The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

---

**Concern ID: 62794**

**This poorly planned and executed proposed Project is being pushed forward for the financial gain of politicians and contractors because taxpayer dollars are being used. Private investment dollars would entail more deliberation and a full impact study, including more natural options with less risk and more overall benefits.**

**Response ID: 16375**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance and constitutes a full impact analysis. A variety of alternatives assessed in the EIS are identified in Chapter 2 Alternatives. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore

---

habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

The LA TIG's Restoration Plan evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG has selected Alternative 1 as the LA TIG's Preferred Alternative.

Jennifer Blanchard

Mid-Barataria Sediment Diversion Public Comment

6/3/2021

by Jennifer Blanchard Earth and Environmental Scientist

The design features of the Mid-Barataria Sediment Diversion project are lacking in innovation and creativity. It is a rudimentary design that consists essentially of a gated control structure, a concrete conveyance channel, and outfall. Once again Louisiana has the opportunity to be a leader in scientific innovation and the development of sustainable solutions for combating climate change, and will let this opportunity simply pass us by.

Question 1- Please describe any innovation in the design of this sediment diversion that varies from the existing Freshwater diversions in current operation.

Question 2- Does the design of this project include any hydraulic energy conversion to electricity?

Question 3- Does the design include the use of technology for the rapid establishment of native vegetation to stabilize soils to prevent erosion from tropical storms and hurricanes?

This project will result in a collapse of the Barataria Bay estuary, having lasting impacts on the commercial and recreational fisheries of Plaquemines and Jefferson Parish with the very likely and almost certain potential to impact coastal commercial and recreational fisheries of the Barataria Basin, Gulf of Mexico, Mississippi River Delta Basin, and the Biloxi Marsh extending to the Mississippi sound. I would expect to see resulting litigation by the state of Mississippi for the impacts to the state commercial and recreational fishing industry, the local tourism industry (Hotels, restaurants, fishing charters, etc..) that rely on the seafood, beaches, and clean waters of this region. The consequence of large-scale freshwater diversion is: increased turbidity, temperature changes, excessive nutrient and pollutant loading, hypoxia, introduction of invasive species, ecological change/collapse, threats to rare/threatened/endangered wildlife.

The data to support this statement is well documented by data collected from the opening of the Bonnet Carre Spillway. In an article published in 2019 Benedict Posadas states the prolonged Bonnet Carre Spillway (BCS) opening in May-June 2011 resulted in massive oyster mortalities in the shellfish growing waters (Posadas, B. 2019). The loss of commercial oyster beds has long lasting and far-reaching effects from the dock to the restaurant and the local/regional tourism of Southeast Louisiana and Mississippi.

He also stated in this article Several recent coastal events were harmful to the oyster fishery in Mississippi (Table 1). The recent hazards which affected the coastal areas in Mississippi included the opening of the Bonnet Carr Spillway due to the Mississippi River flooding events in Jan-Feb. 2016, Mar. 2018, Feb-Apr. 2019, and May-Jun 2019 (US-ACE, 2019). Toxic algal blooms in Nov.-Dec. 2015 in the Mississippi Sound led to massive fish kills in Harrison and Hancock Counties and closure of oyster reefs from Dec. 2015 to Feb. 2016 (MDMR, 2016). Clearly demonstrating that the freshwater releases will result in detrimental effects to the commercial oyster industry, commercial fisheries, and tourism economy in Louisiana and Mississippi.

There are unforeseen risks to human health as the result of toxic algal blooms (Cyanobacteria etc..) that will be the result of excessive nutrient loading from Mississippi River freshwater. As

stated by Stumpf and Tomlinson of the National Oceanic and Atmospheric Administration, National Ocean Service, these risks may include: Amnesic Shellfish Poisoning (ASP), Neurotoxic Shellfish

Poisoning (NSP), Paralytic Shellfish Poisoning (PSP), Diarrhetic Shellfish Poisoning (DSP) and Ciguatera Fish Poisoning (CFP). Most of these syndromes occur through consumption of shellfish made toxic by ingestion of the toxin-producing phytoplankton (R.L. Miller et al., 2005). The duration of these events cannot be determined with a project of this size that has no definitive operation schedule and a project that has never been constructed at this scale.

Question 4- What Steps are being made in advance of the construction of this project to protect the sustainability of Louisianas commercial and recreational fisheries?

Table 1. Adapted from: Coastal hazards which occurred in Coastal Mississippi from Aug. 2005 to Jun. 2019 (Posadas, B. 2019).

Bonnet Carr  spillway

opening

May 9-Jun. 20, 2011

42 days

330 or 94% of BCS (USACE, 2019)

bays opened. MDMR (2011a) reported

86% oyster mortalities.

~235,000cfs

Harmful algal blooms

Nov.-Dec. 2015

MDMR (2015b, 2016) closed the oyster fishery from Dec. 2015 to Mar. 2016.

Bonnet Carr  spillway

opening

Jan. 10-Feb. 1, 2016

22 days

210 or 60% of BCS (USACE, 2019)

bays opened.

~150,000cfs

Bonnet Carr  spillway

opening

Mar. 8-30, 2018

22 days

168 or 48% of BCS (USACE, 2019)

bays opened.

~120,000cfs

Bonnet Carr  spillway

opening

Feb. 27-Apr. 11,

2019

43 days

206 or 59% of BCS (USACE, 2019)

bays opened.

~147,500cfs

Bonnet Carr  spillway

opening

May 9-Jul. 22, 2019

74 days

168 or 48% of BCS (USACE, 2019)

bays opened. MDMR (2019b) reported

>95% oyster mortalities.

~120,000cfs

The BCS has a design capacity of 250,000 cfs

The MBSD has a design capacity of Maximum flow at 75,000 cfs

Estuarine Habitat and Protected Species:

Question 5- What was the justification for the waiver of the Endangered Species act (ESA)?

The risk to the estuary and nursing ground for many species of fish, invertebrates, aquatic insects is threatened by this project.

The threat to the habitat and populations of 28 different species of marine

Mammals known to occur in the Gulf of Mexico (GOM) are at risk. These 28 species are protected under the Mammal Protection Act (MMPA). Three of these marine mammals are dolphin species that occur in the nearshore waters of the GOM.

Question 6- Is there a signed waiver of the MMPA?

There are five GOM species of sea turtle that are threatened endangered species.

The threatened and endangered species of the Gulf sturgeon would be at high risk due to their diadromous spawning in the Pearl River and Pascagoula river basins.

There are many fish species of conservation concern in the northern GOM including the: Dusky shark, Sand tiger shark, Warsaw grouper, Speckled hind (grouper), Alabama shad, Key silverside, Opossum pipefish, Mangrove rivulus. (NOAA, 2012).

Commercial Fisheries cont.:

Question 7- Will you please provide a link to a full cost benefit/economic analysis, detailing the commercial fisheries loss projections?

The GOM supports an important fisheries economy. From an economic standpoint the top five fisheries are shellfish including the: white shrimp, brown shrimp, blue crab, and eastern oyster. The second largest fishery of the US is menhaden harvest by landings (weight) (Spies, Senner, and Robbins. 2016) . The sediment diversion poses a risk to these species and the economies that are based on their harvest.

Question 8- What Pipelines traverse the sediment diversion between the back levee tie-ins and Bayou Dupont/Barataria Basin and what company/companies own these pipelines?

Summary of Comment:

I do not support this project because the current design is lacking in innovation and also due to the risks it poses to our state's extended economy through commercial/recreational fisheries and tourism based on the productivity of our estuaries. I also oppose the MBSD due to the risk associated with excessive nutrient loading and pollution that will result in harmful algal blooms (HABs). The potential risk to the three MMPA protected species of Dolphin that occur in the nearshore waters of the GOM. I ask that you kindly respond to my comment questions in your official report of the public comment response.

Respectfully,

Jennifer L. Blanchard

Earth and Environmental Scientist

Concerned citizen.

---

**Concern ID: 61908**

**Commenters suggested that there will be detrimental impacts on the tourism economy and on restaurants, which are partly dependent on fisheries in the Barataria Basin. Commenters express concerns about adverse effects on Louisiana's attractiveness as a fishing area and place for swamp tours and authentic seafood.**

**Response ID: 16238**

---

EIS Chapter 4, Section 4.16.5.2 in Recreation and Tourism describes how the MBSD Project would impact the tourism economy that is dependent on fisheries. Relative to the No Action Alternative, the proposed Project would cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts on these species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips. As described in the EIS, these changes would not substantially impact the broad tourism economy, which includes more than fisheries.

While availability of shrimp and oysters from the basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's Preferred Alternative than under the No Action Alternative.

This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

---

**Concern ID: 61918**

**Prior to and during the implementation of the proposed MBSD Project, consider ways to slow down the flow of the water in the basin for the sediment to work and to stop tidal surge, including dredging and filling, building islands, and planting vegetation to prevent erosion.**

**Response ID: 16005**

CPRA considered ways to slow down the flow in the basin during design and alternatives development of the proposed MBSD Project. Chapter 2 Alternatives of the EIS describes the various alternatives that were considered including several diversion outfall features (see Section 2.5, Step 3: Evaluation of Sediment Diversion Outfall Features). Marsh terracing is an outfall feature that was included in the reasonable range of alternatives evaluated in the EIS because these features are often used to reduce wave energy, protect eroding or recently restored shorelines, or to promote sediment deposition. However, results of the impact analysis showed mainly negligible to minor differences in impacts when terrace alternatives were compared to alternatives without terraces. If the proposed Project is implemented, CPRA would consider potential ways to optimize diversion operations including outfall management based on Project performance and success as part of the adaptive management and monitoring process.

Refer to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of

---

publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

In addition, other restoration strategies in coastal Louisiana similar to what is being proposed are being currently implemented or considered by CPRA in their Coastal Master Plan and the LA TIG through separate NRDA restoration planning.

---

**Concern ID: 61922**

**The design features of the proposed Mid-Barataria Sediment Diversion Project are lacking in innovation and creativity. Commenters suggests inclusion of innovative design, such as converting hydraulic energy to electricity and potential solutions for combating climate change, as part of the proposed Project.**

**Response ID: 16009**

CPRA states that the proposed Project would be the first of its kind and size that would create a sustained deltaic connection between the Mississippi River and the Barataria Basin.

---

**Concern ID: 62019**

**The Draft EIS fails to address extended economic and community impacts of this proposed Project. The proposed MBSD Project would not only affect localized Louisiana concerns, but would impact no less than three other Gulf Coast states including Texas, Mississippi, and Alabama.**

**Response ID: 16215**

EIS Chapter 3, Section 3.1.1 Project Area identifies the area of analysis for the EIS which includes the Barataria Basin and portions of Mississippi River birdfoot delta. For socioeconomic impacts, the EIS identifies the area of potential impacts as the 10-parish Project area due to indirect socioeconomic impacts. Most impacts would likely be concentrated in Plaquemines, Lafourche, and Jefferson Parishes, Louisiana. For commercial

---

fisheries, the proposed Project area includes two basins (the Barataria Basin and a portion of the Mississippi River Basin birdfoot delta). The proposed Project is not anticipated to have discernable effects on aquatic resources outside of the Project area. Commercial fishermen that travel to Barataria Basin to fish for species that would be adversely affected, particularly shrimp and oysters, could also be adversely affected by the proposed Project. Chapter 4, Section 4.14.4 Operational Impacts in Commercial Fisheries in the Final EIS has been revised to acknowledge this.

In response to one commenter's request for supplemental environmental review to consider potential impacts of the Project on the Texas shrimp fishery, the NOAA Technical Memorandum cited in support of that request has been reviewed. The technical memo does not confirm the comment that shrimp from the Barataria Basin migrate to Texas. While that memo does report that tagged brown shrimp released in Louisiana were recovered in Texas, those recovered shrimp were released in offshore waters south of Calcasieu Lake. Tagged shrimp that were released in the Caillou Lake estuary, which is in the Terrebonne Basin (on the western side of the Barataria Basin) were not recovered in Texas.

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)

- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62079**

**Commenters are concerned that impacts similar to those caused by the fresh water from Bonnet Carré Spillway openings would affect fisheries in the Barataria Basin with the proposed MBSD Project.**

**Response ID: 16244**

---

The Project area for the MBSD EIS includes the Barataria Basin and the Mississippi River birdfoot delta. Existing operations and influences of rivers and diversions, including but not limited to the Bonnet Carré Spillway, were incorporated into the baseline conditions of the No Action Alternative and action alternatives assessed in the Draft EIS, Chapter 4 Environmental Consequences, Sections 4.2 through 4.24. Reasonably foreseeable future (but not existing) diversions, such as the Mid-Breton Diversion, were analyzed for impacts in combination with existing diversions and the proposed MBSD diversion in Chapter 4, Section 4.25 Cumulative Impacts.

A summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and to discuss their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS. Note that the Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological purposes.

---

**Concern ID: 62091**

**Commenters requested that detailed information on the full cost/benefit analysis regarding commercial fisheries be provided.**

**Response ID: 16251**

NEPA does not require that the EIS contain a cost-benefit analysis unless it is relevant to the agency's decision. USACE generally assumes that a permit applicant has done its own economic evaluation of a proposed project. The EIS evaluates potential adverse as well as potential beneficial impacts to commercial fisheries in Chapter 4, Section 4.14 Commercial Fisheries.

Consistent with OPA regulations, in the LA TIG's Final Restoration Plan the LA TIG has evaluated a range of alternatives based on multiple criteria including the cost to carry out each alternative, the likelihood of success, the extent to which future injury would be prevented and avoid collateral injury, the extent of benefits to more than one natural resource, and the effect on public safety. This analysis can be found in Section 3 of the Restoration Plan.

---

**Concern ID: 62172**

**The commenter questioned what pipelines would traverse the sediment diversion between the back levee tie-ins and Bayou Dupont, which is located in the Barataria Basin, and what companies own these pipelines.**

**Response ID: 16406**

The commenter's concern regarding existing pipelines that would be impacted by the diversion were considered in the Draft EIS. The EIS describes pipelines currently known to be present in the Project area based on publicly available pipeline data sources in Chapter 3, Section 3.2.3 Mineral Resources, including ownership of those pipelines. The EIS describes potential impacts to existing pipelines in Chapter 4, Section 4.2.3 Mineral Resources.

---

**Concern ID: 62197**

**Commenter asked what the justification was for the waiver of the Endangered Species Act (ESA).**

**Response ID: 15744**

---

No waiver of the Endangered Species Act was granted for this proposed Project. USACE initiated formal ESA Section 7 consultation with NMFS on February 24, 2021 and USFWS on July 2, 2021, including submission of a Biological Assessment to each of the Services which analyzes the potential impacts to ESA-listed species. This Biological Assessment, as well as the agencies' response in the form of a Biological Opinion, can be found in Appendix O (Biological Assessment and Biological Opinion) of the Final EIS.

---

**Concern ID: 62198**

**Commenter asked if there is a signed waiver of the MMPA.**

**Response ID: 15745**

Yes; the signed waiver can be found in Final EIS Appendix S (Compliance Documentation).

Additional information about the MMPA waiver can be found at

<https://www.fisheries.noaa.gov/action/marine-mammal-protection-act-waiver-select-louisiana-coastal-master-plan-projects>.

---

**Concern ID: 62300**

**The diversion would cause harmful algal blooms which have unforeseen risks to human health, including Amnesic Shellfish Poisoning (ASP), Neurotoxic Shellfish Poisoning (NSP), Paralytic Shellfish Poisoning (PSP), Diarrhetic Shellfish Poisoning (DSP) and Ciguatera Fish Poisoning (CFP).**

**Response ID: 15813**

The impacts raised by the commenters have been considered in the Draft EIS. As discussed in the EIS, Chapter 4, Sections 4.5.5.3 and 4.5.5.4 in Surface Water and Sediment Quality, increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations. Vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin than in the river and reaching the Gulf through Barataria Bay.

Section 4.10.4.4 in Aquatic Resources notes that an increased potential and frequency of phytoplankton blooms would be likely within the Project area, but whether or not these blooms would become harmful algal blooms cannot be definitely determined. A reference to Section 4.10 is included in Section 4.5.5.3 in Surface Water and Sediment Quality of the Draft EIS. A reference to Section 4.10 Aquatic Resources has been added to Section 4.5.5.4 (Phosphorus) of the Final EIS. Clarifying language has been added to Sections 4.5.5.3, 4.5.5.4, and 4.25.5.4 in Cumulative Impacts.

Section 4.14 Commercial Fisheries has been updated in the Final EIS to discuss the National Shellfish Sanitation Program and the Louisiana Department of Health's oversight of shellfish harvesting in order to prevent harvest of oysters that may contain unsuitable levels of fecal coliform or toxins harmful to human health. Additionally, Appendix R2 in the Final EIS includes a Monitoring and Adaptive Management (MAM) Plan that describes monthly fecal coliform monitoring (Section 3.7.5.1) and periodic sampling for Contaminants of Concern in fish, shellfish, and wildlife (Section 3.7.3.23).

Additionally, as described in Appendix R2 CPRA's MAM Plan of the EIS, Section 3.7.3.11, CPRA is proposing to monitor for Harmful Cyanobacterial/Algal Bloom Toxins in Barataria

Surface Waters. Samples will be collected monthly and additional discrete sampling will be done as needed in response to observations of presence of cyanobacterial and/or eukaryotic algal species associated with harmful algal bloom. Filter feeding fish may also be analyzed for toxins in fish tissue.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62771**

**The estuary provides a food source and nursing grounds for many species of fish (including migratory species), invertebrates, aquatic insects, which are threatened by this proposed Project.**

**Response ID: 16149**

The impacts to the Barataria Basin from the proposed Project were discussed throughout Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS, which included both adverse and beneficial impacts on area flora and fauna, based on the specific life histories and habitat preferences.

---

**Concern ID: 62777**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).**

**Response ID: 16359**

---

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

---

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62790**

**Diversion of polluted and nutrient-laden waters into the Barataria Basin would result in harmful algal blooms (HABs) and expansion of the dead zone.**

**Response ID: 16371**

---

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA's Mississippi River/Gulf of Mexico Hypoxia Task Force "Hypoxia 101" webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone "water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen" (<https://www.epa.gov/ms-hf/northern-gulf-mexico-hypoxic-zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.>)

Dissolved oxygen concentrations associated with the Applicant's Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.5.2 in Dissolved Oxygen of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of

the EIS. A reference to this section has been added to Sections 4.5.5.3.2 and 4.5.5.4.2 of the Final EIS. Finally, the EIS acknowledges the potential for up to major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) in the Barataria Basin during Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63090**

**A commenter requests an explanation of steps that will be undertaken before construction to protect sustainability of commercial and recreational fisheries.**

**Response ID: 16513**

The commenter's requested explanation of the steps that will be undertaken before construction of the Project to protect fisheries was addressed in CPRA's Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS). For example, CPRA's oyster mitigation program allocates a portion of the \$15 million in public and private seed ground enhancement funding to providing enhancement in areas adjacent to Barataria Basin prior to commencement of Project operations and to reimburse for cultch or spat/shell to leaseholders choosing to rehabilitate leases, or create new leases, in Lower Barataria Basin. In total, \$54

---

million has been allocated for mitigation and stewardship measures to address impacts to commercial and recreational fisheries. In addition, details on CPRA monitoring activities pre- and post-operations can be found in the MAM Plan (Appendix R2 to the Final EIS). In response to comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63122**

**There are five species of sea turtle that are listed as threatened or endangered in the Gulf of Mexico.**

**Response ID: 16273**

The commenter correctly notes that five federally listed sea turtles occur in the northern Gulf of Mexico, as identified in Chapter 4, Section 4.12 Threatened and Endangered Species, Table 4.12-1 of the EIS; therefore, no related edits have been made to the Final EIS.

---

**Concern ID: 63123**

**The Gulf sturgeon would be at high risk due to their diadromous spawning in the Pearl River and Pascagoula river basins.**

**Response ID: 16274**

---

The proposed Project is not anticipated to have discernable effects on aquatic life outside of the Project area, which includes the Barataria Basin and the Mississippi River birdfoot delta (particularly for biological resources), as defined in Chapter 3, Section 3.1.1 in Introduction of the EIS. As noted in Section 3.12.1 in Threatened and Endangered Species and Figure 3.12-1 of the EIS, the Gulf sturgeon's range is outside the proposed Project area, and the species is therefore not carried forward for an evaluation of impacts from the proposed Project in Chapter 4 Environmental Consequences. Because the issue raised by the commenter was addressed in the Draft EIS, no related edits have been made in the Final EIS.

---

**Concern ID: 63147**

**Commenter requests information on steps being taken before Project construction to protect commercial and recreational fisheries.**

**Response ID: 16529**

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) contained information on fisheries mitigation, including mitigation and stewardship measures that would be undertaken before and during Project construction. In response to public comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS, including providing additional detail on several fisheries mitigation and stewardship efforts that would be undertaken before Project construction, including funding for public and private oyster seed ground enhancement, funding for alternative oyster aquaculture, marketing, shrimp vessel and facility improvements, workforce and business training, and subsistence fishing access (see Appendix R1 to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

---

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63152**

**There are many fish species of conservation concern in the northern Gulf of Mexico including the dusky shark, sand tiger shark, Warsaw grouper, speckled hind (grouper), Alabama shad, key silverside, opossum pipefish, and mangrove rivulus. (NOAA 2012).**

**Response ID: 16154**

The lists of special status species discussed in the Essential Fish Habitat Assessment (Appendix N2 of the EIS) and Chapter 4, Section 4.12 Threatened and Endangered Species were developed in consultation with NMFS and include those species anticipated to incur potential impact from construction or operation of the proposed Project. As these species were not identified as species of concern for the Project during the EFH and ESA consultations, they are not discussed in the EIS. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

**Correspondence ID:40509**

Matthew Tesvich

Im currently 28 years of age. I am a 4th generation oyster fisherman on my Dads side of the family tree. Ive been off and on in the oyster business since I was 16 years old, but full-time captain since 2014.

I know Ive only been fishing Oysters a small fraction of time compared to some of these old timers, but I feel Ive reached a point of understanding and appreciation for this business. Ive seen what makes oyster reefs successful and also what makes them crumble(some explained/some unexplained). With that being said, although oysters are very tough organisms, Ive seen what fresh water does to them.

Fresh water is arguably the worst thing an oyster can encounter. We had a record high river in 2019 which caused oysters to start dying as far north as Bay Adams and No Mans Land. My dad, Kuzma Tesvich Jr., said hes never seen that his entire life. There was no strong storm that pushed the water in, there were regular days with a regular summer breeze. THIS WATER TRAVELED ALL THE WAY FROM VENICE ON ITS OWN. A marine biologist had checked the water in north Bay Adams and the salinity was 0 parts per million. ZERO. Bay Adams, a place that is 20-25 miles north of Venice consisted of 100% river water for one full week. In just that one week, some fishermen saw as much as 40% of their oyster reefs perished. This was the main example I wanted to cover in terms of what freshwater can do to oyster reefs. I could go in extreme detail about other scenarios but I would be here all day.

But now yall want to put a giant diversion 20 miles north of Empire? I am no biologist or scientist, but after reading the above information it doesnt take either one of those to see that every oyster reef between Myrtle Grove and Venice will be nonexistent if this diversion is built.

The state is now saying things like mid Barataria diversion benefits the seafood industry. This is a misleading/pathetic statement in hopes of swaying the opinion of anybody ignorant on the topic. Sure, it would help crawfish and gators, and the lily pads will be flourishing, BIG DEAL! It will completely wipe out the shrimp, oyster, and crab populations! Oh, and say goodbye to the dolphins(go look up how many dolphins were killed by the fresh water in 2019). And this, the state knows, so somehow they were able to get the marine mammal act waived, an act that prevents any type of operation that will kill marine mammals(not sure on the details but again look this up).

The fact that they are saying this will build land is absolutely ridiculous, go look at Mardi Gras pass and Caernarvon. It didnt build land, it grew lily pads, are lily pads great hurricane protection? You tell me. I forgot to mention the charter fishing industry as well, say goodbye to speckled trout between Venice and Myrtle Grove! Yeah you can still catch them if you travel maybe 50 miles. But back to building land. Sure the diversion will move some sediment, sediment that will settle and have to be what? DREDGED!! This sediment will build up in certain areas and will still have to be suction dredged and relocated to the desired location. How about we only dredge and cut out the billions of gallons of polluted river water? The mouth of the River is constantly being dredged and what do they do with the sediment? Dump it off the continental shelf, geniuses!! Take that sediment and build/add to islands. Want more islands? MAKE THEM! They are hoping this will build land in 40 YEARS, there is no proof. Do you want a barrier island thats bulletproof? MAKE IT! And put it exactly where you want it! Make islands TOMORROW by dredging, and not devastating the seafood industry!

On another note, I get the whole natural approach, I really do. ~Build these estuaries in their natural locations from hundreds of years ago.~ but Ive got some news for you. We pissed in mother nature s natural face years ago when we built the levee system. We cannot go back in time. Whats the most natural thing we could do? Completely bus to Levi is wide open, let all the land from Belle Chase down to Venice naturally flood six months out of the year. Sounds crazy right? Thats because it is . Society/businesses has developed and is thriving. Thats also relocating thousands of people. Is that really a possibility? Lower Plaquemines has are commercial fishing, recreational fishing, and a weak oil industry. So we want to wipe out the most successful form of revenue in lower Plaquemines, the only things causing it to still thrive? And not just in forms of money, but lifestyles, generations of businesses that have been passed down, thousands of people and families that have fully invested their lives into this and thats all they know. Charter fishing, lodging, shrimp, oysters, crabs, etc. Wipe out all these for a hope and a prayer that good solid land will magically create these dream barrier islands 40 years from now and flourish, what bizarre way of thinking. Wake up!

And one more thing, the most common response I hear from diversion supporters is Yes, the business will get harder, the tough will survive. You just have to move your reefs out further..... The statement move your reefs out further is absolutely absurd and obviously said by people that know nothing about oyster reproduction/cultivation/maintenance. A successful oyster reef is successful because of the years of cultivating and maintenance. I can speak for 20 minutes JUST on oyster reproduction, but I wont do that. Very rarely do we attempt to create a reef on new sea bottom, and if we do, its very rare that we see success or even a return thats worth our while. My own father(someone who has started to give up on fighting the diversions because the states going to do what the states going to do) has attempted to harness this move your reefs further mentality. Hes trying to jump the gun a little bit and bought oyster leases in Fox Bay close to Mississippi(in preparation of the Breton Sound diversion, which is also in the works). For the last 4 consecutive years, he planted 1 hopper barges of limestone per year. So 4 hopper barges, 1800 tons per barge, 7,200 tons total, \$60,000 per barge, \$240,000 total. The oysters did not spat like we planned. My dad took a risk, made a serious investment, and the last 2 years we have not even sold 600 bushels of oysters from that lease. The return on this \$240,000 investment has been around \$30,000. We will be very lucky to sell 1,200 - 1,500 bushels from this entire lease.

