included below is evidence that CPRA and other agencies should allay impacted communities' fears by proactively funding such strategies. Most importantly, they should look to fishers to identify their own specific adaptation needs. To do this, CPRA should immediately begin partnering with community-based organizations (CBOs), who have robust technical assistance and community service expertise, and who have been designing and implementing adaptation planning for several years. Federal and state agencies should partner with CBOs to carry out extant adaptation planning and programs. In this process, CBOs should be compensated for their adaptation work and the resulting adaptation plans should be funded by the state.

- Information Sharing and Education — In order to properly adapt and plan, CPRA and other agencies need to transparently collaborate with residents who will be impacted by the

MBSD. This includes circulating consistent, up-to-date, and accessible information regarding the MBSD's progress-toward-implementation and its likely impacts to coast-dependent businesses and communities.

- o CPRA to develop a public relation/community outreach office within the agency.
- o Include community-based organizations (CBOs) in every stakeholder group that CPRA has created within its decision-making structure, and in regard to the MBSD in particular. This will make CPRA's approach to decision-making more equitable by ensuring that communities, not just large stakeholders, are represented throughout the Coastal Master Plan process.
- o Fund CBOs who have the respect and trust of their communities to do outreach and education regarding restoration. Conducting outreach and education includes designing community meetings, supporting community members in participating in decision-making processes, and elevating community expertise that has historically been overlooked.
- o Outreach materials, presentations, and meetings should be translated not only into several languages, but should be presented in plain language that is accessible to laypeople, whose stakes in understanding the MBSD are highest.
  - Fund community engagement and adaptation planning; community-based organizations — CBOs like CCC devote the majority of their funding to make technical assistance (TA) accessible (linguistically, culturally, geographically, and financially) to the region's most vulnerable residents. While TA is essential to the MBSD rollout (see above), it has not historically been funded by agencies carrying out large-scale projects in vulnerable communities. As such, when they have reached out to communities to finalize extant plans, CPRA and others have not elicited the information they are looking for. However, CBOs know how to provide the direct assistance residents need to help them participate in surveys, understand programs, requirements, and processes, and complete applications to be awarded benefits and grants. They also know how to design and carry out effective adaptation planning. To address this, CPRA and LA-TIG can use a percentage of their mitigation budget to ensure that CBOs can continue to carry out extant adaptation planning and mitigation efforts that align with the DEIS. Additionally, this funding can and should address the gaps in community TA support throughout the MBSD impact area to ensure that all impacted residents have access to information and direct engagement.
  - Pilot fisheries technology and innovation — To make fishers more adaptive, it is important that they have access to technologies that enhance their productivity and reduce the cost of their operations. Funding should be allocated for R&D dedicated to collaborating with fishers to innovate and change the way their operations work. This includes how harvesting is carried out, either by means of shrimp pots, lighter boats, additional refrigeration, and more. Additionally, salinity tanks for finishing oysters, mechanisms for moving baskets of oysters away from flooding, and a bevy of other potential innovations can mitigate losses for commercial fisheries, improve the quality of the harvest, and may bolster the industry as a whole.
  - Make broadband internet available coast-wide — COVID-19 has shown us that internet is not a luxury; it is a utility. Louisiana must make broadband accessible and low-cost for all residents. Fisherfolk who have never been required to use technology before have begun to both in light of the pandemic and to access more technical business and social

support. It can do so by partnering with federal agencies and NGOs who are already implementing more robust rural broadband access in anticipation of the proposed US Infrastructure Bill.

- Invest in economic development — By investing in industry sectors, such as tourism/ecotourism and more, and further diversifying the regional economy, the state can help create jobs to support displaced fisherfolk and other coast-dependent workers. It will also enhance the cultural viability of the region, as fishers of varying backgrounds share their cultures and knowledge with tourists, who will in turn support communities maintaining their generational practices. Examples include cultural immersion fishing tours, recreational fishing and cooking classes, and tours designed to teach visitors about ecosystem change and restoration. This is a win for the job seeker and also for local parishes and the state as new revenues can be generated by new industries.

### III. MBSD-ADJACENT COASTAL SUPPORT

This area of support identifies actions that CPRA and other state and federal agencies can carry out to bolster fishing-dependent communities' stability in the present and future. Applied concurrent to the MBSD's construction and operation, these approaches will ensure that the project is carried out justly and equitably overall.

- Establish governmental coalition-building and inter-agency education — To better develop and implement effective mitigation programs and adaptation support, CPRA should take the lead on educating and informing other inner state agencies about the MBSD's design, as well as its implications for and impacts on coast-dependent communities. Involving more agencies with a variety of expertise in implementing MBSD will mobilize a variety of resources to help CPRA effectively implement and mitigate the diversion. What's more, this will make more resources available to help affected residents adapt and make use of more effective and equitable mitigation programs. Examples include partnering with LED to develop and offer fisheries-specific loan products, and ensuring that the Louisiana Department of Wildlife and Fisheries do not raise license fees up to 300%. Further, collaborating with HUD to help residents with raising homes as well as establishing a first-time home buyers' program to assist with relocation.
- Address needed changes to fisheries permitting, licensing, and compliance — More than 80% of the state's much larger skimmer fleet will experience a reduction in their catch due to the fresh water driven by the MBSD. In light of this, the Louisiana DWF and NOAA must make major changes in how they administer and regulate federal fishing permits and licenses. As MBSD promises to shift where shrimp and other species are in the basin, adapting to this will require most fishers to go out further from shore and/or further east or west than they currently do. To ensure that fishers have the best chance of maintaining their industries over the life of the MBSD, restrictions that prevent them from working in federal waters must be lifted.
  - o The federal shrimp permit has been under moratorium since 2006. NOAA should lift the moratorium and grant open access to the permit and/or the state should extend the state line further from shore.
  - o The majority of our state's shrimp fleet are Asian American immigrants. While they are legal permanent residents, federal law prohibits anyone who is not a US citizen from operating a vessel outside state waters. Obtaining citizenship can take a year or more,

making this rule incredibly restrictive for residents who work seasonally. Lifting this restriction is critical for immigrant fishers' potential to maintain their fisheries as the MBSD begins operation.

- Promote Louisiana seafood - While one-on-one marketing support is included in the DEIS, it is imperative that the state effectively supports and promotes its fisheries. To this end:
  - o Collaborate with LA restaurants, seafood distributors, farmers markets, and grocery stores to create a market for LA seafood.
  - o Actively enforce House Bill No. 335/Act 372: Restaurant Notice of Foreign Seafood, which requires restaurants to disclose the origin of the seafood they serve.
  - o Create a national network of LA seafood champions to promote LA seafood in major cities.
- Carry out smaller coastal restoration projects
  - o Work with impacted parishes to build safe haven sites, which will protect boats against the potential impacts of the MBSD or other sudden disasters.
  - o Plaquemines Parish has lost fisheries business because many shrimp boats cannot easily or dependably get through canals or lock infrastructure. This forced shrimpers to take their catch elsewhere. To avoid this and other safety concerns, the state must dredge commercial fishing waterways going to and from docks and fishing grounds.
- Provide other kinds of governmental support
  - o Create standards to control and/or cap the price of shrimp and other seafood paid to fishers at the docks.
  - o Provide diesel subsidies for working boats.

---

To conclude, the construction, implementation, and operation of the first large-scale river sediment diversion must meaningfully include and honor the generational and place-based knowledge of coast-dependent residents.

As an organization that has devoted itself to the economic, cultural, and environmental health of Southeast Louisiana's fisheries, CCC believes that fisheries are a meaningful part of Louisiana's present and future. The above mitigation, adaptation, and MBSD-adjacent governmental support strategies emerge directly from our clients' own comments and the expertise they have shared with us for over a decade about the land and water they love. We want to make their lives more livable, and we look forward to working with CPRA, LA-TIG, and many other agencies to ensure this.

Please reach out to us with any questions regarding these comments. We look forward to hearing from you.

Sincerely,

Sandy Ha Nguyen

Executive Director

Coastal Communities Consulting, Inc. (CCC)

[REDACTED] Gretna, LA 70056

**Concern ID: 61929**

**Commenters expressed that southeast Louisiana’s fisheries-dependent residents have endured more overlapping disasters in one generation than anyone can reasonably expect of a community. They have suffered the levee breaches of Hurricane Katrina, the DWH oil spill’s ongoing impacts on fish stock, the historic flood events of 2019, and COVID-19. Many of these same fishers have also survived forced refugee flight from Southeast Asia. Fishing is not just their livelihoods-it’s their lives. One commenter suggested that at a very general level the Applicant’s Preferred Alternative should be implemented when low-income, vulnerable fishing communities see a rebound in their profitability to a point where they can financially prepare for the proposed MBSD Project.**

**Response ID: 16280**

As noted in the purpose and need, the proposed Project is intended to support coastal restoration projects. Such projects may reduce the impacts of tropical events such as hurricanes and associated flooding. Without the Project, adverse impacts on commercial shrimp, oyster, crab, and certain finfish fisheries are anticipated due to reduced marsh habitat and increased salinity over the long term (that is, 50 years), but more rapidly after 2050 for shrimp and oyster, as discussed in Chapter 4, Section 4.14 Commercial Fisheries. It is anticipated that as the coastal areas, including wetlands in the Barataria Basin, continue to erode, communities would be increasingly vulnerable to environmental disasters and the economic effects of declining fisheries. While the proposed Project would not stop subsidence and sea-level rise and associated impacts in the Barataria Basin, by 2070, the proposed Project is projected to create approximately 13,400 acres of land in the Barataria Basin and result in the loss of 3,000 acres of land in the birdfoot delta as compared to the No Action Alternative.

CPRA has expanded and refined its Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG’s Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures

are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61932**

**Communities with environmental justice concerns, which include all communities who are vulnerable to racial, ethnic, economic, and ecological violence, should be “meaningfully involved” in “the development, implementation, and enforcement of environmental laws, regulations, and policies” during the proposed MBSD Project.**

**Response ID: 16285**

As discussed in Chapter 1, Section 1.6 Scope of the EIS, and Chapter 4, Section 4.15 Environmental Justice, the EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance to identify the impacts that would likely occur if the proposed Project were to be approved. USACE, the LA TIG, and CPRA have engaged communities with environmental justice concerns in development of the EIS. Examples of public outreach provided by USACE for the EIS include special public notices for the permit application, the scoping process and scoping meetings, and public review of and public meetings regarding the Draft EIS. Material and information related to the Draft EIS were made available through Federal Register notices, press releases, social media, the New Orleans District website, newspapers, mail outs to distribution lists, and provision of hard copies of the Executive Summary and other materials to local libraries and community centers.

USACE and the LA TIG also coordinated with the SELA Voice organizations to understand the needs of the local communities, including communities with environmental justice concerns, regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan and during the public comment period. Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the joint virtual public meetings on the Draft EIS and the LA TIG's Draft Restoration Plan. Also, the Public Notice to announce the Draft EIS Notice of Availability, the Executive Summary for the Draft EIS, and the Executive Summary for the LA TIG's Draft Restoration Plan were translated into Spanish and Vietnamese. The consolidated pre-recorded public meeting presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage.

CPRA has engaged in public outreach meetings with the communities projected to be impacted by the MBSD to solicit input on mitigation and stewardship strategies, including

---

reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts undertaken to better understand and address potential impacts on communities with environmental justice concerns, including low-income and minority populations, such as cultural impacts, are discussed in Chapter 7 of the Final EIS. Refer to the Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61959**

**State government, elected officials, CPRA and other state agencies, and local jurisdictions must pivot to centering community expertise as they carry out the proposed MBSD Project. This would open the door to creating a truly equitable restoration landscape; one where those impacted by the proposed MBSD Project and future coastal restoration projects are proactively engaged and consulted as restoration projects are planned, designed, and implemented.**

**Response ID: 15905**

Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area, in an effort to reach out to community groups to gather information related to their concerns regarding proposed MBSD Project. More recently, CPRA has engaged the public through meetings with the communities impacted by the proposed MBSD Project to

---

solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities including fishers. This included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. A summary of these public engagement meetings and additional outreach can be found in Chapter 7 Public Involvement of the Final EIS. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that CPRA states it would implement as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62029**

**The EIS describes immediate, major, and permanent adverse impacts on several critical species in the Barataria Basin, including shrimp and oysters. The health of commercial fisheries and the socioeconomic well-being of coastal communities are closely intertwined. Such impacts would inflict economic harm on businesses, families, and individuals.**

**Response ID: 16225**

The issues raised by the commenters were considered in the Draft EIS. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted. The EIS also acknowledges the

---

importance of commercial fisheries to the Louisiana economy and communities, as described by commenters. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana and Section 4.14 Commercial Fisheries describes impacts to commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts to shrimp and oyster fisheries in the proposed Project area are anticipated under the Applicant's Preferred Alternative. Changes in abundance may exacerbate trends of aging fishers leaving the industry and would have adverse impacts on the overall fishery. Adverse impacts may be partially offset by changes in fisher behavior. Additional details on the regional and community level economic impacts on commercial fisheries due to the proposed MBSD Project can be found in Section 4.14 Commercial Fisheries.

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be

required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from**

---

**key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood**

---

**insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or

---

increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 62961**

**Project mitigation must adequately compensate impacts on the oyster industry, including financial compensation for economic losses. Commenters provided suggestions for mitigation such as compensating for increased costs of travel, providing direct financial payments to lease holders whose areas become unproductive, supporting new oyster leases or lease swaps, investing in research and development, using devices to move oysters to higher-salinity water, providing loans to oystermen to develop alternative income streams, providing support for elderly fisherfolk and buying out boats and businesses.**

**Response ID: 16532**

The Draft EIS evaluates how the Project would impact commercial, recreational, and subsistence fishers as compared to No Action conditions in Chapter 4, Sections 4.10 (Aquatic Resources), 4.14 (Commercial Fisheries), 4.15 (Environmental Justice) and 4.16 (Recreation and Tourism).

In response to public comments and resource agency input about the proposed mitigation efforts, CPRA has expanded and refined the oyster mitigation and stewardship measures. CPRA's mitigation and stewardship strategies and associated expenditures would focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to oyster fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for oysters in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to oyster fisheries in the early years of the Project's operational life. The revised mitigation and stewardship measures include allocating \$4 million to establish new public seed grounds, \$15 million to enhance public and private oyster grounds, \$4 million to enhance broodstock reefs and \$8 million for alternative oyster culture.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG

intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)

- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63132**

**Organizations, such as GNO, Inc., Coastal Communities Consulting, and community-based organizations should serve as connectors between CPRA, other state and federal agencies, and fishers and the seafood industry to plan and implement mitigation, and to ensure mitigation reflects environmental, economic, and community needs and changes over time. Mitigation should include funding for community-based organizations to provide this support in developing and carrying out mitigation.**

**Response ID: 16516**

CPRA engaged the fishing community potentially impacted by the Project through public meetings to solicit input on mitigation strategies. Further, CPRA engaged community-based organizations including Coastal Communities Consulting to assist in engaging minority fishers in reviewing and commenting on the Draft EIS, and soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded. CPRA also plans to create outreach materials in easy to read and understand formats for distribution to the public. This would include translated materials for members of the community who do not speak or read English.

CPRA's Mitigation and Stewardship Plan does not currently provide for use of community-based organizations to distribute mitigation funds or to implement mitigation and stewardship measures. However, community-based organizations have been engaged to assist in providing information to community members regarding available programs, to assist in developing eligibility criteria, and to assist in completing any application processes. CPRA will continue to coordinate with community-based organizations in implementing the Final Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section

---

10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63139**

**Commenters noted that work is needed to promote Louisiana seafood, including collaborating with restaurants and distributors, and enforcing House Bill No. 335 (Regular Session 2019).**

**Response ID: 16522**

Since publication of the Draft EIS and in response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). In its Mitigation and Stewardship Plan appended to the Final EIS, CPRA has included a total of \$5 million in funding for shrimp, crab, oyster, and finfish marketing as part of its Mitigation and Stewardship Plan (see Appendix R1 to the Final EIS). The expenditure of those funds would be directed by LDWF, in coordination with the LDWF Crab, Shrimp, Oyster and Finfish task forces. Those groups would determine whether collaboration with restaurants and enforcement of House Bill 335/Act 372 (adopted as Louisiana RS 40.5.5.4 and which requires any food service establishment that serves imported shrimp or crawfish to post a notice that informs patrons that the seafood has been imported from a foreign place) is the best use of those funds.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that

---

USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63140**

**Commenters requested restoration assistance such as safe haven sites to offer protection to boats and assistance with dredging channels for safe vessel passage, including shrimp boats.**

**Response ID: 16523**

The commenter's concern regarding vessel passage was considered in the Draft EIS. Chapter 4, Section 4.21 Navigation provided that the USACE would continue to maintain federal navigation channels in the Project area during Project operations. In response to public comments, CPRA's Mitigation and Stewardship Plan includes measures that CPRA states it would implement to mitigate impacts on navigation resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The impact analysis in the Final EIS does not suggest that the Project would create the need for safe haven sites.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

---

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63192**

**The Proposed Project should include investment in economic development, such as tourism.**

**Response ID: 16565**

The Draft EIS considered the effects of the Project on economic development, including the effects on tourism (see Chapter 4, Section 4.13.5 [Socioeconomics - Operational Impacts] and Section 4.16.5 [Recreation and Tourism - Operational Impacts] of the EIS), concluding that the Project would have both beneficial and adverse impacts on the regional economy associated with recreational expenditures. While the EIS concludes that the Project would have a beneficial impact on hunting and wildlife watching due to an increase in wetland habitat in some areas of Barataria Basin, it also found minor to moderate, permanent, adverse impacts to recreational boating in the delta formation area due to a number of factors.

Commenters' desire for additional economic development associated with the Project is noted. The estuarine and freshwater wetlands are an integral component of recreation in the region and the Project would increase the area and sustainability of wetland habitats (see Section 3.2.1.1.1 [Alternative 1] in the LA TIG's Restoration Plan and Section 4.6 [Wetland Resources and Waters of the U.S.] of the EIS for more information).

The Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitat in the Barataria Basin. Injured resources, including lost recreational use, not addressed in the Final Restoration Plan have been addressed by previous restoration plans and are intended to be the focus of future restoration plans. For example, the LA TIG has addressed restoration of lost recreational use within Louisiana in RP/EA #2 (LA TIG, 2018a) and RP/EA #4 (LA TIG, 2018b).

Additionally, CPRA's Mitigation and Stewardship Plan (Appendix R1 to the EIS) includes measures focused on establishing a sustainable fishing industry in the long term, including providing financial and technical assistance for alternate business ventures, job training, boats and/or boat improvements, and other measures that will provide economic benefits to the industry.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

In light of the public interest expressed in other projects of this scale and nature, the LA TIG anticipates that members of the public may want to visit the Project site. Due to concerns about safety of the public and security for the Project facilities, there is not a plan to make the diversion structure or immediate outfall area accessible for public use. CPRA would, however, provide signage and other public space near the Project to educate the public regarding the purpose and functioning on the Project.

---

**Correspondence ID:40473**

Louisiana Crab Task Force

Britney Breaux

I am writing you this in opposition of the Mid-Barataria sediment diversion project, on behalf of the Louisiana crab task force. To go forth with the diversion project will kill thousands of commercial fishing jobs. This project will never create land like it's being portrayed to do. It will put many of men and women out of work, displaced sea life, and kill many marine animals. This project will destroy the estuaries for years to come. Please consider other options that are more productive and considerate of the people of South Louisiana.

Sincerely,

Britney Breaux, on behalf of the Louisiana Crab Task Force

---

**Concern ID: 61879**

**Commenters questioned why other alternatives are not being considered other than No Action and a sediment diversion with various levels of flow rates. CEQ's regulations require that the EIS rigorously explore and objectively evaluate all reasonable alternatives, which is a requirement that the Draft EIS does not meet. Consider analyzing a range of other alternatives, options, and tools that better preserve and protect the environment and minimize the severe impacts to Louisiana fisheries, the communities, and the entire Gulf Coast ecosystems.**

**Response ID: 15835**

The range of reasonable alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2 of the Draft EIS (Alternatives), an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the

---

screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in its SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in its Restoration Plan. The LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

---

**Concern ID: 62009**

**The negative socioeconomic consequences would devastate southeast Louisiana, destroy people's livelihoods, displace people living near the diversion, and destroy property in the areas impacted by the proposed MBSD Project.**

**Response ID: 16207**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana, including impacts on population, property values, and community cohesion. As noted in these sections, the proposed Project would have both beneficial and adverse socioeconomic impacts on the people and communities within the Project area. Minor to moderate, permanent adverse socioeconomic impacts are expected to occur near the immediate outfall area outside of flood protection. Minor to moderate, permanent, beneficial socioeconomic impacts are expected to occur in the west bank New Orleans area north of the diversion. Moderate to major, beneficial, temporary impacts from job creation and economic activity in the proposed Project area are anticipated. In addition, the Socioeconomics Technical Report in Appendix H1 provides additional details on these projected effects.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is

critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the DWH oil spill.

The commenters' concern regarding the potential impacts of the diversion were considered by CPRA and the LA TIG in developing the Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included mitigation to address and offset some of the projected impacts of the Project on fisheries and surrounding communities outside levee protection including providing structural mitigation and stewardship measures for increased water levels that are projected to result due to the Project, such as raising roads or improving bulkheads. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

In communities south of the Project site outside of federal levee protection where the proposed Project is projected to cause increased water levels, CPRA plans to take one of two approaches. In Myrtle Grove, CPRA is planning to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision. By improving this bulkhead, CPRA would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions without the Project. See Table 1 in the Final Mitigation and Stewardship Plan for more details. CPRA plans to acquire a temporary right-of-way to permit improvement of the bulkhead, voluntarily or through eminent domain if necessary, from the property owners in the Myrtle Grove Marina Estates Subdivision.

In other communities south of the Project site outside of federal levee protection, from Woodpark south to the communities of Grand Bayou and Happy Jack, CPRA plans to elevate the portions of public roads outside of levee protection that provide access to each of these communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62077**

**The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.**

**Response ID: 16242**

---

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact

determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62659**

**The proposed Project is an experiment, and it is not possible to guarantee its alleged benefits.**

**Response ID: 16632**

The uncertainties associated with the Project's success were considered in the Draft EIS. While the benefits of the Project cannot be guaranteed, the EIS uses state-of-the-art modeling, including but not limited to the Delft3D Basinwide Model, to project the Project's beneficial and adverse impacts. These modeling projections of Project impacts include uncertainties. Following standard professional practice, model uncertainties are clearly stated in the EIS with respect to the model's quantitative results. Uncertainties are incorporated into the EIS impact conclusions and are briefly summarized in EIS Chapter 4, Section 4.1.3.3 Model Limitations and Uncertainty, and in detail in Section 8.0 Model Limitations and Uncertainties of EIS Appendix E Delft3D Modeling.

The likelihood of success of the Project was also considered in the LA TIG's Draft Restoration Plan. While recognizing the innovative nature of the proposed Project, the Restoration Plan discusses in detail the factors that would contribute to the Project's success. More specifically, Sections 3.2.1.4 (Likelihood of Success - Alternative 1) and 3.2.2.4 (Likelihood of Success - Alternatives 2-6) of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, such a sediment diversion has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Section 3.2.1.4 [Likelihood of Success - Alternative 1] of the Restoration Plan). The Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

---

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62777**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).**

**Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of

Kristian Murina

I strongly oppose the mid Barataria diversion project. I am deeply concerned about the potential impact on the bottlenose dolphin. I have worked in the past as an oyster fishing deckhand and I understand that the diversion would severely impact the golf oyster production in Louisiana and Mississippi. My children and I spend time in the bayous near and around empire and feel that that area in particular will be heavily impacted by the influx of freshwater.