My point? You cant just move oysters reefs. It doesnt just happen. And if it does happen, the expenses alone would leave you with nothing. So that argument/response is becoming stale. Im sure there are a lot of points that skipped my mind, I was sitting here trying to send this before noon. Yes I couldve spoke about many more things.

DO THE RIGHT THING, dredge DONT divert!

Sincerely,

A pissed-off fisherman

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land**

---

**immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve

---

and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process. CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62639**

**The proposed Project is unlikely to succeed because similar types of projects have failed to build land, and have caused a range of other issues, like destroying habitat, exacerbating flooding, and reducing water quality. Specific examples of similar, problematic projects include the Mississippi River Gulf Outlet, Bonnet Carré Spillway, Caernarvon Freshwater Diversion, Davis Pond, West Bay, Baptiste Collette, Fort St. Philip, and Cubits Gap. In fact, data show that the Caernarvon Diversion in particular was unable to show sustained land gains in the face of Hurricane Katrina-driven losses in wetland habitat (Underwood 1994, Kearney et al. 2011). Davis Pond has seen increased land loss inside the diversion compared to a reference area (Couvillion et al. 2017). Fort St. Philip has lost large areas of wetlands (Suir et al. 2014). While the Atchafalaya River is building land in the Atchafalaya and Wax Lake Deltas, the Atchafalaya River carries more sediment than the Mississippi River does currently (Blum and Roberts 2009), and more of the Atchafalaya River is diverted to each of these deltas and marshes farther south. Additionally, one study identified poor performance of diversions due to many periods of inoperation due to socioeconomic uncertainties (Caffey et al. 2014).**

**Response ID: 16631**

The issues raised by the commenters were considered in the Draft EIS. The EIS states in Chapter 2, Section 2.1.1 Overview of Sediment Diversions, that CPRA considered information

---

from other diversions in its assessment of the Project alternatives, but because the projects mentioned by the commenters had been designed to discharge primarily water, not sediment, they are not fully comparable to the proposed Project. As explained in the EIS Chapter 4, Section 4.1.3 (Environmental Consequences, Overview of Delft3D Basinwide Model for Impact Analysis), Delft3D Basinwide Modeling software was used to assess impacts of the Project on hydrology, land gains and losses, water quality, and vegetation in the Barataria Basin and birdfoot delta. Using standard professional practice, this physics-based model was validated to the West Bay Sediment Diversion. The West Bay Sediment Diversion is useful for validating the physical processes of erosion and deposition of sediment because it, like the proposed MBSD Project, is a sediment diversion that extracts relatively more sediment in the river. The other diversions cited were designed to primarily deliver water, not sediment, and are less useful comparisons.

The West Bay Sediment Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, "A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that diversions do not lead to appreciable sediment accumulation" (Kolker, A. S., Miner, M. D. and Weathers, H. D. 2012. Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, *Estuarine, Coastal and Shelf Science*, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005> ).

Comparing diversions outside of physics-based numerical modeling has limited value because diversions and receiving environments often exhibit unique behaviors that correlations do not account for. For that reason, the physics-based Delft modeling, even with its limitations and uncertainties, is a better predictor than anecdotal comparisons to Fort St. Phillip or other sites. Uncertainties associated with the validation and application of the Delft3D Basinwide Modeling conducted for the proposed Project were assessed by the West Bay application, sensitivity tests, and by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in EIS Appendix E Delft3D Modeling and incorporated into the EIS conclusions throughout Chapter 4 Environmental Consequences. While most citations mentioned by commenters were already included in the Draft EIS, the Final EIS has been edited to include Caffey and Petrola (2014) to Chapter 4, Section 4.6.5.1.2.4 Land Accretion.

The likelihood of success of the Project and information from other freshwater diversions was also considered in the LA TIG's Draft Restoration Plan, Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. The proposed MBSD Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the geomorphological features of the Lower Mississippi River as of 2012, including data from the referenced projects. All citations referenced by the commenters were included in the Final EIS and were considered by the LA TIG in the Final Restoration Plan.

**Concern ID: 62696**

---

**Oysters are not well adapted to prolonged periods of low salinity and would experience higher mortality and lower reproductive success as a result of the proposed Project.****Response ID: 16075**

The commenter correctly notes the impacts on oysters from low salinity. As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the Draft EIS, operation of the proposed Project would result in a permanent, major adverse impact on oysters, due in large part to decreases in salinity.

To address Project impacts, CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). Mitigation measures aimed at oyster impacts include establishment of new oyster seed grounds in appropriate areas of the basin, enhancing existing public and private seed ground, enhancement of broodstock reefs, and funding to support off-bottom oyster culture.

Although not being implemented to mitigate the effects of the MBSD, the LA TIG also continues to address oil spill related injuries to oysters through various non-Project-related restoration/fishery improvement actions, including: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, and the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS (Appendix R) were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

---

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62779****Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.****Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62823**

**The commenter notes that the State got a waiver from the MMPA, which normally prohibits an operation that will kill marine mammals.**

**Response ID: 16393**

Chapter 3, Section 3.11.1 Marine Mammals in the Northern Gulf of Mexico of the Final EIS has been revised to discuss the Marine Mammal Protection Act waiver that was issued for the proposed Project.

---

**Concern ID: 62967**

**Commenters noted that moving reefs would not help oyster fishers because it takes years to develop a productive oyster reef.**

**Response ID: 16535**

A productive oyster reef would take years to develop, which may include finding a suitable location for a new reef, establishing suitable substrate for oyster attachment and growth, and oyster growth to sack size (requiring about 18 months, or less if seed oysters are placed; see Chapter 3, Section 3.10.5 and Chapter 4, Section 4.10.4.5 of the EIS). Section 4.14.4.2.3 Eastern Oyster Fishery of the Final EIS has been updated to identify the timeframe for establishment for new oyster reefs. CPRA's oyster mitigation strategies are focused on establishing a sustainable oyster fishery for the long term, not on alleviating the short-term impacts to individual oyster growers. CPRA's oyster mitigation program allocates funding for public seed ground establishment, public and private seed ground enhancement prior to and after commencement of Project operations, creation or enhancement of broodstock reefs, and reimbursement for cultch or spat/shell to leaseholders choosing to rehabilitate leases. See the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

---

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Commenter

As a resident of Louisiana, of course I would like to see the ever quickening coastal erosion of our state be halted and even reversed. However, I question whether the proposed Mid-Barataria Sediment Diversion project is the best option for the area involved. Several communities will be put into jeopardy economically and physically. This is due in large part to the influx of fresh water that will kill off the brown shrimp and other staple marine life that serve as the main income generator of these fishing communities, and as an additional consequence will limit the amount of seafood they catch to bolster their own food stores. Water levels in these same communities will pose more of a flood risk, despite the goal of such projects being to bolster wetlands and thus keep surge down. Yes, they are different phenomena, but the contradiction stands.

It is also my understanding that the proposed means to restore the wetlands superseded an option that several of the communities involved, namely in Plaquemines Parish, felt was a better choice. I believe this shows a disregard for the opinions of those most effected. On that note, several indigenous peoples of the state of Louisiana, many of whom are experiencing losses of important cultural sites and historic territories due to erosion, were not consulted. The fact that Louisiana has recognized many of these Native nations even if the federal government does not (often due to the interference and influence of the oil lobby) implies an obligation to consult with all indigenous peoples in the area when such a project is proposed.

And as to the oil lobby, the Deepwater Horizon spill and subsequent dispersant usage were listed as a main cause of the heightened pace of wetland destruction that now requires intervention. This is just the leak that has garnered the most attention but other leaks continue uncontained, and have done so for years. The actions of oil companies are a major contributor to land loss in Louisiana. After all, state laws allow pipelines and oil company interference in waterways that were once wetlands as soon as they're so many inches under water. Perhaps, instead of accepting a pittance of what the oil lobby makes off the destruction of the state (and deaths of its people in Cancer Alley) as a donation to wetland restoration, Louisiana and federal legislators/regulators alike should require oil companies to pay back in full this debt for land and life and demand that better methods be devised to prevent any further damage. With such an amount raised solutions could be found that benefit all residents, not just some.

---

**Concern ID: 62406**

**The actions of oil companies are a major contributor to land loss in Louisiana. Perhaps, instead of accepting a pittance of what the oil lobby makes off the destruction of the state (and deaths of its people in Cancer Alley) as a donation to wetland restoration, Louisiana and Federal legislators/regulators alike should require oil companies to pay back in full this debt for land and life and demand that better methods be devised to prevent any further damage.**

**Response ID: 15857**

Comment noted. The Draft EIS recognizes causes and impacts of coastal land loss (see EIS Chapter 3, Section 3.6.2 Wetland Loss)

---

**Concern ID: 62499**

---

**Several Indigenous Peoples of the State of Louisiana are already experiencing losses of important cultural sites and historic territories due to erosion. They should have been consulted. The commenter understands there is no legal obligation, but state-recognized Tribal Nations like the United Houma Nation, Pointe Aux Chien Indians, and the Isle de Jean Charles Band of the Biloxi-Chitimacha-Choctaw-Muskogee Creek Indians would be MOST affected by this sediment diversion; so it stands to reason that there is an ethical obligation to invite and collaborate with their council. The fact that the state has recognized many of these Native Nations even if the federal government does not implies an obligation to consult with all Indigenous Peoples in an area that would be impacted by a state-sponsored project.**

**Response ID: 16457**

The USACE acknowledges the commenter's concern about ensuring that all potentially affected Tribal Nations be invited to participate in the Section 106 consultation process. As indicated in Chapter 4, Section 4.24 Cultural Resources of the Draft EIS, cultural resources consultations have been conducted in accordance with Section 106 of the NHPA. Appendix K Cultural Resources Information of the EIS includes the PA negotiated between the Section 106 consulting parties regarding the proposed Project. The PA explains the outreach conducted by the USACE to Tribal communities, identifies the Tribal Nations that decided to participate in the Section 106 Process, and explains that the USACE has and would continue to consult with any interested Tribal Nation who may have not yet requested to consult.

---

**Concern ID: 62778**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the

---

property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

**Correspondence ID:40513**

Mary Kass

No to the 2 Billion diversion plan .

According to the MS River Delta Organization, which is pro diversion, it admits "that there will be changes to the basin" but glosses over or fails to inform the public of the alarming loss of fisheries, including massive loss of dolphin life that are likely to result, plus the fact that the storm protection will be minimal and not long lasting. Typically, they use terms to confuse the public. "Freshwater" diversion is misleading when in fact, it will be a dirty river diversion, just consider the massive dead zone in the Gulf. Louisiana's economy relies heavily on the seafood industry not to mention tourism of which being a "Sportsman's Paradise" is key. The dirty water diversion will negatively affect our economy and thus trickle down to the quality of life here in Louisiana..

---

**Concern ID: 61819**

**Commenters expressed concern that the proposed Project would have adverse impacts on Barataria Basin's water quality, wetlands, fisheries, recreational uses, and eroding coastlines due to chemicals, oil and hazardous waste, and/or pollutants in the Mississippi River that would be routed to the Barataria Basin via the proposed diversion.**

**Response ID: 16429**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality of the Draft EIS, the segment of the Mississippi River where the proposed diversion river intake structure would be located (subsegment LA070301\_00) fully supports its designated uses. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. LDEQ's water quality assessment indicates that regulated substances are not present in concentrations that would cause a water quality impairment at the location of the intake structure. In response to this concern expressed by commenters, a new subsection has been added to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of nearby industrial facilities on river water routed to the basin during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills from Industrial Sites.

As described in the EIS, Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the

probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:40514**

Shannon Gross

These diversion projects are going to ruin our communities and the areas that produce more than 90% of the US seafood. There are better ways to refill the land in these marshes for storm protection. Dredge!

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional

---

Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRa and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62077**

**The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.**

**Response ID: 16242**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRa has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRa has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62009**

---

**The negative socioeconomic consequences would devastate southeast Louisiana, destroy people's livelihoods, displace people living near the diversion, and destroy property in the areas impacted by the proposed MBSD Project.**

**Response ID: 16207**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana, including impacts on population, property values, and community cohesion. As noted in these sections, the proposed Project would have both beneficial and adverse socioeconomic impacts on the people and communities within the Project area. Minor to moderate, permanent adverse socioeconomic impacts are expected to occur near the immediate outfall area outside of flood protection. Minor to moderate, permanent, beneficial socioeconomic impacts are expected to occur in the west bank New Orleans area north of the diversion. Moderate to major, beneficial, temporary impacts from job creation and economic activity in the proposed Project area are anticipated. In addition, the Socioeconomics Technical Report in Appendix H1 provides additional details on these projected effects.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the DWH oil spill.

The commenters' concern regarding the potential impacts of the diversion were considered by CPRA and the LA TIG in developing the Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included mitigation to address and offset some of the projected impacts of the Project on fisheries and surrounding communities outside levee protection including providing structural mitigation and stewardship measures for increased water levels that are projected to result due to the Project, such as raising roads or improving bulkheads. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

In communities south of the Project site outside of federal levee protection where the proposed Project is projected to cause increased water levels, CPRA plans to take one of two approaches. In Myrtle Grove, CPRA is planning to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision. By improving this bulkhead, CPRA would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions without the Project. See Table 1 in the Final Mitigation and Stewardship Plan for more details. CPRA plans to acquire a temporary right-of-way to permit improvement of the bulkhead, voluntarily or through eminent domain if necessary, from the property owners in the Myrtle Grove Marina Estates Subdivision.

---

In other communities south of the Project site outside of federal levee protection, from Woodpark south to the communities of Grand Bayou and Happy Jack, CPRA plans to elevate the portions of public roads outside of levee protection that provide access to each of these communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently

contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)

Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)

Establishing new oyster seed grounds (\$4 million allocation)

Enhancing public and private oyster grounds (\$15 million allocation)

Enhancing oyster broodstock reefs (\$4 million allocation)

R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)

Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62078**

**The proposed MBSD Project would cause the loss of Louisiana shrimp, oyster, crab and finfish production which would impact the seafood based supply chain of southern Louisiana, including corresponding impacts on restaurants in New Orleans and southern Louisiana.**

**Response ID: 16243**

The impacts raised by the commenters were considered in the Draft EIS. The EIS acknowledges in Chapter 3, Section 3.14.7 in Commercial Fisheries that the seafood industry represents a major source of jobs and income in Louisiana, which includes commercial harvesters, seafood processors and dealers, seafood wholesalers and distributors, and retail sales. Chapter 4, Section 4.14 Commercial Fisheries discusses regional economic impacts and community impacts on the shrimp, oyster, crab, and finfish fisheries, noting that communities with a high reliance on these landings may be most heavily impacted, and that

---

indirect effects may include impacts to fish license holders, crew, dealers, suppliers, and seafood processors. While availability of shrimp and oysters from the basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's Preferred Alternative than under the No Action Alternative. This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects

without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Center for sustainable design associates

Pete Melby

We oppose any diversion of freshwater that does not conform to the salinity cycles needed by oysters in the Mississippi Sound. Restoration of water quality variables required by oysters is paramount in any efforts proposed by the USACOE.

---

**Concern ID: 62750**

**The commenter opposes any diversion of fresh water that does not conform to the salinity cycles and water parameters needed by oysters in the Mississippi Sound.**

**Response ID: 16128**

Comment noted. The proposed Project is not anticipated to have discernable effects on aquatic life outside of the Project area, which includes the Barataria Basin and the Mississippi River birdfoot delta (particularly for biological resources), as defined in Chapter 3, Section 3.1.1 in Introduction of the EIS; therefore, negligible to no impacts on oysters in the Mississippi Sound are anticipated from the construction and operation of the proposed MBSD Project. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

---

**Correspondence ID:40517**

J Hufft

Please consider suction dredge of Mississippi River beneficial material. South Pass, Pass a Loutre, Tiger Pass and other tributaries to pump the river sand material through pipelines. This material can be delivered up to 25 - 30 miles upriver and could be used to build a series of ridges that can be planted with sustainable foliage.

Each ridge and elevated area will reduce salt water intrusion and storm surge. Please research prior dredging of South Pass and how that material was directed to build land mass some 25 years ago that remains today.- near Head of Passes on the east side.

Also, research the diversion that was built south of Venice on the west side; that removal of river batture and hardened river bank that previously kept the river flowing was a tragedy and washed away many acres of land into the GOM above Southwest Pass.

Thank you, Jim Hufft

---

**Concern ID: 61982**

**Consider using suction dredge of Mississippi River beneficial material in South Pass, Pass A Loutre, Tiger Pass and other tributaries to pump the river sand material through pipelines. This material can be delivered up to 25 - 30 miles upriver and could be used to build a series of ridges that can be planted with sustainable foliage.**

**Response ID: 15980**

This alternative as presented, specifically dredging the passes and other tributaries and creating marsh, would not meet the goals and objectives as stated in the purpose and need in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives of the EIS. Similar to marsh creation alternatives (as described in Chapter 2, Section 2.3.5 Large-Scale Marsh Creation), it would not deliver enough fresh water, nutrients, and fine sediments to sustain existing and created wetlands beyond the marsh creation area and over the long term would require repeated lifts and maintenance through placement of additional dredged material to maintain a marsh elevation despite subsidence and sea-level rise. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Other similar restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan, which will be updated in 2023, and by the LA TIG through Natural Resource Damage restoration planning.

---

**Concern ID: 62639**

**The proposed Project is unlikely to succeed because similar types of projects have failed to build land, and have caused a range of other issues, like destroying habitat, exacerbating flooding, and reducing water quality. Specific examples of similar, problematic projects include the Mississippi River Gulf Outlet, Bonnet Carré Spillway, Caernarvon Freshwater Diversion, Davis Pond, West Bay, Baptiste Collette, Fort St. Philip, and Cubits Gap. In fact, data show that the Caernarvon Diversion in particular was unable to show sustained land gains in the face of Hurricane Katrina-driven losses in wetland habitat (Underwood 1994, Kearney et al. 2011). Davis Pond has seen increased land loss inside the diversion compared to a reference area (Couvillion et al.**

---

2017). Fort St. Philip has lost large areas of wetlands (Suir et al. 2014). While the Atchafalaya River is building land in the Atchafalaya and Wax Lake Deltas, the Atchafalaya River carries more sediment than the Mississippi River does currently (Blum and Roberts 2009), and more of the Atchafalaya River is diverted to each of these deltas and marshes farther south. Additionally, one study identified poor performance of diversions due to many periods of inoperation due to socioeconomic uncertainties (Caffey et al. 2014).

#### **Response ID: 16631**

The issues raised by the commenters were considered in the Draft EIS. The EIS states in Chapter 2, Section 2.1.1 Overview of Sediment Diversions, that CPRA considered information from other diversions in its assessment of the Project alternatives, but because the projects mentioned by the commenters had been designed to discharge primarily water, not sediment, they are not fully comparable to the proposed Project. As explained in the EIS Chapter 4, Section 4.1.3 (Environmental Consequences, Overview of Delft3D Basinwide Model for Impact Analysis), Delft3D Basinwide Modeling software was used to assess impacts of the Project on hydrology, land gains and losses, water quality, and vegetation in the Barataria Basin and birdfoot delta. Using standard professional practice, this physics-based model was validated to the West Bay Sediment Diversion. The West Bay Sediment Diversion is useful for validating the physical processes of erosion and deposition of sediment because it, like the proposed MBSD Project, is a sediment diversion that extracts relatively more sediment in the river. The other diversions cited were designed to primarily deliver water, not sediment, and are less useful comparisons.

The West Bay Sediment Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, "A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that

diversions do not lead to appreciable sediment accumulation” (Kolker, A. S., Miner, M. D. and Weathers, H. D. 2012. Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, Estuarine, Coastal and Shelf Science, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005> ).

Comparing diversions outside of physics-based numerical modeling has limited value because diversions and receiving environments often exhibit unique behaviors that correlations do not account for. For that reason, the physics-based Delft modeling, even with its limitations and uncertainties, is a better predictor than anecdotal comparisons to Fort St. Phillip or other sites. Uncertainties associated with the validation and application of the Delft3D Basinwide Modeling conducted for the proposed Project were assessed by the West Bay application, sensitivity tests, and by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in EIS Appendix E Delft3D Modeling and incorporated into the EIS conclusions throughout Chapter 4 Environmental Consequences. While most citations mentioned by commenters were already included in the Draft EIS, the Final EIS has been edited to include Caffey and Petrola (2014) to Chapter 4, Section 4.6.5.1.2.4 Land Accretion.

The likelihood of success of the Project and information from other freshwater diversions was also considered in the LA TIG’s Draft Restoration Plan, Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. The proposed MBSD Project’s goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the geomorphological features of the Lower Mississippi River as of 2012, including data from the referenced projects. All citations referenced by the commenters were included in the Final EIS and were considered by the LA TIG in the Final Restoration Plan.

---

**Concern ID: 62784**

**Prior or proposed diversions and diversion-like projects (including the Caernarvon Diversion, MRGO, Mardi Gras Pass, Maurepas Bonnet Carré Spillway openings) did not work or caused adverse impacts on area resources.**

**Response ID: 16366**

The commenter’s concern regarding the effectiveness and adverse impacts of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the Caernarvon Diversion, MRGO, Mardi Gras Pass, and Bonnet Carré Spillway, is available in Appendix U of the Final EIS. The Maurepas Diversion is subject to an ongoing NEPA analysis, which is anticipated to be finalized in 2022.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG’s Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The referenced projects all had unique goals, and, where goals existed, each of those projects have achieved their goals. Those achievements increase confidence

in the ability of the LA TIG to set goals and select approaches appropriate for achieving those goals. The proposed Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the current geomorphological features of the Lower Mississippi River, as well as data and knowledge gained from the referenced projects.

Corey Miller

Mr. Laborde and Mr. Landry,

I am writing in support of the preferred alternative: Alternative 1, Variable Flow up to 75,000 CFS for the Mid-Barataria Sediment Diversion. I firmly believe that a failure to implement this project results in a much bleaker outlook for our wetlands in southeast Louisiana and the communities that depend on them. As I often say, "we cannot afford a failure to figure out how we can reconnect the Mississippi River to our vanishing wetlands to aid in our fight against coastal land loss." It is imperative. It also must be done with utmost consideration of all those who will be impacted, both beneficially and negatively.

With that said, there is significant potential for the project to alter environmental conditions that may result in grave consequences for some residents living outside of levee protection, especially commercial fishing businesses. The process to develop mitigation and stewardship measures between now and the final EIS needs to be inclusive, thorough, transparent, precise, and participatory. Community leaders in all areas anticipated to be affected should be included, engaged, and supported (financially) to bring together residents, explain likely future conditions resulting from the project, and solicit strategies for mitigation. The process should thoroughly exhaust unique and innovative ideas for mitigation brought forth from stakeholders and do so in a method that is accessible for the targeted populations. The process to get to a final mitigation and stewardship plan of action should be clearly and publicly outlined. It should address the uncertainty of their community, residents, livelihood, and quality of life. The plan should have transparency and assurance of how they will be made whole should their concerns about impacts come to fruition. The money that will be spent on mitigation and stewardship measures should be precisely directed to those who are most likely to be negatively impacted. Residents likely to be impacted must be engaged in mitigation planning in a true participatory fashion in which they are provided a clear range of likely scenarios with the diversion operations and are able to collaboratively identify and develop strategies that allow them to continue to work, live, and play along our wonderful coast with the same quality of life, hopefully, better. This should include translation and interpretation services for the non-English speaking residents.

To elaborate on the point of precision in directing mitigation and stewardship action - the dEIS and the LaTIG reports indicate that brown shrimp and oysters will be among the most negatively impacted species compared to the current status quo of productivity within the Barataria Basin, specifically, the outfall area of the project. I commend the upfront commitment of \$30 million towards mitigation and stewardship actions. The expenditure of these dollars should be prioritized for those that will be the most vulnerable and those that will incur the harshest of impacts to their profitability and quality of life. For shrimpers, it is possible to identify through LDWF records those with a commercial fishing license, who have trip ticket landing data of their catch, who have registered boat length and gear type that cannot safely harvest in offshore waters (limited to the inshore brown shrimp season), who also show a significant portion of total sales correlated to brown shrimp in the Barataria Basin. These are the shrimpers that mitigation and stewardship actions should be prioritized. Similarly, oyster harvesters should be prioritized. This should start with those with smaller operations, the harvesters who are dependent on a minimal amount of leased acreage, and

especially those who have virtually been eliminated from the industry as a result of the declining public seed grounds and the concurrent oyster lease moratorium.

Some of the residents of coastal communities that will likely face the most severe challenges adapting to the shifting environment are the same that have been historically marginalized and systemically outcast from access to resources. To the extent that there will be a new abundance of different resources that flourish as a result of the changed environmental conditions, there should be priority access to those communities and residents whose current business operations will be the most threatened.

There needs to be ample public access to the sub-delta and surrounding area that will benefit from increased habitat and consequent fisheries and wildlife. It would be a tragedy if those who are most impacted due to changes in fishery-dependent businesses and those who have a significant dependence on subsistence fishing are not given priority access to the new fisheries that will likely prosper as a result of the project.

Lastly, the operations and management of the structure must genuinely embrace an adaptive approach that includes stakeholder participation, input, and influence. The governance of decisions about operations should include representatives from the various industries, landowners, and residents with the highest stake in the project's outcomes.

Sincerely,

Corey Miller

Passionate coastal resident

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship,

---

monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62878**

**The EIS and Mitigation Plan does not adequately consider or mitigate for impacts to Ironton. The EIS should include air pollution buffers for Ironton and flood protection easement areas for Ironton and other vulnerable communities outside of levee protection.**

**Response ID: 16505**

The concerns raised by the commenters were considered in the Draft EIS in Chapter 3, Section 3.7.2 Air Quality, Existing Conditions; and Chapter 4, Sections 4.8 Noise, 4.13 Socioeconomics, 4.15 Environmental Justice, 4.22 Land-Based Transportation and 4.25 Cumulative Impacts. Chapter 3, Section 3.7.2 Air Quality - Existing Conditions identifies the existing air quality in the proposed Project area and provides that Plaquemines Parish is designated as "unclassifiable/in attainment" for all criteria pollutants. The resource sections in Chapter 4 address potential air quality, noise, transportation, and tidal flooding impacts specifically concerning the community of Ironton. In addition, Chapter 2 of Appendix H1 Socioeconomics Technical Report to the EIS provides contextual information about the Ironton community.

CPRA committed to implementing best management practices (BMPs) to minimize construction impacts in the EIS in Chapter 4, Section 4.27.1 Avoidance and Minimization and Appendix R1 Mitigation and Stewardship Plan; additional information on BMPs is also included in the Mitigation Summary Table in Appendix R3. Construction emissions would be highly localized, and consequently the Project is only anticipated to impact air quality within 0.5 mile of the construction footprint; however, Ironton is located approximately 0.5 mile from

---

the construction footprint (see EIS, Chapter 4, Section 4.7.1 Area of Potential Impacts). As stated in the EIS in Chapter 4, Section 4.15 Environmental Justice, populations in Ironton would experience minor to moderate, temporary adverse, impacts due to increased noise levels, dust, and transportation delays during the approximately 5-year construction period. During operations, air emissions would be negligible since the diversion structure would be electric-powered (see EIS Chapter 4, Section 4.7.4.2).

Beyond the near-term impacts of construction, operation of the Applicant's Preferred Alternative may have impacts on Ironton. Because it is within the New Orleans to Venice (NOV) Non-Federal Levee (NFL) W-05a.1 (La Reussite to Myrtle Grove levee reach) levee system, Ironton is not expected to be impacted by increases in frequency and duration of tidal flooding due to Project operations (see Section 4.15.4.2.2 Storm Hazards and 4.20.4.2 Public Health and Safety). Further, guide levees constructed parallel to the diversion channel will be constructed to an elevation of approximately 15.6 feet and will serve as hurricane and storm damage risk reduction against storm surges. However, negligible to minor increases in risk of NOV-NFL Levee overtopping south of the immediate outfall area (following the delta formation in the outfall area) due to storm surge during certain 1 percent storms, may impact low-income and minority populations within Ironton. These potential impacts may be exacerbated to the extent that Ironton residents experience unique vulnerabilities.

To ensure that impacts on the community of Ironton have been adequately disclosed and to make that analysis readily accessible in one location within the EIS (rather than throughout the various resource sections), a section has been added to the Final EIS that provides a summary of impacts on the community of Ironton under the Applicant's Preferred Alternative (see Chapter 4, Section 4.15.5.1 Environmental Justice).

CPRA is not proposing specific mitigation to address or offset the negligible to minor increased risk in levee overtopping that could affect the community of Ironton inside the NOV-NFL system because this potential increased risk does not accrue until Project operations have resulted in the development of a delta (wetlands and marsh) in the area outside the NOV-NFL Levee adjacent to Ironton (circa 2040), and because this risk was identified for only one of the 100-year storm scenarios modeled. However, to help Ironton prepare for and mitigate flood risk from storms generally, CPRA would designate a liaison to work with residents in Ironton prior to commencing operations of the Project on community preparedness for storm-based flooding and damage.

CPRA has engaged in public outreach meetings with the communities projected to be impacted by the MBSD to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts were undertaken to better understand and address potential impacts on communities with environmental justice concerns, such as low-income and minority populations, that may be disproportionately impacted by the Project, as discussed in Chapter 7 of the Final EIS. This included meetings in the community of Ironton. CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project. CPRA will continue to engage with potentially

impacted environmental justice communities and organizations concerning the implementation of the mitigation and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62963**

**Mitigation compensation should prioritize those most affected, likely those who rely on oyster leases in the mid-basin areas or smaller operations, as well as economically vulnerable oyster fishers.**

**Response ID: 16533**

The Draft EIS evaluates how the Project would impact commercial, recreational, and subsistence fishers as compared to No Action conditions in Chapter 4, Sections 4.10 Aquatic Resources, 4.14 Commercial Fisheries, 4.15 Environmental Justice and 4.16 Recreation and Tourism.

In response to public comments and resource agency input about proposed mitigation and stewardship efforts, CPRA has expanded and refined the oyster mitigation and stewardship measures. CPRA's mitigation and stewardship strategies and expenditures focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to oyster fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and

---

gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for oysters in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to oyster fisheries in the early years of the Project's operational life. The revised mitigation and stewardship measures include allocating \$4 million to establish new public seed ground, \$15 million to enhance public and private oyster grounds, \$4 million to create or enhance broodstock reefs and \$8 million for alternative oyster culture. While the focus of the proposed mitigation and stewardship measures are on establishing sustainable fisheries, oyster mitigation and stewardship measures have been crafted to focus on those impacted by the Project specifically. For example, a portion of each of the stewardship measures for impacts to oyster harvesters would be expressly designated for use by low-income and minority oyster harvesters. See the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for**

---

such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix

---

R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63336**

**This proposed Project is absolutely crucial for the future of our coast and the safety and livelihoods of our coastal communities.**

**Response ID: 16292**

The commenter's support for the proposed Project is noted. The proposed Project, by reestablishing deltaic processes, is intended to build coastal resiliency and protection for the coastal communities behind Barataria Basin. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community,

and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

See Sections 3.2.1.6 (Benefits Multiple Resources) and 3.2.1.7 (Public Health and Safety) of the LA TIG's Restoration Plan for a detailed discussion of the proposed Project's potential benefits and public health and safety impacts, respectively.

---

**Correspondence ID:40519**

Kelly Messer

Mr. Laborde and Mr. Landry,

I am writing in support of the preferred alternative: Alternative 1, Variable Flow up to 75,000 CFS for the Mid-Barataria Sediment Diversion. I believe this would be very beneficial for coastal Louisiana

With that said, I think the plan forward should be inclusive of all stakeholders involved. Language should not be a barrier.

Impacted fishery-dependent businesses and those who have a significant dependence on subsistence fishing are not given priority access to the new fisheries that will likely prosper as a result of the project.

The operations and management of the structure must embrace an adaptive approach that includes stakeholder participation, input, and influence. The governance of decisions about operations should include representatives from the various industries, landowners, and residents with the highest stake in the project's outcomes.

Sincerely,

Kelly Messer

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement.

---

The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63332**

**A large number of commenters expressed general support for the proposed Project.**

**Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63580**

**CPRA should seek alternative outreach tools to reach typically hard to reach audiences including low-income, minority, and non-English speaking communities.**

**Response ID: 15914**

USACE and LA TIG coordinated with the SELA Voice organizations to understand the needs of the local communities regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan. Recommendations for where to make the Draft EIS and the LA TIG's Draft Restoration Plan available as well as translation of material related to the Draft EIS and Restoration Plan were implemented. USACE and LA TIG tailored the public meeting process for the Draft EIS and the LA TIG's Draft Restoration Plan based on COVID-related restrictions in place at the time. Public meetings were virtual and allowed an open exchange during the public comment portion. Meetings could be accessed via internet/web-based conferencing application or via telephone. Spanish, Vietnamese, and Khmer translators facilitated participation by non-English speakers; key messages from the meeting presentations were translated during the

meetings and the translators were available to interpret participant comments in any of those languages.

In addition to the public meetings, commenters were able to submit their comments via multiple means. Dedicated toll-free numbers were provided through which English-speaking and non-English speaking individuals could listen to pre-recorded presentation information and provide public comment on the Draft EIS and LA TIG's Draft Restoration Plan in their language of choice. The pre-recorded presentation information consisted of an explanation of how to comment, an update on the proposed MBSD Project design, information concerning the ongoing restoration planning efforts and the LA TIG's Draft Restoration Plan, and details about how to navigate and review the contents of the Draft EIS. The Draft EIS was (and is) available on the USACE website. The LA TIG's Restoration Plan was also made available on the LA TIG's website.

The Executive Summary for the Draft EIS and the LA TIG's Draft Restoration Plan were translated into Spanish and Vietnamese and were available at libraries and community centers/organizations. The complete Draft EIS and Draft Restoration Plan with appendices were also available as either a printed copy and/or electronically (thumb drive) at these locations.

Since the release of the Draft EIS and the LA TIG's Draft Restoration Plan, CPRA conducted public outreach to communities projected to be impacted by the Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with impacted fishers and communities, including Indigenous communities and low-income and minority communities. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including through Coastal Connections meetings and use of community non-profit, non-governmental organizations for additional outreach. CPRA has also committed to stakeholder engagement and input during the adaptive management process if the proposed MBSD Project is implemented. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

---

**Correspondence ID:40520**

Shirley Adams

I speak as a concerned Louisiana citizen. I strongly oppose the Mid-Barataria Sediment diversion. Its called

"fresh water" but the dirty, polluted Mississippi River water will destroy our seafood industry by negatively impacting our fisheries, destroying our rich estuaries and ecosystems and bringing about the inevitable extinction of our bottlenose dolphin populations. You can see what it has already done to the Gulf of Mexico, creating a dead zone of approximately 5,700 square miles. This plan is deeply flawed and will cost taxpayers billions of dollars. A good question is who is going to benefit from this expensive undertaking? It will not be the people of Louisiana.

Please listen to the wisdom and experience of our Lt. Gov., Billy Nungesser and the sources he quotes in his article published in the Advocate May 31, 2021. I agree with him that our coast can be saved by building land now by restoring the barrier islands and ridges that protected our communities from storm surge. It is working with nature and the money saved can be used to benefit our state and citizens in much better ways. I urgently request that you reject this CPRA proposal.

Sincerely

Shirley Adams

Metairie, LA

---

**Concern ID: 61819**

**Commenters expressed concern that the proposed Project would have adverse impacts on Barataria Basin's water quality, wetlands, fisheries, recreational uses, and eroding coastlines due to chemicals, oil and hazardous waste, and/or pollutants in the Mississippi River that would be routed to the Barataria Basin via the proposed diversion.**

**Response ID: 16429**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality of the Draft EIS, the segment of the Mississippi River where the proposed diversion river intake structure would be located (subsegment LA070301\_00) fully supports its designated uses. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. LDEQ's water quality assessment indicates that regulated substances are not present in concentrations that would cause a water quality impairment at the location of the intake structure. In response to this concern expressed by commenters, a new subsection has been added to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of nearby industrial facilities on river water routed to the basin during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills from Industrial Sites.

As described in the EIS, Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed.

---

**Concern ID: 61970**

**The only alternatives in the EIS are diversions at different flow rates. The EIS has not listed other possible methods on building land in the Barataria Basin. One alternative is to study the creation of barrier islands and compare the result with the diversion alternative. Also consider fortifying the barrier islands with sheet piles, boulders, and rocks, and dam all pipeline canals and washed-out marsh openings with concrete dams.**

**Response ID: 15972**

The Draft EIS considered barrier islands as a functional alternative to the proposed Project. This alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.4 in Step 1: Evaluation of Functional Alternatives of the EIS for details on why this alternative was eliminated from further analysis in the EIS. While barrier islands play a critical role in reducing land loss, they are not intended or designed to transport sediment, fresh water, or nutrients.

Past investments through a multitude of restoration programs have resulted in the restoration of every major barrier island in the Barataria Basin. CPRA's Coastal Master Plan includes programmatic barrier island restoration to support future maintenance of the restored islands. However, CPRA has stated that fortifying barrier islands with hard structures is not feasible.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:40521**

## Resilience Resolutions

Robin Barnes

We are at a critical moment as we consider the future of our state, the great State of Louisiana. The Mississippi River has been altered and confined by levees for over 100 years, leading to the extensive land loss crisis that has seen over 2,000 square miles already disappear into the Gulf of Mexico. As we continue to lose these important ecosystems at alarming rates, we also lose critical storm surge protection as well as habitat for the seafood our region is renowned for. Restoring the natural functions of the river is essential. The future of New Orleans, the bayou communities, our hospitality and tourism economy, the fisheries and wildlife, and Louisiana's amazing culture all desperately depend on it.

I believe in and support the Louisiana Coastal Master Plan. I believe in and support the Mid-Barataria Sediment Diversion project.

I moved to New Orleans following Hurricane Katrina, and my family and friends have followed, making this place our permanent home. I am devoted to enhancing the environmental and economic viability of this spectacular region and state. This is where I work and play. This is where I will retire.

I purchase Louisiana seafood at the local farmers markets and am thankful to have that opportunity. I am friends with fisherfolk. I know many face rocky times ahead. We cannot pretend that they will not. The Mid-Barataria Sediment Diversion project can and should exemplify community leadership in restoration decision-making. The next decade is a significant opportunity for Louisiana to establish itself at the vanguard of community-level environmental adaptation planning and restoration mitigation. We followed the science and have designed a Diversion. Now we must follow the people and design a complementary solution that guarantees a prosperous future for our coastal-dependent residents, and one that prioritizes equity, empathy and humanity.

I am optimistic about the future and look forward to seeing it unfold.

Robin A. Barnes

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

Louisiana Hypoxia Working Group

Doug Daigle

June 3, 2021

To: U.S. Army Corps of Engineers, New Orleans District

Comments on Draft EIS for the Mid-Barataria Sediment Diversion Project (CEMVN-ODR-E, MVN-2012-2806-EOO)

I am submitting the following comments on the Draft EIS for the Louisiana Hypoxia Working Group. The Group was organized in 2003 and functions as a forum for the exchange of information to facilitate, promote, and support implementation of the Action Plan to Reduce Hypoxia in the Gulf of Mexico (2001, 2008, 2015) in the state of Louisiana. The Action Plan was developed and revised under the Mississippi River/Gulf of Mexico Watershed Nutrient Task Force, which was formed in 1997 and includes key federal agencies (EPA, USDA, USACE, USGS, NOAA) and the 12 states along the Mississippi and Ohio Rivers (AR, IA, IL, IN, KY, LA, MN, MO, MS, OH, TN, WI).

The current version of the Action Plan has two key components: an Interim Target of achieving a 20% reduction in loading of nitrogen (N) and phosphorus (P) from the Mississippi-Atchafalaya River Basin to the Gulf of Mexico by the year 2025; and reaching an average annual size of the Gulf of Mexico hypoxic zone of 5,000 square kilometers (1950 square miles) by the year 2035.

These comments are made on the Draft EIS for the Mid-Barataria Project as it pertains to the Action Plan. The Action Plan and the Project are being pursued under different auspices. The Plans Target for a 20% reduction in N and P loading to the Gulf by the year 2025, along with the reductions that would achieve the 2035 goal, which would result from a significant reduction in nutrient loads in the Mississippi River, would seem to have relevance for the Project and the Draft EIS.

Yet the Action Plan, its goals, and their potential impacts are not mentioned or referenced in the Draft EIS. This is the case for the modeling of N and P trends and water quality impacts of the Project that are described in Chapter 4 and elsewhere, as well as the Past, Present, and Reasonably Foreseeable Future Projects and Trends for N and P (also in Chapter 4). The Action Plan is similarly not included in the 49 Reasonably Foreseeable Future Projects Considered in the Cumulative Impacts Analysis that are listed in Table 4.25.1-1, nor among the Laws, Regulations, and Executive Orders that are listed under Consultation and Coordination in Chapter 5.

There are several discussions of Gulf Hypoxia in the Draft EIS that provide opportunities to reference the Action Plan and the substantial body of science that has informed its development, but none do so. The discussion in Chapter 3 of excessive nutrient (N and P) loads [that] create.. hypoxic conditions, or dead zones that persist for a prolonged duration treats the problem as a global issue without mentioning the large annual hypoxic zone that forms each year in the Project area.

The "Draft Phase II Restoration Plan #3.2", issued by the Louisiana Trustee Implementation Group (TIG) in conjunction with the Draft EIS, does mention the Gulf Hypoxic Zone and the Hypoxia Task Force in its Chapter 3 (on page 3-44), but in a somewhat misleading way.

Following a discussion of nutrient issues that focuses on their positive impacts, a 2018 report from the Hypoxia Task Force is quoted to cite channelization and impoundment of the Mississippi River and loss of coastal wetlands as two factors that contribute to "excess nutrients reaching Gulf water."

The 2018 report does include those two factors but states clearly that "the leading causes" of increased amounts of nutrients delivered to the Gulf are "the nitrogen and phosphorus loads [that] come mainly from sources upstream of the Gulf. Sources of nitrogen include agriculture (both row crop agriculture and animal feeding operations), atmospheric deposition, urban runoff, and point sources such as wastewater treatment plants." (Progress Report on Coordination for Non-point Source Measures in Hypoxia Task Force States; [https://www.epa.gov/sites/production/files/2018-05/documents/nps\\_measures\\_progress\\_report\\_1-\\_may\\_2018.pdf](https://www.epa.gov/sites/production/files/2018-05/documents/nps_measures_progress_report_1-_may_2018.pdf))

Mention of the Action Plan is also absent from the discussion of Mitigation Measures in Chapter 4 and Appendix R of the Draft EIS, though as a currently operating as well as long-standing effort involving conservation and management to reduce nutrient loads upstream of the Project area, the Plan would seem to merit consideration as one way to avoid and minimize at least some of the potential negative impacts of the Project, specifically those caused by high nutrient loads in the river water conveyed by diversions.

Finally, as noted in our comments made last year for the NEPA Scoping Process for the Project, the Corps and a number of federal Cooperating Agencies (EPA, NOAA, USDA, USGS) and the State of Louisiana have all made commitments under the Hypoxia Action Plan to help fulfill its Target and Goal. Those commitments make the complete lack of mention of the Hypoxia Action Plan in the Draft EIS all the more notable.

Sincerely,

Doug Daigle

Coordinator

Louisiana Hypoxia Working Group

**Concern ID: 61815**

**The discussion in Chapter 3 of excessive nutrient (N and P) loads that create hypoxic conditions treats the problem as a global issue without mentioning the large annual hypoxic zone that forms each year in the proposed Project area.**

**Response ID: 16426**

The Gulf of Mexico hypoxic zone was considered in the Draft EIS in Chapter 3, Section 3.5 Surface Water and Sediment Quality. The proposed Project would not have more than negligible impacts on the Gulf of Mexico hypoxic zone because it is located outside of the Project's area of potential impacts (defined in Chapter 3, Section 3.1.1 [Project Area] of the Draft EIS). Although the Gulf hypoxic zone is not expected to be impacted by proposed diversion operations, because it is near the proposed Project area, the USACE did include a

---

description and map of the Gulf hypoxic zone in Section 3.5.2.6 in Surface Water and Sediment Quality (see Figure 3.5-6). In response to this comment, the USACE has revised the title of Section 3.5.2.6 (Dissolved Oxygen) to 3.5.2.6 (Dissolved Oxygen and Hypoxia) in the Final EIS so that information about hypoxia in and near the proposed Project area can be more readily found by EIS readers. As explained in the EIS, Chapter 4, Section 4.25.5.2 in Cumulative Impacts, the combined impact of several Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone. Chapter 4, Section 4.25.5.4.4 Nitrogen and Section 4.25.5.4.5 Phosphorus in Cumulative Impacts of the Final EIS have been updated to include a summary of the Gulf Hypoxia Action Plan.

---

**Concern ID: 61817**

**Commenters stated that information about the Gulf Hypoxia Action Plan (Louisiana Hypoxia Working Group), which calls for a 20 percent reduction in nitrogen and phosphorus loading to the Gulf by 2025, is pertinent to the Draft EIS but is not mentioned. Commenters requested that the plan should be included in the Final EIS.**

**Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. 2008. Gulf Hypoxia Action Plan 2008 for Reducing, Mitigating, and Controlling Hypoxia in the Northern Gulf of Mexico and Improving Water Quality in the Mississippi River Basin. Washington, DC.**

**Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. 2013. Looking Forward, The Strategy of the Federal Members of the Hypoxia Task Force. Washington, DC.**

**Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. 2016. December 2016 Update, Looking Forward, The Strategy of the Federal Members of the Hypoxia Task Force. Washington, DC.**

**Response ID: 16428**

The USACE and the LA TIG agree that the Gulf Hypoxia Action Plan is relevant to the proposed Project area. Therefore, in response to these comments, a discussion about the Gulf Hypoxia Action Plan has been added to Section 4.25.5.4.4 Nitrogen and 4.25.5.4.5 Phosphorus in Cumulative Impacts of the Final EIS. The Hypoxia Action Plan has highlighted the important role that river diversions could play in reducing nutrient loads. In addition, substantial nutrient load reduction could be achieved through the measures being implemented by the other states and entities involved with the Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. These combined efforts could lessen the potential impacts of excess nutrient loads to Barataria Basin and the northern Gulf of Mexico.

---

**Concern ID: 62638**

**The Restoration Plan should be clear that, as stated in the Progress Report on Coordination for Non-point Source Measures in Hypoxia Task Force states, the leading causes of increased amounts of nutrients delivered to the Gulf are upstream sources of nitrogen and phosphorus (that is, agriculture, atmospheric deposition, urban runoff, and point sources like wastewater treatment plants).**

**Response ID: 16649**

---

Chapter 3, Section 3.10.5.1.4 Nutrient Loading of the Final EIS has been revised to reference the Hypoxia Task Force report and further identify the types of anthropogenic sources that have resulted in increased nutrient loading in the Gulf.

The LA TIG acknowledges the comment about the leading causes of increased amounts of nutrients being delivered to the Gulf and has revised Section 3.2.1.6.5 (Alternative 1 - Benefits to Offshore Ecosystems) of the LA TIG's Final Restoration Plan accordingly.

---

**Concern ID: 63190**

**Commenters recommend Hypoxia Action Plan be seen as a mitigation effort already in place and/or that its recommended actions be considered as part of the mitigation for Project.**

**Response ID: 16564**

The commenters accurately noted that the Gulf Hypoxia Action Plan is relevant to the Project area. In response to these comments, a discussion of the Gulf Hypoxia Action Plan has been added to Chapter 4, Section 4.25.5 (Cumulative Impacts - Surface Water and Sediment Quality) of the Final EIS. Similar text has been added to the LA TIG's Final Restoration Plan. The proposed Project is anticipated to reduce the amount of nitrogen and phosphorus that reaches the Gulf of Mexico through nutrient uptake in the marshes that would be created and/or sustained by the proposed diversion. Because the proposed Project is already anticipated to reduce the nutrients that contribute to the Gulf Hypoxia Zone (GHZ), further mitigation actions with respect to the GHZ for the proposed Project are not considered necessary. However, CPRA has committed to implement water quality monitoring for nitrogen and phosphorus (and other parameters) in the outfall area and to make the results of that monitoring available online to the public and interested parties in real time. Consequently, while the Hypoxia Action Plan would not be considered as mitigation for impacts associated with the Project, the anticipated reduction in nutrients reaching the Gulf through wetlands restoration and the water quality monitoring/access to water quality monitoring data would be consistent with the Hypoxia Action Plan.

---

**Correspondence ID:40523**

Planet Share

Nancy Adkins

As farming along the the Mississippi River increases and the potential for more nitrogen and phosphorus runoff also increases, how will this effect the restoration of the wetlands as well as the entire Gulf of Mexico? How will this potential increase be monitored and dealt with? Thank You for your time.

Sincerely, Nancy Adkins,Imperial,Mo.

---

**Concern ID: 61812**

**Commenters expressed concern that the proposed Project would have adverse water quality impacts in the Barataria Basin due to the introduction of nitrate and phosphate from the Mississippi River. Several commenters questioned whether the proposed Project would create harmful algal blooms and hypoxia in the Barataria Basin similar to the hypoxic “dead zone” in the Gulf of Mexico that exists due to nutrients in Mississippi River waters. One commenter expressed concern that the EIS does not adequately assess the potential for the proposed Project to create algal blooms and hypoxia in the basin, other than acknowledging it.**

**Response ID: 16425**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA’s Mississippi River/Gulf of Mexico Hypoxia Task Force “Hypoxia 101” webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone “water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen” (<https://www.epa.gov/ms-htf/northern-gulf-mexico-hypoxic-zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.>)

Dissolved oxygen concentrations associated with the Applicant’s Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in

---

lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.5.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section is included in Section 4.5.5.3 in Surface Water and Sediment Quality and has been added to Section 4.5.5.4.2 Applicant's Preferred Alternative of the Final EIS. Finally, the EIS acknowledges the potential for major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) if warranted, in the Barataria Basin during Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62867**

**The Final EIS should not be published unless there are commitments to monitor the following parameters at the diversion site or in Barataria Bay: Project operations, the flow and quality of the water flowing through the diversion, wetland type coverage over time, water surface elevation, water quality in the basin, salinity, contaminant concentrations in diverted sediments, fish and shellfish abundance, oyster reef parameters, benthic community composition and abundance, SAV coverage, finfish and oyster contaminant concentrations, and shellfish harvest restrictions. These same data should also be collected in two reference basins.**

**Response ID: 16676**

Basin-side monitoring of water surface elevation, water quality in the basin, salinity, fish and shellfish abundance, and benthic community composition and abundance to evaluate how the Project is meeting Project objectives were included in the Monitoring and Adaptive Management (MAM) Plan of the Draft EIS (Appendix R2 ). Riverside monitoring parameters include river discharge, suspended sediment concentrations, nutrient concentrations in water conveyed to the Barataria Basin, sedimentology of the Alliance South sand bar, and Mississippi River sediment load were also included in the MAM Plan of the Draft EIS. Additionally, in the Fish and Wildlife Coordination Act Report (CAR) section of Chapter 5 (Consultation and Coordination) of the Draft EIS, CPRA accepted USFWS' recommendation on pre- and post-construction periodic sampling of Contaminants of Concern in fish, shellfish, and wildlife from the outfall area and the Mississippi River (see Section 3.7.3.23 of the MAM Plan [Appendix R2 to the EIS]). Therefore, no changes were made in the Final EIS on these issues. The Louisiana Department of Health will continue to monitor shellfish harvest restrictions. Additionally, the majority of the parameters above are collected via the State's System Wide Assessment and Monitoring Program that will allow comparison of the Project variables within and among other estuarine basins across the Louisiana coast.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the

---

Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Wilkie Declouet

This Mid-Sediment Diversion is going to destroy everything and our way of life. My community of Ironton has been picked on for a long time. First we had to fight for running water. Next it was the RAM company. Oil tank farm and now this damn diversion. The diversion is going to cause a lot of problems for my community and neighboring communities. I for one just want our community left alone.

---

**Concern ID: 61933**

**Commenters expressed concern that the MBSD Project is going to cause a lot of problems for the community of Ironton and the neighboring communities. There is an alarming lack of detail and lack of analysis about how the MBSD Project would affect Ironton. Some specific concerns regarding Ironton include whether the MBSD Project would result in impacts on air quality, noise, traffic, emergency services, flood risks, and community cohesion.**

**Response ID: 16286**

The Draft EIS Chapter 4, Sections 4.7 Air Quality, 4.8 Noise; 4.13 Socioeconomics; 4.15 Environmental Justice; and 4.22 Land-Based Transportation identified potential air quality, noise, transportation, and flooding impacts specifically concerning the community of Ironton. In addition, Chapter 2 of Appendix H1 (Socioeconomics Technical Report) provides contextual information about the community. Section 4.15 Environmental Justice, has been revised to highlight information about potential impacts on the community of Ironton in the Final EIS. Also, in the Final EIS, Section 4.15.5.1 Environmental Justice has been added to provide a summary of impacts on the majority-Black community of Ironton, which is the closest community to the diversion, to assist understanding the projected impacts of the proposed Project on that community.