---

**Concern ID: 61905**

**Commenters expressed that residents' way of life including living off of and recreating in the water would be impacted by an influx of fresh water due to the MBSD Project.**

**Response ID: 16235**

The issues raised by the commenters were considered in the Draft EIS. As described in the Existing Conditions in Chapter 3, Section 3.16 Recreation and Tourism, as well as Appendix H1 Socioeconomics Technical Report, the Draft EIS acknowledges the importance of recreational use in the region, describing many types of outdoor recreational activities, including fishing, hunting, boating, wildlife viewing, and general shoreline use, among others. The EIS further acknowledges that extensive estuarine and freshwater wetlands provide habitat for many kinds of fish, birds, reptiles, and mammals that are an integral component of recreation in the region. The evaluation of environmental changes in the basin under the No Action Alternative shows that the abundance of target recreational species, including spotted seatrout and red drum, would decline over time. Access to recreational boating sites would also increase from negligible impacts in the early decades to major, adverse impacts in the later decades, leading to decreases in recreational use in the southern portions of the basin even without the Project. Chapter 4, Sections 4.16.4.2 and 4.16.5.2 in Recreation and Tourism describe how changes in the amount of fresh water due to the MBSD Project would impact recreation and tourism. As noted, there would be adverse impacts on-site accessibility, recreational boating, and boat-based recreational fishing due to tidal flooding, sedimentation, and invasive plants. There would be adverse impacts on recreational fishing for spotted seatrout and beneficial impacts on recreational fishing for red drum.

CPRA has developed a suite of mitigation and stewardship measures to help address and offset Project impacts (see the Draft Mitigation and Stewardship Plan in Appendix R1 to the Draft EIS). In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)

- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

AmeriPure Oysters

John Tesvich

Please accept these comments to the Draft Environmental Impact Statement published for the Mid Barataria Sediment Diversion project submitted by The Coastal Protection and Restoration Authority of Louisiana.

Sincerely Yours,

John A. Tesvich, President

**BACKGROUND**

The debate over the use of large-scale river diversions for coastal restoration has been going on for over 30 years in Louisiana. There are clear divides in the pro-diversion camp and anti-diversion camp and there are only a few cross-overs.

In the pro-diversion camp one group share a belief in the theory that a man-made and controlled river diversion is a more natural way to create new wetlands; and another faction are those that personally have something to gain economically like project engineers, contractors and land speculators. Furthermore, most of these people have little or nothing to lose with the implementation of a large river diversion located away from their hometown. The Coastal Protection and Restoration Authority (CPRA) has been advocating large-scale river diversions since the first draft of the state's Master Plan in 2007. Some large, well funded, NGOs are also actively involved in promoting large-scale diversions.

In the anti-diversion camp are the local stakeholders who live and work in the basin area. Their homes, livelihoods, and/or businesses will be taken away or severely challenged with the implementation of a diversion. Other people in the anti-diversion camp are those who objectively look at the negative impacts of large diversions, like socio-economic loss (including fisheries), eco-system disruption (including Essential Fish Habitat), increased flood risks, and wiping out a special dolphin population. For the anti-diversion camp, the negative impacts of a large river diversion far outweigh the purported benefits that are routinely touted by the pro-diversion camp. Locally, the parish governments of Plaquemines, St. Bernard, St. Tammany, and the Town of Grand Isle are all part of the anti-diversion camp having passed ordinances and/or resolutions opposing the diversion project.

The U.S. Army Corp of Engineers (USACE) is thrust into this river-diversion debate looked upon like an arbiter or referee. And that would be fine except for the fact that the USACE is just not an innocent bystander in its long history of navigational and flood protection projects that have greatly affected Louisiana's coast.

Stakeholders in coastal Louisiana, including myself have routinely criticized the CPRA for not considering the negative environmental and socio-economic impacts that large-scale diversions will cause in their cost-benefit analysis of a project. In an effort to appease their critics, the CPRA has publically stated that the USACE's EIS will be the critical review of the environmental impacts of their proposed project and will require a range of reasonable alternatives to be considered. From the DEIS:

- The EIS has been prepared to analyze the potential impacts of the proposed Project and a range of reasonable alternatives, including No Action, on the natural and human environment. The EIS is intended to be sufficient in scope to provide the environmental review necessary to

address federal, state, and local requirements with respect to permits, approvals, and authorizations for the proposed Project.

The DEIS's major failure is in its responsibility to explore "a range of reasonable alternatives". The only alternatives included in the DEIS, except for No Action, were other large-scale river diversions. We expect and want to see other alternatives for coastal restoration besides river diversions. Whether intentional or inadvertent, the USACE, as the Lead Agency, has allowed misleading and false statements of purpose and need to side-step and shortchange a critical aspect of the National Environmental Policy Act (NEPA) process in this project's review.

#### Section 1: Purpose and Need

As stated in the DEIS:

- Defining the purpose and need of a proposed project is a critical component of the NEPA process, as it forms the basis for the scope of alternatives considered in the EIS. In short, federal agencies are required to evaluate the impacts of the proposed project and a range of reasonable alternatives that satisfy the project's purpose and need...
- The CWA Section 404(b)(1) guidelines require that a basic and overall purpose for a proposed project be identified by the USACE. The overall project purpose is a statement designed to be concise, apply to the basic project purpose, and serve as the basis for the alternatives analysis. The basic project purpose is designed to capture the fundamental, essential, or irreducible purpose of a proposed project and is used to determine whether an action is water dependent.

The Purpose of this project as stated in the DEIS is:

. . . the purpose is to restore for injuries caused by the DWH oil spill by implementing a large-scale sediment diversion in the Barataria Basin that will reconnect and re-establish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, freshwater, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

This statement of purpose does not meet the requirement for a concise, basic, essential and irreducible purpose. The statement of purpose is furthermore false and misleading by making the project itself and the DWH oil spill restoration (implementing a large-scale diversion) a part of the purpose. The purpose should be limited to one or the other, but not both.

The CPRA has clearly shown their intention with this project is to create a new river delta in Barataria Bay, while causing the loss in the present day Birdfoot Delta of the Mississippi River. Creating a river delta in Barataria Bay has nothing to do with restoring injuries caused by DWH oil spill. Yes, the Barataria Basin was part of the Lafourche Delta Complex over a thousand years ago. Does going back over 1000 years meet USACE's definition for "restoration due to an oil spill"?

Clearly, the DWH oil spill has nothing to do with this project, except for the applicant's desire to use it as a source of funding. Any reasonable person can see through this. The USACE knows it also and should not allow this charade by the CPRA and the LA Trustee Implementation Group to continue - - especially not to allow it in the critical statement of Purpose.

The statement of Need taken from the DEIS:

- The proposed Project is needed to restore habitat and ecosystem services injured in the northern Gulf of Mexico as a result of the DWH oil spill.

This statement is blatantly false. With this statement of need, the applicant, CPRA, is allowed to infer that a large-scale river diversion is necessary and the only method to restore for damages due to DWH oil spill. Because of this statement that a "river-diversion is necessary" it shows why other real alternatives for restoration were not even considered in the DEIS.

This is not what the public wanted or expected in the DEIS. The USACE and other agencies that have evaluated this project have clearly shown that the habitat and ecosystem services that have been part of the Barataria Basin for well over 100 years will be critically and (some) permanently changed by the project.

There are clearly better, simpler, more cost-effective alternative methods available for restoring habitat and ecosystem services that were injured by the DWH oil spill. Under OPA 15 CFR Sect 990.54 Restoration Selection states that the restoration alternatives be evaluated by at least: "(4) The extent to which each alternative will prevent future injury as a result of the incident, and avoid collateral injury as a result of implementing the alternative"

The CPRA large-scale diversion will cause additional injury and collateral injury to many of the same eco-resources damaged by the DWH oil spill, like bottlenose dolphins, like seafood fisheries, Essential Fish Habitat, etc. This is in direct conflict and a clear violation of OPA.

The CPRA presents one restoration method, river diversions and obviates all other practical methods of restoration. The other alternatives of restoration were not evaluated in the DEIS because the USACE has allowed this deceptive statement of Need to guide their project analysis.

Except as a potential source of funding, the DWH oil spill has nothing to do with this project. A large-scale river diversion is not needed to restore damages due to the oil spill. The USACE knows this and should not allow this deception to continue - - especially in the critical statement of Need.

## Section 2: Alternatives

The alternatives in the DEIS are limited to only other large-scale river diversions or No Action. As stated in the discussion in the Purpose and Need section above, the Purpose and Need statements are false, misleading, and do not comply with NEPA regulations requiring a concise, essential, and irreducible purpose. Because of this, the analysis of alternatives is likewise flawed from the beginning.

Traditional proven methods for coastal restoration such as dredging and pipe-line sediment delivery projects were not even considered as alternatives in rehabilitating the Barataria Basin. This is a major flaw in the DEIS. A major problem with the large-scale diversion project being proposed by the CPRA is the effects of the inundation of a huge amount of river water on the estuary. Alternative designs in the outflow area are possible that channel the river waters with the use of dikes and levees to limit the uncontrolled spread of river water throughout the basin. Alternatives such as this could substantially decrease the negative environmental, socio-economic and other adverse impacts that the project would cause and should be required for the applicant to consider.

## Section 3 Affected Environment & Section 4 Environmental Consequences

### Discussion of Eastern Oysters

The EIS does not mention the water quality standards based on fecal coliform levels for oyster harvesting. The program is implemented and maintained by the Department of Health and Hospitals in cooperation with the Dept of Wildlife and Fisheries for enforcement. DHH issues seasonal maps for oyster harvesting. In many areas of the state's coastal waters there may be oyster resources that cannot be harvested because of high levels of fecal coliforms. The Mississippi River has high fecal coliforms levels and impacts from the river diversion could close extensive areas to harvesting even if the oyster crop were to survive.

In the oyster discussion there is no mention of the significant investments that have been made in the private oyster leases in the Barataria Basin. Hundreds of millions of dollars have been invested by oyster growers in developing their oyster reefs. Approximately 100,000 acres of private oyster leases in Barataria Basin will be severely affected by the project.

Prior to implementation of the Davis Pond river diversion in 2002 the state of Louisiana sponsored an oyster lease relocation program that was deemed very successful by all participants, including the Department of Natural Resources, the lead state agency for the Davis Pond Project. This program can be used as a template to look at what a successful mitigation program for private oyster lease owners might look like.

The Mike Voisin Oyster Hatchery on Grand Island in which the state invested millions of dollars will be severely compromised and will have to be relocated because of the degradation of water quality expected.

### Land and Mineral Rights and Public Trust Doctrine

In Louisiana's coastal zone reportedly eighty percent (80%) of the wetlands are privately owned. When wetlands are allowed to naturally erode or subside and become navigable the Public Trust Doctrine may apply giving the state ownership of the water-bottoms and mineral rights. The legal situation, however, is not always clear.

Because the CPRA is using public monies for this project brings in other questions. The project will destroy wetlands in certain areas in the beginning phases and over time proposes to create wetlands in the outfall area. The applicant has not publically addressed the issue of the Public Trust Doctrine and future land and mineral rights. Who will own land and mineral rights in the outfall area where land may be built? Will the public be allowed to fish, hunt, and navigate through the outfall areas? These are important socio-economic questions for local stakeholders.

### Conclusions

The applicant, CPRA, along with the LA Trustee Implementation Group has provided a confused, misleading, and inappropriate Purpose and Need statement which does not follow NEPA guidelines.

Creating a new river delta in the Barataria Basin has nothing to do with restoring injuries caused by the DWH oil spill. A large-scale river diversion is clearly not the best way to restore damages due to DWH oil spill.

The proposed river diversion will kill off the Barataria Bay dolphin population to practical extinction, damage Essential Fish Habitat, and severely impact several species of fish and shellfish that were already harmed by the DWH oil spill. To implement this project for the

restoration of DWH oil spill impacts is a clear violation of the regulations under OPA 190 15 CFR Sect 990.54 Restoration Selection.

Creating a new river delta in Barataria Bay is one step in the CPRA's plans for a major re-design of the coast. The CPRA has already applied for a permit for the Mid- Breton Diversion on the east bank. This coastal redesign is in coordination with an initiative advocated by several powerful NGOs called Changing Course which advocates building new river deltas in Barataria Bay and Breton Sound, giving up on sustaining communities in lower Plaquemines Parish, and allowing the Bird Foot Delta to collapse.

The applicant's desire to connect the implementation of a large-scale river diversion with restoration for damages due to DWH oil spill is simply to provide a funding source for the project. This ploy should be rejected by the USACE and they should require that the Purpose and Need statements be re-written to follow NEPA guidelines for the Final EIS.

The Alternatives presented in the DEIS are likewise flawed because of the faulty Purpose and Need. Other alternatives that need to be considered for restoring Barataria Bay include sediment dredging and shoreline protection systems.

Alternative outflow designs can be constructed to control river water from a diversion and channel it safely offshore and should be considered because they could severely reduce the environmental impacts from an uncontrolled outfall flow into Barataria Bay. In the final EIS the applicant should be required to present a range of alternative designs that can reduce the considerable negative impacts the current project design would cause.

---

**Concern ID: 61868**

**Alternative designs in the outflow area should be considered to minimize the impacts due to the outflow into the Barataria Basin.**

**Response ID: 15939**

Alternative outfall features that could potentially expedite Project-related benefits were considered in the Draft EIS. As part of the Applicant's Preferred Alternative, CPRA incorporated features into the design of the Project to aid in expediting anticipated Project benefits (see Section 2.8.1.1.2 Basin Outfall Area and Delta Formation Area). These features include beneficial use of material from construction of the diversion channel to create marsh in designated areas within the outfall area, and an outfall transition feature. Due to public scoping comments received, the EIS also considered potential features in the outfall area such as canals, bayous, impoundments, weirs, and chenier-like ridges to manipulate the flow of water and sediment for water quality and sediment retention benefits, to create barriers for storm surge and wind, and to redirect waters away from oyster production and sensitive areas. However, these features were eliminated from consideration because of the potential for such features to impede delta formation. Refer to Chapter 2, Section 2.5 Step 3: Evaluation of Sediment Diversion Outfall Features for evaluation of these alternative outfall features as part of the alternatives screening process.

In consideration of public scoping comments, and because of the possibility of expediting anticipated Project-related benefits, while not interfering with the proposed Project's purpose, two types of outfall features (in addition to construction of the outfall transition feature and beneficial use of material from the diversion channel) were reviewed for further consideration in the Draft EIS. These included ridges and marsh terraces outside of the area where the delta would be expected to initially form. After evaluating these two outfall features, marsh

terracing was chosen as a Project feature in the range of alternatives to be analyzed further in the EIS because marsh terraces are often used to reduce wave energy within an area, to protect eroding or recently restored shorelines, or to promote sediment deposition and resultant benefits. See Section 2.5.1 Additional Considerations.

---

**Concern ID: 61875**

**The purpose and need is false and misleading and does not follow NEPA guidelines for a concise, basic, essential, and irreducible purpose. The statement is misleading by making the proposed Project itself part of the purpose. The DWH oil spill, including restoring for injuries caused by the DWH oil spill, has nothing to do with the proposed Project other than justifying its use as a source of funding.**

**Response ID: 15831**

As described in Chapter 1, Section 1.4 Purpose and Need of the EIS, NEPA regulations (40 CFR 1502.13) state that an EIS “shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action.” The purpose and need statement should be clear and concise in order to facilitate development of a reasonable range of alternatives. USACE generally focused on CPRA’s purpose and need for the proposed Project and considered the public’s and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities), and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project’s purpose and need for the EIS.

Separate from the USACE process, as discussed in the PDARP/PEIS, the SRP/EA #3, and the Restoration Plan, the LA TIG found that impacts of the injuries from the DWH oil spill were particularly detrimental to the resources of the Barataria Basin, which were already in peril as a result of the separation of sediment-loaded river water by levees, subsidence and a changing climate. In the Barataria Basin, marshes already suffering from significant coastal erosion experienced heavy oiling and subsequently experienced double or triple the rate of marsh loss. The Final PDARP/PEIS (DWH NRDA Trustees, 2016a) documented the nature, degree, and extent of injuries from the DWH oil spill to both natural resources and the services they provide, and the nexus between those injuries and need for restoration within the Barataria Basin. Evaluating restoration strategies that could restore for injuries in the Barataria Basin, the SRP/EA #3 found that a combination of “marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats” (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in the EIS and Restoration Plan. The LA TIG’s Restoration Plan concludes that the proposed Project would best restore for injuries caused by the DWH oil spill by reconnecting and reestablishing sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

---

**Concern ID: 61879**

---

**Commenters questioned why other alternatives are not being considered other than No Action and a sediment diversion with various levels of flow rates. CEQ's regulations require that the EIS rigorously explore and objectively evaluate all reasonable alternatives, which is a requirement that the Draft EIS does not meet. Consider analyzing a range of other alternatives, options, and tools that better preserve and protect the environment and minimize the severe impacts to Louisiana fisheries, the communities, and the entire Gulf Coast ecosystems.**

**Response ID: 15835**

The range of reasonable alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2 of the Draft EIS (Alternatives), an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

---

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in its SRP/EA #3 and found that a combination of “marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats” (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in its Restoration Plan. The LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG’s Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

---

**Concern ID: 62026**

**The proposed Project would destroy wetlands in certain areas in the beginning phases and over time proposes to create wetlands in the outfall area. The Applicant has not publicly addressed the issue of the Public Trust Doctrine and future land and mineral rights. The commenter inquires as to who would own land and mineral rights in the outfall area where land may be built and if the public would be allowed to fish, hunt, and navigate through the outfall areas which are important socioeconomic questions for local stakeholders.**

**Response ID: 16222**

According to CPRA, due to concerns about safety of the public and security for the proposed Project facilities, there is not a plan to make the diversion structure or immediate outfall area accessible for public use. CPRA is, however, planning to provide signage and other public space near the proposed Project to educate the public regarding the purpose and functioning on the Project. CPRA also states that ownership of any lands created by operation of the proposed Project would be determined in accord with current state law, including mineral rights, pursuant to La. R.S. 31:149 and La. R.S. 49:214.5.5(E) and that pursuant to La. R.S. 49:214.5.5(B), the proposed Project would not create any rights to the public in or on private property.

---

**Concern ID: 62103**

**The Draft EIS does not fully address the anticipated destruction of multiple components of the commercial oyster fishery, including oyster habitat, off-bottom oyster farms, and the oyster hatchery at Grand Isle resulting from impacts to water quality and changes in salinity.**

**Response ID: 16258**

Impacts of the proposed Project on eastern oysters are discussed in the Aquatic Resources section of the EIS in Chapter 4, Section 4.10.4.5, Key Species. The section identifies that most adverse impacts on oysters are anticipated at mid-basin locations, while some beneficial impacts may occur in the lower basin, including the Grand Isle area. The off-bottom and hatchery components of the oyster fishery would not be affected by the Project, or may benefit from it. Specifically, the only significant off-bottom oyster fisheries in Barataria Basin occurs in the lower basin. As indicated in Chapter 3, Section 3.14.6, Aquaculture, the Mike

Voisin Oyster Hatchery in Grand Isle is the only commercially available source of oyster larvae and seed. These areas could benefit from the Project. Final EIS Chapter 4, Section 4.14 Commercial Fishing has been revised to discuss these effects.

CPRA's Mitigation and Stewardship Plan includes measures to increase funding for the development of broodstock reefs, enhancing public and private oyster areas, creating a new public oyster seed ground and to further develop alternative oyster culture methods, including off-bottom oyster culture. See the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62300**

**The diversion would cause harmful algal blooms which have unforeseen risks to human health, including Amnesic Shellfish Poisoning (ASP), Neurotoxic Shellfish Poisoning (NSP), Paralytic Shellfish Poisoning (PSP), Diarrhetic Shellfish Poisoning (DSP) and Ciguatera Fish Poisoning (CFP).**

**Response ID: 15813**

The impacts raised by the commenters have been considered in the Draft EIS. As discussed in the EIS, Chapter 4, Sections 4.5.5.3 and 4.5.5.4 in Surface Water and Sediment Quality, increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations. Vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in

---

lower concentrations of nutrients occurring in the Barataria Basin than in the river and reaching the Gulf through Barataria Bay.

Section 4.10.4.4 in Aquatic Resources notes that an increased potential and frequency of phytoplankton blooms would be likely within the Project area, but whether or not these blooms would become harmful algal blooms cannot be definitely determined. A reference to Section 4.10 is included in Section 4.5.5.3 in Surface Water and Sediment Quality of the Draft EIS. A reference to Section 4.10 Aquatic Resources has been added to Section 4.5.5.4 (Phosphorus) of the Final EIS. Clarifying language has been added to Sections 4.5.5.3, 4.5.5.4, and 4.25.5.4 in Cumulative Impacts.

Section 4.14 Commercial Fisheries has been updated in the Final EIS to discuss the National Shellfish Sanitation Program and the Louisiana Department of Health's oversight of shellfish harvesting in order to prevent harvest of oysters that may contain unsuitable levels of fecal coliform or toxins harmful to human health. Additionally, Appendix R2 in the Final EIS includes a Monitoring and Adaptive Management (MAM) Plan that describes monthly fecal coliform monitoring (Section 3.7.5.1) and periodic sampling for Contaminants of Concern in fish, shellfish, and wildlife (Section 3.7.3.23).

Additionally, as described in Appendix R2 CPRA's MAM Plan of the EIS, Section 3.7.3.11, CPRA is proposing to monitor for Harmful Cyanobacterial/Algal Bloom Toxins in Barataria Surface Waters. Samples will be collected monthly and additional discrete sampling will be done as needed in response to observations of presence of cyanobacterial and/or eukaryotic algal species associated with harmful algal bloom. Filter feeding fish may also be analyzed for toxins in fish tissue.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62402**

**The U.S. Army Corp of Engineers (USACE) is thrust into this river diversion debate and looked upon like an arbiter or referee. And that would be fine except for the fact that the USACE is just not an innocent bystander in its long history of navigational and flood protection projects that have greatly affected Louisiana's coast.**

**Response ID: 15926**

USACE is neither a proponent for nor an opponent to the proposed Project. As part of its Section 10/404 permitting decision-making process, USACE conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

---

**Concern ID: 62403**

**MBSD and Mid-Breton Sediment Diversion are advocated by several powerful NGOs called Changing Course which advocates building new river deltas in Barataria Bay and Breton Sound, giving up on sustaining communities in lower Plaquemines Parish, and allowing the birdfoot delta to collapse.**

**Response ID: 15927**

The "Changing Course" proposal is not being evaluated as part of this EIS.

All public comments received on the EIS and Restoration Plan, including those in support of and critical of the Project, were reviewed and considered in developing the Final EIS and Final Restoration Plan.