CPRA has engaged in public outreach meetings with the communities that would be impacted by the MBSD to solicit input on mitigation strategies, including reaching out to local non-profits to assist with and facilitate meetings with the communities projected to be impacted.

Outreach efforts to better understand community concerns regarding impacts, including cultural impacts, and mitigation and stewardship measures are discussed in Chapter 7 of the Final EIS. Refer to the Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures

are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

OysterFellas Oyster Co.

PJ

These diversion projects that want to divert the river into two major estuaries will not only destroy the marine life but will also destroy the existing flora that holds the fragile system together now. It will completely change the hydrology, which is hanging in the balance now. Channelizing river water into the estuary will not build land, it will only eliminate any salinity. The only way to build land with a river is to have heavy sediment laden water slowly overflow the banks of the river dropping the sediment as it moves outward. The key is to have sediment!!!! The river has minimal in its water column. Once again, you must flood an area with SEDIMENT LADEN WATER AND LET IT SLOWLY MOVE ACROSS TO LET THE SEDIMENT DROP OUT. Not turbulent water!!! And so many other reasons that I have voiced before. And yes I am a fisherman with Forty years of experience watching it die and trying to stop it long ago. It caused me to go back to school for an environmental degree, so I could be part of the solution, which is to stop this stupidity. In grammar school I did a science project on the river building new land, basically it just re-deposited soil from one place to another, which is what Mardi Gras pass is doing. And when the water is slow moving it stays separate fresher on top and higher salinity on the bottom. Which is why we had the worlds biggest oyster reefs. Dredge and build new lands from the gulf side in or you will just be wasting everyone's time and destroying everything left in lower Louisiana.

---

**Concern ID: 61782****Commenters expressed concern that there's not enough sediment in the river to achieve wetland and land creation goals of the proposed Project.****Response ID: 16412**

The commenter's concerns regarding the sediment load of the river and whether the river carries sufficient sediment to achieve the land projected to be built during diversion operation were considered in the Draft EIS. The Mississippi River carries much less sediment than it did in the past. It still carries a massive sediment load, but not as massive as before. As explained in Chapter 3, Section 3.4.2.5 Sediment Transport, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes. Quantifying the relative contributions of multiple factors to the diminished sediment load is beyond the scope of the Draft EIS. The Draft EIS (Appendix E Delft3D Modeling, Delft3D Modeling Section 5.2.2) takes this diminished sediment load into account when computing the sediment that would be delivered to the Barataria Basin. To help clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations, discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

---

**Concern ID: 61966**

---

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process. CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

Town of Jean Lafitte

Timothy Kerner

The probably and possible negative effects that will and may be caused by the The Mid-Barataria Sediment Diversion project concerns our community gravely. The projected increase in tidal surge and water level, even in its slightest, could be a catastrophic to the Town Jean Lafitte, Barataria, Crown Point, and Lower Lafitte. I would also like to emphasize the discrepancy between the mitigation plans and funds for the oyster beds/ dolphin population and the brown shrimp fishery. The amount of mitigation should reflect the potential damage that may be caused and that is simply not the case for the brown shrimp fishery, which has been one of our strongest resources for over a century.

It is clear that our communities of Jean Lafitte, lower Lafitte, Barataria, and Crown Point will suffer some of the worst effects caused by this project, especially in the 50 years that it takes to build up the land.

I am also concerned about the root strength of the freshwater diversions facing a more frequent and stronger weather events than it has when most of Louisiana land was built. Could newly settled sediment form together to build land under these modern conditions? Just this past year, we experienced 7 strong tidal surge events. There is less sediment and worse conditions that should be examined to the fullest extent.

That being said, I do understand that we are in midst of Louisiana's greatest crisis and something drastic needs to be done to save our Coast. If this project is approved it will be of the greatest importance that we complete the Jean Lafitte, Barataria, Crown Point and Lower Lafitte tidal protection and that our commercial fishermen (brown shrimp fishermen) are properly mitigated. The Barataria Basin produces 1/3 of the brown shrimp in Louisiana, and is the most concentrated area for brown shrimp in the country. There needs to be a better plan of action for this incredibly important industry to not only the State of Louisiana, but to the United States.

CPRA has made great strides to save our Coast and I commend them. They are leading the fight to this national crisis. They have been in constant communication and have provided aid to increase our flood protection. They have handled this entire process with open ears and have adapted along the way. I greatly appreciate it.

If the project works it could save South Louisiana, but if it doesn't it will destroy the very fabric of what will be left.

---

**Concern ID: 62011**

**Commenters are concerned about the impacts of the proposed MBSD Project operations on the coastal communities including Jean Lafitte, lower Lafitte, Barataria, Crown Point, and the island of Grand Isle.**

**Response ID: 16209**

The impacts raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics considers impacts on community populations, housing and property values, community infrastructure, as well as community cohesion and other potential socioeconomic impacts on affected communities in the proposed Project area. As described, communities near the immediate outfall area (within 10 miles north and 20 miles south)

---

outside of flood protection are anticipated to experience increased tidal flooding and storm surge that may increase ongoing trends in outmigration and cause minor to moderate, permanent, adverse impacts on community cohesion in these areas. Long-term benefits of the proposed Project are also anticipated in communities in the west bank New Orleans area north of the diversion, where decreases in storm damages are anticipated over time due to the Project. The communities of Lafitte and Des Allemands are located in areas anticipated to experience permanent, minor to moderate beneficial impacts associated with storm hazards. The proposed Project is projected to increase surge heights by only up to 0.1 foot in the community of Grand Isle. Chapter 4, Sections 4.13 Socioeconomics, 4.14 Commercial Fisheries, and 4.15 Environmental Justice provide detailed analyses of impacts from the proposed Project. The Socioeconomics Technical Report in Appendix H1 provides additional details.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

---

**Concern ID: 62224**

**Communities like Happy Jack, Lake Hermitage and Myrtle Grove, some of which have homes that are not above the new base flood elevation, already experience some degree of flooding which would be made worse by the diversion. This would affect the ability of residents to access and enjoy their homes and communities.**

**Response ID: 15757**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discuss the anticipated increased flooding impacts outside of federal levee systems to be caused by the operation of the diversion. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes, which would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable

to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62409**

**The commenter commends CPRA for making great strides to save our coast and for being in constant communication and have provided aid to increase the Town of Jean**

---

**Lafitte's flood protection. They have handled this entire process with open ears and have adapted along the way.**

**Response ID: 15874**

Comment noted.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

---

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the

LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63015**

**There are misrepresentations in the EIS about how nutrients in the river would spread out far from the sand deposition area to lower plant biomass belowground. Increasing nutrient loads from diversions would weaken soils, not strengthen soils.**

**The modern Mississippi River has nutrient concentrations that are much higher than when the mostly organic soils were created centuries ago (Turner et al. 2007) and may weaken soils by 30 percent, resulting in less belowground biomass, and change vegetation from being comprised of perennials to annuals (Turner et al. 2011). Increased flooding inundation, which is a consequence of river diversions, also weakens the belowground biomass of wetland plants (Morris et al. 2017) that may erode during high water events or from hurricanes (Kearney et al. 2011, Howes et al. 2010). Individual roots become weaker when exposed to ambient levels of nutrients found in the river (Hollis and Turner 2019a, b; Hollis and Turner 2021). The soil becomes degraded, accumulates less biomass, and decomposes and erodes faster (Swarzenski et al. 2008, Hebert et al. 2020). The diversion of river water into the nearby marshes would almost certainly weaken soils, making them less resistant to wave energy and hurricanes. A striking example is the net loss of wetlands in the Davis Pond Diversion where increased land loss occurred beginning the year after the diversion opened (Turner et al. 2019). This is an area that has no significant sediment input.**

**Response ID: 16028**

The literature cited by the commenters has been reviewed, including Turner et al. 2007, Turner et al. 2011, Morris et al. 2017, Kearney et al. 2011, Howes et al. 2010, Hollis and Turner 2019, Swarzenski et al. 2008, Hebert et al. 2020, Turner et al. 2019, and Mo et al. 2020, and Chapter 4, Section 4.6.5.1.2 Applicant's Preferred Alternative of the Final EIS has been revised to include additional analysis regarding the impact of nutrient input from the proposed Project on vegetation communities and soil shear strength.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation**

---

**measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

---

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63182**

**Proposed mitigation is insufficient and not guaranteed, and the amount of funding for mitigation is not clearly stated.**

**Response ID: 16559**

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

---

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Comments: Draft Restoration Plan and Environmental Impact Statement: Mid-Barataria Sediment Diversion

The diversions planned by the State of Louisiana CPRA will impact our saline marsh negatively as seen by previous diversions, natural and manmade.

An alternative would be dredging from river with very little fresh water intrusion.

#### Land Building

These diversions have built land in the immediate outfall; however the areas farther away have experienced a higher land loss due to changes caused by the lower salinity. The salt marsh flora losses causes increased erosion and land subsidence in old marshland and result in a net land loss. The natural land took nature thousands of years to build cannot be replicated by diversions.

#### Protection

Due to land loss and subsidence, FEMA base flood elevations increase causing higher vulnerability to structures and increasing private and public costs to protect these communities. The diversions will also increase tide in the outfall areas increasing the water level on our levees making them weaker from extended periods of water saturation.

#### Controlled Diversion Structures Operations

These structures are operated by boards with people who leave structures open when sediment material in river water is at its least during the year. Originally, CPRA informed that structures would be open only during high sediment load periods. The Caernarvon Diversion proved that responsible planning should include local control over the diversion with common goals in mind such as open in high river and closed in low river. Caernarvon remained open and contributed to extensive land loss during Hurricane Katrina. The Bohemia Freshwater Control structure is another example of failed policies by government. It was neglected, eroded from high river to the once salt marsh and now the Breton sound estuary is almost devoid of salt marsh flora and fauna.

#### Marine Mammal Act

The Marine Mammal Act protecting the marine animals has been politically removed from outfall areas of planned diversions. These animal and their pods will disappear. MMA is a nationwide act.

#### Economics

All salt marsh fauna; fish, oysters, shrimp and their food chain will disappear causing a major impact on the fisherman who support their families, businesses and communities. The entire Barataria and Breton

Estuaries will be impacted and no longer produce the seafood so many depend upon. I operate Beshel

Boat Launch which is located four miles upriver from the Bohemia Freshwater Control structure, now called Mardi Gras Pass, and the chart below maps out over time the losses incurred from fresh water intrusion.\*

#### Culture

If you have never been to a backyard boil, then you don't live in southeast Louisiana. We risk our entire future on these unproven diversions. Generations of fishermen will lose their livelihood and the culture will vanish. The fresh catches that are sold throughout our area will be replaced by foreign or higher priced domestic seafood which will limit the exposure of seafood in our culture. Louisiana is the Sportsman's Paradise and the two most important estuaries, Barataria and Breton estuary, will no longer provide the stock that makes Louisiana world renowned.

#### Summary

The proposed diversions will not be beneficial long term for the people of Plaquemines Parish and no guarantee can be made that they will perform as planned.

#### Beshel Boat Launch\*

##### Annual Sales Increase/Decrease Previous Year

|       |                                                                                          |

Don Beshel

Braithwaite, LA 70040

---

#### **Concern ID: 61906**

**The MBSD Project would cause loss and detrimental impacts on the recreational and sport fishing industry in the Barataria Basin.**

#### **Response ID: 16236**

The issues raised by the commenters were considered in the Draft EIS. EIS Chapter 4, Section 4.16.5.2 in Recreation and Tourism acknowledges that the proposed Project would impact recreational and sport fishing in the Barataria Basin. Relative to the No Action Alternative, the proposed Project would cause minor, permanent, adverse impacts on

---

recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts on these species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips.

---

**Concern ID: 61917**

**Commenters expressed concerns over CPRA's potential for mishandling of the operation and long-term maintenance of the proposed MBSD Project, particularly pointing to CPRA's past inadequate operations and maintenance of other diversions.**

**Response ID: 16004**

CPRA would operate the proposed MBSD Project as detailed in the Operations Plan, which is found in Appendix F2 Preliminary Operations Plan in the Final EIS. In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated proposed Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

---

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated

---

Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRAs and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62029**

**The EIS describes immediate, major, and permanent adverse impacts on several critical species in the Barataria Basin, including shrimp and oysters. The health of commercial fisheries and the socioeconomic well-being of coastal communities are closely intertwined. Such impacts would inflict economic harm on businesses, families, and individuals.**

**Response ID: 16225**

The issues raised by the commenters were considered in the Draft EIS. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted. The EIS also acknowledges the importance of commercial fisheries to the Louisiana economy and communities, as described by commenters. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana and Section 4.14 Commercial Fisheries describes impacts to commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts to shrimp and oyster fisheries in the proposed Project area are anticipated under the Applicant's Preferred Alternative. Changes in abundance may exacerbate trends of aging fishers leaving the industry and would have adverse impacts on the overall fishery. Adverse impacts may be partially offset by changes in fisher behavior. Additional details on the regional and community level economic impacts on commercial fisheries due to the proposed MBSD Project can be found in Section 4.14 Commercial Fisheries.

CPRAs's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than

---

measures for compensating the short-term economic losses of individual fishers. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62077**

**The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp,**

---

**crawfish, crabs, and alligators. Altogether, Louisiana’s commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.**

**Response ID: 16242**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant’s Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant’s Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

---

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62227**

**The diversion would flood access roads, damage vehicles, cause siltation/sludge, cause cancellation of flood insurance, inundate cemeteries, stress levees, impact provision of emergency services, and increase the cost to raise homes, slabs and wharves.**

**Response ID: 15820**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discusses the increased flooding impacts outside of federal levee systems, including road inundation and infrastructure damage, anticipated to be caused by the operation of the diversion. Sections 4.13.5.1.2.1 and 4.13.5.3.2.1 in Socioeconomics of the Final EIS has been updated to include potential impacts such as vehicle damage, accumulation of siltation and sludge, cemetery inundation and interruption of emergency services. Recognizing the potential for these impacts, CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Final EIS concludes that the proposed Project would not have impact on the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not

know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62784**

**Prior or proposed diversions and diversion-like projects (including the Caernarvon Diversion, MRGO, Mardi Gras Pass, Maurepas Bonnet Carré Spillway openings) did not work or caused adverse impacts on area resources.**

**Response ID: 16366**

The commenter's concern regarding the effectiveness and adverse impacts of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the Caernarvon Diversion, MRGO, Mardi Gras Pass, and Bonnet Carré Spillway, is available in Appendix U of the Final EIS. The Maurepas Diversion is subject to an ongoing NEPA analysis, which is anticipated to be finalized in 2022.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The referenced projects all had unique goals, and, where goals existed, each of those projects have achieved their goals. Those achievements increase confidence in the ability of the LA TIG to set goals and select approaches appropriate for achieving those goals. The proposed Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the current geomorphological features of the Lower Mississippi River, as well as data and knowledge gained from the referenced projects.

---

**Concern ID: 62785**

**This type of freshwater and sediment diversion project is unproven and there are uncertainties with respect to what the diversion would do (that is, if it would work and, if so, to what extent).**

**Response ID: 16367**

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties have been incorporated into the EIS impact conclusions and were briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties.

---

Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or as predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the projected changes for the No Action Alternative.

In addition to the modeled data, Chapter 4 Environmental Consequences of the EIS includes additional analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in drafting the EIS. In response to public comments, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The LA TIG recognizes and acknowledges that a controlled sediment diversion of this scale has not been constructed in Louisiana previously. However, a sediment diversion at this location has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Chapter 3, Section 3.2.1.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan). The proposed Project would be monitored and adaptively managed to meet its objectives (see the Monitoring and Adaptive Management [MAM] Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62986**

**The Project would drive decreases in salinity that would reduce the overall health, survival, and reproduction of bottlenose dolphins that reside in the Barataria Basin, a species that was negatively affected by the Deepwater Horizon oil spill (NMFS, 2013). Some commenters felt that because of this, the Project should either not move forward or its operation should be altered.**

**National Marine Fisheries Service (NMFS). 2013. Roy Crabtree (NMFS) to Elizabeth Davoli (CPRA). <https://s3.documentcloud.org/documents/726710/national-marine-fisheries-service-comments-on.pdf>**

**Response ID: 16701**

The concerns raised by the commenters about the projected decreases in salinity and resulting effects on Barataria Bay dolphins were considered in the Draft EIS. More specifically, Chapter 4, Section 4.11.5.2 in Marine Mammals of the EIS acknowledges that the proposed Project would likely have significant, adverse impacts to Barataria Basin dolphins, a species that suffered significant impacts from the DWH oil spill. This section also discusses the physiological changes caused by exposure to low-salinity water, the duration of those changes that leads to mortality, and the anticipated mortality of a large portion of the dolphin population in the Barataria Basin within the first decade. These sections of the EIS provide a more in-depth analysis of potential impacts to dolphins than the letter cited by the commenter.

The concerns raised by the commenters were also considered in the LA TIG's Draft Restoration Plan (see Section 3.2.1.5 [Collateral Injury]); the Final Restoration Plan has been edited consistent with changes made to the Final EIS and see below regarding new, related content included in Appendix R.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources, like dolphins, that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of

---

the proposed Project against its benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible (if it is possible), the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins in Louisiana (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which

measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63060**

**The proposed diversions would build land in the immediate outfall; however, the areas farther away would experience a higher land loss due to changes caused by the lower salinity. The losses in salt marsh flora causes increased erosion and land subsidence in old marshland and would result in a net land loss. The natural land that took nature thousands of years to build cannot be replicated by diversions.**

**Response ID: 16066**

The EIS acknowledges that the fresh water transported by the diversion may result in the loss of some wetlands in the immediate outfall area due to inundation during the initial period following commencement of operations (see Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS).

However, salt- and brackish marsh vegetation would not be subjected to direct mortality due to the lower salinity of transported water. While saline and brackish species are associated with salinity ranges of greater than 18 ppt and between 18 and 5 ppt, respectively (see Chapter 3, Section 3.6.1.2 in Estuarine Wetlands of the EIS), brackish marsh can fluctuate from fresh to saline conditions depending on tidal movement, and species such as *Spartina alterniflora* are common in both salt and brackish marsh (Connor and Day 1987). Salt is a stressor affecting osmosis and cell structure. Plants occurring in saline and brackish marshes have developed adaptations to either exclude uptake or excrete salt; however even salt marsh species grow better at lower salinities (Mitsch and Gosselink 2000; Teal et al. 2012). However, as described in Chapter 4, Section 4.6.5.1.2.1 Salinity of the Final EIS, in some areas of the Barataria Basin, the seasonal change in salinity due to operation of the diversion above base flow (primarily during spring and early summer) and lower-flow conditions during fall and winter months would be large enough to temporarily change the wetland hydrology from a brackish to fresh or saline to brackish system. In the southern basin, where salt marsh predominates, peak salinities would be within the range for salt marsh vegetation under the

---

No Action and Applicant's Preferred Alternatives. While the action alternatives would not counteract all wetland losses across the Barataria Basin over the analysis period, as shown in Section 4.6 in Wetland Resources and Waters of the U.S., Table 4.6-4, the proposed Project would reduce wetland losses when compared with the No Action Alternative. Because this issue was considered in the Draft EIS, no related edits have been made to the Final EIS.

---

**Concern ID: 64057**

**The socioeconomic impacts would affect southeast Louisiana and the area impacted by the proposed MBSD Project for generations and ensure the end to the traditions and culture of south Louisiana and its families.**

**Response ID: 16230**

The EIS discusses impacts on the local communities and various quantitative and qualitative impacts from the proposed Project in Chapter 4, Section 4.13 Socioeconomics, including Community Cohesion (Section 4.13.5.6). Consistent with the concern of the commenter, the EIS does find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative.

**Correspondence ID:40530**

Greg Gasperecz

Ladies and Gentlemen of the USACE,

I am writing to indicate my support for the Mid-Barataria Sediment Diversion permit application requested by the Louisiana Coastal Restoration Authority. I believe the project will greatly benefit all of southeast Louisiana by creating new marshlands in an area that has been severely degraded. Such wetlands are vital to hurricane protection, wildlife habitat, and fisheries.

While the project will result in significant expansion of freshwater marshes, it will also cause the displacement of certain fisheries toward the Gulf of Mexico. Oyster harvesting will be significantly affected in the areas that revert to predominantly freshwater. Shrimp and crab fisheries will also likely be displaced. Recreational fishing for species such as spotted sea trout, red drum, black drum, and flounder will also likely be significantly displaced southward. These impacts will cause economic hardship to the commercial fishers who currently work in the areas that will be converted to freshwater marsh. I urge the USACE to impose restrictions on the operation of the project as may be needed to limit the extent of the displacement of these fisheries, so as to somewhat mitigate the impact on commercial fishers.

Thank you,

Greg J. Gasperecz

New Orleans

---

**Concern ID: 61912**

**CPRA should consider alternative flow triggers, designs, and features in the operations plan and design of the proposed MBSD Project in order to minimize impacts. CPRA should also consider adjusting diversion design elements such as triggers, peak flows, volumes, and nutrient loads over the first years of operation to minimize impacts. These adjustments could minimize impacts to dolphins, oysters, brown shrimp, and other aquatic organisms. Some commenters suggested limits be imposed by USACE, others suggested an operating plan that is tied to specifics, while others emphasized flexibility tied to real-world experiences. CPRA should also consider alternative methods of operating the proposed MBSD Project, such as operating the diversion during winter when water levels in the basin are lower and can accept high volumes of water from the diversion.**

**Response ID: 15999**

The proposed MBSD Operations Plan can be found in Appendix F2 Preliminary Operations Plan of the Final EIS. As stated in the Chapter 4, Section 4.4.4.2.4 Sediment Transport in Chapter 4 Surface Water and Coastal Processes, sediment transported by the Mississippi River is primarily comprised of fine sediments, with higher river flows (typically occurring in the spring) suspending more coarse-grained sediment that are important in delta building (see Chapter 3, Section 3.4 Surface Water and Coastal Processes). Fine-sediment transport through the diversion would be generally proportional to water flow in the river. The intake channel was modeled and designed to divert a high sediment-to-water ratio while minimizing energy loss (to maintain flow and sediment transport through the diversion complex) and

impacts on the river. The amount of sediment carried through the diversion would vary by year, depending on flow rates in the river and the corresponding variation of diversion operations. As explained in Chapter 2, Section 2.8.1.3 Project Operations in Action Alternatives Carried Forward for Detailed Analysis, the Mississippi River discharge of 450,000 cfs would be the standard operations “trigger to open the diversion for flow (above the base flow)”. Operations (with the exception of a base flow up to 5,000 cfs) would cease when the river discharge falls below 450,000 cfs or when certain emergency triggers are met (such as in advance of hurricanes or when a spill of hazardous substances occur in the river). When the Mississippi River flows exceed 450,000 cfs, the gates would be fully opened (above base flow). At river flows of 450,000 cfs, the diversion flow would be approximately 25,000 cfs, and flows would increase proportionally as the river flow increases. This ramp would continue up to maximum diversion capacity flow of 75,000 cfs when the river reaches a flow of 1,000,000 cfs.

An alternative related to operational triggers specific to sediment concentration was considered but determined not to be technically feasible or reasonable because data and technology do not currently exist to support this operational regime (refer to the Eliminated Alternatives Matrix in Appendix D2 of the EIS). According to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS, as part of the adaptive management and monitoring process, CPRA would consider potential ways to optimize diversion operations based on Project performance and success and would assess potential operational changes that may minimize impacts to basin resources where practicable after sufficient operational data become available for analysis.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

**Correspondence ID:40531**

Virginia Richard

Halito, sv hochifo yvt Virginia Richard. MOWA Chahta ohoyo sia. Bvlbancha atalih. Hello, my name is Virginia Richard. I am a MOWA Choctaw woman. I currently live in the city my people have called Bvlbancha long before European arrival. It is also known as New Orleans, LA. I was born and raised in South Louisiana, and have spent most of my life here. I currently work in the environmental non-profit sector and have an insider perspective on how restoration is carried out in our state.

I object to the Mid-Barataria Sediment Diversion (hereafter also referred to as "MBSD") as proposed because the process by which this project has garnered public support embodies the core of what is wrong with how we approach restoration in Louisiana. The Mississippi River levee system is partially to blame for our land loss, but what has been purposefully and conveniently left out of the narrative is accountability for extractive industries. For almost a century, extractive industries have shredded our coastline, thus inducing the rapid decline of wetlands from saltwater intrusion. They are also the biggest drivers of climate change, which is fueling sea-level rise. We will not and cannot move forward in the face of land loss and climate change until we fully hold extractive industries accountable. Unfortunately, the restoration industrial complex of Louisiana is afraid to speak the truth and hold them accountable because these same industries fund a very small portion of the restoration we need.

Secondly, the planners and promoters of the MBSD have decided in their paternalistic wisdom to sacrifice the homes, cultures, and livelihoods of Indigenous people and other people of color whose ways of life will be irreparably altered, for the good of larger tax bases upstream. Additionally affected will be fishers, shrimpers, and others of all ethnicities who make their living from the land and water. It is a shame that these communities are left to seek funding on their own to repair the damages of extractive industry such as spoil banks and open canals. It is a greater shame that they should have to do this while also fighting for their livelihoods. Meanwhile, a well-funded propaganda machine is touting a highly-experimental project using a narrative that conveniently ignores what is easily the biggest source of our woes: extraction.

Additional points to address are:

1. Frontline, and especially Indigenous, communities must have a greater say in restoration processes at all phases, from the very beginning of looking for potential restoration projects, all the way through implementation and monitoring.
  - a. Indigenous communities consulted must include all self-identified Indigenous people, not just state and federally recognized entities. Louisiana has a long and complicated colonial history that has left much of its Indigenous population without state, and more often without federal, recognition.
  - b. To not intentionally include ALL of these communities and to not give their input the same gravity as the input from federally recognized tribes is to be complicit in, and an act of, genocide. To be clear, consultation with federally recognized tribes is insufficient.

c. Consultation with Indigenous and minority communities (regardless of recognition status) does not constitute consent. Consultation with any Indigenous and/or minority community is not sufficient in and of itself.

d. Traditional ecological knowledge (TEK) must be taken into account and considered with equal, if not greater, gravity as academic studies.

2. BEFORE the MBSD is started, ALL canals dug into our wetlands should be filled. All spoil banks left by pipelines should be leveled.

3. All spending for the promotion of the MBSD must be reported to the public in extensive detail. This includes spending from federal and state agencies, foundations, non-profits, businesses, etc.

4. The Mississippi River carries massive amounts of pollution from upstream.

a. Some of that pollution, such as per-and polyfluorinated substances (PFAS), do not exist in nature, do not ever break down (earning the name "forever chemicals"), and have been linked to horrendous side effects in living organisms.

b. Plastic pellets called "nurdles" cause harm to wildlife and humans. Plastics never fully disintegrate; they just get smaller and smaller. Microplastics harbor toxins and bacteria, especially in warmer waters. They have made their way into every part of the food chain and have even been found in human placenta.

On August 2, 2020, CMA CGM Group vessel Bianca released nurdles into the Mississippi River. After almost a year of volunteer clean ups, the river and river banks are still teeming with them. (I helped document and clean up these on a volunteer basis, and know that we have barely made a dent.) Due to the lackluster response from the government and the company involved, it is more than reasonable to expect more spills in the future.

Until nurdles are well-regulated (and this spill is completely cleaned up), it is unsafe to introduce river water into the Barataria Basin.

c. Fertilizer runoff from the Mississippi River into the Gulf of Mexico continues to cause historic "dead zones". Clearly, current environmental regulations are not enough to protect our water from excessive nitrogen and other causes of hypoxia. The water introduced into the Barataria Basin must have a way of having excess nutrients safely removed, and the definitions of acceptable amounts of nutrients must be re-evaluated.

d. Any plan to introduce water from the Mississippi River into the Barataria Basin must come with a comprehensive plan to protect the basin from all types of pollution, at any concentration, especially for pollutants we don't yet fully understand and/or regulate. Anything less is irresponsible for our water, land, wildlife, and humans.

5. Any studies done by institutions funded by any extractive industries should be redone in a completely neutral environment.

6. The possibility of salinating river water upon introduction to the Barataria Basin must be studied.

---

**Concern ID: 61894**

**Consider the alternative of tearing down spoil banks and backfilling abandoned canals before, in addition to, or instead of implementing the proposed MBSD Project.**

**Response ID: 15987**

---

This suggested alternative would not meet the goals and objectives as stated in the purpose and need and described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives. It would not re-establish deltaic processes between the Mississippi River and Barataria Basin through the delivery of sediment, fresh water, and nutrients. However, the EIS acknowledges the influence of canals and spoil banks on wetland losses in Barataria Basin (see Chapter 3, Section 3.6.2.2 in Wetland Resources and Waters of the U.S. of the Final EIS), and has updated the analysis to include additional technical references regarding the influence of canals on the existing environment in the Barataria Basin. The EIS does not describe the proposed Project as a solution to fully reverse ongoing land-loss trends. The EIS recognizes that the proposed Project is projected to create and maintain only a portion of the wetlands that would otherwise be lost in the absence of the proposed Project over the next 50 years.

This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Other similar restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan and the LA TIG through Natural Resources Damage restoration planning.

---

**Concern ID: 61896**

**Add salt injection points directly downstream of the river sediment flow before it gets into the basin so that the volume of fresh water is reduced.**

**Response ID: 15990**

This outfall feature alternative was considered in the Draft EIS but was not fully evaluated because it does not meet purpose and need for the Project because it does not restore the natural deltaic process between the Mississippi River and Barataria Basin through the introduction of fresh water, sediment, and nutrients from the Mississippi River into the Basin. Refer to the Eliminated Alternatives Matrix in Appendix D2 of the EIS. Additionally, the basin will experience periodic introduction of more saline water naturally through tidal processes and storm events. Potential impacts associated with changes in salinity are addressed in Chapter 4, Section 4.5 Surface Water and Sediment Quality.

---

**Concern ID: 61930**

**The proposed MBSD Project is an inequitable use of public funds because its negative impacts fall most directly on marginalized ethnic groups, including African American, Native American, Latin American, Asian American, Canary Islander American (Islenos), and Croatian American and unjustly places the burden on Louisiana's coastal fishers. Risks often fall disproportionately on low-income or minority communities due to ongoing institutional injustices. These low-income and minority communities, including homes, cultures, and livelihoods of Indigenous people and other people of color are often sacrificed for the benefit of the "greater good", particularly for the larger tax bases upstream of the proposed MBSD Project. For example, when the levee breached at Mardi Gras Pass, nothing was done to re-protect the mostly African American oyster farmers and fishers whose oyster farms in Breton Sound were destroyed by the fresh water from Mardi Gras Pass. But a levee breach anywhere else along the Mississippi River would be quickly rebuilt and the impacted people would be**

---

**indemnified. Also, the most effective flood risk reduction solutions, like home buyouts, are not offered to low-income populations in areas south of New Orleans. Both the Draft EIS and the LA TIG's Draft Restoration Plan would benefit from additional reflections on the natural and human history of the Project geography that resulted in such fundamental changes to the landscape and set us on the course of the land-loss crisis that Louisiana faces today. The EIS should describe historic, systemic inequities affecting communities with environmental justice concerns in the Project area to provide authentic and more complete context for the discussions.**

**Response ID: 16281**

The Draft EIS (including Section 4.15 Environmental Justice and Appendix H, Socioeconomics Technical Report at Chapter 2) included a discussion of communities with low-income and minority populations, including information about factors that have contributed to historic and systemic inequities in southeast Louisiana. As discussed in the EIS, the Project may have disproportionately high and adverse, long-term impacts on some low-income and minority populations in communities engaged in commercial and subsistence fishing and dependent on adversely impacted fisheries, as well as communities located near the immediate outfall area (within approximately 10 miles north and 20 miles south) and outside of federal levee protection. In addition, negligible to minor, adverse impacts related to increased risk of levee overtopping during certain 1 percent storm events south of the immediate outfall area may occur, which may impact the community of Ironton. Commenters also raised concerns about Mardi Gras Pass; however, the closure of Mardi Gras Pass is outside of the scope of the EIS.

CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61932**

**Communities with environmental justice concerns, which include all communities who are vulnerable to racial, ethnic, economic, and ecological violence, should be “meaningfully involved” in “the development, implementation, and enforcement of environmental laws, regulations, and policies” during the proposed MBSD Project.**

**Response ID: 16285**

As discussed in Chapter 1, Section 1.6 Scope of the EIS, and Chapter 4, Section 4.15 Environmental Justice, the EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance to identify the impacts that would likely occur if the proposed Project were to be approved. USACE, the LA TIG, and CPRA have engaged communities with environmental justice concerns in development of the EIS. Examples of public outreach provided by USACE for the EIS include special public notices for the permit application, the scoping process and scoping meetings, and public review of and public meetings regarding the Draft EIS. Material and information related to the Draft EIS were made available through Federal Register notices, press releases, social media, the New Orleans District website, newspapers, mail outs to distribution lists, and provision of hard copies of the Executive Summary and other materials to local libraries and community centers.

USACE and the LA TIG also coordinated with the SELA Voice organizations to understand the needs of the local communities, including communities with environmental justice concerns, regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan and during the public comment period. Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the joint virtual public meetings on the Draft EIS and the LA TIG's Draft Restoration Plan. Also, the Public Notice to announce the Draft EIS Notice of Availability, the Executive Summary for the Draft EIS, and the Executive Summary for the LA TIG's Draft Restoration Plan were translated into Spanish and Vietnamese. The consolidated pre-recorded public meeting presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage.

CPRA has engaged in public outreach meetings with the communities projected to be impacted by the MBSD to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts undertaken to better understand and address potential impacts on communities with environmental justice concerns, including low-income and minority populations, such as cultural impacts, are discussed in Chapter 7 of the Final EIS. Refer to the Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62077**

**The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.**

**Response ID: 16242**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62263**

**Commenters expressed concern that plastics and microplastics (including but not limited to PFAS) in the Mississippi River would be introduced into the basin through the proposed MBSD diversion, causing adverse impacts on wildlife and humans. Commenters stated that plastics never fully disintegrate, are poorly regulated, and have made their way into every part of the food chain. One commenter witnessed a major spill in the river of plastic pellets called “nurdles” that was never fully cleaned up.**

**Response ID: 16435**

The USACE acknowledges that microplastics and PFAS in surface water are currently not regulated. There are currently no data to determine whether PFAS concentrations in the Mississippi River are significantly different from concentrations in the Barataria Basin. There are no standards to evaluate whether PFAS concentrations are unacceptably elevated in the river or the basin.

The Draft EIS acknowledges that accidents and spills can occur unexpectedly in the river or in the basin. Public and private emergency response teams are available to minimize damage from such accidental releases. As described in Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed. Also in response to this concern, the USACE has added a new subsection to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of accidental spills of hazardous substances in the river during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills in the Mississippi River.

---

**Concern ID: 62264**

**The commenter expressed concern that the Draft EIS understates the proposed Project's potential impacts on nitrogen and phosphorus in the Barataria Basin and requested that the Final EIS explain how nitrogen (N) to Phosphorus (P) ratios (N:P) indicate the health of waters. While a portion of LDEQ's narrative nutrient criteria calls for the maintenance of natural N:P ratios, this does not account for the fact that while ratios might remain relatively constant, the loading of N and P would certainly increase, likely resulting in increased algal growth (and potentially toxic algae blooms and hypoxic areas). The Draft EIS only refers to half of LDEQ's narrative nutrient criteria, leaving out the half stating that nutrient concentrations that produce aquatic growth that it creates a public nuisance or interferes with designated water uses shall not be added to any surface waters. (L.A.C 33:IX.1113.B.8). The commenter further explained that this portion of the criteria is arguably the most important, as it refers to actual impacts of nitrogen and phosphorus pollution. The commenter stated that the**

---

**Draft EIS also fails to consider USEPA or other proposed numeric criteria. It is difficult to understand how the authors can make impact determinations when no consideration was given to half of the narrative nutrient criteria and no numeric nitrogen and phosphorus goals are given.**

**Response ID: 16438**

In response to this comment, the USACE has added the full narrative nutrient criteria statement to Chapter 3, Section 3.5.2.4 in Surface Water and Sediment Quality and to Chapter 4, Sections 4.5.5.3 and 4.5.5.4 in the Surface Water and Sediment Quality. As explained in Section 3.5.2.4, “the EPA generated sub-ecoregion reference condition metrics for total nitrogen (0.71 milligrams/liter[mg/L]) and total phosphorus (0.125 mg/L) for the Mississippi River and Barataria Basin concentrations (USEPA 2001). It is important to note that the reference metrics provide a numerical value to compare the Mississippi River and the Barataria Basin nutrient concentrations and are not intended to be used to evaluate waterbody status relative to the current narrative nutrient criterion.” The USEPA reference metrics, however, are not enforceable criteria.

Proposed Project impacts associated with nutrient loading and algal blooms are addressed in Section 4.10.4.4 in Aquatic Resources of the Final EIS. A reference to Section 4.10 is included in Section 4.5.5.3 in Surface Water and Sediment Quality of the Draft EIS. A reference to Section 4.10 Aquatic Resources has been added to Section 4.5.5.4 (Phosphorus) of the Final EIS. Clarifying language has been added to Sections 4.5.5.3, 4.5.5.4, and 4.25.5.4 in Cumulative Impacts. Appendix R2 Monitoring and Adaptive Management (MAM) Plan includes proposed monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species), in the Barataria Basin during proposed Project operations to guide CPRA’s management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

---

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62421**

**A well-funded propaganda machine is touting a highly-experimental project using a narrative that conveniently ignores what is easily the biggest source of the local communities' woes: extraction; these communities are left to seek funding on their own to repair the damage from these industries such as spoil banks and open canals.**

**Response ID: 15953**

Comment noted; however, this comment raises concerns that are outside the scope of this EIS.

---

**Concern ID: 62422**

**All spending for the promotion of the MBSD must be reported to the public in extensive detail. This includes spending from federal and state agencies, foundations, non-profits, and businesses.**

**Response ID: 15862**

The commenter's recommendation is noted, but is outside the scope of this EIS. Financial reporting regarding the LA TIG agencies' budgets and amounts expended is available through the Deepwater Horizon DIVER database. <https://www.diver.orr.noaa.gov/web/guest/diver-explorer?siteid=9&subtitle=DWH%20Natural%20Resource%20Damage%20Assessment%20Data>. USACE does not have information regarding expenditures by agencies and/or organizations to promote the proposed MBSD Project.

---

**Concern ID: 62423**

**Any studies completed by institutions funded by extractive industries should be redone by a neutral party.**

**Response ID: 15954**

The authors and agencies involved in the EIS analysis utilized the best information and data available to them to develop a comprehensive document that considers the beneficial and adverse impacts of the proposed Project. USACE is neither a proponent for nor an opponent of the proposed Project. Studies utilized in the EIS were reviewed and considered by USACE's independent third-party contractor, GEC, and its experts for technical acceptability. GEC executed an Organizational Conflict of Interest statement attesting that it does not have an interest in the outcome of the permitting process. USACE independently evaluated and verified the EIS for its accuracy, scope, and contents.

---

**Concern ID: 62499**

**Several Indigenous Peoples of the State of Louisiana are already experiencing losses of important cultural sites and historic territories due to erosion. They should have been consulted. The commenter understands there is no legal obligation, but state-recognized Tribal Nations like the United Houma Nation, Pointe Aux Chien Indians, and the Isle de Jean Charles Band of the Biloxi-Chitimacha-Choctaw-Muskogee Creek Indians would be MOST affected by this sediment diversion; so it stands to reason that there is an ethical obligation to invite and collaborate with their council. The fact that the state has recognized many of these Native Nations even if the federal government**

---

**does not implies an obligation to consult with all Indigenous Peoples in an area that would be impacted by a state-sponsored project.**

**Response ID: 16457**

The USACE acknowledges the commenter's concern about ensuring that all potentially affected Tribal Nations be invited to participate in the Section 106 consultation process. As indicated in Chapter 4, Section 4.24 Cultural Resources of the Draft EIS, cultural resources consultations have been conducted in accordance with Section 106 of the NHPA. Appendix K Cultural Resources Information of the EIS includes the PA negotiated between the Section 106 consulting parties regarding the proposed Project. The PA explains the outreach conducted by the USACE to Tribal communities, identifies the Tribal Nations that decided to participate in the Section 106 Process, and explains that the USACE has and would continue to consult with any interested Tribal Nation who may have not yet requested to consult.

---

**Concern ID: 62882**

**The understated cause of coastal land loss is dredging canals and building spoil banks, which diversions do not address.**

**Response ID: 15834**

The EIS acknowledges the influence of canals and spoil banks on wetland losses in Barataria Basin (see Chapter 3, Section 3.6.2.2.4 in Wetland Resources and Waters of the U.S. of the EIS), and the analysis has been updated in the Final EIS to include additional technical references regarding the influence of canals on the existing environment in the Barataria Basin. The EIS does not describe the proposed Project as a solution to fully reverse ongoing land-loss trends. The EIS recognizes that the proposed Project is projected to create and maintain only a portion of the wetlands that would otherwise be lost in the absence of the proposed Project over the next 50 years. In addition, Chapter 1, Section 1.2.1 in Project Background and Chapter 3, Section 3.1.4 in Introduction describes the historical reasons for coastal land loss within the Barataria Basin and notes that as a result of this coastal land loss, various agencies and non-governmental organizations have implemented coastal protection, restoration, and rehabilitation projects within the basin. CPRA has identified the proposed Project for implementation based on the recommendations in its Coastal Master Plan and identified large-scale sediment diversions as a restoration tool for sustainable ecosystem restoration to counter the basin-wide effects of erosive processes such as sea-level rise and subsidence.

---

**Concern ID: 62883**

**Frontline, and especially Indigenous, communities must have a greater say in restoration processes at all phases, from the very beginning of looking for potential restoration projects, all the way through implementation and monitoring. Traditional ecological knowledge (TEK) must be taken into account and considered with equal, if not greater, gravity as academic studies. CPRA should have meetings that include these Indigenous people, their voices, their understanding of the natural world and their compassion for the other entities of the coast.**

**Response ID: 16404**

USACE and the LA TIG, including CPRA, acknowledge the comments and seek engagement and participation from all communities, the public, agency, and stakeholder groups wishing to be involved in the EIS and Restoration Plan processes. USACE and LA TIG coordinated with

the SELA Voice organizations to understand the needs of the local communities, including Indigenous communities, regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan. Recommendations for where to make the Draft EIS and the LA TIG's Draft Restoration Plan available so it would be accessible to disadvantaged individuals and groups, as well as recommendations regarding translation of materials related to the Draft EIS and Restoration Plan, were implemented.

Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area, in an effort to reach out to community groups to gather information related to the proposed MBSD Project. In addition, CPRA has engaged the public through numerous meetings with the communities projected to be impacted by the proposed MBSD Project, including several Indigenous communities, to solicit input on mitigation and stewardship strategies. This includes reaching out to local non-profits to assist with and facilitate meetings with the impacted communities, including low-income, minority, and Indigenous communities. This input has resulted in substantial revisions to CPRA's Mitigation and Stewardship Plan since the release of the Draft EIS (see Appendix R1 to the Final EIS). A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. CPRA acknowledges the suggestion to consider traditional ecological knowledge and would take these suggestions into consideration for future engagement efforts. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 to the Final EIS for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

Also, as explained in Chapter 4, Section 4.24 Cultural Resources of the Final EIS, cultural resources consultations have been conducted in accordance with Section 106 of the National Historic Preservation Act. The Section 106 Consulting Parties included USACE (the lead federal agency), the State Historic Preservation Office, the Advisory Council on Historic Preservation, CPRA (the Applicant), LA TIG, and federally recognized Tribal Nations who expressed historic ties to the Barataria Basin. The Programmatic Agreement developed for the proposed Project through the NHPA Section 106 consultation sets forth the alternative mitigation to be implemented by CPRA as part of implementing the Project. This alternative mitigation involves a comprehensive research project regarding the historical cultures of the Indigenous Tribes of Southeastern Louisiana focusing on the Barataria Basin and the larger southeastern Mississippi River delta region to prepare a comprehensive ethnohistoric overview documenting Native American presence and history. A website and public education materials are included as products to be developed through the alternative mitigation. See Section 4.9 of the Final Mitigation and Stewardship Plan for the proposed Project (in Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement.

Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63202**

**There needs to be a plan to protect the basin from pollution introduced from the Mississippi River into the Barataria Basin.**

**Response ID: 16570**

Chapter 3, Section 3.5.1.1 Water Quality Standards and Dedicated Uses - Mississippi River of the Draft EIS considered the commenter's concern regarding the potential for the Project to introduce pollution from the Mississippi River into the basin and explains that the Mississippi River fully supports designated uses for the river established by the Environmental Protection Agency and the Louisiana Department of Environmental Quality. However, the designated uses for the Mississippi River may be different from the designated uses for other waterbodies in the Barataria Basin. The Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Final EIS) includes monitoring of a variety of water quality related parameters, which would start prior to construction and continue throughout the Project's implementation.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in

---

the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63843****Nutrients in diverted water should be monitored and removed before reaching Barataria Basin.****Response ID: 16692**

The issue raised by the commenter on monitoring nutrients in diverted water was considered in the Monitoring and Adaptive Management (MAM) Plan included with the Draft EIS (Appendix R2); no changes were made in the MAM Plan in response to this comment. CPRA has proposed to measure Mississippi River nutrient concentrations on a biweekly basis during operational events (above baseflow), and quarterly during base flow conditions. This information will be used to calculate, in conjunction with measurement of the water volume conveyed into the Barataria Basin, the nutrient loads conveyed into the Barataria Basin. CPRA also proposes to measure nutrient levels in Barataria surface waters on a monthly basis.

Chapter 4, Section 4.6 (Wetland Resources and Waters of the U.S.) of the Draft EIS also discussed how wetlands created by the Project would likely absorb the additional nutrients diverted to the basin, thereby reducing the potential negative impacts of nutrients in Mississippi River water. In response to commenters' concerns, a discussion of the Gulf Hypoxia Action Plan has been added to Chapter 4, Section 4.25.5 (Cumulative Impacts - Surface Water and Sediment Quality) of the Final EIS.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not

---

know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:40532**

Kindra Arnesen

The Louisiana CPRA Mid- Barataria river diversion if built will have widespread negative impacts to coastal communities throughout Louisiana and the surrounding Gulf states. Plaquemines Parish house's the largest commercial fishing fleet in Louisiana. Our way of life depends on the health and sustainability of the estuaries and Fish stocks the system supports this is true in both state and federal fisheries. The fallout area of the mid Barataria diversion is essential fish habitat. The importance of this area is immeasurable not only as a food source here on the coast but for our entire country. While sustaining the culture heritage and way of life for coastal communities this area is a nursery and provides the food source for species throughout the northern Gulf of Mexico. This includes migratory species that populate the East Coast such as bluefin tuna. Considering the projected change in salinity levels, this project will cause [REDACTED] widespread damages including oyster and brown shrimp mortality, the extinction of the Barataria Basin Dolphins. Create a forced mass migration of fishery effort sending vessels into other areas causing increase pressure on stocks in these areas. This area should be protected by the Magnuson Steven fisheries conservation and management act of 1976 [REDACTED]. No permit should be issued as this project will violate federal law. The project also violates the oil pollution act of 1990 regarding the standards of collateral injury that the project would cause. River water impacts associated with existing diversion are undeniable. The CPRA has no real plan to mitigate the damages to the mid Barataria diversion project will cause. This project also is in direct violation of the PP ordinance 14 - 52 [REDACTED]. Ordinance prohibits the granting of any permits in Plaquemines Parish regarding the construction and development or employment patient of additional freshwater sediment diversion projects. Over the last five years I've attended meetings held by the CPRA in multiple communities people throughout coastal communities. People throughout coastal communities have asked for an alternative to the planned diversion. The CPRA has refused to even consider an alternative to this destructive project. Dredging is a proven method to build land. The river diversion will do more harm to the existing vegetation this will increase land lose we can build our coast back without large scale river diversions. [REDACTED]

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned

coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62077**

**The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of**

---

**seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.**

**Response ID: 16242**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of

---

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62083**

**Commenters suggested that shrimping, fishing, and oysters would disappear in the Barataria Basin because of the fresh water diluting the salinity to a level that cannot sustain breeding of these species.**

**Response ID: 16247**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS described impacts of the proposed Project on finfish and shrimp and oyster species. As described, impacts may include those associated with changes in salinity. As summarized in EIS Section 4.14.5 in Commercial Fisheries, as compared to the No Action Alternative moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative sometime after 2050. While abundance of shrimp and oysters would decline under the Applicant's Preferred Alternative (as compared to the No Action Alternative), the EIS impact analysis does not anticipate shrimp and oysters would disappear from the basin. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS

---

(Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the

proposed Project. Impacts related to subsistence activities are discussed in Section 4.15 Environmental Justice.

---

**Concern ID: 62492**

**Commenters suggested that no permit should be issued as this Project would violate federal law.**

**Response ID: 15746**

Table 5.1-1 in Chapter 5, Section 5.1 Compliance with Laws, Regulations, and Executive Orders summarizes the Project's status of compliance with applicable federal statutes, executive orders, and policies. Final EIS Appendix S (Compliance Documentation) provides associated documentation of this compliance.

---

**Concern ID: 62504**

**This area should be protected by the Magnuson-Stevens Fisheries Conservation and Management Act of 1976.**

**Response ID: 15747**

Estuarine and marine areas within the Project area are considered Essential Fish Habitat under the Magnuson-Stevens Fishery Conservation and Management Act. As required by that Act, USACE and the LA TIG formally requested essential fish habitat (EFH) consultation with NMFS on February 24, 2021, regarding the proposed Project. As a cooperating agency in the development of the EIS, NMFS provided technical input for the development of an EFH assessment. NMFS reviewed the EFH assessment and concurred with the USACE's findings of impacts on federally managed fisheries from the construction and operation of the proposed Project. NMFS included two conservation recommendations in its concurrence letter. USACE and the LA TIG provided interim responses to the NMFS concurrence letter, both noting that they would provide a final response prior to the issuance of any Record of Decision for the Project. The EFH assessment, NMFS concurrence, and the USACE and LA TIG responses can be found in the Final EIS Appendix N (Aquatic Resources including Essential Fish Habitat Assessment).

---

**Concern ID: 62506**

**Commenters noted that this Project is in direct violation of the Plaquemines Parish ordinance 14 - 52 which prohibits the granting of any permits in Plaquemines Parish regarding the construction and development of additional freshwater sediment diversion projects.**

**Response ID: 15989**

The permit applicant, CPRA, is responsible for compliance with local laws and regulations applicable to the Project.

---

**Concern ID: 62634**

**The proposed Project would cause excessive harm to fisheries (for example, oysters and brown shrimp), dolphins, communities and recreational uses, which is unacceptable and would make its implementation a clear violation of OPA. OPA regulations states that proposed restoration actions should be evaluated by "the extent to which each alternative will prevent future injury as a result of the incident, and avoids collateral injury as a result of implementing the alternative". Because the Project would injure species that were harmed by the Deepwater Horizon oil spill, it**

---

**should not be implemented, even if it does benefit some habitats and species. Some commenters argued it was also inconsistent or in violation of the 2013 U.S. Court Consent Decree and the BP plea agreement relevant to the National Fish & Wildlife Foundation (NFWF) funds.**

**Response ID: 16650**

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is not evaluating the proposed Project for compliance with OPA and not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG's Draft Restoration Plan, OPA, or NRDA processes represent solely the views of the LA TIG, not USACE.

The potential collateral injuries of the proposed Project were considered in the LA TIG's Draft Restoration Plan.

OPA requires that Trustees develop and implement a plan for restoration, rehabilitation, replacement, or acquisition of the equivalent, of the injured natural resources under their trusteeship. See 33 U.S.C. § 2706(c). OPA further requires federal agencies to propose regulations for the "assessment of natural resource damages." See § 2706(e). Under 2707(e)(2), any assessment of natural resource damages made in accordance with these regulations creates a rebuttable presumption on behalf of a Trustee in any administrative or judicial proceeding under the Act.

As required by OPA 2706(e), NOAA developed regulations outlining a process for the assessment of natural resource damages. These regulations (hereinafter "NRDA regulations" at 15 CFR Part 990) also include a process for restoration planning, including the development and evaluation of restoration alternatives.

The 2016 U.S. Consent Decree with BP provides that monies received under the settlement for natural resource damages will be spent as outlined in restoration plans adopted by the Trustees consistent with 15 CFR 990. See Paragraph 19, and Appendix 2. The LA TIG's Restoration Plan is consistent with 15 CFR 990.