With respect to the impact of the proposed Project on lower Plaquemines Parish and the birdfoot delta, the diversion would be expected to accelerate land loss as compared to the No Action Alternative. See Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology for further discussion. The impacts of the proposed Mid-Breton Sediment Diversion were considered in the Draft EIS as part of the cumulative impacts analysis, which analyzes the incremental impacts of the proposed Project when added to other past, present, and reasonably foreseeable future actions (see Chapter 4, Section 4.25 Cumulative Impacts). Additionally, there will be an opportunity for the public to provide comments on the proposed Mid-Breton Sediment Diversion when USACE releases the Draft EIS for that proposed project.

---

**Concern ID: 62634**

**The proposed Project would cause excessive harm to fisheries (for example, oysters and brown shrimp), dolphins, communities and recreational uses, which is unacceptable and would make its implementation a clear violation of OPA. OPA regulations states that proposed restoration actions should be evaluated by "the extent to which each alternative will prevent future injury as a result of the incident, and avoids collateral injury as a result of implementing the alternative". Because the Project would injure species that were harmed by the Deepwater Horizon oil spill, it should not be implemented, even if it does benefit some habitats and species. Some commenters argued it was also inconsistent or in violation of the 2013 U.S. Court Consent Decree and the BP plea agreement relevant to the National Fish & Wildlife Foundation (NFWF) funds.**

**Response ID: 16650**

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is not evaluating the proposed Project for compliance with OPA and not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG's Draft Restoration Plan, OPA, or NRDA processes represent solely the views of the LA TIG, not USACE.

The potential collateral injuries of the proposed Project were considered in the LA TIG's Draft Restoration Plan.

OPA requires that Trustees develop and implement a plan for restoration, rehabilitation, replacement, or acquisition of the equivalent, of the injured natural resources under their trusteeship. See 33 U.S.C. § 2706(c). OPA further requires federal agencies to propose regulations for the "assessment of natural resource damages." See § 2706(e). Under 2707(e)(2), any assessment of natural resource damages made in accordance with these regulations creates a rebuttable presumption on behalf of a Trustee in any administrative or judicial proceeding under the Act.

As required by OPA 2706(e), NOAA developed regulations outlining a process for the assessment of natural resource damages. These regulations (hereinafter "NRDA regulations" at 15 CFR Part 990) also include a process for restoration planning, including the development and evaluation of restoration alternatives.

The 2016 U.S. Consent Decree with BP provides that monies received under the settlement for natural resource damages will be spent as outlined in restoration plans adopted by the Trustees consistent with 15 CFR 990. See Paragraph 19, and Appendix 2. The LA TIG's Restoration Plan is consistent with 15 CFR 990.

Title 15 CFR §990.54 of the regulations outlines a number of areas in which a reasonable range of alternatives should be evaluated to select the preferred alternative. Recognizing that almost all restoration comes with some potential for collateral injury, one factor for evaluation is the extent to which each alternative will prevent future injury and avoid collateral injury. The potential for collateral injury does not preclude an alternative from selection, rather the Trustees must evaluate each alternative under multiple factors, and select a preferred alternative to meet the outlined restoration objectives.

The LA TIG, in selecting the Preferred Alternative in the Restoration Plan, evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 (Identification of a Preferred Alternative), 3.2.1.5 (Alternative 1 – Avoids Collateral Injury), and 3.2.2.5 (Alternatives 2–6 – Avoids Collateral Injury) of the Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems and necessarily entails reverting the current ecosystem to a more natural state that was altered when Mississippi River flows were cut off by construction of levees. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is

anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the Preferred Alternative in the Restoration Plan.

The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Alternative 1 – Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as the Preferred Alternative in the Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project would meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the spill.

The BP Plea Agreement as it applies to NFWF funds is not relevant here as the LA TIG is not authorizing the use of those funds for this Project. Even if it were applicable, the criminal plea agreement expressly contemplates the use of criminal penalties for sediment diversion in Louisiana.

---

**Concern ID: 62635**

**The proposed Project would cause harm to some species and fisheries, and would increase flooding in some communities, and the EIS does not show that the proposed Project's benefits outweigh these harms. Other less harmful alternatives to the proposed Project should be considered to minimize impacts.**

**Response ID: 16651**

The range of alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. USACE generally focused on the Applicant's purpose and need and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities), and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project purpose and need.

---

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. Based on a review of the various alternatives against these criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2 Alternatives, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such a cost-benefit analysis is relevant to the agency's permit decision. USACE generally assumes that a permit applicant has made its own economic evaluation regarding the costs of a proposed project and therefore a cost-benefit analysis is not relevant to its decision. However, as part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

The LA TIG is the group responsible for restoring natural resources and services within Louisiana that were injured by the DWH oil spill. In the LA TIG's Restoration Plan, the LA TIG also evaluates a range of alternatives and identifies its Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs) as providing the right balance in terms of likely benefits the Project would achieve and risks related to collateral injury for its NRDA decision. Title 15 CFR §990.54 of the NRDA regulations outlines the criteria that are used to evaluate a reasonable range of alternatives and select the preferred alternative. Recognizing that almost all restoration comes with some potential for collateral injury, one factor for evaluation is the extent to which each alternative will prevent future injury and avoid collateral injury. The potential for collateral injury does not preclude an alternative from selection, rather the Trustees must evaluate each alternative under multiple factors and select a preferred alternative to meet the outlined restoration objectives.

The LA TIG, in selecting the Preferred Alternative in the Restoration Plan, evaluates a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 (Identification of a Preferred Alternative), 3.2.1.5 (Avoids Collateral Injury – Alternative 1), and 3.2.2.5 (Avoids Collateral Injury – Alternatives 2-6) of the Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is

especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems, and necessarily entails reverting the current ecosystem to a more natural state that was altered when Mississippi River flows were cut off by construction of levees. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as its Preferred Alternative in the Restoration Plan.

The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing a deltaic process, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project would meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the spill.

**Concern ID: 62978**

**Collaboration is needed to minimize impacts on oyster industry, including developing innovative uses for bottom oysters and supporting collaboration between CPRA and LDWF.**

**Response ID: 16539**

CPRA and other state agencies, such as LDWF, recognize the importance of collaboration to support the fishing industry in adapting the ongoing changes in the environment. As explained in Section 4.14.4.1 Commercial Fisheries of the Draft EIS, without the Project, adverse impacts to oyster fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for oysters in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause

---

significant adverse impacts to oyster fisheries in the early years of the Project's operational life. bCPRA and LDWF worked together with numerous oyster fishers as part of Louisiana Sea Grant's Seafood Futures Initiative to develop mitigation and stewardship measures aimed at maintaining a sustainable oyster fishery. CPRA anticipates working with other agencies, such as Louisiana Economic Development, on the workforce development, education and training programs included in the Mitigation and Stewardship Plan (see Appendix R1 to the Final EIS). In addition, CPRA engaged the fishing community potentially impacted by the Project through public meetings to solicit input on mitigation and stewardship strategies and engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures from affected fishers. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Refer to the Mitigation and Stewardship Plan for mitigation measures to be implemented as a result of these engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63770**

**A large-scale river diversion is not needed to restore damages from the Deepwater Horizon oil spill and is unrelated to the spill.**

**Response ID: 16630**

---

Chapter 2, Section 2.2.1 Define Project Objectives of the EIS describes the goals and objectives of the Project, which are based on the Project's purpose and need. As described in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose and need for this Project was developed taking into consideration the Applicant's stated purpose and need, the public's and other perspectives, input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities), and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC). Chapter 3 (Affected Environment) of the EIS describes existing conditions within the Project area and Section 3.1 (Introduction) provides an overview and history of the Project area, including the DWH oil spill. These existing conditions are factored into the impact analysis in Chapter 4 (Environmental Consequences) of the EIS.

The appropriate means to restore the injuries caused by the DWH oil spill was considered by the LA TIG. As discussed in the PDARP/PEIS, the SRP/EA #3, and the LA TIG's Restoration Plan, the LA TIG agencies found that impacts of the injuries from the DWH oil spill were particularly detrimental to the resources of the Barataria Basin, which were already in peril as a result of the coastal wetland losses (caused by multiple factors including river levees that prevent deposition of sediments through regular flood events, subsidence and a changing climate). In the Barataria Basin, marshes already suffering from significant coastal erosion experienced heavy oiling and subsequently experienced double or triple the rate of marsh loss. In identifying the nexus to injury, the Final PDARP/PEIS (DWH NRDA Trustees, 2016a) documented the nature, degree, and extent of injuries from the DWH oil spill to both natural resources and the services they provide within the Barataria Basin, and the need for restoration to restore for the injuries incurred.

Evaluating restoration strategies that could restore injuries in the Barataria Basin, the SRP/EA #3 found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018, page 3-32) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed MBSD Project evaluated in this Restoration Plan, and finds that it would best restore for injuries caused by the DWH oil spill by reconnecting and reestablishing sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

---

**Concern ID: 64382**

**A cost-benefit analysis should be taken into consideration for the proposed Project.**

**Response ID: 15841**

NEPA does not require that an EIS contain a cost-benefit analysis unless it is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of the proposed project and therefore, does not require a financial cost-benefit accounting for its decision. However, as part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a proposed project against its prospective benefits.

---

Consistent with OPA regulations, the LA TIG has evaluated in the Restoration Plan a range of alternatives based on multiple criteria including the cost to carry out each alternative, the likelihood of success, the extent to which future injury will be prevented and avoid collateral injury, the extent of benefits to more than one natural resource, and the effect on public safety. This analysis can be found in Section 3 of the LA TIG's Restoration Plan.

N/A N/A

As a group of native Louisianans, current or former residents, frequent visitors of relatives or friends in the region, or simply just tourists who have enjoyed Louisiana's unique culture, we are writing to express our strong support for the Mid-Barataria Sediment Diversion. The Mid-Barataria Sediment Diversion is a crucial first step to ensuring the long-term health of Louisiana's coastal communities, ecosystems and wildlife in the face of a rising sea levels, increasing storm intensity, and continued land loss.

The Mississippi River has been altered and confined by levees for over 100 years leading to the extensive land loss crisis that has seen over 2,000 square miles already disappear into the Gulf of Mexico. But the "Muddy Mississippi" is also the very tool that can start to rebuild wetlands and habitat, provide a line of defense to storms and sea level rise, and provide sustainability for communities including our beloved bayou communities and New Orleans.

We also understand that changing the ecosystem to a more natural state will mean unfortunate impacts to some resources that have benefited from the artificially created estuary over the past decades, such as oysters, brown shrimp and dolphins. We appreciate your efforts to address those impacts with stewardship measures and funding and encourage you to continue to take a holistic approach to address citizen concerns. No matter where we are in the country, we can enjoy the bounty of Louisiana's seafood and who doesn't have an affinity for dolphins. But we also understand that by not reconnecting the Mississippi River, these precious resources may suffer even greater impacts in the future, along with the ecology, economy, communities and culture. Restoring a more natural state to the Louisiana delta will not be easy but is fundamentally essential if future generations want to enjoy the bounty and culture of the region.

We support the selection of the 75,000 cfs sediment diversion, but also encourage the continued exploration of increased capacity and the acceleration of other sediment diversions that are identified in Louisiana's Coastal Master Plan to maximize use of the natural resources of the river. We have no time to lose to reconnect the sediment, nutrients and freshwater of the Mississippi River to its wetlands and start to rebuild our coast. The future of New Orleans, the bayou communities, the fisheries and wildlife and Louisiana's amazing culture desperately depend on it.

We thank you for your tireless efforts for our generation and for the generations to come,

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63340**

---

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

This will be a short but concise response. First, I need to state that I have been researching continuously in the wetlands of S.E. Louisiana since literally 1975 when I began my Masters in Biology work at Tulane University; then my Ph.D. from Tulane in 1979, and finally retiring from teaching and research at Loyola University in 2017. Too many publications, and papers at meetings to outline here! Most of my research has been within 3 wetland areas: lower Pearl River basin, Delacroix and Bayou Terre aux Boeuf, and the Mississippi River Birdfoot Delta proper. I know those wetland areas very well. I've a ton of baseline knowledge of the changes that have occurred within each one. It's not a pretty story. Another point regarding my credentials: I began teaching formally Climate Change Science in 1982 - each and every year since then. I was one of the founding members of the Program in the Environment at Loyola University and chair of the program for a time.

So, the bottom line is this related to the Mid-Barataria Sediment Diversion Project - I fully support it and know well that it's back up by TONS of hard science AND urgency. The State would have to have it's head examined to not support it. The State and it's citizenry need as much wetland as possible. Marsh creation naturally in any way the RIVER is allowed to do should be of highest priority. The situation is only going to get worse and I am 1000% confident more livelihoods will be destroyed if we don't recognize what folks must give up for the better good.

---

**Concern ID: 63333**

Kristi Trail

I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion Project.

I am a life long resident of Louisiana.

Our coast is a vital productive ecosystem necessary for breeding and survival of fish, shellfish, and wildlife. It is estimated that over 75 percent of the state commercial and recreational fishing depends on the state' wetlands. As result, when wetlands are lost, so are the habitats that sustain our commercial and recreational fishing industry, and Louisiana will no longer be known as a fisherman's paradise.

The Mid-Barataria Sediment Diversion will rebuild our wetlands, protect our coast and help reduce the Gulf of Mexico Dead Zone through the use of nutrients as a positive rebuilding tool.

For the above reasons I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion Project.

---

**Concern ID: 63394**

**The Mid-Barataria Sediment Diversion would rebuild wetlands, protect the coast, and help reduce the Gulf of Mexico Dead Zone through diversion of nutrients into the Barataria Basin to increase area productivity.**

**Response ID: 16356**

The commenter correctly notes that the proposed Project would build and maintain wetlands within the Barataria Basin that would provide some storm surge reduction to some portions of the basin, as discussed in Chapter 4, Sections 4.6.5.1 in Wetland Resources and Waters of the U.S. and 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the EIS. As discussed in Section 4.10.4.4 in Aquatic Resources, nutrient load would increase in the Barataria Basin from the input of water from the Mississippi River; however, the birdfoot delta is projected to have negligible changes in nutrient loads. Section 4.25.5.4.4 and 4.25.5.4.5 in Cumulative Impacts, Surface Water and Sediment Quality of the Final EIS has been revised to discuss the Gulf Hypoxia Action Plan, which highlights the important role that river diversions could play in reducing nutrient loads; however, the Gulf hypoxic zone is not expected to be impacted by operation of the proposed Project.

Dear Sir/Madam,

This is my comment on the USACE Mid-Barataria Sediment Diversion (MBSD) Environmental Impact Statement.

Please require the Coastal Protection and Restoration Authority (CPRA) and the Louisiana Trustee Implementation Group (LaTIG) to resubmit their permit application with a plan to address the specific damages caused by the Deep Water Horizon oil spill (DWH) and with alternative means of achieving the "purpose of restoration" (Purpose) for use of the DWH funds.

Quoting from Draft Phase II Restoration Plan #3.: Mid-Barataria Sediment Diversion, March 2021, Page 1-7: "The purpose of restoration, as discussed in this Draft RP and detailed more fully in the Deepwater Horizon Oil Spill: Final Programmatic Damage Assessment and Restoration Plan and Final Programmatic Environmental Impact Statement (Final PDARP/PEIS; DWH NRDA Trustees, 2016a), is to make the environment and the public whole for injuries resulting from the Incident by implementing restoration actions that return injured natural resources and services to the condition they would have been in but for the spill, and compensate for interim losses."

1. The MBSD project misuses Deep Water Horizon oil spill (DWH) funds because it does not restore for the specific injuries caused by the DWH.

a. The Trustees were overly ambitious in choosing the Comprehensive Integrated Ecosystem Restoration Alternative (Alternative A) as their response to the DWH. Alternative A seeks to restore for ecosystem-level damages due to subsidence, saltwater intrusion, levees, canals, and the DWH. In the context of coastal land loss, the DWH seems to be a minor factor of coastal land loss. Proper use of the funds due to the DWH should be focused on restoring for injuries due to the DWH. The Trustees should have chosen an alternative that focuses on the impacts of the DWH.

b. The MBSD project reflects the LaTIG decision to implement an ecosystem-level restoration while, as noted in the quotation above, the "purpose of restoration" (Purpose) is to implement a project that would "return injured natural resources and services to the condition they would have been in but for the spill." The Purpose directs the project to remedy the specific injuries caused by the spill. Yet, the USACE EIS indicates the MBSD will harm brown shrimp, oysters, and bottlenose porpoises. This is in violation of the Purpose for use of the DWH funds.

See also the following quotation from Page 4-382 . Final Programmatic Damage Assessment and Restoration Plan (PDARP) and Final Programmatic Environmental Impact Statement (PEIS). Feb/2016. ). "When average daily salinity conditions dropped below 5 parts per thousand for more than 30 consecutive days between April and September, substantial numbers of oysters were killed, as shown by over a decade of data collected in these zones by the state of Louisiana (see Nestier tray dose response curve in Figure 4.6-46) (Powers et al. 2015a; Rouhani & Oehrig 2015a, 2015b). Observations from NRDA sampling have confirmed this. Oyster abundance in 2010 was very low in many areas within the areas

---

affected by these river water releases and dropped to zero over most of these areas in 2011 (Powers et al. 2015a)."

c. The Final PDARP/PEIS indicated the DWH negatively impacted more than a thousand miles of *Spartina alterniflora* marsh edge. Freshwater is detrimental to *Spartina alterniflora*. *Spartina* dominates marsh in water with a salinity range of 3 to 5 parts per thousand. The MBSD uses freshwater partially to build freshwater marshes. Thus, the MBSD is using DWH funds for purposes that are beyond the mandate of the Purpose.

2. The permit application does not give adequate consideration to alternative methods of achieving the Purpose.

a. The permit application gives consideration only to different sizes of diversions. This forces a decision to implement a diversion of some size. It ignores other alternatives for achieving the Purpose that are less expensive, provide immediate storm protection, and promote wildlife-based industries such as the sports-fishing, shrimp, crab, and oyster industries.

For example, it gives no consideration to the use of inshore islands. The Court said the DWH funds could be used to build either diversions or offshore islands. The State of Louisiana, the CPRA and the LaTIG should have gone back to court to define "offshore islands" to include inshore islands. Inshore islands are the second line of storm defense behind offshore islands. Islands are dryland and well-appreciated for their capacities to dampen storm surge. For example, the loss of inshore islands behind Grand Isle has weakened the natural storm defense in the Barataria Basin. CPRA has experience in rebuilding islands. One notable rebuild was Queen Bess Island, a pelican rookery. Islands begin providing extra storm surge protection "immediately." There is no fifty year lag as is the case with the CPRA approach of building wetland.

b. CPRA says the MBSD will build twenty square miles of land at the mouth of the MBSD. Why not use a fraction the \$2 billion planned for the MBSD to build an inshore island in the same area? A twenty-five square mile island, five miles wide and five miles long would have a 20-mile perimeter. At \$25 million per mile the perimeter around the island would cost \$500 million. That's about ¼ the cost of the MBSD. And the island would begin providing enhanced storm protection "immediately (after the 5-10 years required to build it). The interior of the island would quickly become freshwater marsh, then a freshwater swamp. If the interior of the island were given to an economic development organization, it would be converted to its highest-value use. Perhaps, space for migrating ducks or a cypress swamp, or an industrial or urban zone.

3. The adaptive management plan is not feasible. See Table 4.5-2 of the USACE DEIS Environmental Impacts Chapter 4, page 4-139. The Table shows that expected salinities would not support oyster culture in the Barataria Basin, except at Barataria Pass at Grand Isle. The proposed "adaptive management" would require actions to maintain the existing salinity pattern in the project area, that is, undoing the impact of the freshwater diversion.

4. The large-scale diversions promote inequity and the violation of the social contract to protect citizens from storm and flood damage. The MBSD is an inequitable use of public funds in that its negative impacts fall most directly on marginalized ethnic groups, including African American, Native American, Latin American, Asian American, Canary Islander American (Islenos), and Croatian American. The MBSD will harm these people first.

- a. Levee breaks and flooding up-river are quickly repaired and the impacted communities are helped to rebuild their homes and businesses. Down-river, society breaks the levees or does not restore breaks in existing levees. The affected communities are considered "part of the egg shell" (When you make an omelet, you have to break some eggs.)
- b. The CPRA/LaTIG focus on wetland construction with river water is ecologically pleasing. But it is inappropriate for our civilization as it is established today. It is also inequitable. It breaks the social contract that guaranteed the people of southern Louisiana would be protected from floods. When the natural Mississippi River levee broke and created Mardi Gras Pass, the (mostly African American) oyster farmers/fishers in Breton Sound assumed the break would be quickly repaired and they would be helped to recover from the damage caused to their farms and fishery. If such a crevasse has occurred up-river and flooded sugar cane farms in Louisiana or dairy farms in the Ohio river basin, the repair would have been immediate and farmers would have been helped recover from their losses. But Mardi Gras Pass has been allowed to exist and to widen. And, perhaps, only coincidentally, the oyster industry at Point a la Hache has disappeared. Prior to Mardi Gras Pass, lower Breton Sound near Pointe a la Hache regularly produced half of the oyster landings in the state of Louisiana. Is society's response to Mardi Gras Pass equitable?

---

**Concern ID: 61858**

**CPRA should resubmit their permit application with a plan to address the specific damages caused by the DWH oil spill and with alternative means of achieving the "purpose of restoration" (Purpose) for use of the DWH funds.**

**Response ID: 15884**

CPRA submitted a Section 10/404 permit application and Section 408 permission request to the USACE to construct, operate, and maintain the proposed MBSD Project. Chapter 2 Alternatives, Section 2.2 Steps Taken to Identify and Evaluate Reasonable Alternatives of the EIS provides a detailed explanation for the identification and evaluation of a range of reasonable alternatives based on the purpose and need for the proposed MBSD Project.

Chapter 2 of the LA TIG's Final Restoration Plan describes how the LA TIG screened and selected the alternatives considered in the Restoration Plan. Briefly, as discussed in the PDARP/PEIS, the SRP/EA #3, and the Final Restoration Plan, the LA TIG found that impacts of the injuries from the DWH oil spill were particularly detrimental to the resources of the Barataria Basin, which were already in peril as a result of the separation of sediment-loaded river water by levees, subsidence and a changing climate. In the Barataria Basin, marshes already suffering from significant coastal erosion experienced heavy oiling due to the DWH oil spill and subsequently experienced double or triple the rate of marsh loss. The Final PDARP/PEIS (DWH NRDA Trustees, 2016a) documented the nature, degree, and extent of injuries from the DWH oil spill to both natural resources and the ecological services they provide, and the nexus between those injuries and need for restoration within the Barataria Basin. Evaluating restoration strategies that could restore for injuries in the Barataria Basin, the SRP/EA #3 found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured wetlands, coastal, and nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a

---

large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion that is evaluated in the EIS and the LA TIG's Final Restoration Plan. The LA TIG's Final Restoration Plan explains that the proposed Project would best restore for injuries caused by the DWH oil spill by reconnecting and reestablishing sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, freshwater, and nutrients to support the long-term viability of existing and planned coastal restoration efforts. Other restoration projects, including marsh and ridge restoration activities, that would help restore for the injuries caused by the DWH oil spill are being considered and implemented by the LA TIG under their restoration planning efforts.