Title 15 CFR §990.54 of the regulations outlines a number of areas in which a reasonable range of alternatives should be evaluated to select the preferred alternative. Recognizing that almost all restoration comes with some potential for collateral injury, one factor for evaluation is the extent to which each alternative will prevent future injury and avoid collateral injury. The potential for collateral injury does not preclude an alternative from selection, rather the Trustees must evaluate each alternative under multiple factors, and select a preferred alternative to meet the outlined restoration objectives.

The LA TIG, in selecting the Preferred Alternative in the Restoration Plan, evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 (Identification of a Preferred Alternative), 3.2.1.5 (Alternative 1 – Avoids Collateral Injury), and 3.2.2.5 (Alternatives 2–6 – Avoids Collateral Injury) of the Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems and necessarily entails reverting the current

---

ecosystem to a more natural state that was altered when Mississippi River flows were cut off by construction of levees. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the Preferred Alternative in the Restoration Plan.

The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Alternative 1 – Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as the Preferred Alternative in the Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project would meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the spill.

The BP Plea Agreement as it applies to NFWF funds is not relevant here as the LA TIG is not authorizing the use of those funds for this Project. Even if it were applicable, the criminal plea agreement expressly contemplates the use of criminal penalties for sediment diversion in Louisiana.

---

**Concern ID: 62771**

**The estuary provides a food source and nursing grounds for many species of fish (including migratory species), invertebrates, aquatic insects, which are threatened by this proposed Project.**

**Response ID: 16149**

The impacts to the Barataria Basin from the proposed Project were discussed throughout Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS, which included both adverse and beneficial impacts on area flora and fauna, based on the specific life histories and habitat preferences.

---

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62784**

**Prior or proposed diversions and diversion-like projects (including the Caernarvon Diversion, MRGO, Mardi Gras Pass, Maurepas Bonnet Carré Spillway openings) did not work or caused adverse impacts on area resources.**

**Response ID: 16366**

The commenter's concern regarding the effectiveness and adverse impacts of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the Caernarvon Diversion, MRGO, Mardi Gras Pass, and Bonnet Carré Spillway, is available in Appendix U of the Final EIS. The Maurepas Diversion is subject to an ongoing NEPA analysis, which is anticipated to be finalized in 2022.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The referenced projects all had unique goals, and, where goals existed, each of those projects have achieved their goals. Those achievements increase confidence in the ability of the LA TIG to set goals and select approaches appropriate for achieving those goals. The proposed Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the current geomorphological features of the Lower Mississippi River, as well as data and knowledge gained from the referenced projects.

---

**Concern ID: 62986**

**The Project would drive decreases in salinity that would reduce the overall health, survival, and reproduction of bottlenose dolphins that reside in the Barataria Basin, a species that was negatively affected by the Deepwater Horizon oil spill (NMFS, 2013).**

---

**Some commenters felt that because of this, the Project should either not move forward or its operation should be altered.**

**National Marine Fisheries Service (NMFS). 2013. Roy Crabtree (NMFS) to Elizabeth Davoli (CPRA). <https://s3.documentcloud.org/documents/726710/national-marine-fisheries-service-comments-on.pdf>**

**Response ID: 16701**

The concerns raised by the commenters about the projected decreases in salinity and resulting effects on Barataria Bay dolphins were considered in the Draft EIS. More specifically, Chapter 4, Section 4.11.5.2 in Marine Mammals of the EIS acknowledges that the proposed Project would likely have significant, adverse impacts to Barataria Basin dolphins, a species that suffered significant impacts from the DWH oil spill. This section also discusses the physiological changes caused by exposure to low-salinity water, the duration of those changes that leads to mortality, and the anticipated mortality of a large portion of the dolphin population in the Barataria Basin within the first decade. These sections of the EIS provide a more in-depth analysis of potential impacts to dolphins than the letter cited by the commenter.

The concerns raised by the commenters were also considered in the LA TIG's Draft Restoration Plan (see Section 3.2.1.5 [Collateral Injury]); the Final Restoration Plan has been edited consistent with changes made to the Final EIS and see below regarding new, related content included in Appendix R.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources, like dolphins, that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the

---

proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible (if it is possible), the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins in Louisiana (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63181**

**CPRA has no real mitigation plan.**

**Response ID: 16558**

The Draft EIS contained CPRA's Mitigation and Stewardship Plan in Appendix R1.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 64168**

**Commenter questions the viability of workplace substitutions to other fishery species or industries and notes that these types of substitutions are not likely to fully offset the adverse impacts.**

**Response ID: 16265**

---

The impacts raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14 Commercial Fisheries of the Draft EIS discussed the potential impacts on commercial fishing activities, which includes a discussion of potential behavioral changes that fishers may make in response to changes in species availability, including substitution of fish species, taking longer trips, and upgrading gear. While substitution of species may occur, such changes have costs that the fishers would incur.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be

listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Re: Draft Restoration Plan and Environmental Impact Statement: Mid-Barataria Sediment Diversion

Dear U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

I would like to provide comments to the U.S. Army Corps of Engineers, other cooperating agencies, and the Louisiana Trustee Implementation Group on the Draft Environmental Impact Statement (DEIS) and Phase 2 Restoration Plan #3.2 for the Mid-Barataria Sediment Diversion.

First and foremost, I would like to express my full support for the identified preferred alternative in the Draft EIS for the project, and the proposed use of funds from the Deepwater Horizon Oil Spill to implement the project.

I am a proud Louisianan - born and raised. I care deeply for the people of this state; all of the people across all of the state. I am also a trained ecologist and wildlife biologist; and I have studied and been witness to the deterioration of our natural ecosystems because of extreme anthropogenic changes. In Louisiana, that has notably included the extensive levee system built along the Mississippi River, albeit well intentioned, that severed the vast majority of the delta from the freshwater and sediment input needed to sustain land in the face of rising sea level. The Mid-Barataria Sediment Diversion will reintroduce a component that is critical to the longevity of this ecosystem and region – prolonged sediment input.

The Barataria Basin was also one of the most impacted areas during the 2010 Deepwater Horizon oil spill. The Mid-Barataria Sediment Diversion would help address the injuries to wetland habitat associated with the 2010 oil disaster.

I commend the Coastal Protection and Restoration Authority for being at the forefront of climate adaptation planning with the Coastal Master Plan. Within the Coastal Master Plan, the Mid-Barataria Sediment Diversion is a large-scale restoration project that will work in concert with nearby marsh creation projects; it will greatly extend the life of those nearby projects, as well as the millions of dollars that have already been invested in them and the surrounding area.

Over 30 decades of research have gone in to understanding how to maximize the land building power of a sediment diversion. And I have had the privilege to witness fist hand the land building power that a diversion from the Mississippi River can have – Davis Pond, Caernarvon, and Mardi Gras Pass are all building land. I have also seen the rookeries of nesting birds – herons, egrets, ibis and spoonbills – that these outfall areas now support, which is further indicative of a rebounding food-web and ecosystem.

However, because the diversion will inevitably cause changes to the abundance and distribution of some fish and wildlife species, I would also like to see the development of a robust adaptive management program that functions with utmost transparency and includes as many people and agencies as is feasible in that process. Furthermore, I support the use of mitigation funds for the commercial fisheries and communities who will be most impacted by the diversion.

It is an unfortunate fact that without the diversion this ecosystem, and the added storm surge buffer that it provides, will suffer irreversible degradation. Ultimately, I believe the cumulative benefits of the Mid-Barataria Sediment Diversion have been established in the DEIS.

I support restoration and risk reduction projects that have the greatest potential benefit. For that reason, I support the Mid-Barataria Sediment Diversion project.

With gratitude,

Katie Percy

Baton Rouge, Louisiana

---

**Concern ID: 61737**

**The construction of levees along the Mississippi River precluded land-building sediments from entering Louisiana estuaries, which has caused a loss of Louisiana's coastal wetlands and other problems, such as making properties more vulnerable to hurricane damage and decreasing property values.**

**Response ID: 16024**

The impacts raised by the commenters were considered in the Draft EIS. Information about historic causes of land loss can be found in Chapter 3, Section 3.1.4 Overview and History of the Project Area and Section 3.6.2 in Wetland Resources and Waters of the U.S. The importance of maintaining wetlands for the protection of coastlines, coastal communities, and wildlife resources is discussed in Sections 3.6 Wetland Resources and Waters of the U.S. and 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the EIS. As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the Applicant's Preferred Alternative is to implement a large-scale sediment diversion in the Barataria Basin that would reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

---

**Concern ID: 61848**

**Commenters expressed the opinion that the Mid-Barataria Sediment Diversion Project would help support and enhance the lifespan of other coastal restoration and protection projects.**

**Response ID: 16462**

The commenters correctly note that, as discussed in Chapter 4, Section 4.25.6 Cumulative Impacts, Wetland Resources and Waters of the U.S., "Cumulative impacts on wetland accretion from operation of the reasonably foreseeable future projects combined with operation of the MBSD Project action alternatives would likely result in fewer losses in

---

wetlands in both the Barataria Basin and birdfoot delta, but most notably in the Barataria Basin, where implementation of the MBSD Project action alternatives would prevent the loss of an additional 26,000 acres.”

---

**Concern ID: 61870**

**If no action is taken, the resources may suffer even greater impacts in the future, along with the local ecology, economy, communities, and culture.**

**Response ID: 15941**

The concerns raised by the commenters were considered in the Draft EIS. The EIS evaluates anticipated conditions in the Barataria Basin if no action is taken. Within the EIS, the No Action Alternative enables a comparison of anticipated future conditions without the proposed Project to anticipated future conditions with the proposed Project and the alternatives. Refer to Chapter 4 Environmental Consequences of the EIS, for a description of anticipated conditions under the No Action Alternative for each of the resource areas evaluated. The Delft3D Basinwide Model was used to forecast conditions that would occur under the No Action Alternative which helped to inform the analysis in Chapter 4.

---

**Concern ID: 62211**

**The Project would provide prolonged sediment input so critical to this ecosystem and region.**

**Response ID: 16423**

The Draft EIS considered the benefits of sediment that the proposed Project would deposit into the Barataria Basin. It can contribute in numerous ways, including by being resuspended and transported elsewhere for deposition and by forming a base layer upon which future pulses of sediment can form marsh or land. These benefits are discussed in Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology; Section 4.4.4 Hydrology and Hydrodynamics; and in Section 4.6 Wetland Resources and Waters of the U.S.. These processes are part of the model computations described in Appendix E Delft3D Modeling and are fully incorporated in the results and conclusions of the Draft EIS. No related edits have been made to the Final EIS.

---

**Concern ID: 62662**

**The proposed Project is likely to succeed because other diversions have also built land and restored ecosystems. Specific examples of land-building projects include the Caernarvon Freshwater Diversion, Davis Pond, West Bay, Fort St. Phillip, the Jaws, Wax Lake, and Mardi Gras Pass. Many of the benefits of the Project, in terms of soil creation and microbial processes, are not captured in the engineering of the modeling. Many of the fine sediments transported by the diversion cannot be dredged but are critical soil components.**

**Response ID: 16635**

The benefits to land building of fine sediments transported by the diversion were addressed in the Draft EIS in Chapter 4, Section 4.2.3.2 Operational Impacts in 4.2.3 Geology, Topography, and Geomorphology. The Delft3D modeling conducted for the EIS distinguishes the types of sediment (sands and fine sediments) that would be deposited in the basin. Table 5.2-1 in EIS Appendix E Delft3D Modeling lists the sediment classes included in the model. As described in EIS Chapter 4, Section 4.4.4 Hydrology and Hydrodynamics, sand and fine

sediments would contribute to land building in the basin in two ways - by being resuspended and transported elsewhere for deposition and by forming a base layer upon which future pulses of sediment could form marsh or land. The model's physics-based computations showed that the coarser sands would settle out before the finer sediment. As the sediment builds up, discharge velocities would increase over the previously deposited sediment and resuspend it, pushing it farther into the basin. Thus, the model reproduces the natural process of delta building in which successive waves of sediment push farther out, either forming land/marsh or creating a base upon which land/marsh can be formed without moving it by dredging and placement. In addition, Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology of the EIS discusses the geomorphic impacts of diversion operations, including the Wax Lake Outlet, the Caernarvon Freshwater Diversion, the Davis Pond Freshwater Diversion, the Bohemia Spillway, and Bonnet Carré Spillway, and Mardi Gras Pass.

The likelihood of the Project's success and its potential benefits were considered in the LA TIG's Draft Restoration Plan. As part of evaluating the Project and alternatives, the LA TIG considered the likelihood that the Project would succeed and achieve the LA TIG's goals. Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the LA TIG's Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, these sections note that the knowledge gained through the projects noted by the commenters has been applied in designing the Project and evaluating whether and how the Project would restore and sustain critical marshlands. A full description of the range of benefits that would be provided by the Project is also included in Section 3.2.1.6 Benefits Multiple Resources of the Restoration Plan.

---

**Concern ID: 62675**

**Commenters noted that the impacts of the DWH oil spill on wetlands, wildlife, birds, communities, and land loss are still felt by this region and in particular, Barataria Basin where 95 percent of the oiling occurred. These impacts are exacerbated by decades of saltwater intrusion, sea-level rise, and subsidence.**

**Response ID: 16497**

The impacts of the DWH oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss of the EIS notes the ongoing impact of the DWH oil spill on wetlands, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species of the EIS provides an overview of the adverse impacts of the oil spill on key aquatic species within the Barataria Basin.

The LA TIG agrees with the commenters that the impacts of the DWH oil spill are significant in this region and thus the LA TIG is committed to continuing to plan and implement significant restoration projects like the LA TIG's Preferred Alternative in the Restoration Plan. The LA TIG's Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin. These habitats are critical components of the broader northern Gulf of Mexico ecosystem and suffered the greatest degree of oiling in Louisiana due to the DWH oil spill.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates**

---

**knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63133**

**Commenters support the proposed mitigation measures for the commercial fishing industry.**

**Response ID: 16517**

---

The comments received in support of the Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) are acknowledged. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

---

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63332**

**A large number of commenters expressed general support for the proposed Project.**

**Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:40535**

John Hancock

We live in a time that forces us to make difficult choices. Do we choose to prioritize the economic well-being of one industry or the economic sustainability of the region at large? Do we choose to protect a small number of ecological niches or do we attempt to restore and protect the regional ecology over the long term. This project raises fundamental ethical questions about humankind's relationship with nature. The costs of this project are high, but I fear the cost of inaction will be far more consequential. I support this project because it restores the natural role the river has played in this region, will restore local ecology lost to rising sea levels, and will protect the greater economic region from the devastating impacts of climate change.

---

**Concern ID: 61854**

**The cost of the proposed Project is a sound investment. More specifically, \$2 billion seems a reasonable price for decades of extension of habitat and use. Even though the cost of the Project is high, the price of inaction would be far greater.**

**Response ID: 16619**

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

The LA TIG acknowledges commenters' belief that the Project would be a sound investment. As part of the OPA analysis, the LA TIG considered the cost to carry out the Project consistent with the Restoration Plan alternatives evaluation criteria, 15 CFR §990.54. The cost to carry out the Project was evaluated in Section 3.2.1.2 Cost to Carry Out the Alternative of the LA TIG's Draft Restoration Plan. The LA TIG has found that the Project costs are commensurate with achieving the goals of comprehensive integrated ecosystem restoration intended to persist for decades even in the face of rising sea levels and continued coastal erosion.

---

**Concern ID: 61880**

**Commenter expressed concern regarding societal choices the Project presents such as whether to prioritize the economic well-being of one industry or the economic sustainability of the region at large.**

**Response ID: 15836**

Under NEPA, the EIS was prepared to analyze environmental impacts, both beneficial and adverse, that may result from construction, operation, and maintenance of the proposed MBSD Project and its reasonable alternatives. Proposed measures to avoid, minimize, and mitigate impacts on resources were also suggested by CPRA and have been summarized in Chapter 4, Section 4.27 Mitigation Summary and in CPRA's Final Mitigation and Stewardship Plan in Appendix R1 of the Final EIS. As part of its decision-making process, USACE will conduct a public interest review in which the project's probable harms will be weighed against its prospective benefits.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62348**

**Commenters note that humans should be good stewards of our environment as it supports life on earth, and note some of the benefits of ecosystem restoration.**

**Response ID: 15792**

Comment noted. The Draft EIS considered the various effects of the Project on the natural and human environment.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

**Correspondence ID:40536**

Devon Turner

As a resident of Port Sulphur, LA in southern Plaquemines Parish, I love the people and land that I call home. Land loss in southern Plaquemines is real, and I support the diversion project to rebuild that land which is so crucial to our long-term presence on maps. Louisiana and Plaquemines Parish also have a detailed history of sacrificing the people of color and working people of this part of the parish for the "greater good," for the benefit of people in the more populated northern half of the parish, the city of New Orleans, and/or white business owners who do not reside in the parish. The Bohemia Spillway project is just one example. The destruction of local levees to lessen flooding in other areas of the region is another. Louisiana and Plaquemines Parish also have a longstanding history of engaging in racist practices when it comes to allocating resources. For example, when large land owners and businesses receive governmental supports, they do not often trickle down to the workers that sustain their businesses.

I appreciate the mitigation efforts outlined in the draft proposal and presented in the slides during the April community sessions. More specifically, I support the aspects of the proposal that provide supports for folks in the seafood industry to adapt (provisions for grants to access new technologies and materials and trainings to develop skills) and supports for homeowners who may experience more flooding.

I am also advocating for these additional measures: (1) monetary support or sufficient compensation for seafood industry workers who experience a loss in income during the adaptation period; (2) access to capital for people who rent or are contracted by "water barons" (and whose employment relationships is more akin to debt peonage) to purchase equipment and materials to go into business for themselves; (3) the prioritization of support for historically marginalized groups and lower Plaquemines Parish residents; and (4) the direct involvement of people most impacted by the diversion project in the planning and implementation of mitigation efforts.

If not already addressed in the mitigation plan, I believe the above additional measures would further advance the equitable implementation of the project and mitigation efforts. If these or similar measures are not adopted, the diversion project planners must address how they will ensure the equitable allocation of resources.

---

**Concern ID: 61930**

**The proposed MBSD Project is an inequitable use of public funds because its negative impacts fall most directly on marginalized ethnic groups, including African American, Native American, Latin American, Asian American, Canary Islander American (Islenos), and Croatian American and unjustly places the burden on Louisiana's coastal fishers. Risks often fall disproportionately on low-income or minority communities due to ongoing institutional injustices. These low-income and minority communities, including homes, cultures, and livelihoods of Indigenous people and other people of color are often sacrificed for the benefit of the "greater good", particularly for the larger tax bases upstream of the proposed MBSD Project. For example, when the levee breached at Mardi Gras Pass, nothing was done to re-protect the mostly African American oyster farmers and fishers whose oyster farms in Breton Sound were**

---

**destroyed by the fresh water from Mardi Gras Pass. But a levee breach anywhere else along the Mississippi River would be quickly rebuilt and the impacted people would be indemnified. Also, the most effective flood risk reduction solutions, like home buyouts, are not offered to low-income populations in areas south of New Orleans. Both the Draft EIS and the LA TIG's Draft Restoration Plan would benefit from additional reflections on the natural and human history of the Project geography that resulted in such fundamental changes to the landscape and set us on the course of the land-loss crisis that Louisiana faces today. The EIS should describe historic, systemic inequities affecting communities with environmental justice concerns in the Project area to provide authentic and more complete context for the discussions.**

**Response ID: 16281**

The Draft EIS (including Section 4.15 Environmental Justice and Appendix H, Socioeconomics Technical Report at Chapter 2) included a discussion of communities with low-income and minority populations, including information about factors that have contributed to historic and systemic inequities in southeast Louisiana. As discussed in the EIS, the Project may have disproportionately high and adverse, long-term impacts on some low-income and minority populations in communities engaged in commercial and subsistence fishing and dependent on adversely impacted fisheries, as well as communities located near the immediate outfall area (within approximately 10 miles north and 20 miles south) and outside of federal levee protection. In addition, negligible to minor, adverse impacts related to increased risk of levee overtopping during certain 1 percent storm events south of the immediate outfall area may occur, which may impact the community of Ironton. Commenters also raised concerns about Mardi Gras Pass; however, the closure of Mardi Gras Pass is outside of the scope of the EIS.

CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as

---

conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations.

---

The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review,

Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final

---

EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63133**

**Commenters support the proposed mitigation measures for the commercial fishing industry.**

**Response ID: 16517**

The comments received in support of the Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) are acknowledged. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any

---

particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63334**

**The proposed MBSD Project would maintain and restore coastal lands and should move forward.**

**Response ID: 16291**

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63703**

**Commenters request that the agencies involved with developing the EIS meaningfully engage with affected EJ communities/organizations to inform the development of EJ mitigation measures. Specifically, it was requested that relevant materials are translated and presented in plain, non-technical language.**

**Response ID: 16508**

CPRA engaged the communities potentially impacted by the Project, including low-income and minority communities, through public meetings to solicit input on mitigation strategies. Further, CPRA engaged community-based organizations to assist in soliciting additional

feedback from low-income and minority community members on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 of the Final EIS. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). CPRA will continue to engage with potentially impacted communities and organizations with EJ concerns concerning the implementation of the mitigation and stewardship measures. Additionally, CPRA has and will continue to provide requested translation and provide key documents and information on the Project in English, Spanish, and Vietnamese.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63930**

**Public comments asked to ensure mitigation dollars are set aside to help the most marginalized communities and provide an equitable allocation of resources.**

**Response ID: 16579**

CPRA's Draft Mitigation and Stewardship Plan included in the Draft EIS (Appendix R1) set forth numerous measures that CPRA could undertake to mitigate Project impacts. CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The Final Mitigation and Stewardship Plan contains additional details on the various mitigation and stewardship measures specifically designed and

---

targeted to assist low-income and minority individuals and communities including reserving a portion of some mitigation and stewardship programs for individuals from identified communities with environmental justice concerns that may be disproportionately impacted by the Project and engaging an outreach coordinator to assist community members with available programs and resources. A summary of the public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63935**

**State and Federal agencies should collaborate with CPRA to help with mitigation efforts related to workforce development, housing, education and training programs, mental health, fisheries subsidies and access to capital for people to go into business for themselves.**

**Response ID: 16582**

According to CPRA, it is collaborating with the LA TIG federal agencies (NOAA, DOI, USEPA, USDA) through the LA TIG framework as well as other venues, in the development and implementation of the Mitigation and Stewardship Plan. CPRA anticipates working with other State agencies, such as Louisiana Economic Development, on the workforce development, education and training programs included in the Mitigation and Stewardship Plan (Appendix R1 to the EIS). Finally, the State of Louisiana has been working with, and will continue to work with, Louisiana Sea Grant on the Seafood Futures initiative, focused on ensuring a long

---

term, sustainable fishing industry in spite of coastal changes. Louisiana Sea Grant, based at Louisiana State University, is part of the National Sea Grant Program, a network made up of 34 programs located in each of the coastal and Great Lakes states and Puerto Rico. Sea Grant Programs work individually and in partnership to address major marine and coastal challenges.

Richard Carriere

The Mid-Barataria Sediment Diversion has been well researched and seems a prudent plan of action verses the choice of doing nothing.

The intent is to restore some of the very land building processes (in a managed manner) that historically occurred in the lower Mississippi that built much of the land of SE Louisiana prior to the heightened levees and other controls upon the river.

The project is especially essential now due to past and predicted continued likely accelerating such as land loss, due to sinking, sea level rise, and other factors as pointed out in the Draft Plan.

The chances of significant benefit from the project are favorable. Even if in time we lose SE Louisiana as well as other low lying coastal regions of earth at least here in SE Louisiana we have a extremely potent land building asset namely the Mississippi River including its' annual high flow stages and sediment load. It is likely to at least buy time, "likely decades" if perchance climate change is not stopped. Two billion \$ seems a reasonable price for decades of extension of habitation and use.

I am fully in support of seizing the opportunity and going forward with this important project.

Thanks Kindly,

Richard Carriere, Jr., Masters in Science Teaching

---

**Concern ID: 61854**

**The cost of the proposed Project is a sound investment. More specifically, \$2 billion seems a reasonable price for decades of extension of habitat and use. Even though the cost of the Project is high, the price of inaction would be far greater.**

**Response ID: 16619**

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

The LA TIG acknowledges commenters' belief that the Project would be a sound investment. As part of the OPA analysis, the LA TIG considered the cost to carry out the Project consistent with the Restoration Plan alternatives evaluation criteria, 15 CFR §990.54. The cost to carry out the Project was evaluated in Section 3.2.1.2 Cost to Carry Out the Alternative of the LA TIG's Draft Restoration Plan. The LA TIG has found that the Project costs are commensurate with achieving the goals of comprehensive integrated ecosystem restoration intended to persist for decades even in the face of rising sea levels and continued coastal erosion.

---

**Concern ID: 61872**

**The purpose and need statement upon which the alternatives analysis was built meets the intentions and goals of the proposed Project and appropriately captures the need**

---

**to restore injury by reestablishing deltaic processes between the Mississippi River and Barataria Basin.**

**Response ID: 15828**

The commenter's support for and approval of the Project's purpose and need is acknowledged.

---

**Concern ID: 61881**

**The Mid-Barataria Sediment Diversion has been well researched, the range of alternatives evaluated in the Draft EIS is reasonable and meets the purpose and need, and seems a prudent plan of action versus the choice of doing nothing.**

**Response ID: 15837**

The commenter's support of the proposed Project is acknowledged.

---

**Concern ID: 62662**

**The proposed Project is likely to succeed because other diversions have also built land and restored ecosystems. Specific examples of land-building projects include the Caernarvon Freshwater Diversion, Davis Pond, West Bay, Fort St. Phillip, the Jaws, Wax Lake, and Mardi Gras Pass. Many of the benefits of the Project, in terms of soil creation and microbial processes, are not captured in the engineering of the modeling. Many of the fine sediments transported by the diversion cannot be dredged but are critical soil components.**

**Response ID: 16635**

The benefits to land building of fine sediments transported by the diversion were addressed in the Draft EIS in Chapter 4, Section 4.2.3.2 Operational Impacts in 4.2.3 Geology, Topography, and Geomorphology. The Delft3D modeling conducted for the EIS distinguishes the types of sediment (sands and fine sediments) that would be deposited in the basin. Table 5.2-1 in EIS Appendix E Delft3D Modeling lists the sediment classes included in the model. As described in EIS Chapter 4, Section 4.4.4 Hydrology and Hydrodynamics, sand and fine sediments would contribute to land building in the basin in two ways - by being resuspended and transported elsewhere for deposition and by forming a base layer upon which future pulses of sediment could form marsh or land. The model's physics-based computations showed that the coarser sands would settle out before the finer sediment. As the sediment builds up, discharge velocities would increase over the previously deposited sediment and resuspend it, pushing it farther into the basin. Thus, the model reproduces the natural process of delta building in which successive waves of sediment push farther out, either forming land/marsh or creating a base upon which land/marsh can be formed without moving it by dredging and placement. In addition, Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology of the EIS discusses the geomorphic impacts of diversion operations, including the Wax Lake Outlet, the Caernarvon Freshwater Diversion, the Davis Pond Freshwater Diversion, the Bohemia Spillway, and Bonnet Carré Spillway, and Mardi Gras Pass.