---

**Concern ID: 61930**

**The proposed MBSD Project is an inequitable use of public funds because its negative impacts fall most directly on marginalized ethnic groups, including African American, Native American, Latin American, Asian American, Canary Islander American (Islenos), and Croatian American and unjustly places the burden on Louisiana's coastal fishers. Risks often fall disproportionately on low-income or minority communities due to ongoing institutional injustices. These low-income and minority communities, including homes, cultures, and livelihoods of Indigenous people and other people of color are often sacrificed for the benefit of the "greater good", particularly for the larger tax bases upstream of the proposed MBSD Project. For example, when the levee breached at Mardi Gras Pass, nothing was done to re-protect the mostly African American oyster farmers and fishers whose oyster farms in Breton Sound were destroyed by the fresh water from Mardi Gras Pass. But a levee breach anywhere else along the Mississippi River would be quickly rebuilt and the impacted people would be indemnified. Also, the most effective flood risk reduction solutions, like home buyouts, are not offered to low-income populations in areas south of New Orleans. Both the Draft EIS and the LA TIG's Draft Restoration Plan would benefit from additional reflections on the natural and human history of the Project geography that resulted in such fundamental changes to the landscape and set us on the course of the land-loss crisis that Louisiana faces today. The EIS should describe historic, systemic inequities affecting communities with environmental justice concerns in the Project area to provide authentic and more complete context for the discussions.**

**Response ID: 16281**

The Draft EIS (including Section 4.15 Environmental Justice and Appendix H, Socioeconomics Technical Report at Chapter 2) included a discussion of communities with

---

low-income and minority populations, including information about factors that have contributed to historic and systemic inequities in southeast Louisiana. As discussed in the EIS, the Project may have disproportionately high and adverse, long-term impacts on some low-income and minority populations in communities engaged in commercial and subsistence fishing and dependent on adversely impacted fisheries, as well as communities located near the immediate outfall area (within approximately 10 miles north and 20 miles south) and outside of federal levee protection. In addition, negligible to minor, adverse impacts related to increased risk of levee overtopping during certain 1 percent storm events south of the immediate outfall area may occur, which may impact the community of Ironton. Commenters also raised concerns about Mardi Gras Pass; however, the closure of Mardi Gras Pass is outside of the scope of the EIS.

CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61980**

**The permit application does not give adequate consideration to alternative methods of achieving the purpose. The permit application gives consideration only to different sizes of diversions. This forces a decision to implement a diversion of some size. It ignores other alternatives for achieving the purpose that are less expensive, provide**

---

**immediate storm protection, and promote wildlife-based industries such as the sports-fishing, shrimp, crab, and oyster industries. For example, it gives no consideration to the use of inshore islands.**

**Response ID: 15979**

CPRA's permit application requests USACE authorization of the Applicant's Preferred Alternative (75,000 cfs sediment diversion with 5,000 cfs base flow). The EIS evaluates the Applicant's Preferred Alternative and a range of reasonable alternatives, including No Action, based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS consistent with CEQ NEPA regulations. As described in Chapter 2 Alternatives of the EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan.

Details of the screening process including screening criteria are described in Chapter 2 Alternatives, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS. Similar to marsh creation alternatives, inshore islands typically involve dredging and movement of sediment to increase the elevation of uplands to create, or improve the abundance and quality of, nesting habitat for birds. Inshore islands would not meet the goals and objectives as stated in the purpose and need in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives of the EIS.

Prior to USACE's preparation of the EIS and the LA TIG's preparation of the Restoration Plan, the LA TIG evaluated restoration strategies that could restore injuries in the Barataria Basin in SRP/EA #3. In that document, the LA TIG found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in the Restoration Plan. However, it is worth noting that the LA TIG has also funded, and will continue to fund, other types of restoration projects that provide ecosystem services lower in the basin (for example, the Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Chapter 2, Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of the process the LA TIG used to identify alternatives for its SRP/EA#3.

---

See Chapter 4, Section 4.25 Cumulative Impacts of the EIS for a discussion of marsh creation projects in the Barataria Basin that are anticipated to provide complementary ecosystem services with the proposed Project.

---

**Concern ID: 62634**

**The proposed Project would cause excessive harm to fisheries (for example, oysters and brown shrimp), dolphins, communities and recreational uses, which is unacceptable and would make its implementation a clear violation of OPA. OPA regulations states that proposed restoration actions should be evaluated by “the extent to which each alternative will prevent future injury as a result of the incident, and avoids collateral injury as a result of implementing the alternative”. Because the Project would injure species that were harmed by the Deepwater Horizon oil spill, it should not be implemented, even if it does benefit some habitats and species. Some commenters argued it was also inconsistent or in violation of the 2013 U.S. Court Consent Decree and the BP plea agreement relevant to the National Fish & Wildlife Foundation (NFWF) funds.**

**Response ID: 16650**

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is not evaluating the proposed Project for compliance with OPA and not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG’s Draft Restoration Plan, OPA, or NRDA processes represent solely the views of the LA TIG, not USACE.

The potential collateral injuries of the proposed Project were considered in the LA TIG’s Draft Restoration Plan.

OPA requires that Trustees develop and implement a plan for restoration, rehabilitation, replacement, or acquisition of the equivalent, of the injured natural resources under their trusteeship. See 33 U.S.C. § 2706(c). OPA further requires federal agencies to propose regulations for the “assessment of natural resource damages.” See § 2706(e). Under 2707(e)(2), any assessment of natural resource damages made in accordance with these regulations creates a rebuttable presumption on behalf of a Trustee in any administrative or judicial proceeding under the Act.

As required by OPA 2706(e), NOAA developed regulations outlining a process for the assessment of natural resource damages. These regulations (hereinafter “NRDA regulations” at 15 CFR Part 990) also include a process for restoration planning, including the development and evaluation of restoration alternatives.

The 2016 U.S. Consent Decree with BP provides that monies received under the settlement for natural resource damages will be spent as outlined in restoration plans adopted by the Trustees consistent with 15 CFR 990. See Paragraph 19, and Appendix 2. The LA TIG’s Restoration Plan is consistent with 15 CFR 990.

Title 15 CFR §990.54 of the regulations outlines a number of areas in which a reasonable range of alternatives should be evaluated to select the preferred alternative. Recognizing that almost all restoration comes with some potential for collateral injury, one factor for evaluation is the extent to which each alternative will prevent future injury and avoid collateral injury. The potential for collateral injury does not preclude an alternative from selection, rather the Trustees must evaluate each alternative under multiple factors, and select a preferred alternative to meet the outlined restoration objectives.

The LA TIG, in selecting the Preferred Alternative in the Restoration Plan, evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 (Identification of a Preferred Alternative), 3.2.1.5 (Alternative 1 – Avoids Collateral Injury), and 3.2.2.5 (Alternatives 2–6 – Avoids Collateral Injury) of the Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems and necessarily entails reverting the current ecosystem to a more natural state that was altered when Mississippi River flows were cut off by construction of levees. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the Preferred Alternative in the Restoration Plan.

The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Alternative 1 – Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as the Preferred Alternative in the Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net

benefits of the proposed Project would meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the spill.

The BP Plea Agreement as it applies to NFWF funds is not relevant here as the LA TIG is not authorizing the use of those funds for this Project. Even if it were applicable, the criminal plea agreement expressly contemplates the use of criminal penalties for sediment diversion in Louisiana.

---

**Concern ID: 62666**

**It would be inappropriate, and contrary to the stated purpose of restoring injured resources, to use DWH settlement funds to implement a project that would harm the same wildlife (for example, shrimp, oysters, bottlenose dolphins, *Spartina alterniflora*) and ecological services that were negatively affected by the oil spill.**

**Response ID: 16625**

USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore the damage caused by the DWH oil spill. USACE's involvement with the proposed Project is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under the CWA Section 404 and RHA Sections 10 and 14 (33 USC Section 408). USACE is not executing any DWH restoration actions under the OPA. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH spill in the Louisiana Restoration Area. As explained in the Final EIS, Appendix B2 DEIS Public Review and Public Meetings, Section 2.0 Agency Roles in the Responses to Public Comments, response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views.

In the Restoration Plan, the LA TIG explained that the DWH oil spill resulted in the oiling of more than 1,100 kilometers of wetlands, nearly all of which were located in coastal Louisiana (DWH NRDA Trustees, 2016). The heaviest oiling occurred in the Barataria Basin, resulting in substantial injuries to natural resources in the basin (DWH NRDA Trustees, 2016).

Recognizing that the resulting loss of marsh productivity affected resources throughout the northern Gulf of Mexico ecosystem, the State of Louisiana and the federal Trustees that negotiated the DWH Natural Resource Damages settlement allocated \$4 billion, almost half of the total settlement amount, to restoring Louisiana's wetland, coastal, and nearshore habitats.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree of collateral injuries, to natural resources injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the LA TIG's Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, as noted in the LA TIG's Restoration Plan, without the proposed Project, sea-level rise, subsidence, and other existing stressors would result in additional marsh loss over time reducing the suitability of habitat for many of the same species.

---

The LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing a deltaic process, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Final Restoration Plan because the LA TIG believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the NRDA Trustee's Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

In its Strategic Restoration Plan for Barataria Basin (2018), the LA TIG evaluated the potential and extent of collateral injury for a range of restoration techniques. Unfortunately, almost all large-scale restoration comes with some potential for collateral injury. The LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54. In the Restoration Plan, the LA TIG strives to identify an alternative that would provide what it considers the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. Again, see Section 3.2.4 of the Restoration Plan for a discussion of how the LA TIG came to its decision.

In recognition of the potential for collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA will implement a suite of stewardship measures (see Section 3.2.1.1.5 [Associated Stewardship Measures] of the Restoration Plan and Appendix R1 to the EIS). The LA TIG is also committed through these measures to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures

are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62846**

**Adaptively managing the Project to support oyster culture would be infeasible, as doing so would require maintaining current salinity patterns.**

**Response ID: 16666**

CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS) outlines a monitoring process for salinities in the basin after Project operations commence. As explained in the MAM Plan, information from salinity monitoring would be used to inform potential relocation of seed grounds to more environmentally suitable areas within the basin or the establishment of broodstock reefs to address larval supply.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

LA Shrimp Task Force

George Barisich

Historically, the Louisiana Shrimp Task Force was created to enable all the factions that make up Louisiana's shrimp industry to advise the governor's office, legislators, and the state's regulators on what actions are needed to preserve Louisiana's shrimp industry.

In keeping with its mission, the Louisiana Shrimp Task Force unanimously voted to send a letter to Governor Edwards opposing the creation and implementation of the Mid-Barataria large scale sediment diversion. The shrimp industry recognizes the overwhelming need for coastal restoration, but objects to the method the state plans on attempting to restore one of Louisiana's most productive brackish water estuaries. Consequently, any coastal restoration project that will eventually eliminate the cultural businesses in the outfall area of the diversion is not acceptable. Economically, the state cannot afford to lose the jobs and the income generated from both the commercial and recreational fisheries that will be severely negatively impacted.

We believe that although the most recent EIS on the Mid Barataria Sediment Diversion did recognize the negative impact on the brown shrimp crop as well as the destruction of healthy oyster reefs; which supports a healthy environment for all fisheries, the EIS severely underestimates both the short term and long term damages to our fisheries. While it is true that white shrimp can tolerate lower salinities and white shrimp production may increase, the reduction of the annual brown shrimp far exceeds any increase in the white shrimp production. Case in point, production records from the Breton Sound area impacted by both the Caernarvon Freshwater Diversion and Mardi Gras Pass indicate a sharp and steady decline in brown shrimp that far exceeds any rise in white shrimp production.

To further exacerbate the problem, long term exposure to excessive fresh water will eventually be detrimental to all shrimp species. Vermillion Bay after years of overexposure to freshwater, has no brown shrimp production and minimal white shrimp production.

The task force strongly recommends that more consideration be given to real life effects of excessive freshwater. Case in point: The unprecedented 2019 double opening of the Bonne Carre Spillway caused over 285 million in damages in just \_\_\_ days.

In closing, the Louisiana Shrimp Task force as charged by LA RS. 56-494 strongly recommends other methods of coastal restoration that would be less detrimental to the shrimp industry; therefore, more beneficial to the state of Louisiana and its citizens.

Thank you for your consideration in this matter.

Kind Regards,

George Barisich, Chairman

Louisiana Shrimp Task Force

---

**Concern ID: 62751**

**The EIS severely underestimates both the short- and long-term damages to the shrimp fisheries. While it is true that white shrimp production may increase, the reduction of the annual brown shrimp far exceeds any increase in the white shrimp production, as evidenced in production records from the Breton Sound area after inputs from the Caernarvon Freshwater Diversion and Mardi Gras Pass.**

**Response ID: 16129**

As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS, brown shrimp are anticipated to experience a major decrease in abundance from operation of the proposed Project, and white shrimp are anticipated to experience a negligible to minor increase in abundance; therefore, the commenter is correct that the increase in white shrimp abundance would not outweigh the decrease in brown shrimp. As further discussed in EIS Chapter 4, Section 4.14.4.2 in Commercial Fisheries, overall impacts on the commercial shrimp industry would be expected to be moderate to major, permanent, and adverse, with the potential for a substantial loss of income in some months due to the decreased abundance of brown shrimp. Further, a summary of select natural and man-made diversions in southeastern Louisiana, including the Caernarvon Freshwater Diversion and Mardi Gras Pass, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

---

**Concern ID: 62752**

**Long-term exposure to excessive fresh water would eventually be detrimental to all shrimp species. Vermilion Bay after years of overexposure to freshwater, has no brown shrimp production and minimal white shrimp production.**

**Response ID: 16130**

The impacts of the proposed Project's introduction of fresh water on brown and white shrimp were analyzed and are discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS. The impacts on brown shrimp from Project operations are anticipated to be major and adverse, due in part to salinity changes. White shrimp are more tolerant of lower salinities and are anticipated to experience a negligible to minor increase in abundance; for white shrimp, the projected benefits of the proposed Project outweigh the negative effects, resulting in an overall negligible to minor benefit on white shrimp from the Project.

To further address the commenter's concern, a summary of select natural and man-made diversions in southeastern Louisiana, including the Wax Lake Outlet, which has impacted Vermilion Bay, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

---

**Concern ID: 62753**

**The task force strongly recommends that more consideration be given to real life effects of excessive fresh water on shrimp populations, including the 2019 opening of the Bonne Carré Spillway which caused over \$285 million in damages.**

**Response ID: 16131**

As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS, brown shrimp are anticipated to experience a major decrease in abundance from operation of the proposed Project, and white shrimp are anticipated to experience a negligible to minor increase in abundance; these assessments included review of available literature as well as model projections. The Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological purposes. However, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions,

would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

Trac Myers

I am against the Diversion. This will ruin our commercial fishermen's livelihood.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

---

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

ETG, Inc.

Omana Taylor

I am here to urge you to please adopt Alternative 5, with Alternative 1, as a second choice. As climate change bears down on us, this is an urgent need for humans as well as all life that depends on coastal stability. Alternative 5 appears to be the best plan.

Thank you

Omana Taylor

---

**Concern ID: 63353**

**The commenter strongly supports the Applicant's Preferred Alternative, but would prefer something larger. The commenter further notes that south Louisiana cannot afford to wait longer or accept lesser solutions because the coastline is sinking and local fisheries and wildlife habitat is washing into the Gulf. Fortunately, the Mississippi River offers a chance at salvation if the river is used correctly.**

**Response ID: 16315**

The commenter's support for the proposed Project is noted. The relative impacts, both beneficial and adverse, for the various capacity alternatives is explained throughout Chapter 4 Environmental Consequences of the EIS. Although the 150,000 cfs Alternative would result in the greatest degree of benefits (including the most land building), it also would result in the greatest degree of adverse impacts, particularly to marine mammals (see Section 4.11.5 in Marine Mammals), shrimp and oysters (see Section 4.10.4.5 in Aquatic Resources), and public health and safety (through increased water levels and inundation in areas closer to the immediate outfall, see Section 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction). The USACE has supplemented Section 4.10.4.5.3 in the Final EIS to further discuss the impacts of the 150,000 cfs Alternative to brown shrimp and oysters. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

The LA TIG's Restoration Plan evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54 and strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. While 150,000 cfs diversion would be expected to deliver more ecological benefits in terms of land creation and marsh building than the LA TIG's Preferred Alternative, it would also incur more collateral injuries and pose a greater risk to human health and safety; thus, it was not selected as the LA TIG's Preferred Alternative. See Section 3.2.4 (Overall OPA Evaluation Conclusions) of the Final Restoration Plan for a discussion of how the LA TIG came to its decision. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

New York State Assembly

Deborah Glick

U.S. Army Corps of Engineers

New Orleans District

Attn: CEMVN-ODR-E; MVN-2012-2806-EOO

7400 Leake Avenue

New Orleans, LA 70118

To Whom It May Concern:

I am writing to strongly support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion (MBSD).

Migratory birds are essential to the ecosystem of not just Louisiana, but the entire country. Over 40% of migratory birds spend some part of their life in the Barataria Basin, but its critical wetlands have been slowly disappearing over the last century. The combination of climate change and man-made disasters like oil spills have contributed to the loss of nearly 295,000 acres of land in the Basin, and the ambitious MBSD project is an important step in repairing this damage. The projected 17,500 acres of land that will be created over the next decades will benefit birds, wildlife, and fisheries, as well as the coastal populations of Louisiana threatened by land loss, sea-level rise, and destruction from hurricanes.

The MBSD project will be the largest individual land restoration project ever undertaken, and for that reason must be pursued with care and an eye toward innovation. I urge the federal and state-level decision-makers involved to commit to developing a robust adaptive management program that can account for and respond to the knowledge gained from monitoring the project as well as feedback from key stakeholders. Given the size of the project and expressed concerns about its impacts by some of the surrounding communities, I also urge that decision-makers engage in a proactive, collaborative, and transparent process with those communities to develop ideas and proposals for adaptations and mitigations as needs arise.

The impacts of climate destruction must be combatted, and I applaud the Coastal Protection and Restoration Authority of Louisiana's ingenuity and commitment to pursuing large-scale solutions for the large-scale problems we face. This project can serve as an example to not just Louisiana but to the country of what we can achieve when we combat habitat loss head-on, and I urge you to support it.

Sincerely,

Deborah J. Glick

Assemblymember

---

**Concern ID: 61756**

**The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the**

---

**mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.**

**Response ID: 15891**

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA

---

had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement.

---

The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62890**

**The wetlands and coastal habitats of Louisiana are essential to the bird populations (both resident and migratory) and must be protected and restored. The proposed Project is important to maintaining and rebuilding important bird habitat.**

**Response ID: 16190**

Chapter 3, Section 3.9.2.1 in Terrestrial Wildlife and Habitat of the Draft EIS identified the importance of area habitats and resources to migratory, and other, birds in the Barataria Basin. Further, Chapter 4, Section 4.9.4.2 in Terrestrial Wildlife and Habitat of the Draft EIS, discussed the maintenance and creation of marsh, as well as initial land accretion and creation of mudflats, that is projected to occur as part of the proposed Project, and identified that the net addition of these habitats would generally be beneficial to waterfowl and shorebirds.

The potential benefits of the proposed Project to resources in the Gulf, including birds, are also described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan.

---

**Concern ID: 63332**

**A large number of commenters expressed general support for the proposed Project.**

**Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54

---

and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63339**

**The Mid-Barataria Sediment Diversion is the largest individual ecosystem restoration project in our country's history, which is fitting since the Barataria Basin is experiencing one of the highest rates of land loss on the planet. Large-scale projects like the Mid-Barataria Sediment Diversion are just the kind of bold actions that are needed if there is to be any hope of a truly sustainable coast.**

**Response ID: 16297**

The commenters' support for the proposed Project is noted. Land and wetland loss along coastal Louisiana is described in EIS Chapter 3, Sections 3.1.4.1 and 3.1.4.2 in Introduction.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

Delta Science LLC

John Lopez

I am pleased to submit this comment in support of the Mid-Barataria Sediment Diversion.

I have reviewed much of the DEIS and find that the science and engineering is sound. The project represents decades of science, engineering and planning. The public has been aware of the need for restoration and that diversions are part of state planning for more than 30 years. No one should be surprised by that the DEIS demonstrates that the benefits outweigh any negative impacts. This conclusion has been reached many times in past studies by the Corps, state and academia.

Permitting and construction should proceed as quickly as possible.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Noah Murina

The diversion will cause mass death in the Barataria Bay bottle nose dolphin in Louisiana. Dolphins are a protected species under the Marine Mammal Protection Act. Since humans are the apex predators of the earth it should be our duty to protect animals rather than kill mass amounts of them off. The politicians want to make this diversion happen so they passed a waiver through congress, that will allow them to make this project move forward. This is shameful that politician put money and greed above the welfare of citizens and animals. I feel that my rights as American citizen have been violated as a result.

---

**Concern ID: 62986**

**The Project would drive decreases in salinity that would reduce the overall health, survival, and reproduction of bottlenose dolphins that reside in the Barataria Basin, a species that was negatively affected by the Deepwater Horizon oil spill (NMFS, 2013). Some commenters felt that because of this, the Project should either not move forward or its operation should be altered.**

**National Marine Fisheries Service (NMFS). 2013. Roy Crabtree (NMFS) to Elizabeth Davoli (CPRA). <https://s3.documentcloud.org/documents/726710/national-marine-fisheries-service-comments-on.pdf>**

**Response ID: 16701**

The concerns raised by the commenters about the projected decreases in salinity and resulting effects on Barataria Bay dolphins were considered in the Draft EIS. More specifically, Chapter 4, Section 4.11.5.2 in Marine Mammals of the EIS acknowledges that the proposed Project would likely have significant, adverse impacts to Barataria Basin dolphins, a species that suffered significant impacts from the DWH oil spill. This section also discusses the physiological changes caused by exposure to low-salinity water, the duration of those changes that leads to mortality, and the anticipated mortality of a large portion of the dolphin population in the Barataria Basin within the first decade. These sections of the EIS provide a more in-depth analysis of potential impacts to dolphins than the letter cited by the commenter.

The concerns raised by the commenters were also considered in the LA TIG's Draft Restoration Plan (see Section 3.2.1.5 [Collateral Injury]); the Final Restoration Plan has been edited consistent with changes made to the Final EIS and see below regarding new, related content included in Appendix R.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources, like dolphins, that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible (if it is possible), the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins in Louisiana (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review,

Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63080**

**The Corps and the TIG have circumvented a legal process intended to conserve marine mammals and protect ecosystems by obtaining a Congressionally-mandated MMPA waiver for the proposed Project. The waiver does not establish a quota for how many dolphins can be taken by the proposed Project, and it is clear that the level of take for this stock will be grossly unsustainable, in clear violation of the MMPA (absent BBA-18). The legislative waiver, quite simply, provided Congressional permission to break the law. It is critical for the protection of marine mammals that such a legislative waiver be a one-off occurrence.**

**Response ID: 16599**

The U.S. Army Corps had no role in seeking a Marine Mammal Protection Act waiver for this Project from Congress, nor did any federal agencies on the LA TIG. CPRA sought the waiver. Title II, section 20201 of the Bipartisan Budget Act of 2018 provides: "(a) In recognition of the consistency of the Mid-Barataria Sediment Diversion, Mid-Breton Sound Sediment Diversion, and Calcasieu Ship Channel Salinity Control Measures projects, as selected by the 2017 Louisiana Comprehensive Master Plan for a Sustainable Coast, with the findings and policy declarations in section 2(6) of the Marine Mammal Protection Act (16 U.S. C. 1361 et seq., as amended) regarding maintaining the health and stability of the marine ecosystem, within 120 days of the enactment of this section, the Secretary of Commerce shall issue a waiver pursuant to section 101(a)(3)(A) and this section to Section 101(a) and Section 102( a) of the Act, for such projects that will remain in effect for the duration of the construction, operations and maintenance of the projects. No rulemaking, permit, determination, or other condition or limitation shall be required when issuing a waiver pursuant to this section. (b) Upon issuance

---

of a waiver pursuant to this section, the State of Louisiana shall, in consultation with the Secretary of Commerce: (1) To the extent practicable and consistent with the purposes of the projects, minimize impacts on marine mammal species and population stocks; and (2) Monitor and evaluate the impacts of the projects on such species and population stocks.”