The likelihood of the Project's success and its potential benefits were considered in the LA TIG's Draft Restoration Plan. As part of evaluating the Project and alternatives, the LA TIG considered the likelihood that the Project would succeed and achieve the LA TIG's goals. Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success -

---

Alternatives 2-6 of the LA TIG's Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, these sections note that the knowledge gained through the projects noted by the commenters has been applied in designing the Project and evaluating whether and how the Project would restore and sustain critical marshlands. A full description of the range of benefits that would be provided by the Project is also included in Section 3.2.1.6 Benefits Multiple Resources of the Restoration Plan.

---

**Concern ID: 63332**

**A large number of commenters expressed general support for the proposed Project.**

**Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

RE: Draft EIS of Mid-Barataria Sediment Diversion

CEMVN-PM-P #2013-0634 (Section 408)

CEMVN-OD-SE #MVN-2012-2806-EOO (Section 10/404)

Nearly four years after scoping comments were accepted, we are presented with 1,000 pages of documents, and yet questions raised during scoping in 2017 were not addressed. The document is particularly vague when it comes to addressing the impacts on the communities that are within a two mile radius of the Mid-Barataria Sediment Diversion: Ironton, Myrtle Grove and Wood Park.

1. Is Louisiana going to do right by people on the frontlines of the coastal crisis?

"The closest residence are in Ironton, about 0.5 mile south-southeast [down river] of the proposed diversion complex" (DEIS, Chapter 4, p.674).

There is an alarming lack of detail and lack of analysis about how the Mid-Barataria Sediment Diversion will effect Ironton.

This Draft EIS belittles the major impacts the Mid-Barataria Sediment Diversion would have on Ironton, and implies that impacts are limited to construction. Ironton already is inundated with pollution from upriver grain terminal (CHS) and Alliance Refinery and down river coal export terminals. Removing trees from the land removes a critical buffer of air quality protection for Ironton.

As this Draft EIS acknowledges, there is new information about the site: the historic St. Rosalie cemeteries. We request that state and federal officials work with residents of Ironton as well as those who are connected to the St. Rosalie sacred sites, to respect the rights of people to make decisions on what happens to homes, sacred places and how to best preserve and protect this local Black community and local Black history.

2. What Got Us Into This Mess Will Not Get Us Out Of It

Louisiana cannot have its coast and eat it to. Without guaranteeing that coastal land in this same project scope-which is most of coastal Plaquemines and Jefferson Parish-will not be further degraded, the analysis of this EIS is flawed. Louisiana cannot mandate that coastal residents raise their homes or leave while simultaneously accepting permit applications for

heavy industrial facilities that destroy what precious coastal land is left. The land that CPRA claims will be built by the proposed Diversion goes out the window if a dock is put next to the structure or if pipelines are permitted to crisscross through.

The pride of the idea behind the proposed Mid-Barataria Sediment Diversion is that it undoes the mistake of straight-jacketing the river, and in theory would mimic natural processes to build land the way the Mississippi River built land for thousands of years. This is a good pivot towards more ecologically-minded design, and yet, changing one thing - busting a section of levee and digging a channel, which has been done in the vicinity with Caernarvon, the Industrial Canal that destabilized and divided the 9th Ward in New Orleans leading to devastating tragedy in 2005, and MRGO - is not enough. The process must also be different. The proposed mitigation fund is a step in the right direction, and it needs to include transparent details, and it needs to include the historic Black community right next to the Diversion.

How is the state and federal government going to make Ironton whole? This draft EIS seems to ignore one of the core purposes of NEPA: to not sacrifice marginalized communities. Ironton has survived the white supremacy of Leander Judge Perez (infamously excommunicated by the Catholic Church), numerous hurricanes including more recently Katrina (2005), Gustav (2008), Isaac (2012) and Zeta (2020). Current Lieutenant Governor Billy Nungesser wanted to move Ironton down river after Katrina. A number of polluting industries have attempted to come in on top of Ironton and neighboring communities since Katrina as well - the failed RAM coal export terminal, the failed NOLA oil tank farm, the failed IGP chemical complex and now theres the proposed Tallgrass oil export terminal. Those same business interests pushed the Plaquemines Parish Zoning Board to re-zone residential and light commercial property as heavy industrial.

All to say, with all these unrelenting pressures bearing down amidst a coastal crisis on Ironton, is it going to be a cornerstone \$1billion project in the states Coastal Master Plan that does this beautiful, historic community in?

3. While Its an Open Secret that 500-year Storms are Happening with 100-year Frequency, 100-year Levee Protection Is Still Official, So&

While the entire vibrant coastal community in Louisiana is in the crosshairs of coastal crisis, those living outside of 100-year levee protection are especially vulnerable. The 2017 Coastal Master Plans Appendix B, People and the Landscape, states:"...approximately 70-80% of all coastal homeowners do not have flood insurance. Being uninsured is not always a matter of choice in south Louisiana. NFIP rates are rising, and private flood insurance is almost impossible to obtain" (12).

It is highly misleading that this draft EIS refers to levees in vague language. The implication is that levees referred to are 100 year levees, whereas in reality that is not the case. The EIS needs to include explicit detail on the status of levees and analysis of impacts to nearby residents home insurance and flood insurance costs.

These comments are submitted on behalf of the Sierra Club, which is the nations oldest grassroots environmental advocacy organization, with 3,700 members residing in Louisiana, and is dedicated to protecting public health and the environment.

Sincerely,

Grace Morris  
Organizing Representative

**Concern ID: 61850**

**Commenters expressed concern that reasonably foreseeable industrial facilities like the Plaquemines Liquids Terminal and pipelines that may be built near the proposed MBSD Project structure or in the Barataria Basin would cause adverse impacts on the marsh ecosystem restored by the MBSD Project operations. One commenter expressed the opinion that industrial facilities that may be constructed near the proposed MBSD Project should be denied permit because they would be inconsistent with the objectives of the proposed MBSD Project.**

**Response ID: 16464**

The commenters' concern about the potential impact of future industrial development and activity on the habitat that would be created by the proposed Project was considered in Chapter 4, Sections 4.25.4 and 4.25.6 in the Cumulative Impacts section of the Draft EIS. These sections explain that reasonably foreseeable industrial facilities and infrastructure that may be constructed in the proposed MBSD Project area are expected to have negligible impacts on proposed Project-area resources because the facilities would be required to adhere to permit conditions imposed by regulating agencies such as wetland mitigation, SWPPP, and SPCC plans in order to be constructed and operated.

Furthermore, CPRA entered into a Memorandum of Understanding with the Plaquemines Port Harbor & Terminal District (PPHTD) and the Plaquemines Liquid Terminal, LLC (PLT) requiring PPHTD and PLT to perform sediment transport modeling and a navigation study to determine the impact, if any, that the PLT Project may have on the proposed MBSD Project, and to agree to certain terms and conditions, as needed, to ensure that the PLT, once constructed and operated, does not have unreasonable adverse impacts on the design, construction, or operation of the proposed MBSD Project. These steps would help ensure that the PLT Project remains consistent with the Louisiana Coastal Master Plan.

Since publication of the Draft EIS, the Tallgrass/PLT facility's sponsors PPHTD/PLT have withdrawn their Joint Permit application (Louisiana Department of Natural Resources Coastal Use Permit [CUP] number P20180379 and DA Permit number MVN-2012-0123-EPP), and terminated the Memorandum of Understanding (MOU) (originally dated April 24, 2019) between CPRA and PPHTD/PLT pertaining to the facility. A footnote has been added in Section 4.25.1.3.2 Reasonably Foreseeable Future Projects of the Final EIS to reflect the withdrawal of the PLT Project.

---

**Concern ID: 61925**

**The Draft EIS belittled the major impacts the proposed Mid-Barataria Sediment Diversion would have on Ironton, and implied that impacts are limited to construction. Ironton already is inundated with pollution from an upriver grain terminal (CHS) and Alliance Refinery and down river coal export terminals. Removing trees from the land removes a critical buffer of air quality protection for Ironton.**

**Response ID: 16187**

---

Chapter 3, Section 3.7.2 in Air Quality of the EIS describes the existing air quality classification under the Clean Air Act in the proposed Project area. Plaquemines Parish is designated as “unclassifiable/in attainment” for all criteria pollutants, meaning that the air quality in the area meets or is cleaner than national standards. As described in Chapter 4, Section 4.7.3.2 of the EIS in Air Quality, the Action Alternatives would cause minor to moderate adverse impacts on air quality during construction related to the use of combustion-powered equipment and fugitive dust generated by off-road vehicle use, earthwork (such as land clearing and ground excavation), aggregate and material handling (including concrete manufacturing), and wind erosion of exposed piles of dredged and excavated material. As described in Chapter 4, Section 4.7.4.2 in Air Quality of the EIS, the Action Alternatives would cause negligible air quality impacts during operation of the proposed Project due to active maintenance, which would not be sufficient to cause the proposed Project area to be re-designated as a non-attainment area. Tree cover can improve air quality via uptake of pollutants and the proposed Project would require clearing of some of the forest areas between Ironton and the existing Alliance Refinery. However, as depicted in Chapter 4, Section 4.18 Land Use and Land Cover, Figure 4.18-1, forest vegetation would remain on either side of the diversion structure and would continue to provide some buffer to air emissions from the Alliance Refinery and dust from the grain terminal for the community of Ironton. Chapter 3, Section 3.7.2 of the Final EIS was updated to identify existing sources of emissions in the Project vicinity include operation of the Alliance Refinery, the CHS terminal, and other industrial facilities.

Chapter 4, Section 4.15 Environmental Justice of the Final EIS has been revised to clarify information about potential impacts on the community of Ironton.

---

**Concern ID: 61933**

**Commenters expressed concern that the MBSD Project is going to cause a lot of problems for the community of Ironton and the neighboring communities. There is an alarming lack of detail and lack of analysis about how the MBSD Project would affect Ironton. Some specific concerns regarding Ironton include whether the MBSD Project would result in impacts on air quality, noise, traffic, emergency services, flood risks, and community cohesion.**

**Response ID: 16286**

The Draft EIS Chapter 4, Sections 4.7 Air Quality, 4.8 Noise; 4.13 Socioeconomics; 4.15 Environmental Justice; and 4.22 Land-Based Transportation identified potential air quality, noise, transportation, and flooding impacts specifically concerning the community of Ironton. In addition, Chapter 2 of Appendix H1 (Socioeconomics Technical Report) provides contextual information about the community. Section 4.15 Environmental Justice, has been revised to highlight information about potential impacts on the community of Ironton in the Final EIS. Also, in the Final EIS, Section 4.15.5.1 Environmental Justice has been added to provide a summary of impacts on the majority-Black community of Ironton, which is the closest community to the diversion, to assist understanding the projected impacts of the proposed Project on that community.

CPRA has engaged in public outreach meetings with the communities that would be impacted by the MBSD to solicit input on mitigation strategies, including reaching out to local non-profits to assist with and facilitate meetings with the communities projected to be impacted.

---

Outreach efforts to better understand community concerns regarding impacts, including cultural impacts, and mitigation and stewardship measures are discussed in Chapter 7 of the Final EIS. Refer to the Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62013**

**The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.**

**Response ID: 16210**

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie

---

Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62020**

**The EIS is lacking in detail and particularly vague when it comes to addressing the impacts on the communities that are within a 2-mile radius of the Mid-Barataria Sediment Diversion: Ironton, Myrtle Grove, and Wood Park. An assessment should be made on how the construction of this proposed Project might impact the property value of homes in the surrounding area and that those landowners/homeowners be made aware of the impact. Efforts should be made to reduce, as much as possible, the potential negative impacts that the construction of this proposed Project would have on surrounding communities including Ironton, Myrtle Grove, and Wood Park.**

**Response ID: 16216**

The impacts raised by the commenters were considered in the Draft EIS. The EIS includes analysis of socioeconomic impacts on affected communities. Section 4.13 Socioeconomics, 4.14 Commercial Fisheries, and 4.15 Environmental Justice provide detailed analyses of impacts from the proposed Project. In addition, the Socioeconomics Technical Report in Appendix H of the EIS provides additional details. In Chapter 4, Section 4.15.5 Environmental Justice of the Final EIS, a section has been added that provides a summary of impacts on the community of Ironton to assist understanding impacts of the proposed Project on that community.

CPRA has engaged in public outreach meetings with the communities and groups impacted by the proposed MBSD Project to solicit input on mitigation strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities and groups. A summary of these public outreach meetings can be found in Chapter 7 Public Involvement of the Final EIS. The Mitigation and Stewardship Plan in Appendix R1 of the EIS provides additional details about mitigation proposed by CPRA for the proposed Project, including mitigation measures for the communities projected to be impacted.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62294**

**The EIS needs to include explicit detail on the status of levees and analysis of impacts to nearby residents' home insurance and flood insurance costs.**

**Response ID: 15800**

---

EIS Chapter 3, Section 3.20.3.1 Federal Risk Reduction Levees, provides information on the level of risk reduction or elevation to which each levee system was designed. EIS Chapter 4, Section 4.20.4.2 Public Health and Safety, provides an analysis of projected water levels through the 50-year analysis period as compared to the levee design heights throughout the Project area. Section 4.20.4.2 also explains that all permanent Project features such as guide levees that would be subject to storm surge and waves would be designed and built to provide a 50-year level of hurricane and storm damage risk reduction. Section 4.13.5.3 Housing and Property Values in Socioeconomics has been revised in the Final EIS to provide additional discussion of flood insurance due to MBSD impacts.

---

**Concern ID: 62497**

**The commenters request that state and federal officials work with the residents of Ironton to respect the rights of these people to make decisions about what happens to sacred places (like St. Rosalie cemeteries) and how to best preserve and protect this local black community that is an important part of black history.**

**Response ID: 16455**

Information regarding the effects of the Project on the St. Rosalie cemetery has been added to the Executive Summary and to Chapter 4, Section 4.24.2.2 Applicant's Preferred Alternative in Cultural Resources of the Final EIS. To clarify potential impacts on Ironton, Section 4.15 Environmental Justice has been revised to highlight information about potential impacts on the community of Ironton in the Final EIS. For a summary of public outreach efforts related to the EIS and the Draft Restoration Plan, including outreach to Ironton residents, refer to Chapter 7 of the Final EIS. Similar information specific to the restoration planning is included in Section 1.8 of the LA TIG's Draft Restoration Plan.

CPRA held a public meeting in the community of Ironton. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. A summary of these public engagement meetings can be found in Chapter 7 of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section

---

10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62878**

**The EIS and Mitigation Plan does not adequately consider or mitigate for impacts to Ironton. The EIS should include air pollution buffers for Ironton and flood protection easement areas for Ironton and other vulnerable communities outside of levee protection.**

**Response ID: 16505**

The concerns raised by the commenters were considered in the Draft EIS in Chapter 3, Section 3.7.2 Air Quality, Existing Conditions; and Chapter 4, Sections 4.8 Noise, 4.13 Socioeconomics, 4.15 Environmental Justice, 4.22 Land-Based Transportation and 4.25 Cumulative Impacts. Chapter 3, Section 3.7.2 Air Quality - Existing Conditions identifies the existing air quality in the proposed Project area and provides that Plaquemines Parish is designated as "unclassifiable/in attainment" for all criteria pollutants. The resource sections in Chapter 4 address potential air quality, noise, transportation, and tidal flooding impacts specifically concerning the community of Ironton. In addition, Chapter 2 of Appendix H1 Socioeconomics Technical Report to the EIS provides contextual information about the Ironton community.

CPRA committed to implementing best management practices (BMPs) to minimize construction impacts in the EIS in Chapter 4, Section 4.27.1 Avoidance and Minimization and Appendix R1 Mitigation and Stewardship Plan; additional information on BMPs is also included in the Mitigation Summary Table in Appendix R3. Construction emissions would be highly localized, and consequently the Project is only anticipated to impact air quality within 0.5 mile of the construction footprint; however, Ironton is located approximately 0.5 mile from the construction footprint (see EIS, Chapter 4, Section 4.7.1 Area of Potential Impacts). As stated in the EIS in Chapter 4, Section 4.15 Environmental Justice, populations in Ironton would experience minor to moderate, temporary adverse, impacts due to increased noise levels, dust, and transportation delays during the approximately 5-year construction period. During operations, air emissions would be negligible since the diversion structure would be electric-powered (see EIS Chapter 4, Section 4.7.4.2).

Beyond the near-term impacts of construction, operation of the Applicant's Preferred Alternative may have impacts on Ironton. Because it is within the New Orleans to Venice (NOV) Non-Federal Levee (NFL) W-05a.1 (La Reussite to Myrtle Grove levee reach) levee system, Ironton is not expected to be impacted by increases in frequency and duration of tidal flooding due to Project operations (see Section 4.15.4.2.2 Storm Hazards and 4.20.4.2 Public

Health and Safety). Further, guide levees constructed parallel to the diversion channel will be constructed to an elevation of approximately 15.6 feet and will serve as hurricane and storm damage risk reduction against storm surges. However, negligible to minor increases in risk of NOV-NFL Levee overtopping south of the immediate outfall area (following the delta formation in the outfall area) due to storm surge during certain 1 percent storms, may impact low-income and minority populations within Ironton. These potential impacts may be exacerbated to the extent that Ironton residents experience unique vulnerabilities.

To ensure that impacts on the community of Ironton have been adequately disclosed and to make that analysis readily accessible in one location within the EIS (rather than throughout the various resource sections), a section has been added to the Final EIS that provides a summary of impacts on the community of Ironton under the Applicant's Preferred Alternative (see Chapter 4, Section 4.15.5.1 Environmental Justice).

CPRA is not proposing specific mitigation to address or offset the negligible to minor increased risk in levee overtopping that could affect the community of Ironton inside the NOV-NFL system because this potential increased risk does not accrue until Project operations have resulted in the development of a delta (wetlands and marsh) in the area outside the NOV-NFL Levee adjacent to Ironton (circa 2040), and because this risk was identified for only one of the 100-year storm scenarios modeled. However, to help Ironton prepare for and mitigate flood risk from storms generally, CPRA would designate a liaison to work with residents in Ironton prior to commencing operations of the Project on community preparedness for storm-based flooding and damage.

CPRA has engaged in public outreach meetings with the communities projected to be impacted by the MBSD to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts were undertaken to better understand and address potential impacts on communities with environmental justice concerns, such as low-income and minority populations, that may be disproportionately impacted by the Project, as discussed in Chapter 7 of the Final EIS. This included meetings in the community of Ironton. CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project. CPRA will continue to engage with potentially impacted environmental justice communities and organizations concerning the implementation of the mitigation and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances

where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63697**

**Commenters request that the EIS and Mitigation Plan include more details about planned EJ mitigation measures for diversion operations.**

**Response ID: 16507**

The Draft EIS considered impacts to low-income and minority communities due to Project operations in Chapter 4, Section 4.15.4 Operational Impacts in Environmental Justice.

In addition, since completion of the Draft EIS and the LA TIG's Draft Restoration Plan, CPRA engaged the communities potentially impacted by the Project, including low-income and minority community members, through public meetings to solicit input on CPRA's mitigation strategies. Further, CPRA engaged community-based organizations to assist in soliciting additional feedback from low-income and minority community members on the proposed mitigation measures. A summary of these public engagement meetings and other outreach efforts is provided in Chapter 7 of the Final EIS. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (see Appendix R1). This includes additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project. CPRA will continue to engage with potentially impacted EJ communities and organizations concerning the implementation of the mitigation measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such

---

measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

RE: Response to Draft Phase II Restoration Plan #3.2 Mid-Barataria Sediment Diversion

Dear Sir or Madame:

Thank you for allowing me the opportunity to comment on the plan. Before going into a few detailed questions and concerns, I want to make a few general comments. First, this project absolutely must move forward. This is the silver Lining in the very dark cloud that was Hurricane Katrina. The need for significant coastal restoration projects has finally been realized. Please do not let anything that follows take away from the fact that I support the Mid-Barataria Sediment Diversion. In fact I have been suggesting multiple diversions like this for almost 40 years.

Second, we indeed must have multiple sediment diversions like this on both sides of the Mississippi to mimic the rivers natural flow and rebuild the delta. When the federal government built the current levee system, their decisions had significant repercussions. Yes, the vast majority of people who live in the Mississippi River Valley have been protected from devastating floods. However, in Plaquemines Parish, the river used to also nourish and renew the very ground on which we lived. It was our best defense against the forces of erosion and subsidence that are ever-present enemies of a coastal community. We have been robbed of an adequate defense mechanism for far too long.

Third, no group should be allowed to have veto power over this or similar projects. Rebuilding Louisianas coast is essential to all of us. At the same time, those who legitimately experience a taking from this and future diversions, must be reasonably compensated for their losses. However, I do not think that having to find a new spot to catch speckled trout should qualify as a taking. For legitimate groups like actual oyster fishermen, our diversion plan must include funds to compensate them for legitimate losses, and they should be given priority when issuing new oyster leases in the areas that become hospitable for the new oyster beds.

Moving to my specific comments and concerns about the current plan. After reviewing the 3 main options, I urge you to choose Option 3, the 150,000 cfs alternative. The reason is straight-forward. Spending 49.6% more on the project yields 86.1% more sediment, and 81.5% increase in new land area created, and a 63.3% increase in the bed elevation 10 miles south of the diversion. Those kinds of economies of scale will significantly leverage the increased construction investment.

At the same time, I have to question how Option 3 is alleged to produce only 9.7% more fresh and intermediate mars and less brackish and saline marsh than than Option 1. This does not make sense to me. The only thing I can figure is that the survey area for Option 3 was not large enough to quantify all of the benefits of marsh creation. Please address this issue.

A couple of other points we brought to my attention. First, it was claimed that a new governor who was not in favor of this project could shut it down at any point. That cannot happen. Second, it was alleged that the mitigation money , especially that greed to the oyster fishermen and property-owners impacted was way too small. Lastly, there was a structural concern regarding the diversion. It appears to have no flood gate on the marsh side. That would be a serious problem should a hurricane threaten the area, and it will happen again.

---

There simply must be a flood gate as high as the river levees to protect the residents of Plaquemines Parish from being inundated.

Thanks very much for considering these comments. This project must go forward though with a few minor changes. No one or nothing can be allowed to stop the rebuilding of our coast. There is too much at stake. The animals with fins will swim to the water that is right for them, and the fishermen with motors on their boats will follow. May God bless your good work.

Regards,

Mike Mariana

**Concern ID: 61871**

**Alternative 5, Variable Flow up to 150,000 cfs, should be chosen for implementation because it provides substantially greater benefits at the higher flow, with only marginally increased adverse effects, most of which could be mitigated by the same measures being proposed for the 75,000 cfs Applicant's Preferred Alternative.**

**Response ID: 15944**

CPRA submitted a joint Section 10/404 permit application and Section 408 permission request to USACE for the construction, operation, and maintenance of a 75,000 cfs sediment diversion (Applicant's Preferred Alternative). The EIS evaluates the Applicant's Preferred Alternative and five additional action alternatives as well as the No Action Alternative in order to inform USACE's permit and permission decisions and the LA TIG's NRDA decision in compliance with the statutes, orders, and policies outlined in EIS Chapter 5 Consultation and Coordination.

In the Restoration Plan, the LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54, and made every effort to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. As noted in the LA TIG's Restoration Plan, while the 150,000 cfs Alternative was projected to provide greater ecological benefits than the LA TIG's Preferred Alternative, it was also expected to cause greater collateral injury and greater risks to public health and safety. See Chapter 3, Section 3.2.4 of the Final Restoration Plan for a discussion of how the LA TIG came to its decision. Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

The Mitigation and Stewardship Plan (Appendix R1 to the EIS) has been designed by CPRA to mitigate the projected impacts of the 75,000 cfs sediment diversion (Applicant's Preferred Alternative). Different or additional mitigation could be needed to address the projected

---

impacts of the proposed Project if a large capacity diversion (150,000 cfs) were to be selected.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61920**

**Commenters recommended that there must be a flood gate on the marsh side of the diversion structure to protect the residents of Plaquemines Parish from being inundated.**

**Response ID: 16007**

As described in Chapter 2, Section 2.8, Action Alternatives Carried Forward for Detailed Analysis of the Draft EIS, the proposed Project design includes earthen guide levees that would be constructed along both sides of the diversion conveyance channel. The portion of the guide levees on the protected side of the New Orleans to Venice Levee system (NOV-NF-W-05a.1) would be designed and built as hurricane and storm damage risk reduction against storm surges that may enter the diversion channel. A gated control structure would also be built on the Mississippi River side of the conveyance channel, and the gate would be closed prior to and during storm events.

CPRA considered a diversion structure with a back gate structure on the basin side (which is the marsh side). After detailed design and cost consideration, however, CPRA proposed eliminating the back gate design and proceeded with a diversion structure with hurricane/guide levees and no back gate structure. CPRA determined that the proposed Project without a gate structure is generally lower risk due to its passive operation relative to

---

the active operation of a gate structure. In addition, the guide levees are proposed to be constructed to an elevation equivalent to a 2 percent Annual Exceedance Probability (AEP) (50-year storm) and will connect to the NOV-NF-W-05a.1 levee. CPRA worked with USACE to complete a USACE Risk Assessment of this proposed design through the Section 408 process.

---

**Concern ID: 62081**

**Commenters suggested that the “catch” would move elsewhere to a place they can still be harvested.**

**Response ID: 16245**

Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS described anticipated impacts on aquatic species from the proposed Project. As described, there would be major adverse impacts on brown shrimp populations, while impacts to white shrimp and blue crab would be negligible to minor beneficial, and impacts on finfish would range from adverse to beneficial, depending on the species. Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed potential responses of the commercial fishing industry to changes in fish abundance and catch within the basin as well as the potential for fishers to partially offset some adverse impacts by changing their fishing locations, while noting that these adjustments would likely be accompanied by increased costs.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). CPRA’s Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations

---

become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62372**

**A commenter noted that it has been said that a new governor could shut down this Project at any point, which cannot happen.**

**Response ID: 15854**

The commenter's input is noted. Consideration of potential future actions of undetermined governors is outside the scope of the EIS. The EIS evaluates the environmental impacts of the proposed Project and a reasonable range of alternatives, including No Action, to inform the USACE's decision regarding the requested Section 404/10 permit and Section 408 permission, as well as the NRDA decision of the LA TIG.