The National Marine Fisheries Service issued the waiver in March 2018. Since that waiver in 2018, CPRA has not requested any additional waivers for coastal restoration projects. More information on the waiver can be found at <https://www.fisheries.noaa.gov/action/marine-mammal-protection-act-waiver-select-louisiana-coastal-master-plan-projects>.

Tammy Greer

I am a member of the United Houma Nation and I have seen the degradation of our coast and how the natural environment has changed over many years. My great grandmother told me about how she and her family lived on Isle de Jean Charles in the woods on that island when she was a child after her parents unknowingly signed away their family land with their X to the oil companies. She was never really at peace with the theft of their home and land and way of life.

The lack of acknowledgement of these thefts and the continued bias in favor of big oil and big construction come from a paradigm of domination that was used then and is now to serve the needs of only the humans on this planet and very few of them even. The environment of fish and shrimp and plants and others is absolutely not considered in this paradigm. The Mid-Barataria Sediment Diversion (MBSD) project fits with this paradigm of domination, domination over nature, domination over our beloved Mississippi. Blowing holes in the ground has gotten us into this situation, canals are part of why we are here in this era of coastal erosion.

We need to slow down, fix what we have messed up, stop the borrow pits on land that is sinking and flooding, worry about the survival and thriving of other entities in this ecosystem and not just our own survival and thriving, and not just the survival and thriving of the rich among us.

Our tribal folks, many of them, still live on this land. They fish and hunt and farm and trap for their livelihood. Some of these UHN folks understand the bayous, canals, gulf, river and forests better than many of your engineers. They work with these environments and without the use of big machines and digging holes.

We need your best and brightest and most compassionate people on this task of serving all of the citizens of this area. Find a way to make right what was done wrong to the Indigenous peoples, plants and animals of this place. You will need to have meetings that include these people, their voices, their understanding of the natural world and their compassion for the other entities of the coast.

There is bias when the same industries who stand to benefit from the program also research the impact of the program. It's a conflict of interest. And when your CPRA meetings are composed of the folks who will benefit and who, also, are exercising their voices at these meetings, and who, also, are directing or doing the research for these programs, well, that's just bad business and horrible science.

I know it's hard to change paradigms. I would like to offer this one though. Maybe we can look more to becoming co-creators with all of the citizens of this area, even the creepy crawlys. Maybe we can think in terms of what the Mississippi River seems to need, she seems to need to move for her own survival, and then think on what we can do to help her with that and also survive and thrive as human beings along this river. Maybe we can do the same with coastal restoration. We can observe and try to understand these natural processes instead of trying to control them. The coast needs her vegetation back. We can help her with that, and in doing so help ourselves, our children, the plants and animals and all of the citizens of this place for many years to come.

---

**Concern ID: 62505**

**A commenter expressed the view that there is bias when the same industries who stand to benefit from the program also research the impact of the program; it is a conflict of interest.**

**Response ID: 15985**

USACE is neither a proponent nor an opponent of the proposed Project. With respect to the EIS, USACE's third-party contractor, GEC, prepared the EIS based on its own research, expertise and review of scientific literature and based on technical reports and information submitted by the permit applicant, CPRA, LA TIG, and/or cooperating agencies. USACE and GEC reviewed such technical reports and information for technical accuracy and sufficiency and for objectivity. NMFS contributed to the portion of the EIS discussing marine mammals in the Project area in Chapter 3 of the EIS, and prepared the portion of the EIS discussing impacts on Marine Mammals in Chapter 4. The Delft3D modeling was performed by the Water Institute of the Gulf (Water Institute) for CPRA and the Water Institute provided information regarding the modeling used in the EIS. USACE and members of the LA TIG reviewed the model parameters and assumptions and determined that they were sufficient for the EIS. GEC executed an Organizational Conflict of Interest Certification attesting that it does not have any financial or other interest in the outcome of the USACE permit application and permission request process. Table 6-1 in Chapter 6 contains a List of Preparers identifying the primary authors of the EIS, their employers and their credentials. As USACE prepared the Draft EIS, draft chapters and sections and the Draft EIS were circulated to the members of the LA TIG and cooperating agencies for multiple rounds of review and comment. Commenters are not identified in the List of Preparers. See EIS Chapter 5, Section 5.2 for further explanation of the EIS preparation process.

---

**Concern ID: 62794**

**This poorly planned and executed proposed Project is being pushed forward for the financial gain of politicians and contractors because taxpayer dollars are being used. Private investment dollars would entail more deliberation and a full impact study, including more natural options with less risk and more overall benefits.**

**Response ID: 16375**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance and constitutes a full impact analysis. A variety of alternatives assessed in the EIS are identified in Chapter 2 Alternatives. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

The LA TIG's Restoration Plan evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting

public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG has selected Alternative 1 as the LA TIG's Preferred Alternative.

---

**Concern ID: 62883**

**Frontline, and especially Indigenous, communities must have a greater say in restoration processes at all phases, from the very beginning of looking for potential restoration projects, all the way through implementation and monitoring. Traditional ecological knowledge (TEK) must be taken into account and considered with equal, if not greater, gravity as academic studies. CPRA should have meetings that include these Indigenous people, their voices, their understanding of the natural world and their compassion for the other entities of the coast.**

**Response ID: 16404**

USACE and the LA TIG, including CPRA, acknowledge the comments and seek engagement and participation from all communities, the public, agency, and stakeholder groups wishing to be involved in the EIS and Restoration Plan processes. USACE and LA TIG coordinated with the SELA Voice organizations to understand the needs of the local communities, including Indigenous communities, regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan. Recommendations for where to make the Draft EIS and the LA TIG's Draft Restoration Plan available so it would be accessible to disadvantaged individuals and groups, as well as recommendations regarding translation of materials related to the Draft EIS and Restoration Plan, were implemented.

Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area, in an effort to reach out to community groups to gather information related to the proposed MBSD Project. In addition, CPRA has engaged the public through numerous meetings with the communities projected to be impacted by the proposed MBSD Project, including several Indigenous communities, to solicit input on mitigation and stewardship strategies. This includes reaching out to local non-profits to assist with and facilitate meetings with the impacted communities, including low-income, minority, and Indigenous communities. This input has resulted in substantial revisions to CPRA's Mitigation and Stewardship Plan since the release of the Draft EIS (see Appendix R1 to the Final EIS). A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. CPRA acknowledges the suggestion to consider traditional ecological knowledge and would take these suggestions into consideration for future engagement efforts. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 to the Final EIS for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

Also, as explained in Chapter 4, Section 4.24 Cultural Resources of the Final EIS, cultural resources consultations have been conducted in accordance with Section 106 of the National Historic Preservation Act. The Section 106 Consulting Parties included USACE (the lead federal agency), the State Historic Preservation Office, the Advisory Council on Historic

---

Preservation, CPRA (the Applicant), LA TIG, and federally recognized Tribal Nations who expressed historic ties to the Barataria Basin. The Programmatic Agreement developed for the proposed Project through the NHPA Section 106 consultation sets forth the alternative mitigation to be implemented by CPRA as part of implementing the Project. This alternative mitigation involves a comprehensive research project regarding the historical cultures of the Indigenous Tribes of Southeastern Louisiana focusing on the Barataria Basin and the larger southeastern Mississippi River delta region to prepare a comprehensive ethnohistoric overview documenting Native American presence and history. A website and public education materials are included as products to be developed through the alternative mitigation. See Section 4.9 of the Final Mitigation and Stewardship Plan for the proposed Project (in Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:40491**

Commenter

I want to recommend moving forward with the Mid Barataria Sediment Diversion project. I believe that this will bring not only a long term solution to the loss of our costal land but also job opportunities. Due to the massive amount of damage the BP deep horizon oil spill has done on the gulf coast, the project should be funded by reserved settlement dollars set aside by BP. The added coastal land created by this project will also further prevent coastal flooding and hurricane damage. We need to take care of the future of Louisiana and this is a major part of the solution.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

U.S. Army Corps of Engineers  
New Orleans District  
7400 Leake Avenue  
New Orleans, LA 70118

Attn: CEMVN-ODR-E, MVN-2012-2806-EOO - Mid-Barataria Sediment Diversion Draft EIS

To the U.S. Army Corps of Engineers and Cooperating Agencies,

The Louisiana Environmental Action Network (LEAN) and Lower Mississippi Riverkeeper (LMRK) submit the following comments on the Draft Environmental Impact Statement (EIS) for the Mid-Barataria Sediment Diversion Project (MBSD).

In our August 16, 2020 comments for the scoping process for the EIS, we identified a number of issues that the EIS should address in its assessment of the MBSD Project. (Those comments are attached as an appendix.) In reviewing this Draft EIS, we have focused our comments on two of those issues, Water Quality and Environmental Justice, where outstanding questions remain.

Water Quality

LPDES Permits

The Draft EIS provides only a partial picture of water quality considerations for the Lower Mississippi River, in particular for the section south of Baton Rouge, which hosts one of the countrys largest industrial corridors. As part our mission, LEAN and LMRK track and review applications submitted to the Louisiana Department of Environmental Quality (LDEQ) for Louisiana Pollutant Discharge Elimination System (LPDES) permits for facilities located on and near the Mississippi River. The list below summarizes those facilities applying for new or renewed LPDES permits from Baton Rouge south along the river during the second half of 2020 and first half of 2021, along with their permit numbers. Those permits requiring reporting of Total Nitrogen (TN) and/or Total Phosphorus (TP) under the Louisiana Nutrient Reduction and Management Strategy (LNRMS) are noted. The LNRMS was updated in 2019.

LPDES-Mississippi River Permits - July-December 2020

YCI Methanol One, LLC - St. James, LA - AI194165

ExxonMobil Chemical Co. - BR, LA - AI1395

Plantation Pipe Line Co. - BR, LA - AI582

Nalco Co. - Garyville, LA - AI2290

Methanex USA Services, LLC - Geismar, La - AI181192

Phillips 66 Co. - Belle Chasse, LA - AI2418 - TN-TP reporting per LNRMS

Linde, Inc. - Convent, LA - AI214907

Raven Energy, LLC - Convent, LA - AI30490 - TN under LNRMS

Atlantic Self Unloading, LLC - multiple parishes (EBR, WBR, Ascension, St. James, St. John, St. Charles, Jefferson, Orleans, St. Bernard, Plaquemines) - AI221916

LPDES-MR permits - January-May 2021

Nachurs Alpine Solutions, LLC - St. Gabriel, LA - AI26984 - TN-TP reporting under LNRMS

Air Products & Chemicals, Inc. - BR, LA - AI154867

Addis, La. WWT Plant - Addis, LA - AI22377 - TN-TP reporting under LNRMS

Brusly, La. WWT Plant - Brusly, LA - AI19911 - TN-TP reporting under LNRMS

Cemus, LLC - BR, LA - AI282

International-Matex Tank Terminals, LLC - St. Rose, LA - AI4885

Bunge North America, Inc. - Destrehan, LA - AI1738 - TN-TP reporting under LNRMS

Buckeye Marrero Terminal, LLC - Marrero, LA - AI2236

Stolthaven New Orleans, LLC - Braithwaite, LA - AI87738

Terminal Stevedores, Inc. - Jefferson, St. Charles, St. John, St. James Parishes - AI43508

Jefferson Parish Municipal Storm Sewer Systems (MS4s) - Gretna, Harahan, Kenner, Westwego, LA - AI95365

Arcosa Marine Products, Inc. - Brusly, LA - AI43634 - TN-TP reporting under LNRMS

PCS Nitrogen - Geismar, LA - AI3732 - TN-TP reporting under LNRMS

Cornerstone Chemical Co. - Waggaman, LA - AI1357 - TN-TP reporting under LNRMS

A major Designated Use of the Mississippi River is as a drinking water supply. The Buckeye Marrero Terminal, LLC permit cited above includes a list of Mississippi River Drinking Water Intakes from Plaquemine, La. downstream (dated 2/25/2002), which is a feature that has been included on some other LPDES permits. It also includes the statements that no discharge should occur within one mile upstream of any drinking water intake, and the permittee is responsible for determining the existence and location of the nearest drinking water intake. The listed intakes downstream of the MBSD project site are at Point a la Hache (River Mile 49.2E), Port Sulphur (River Mile 49W), and Venice (River Mile 18.6W).

The Phillips 66 Alliance Refinery is of particular interest because it lies a short distance (0.7 miles) upstream from the MBSD project site. The Alliance Refinery, which had its LPDES permit renewed in 2020, has a continuous facility effluent flow of 45.1 million gallons per day (MGD). The parameters for discharge include Biological Oxygen Demand (BOD), Chemical Oxygen Demand (COD), Total Ammonia N, Sulfide, Total Recoverable Phenolics, Total Chromium, Hexavalent Ion Chromium, pH, and Oil and Grease.

The Alliance Refinery is mentioned in Chapter 3 of the Draft EIS for past releases of petroleum and hazardous substances, and for hazardous waste violations under the Resource Conservation and Recovery Act (RCRA) between 1986 and 2016. The facility is also described as having an active industrial landfill site operating under a LDEQ permit. (p. 3-275, 3-276) The Alliance Refinery is listed among those adjacent to the MBSD project site that were reviewed for the Draft and found to have no adverse environmental concerns that may have impacted the Project footprint, though it is not stated whether this included potential impacts from discharges in the diversion flow into the receiving basin. (p. 3-277)

Another facility of heightened interest is the Plaquemines Liquids Terminals (PLT) facility, a proposed bulk liquid export terminal would be located on the right bank of the river (Mile Marker 61) between the Alliance Refinery and the MBSD site, i.e. directly adjacent to the latter. The PLT facility, which would include above ground storage tanks and supporting infrastructure, would have a 17 million barrel capacity. The site would include a 1500 foot setback between the river levee and the terminal.

The PLT facility has applied to LDEQ for air permits (Part 70 operating permit, Prevention of Significant Deterioration, and Environmental Assessment Statement), but has not yet applied for its LPDES permit. The facility requires a Louisiana Coastal Use Permit because of its location, as well as a determination of consistency under Louisiana Governors Executive Order No. BJ 2008-7, which directs state agencies to regulate practices, programs, contracts, grants, and all other functions vested in them in a manner consistent with Louisianas Master Plan for a Sustainable Coast and the public interest to the maximum extent possible.

The Louisiana Coastal Protection and Restoration Authority (CPRA) issued a consistency determination for the facility in 2019, with the requirement for a sediment model to evaluate potential impacts of the PLT facility on operation of the MBSD project. A 2012 study by the Water Institute of the Gulf of the RAM coal terminal, an earlier facility proposed for the MBSD site, concluded that it might reduce sediment transport through the diversion by 3 to 17%. These issues receive some discussion in Chapter 4 of the Draft EIS under Overall Cumulative Impacts (p. 4-847)

Under Cumulative Impacts during [MBSD] Operations (4.25.5.4), the PLT facility is among three projects (along with NOLA Oil Terminal and Plaquemines LNG/Gator Express Pipeline) whose impacts were considered outside of the Delft3D Basinwide Modeling analysis. The section on Permitted Discharges (p. 4-855) acknowledges that the PLT facility would have the potential for oil spills that could enter the MBSD intake and be conveyed into Barataria Basin sediments, waters, and wetlands.

A related issue to Water Quality is that of Sediment Quality, which also receives attention in Chapter 3 of the Draft EIS. This section (3.5.3) notes that the Mississippi River carries dissolved and suspended contaminants and bacteria from a variety of municipal, agricultural, and industrial sources, and that their distribution in the river depends on the nature and location of their sources and the degree of wastewater treatment and organic contaminants such as (PCBs) and inorganic contaminants such as lead, which are more likely to adhere to sediment particles. (p. 3-55).

The section also describes evaluation of dredged material discharged under the Regional Implementation Agreement (RIA), which provides a list of potential contaminants of concern (COC), including USEPA Priority Pollutants. The COCs include metals, Polycyclic Aromatic Hydrocarbons (PAHs), pesticides, organonitrogen compounds, chlorinated hydrocarbons including PCBs, total organic carbon, and ammonia. A longer list of Parameters for Dredge Sediment Quality Evaluations is provided on pages 3-56 and 3-57. On the basis of our review of LPDES permits for facilities along the Mississippi River, we can attest that the effluents mentioned in this section are discharged from multiple outfalls into the river.

The Draft EIS concludes that although the above& sediment assessments do not provide sediment quality data for sediments that would be transported by the diversion into the Barataria Basin, the agencies believe that such sediments are free from COCs at

concentrations that would result in detrimental impacts, primarily due to the dilution capacity of the Mississippi River, but also states that interpretation of the conclusions of the reports cited is limited because they focused specifically on sediment disposal in the river or offshore waters where currents, Flow, waves, and tides are greater than those in the Barataria Basin. (p. 3-58)

#### Environmental Justice

The Draft EIS cites federal policies mandating that issues of Environmental Justice be given full consideration (p. 3-208), in particular the long standing Executive Order (12898) on Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations and comparable Department of Defense directives. Chapter 3 points out that minority populations are present throughout much of the Project area, and provides a statistical picture through several graphs and maps. In the parishes closest to the project site, Plaquemines and Jefferson, minority populations respectively constitute 36 and 60 percent of the overall population.

In our earlier comments on the scoping process for the EIS, we drew attention to the small community of Ironton, Louisiana. Ironton is the closest community to the MBSD site, as well as the proposed PLT site and the Alliance Refinery, lying due south of all three. While these three projects/facilities are proceeding on separate administrative permit paths, Ironton is particularly vulnerable to impacts from all three in terms of potential flood and/or health effects. The Draft EIS points out that MBSD construction impacts could be disproportionately high and adverse for the population of Ironton. (p. ES-13)

Ironton and some other small communities in the Project area also lie outside the federal levee system. The Draft EIS notes that operation of the project could lead to long-term, minor to major, adverse impacts on communities not protected by federal levees, from acceleration of increases in tidal flooding and storm hazards. (p.ES-14) It also states that CPRA is evaluating mitigation measures related to the potential acquisition of easements on properties within approximately 20 miles to the south of the diversion in areas outside of levee protection due to the potential for disproportionately high and adverse impacts.

In our comments on the PLT air permit applications in 2020 and 2021, we pointed to information provided in the 2018 Supplement developed for that project. The Supplement stated (p. 8) that the remainder of the 614 acre property on which the 320 acre site proposed for the PLT facility is located includes, along with the land required for the MBSD project, a 50 acre tract retained by the Plaquemines Port Harbor and Terminal District (PPHTD) as a conservation easement. We recommended per the PLT air permit that this conservation area be used as an air pollution buffer for the Ironton community. The potential for utilization of this area and others as flood protection easement areas for Ironton and other vulnerable communities should be pursued by CPRA and the Corps.

We support the inclusion of commercial and subsistence fisheries in the Project area in the Draft EIS discussions of Environmental Justice, with the acknowledgment that disproportionately high and adverse impact on low-income and minority populations could occur in some communities where reductions in abundance of oysters, brown shrimp, and certain finfish species are anticipated as a result of the Project. (p. ES-14) CPRA is said to be evaluating mitigation measures to address the potential for those disproportionate impacts on commercial oyster and brown shrimp fishing.

The Draft EIS acknowledges that: 1) shrimp landings from the Project area constitute on average about one-third of state shrimp landings; 2) shrimping was the largest commercial fishery by value and weight in the Project area between 2014 and 2018; and 3) despite market conditions, weather events, and the Deepwater Horizon oil disaster, the overall volume of catch in the Project area has been relatively steady since 2000. (p 4-576)

One area where the issues of water quality, environmental justice, and mitigation converge is the potential and risk for impacts from hypoxia and harmful algal blooms (HAB) in the Barataria Basin resulting from Project operation. It is not clear that the Draft EIS has adequately assessed these risks, other than acknowledging them. The Draft EIS also fails to mention federal, state, and regional actions to reduce the nutrient loading that causes both hypoxia and HABs, such as the Gulf Hypoxia Action Plan. Reducing nutrient loads in the Mississippi River has long provided a direct path to mitigating and reducing the impacts from hypoxia and HABs on fisheries and human health in the Barataria Basin that would result from the Project.

### Conclusions

The MBSD Project has, since its inception, faced significant skepticism and opposition from a variety of stakeholders, including commercial fishers, residents and local political leaders in the area of the proposed diversion. LEAN's work as an empowerment organization is focused on listening to and supporting impacted individuals whose voices are often ignored and overpowered by larger economic/industrial interests. The significant, and growing, local opposition to the proposed MBSD Project should be addressed prior to the diversion project continuing.

Despite the extensive length of the Draft EIS, important questions still remain, especially for those members of the public trying to assess the MBSD Projects results over the 50-year analysis period. Local concerns are based on legitimate risks and impacts insufficiently mitigated, in the eyes of opponents.

Mitigation efforts necessary to offset these impacts, in particular to the vulnerable community of Ironton, commercial fishing, shrimping, and oyster producers, and waters in the Barataria Basin, should be in place prior to the project being approved. We have also asked why some initiatives that can provide mitigation benefits, such as the Gulf Hypoxia Action Plan, are not acknowledged.

The Draft EIS states that sediment deposition and land building would occur against the backdrop of significant land loss in the basin and across the region due to subsidence and sea-level rise, so that even as diversion operations are increasing sediment deposition and land creation, some of this acreage would be lost over time due to these ongoing processes. (p. ES-7)

With anthropogenic climate change a key driver of sea-level rise, it is worth noting that a number of facilities in the Project area are or are projected to be significant sources of greenhouse gases (GHG). The PLT facility would emit 566,466 tons CO<sub>2</sub> equivalent per year, while another facility in the area, Venture Plaquemines Liquid Natural Gas, LLC (AI197379), was listed in a 2020 report by the Environmental Integrity Project as a major GHG emitting facility on the national level (based on preliminary figures available at the time of publication - which requested air permit changes in 2020 would increase.)

The PLT, Alliance Refinery, and Venture Plaquemines LNG facilities are among numerous facilities in the Mississippi River Corridor which would emit increased amounts of pollutants and GHG emissions and have recently applied for and received LDEQ air permits. Others include: Marathon Petroleum Company LP - Garyville Refinery (AI3165), YCI Methanol One, LLC-Methanol Plant (AI194165), South Louisiana Methanol, LP/St. James Methanol Plant (AI188074), and the Shintech Louisiana, LLC Plaquemine Plant 3 (AI126578).

While GHG mitigation may lie outside of the Draft EIS parameters, consideration of the MBSD Project does provide an important opportunity to raise that issue. This should include the potential for coastal restoration projects to provide CO2 sequestration and for GHG emitting facilities to contribute towards the costs of those projects as part of their mitigation efforts. We hope that the Louisiana Climate Initiatives Task Force launched in 2020 will address those questions.

Finally, an emerging issue for the Mississippi River and all waterways is the prevalence of plastic pollution, both in the form of debris and micro-plastics. The Mississippi River Cities and Towns Initiative, acting in partnership with the United Nations Environment Program, recently launched a Mississippi River Plastic Pollution Initiative, with data collection by local governments and volunteers.

The Mississippi River acts as a major conveyance channel for plastics to the Gulf of Mexico and any receiving waters; thus, coastal diversion projects going forward should include plastics pollution as one of the impacts to be addressed.

Sincerely,

Marylee Orr  
Executive Director  
Louisiana Environmental Action Network

Michael Orr  
Director  
Lower Mississippi Riverkeeper

APPENDIX: Comments on August 2020 Scoping Process for MBSD

August 16, 2020

U.S. Army Corps of Engineers

New Orleans District

7400 Leake Ave.

New Orleans, LA 70118

ATTN: CEMVN-ODR-E, #MVN-2018-1120-EOO

To Whom It May Concern,

The Louisiana Environmental Action Network (LEAN) and Lower Mississippi Riverkeeper (LMRK) submit the following comments on the Permit Application MVN-2018-1120-

---

EOO/2019-0104, pertaining to an Environmental Impact Statement (EIS) for construction of the Mid-Breton Sediment Diversion Project.

The New Orleans District of the U.S. Army Corps of Engineers (CEMNV) has solicited public comments as part of the scoping process under the National Environmental Policy Act (NEPA) to determine the scope of issues, resources, impacts, and alternatives to be addressed by the EIS. Our organizations welcome the opportunity to participate in this process.

The Coastal Protection and Restoration Authority of Louisiana (CPRA) has submitted this permit request to construct, maintain, and operate the proposed Mid-Breton Sediment Diversion Project at Mississippi River Mile 68.6 in Plaquemines Parish. The project is a component of the Louisiana Comprehensive Master Plan for a Sustainable Coast (2017), where it is described as (p. 66):

[A] Sediment diversion into Mid-Breton Sound in the vicinity of Whites Ditch to build and maintain land, 35,000 cfs [cubic feet per second] capacity (modeled at 35,000 cfs when the Mississippi River flow equals 1,000,000 cfs; flow rate calculated using a linear function for river flow from 200,000 cfs to 1,000,000 cfs; flows variable above 1,000,000 cfs; 5,000 cfs minimum flow maintained when Mississippi River flow is below 200,000 cfs).

The Project Details in the Notice of Intent filed in the U.S. Federal Register of July 2, 2020 states that CPRA would maintain a base flow up to 5000 cfs through the structure, which would open when the Mississippi River gage at Belle Chasse, Louisiana exceeds 450,000 cfs to divert varying volumes of sediment, fresh water, and nutrients into the Breton Sound Basin. Maximum discharge would be 75,000 cfs when the Belle Chasse gage on the river measures 1 million cfs.

We request that the following issues and questions be addressed in the EIS for this project:

Impacts on Coastal and Estuarine Fisheries Resources: Breton Sound was once one of the most productive areas of oyster production in the U.S. The Sound and nearby coastal waters remain important areas for that resource as well as shrimp and other commercially and recreationally valuable species. The area of impact would include key areas of Inside Louisiana Waters for Shrimp Harvest (30 degrees 03 00.00 N, 89 degrees 22 23.00 W), and the highest area for oyster harvests (Lake Pontchartrain Basin) from 2000-2014.

The Louisianas Seafood Future report released by Louisiana Sea Grant in 2019 found that the Breton Sound/South Pass and eastward area accounted for the following percentages of state harvests: 28.57% of commercial crabbing, 16.67% of commercial shrimping, 16.67% of commercial oyster production, 20% of commercial finfish, and 15.79% of commercial charter boat fishing. This report also reflected the serious concerns that commercial fishers and shrimpers have about their future, due to economic and environmental trends.

Oyster harvests in the Pontchartrain Basin have been heavily impacted by recent openings of the Bonnet Carre Spillway which reflect more frequent high-water events, as well as opening of east-side diversion structures after the 2010 BP Disaster. The EIS should fully assess the impacts of the current operational plan for the project on these resources.

Water Quality Impacts: A major concern for coastal and estuarine waters, as well as fishery resources, in Louisiana and elsewhere are growing problems caused by water quality decline, such as harmful algal blooms (HAB) and hypoxia. A long-standing concern in Louisianas

coastal waters is the annual offshore hypoxic (low oxygen) area fueled by nutrient loading from the Mississippi River. While the large hypoxic zone off Louisianas coast forms west of the river mouth, the Pontchartrain Conservancy has monitored increased areas of hypoxia east of the river for a number of years. Coastal water quality impacts experienced by the State of Mississippi in 2019 included red tides from the east and hypoxia from the west, both fueled by similar nutrient pollution sources. The Project Description mentions water quality as a potential issue of concern, but the EIS should describe how this issue will be addressed.

Full Assessment of Alternatives: The public interest will be best served in the EIS by a full assessment and discussion of alternatives to the current version of the project. The Public Notice states that the EIS will address a reasonable range of alternatives based on the proposed projects purpose and need. Understanding the scale and scope of Louisianas coastal issues today entails inclusion of the history of those issues and particular projects. The earliest version of the Mid-Breton Diversion was the Myrtle Grove Diversion included in the Coast 2050 Plan (1997), and later authorized in the Louisiana Coastal Area Study (2002). The Corps held public meetings in 2007 on the earlier authorized version of the project, which was not funded, prior to the State of Louisiana leaving the LCA partnership with the Corps in 2012.

In the ensuing years, the project has undergone substantial changes, especially in its size, projected costs, and the timeframe for its completion. The projected costs have risen from \$479,100,000 in the 2017 Coastal Master Plan to an estimated \$800,000,000, and the timeframe for completion is undefined at this time since it depends on funding and other contingencies. It may lie outside the scope of the EIS to assess whether those changes impact the feasibility of the project in its current form, but such considerations do relate to the question of whether a smaller alternative is in fact more feasible. The feasibility of such projects affects directly their ability to actually mitigate and improve the sustainability of Louisianas coast, given the acceleration of sea-level rise due to climate change and other trends.

Inclusion of Significant Issues: The Public Notice states that this scoping process will help identify and define the range of potential significant issues that will be considered in the EIS, which can include (but are not limited to) a number of those raised here: aquatic resources, commercial and recreational fisheries, essential fish habitat, and water quality. We mentioned the issue of climate change above, and note that the state of Louisiana - as well as the federal government - currently lack effective policies to address this pressing problem, which is affecting Louisianas coast and will directly impact the success of the states coastal restoration effort. Projects such as the proposed diversion cannot offset the impacts of climate change in the absence of federal and state programs to reduce greenhouse gas emissions.

Conclusion: In conclusion, we urge the Corps and Cooperating Agencies to fully carry out your respective duties under the laws that define and regulate the permit process: the National Environmental Policy Act (NEPA), the Clean Water Act (Sections 404, 408), and the Rivers and Harbors Act (Section 10), among others. It is worth noting that these laws and their effectiveness have been under duress from the Executive Branch and in previous years from Congress. We support their critical role in upholding the public interest and protecting the health of citizens and the environment.

Sincerely,

---

Marylee Orr  
Executive Director  
Louisiana Environmental Action Network

Michael Orr  
Director  
Lower Mississippi Riverkeeper

**Concern ID: 61812**

**Commenters expressed concern that the proposed Project would have adverse water quality impacts in the Barataria Basin due to the introduction of nitrate and phosphate from the Mississippi River. Several commenters questioned whether the proposed Project would create harmful algal blooms and hypoxia in the Barataria Basin similar to the hypoxic “dead zone” in the Gulf of Mexico that exists due to nutrients in Mississippi River waters. One commenter expressed concern that the EIS does not adequately assess the potential for the proposed Project to create algal blooms and hypoxia in the basin, other than acknowledging it.**

**Response ID: 16425**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved

---

oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA's Mississippi River/Gulf of Mexico Hypoxia Task Force "Hypoxia 101" webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone "water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen" (<https://www.epa.gov/ms-htf/northern-gulf-mexico-hypoxic-zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.>)

Dissolved oxygen concentrations associated with the Applicant's Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section is included in Section 4.5.5.3 in Surface Water and Sediment Quality and has been added to Section 4.5.5.4.2 Applicant's Preferred Alternative of the Final EIS. Finally, the EIS acknowledges the potential for major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well

understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) if warranted, in the Barataria Basin during Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61817**

**Commenters stated that information about the Gulf Hypoxia Action Plan (Louisiana Hypoxia Working Group), which calls for a 20 percent reduction in nitrogen and phosphorus loading to the Gulf by 2025, is pertinent to the Draft EIS but is not mentioned. Commenters requested that the plan should be included in the Final EIS.**

**Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. 2008. Gulf Hypoxia Action Plan 2008 for Reducing, Mitigating, and Controlling Hypoxia in the Northern Gulf of Mexico and Improving Water Quality in the Mississippi River Basin. Washington, DC.**

**Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. 2013. Looking Forward, The Strategy of the Federal Members of the Hypoxia Task Force. Washington, DC.**

---

**Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. 2016. December 2016 Update, Looking Forward, The Strategy of the Federal Members of the Hypoxia Task Force. Washington, DC.**

**Response ID: 16428**

The USACE and the LA TIG agree that the Gulf Hypoxia Action Plan is relevant to the proposed Project area. Therefore, in response to these comments, a discussion about the Gulf Hypoxia Action Plan has been added to Section 4.25.5.4.4 Nitrogen and 4.25.5.4.5 Phosphorus in Cumulative Impacts of the Final EIS. The Hypoxia Action Plan has highlighted the important role that river diversions could play in reducing nutrient loads. In addition, substantial nutrient load reduction could be achieved through the measures being implemented by the other states and entities involved with the Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. These combined efforts could lessen the potential impacts of excess nutrient loads to Barataria Basin and the northern Gulf of Mexico.

---

**Concern ID: 61936**

**Environmental Justice Executive Order 12898 (1994) addresses environmental justice in minority and low-income populations. The order acknowledges the disproportionate adverse impacts that federal actions have historically had on certain communities. It also commits the federal government to promoting nondiscrimination in future federal actions that may impact environmental quality. As most of the funds that are suggested for this Project would come from the federal funding streams this issue should be addressed. The Draft EIS cites federal policies mandating that issues of environmental justice be given full consideration, in particular the long standing Executive Order (12898) on Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations and comparable Department of Defense directives. Attention must be paid to communities such as the Native Americans in Grand Bayou, Vietnamese fishermen, and low-income resident fishers of Plaquemines, Jefferson, and Lafourche who may be negatively impacted by this Project. In the parishes closest to the Project site, Plaquemines and Jefferson, minority populations respectively constitute 36 and 60 percent of the overall population.**

**Response ID: 16293**

The EIS Chapter 4, Section 4.15 Environmental Justice acknowledges that disproportionately high and adverse impacts on low-income and minority populations could occur in some communities where reductions in abundance of oysters, brown shrimp, and certain fish species are anticipated as a result of the proposed Project. These impacts would depend in part on the extent to which affected populations engage in or are heavily reliant on commercial and subsistence fishing for these species. The EIS Chapter 4, Section 4.15, Environmental Justice recognizes the presence of low-income and minority populations in communities that depend on shrimp and oyster fishing in Barataria Bay, including Grand Isle, Galliano, the Lafitte area, Barataria, Belle Chasse, Live Oak, West Pointe à la Hache, Ironton, Grand Bayou, and Port Sulphur. However, as discussed in the EIS, there are insufficient data to correlate fisheries harvests with specific low-income and minority populations. Consequently, the precise extent to which impacts on shrimp and oyster fisheries would affect specific low-income and minority populations cannot be determined.

---

CPRA has expanded and refined its Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. CPRA's mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61938**

**The EIS identifies and acknowledges that there are low-income and minority communities that might experience disproportionately high and adverse economic impacts as a result of the proposed Project, particularly as such impacts relate to commercial and subsistence fishing.**

**Response ID: 16296**

The EIS Chapter 4, Section 4.15 Environmental Justice acknowledges that disproportionately high and adverse impacts on low-income and minority populations could occur in some communities where reductions in abundance of oysters, brown shrimp, and certain fish species are anticipated as a result of the proposed Project. These impacts would depend in part on the extent to which affected populations engage in or are heavily reliant on commercial and subsistence fishing for these species. The EIS Chapter 4, Section 4.15 Environmental Justice recognizes the presence of low-income and minority populations in communities that depend on shrimp and oyster fishing in Barataria Bay, including Grand Isle, Galliano, the Lafitte area, Barataria, Belle Chasse, Live Oak, West Pointe à la Hache, Ironton,

---

Grand Bayou, and Port Sulphur. However, as discussed in the EIS, there are insufficient data to correlate fisheries harvests with specific low-income and minority populations.

Consequently, the precise extent to which impacts on shrimp and oyster fisheries would affect specific low-income and minority populations cannot be determined.

CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the EIS, since issuance of the Draft EIS and LA TIG's Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61963**

**The significant, and growing, local opposition to the proposed MBSD Project should be addressed prior to the diversion project continuing.**

**Response ID: 15908**

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan.

All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

---

---

**Concern ID: 62254**

**Commenters expressed concerns that hazardous substances spilled by industrial facilities upstream from the proposed diversion's intake structure in the Mississippi River could be routed to the Barataria Basin via the diversion during proposed Project operations. One commenter requested that because the Alliance Refinery is described in Chapter 3, Section 3.23 Hazardous, Toxic, and Radioactive Waste Assessment of the Draft EIS as having had past releases of petroleum and hazardous substances, hazardous waste violations under the Resource Conservation and Recovery Act (RCRA), and as having an active industrial landfill site, the Final EIS should assess the potential for the facility to discharge contaminated substances into the Barataria Basin via diversion flows.**

**Response ID: 16433**

The commenters' concerns regarding hazardous spills were considered in the Draft EIS. As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality, the receiving waterbody for industrial facilities along the Mississippi River upstream from the proposed Project's intake structure (LDEQ Mississippi River subsegment LA070301\_00), is not listed as impaired by LDEQ. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. LDEQ's water quality assessment for subsegment LA070301\_00 indicates that regulated substances are not present at concentrations that would cause a water quality impairment. Industrial facilities, for example the Alliance Refinery, are regulated by LDEQ through permits that include monitoring and reporting requirements. Facilities are required to report any releases of oil or hazardous substances to water to LDEQ.

LDEQ's assessment of this subsegment of the river includes contributions from industrial facilities' regulated discharges to the Mississippi River. In the event of accidental spills of hazardous substances into the river, these facilities would follow their required Spill Prevention, Control, and Countermeasure (SPCC) and Stormwater Pollution Prevention (SWPP) plans to minimize impacts of accidental releases.

As described in Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed. In response to this concern, the USACE has added a new subsection to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of accidental spills of hazardous substances in the river during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills in the Mississippi River.

---

**Concern ID: 62255**

**Commenters expressed concern that during proposed MBSD diversion operations, contaminated sediments from the Mississippi River may be routed to the Barataria Basin, where they would cause adverse impacts. One commenter stated concern that because the dilution capacity of the basin is less than that of the Mississippi River, contaminants routed to the basin via the diversion would reach toxic levels because basin waters would not sufficiently dilute the sediment.**

**Response ID: 16434**

---

Impacts related to contaminated sediment raised by the commenters were considered in the Draft EIS. As noted in Chapter 4, Section 4.5.5.10 in Surface Water and Sediment Quality, recent evaluations of Mississippi River sediments in the vicinity of the proposed Project intake structure indicate that they are free from contaminants at concentrations that would result in detrimental impacts. The dilution referenced in Chapter 3, Section 3.5.3.1 in Surface Water and Sediment Quality refers to movement along the entire length of the river from Minnesota to Louisiana and is not meant to imply that dilution is occurring or needed to dilute elevated concentrations in the proposed Project area. In response to these comments, the USACE has edited Section 3.5.3.1 in Surface Water and Sediment Quality to make this clear in the Final EIS.

---

**Concern ID: 62263**

**Commenters expressed concern that plastics and microplastics (including but not limited to PFAS) in the Mississippi River would be introduced into the basin through the proposed MBSD diversion, causing adverse impacts on wildlife and humans. Commenters stated that plastics never fully disintegrate, are poorly regulated, and have made their way into every part of the food chain. One commenter witnessed a major spill in the river of plastic pellets called “nurdles” that was never fully cleaned up.**

**Response ID: 16435**

The USACE acknowledges that microplastics and PFAS in surface water are currently not regulated. There are currently no data to determine whether PFAS concentrations in the Mississippi River are significantly different from concentrations in the Barataria Basin. There are no standards to evaluate whether PFAS concentrations are unacceptably elevated in the river or the basin.

The Draft EIS acknowledges that accidents and spills can occur unexpectedly in the river or in the basin. Public and private emergency response teams are available to minimize damage from such accidental releases. As described in Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed. Also in response to this concern, the USACE has added a new subsection to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of accidental spills of hazardous substances in the river during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills in the Mississippi River.

---

**Concern ID: 62432**

**The Buckeye Marrero Terminal, LLC permit includes the statements that no discharge should occur within one mile upstream of any drinking water intake, and the permittee is responsible for determining the existence and location of the nearest drinking water intake. The listed intakes downstream of the MBSD Project site are at Point a la Hache (River Mile 49.2E), Port Sulphur (River Mile 49W), and Venice (River Mile 18.6W).**

**Response ID: 15962**

---

The Buckeye Marrero Terminal LPDES Permit conditions are outside the scope of this EIS. However, CPRA would be required to comply with any LPDES permit conditions if such a permit is required by LDEQ for the proposed MBSD Project.

---

**Concern ID: 62437**

**Commenters expressed concerns about potential increases in carbon dioxide emissions of the reasonably foreseeable industrial facilities that may be constructed and operated in the Project area of the proposed MBSD Project. One commenter requested that the Final EIS include an analysis of the scale of carbon dioxide emissions of reasonably foreseeable petrochemical facilities and their associated infrastructure in the proposed Project area.**

**Response ID: 16465**

The commenters' concerns about the air quality impacts of reasonably foreseeable petrochemical facilities in the Project area were considered in the air quality cumulative impacts analysis (see Section 4.25.7 Cumulative Impacts, Air quality).

Chapter 4, Section 4.25.7 Cumulative Impacts, Air Quality of the EIS addresses the air quality impacts of reasonably foreseeable future petrochemical facilities in the Project area. As noted in Section 4.25.1.1 Cumulative Impacts, air quality would only be negligibly impacted by operation of the MBSD Project action alternatives and therefore none would measurably contribute to cumulative air quality effects. While petrochemical and industrial facilities in the Project area may result in more than negligible individual or cumulative impacts on air quality during their operations, the Project alternatives would not contribute measurable impacts. Further, other petrochemical and industrial facilities in the Project area would be required to comply with applicable regulations and permitting requirements pertaining to air quality. Finally, the Project would result in permanent, indirect, minor, beneficial impacts on carbon sequestration and atmospheric GHG concentrations due to wetland creation and restoration within the Barataria Basin (see Chapter 4, Section 4.7.4.2 in Air Quality of the EIS).

---

**Concern ID: 62440**

**The commenter expressed concern that in the Draft EIS, Chapter 4, Section 4.25.5.4 Cumulative Impacts - Surface Water and Sediment Quality, the PLT facility is among three reasonably foreseeable industrial projects (along with NOLA Oil Terminal and Plaquemines LNG/Gator Express Pipeline) with potential impacts that were not considered in the Delft3D Basinwide Modeling for the EIS. However, this EIS section acknowledges that the PLT facility would have the potential for oil spills that could enter the MBSD intake and be conveyed into Barataria Basin sediments, waters, and wetlands.**

**Response ID: 16466**

The commenter's concern about oil spills potentially contaminating water diverted into the basin by the proposed Project was considered in the Draft EIS in Chapter 2, Section 2.8.1.4 (Project Operations) and Appendix F (MBSD Design and Operations Information). This section and appendix explain that in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed. Information regarding closing the diversion structure in the event

---

of hazardous spills has been added to the Cumulative Impacts section, Chapter 4, Section 4.25.5.4 in the Final EIS.

Since publication of the Draft EIS, the Tallgrass/PLT facility's sponsors PPHTD/PLT have withdrawn their Joint Permit application (Louisiana Department of Natural Resources Coastal Use Permit [CUP] number P20180379 and DA Permit number MVN-2012-0123-EPP), and terminated the Memorandum of Understanding (MOU) (originally dated April 24, 2019) between CPRA and PPHTD/PLT pertaining to the facility. A footnote has been added in Section 4.25.1.3.2 Reasonably Foreseeable Future Projects of the Final EIS to reflect the withdrawal of the PLT Project.

---

**Concern ID: 62442**

**Commenters requested that additional information about the reasonably foreseeable Plaquemines Liquids Terminal be added to the Final EIS, Chapter 4, Section 4.25 (Cumulative Impacts), such as the potential for the project to affect sediment transport capabilities of the proposed MBSD Project.**

**Response ID: 16467**

Furthermore, CPRA entered into a Memorandum of Understanding with the Plaquemines Port Harbor & Terminal District (PPHTD) and the Plaquemines Liquid Terminal, LLC (PLT) requiring PPHTD and PLT to perform sediment transport modeling and a navigation study to determine the impact, if any, that the PLT Project may have on the proposed MBSD Project, and to agree to certain terms and conditions, as needed, to ensure that the PLT, once constructed and operated, does not have unreasonable adverse impacts on the design, construction, or operation of the proposed MBSD Project. These steps would help ensure that the PLT Project remains consistent with the Louisiana Coastal Master Plan.

Since publication of the Draft EIS, the Tallgrass/PLT facility's sponsors PPHTD/PLT have withdrawn their Joint Permit application (Louisiana Department of Natural Resources Coastal Use Permit [CUP] number P20180379 and DA Permit number MVN-2012-0123-EPP), and terminated the Memorandum of Understanding (MOU) (originally dated April 24, 2019) between CPRA and PPHTD/PLT pertaining to the facility. A footnote has been added in Section 4.25.1.3.2 Reasonably Foreseeable Future Projects of the Final EIS to reflect the withdrawal of the PLT Project.

---

**Concern ID: 62461**

**The commenter identified a number of facilities applying for new or renewed LPDES permits in Louisiana during the years 2020 to 2021.**

**Response ID: 16471**

The potential impacts of the proposed projects noted by the commenter were considered in the Draft EIS in Chapter 4, Section 4.25 Cumulative Impacts with the exception of those projects the commenter listed that are outside of the proposed MBSD Project impact area as described in the Draft EIS Chapter 4, Section 4.25.1.3 Cumulative Impacts, Step 3: Identify the Projects and Actions to be Considered. Reasonably foreseeable projects and information about them was based on the stage of development that the actions and facilities had reached at the time the Draft EIS was being prepared. To be considered a "reasonably foreseeable project" to be included in the evaluation of cumulative effects in the EIS, a proposed project needed to be sufficiently advanced in the planning process that it was no

---

longer speculative. In this case, proposed projects that had been submitted to relevant agencies for permitting (including USACE) by May 2020 were considered reasonably foreseeable and were included the cumulative impacts analysis. No related edits have been made for the Final EIS.

In May 2022 after publication of the Draft EIS, the USACE conducted a search to identify any new/additional reasonably foreseeable projects that, cumulatively with the proposed MBSD Project, have the potential to significantly alter the environmental landscape from what was assessed in the Draft EIS. After identifying new, reasonably foreseeable projects, USACE evaluated those projects for their potential to significantly affect the environmental landscape that was presented in the Draft EIS and concluded that none would significantly change the MBSD cumulative impacts as described in the Draft EIS. Nevertheless, USACE determined that five newly-identified projects would have more than negligible cumulative impacts. To provide a complete picture of MBSD cumulative effects to the decision maker(s) and the public, these five projects have been added to the Final EIS in Chapter 4, Section 4.25.25 Cumulative Impacts Analysis 2022 Update.

---

**Concern ID: 62463**

**The commenter stated concern that because Ironton is the closest community to the MBSD Project site and to the proposed Plaquemines Port Harbor & Terminal District/Plaquemines Liquids Terminal (PPHTD/PLT) site and the existing Alliance Refinery, Ironton would be particularly vulnerable to impacts from all three in terms of potential flood and/or health effects.**

**Response ID: 16472**

The concerns raised by the commenters were considered in the Draft EIS in Chapter 3, Section 3.7.2 Air Quality, Existing Conditions; and Chapter 4, Sections 4.8 Noise, 4.13 Socioeconomics, 4.15 Environmental Justice, 4.22 Land-Based Transportation and 4.25 Cumulative Impacts. Chapter 3, Section 3.7.2 Air Quality - Existing Conditions identifies the existing air quality in the proposed Project area and provides that Plaquemines Parish is designated as "unclassifiable/in attainment" for all criteria pollutants. The resource sections in Chapter 4 address potential air quality, noise, transportation, and flooding impacts specifically concerning the community of Ironton. In addition, Chapter 2 of Appendix H1 Socioeconomics Technical Report to the EIS provides contextual information about the Ironton community. As stated in the EIS in Chapter 4, Section 4.15 Environmental Justice, populations in Ironton would experience minor to moderate, temporary adverse, impacts due to increased noise levels, dust, and transportation delays during the approximately 5-year construction period. However, as previously described in the Land-Based Transportation section of Section 4.25.22 Cumulative Impacts of the Draft EIS, cumulative impacts on traffic from construction of the reasonably foreseeable future actions combined with construction of the proposed MBSD Project action alternatives would likely be major, adverse, and temporary and could cause substantial traffic delays on LA 23. Ironton would experience these major, adverse impacts because of its proximity to LA 23 and the proposed MBSD Project. To make this clearer, Section 4.25.22.3 in Cumulative Impacts of the Final EIS has been revised to state that Ironton would experience major, adverse impacts during the 5-year construction period of the proposed Project due to cumulative impacts of the proposed MBSD Project and reasonably foreseeable projects on LA 23 traffic volumes and congestion.

Beyond the near-term impacts of construction, operation of the Applicant's Preferred Alternative may have impacts on Ironton. Because it is within the New Orleans to Venice (NOV) Non-Federal Levee (NFL) W-05a.1 (La Reussite to Myrtle Grove levee reach) levee system, Ironton is not expected to be impacted by increases in frequency and duration of tidal flooding due to Project operations (see Section 4.15.4.2.2 Storm Hazards and 4.20.4.2 Public Health and Safety). However, negligible to minor increases in risk of overtopping of the NOV-NFL Levee south of the immediate outfall area following the delta formation in the outfall area that may affect storm surge during certain 1 percent storms may impact low-income and minority populations within Ironton.

Also, in the Final EIS, Section 4.15.5.1 Environmental Justice has been added to provide a summary of impacts on the majority-Black community of Ironton, which is the closest community to the diversion, to assist understanding the projected impacts of the proposed Project on that community.

---

**Concern ID: 62878**

**The EIS and Mitigation Plan does not adequately consider or mitigate for impacts to Ironton. The EIS should include air pollution buffers for Ironton and flood protection easement areas for Ironton and other vulnerable communities outside of levee protection.**

**Response ID: 16505**

The concerns raised by the commenters were considered in the Draft EIS in Chapter 3, Section 3.7.2 Air Quality, Existing Conditions; and Chapter 4, Sections 4.8 Noise, 4.13 Socioeconomics, 4.15 Environmental Justice, 4.22 Land-Based Transportation and 4.25 Cumulative Impacts. Chapter 3, Section 3.7.2 Air Quality - Existing Conditions identifies the existing air quality in the proposed Project area and provides that Plaquemines Parish is designated as "unclassifiable/in attainment" for all criteria pollutants. The resource sections in Chapter 4 address potential air quality, noise, transportation, and tidal flooding impacts specifically concerning the community of Ironton. In addition, Chapter 2 of Appendix H1 Socioeconomics Technical Report to the EIS provides contextual information about the Ironton community.

CPRA committed to implementing best management practices (BMPs) to minimize construction impacts in the EIS in Chapter 4, Section 4.27.1 Avoidance and Minimization and Appendix R1 Mitigation and Stewardship Plan; additional information on BMPs is also included in the Mitigation Summary Table in Appendix R3. Construction emissions would be highly localized, and consequently the Project is only anticipated to impact air quality within 0.5 mile of the construction footprint; however, Ironton is located approximately 0.5 mile from the construction footprint (see EIS, Chapter 4, Section 4.7.1 Area of Potential Impacts). As stated in the EIS in Chapter 4, Section 4.15 Environmental Justice, populations in Ironton would experience minor to moderate, temporary adverse, impacts due to increased noise levels, dust, and transportation delays during the approximately 5-year construction period. During operations, air emissions would be negligible since the diversion structure would be electric-powered (see EIS Chapter 4, Section 4.7.4.2).

Beyond the near-term impacts of construction, operation of the Applicant's Preferred Alternative may have impacts on Ironton. Because it is within the New Orleans to Venice (NOV) Non-Federal Levee (NFL) W-05a.1 (La Reussite to Myrtle Grove levee reach) levee

---

system, Ironton is not expected to be impacted by increases in frequency and duration of tidal flooding due to Project operations (see Section 4.15.4.2.2 Storm Hazards and 4.20.4.2 Public Health and Safety). Further, guide levees constructed parallel to the diversion channel will be constructed to an elevation of approximately 15.6 feet and will serve as hurricane and storm damage risk reduction against storm surges. However, negligible to minor increases in risk of NOV-NFL Levee overtopping south of the immediate outfall area (following the delta formation in the outfall area) due to storm surge during certain 1 percent storms, may impact low-income and minority populations within Ironton. These potential impacts may be exacerbated to the extent that Ironton residents experience unique vulnerabilities.

To ensure that impacts on the community of Ironton have been adequately disclosed and to make that analysis readily accessible in one location within the EIS (rather than throughout the various resource sections), a section has been added to the Final EIS that provides a summary of impacts on the community of Ironton under the Applicant's Preferred Alternative (see Chapter 4, Section 4.15.5.1 Environmental Justice).

CPRA is not proposing specific mitigation to address or offset the negligible to minor increased risk in levee overtopping that could affect the community of Ironton inside the NOV-NFL system because this potential increased risk does not accrue until Project operations have resulted in the development of a delta (wetlands and marsh) in the area outside the NOV-NFL Levee adjacent to Ironton (circa 2040), and because this risk was identified for only one of the 100-year storm scenarios modeled. However, to help Ironton prepare for and mitigate flood risk from storms generally, CPRA would designate a liaison to work with residents in Ironton prior to commencing operations of the Project on community preparedness for storm-based flooding and damage.

CPRA has engaged in public outreach meetings with the communities projected to be impacted by the MBSD to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts were undertaken to better understand and address potential impacts on communities with environmental justice concerns, such as low-income and minority populations, that may be disproportionately impacted by the Project, as discussed in Chapter 7 of the Final EIS. This included meetings in the community of Ironton. CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project. CPRA will continue to engage with potentially impacted environmental justice communities and organizations concerning the implementation of the mitigation and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG

intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62963**

**Mitigation compensation should prioritize those most affected, likely those who rely on oyster leases in the mid-basin areas or smaller operations, as well as economically vulnerable oyster fishers.**

**Response ID: 16533**

The Draft EIS evaluates how the Project would impact commercial, recreational, and subsistence fishers as compared to No Action conditions in Chapter 4, Sections 4.10 Aquatic Resources, 4.14 Commercial Fisheries, 4.15 Environmental Justice and 4.16 Recreation and Tourism.

In response to public comments and resource agency input about proposed mitigation and stewardship efforts, CPRA has expanded and refined the oyster mitigation and stewardship measures. CPRA's mitigation and stewardship strategies and expenditures focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to oyster fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for oysters in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to oyster fisheries in the early years of the Project's operational life. The revised mitigation and stewardship measures include allocating \$4 million to establish new public seed ground, \$15 million to enhance public and private oyster grounds, \$4 million to create or enhance broodstock reefs and \$8 million for alternative oyster culture. While the focus of the proposed mitigation and stewardship measures are on establishing sustainable fisheries, oyster mitigation and stewardship measures have been crafted to focus on those impacted by the Project specifically. For example, a portion of each of the stewardship measures for impacts to oyster

---

harvesters would be expressly designated for use by low-income and minority oyster harvesters. See the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS). The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiessky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of

specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63965**

**The Trustees should begin mitigation and adaptation during construction before impact as opposed to waiting after impacts occur to initiate the process.**

**Response ID: 16588**

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) contained information on mitigation and stewardship measures, including measures that would be undertaken by CPRA before Project construction. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS, which now provides additional detail on several efforts that CPRA would undertake before Project construction, including funding for public and private oyster seed ground enhancement, marketing, shrimp vessel and facility improvements, workforce and business training, and subsistence fishing access (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

CPRA would be responsible for implementation of any mitigation actions and for monitoring and adaptive management associated with the proposed Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that

---

USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:40494**

Harold Herrmann

To Whom It May Concern,

I am writing to voice my opposition to the construction of the Mid-Barataria Sediment Diversion.

This project is economically inefficient and overly costly. It is a safe assumption that the original budget is highly understated which is typical of projects of this magnitude. There are less expensive ways to build land or replace land loss such as through dedicated dredging which can pinpoint with great precision exactly where you want the land created. You have other projects on the books now at half the cost of this proposed one that are projected to build much more acreage than this diversion ever could.

[REDACTED]

What is certain about this diversion project and why it should not be allowed follows:

- a) It will destroy the fisheries in the Barataria basin and therefore the businesses of local fishers and sport fishers and guides that line lower Plaquemine parish banks. Common saltwater species such as speckled trout, shrimp, crabs will disappear. So will the ability of our commercial fisherman to make a living. Seafood and Cajun cuisine are a treasure for the state of Louisiana and the City of New Orleans that relies so heavily on tourism. Why are we willing to put the commercial fishers out of business and reduce the catch of these wonderful delicacies?
- b) The diversion will have permanent and detrimental effect on Myrtle Grove with predicted increases in tidal flooding in Myrtle Grove by at least 119 days per year (EIS table 4.20.2) leaving maybe two-thirds of the year accessible. This is unacceptable for a subdivision for a subdivision containing homes in the \$500,000 to \$1,000,000 range!!
- c) Further, Environmental Impact Study (EIS) on page 4-694 in figure 4-20-3 shows flooding twice as often with inundation 2/3s of the year. This is not consistent with item (c) above. Which is more correct? What is the true impact estimated?
- d) The same is true of other communities that are outside of the Federal levee system.
- e) The diversion will silt the Wilkinson Canal making it impossible to leave Myrtle Grove by boat or the commercial launch by boat. The Environmental Impact Study (EIS) does not require CPRA to remedy this-only states that they MIGHT do so. What manner of foolishness is that? Why did we all pay money to live on the water, have ready access to the water not to be able to use it? This is a major devaluation of our property values!
- f) Appendix H, Table 2-6 identifies Myrtle Grove with 76 homes and 231 undeveloped properties valued at \$52.0 million yet EIS page 4-554 identifies a value of \$5.9 million for 532 residential properties. Why are these values inconsistent??? They must be reconciled, especially now with the new cost of construction.

- g) I am not aware of any flowage easements in the various residential subdivisions which will be adversely affected by this project. I certainly do not intend to grant an easement to the Corps of Engineers to flood my property and deny me access to it at their discretion.
- h) There was not a hydrology report in the EIS showing the impact upon the water levels. Without this information, it is impossible to confirm the amount of increased water in Myrtle Grove.
- i) Why is there not a Real Estate Plan for Myrtle Grove like the one for the Upper Barataria EIS? Why is there a buy-out for the homes in the Upper Barataria and not for Myrtle Grove and the other affected communities in the Mid-Barataria?
- j) I object to the EIS not detailing the impact upon the dolphin population. While an exemption for killing dolphins was included in a budget bill, the actual impact must be studied and disclosed to the public. The recent flow of fresh water from the Bonnet Carre spillway into Lake Pontchartrain caused the death of at least 200 dolphins and this was only a short-term flow of fresh water.
- k) Why were the effects on people not included in the study? The water from the Mississippi River contains significant amounts of fertilizer which results in dead zones at the mouth of the River and the flow into Lake Pontchartrain resulted in harmful amounts of blue-green algae.
- l) Having watched the effects of the Carnarvon diversion for 20 plus years what I have seen is an influx of fresh water, introduction of freshwater plant species such as water hyacinth and salvinia, that clog available waterways, suffocate natural marsh grass and stagnate water by restricting its flow. In all of this time I have not seen any real marsh land built or marsh grass created. Same is true for the Naomi diversion north of Myrtle Grove. Again, I close voicing 100% opposition to this project. I respectfully ask that personal information beyond my name be withheld from public view.

---

**Concern ID: 61852**

**The cost per acre of marsh creation by the diversion is far higher than a corresponding alternative of marsh creation through the use of dredged material. Marsh creation through a diversion takes 50 years unlike marsh creation through dredging. In addition, brackish/salt marshes (which would be created by dredging) are more resilient than freshwater marshes, and thus marsh created through dredging would be a more sound investment of restoration funding than a sediment diversion.**

**Response ID: 16617**

The timing of marsh benefits created by the proposed diversion was considered in the Draft EIS in Chapter 4, Section 4.6.5 Wetland Resources, Operational Impacts. In response to these comments, additional detail has been added regarding the resiliency of fresh marsh compared to brackish marsh in the Final EIS, Sections 4.6.5.1.2.3 Soil Shear Strength and 4.6.5.1.2.4 Land Accretion. Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its

---

decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

While the commenters suggest that marsh creation through dredging would cost less than the proposed Project, the LA TIG does not believe that comparing the costs of a sediment diversion to marsh creation projects using dredged material is relevant for several reasons. Most importantly, as explained in the LA TIG's Restoration Plan, the goal of the Project is to create a long-term sustainable ecosystem through the reestablishment of deltaic process. Marsh creation through the use of dredged material would not bring fresh water or nutrients to the basin on an ongoing basis. The benefits of marsh created with dredged material would diminish over time without maintenance in the form of additional pumping events due to subsidence and sea-level rise; thus, the temporal nature of Project benefits in the absence of periodic maintenance would also be very different. The costs and benefits of the Project were fully considered by the LA TIG and are discussed in the Draft Restoration Plan in Section 3.2.1.2 Cost to Carry Out the Alternative.

---

**Concern ID: 62013**

**The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.**

**Response ID: 16210**

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without

---

implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review,

Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62018**

**Commenters noted inconsistencies in the property values presented in the EIS and Appendices. Specifically, comments highlighted a need to reconcile the property value of \$52 Million for Myrtle Grove in Appendix H compared to the value of \$5.9 Million for Myrtle Grove and all the other affected communities in Chapter 4, Section 4.13.5.3 in Socioeconomics of the main body of the EIS.**

**Response ID: 16214**

The commenter's concern with the consistency of property valuation in the EIS is acknowledged. The issues raised by the commenters were considered in the Draft EIS. Appendix H1 Socioeconomics Technical Report and Chapter 4, Section 4.13.5.3 Housing and Property Values in Socioeconomics present different statistics about housing values. Specifically, Table 2-6 in Appendix H1 Socioeconomics Technical Report presents total property values based on estimated online fair market estimates in Myrtle Grove. Section 4.13.5.3 Housing and Property Values in Socioeconomics presents the assessed value of properties as reported by the Plaquemines Parish Assessor. Per the Plaquemines Parish Assessor, the assessed value is calculated as 15 percent of the fair market value for all commercial improvements, and 10 percent of the fair market value for all residential improvements and all land. For clarity, edits have been made to Section 4.13.5.3 and Appendix H1 Socioeconomics Technical Report of the Final EIS.

---

**Concern ID: 62234**

**There was not a hydrology report in the Draft EIS showing the impact upon the water levels.**

**Response ID: 15760**

---

The EIS does not include a separate, stand-alone hydrology report; however, hydrology is one of the outputs provided by the Delft3D Basinwide Model. The results of this modeling are included in Appendix E, Delft3D Modeling. Based on these results, several sections of the Draft EIS discussed the projected impacts on water levels throughout the basin for all Project alternatives, including in the vicinity of Myrtle Grove. These sections include Section 4.4 Surface Water and Coastal Processes and Section 4.20 Public Health and Safety. These sections are supplemented by additional information in Appendix P, Flood & Storm Hazards Evaluation.

---

**Concern ID: 62236**

**The commenter asserts that information provided in several sections of the Draft EIS and in presentations are inconsistent and would like to know what the actual impact to Myrtle Grove would be.**

**Response ID: 15822**

The USACE acknowledges the commenters' concerns regarding the consistency and accuracy of the reported projections. USACE is the lead agency for development of this EIS, which contains the results from the Delft3D Basinwide Model regarding the projected effects of the Project on water levels in Barataria Basin, including areas close to the diversion outfall (within a 20-mile radius). The estimated flooding impacts in Myrtle Grove are described in Chapter 4, Sections 4.20.4.2.1.2 and 4.20.4.2.2.2 in Public Health and Safety. USACE is not familiar with other numbers that may have been reported by CPRA. Readers of the EIS should not consider the model outputs as absolute values or predictions of actual future conditions. Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future conditions. Uncertainties are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 (Model Limitations and Uncertainty), and in detail in Appendix E (Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties).

---

**Concern ID: 62299**

**The commenter asserts that they do not intend to grant a flowage easement to allow USACE to flood their property and deny them access to their property at USACE's discretion.**

**Response ID: 15801**

The proposed Project would be a CPRA project, not a USACE project; therefore, CPRA would seek any flowage easements not USACE. Additional detail on the CPRA's proposed flowage easements, referred to as Project servitudes, can be found in Final EIS Appendix R1, Mitigation and Stewardship Plan.

CPRA plans to acquire Project servitudes in the communities south of the diversion outside of levee projection beginning at Woodpark and continuing south to Grand Bayou and Happy Jack. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would

attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. The USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62300**

**The diversion would cause harmful algal blooms which have unforeseen risks to human health, including Amnesic Shellfish Poisoning (ASP), Neurotoxic Shellfish Poisoning (NSP), Paralytic Shellfish Poisoning (PSP), Diarrhetic Shellfish Poisoning (DSP) and Ciguatera Fish Poisoning (CFP).**

**Response ID: 15813**

---

The impacts raised by the commenters have been considered in the Draft EIS. As discussed in the EIS, Chapter 4, Sections 4.5.5.3 and 4.5.5.4 in Surface Water and Sediment Quality, increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations. Vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin than in the river and reaching the Gulf through Barataria Bay.

Section 4.10.4.4 in Aquatic Resources notes that an increased potential and frequency of phytoplankton blooms would be likely within the Project area, but whether or not these blooms would become harmful algal blooms cannot be definitely determined. A reference to Section 4.10 is included in Section 4.5.5.3 in Surface Water and Sediment Quality of the Draft EIS. A reference to Section 4.10 Aquatic Resources has been added to Section 4.5.5.4 (Phosphorus) of the Final EIS. Clarifying language has been added to Sections 4.5.5.3, 4.5.5.4, and 4.25.5.4 in Cumulative Impacts.

Section 4.14 Commercial Fisheries has been updated in the Final EIS to discuss the National Shellfish Sanitation Program and the Louisiana Department of Health's oversight of shellfish harvesting in order to prevent harvest of oysters that may contain unsuitable levels of fecal coliform or toxins harmful to human health. Additionally, Appendix R2 in the Final EIS includes a Monitoring and Adaptive Management (MAM) Plan that describes monthly fecal coliform monitoring (Section 3.7.5.1) and periodic sampling for Contaminants of Concern in fish, shellfish, and wildlife (Section 3.7.3.23).

Additionally, as described in Appendix R2 CPRA's MAM Plan of the EIS, Section 3.7.3.11, CPRA is proposing to monitor for Harmful Cyanobacterial/Algal Bloom Toxins in Barataria Surface Waters. Samples will be collected monthly and additional discrete sampling will be done as needed in response to observations of presence of cyanobacterial and/or eukaryotic algal species associated with harmful algal bloom. Filter feeding fish may also be analyzed for toxins in fish tissue.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as

conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently

---

contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62968**

**If operation of the diversion causes infill of various canals used to access surrounding communities, who will be responsible for dredging to maintain access? For example, if Wilkinson Canal is filled with silt then the canal cannot be used and waterfront property owners with boat lifts in Myrtle Grove will not be able to get out using their boats; the EIS does not require a remedy or provide a funded maintenance plan for this issue (including who would pay for dredging).**

**Response ID: 16642**

The impacts raised by the commenters were considered in the Draft EIS. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the Project area during Project operations.

In acknowledgement of commenters' concerns regarding maintenance of non-federal navigation channels and canals impacted by sedimentation of the proposed diversion, the Mitigation and Stewardship Plan includes measures to mitigate impacts on navigation resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures

---

CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63016**

**The Carnarvon Diversion (and other diversions, such as the Naomi Siphon) did not build marsh but rather caused damage to the existing marsh, such as through the introduction of freshwater invasive plant species that clog available waterways, suffocating natural marsh grass, restricting water flow.**

**Response ID: 16029**

A summary of select natural and man-made diversions in southeastern Louisiana, including the Caernarvon Diversion and Naomi Siphon, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and discuss their recorded impacts on the natural environment. This summary, which includes a discussion on changes to marsh extent and the presence of invasive plants, is available in Appendix U of the Final EIS.

---

**Concern ID: 63067**

**The majority of the bottlenose dolphin population of this area will be destroyed... not just killed but sentenced to a horrific death. Freshwater releases at Bonnet Carré Spillway in 2019 resulted in an unusual mortality event (UME), demonstrating the harm that freshwater releases can cause to dolphins. A study by the Galveston Bay Dolphin Research Program also found that dolphins in upper Galveston Bay developed skin lesions after flooding from Hurricane Harvey. Additional studies further support the harm that the diversion could cause by demonstrating negative impacts to dolphins from exposure to low-salinity conditions (Deming and Garrison, 2021; Duignan et al., 2020; McClain et al., 2020).**

**Deming, A., and L. Garrison. 2021. 2019 Northern Gulf of Mexico bottlenose dolphin unusual mortality event. Marine Mammal Commission meeting/webinar on "Effects of Low Salinity Exposure on Bottlenose Dolphins," 23 March 2021. Oral presentation.**

---

<https://www.mmc.gov/events-meetings-and-workshops/other-events/effects-of-low-salinity-exposure-on-bottlenose-dolphins-webinar/>

**Duignan, P.J., N.S. Stephens, and K. Robb. 2020. Fresh water skin disease in dolphins: a case definition based on pathology and environmental factors in Australia. Scientific Reports 10:21979.**

**McClain, A.M., R. Daniels, F.M. Gomez, S.H. Ridgway, R. Takeshita, E.D. Jensen, and C.R. Smith. 2020. Physiological effects of low-salinity exposure on bottlenose dolphins (*Tursiops truncatus*). Journal of Zoological and Botanical Gardens 1:61-75.**

**Response ID: 16590**

The Draft EIS included an analysis based on extensive literature and soon-to-be published data (now published) demonstrating the impacts of low-salinity conditions on dolphins. These data were considered as part of an Expert Elicitation (a garnering of expert opinions to determine or quantify an unknown) that resulted in dose-response curves (Booth et al. 2020) and summarized in Chapter 4, Section 4.11.3 (Marine Mammals - Overview of Impact Analysis Approach) of the EIS. While Deming and Garrison (2021) was presented after the release of the Draft EIS, the presentation was based on data that were fully considered in the Draft EIS, including as part of the Expert Elicitation. Along with other relevant data (for example, BBES tagging studies), the analysis contained in the Draft EIS determined that there would be a significant, adverse, permanent impact on the BBES Stock. Further, the analysis in the Draft EIS concluded that if the 75,000 cfs Alternative were implemented, impacts would be immediate and only a remnant population would be likely to exist near the barrier islands after 50 years of operation.

After release of the Draft EIS, at the request of the Marine Mammal Commission, the National Marine Mammal Foundation and University of St. Andrews released a population impact projection based on the information presented in the Draft EIS (including annual survival rates from Garrison et al. 2020) coupled with an updated population model for BBES dolphins (Schwacke et al. 2022, Thomas et al. 2021). This new, additional analysis has been incorporated into the Final EIS in Chapter 4, Sections 4.11.5.2 Barataria Bay Estuarine Stock and supports the original determination in the Draft EIS of major, permanent, adverse impacts on the BBES dolphin population. The research presented in the McClain et al. (2020) study cited by commenters was considered in the Draft EIS [cited at the time as McClain et al. (in prep)]; the research presented by Duignan et al. (2020) is consistent with the established literature and does not change the conclusions of the Draft EIS, but this study has been incorporated in Chapter 4, Section 4.11.5.2.2.1 General Effects on Dolphin Health of the Final EIS. Similarly, the information included in the Deming and Garrison presentation was considered in the Draft EIS, is consistent with the conclusions of the Draft EIS, and the presentation has now been cited in Section 4.11.5.2.2.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is

---

possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include specific marine mammal response triggers that may affect Project operation mitigation efforts; see Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63092**

**Further development of the Mitigation Plan is needed for properties that would be impacted by flooding caused by Project operations. Multiple commenters made specific requests for how their property should be handled (for example, through sales or easements), while others wondered why a more detailed, "real estate plan" for impacted communities was not available.**

**Response ID: 16511**

The Draft Mitigation and Stewardship Plan included with the Draft EIS (Appendix R1) included CPRA's initial framework for mitigation and stewardship measures to assist property owners in these communities impacted by increased tidal flooding and to address the Project impacts

---

of Project operations on water levels. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

CPRA states that it is interested in assisting affected communities to remain in place as long as they would like. Mitigation would include a combination of structural measures (for example, raising roads, boat houses, docks and utilities) and non-structural measures. Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

Where the proposed Project would cause increased water levels and/or increased incidence of flooding, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to purchasing a flowage servitude, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property (rather than a servitude) would be made on a case-by-case basis depending on the particular circumstances.

A complete listing of the mitigation and stewardship measures that CPRA would implement if the proposed Project is approved and funded is included in CPRA's Mitigation and Stewardship Plan included in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not

know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63791**

**CPRA should monitor canals and dredge them as they begin to silt from the diversion.**

**Response ID: 16645**

The commenter's concerns regarding siltation and infill of Wilkinson Canal and other navigation channels in the Barataria Basin were considered in the Draft EIS in Chapter 4, Section 4.16.5.2 Recreation and Tourism - Operational Impacts and Section 4.21.5.2 in Navigation.

Siltation and infill of Wilkinson Canal was considered in the Draft Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. Since issuance of the Draft EIS, CPRA has revised its plan to address infill of Wilkinson Canal caused by Project operations. See Section 6.3.1 (Impacts to Navigation) of the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) for CPRA's final plan with regard to the siltation of Wilkinson Canal.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

---

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:40495**

Jamie Parrino

I like to fish our coastal marshes and it breaks my heart to see the changes from year to year. I absolutely love oysters, but will gladly pay more or even give them up to save our coast. The problem has been studied and is as well identified as the only obvious solution. Turn the Mississippi loose. Stop wasting all that silt and time. Diversions have proved to be the most viable option that we have. I recommend that multiple diversions be installed now. You can study a better solution for the next 100 years, just put the MS to work while we wait.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

Patricia McCarty

The state is of two opposing opinions regarding the results and effects of the Mid-Barataria Sediment Diversion. With the current plans for the diversion, the state is sacrificing the economic and environmental welfare of Plaquemines Parish citizens and resources: Current plans are insufficient and lack the proper planning. This is a Band-Aid approach to a larger problem. The Diversion will not generate enough sediment to make an appreciable effect on the coast line. We need to truck in the sediment to build up land and estuaries; that is expensive. But at what cost will the government be responsible for the damage caused to the region. Make no mistake, Plaquemines Parish has the power to make everyone listen!

---

**Concern ID: 62811**

**CPRA is sacrificing the economic and environmental welfare of Plaquemines Parish citizens and resources for the implementation of the proposed Project. The commenter suggests that trucking in sediment to build up land, while expensive, is an option. The commenter questions at what cost the government would be responsible for the damage caused to the region.**

**Response ID: 16384**

As discussed in Chapter 1, Section 1.4 Purpose and Need of the EIS, the proposed Project is intended to reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the input of sediment, fresh water, and nutrients, which would create wetlands, sustain existing wetlands, and support the long-term viability of existing and planned coastal restoration efforts, including dredging projects being built now and in the future. One such project is the Large-scale Marsh Creation and Component E Planning discussed in Chapter 4, Section 4.25 Cumulative Impacts of the EIS. This is all with the goal to provide for the long-term sustainability of the Barataria Basin (including Plaquemines Parish), not at its expense. However, the potential socioeconomic impacts of the proposed Project are described in 4.13 Socioeconomics of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

The Mitigation and Stewardship Plan (Appendix R1), revised for the Final EIS in response to public comment, includes mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project, including impacts on fisheries and on water levels in the communities south of the outfall outside of levee protection. For fisheries related impacts, the Plan includes job training, vessel and dock improvements, fisheries innovation support (for example, alternative oyster culture), and marketing support. For increased water levels and tidal flooding in communities south of the diversion outside federal levee protection, the Plan includes structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures. See Appendix R1 to the Final EIS for more details.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if the permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations.

---

The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

LDWF

Commenter

RE: Mid-Barataria Sediment Diversion (MBSD) DRAFT Environmental Impact Statement (DEIS)

To Whom It May Concern:

The Louisiana Department of Wildlife and Fisheries (LDWF) appreciated the opportunity to be included in the collaborative writing process as part of the Louisiana Trustee Implementation Group (LA TIG) during the Draft Environmental Impact Statement (DEIS) preparation to ensure appropriate species of concern were considered and no important recreational or commercial species were omitted from impact determinations. We concur with the recommendations made by the U.S. Fish and Wildlife Service in the Draft Fish and Wildlife Coordination Act Report (DEIS - Appendix T and summarized in Chapter 5) and look forward to remaining a collaborative partner as this EIS is finalized. Importantly, we remain committed to participating fully in the continued development of the associated Mitigation Plan and Monitoring and Adaptive Management Plans.

The Barataria Basin is one of Louisianas most valuable estuaries in terms of commercial seafood harvest, recreational and charter fishing opportunities, and biological productivity. This productivity stems from the diversity of habitat types present in the basin including saline, intermediate, brackish and freshwater marshes. Historically, brown shrimp, white shrimp, oyster, blue crab, spotted sea trout, redfish and dozens of other species are harvested by the millions of pounds within this basin each year contributing hundreds of millions of dollars to Louisianas economy. To continue to flourish, these estuarine organisms depend on having habitat suitable to their needs available during their early life stages.

As outlined in the DEIS, existing oyster production will be substantially impacted by the proposed Mid-Barataria Sediment Diversion (MBSD), primarily through changes to the salinity regime in the receiving estuary, which is acknowledged in the DEIS. The Barataria Basin contributes almost 25% of Louisianas total oyster production, on average. Approximately one third of Louisianas private oyster leases are in this basin. The Hackberry Bay Public Oyster Seed Reservation and Little Lake/Barataria Bay Public Oyster Seed Grounds are all located within the basin and provide seed and market oysters for the industry when conditions are favorable. While tolerant of a wide range of salinities, oysters require several years of favorable salinity conditions for reef areas to develop and populations to become self-sustaining. While there are positive effects of flood pulses, massive freshets, especially when water temperatures are high, can cause elevated levels of oyster mortality. Aside from changes to the salinity regime, the operation of the MBSD could also affect reefs through sedimentation and burial. Nutrient rich waters may also contribute to harmful algal blooms, excessive fouling of reef areas, and low oxygen events which could impact oysters and other fisheries.

Approximately 40% of the states brown shrimp landings are from the Barataria Basin, and the DEIS correctly indicates major adverse impacts on brown shrimp populations from this project. Therefore, the development of a robust, strategic operational plan may allow for limited brown shrimp harvest opportunities, with minimal impacts to land building or project

maintenance. We continue to encourage full evaluation of ways to operate the project that still allows for commercial seafood production within the basin.

Outfall management techniques should also be fully evaluated to help redirect diverted waters away from oyster production areas, or other sensitive areas, where feasible. These techniques could be utilized as part of a comprehensive adaptive management plan that may reduce impacts to seafood species.

The possibility for invasive aquatic species to be introduced, and/or expanded are concerns that are acknowledged in the DEIS. The Mitigation Plan should include sufficient resources to address invasive aquatic plants in the area of influence. Monitoring of pre-operational conditions can help assess post-operation effects and aid in adaptive management of operation in the future.

The Louisiana Wildlife Diversity Program (WDP) database indicates the presence of bird nesting colonies within one mile of this proposed project. Please be aware that entry into or disturbance of active breeding colonies is prohibited by LDWF. In addition, LDWF prohibits work within a certain radius of an active nesting colony, unless a specific variance is granted by the Secretary.

Nesting colonies can move from year to year and no current information is available on the status of these colonies. If work for the proposed project will commence during the nesting season, a field visit to the worksite to look for evidence of nesting colonies is required. This field visit should take place no more than two weeks before the project begins. If no nesting colonies are found within 1000 feet (2000 feet for Brown Pelicans) of the proposed project, no further consultation with WDP staff may be necessary. If active nesting colonies are found within the previously stated distances of the proposed project, further consultation with WDP staff will be required. Colonies should be surveyed by a qualified biologist to document species present and the extent of colonies. Additionally, LDWF should be provided with a survey report. For report requirements and restrictions for minimizing disturbance to colonial nesting birds or if at any time Louisiana Natural Heritage Program-tracked species are encountered within the project area, please contact our WDP biologists at [REDACTED].

LDWF strongly recommends that the applicant involve the local coastal and fishing communities in any mitigation planning required for this project.

If you have any questions about our comments or concerns, please feel free to contact our staff lead on this matter, Brady Carter, at [REDACTED].

Sincerely,

Patrick D. Banks

Assistant Secretary

LDWF Office of Fisheries

---

**Concern ID: 61912**

**CPRA should consider alternative flow triggers, designs, and features in the operations plan and design of the proposed MBSD Project in order to minimize impacts. CPRA should also consider adjusting diversion design elements such as triggers, peak flows, volumes, and nutrient loads over the first years of operation to minimize impacts.**

---

**These adjustments could minimize impacts to dolphins, oysters, brown shrimp, and other aquatic organisms. Some commenters suggested limits be imposed by USACE, others suggested an operating plan that is tied to specifics, while others emphasized flexibility tied to real-world experiences. CPRA should also consider alternative methods of operating the proposed MBSD Project, such as operating the diversion during winter when water levels in the basin are lower and can accept high volumes of water from the diversion.**

**Response ID: 15999**

The proposed MBSD Operations Plan can be found in Appendix F2 Preliminary Operations Plan of the Final EIS. As stated in the Chapter 4, Section 4.4.4.2.4 Sediment Transport in Chapter 4 Surface Water and Coastal Processes, sediment transported by the Mississippi River is primarily comprised of fine sediments, with higher river flows (typically occurring in the spring) suspending more coarse-grained sediment that are important in delta building (see Chapter 3, Section 3.4 Surface Water and Coastal Processes). Fine-sediment transport through the diversion would be generally proportional to water flow in the river. The intake channel was modeled and designed to divert a high sediment-to-water ratio while minimizing energy loss (to maintain flow and sediment transport through the diversion complex) and impacts on the river. The amount of sediment carried through the diversion would vary by year, depending on flow rates in the river and the corresponding variation of diversion operations. As explained in Chapter 2, Section 2.8.1.3 Project Operations in Action Alternatives Carried Forward for Detailed Analysis, the Mississippi River discharge of 450,000 cfs would be the standard operations “trigger to open the diversion for flow (above the base flow)”. Operations (with the exception of a base flow up to 5,000 cfs) would cease when the river discharge falls below 450,000 cfs or when certain emergency triggers are met (such as in advance of hurricanes or when a spill of hazardous substances occur in the river). When the Mississippi River flows exceed 450,000 cfs, the gates would be fully opened (above base flow). At river flows of 450,000 cfs, the diversion flow would be approximately 25,000 cfs, and flows would increase proportionally as the river flow increases. This ramp would continue up to maximum diversion capacity flow of 75,000 cfs when the river reaches a flow of 1,000,000 cfs.

An alternative related to operational triggers specific to sediment concentration was considered but determined not to be technically feasible or reasonable because data and technology do not currently exist to support this operational regime (refer to the Eliminated Alternatives Matrix in Appendix D2 of the EIS). According to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS, as part of the adaptive management and monitoring process, CPRA would consider potential ways to optimize diversion operations based on Project performance and success and would assess potential operational changes that may minimize impacts to basin resources where practicable after sufficient operational data become available for analysis.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and

---

the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62708**

**The release of polluted river water into the Barataria Basin would create harmful algal blooms and/or large areas of low dissolved oxygen that could negatively affect aquatic fauna including mortality of adults and juveniles that may not be able to escape impacted areas.**

**Response ID: 16086**

As discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS, the input of nutrients from the Mississippi River is generally anticipated to be beneficial to the food web, although there is an acknowledged potential for harmful algal blooms. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and well-mixed by wind and tidal action, such that it is not typically prone to stratification that promotes hypoxic (dissolved oxygen of less than 2 to 3 mg/L) conditions. Further, as discussed in Section 4.10.4.4 in Aquatic Resources, the Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below 5 mg/L on an average monthly basis; therefore, although sporadic and limited areas of low dissolved oxygen may occur, mainly in the summer months, no large or prolonged periods/layers of low dissolved oxygen are projected by the Delft3D Basinwide Model, nor anticipated based on the Barataria Basin's identification as a largely well-mixed estuary. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to Project implementation has been added to Section 4.5.5.5.2 in Dissolved Oxygen of the Final EIS.

The Monitoring and Adaptive Management (MAM) Plan (Appendix R2), which has been updated for the Final EIS in response to public comments, includes CPRA's plan to implement a monitoring program for phytoplankton species composition, including harmful

---

cyanobacterial/algal bloom species (and associated toxins) (see Sections 3.7.3.10 and 3.7.3.11 of Appendix R2 of the Final EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62757**

**Although tolerant of a wide range of salinities, oysters require several years of favorable salinity conditions for reef areas to develop and populations to become self-sustaining. While there are positive effects of flood pulses, massive freshets can cause elevated levels of oyster mortality, especially when water temperatures are high**

**Response ID: 16135**

Consistent with the commenter's statements, there would be both positive and negative effects on oysters from the salinity changes projected to occur during operation of the proposed Project, with potentially positive benefits on oysters in the lower basin, where salinity is expected to remain high enough to allow growth and survival, but low enough to minimize the potential for predation and disease. However, the overall impact of freshwater input on oysters anticipated to be major and adverse. The effects of altered temperatures and salinities on oysters during operation of the proposed Project are further discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

---

**Concern ID: 62758**

**The operation of the MBSD could also affect reefs through sedimentation and burial.**

**Response ID: 16136**

The commenter correctly notes that existing oyster reefs could be affected through sedimentation and burial during operation of the proposed Project, with the potential for adverse effects related to distance from the outfall and the current productivity of the reef (in other words, if oyster growth can outpace sediment deposition rates). The potential for oyster reef burial from sedimentation during operation of the proposed Project is further discussed in Chapter 4, Sections 4.10.4.4 and 4.10.4.5 in Aquatic Resources of the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

---

**Concern ID: 62759**

**Nutrient rich waters may contribute to excessive fouling of reef areas, which could impact oysters and other fisheries.**

**Response ID: 16137**

Chapter 4, Sections 4.10.4.4.2.2 Substrates and 4.10.4.5.2.11 Eastern Oysters in the Final EIS has been revised to discuss the potential for nutrient loading from the proposed Project to increase fouling of oyster reefs and oysters, respectively.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or

---

adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62861**

**Outfall management techniques should be fully evaluated to help redirect diverted waters away from oyster production areas, or other sensitive areas, where feasible. These techniques could be utilized as part of a comprehensive adaptive management plan that may reduce impacts, including the introduction of invasive species, on seafood species.**

**Response ID: 16670**

Based on analyses included in the Coastal Master Plan, the size and scope of ridges necessary to isolate areas in the basin from fresh water would make this solution infeasible. No related edits have been made to the Final EIS.

CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the EIS) outlines a monitoring process for salinities in the basin that CPRA would implement after operations commence. The salinity information would inform potential relocation of seed grounds to more environmentally suitable areas within the basin or the establishment of broodstock reefs in environmentally suitable areas to address larval supply. The Mitigation and Stewardship Plan (Appendix R1 to the EIS) includes oyster mitigation measures totaling \$32 million. Table 4.27-2 in Section 4.27 (Mitigation Summary) identifies which of these oyster mitigation measures are specific to the proposed Project and which are augmentation of existing or proposed programs.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the

---

Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62881**

**The Louisiana Department of Wildlife and Fisheries (LDWF) appreciated the opportunity to be included in the collaborative writing process as part of the Louisiana Trustee Implementation Group (LA TIG) during the Draft Environmental Impact Statement preparation to ensure appropriate species of concern were considered and no important recreational or commercial species were omitted from impact determinations. The commenters concur with the recommendations made by the U.S. Fish and Wildlife Service in the Draft Fish and Wildlife Coordination Act Report (Draft EIS, Appendix T and summarized in Chapter 5) and look forward to remaining a collaborative partner as this EIS is finalized. Importantly, the commenters remain committed to participating fully in the continued development of the associated Mitigation Plan and Monitoring and Adaptive Management Plan.**

**Response ID: 15739**

USACE appreciates LDWF's input into the Draft EIS and the Final EIS. CPRA and the LA TIG appreciate the agency's continued participation in the development of the Mitigation and Stewardship Plan and Monitoring and Adaptive Management Plan.

---

**Concern ID: 62894**

**Colonial nesting waterbirds are documented within 1 mile of the proposed Project and activities within a certain radius of an active colony are generally prohibited. Nesting colonies can move from year to year and no current information is available on the status of these colonies. ---

**minimizing disturbance to colonial nesting birds or if at any time Louisiana Natural Heritage Program-tracked species are encountered within the proposed Project area, please contact our WDP biologists at 225-765-2643.**

**Response ID: 16193**

As noted in Chapter 4, Section 4.9.3.2 in Terrestrial Wildlife and Habitat and Appendix R1 (Mitigation and Stewardship Plan) of the EIS, if a permit is issued, CPRA would conduct pre-construction surveys for colonial waterbirds and would provide the survey results to the LDWF for review. As further noted in Chapter 5, Section 5.3 Fish and Wildlife Coordination Act Report Recommendations of the EIS, if a permit is issued, CPRA has agreed to implement Conservation Recommendation 13 resulting from the Fish and Wildlife Coordination Act consultation with USFWS, which requires inspection and monitoring measures similar to those recommended by the commenter. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the

---

Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63834**

**The Mitigation Plan should include sufficient resources to address invasive aquatic plants in the area of influence.**

**Response ID: 16691**

The invasive aquatic plant issue raised by the commenter was considered in CPRA's Monitoring and Adaptive Management (MAM) Plan included with the Draft EIS (Appendix R2), which included monitoring for flora and fauna including potential increases in invasive species. Observed increases would then be addressed through the adaptive management structure within the MAM Plan. No related changes were made to the MAM Plan included in the Final EIS (see Appendix R2).

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

National Audubon Society

Nicholas Dixon

When I am in the coastal wetlands of Louisiana, navigating the landscape, looking for birds and other beauties, I find a spiritual connection to the earth and everything around me. The connection makes me aware of what it means to be alive - - it invigorates me hope for the future while at the same time grounds me in the present. But it also makes me more aware of the greatly chaotic era that is upon us. This chaos has shaken our ecology, making things less suitable for the common man. My connection with the earth and it's people extends to all - - some without means, or ability to make the same connections that I have with with nature. This could be caused by many things, including restrictions imposed by extensive boundaries of private property that rob us of the universal spirit. There are financial constraints and a cultural divorce from nature as well. I say all this to suggest that as restoration plans are considered, any restored land should be returned to the commons and plans should be made to ensure equal access- - I think that would help heal our splintering universal spirit. Additionally, I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and support funding the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan. Centering community needs in planned mitigation and stewardship efforts should also be a priority. Plans to help communities deal with impacts of the projects should be clearly stated and fully funded.

**If public funds are spent to acquire rights to private property in the receiving basin, then the right to free and unfettered public access must be acquired as well. Private landowners that succeed in requiring the purchase of rights such as flowage easements in order to allow a project that would prevent their land from disappearing should not be allowed to profit from this massive beneficial investment beyond sale of their property to the people in fee simple at fair market value.**

**Response ID: 15952**

Ownership of any lands created or acquired related to construction or operation of the Project would be determined in accord with current state law, including ownership of mineral rights pursuant to La. R.S. 31:149 and La. R.S. 49:214.5.5(E). Pursuant to La. R.S. 49:214.5.5(B), the Project would not create any rights of access to the public in or on private property.

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing

community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Matthew Duhon

To the U.S. Army Corps of Engineers and the Louisiana Trustee Implementation Group (LaTIG) c/o of NOAA:

Coastal Louisiana is part of my family's legacy and my own time living, working, and playing in south Louisiana is something that money cannot buy. My family has enjoyed this pleasure for generations. Unfortunately, we have immense amounts of land loss of Coastal Louisiana. This is a tragedy because I do not want my daughter's generation to lose the experience of the marshes, swamps, bayous, lakes, and everything within those ecosystems. What cannot be ignored is the Mississippi river's ability to carry sediment and build lands - this too is a generational phenomenon. A crucial component to restoring the coast is reconnecting the Mississippi River to the surrounding marshes. I support the selection of the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and support funding the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

Rev. Tyronne Edwards

My congregation is totally against the Mid- Barataria Sediment Diversion project! This project has no benefit use to our communities! It will however destroy our properties to benefit a few rich contractors. Please denial this project for the safety of our communities properties cultural way of living. The science doesn't back of need for this project to destroy our communities!

---

**Concern ID: 62778**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.