---

**Concern ID: 62961**

**Project mitigation must adequately compensate impacts on the oyster industry, including financial compensation for economic losses. Commenters provided suggestions for mitigation such as compensating for increased costs of travel, providing direct financial payments to lease holders whose areas become unproductive, supporting new oyster leases or lease swaps, investing in research and development, using devices to move oysters to higher-salinity water, providing loans to oystermen to develop alternative income streams, providing support for elderly fisherfolk and buying out boats and businesses.**

**Response ID: 16532**

The Draft EIS evaluates how the Project would impact commercial, recreational, and subsistence fishers as compared to No Action conditions in Chapter 4, Sections 4.10 (Aquatic Resources), 4.14 (Commercial Fisheries), 4.15 (Environmental Justice) and 4.16 (Recreation and Tourism).

In response to public comments and resource agency input about the proposed mitigation efforts, CPRA has expanded and refined the oyster mitigation and stewardship measures. CPRA's mitigation and stewardship strategies and associated expenditures would focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to oyster fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for oysters in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to oyster fisheries in the early years of the Project's operational life. The revised mitigation and stewardship measures include allocating \$4 million to establish new public seed grounds, \$15 million to enhance public and private oyster grounds, \$4 million to enhance broodstock reefs and \$8 million for alternative oyster culture.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62975**

**Those who experience a taking from this and future diversions must be reasonably compensated for their losses; however, having to fish in a new location does not warrant compensation.**

**Response ID: 16611**

Statements about what types of losses might constitute compensable takings are beyond the scope of the EIS. The Mitigation and Stewardship Plan (Appendix R1 to the EIS) focuses on maintaining a sustainable fishery into the future, rather than compensating individual fishers for alleged losses.

---

**Concern ID: 63055**

**Clarify how the 150,000 cfs Alternative is projected to produce only 9.7 percent more fresh and intermediate marsh and less brackish and saline marsh than the 50,000 cfs Alternative.**

**Response ID: 16061**

The same Project area was used for all alternatives assessed in the EIS, which is the extent of the Barataria Basin and birdfoot delta. Under each action alternative, the proposed Project would create and sustain existing wetlands. The magnitude of impacts would be greater under the 150,000 cfs Alternative when compared with the 50,000 cfs Alternative; however, because the 150,000 cfs Alternative would discharge more fresh water into the Barataria Basin, it would result in greater inundation of the marsh surface in the immediate outfall area, increasing plant stress and mortality. Therefore, the 150,000 cfs Alternative would result in the conversion of a larger area of existing, brackish marsh to freshwater and intermediate marsh in the delta formation area when compared with the other action alternatives. This difference is illustrated in Chapter 4, Section 4.6 Wetland Resources and Waters in the U.S., Figure 4.6-15. Because this issue was considered in the Draft EIS, no related edits have been made to the Final EIS.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63182**

**Proposed mitigation is insufficient and not guaranteed, and the amount of funding for mitigation is not clearly stated.**

**Response ID: 16559**

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

---

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63334**

**The proposed MBSD Project would maintain and restore coastal lands and should move forward.**

**Response ID: 16291**

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:40541**

David Cvitanovich

My name is David Cvitanovich. I am a stakeholder in this upcoming Myrtle Grove project. I am steadfastly against the proposed mid-barataria diversion. It's going to destroy our culture and our livelihood. I am a marshland owner on the east side of the river and am losing lots of marsh due to freshwater intrusion. Control freshwater would be good, but wide open diversion is no good whatsoever. They study it to death. They don't listen to the stakeholders. They don't listen to the people that have witnessed the utmost destruction down at Fort St. Phillip, Mardi Gras pass. All it did was move mud from here to there. I am deadly against it. I am steadfastly against it. I am against all these expensive studies before the shovel hits the ground. Dredge, don't divert. Dredge, don't divert. Dredge, don't divert. Thank you very much

---

**Concern ID: 61957**

**Commenters are concerned with the lack of inclusion by CPRA. The CPRA held meetings, reached out to local communities throughout the process; however, the CPRA ignored most, if not all, of the input they received from the communities, shrimpers, crabbers, oyster fisherman, and others.**

**Response ID: 15903**

Chapter 7 Public Involvement of the Final EIS includes a summary of meetings that CPRA held with the communities and groups projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities and groups. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. Refer to the Final Mitigation and Stewardship Plan in Appendix R1, which has been revised since the release of the Draft EIS in response to public input, for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional

Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRAs and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62639**

**The proposed Project is unlikely to succeed because similar types of projects have failed to build land, and have caused a range of other issues, like destroying habitat, exacerbating flooding, and reducing water quality. Specific examples of similar, problematic projects include the Mississippi River Gulf Outlet, Bonnet Carré Spillway, Caernarvon Freshwater Diversion, Davis Pond, West Bay, Baptiste Collette, Fort St. Philip, and Cubits Gap. In fact, data show that the Caernarvon Diversion in particular was unable to show sustained land gains in the face of Hurricane Katrina-driven losses in wetland habitat (Underwood 1994, Kearney et al. 2011). Davis Pond has seen increased land loss inside the diversion compared to a reference area (Couvillion et al. 2017). Fort St. Philip has lost large areas of wetlands (Suir et al. 2014). While the Atchafalaya River is building land in the Atchafalaya and Wax Lake Deltas, the Atchafalaya River carries more sediment than the Mississippi River does currently (Blum and Roberts 2009), and more of the Atchafalaya River is diverted to each of these deltas and marshes farther south. Additionally, one study identified poor performance of diversions due to many periods of inoperation due to socioeconomic uncertainties (Caffey et al. 2014).**

**Response ID: 16631**

The issues raised by the commenters were considered in the Draft EIS. The EIS states in Chapter 2, Section 2.1.1 Overview of Sediment Diversions, that CPRA considered information from other diversions in its assessment of the Project alternatives, but because the projects mentioned by the commenters had been designed to discharge primarily water, not sediment, they are not fully comparable to the proposed Project. As explained in the EIS Chapter 4, Section 4.1.3 (Environmental Consequences, Overview of Delft3D Basinwide Model for Impact Analysis), Delft3D Basinwide Modeling software was used to assess impacts of the Project on hydrology, land gains and losses, water quality, and vegetation in the Barataria Basin and birdfoot delta. Using standard professional practice, this physics-based model was validated to the West Bay Sediment Diversion. The West Bay Sediment Diversion is useful for validating the physical processes of erosion and deposition of sediment because it, like the proposed MBSD Project, is a sediment diversion that extracts relatively more sediment in the river. The other diversions cited were designed to primarily deliver water, not sediment, and are less useful comparisons.

The West Bay Sediment Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, "A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that diversions do not lead to appreciable sediment accumulation" (Kolker, A. S., Miner, M. D. and Weathers, H. D. 2012. Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, *Estuarine, Coastal and Shelf Science*, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005> ).

Comparing diversions outside of physics-based numerical modeling has limited value because diversions and receiving environments often exhibit unique behaviors that correlations do not account for. For that reason, the physics-based Delft modeling, even with its limitations and uncertainties, is a better predictor than anecdotal comparisons to Fort St. Phillip or other sites. Uncertainties associated with the validation and application of the Delft3D Basinwide Modeling conducted for the proposed Project were assessed by the West Bay application, sensitivity tests, and by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in EIS Appendix E Delft3D Modeling and incorporated into the EIS conclusions throughout Chapter 4 Environmental Consequences. While most citations mentioned by commenters were already included in the

---

Draft EIS, the Final EIS has been edited to include Caffey and Petrola (2014) to Chapter 4, Section 4.6.5.1.2.4 Land Accretion.

The likelihood of success of the Project and information from other freshwater diversions was also considered in the LA TIG's Draft Restoration Plan, Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. The proposed MBSD Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the geomorphological features of the Lower Mississippi River as of 2012, including data from the referenced projects. All citations referenced by the commenters were included in the Final EIS and were considered by the LA TIG in the Final Restoration Plan.

---

**Concern ID: 62778**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest

---

review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Dear Louisiana Trustee Implementation Group Members and U.S. Army Corps of Engineers:

The Marine Mammal Commission (the Commission), in consultation with its Committee of Scientific Advisors on Marine Mammals, has reviewed the Louisiana Trustee Implementation Group's (Louisiana TIG) draft Phase II Restoration Plan #3.2: Mid-Barataria Sediment Diversion (draft RP #3.2) and the U.S. Army Corps of Engineers (USACE) New Orleans District's (CEMVN) Draft Environmental Impact Statement (DEIS)<sup>1</sup>. The draft RP #3.2 evaluates the Louisiana TIG's alternatives for restoring Louisiana's wetland, coastal, and nearshore habitats injured by the *Deepwater Horizon* (DWH) oil spill. The DEIS analyzes the potential impacts of the proposed Mid-Barataria Sediment Diversion (MBSD) project and a range of alternatives, including no action, on the natural and human environment.

### **Project background**

Large-scale sediment diversions are intended to transport sediment, freshwater, and nutrients via high-discharge volumes from the Mississippi River as a land-building tool. The proposed MBSD project would reconnect the Mississippi River to the Barataria Basin with the goal of rebuilding and stabilizing the delta marshes to protect against further erosion and land loss due to ongoing and future sea level rise, subsidence, and storm events. The MBSD would be constructed in Plaquemines Parish, Louisiana, on the right bank of the Mississippi River at mile 60.7. The project would involve the construction of a sediment intake system, a 2-mile long concrete conveyance channel, and an outfall transition feature. The intake system is designed to capture a high concentration of sediments and larger grain sizes from the lower portion of the water column, which would be delivered during the river's annual flood cycle. Nutrients introduced into the basin as part of the river flow are expected to enhance primary productivity. The introduction of fresh water is intended to maintain

<sup>1</sup> See notice of availability at 86 Fed. Reg. 12915 (5 March 2021), and extension of public comment period at 86 Fed. Reg. 22397 (28 April 2021).

the estuarine salinity gradients that are projected to be altered as a result of sea level rise and associated land loss.

The amount of sediment and fresh water that would be discharged through the MBSD is dependent in part on sediment levels in the Mississippi River, upstream flow conditions (i.e., the diversion would be operating only during flow rates exceeding 450,000 cubic feet per second (CFS) at the Belle Chasse water gage), and the maximum discharge flow rate for the MBSD considered under each alternative. The amount of land expected to be built or maintained varies with each alternative, and is dependent on Mississippi River flow rates as well as other factors, such as continued sea level rise, storms, subsidence, and other marsh restoration activities.

In 2016, the *Deepwater Horizon* (DWH) Natural Resource Damage Assessment (NRDA) Trustees determined that diversions of Mississippi River water into adjacent wetlands would provide large-scale benefits to coastal habitats injured by the DWH oil spill (DWH NRDA Trustees 2016). In its Strategic Plan and Environmental Assessment (SRP/EA) #3: Restoration of Wetlands, Coastal, and Nearshore Habitats in the Barataria Basin, Louisiana, the Louisiana TIG selected the MBSD as the specific sediment diversion project to move forward for further analysis.

Available scientific literature indicates considerable ongoing debate about the effectiveness of large-scale sediment diversions as a land-building strategy (Turner et al. 2019, Blaskey 2020). The amount and type of sediment in the Mississippi River available for land building (Blum and Roberts 2009), sea level rise, large storm events, subsidence, and other natural events may negate any land building over the long-term (DeLaune et al. 2013; Suir et al. 2014; Chamberlain et al. 2018). These issues and uncertainties surrounding them were not, but should have been, fully addressed in the DEIS.

The Commission provided extensive comments<sup>2</sup> on the draft SRP/EA #3 in February 2018, notably raising concerns that a large-scale sediment diversion would have significant adverse impacts on bottlenose dolphins that are resident to the Barataria Basin. Despite those concerns, the Louisiana TIG finalized the SRP/EA #3 in March 2018, selecting as its preferred alternative a suite of restoration approaches that included the MBSD.

### **Restoration alternatives**

The DEIS follows on the analyses from the SRP/EA #3 to evaluate alternatives for restoring injured marsh resources in Barataria Bay, each of which included the MBSD but with different flow scenarios and with or without marsh terrace outfall features. The alternatives were based on a specific purpose and need statement that included only the implementation of a large-scale sediment diversion into Barataria Bay. The alternatives are as follows—

- Alternative 1: Variable flow up to 75,000 CFS maximum sediment diversion (applicant's preferred alternative, or APA)
- Alternative 2: Variable flow up to 75,000 CFS maximum sediment diversion including marsh terrace outfall features

<sup>2</sup> See the Commission's [5 February 2018 letter](#).

- Alternative 3: Variable flow up to 50,000 CFS maximum sediment diversion (A3)
- Alternative 4: Variable flow up to 50,000 CFS maximum sediment diversion including marsh terrace outfall features
- Alternative 5: Variable flow up to 150,000 CFS maximum sediment diversion (A5)
- Alternative 6: Variable flow up to 150,000 CFS maximum sediment diversion including marsh terrace outfall features
- No Action Alternative (NAA)

The draft DEIS concluded that there were negligible to minor differences in the impacts when terrace features were included. For that reason, the following comments focus only on the impacts associated with the action alternatives under the three selected flow scenarios (i.e., APA, with 75,000 CFS; AP3, with 50,000 CFS; and AP5, with 150,000 CFS), as compared to the NAA. The comments also focus primarily on direct impacts of MBSD operation under each alternative on bottlenose dolphins in Barataria Bay and their estuarine habitat, given that the MBSD is expected to operate for at least 50 years, and that impacts resulting from the operation of the MBSD would outweigh those resulting from construction activities. The Commission notes that operation of the MBSD will also have significant adverse impacts on dolphin prey species, such as spotted sea trout, and other important marine resources, such as submerged aquatic vegetation, benthic algae and other benthic fauna, brown shrimp, southern flounder, and eastern oyster. It will also have significant, long-term impacts on commercial and recreational fishermen and local communities.

### **Projected impacts of the MBSD project on Barataria Bay bottlenose dolphins**

Of primary concern to the Commission are the direct, permanent, and significant adverse impacts from MBSD operations on common bottlenose dolphins in Barataria Bay. Those impacts are expected to occur once the project is constructed (scheduled for 2027) as a result of large, frequent, and/or sustained influxes of fresh water into the dolphin's estuarine habitat. The common bottlenose dolphins identified as belonging to the Barataria Bay stock are year-round residents, inhabiting estuarine and Gulf coastal waters out to an average distance of 1.75 km from shore, with highest densities north of the barrier islands (Wells et al. 2017). The most recent abundance estimate for the stock is 2,071 dolphins (95% CI: 1,832 – 2,309), derived from a basin-wide capture-mark-recapture (photo-identification) survey conducted in March 2019 (Garrison et al. 2020). Additional background on the stock's preferred habitat, residency patterns, foraging, prey species, and DWH oil spill-related injuries were included in the Commission's [5 February 2018 letter](#), noting in particular an estimated 51 percent mean proportional decrease of the stock as a result of spill-related exposure (Schwacke et al. 2017). Follow-up studies conducted from 2016 to 2019 in Barataria Bay included health assessments in 2016, 2017, and 2018, photo-identification studies from 2017 to 2019, and the 2019 capture-mark-recapture study noted above. A scoring system was developed by marine mammal veterinarians to compare the health of the pre- and post-spill cohorts, based on a number of health factors (Schwacke et al. 2020). The results of that study showed an overall "guarded to worse" prognosis for the pre-spill cohort compared to the post-spill one, with continued evidence of chronic lung disease, impaired adrenal function, inflammation, and anemia. The researchers concluded that the health of the pre-spill cohort has not improved over time, and likely has worsened, compared to the post-spill cohort. The initial population recovery model developed for the NRDA studies (Schwacke et al. 2017) was subsequently revised based on the more recent data,

indicating that the population is currently at its lowest abundance since the spill occurred 10 years ago. The projected time to recovery<sup>3</sup> estimated by the revised model is 32 years. However, the population's recovery is still uncertain because that recovery trajectory does not account for the effects of various restoration efforts (whether positive or negative) or a changing climate, either or both of which could have a significant impact on the population's recovery (Schwacke 2021).

As discussed in the Commission's 2018 letter and demonstrated in other recent studies (Duignan et al. 2020; McClain et al. 2020), estuarine bottlenose dolphins known to have been exposed to low-salinity conditions or flooding events are prone to disease outbreaks and higher rates of stranding, mortality, and morbidity due to compromised epidermal integrity and/or physiological stress, which increases susceptibility to secondary infection. An Unusual Mortality Event (UME) in the northern Gulf of Mexico from February to November 2019<sup>4</sup> provided additional insights into the impacts of low-salinity exposure on bottlenose dolphins. The UME involved strandings of at least 337 bottlenose dolphins, with the majority reported from Mississippi, followed by Louisiana<sup>5</sup>, Alabama, and Florida. Although histologic examination of stranded animals was not always possible due to the advanced decomposition state of many of the dolphins, scientists noted that a large percentage of the dolphins exhibited mild to severe skin lesions consistent with prolonged exposure to low-salinity water (Deming and Garrison 2021). The increased strandings coincided with record rainfall in watersheds draining into the Gulf of Mexico during the 2019 winter, spring, and summer months, and the opening of the Bonnet Carre spillway in Louisiana<sup>6</sup> to prevent flooding. The influx of freshwater into dolphin estuarine habitat in Barataria Bay and other northern Gulf bays, sounds, and estuaries resulted in prolonged low-salinity conditions (less than 5 parts per thousand; ppt) throughout the Gulf for several months (Deming and Garrison 2021). Other factors that might have contributed to elevated stranding rates (such as cold or disease) have since been ruled out as causal factors for the UME (Deming and Garrison 2021).

Despite information gained from previous low-salinity events, our understanding of how different durations of varying salinity exposures affect the health and survival of bottlenose dolphins remains unclear. Therefore, an expert elicitation<sup>7</sup> was conducted to assess the possible thresholds at which adverse, permanent impacts of low-salinity exposure are expected to occur (Booth and

<sup>3</sup> Defined as the number of years for the stock to recover to at least 95 percent of baseline abundance. The originally estimated time to recovery for the Barataria Bay stock was 39 years (Schwacke et al. 2017).

<sup>4</sup> From February to November 2019, at least 337 bottlenose dolphins stranded from Florida to Louisiana, with the peak of strandings occurring from February to June. Scientists investigating the strandings attributed the deaths to prolonged exposure to low salinity waters, less than 10 parts per thousand (ppt), stemming from large amounts of precipitation (rain and snow) draining into watersheds that flow into the northern Gulf during the 2019 winter, spring, and summer months. (<https://www.fisheries.noaa.gov/national/marine-life-distress/2019-bottlenose-dolphin-unusual-mortality-event-along-northern-gulf>)

<sup>5</sup> The Louisiana Department of Wildlife and Fisheries (LDWF) stopped responding to dolphin strandings in early 2019 and completely withdrew from the state's stranding response program in September 2019, which affected the detection, reporting, and examination of dolphins that stranded in Louisiana during the UME. The number of stranded dolphins reported in Louisiana during the timeframe of the UME is therefore likely biased low.

<sup>6</sup> The Bonnet Carre spillway was opened twice in 2019, from 27 February to 11 April, and again from 10 May to 27 July, for a total of 123 days (<https://www.mvn.usace.army.mil/Missions/Mississippi-River-Flood-Control/Bonnet-Carre-Spillway-Overview/Spillway-Operation-Information/>).

<sup>7</sup> Expert elicitation is a formal, structured process in which expert knowledge of an uncertain quantity is captured in the form of a probability distribution (O'Hagan 2019).

Thomas 2021). Specifically, the expert elicitation was designed to assess the relationship between the number of days a dolphin spends in water with salinity levels less than 5 ppt and its survival probability, based on the professional judgment of relevant experts. The expert elicitation produced a dose-response function that integrated salinity and time as the specified “dose” (Booth and Thomas 2021). The experts believed that dolphins can endure some periods of exposure to salinity levels below 5 ppt before their health is compromised (median value of 62 days for dolphins exposed to other environmental stressors as well; 77 days for dolphins exposed to few other stressors). The period of tolerable exposure is shorter for dolphins exposed to acute changes in salinity, with a median time to death of 22 days of continuous exposure to water with salinity levels below 5 ppt. The experts also believed that once the survival probability begins to decrease, it decreases rapidly, especially in the presence of other environmental or health stressors.

As stated in section 4.11.5 of the DEIS, **operation of the MBSD under each of the alternatives is expected to have immediate, permanent, and major adverse impacts on the health, survival, and reproduction of the Barataria Bay stock of bottlenose dolphins due to prolonged exposure to low-salinity conditions.** The DEIS used a quantitative model to determine the projected impacts of MBSD operations associated with each flow-rate alternative (Garrison et al. 2020). The model assumed strong site fidelity by dolphins, based on telemetry data collected from tagged dolphins in Barataria Bay during the 2010-2014 NRDA surveys (Hornsby et al. 2017; Wells et al. 2017), a subsequent health assessment in 2018 (Cloyed et al. 2021), and the 2019 capture-mark-recapture study (Garrison et al. 2020). These and other studies summarized in the Commission’s 2018 letter suggest that dolphins exposed to low-salinity conditions would not be expected to move to other, more saline portions of the bay or gulf, or to neighboring estuaries, during an extended freshwater discharge event. The model integrated (1) spatial distribution data from the 2019 capture-mark-recapture study to simulate movements of animals, (2) projected salinity fields from a representative salinity year based on the high-resolution hydrodynamic Delft3D model used in the DEIS (corrected for retrospective and future salinity-prediction biases and uncertainties), and (3) the expert elicitation dose-response curves to determine individual survival rates based on a projection of continuous salinity exposure (consistent with the scenario considered by the expert elicitation). The model predicted changes in population survival rates under each alternative for dolphins inhabiting each of four strata in the bay – southeast, central, western, and island – as well as overall.

The model estimated a 34 percent reduction in the mean annual survival rate of dolphins due to projected freshwater inputs under the APA, relative to the NAA. In fact, all three alternatives considered here are expected to have a statistically significant reduction in mean annual survival rate relative to the NAA. The greatest reductions under the APA would be in the central and western strata (66 and 42 percent, respectively), where salinity gradients are the steepest, with lesser reductions in the island and southeast strata (7 and 15 percent, respectively). Higher flow years would presumably result in more significant reductions in survival relative to the NAA. The model projected a substantial decline in survival rates in the first few years of the project, particularly for dolphins in the central and western strata. The projected survival rates were determined to be insufficient to sustain the stock.

The model generated a projection of survival rates for a fairly constrained set of parameters, and so may represent a simplified “best-case scenario” for the dolphins in Barataria Bay. Shortcomings in the model, as identified in the DEIS and Garrison et al. (2020), are as follows—

- The model is limited to generating survival rates for only one year of operation, rather than a time series representing the planned operational period of the project (50 years).
- The model is based on the longest continuous number of days of low salinity exposure rather than the number of exposure events or days of exposure in a year. A second exposure event separated from the first by more than two days<sup>8</sup> would not be considered when evaluating impacts on survival.
- The projected salinity field is based on a hydrograph from a single “representative” year, in this case 1970 (cycle 0), rather than incorporating annual variability in hydrological conditions.
- The model does not account for future hydrological or climate conditions.
- The model does not account for potential changes in prey-species abundance and/or distribution, as well as other stressors experienced by dolphins in Barataria Bay, such as noise, fishery interactions, illegal feeding and/or harassment, vessel disturbance and/or strikes, pollution, and large storm events.

Based on the projected reductions in mean annual survival in the DEIS, the Commission requested that the National Marine Mammal Foundation and the National Marine Fisheries Service (NMFS) conduct additional analyses to determine (1) the projected effects of the MBSD project on dolphin recovery over time, and (2) how the MBSD project could delay recovery of the Barataria Bay bottlenose dolphin stock. As noted previously, the population trajectory model developed by Schwacke et al. (2017) and subsequently revised (Schwacke 2021) did not account for the effects of restoration activities (whether positive or negative). Those analyses were provided in the form of the enclosed report by Thomas et al. (2021) for two MBSD operational scenarios — the APA and the NAA. Using the Schwacke (2021) revised population trajectory model, the authors concluded that implementation of the APA would not only prevent recovery of the Barataria Bay stock (as predicted under the NAA), but it would also result in a precipitous decline in survival in the western and central strata within the first year of MBSD operation (consistent with the Garrison et al. (2020) model results). Within ten years of operation, bottlenose dolphins in the island strata are predicted to be reduced by 38 percent, in the southeast strata by 82 percent, and in the western and central strata by 100 percent; overall the Barataria Bay dolphin stock would be reduced by 78 percent. Within 50 years, dolphins in the island strata are predicted to be reduced by 85 percent and in the southeastern strata by 100 percent; overall, the Barataria Bay dolphin stock is predicted to be reduced by 96 percent.

**The near total loss of the Barataria Bay bottlenose dolphin stock due to MBSD project operations, or even losing the stock completely, appears inevitable if the project goes forward as planned. The Commission recognizes that this outcome could be consistent with Public Law 115-123 and the waiver issued under the Marine Mammal Protection Act if alternatives to avoid this result are not available. However, the Commission believes that there are alternative actions and additional measures that the state of Louisiana can take**

<sup>8</sup> The assumption of a physiological “reset” after 48 hours would require further research to validate.

that would reduce the impacts on dolphins, while still allowing the purposes of the project to be achieved.

### Marine mammal take waiver

In 2018, NMFS, at the direction of Congress, issued a waiver<sup>9</sup> to the state of Louisiana under the Marine Mammal Protection Act, authorizing the taking of marine mammals during the construction, operation, and maintenance of the MBSD and two other projects<sup>10</sup> included in Louisiana's 2017 Comprehensive Master Plan for a Sustainable Coast (Coastal Protection and Restoration Authority; CPRA 2017). The statutory language directing the Secretary of Commerce to issue the waiver requires the state of Louisiana to consult with the Secretary (through NMFS) to ensure that impacts on marine mammal species and stocks would be minimized to the extent practicable and consistent with the purpose of the project. It is unclear from the DEIS what effort was made by the state of Louisiana to meet this statutory responsibility in its selection of alternatives.

Section 6.3.6 of the draft RP #3.2 Appendix B: Mitigation and Stewardship Plan states that "CPRA will examine operational strategies to minimize (to the extent practicable consistent with the purpose and performance of the project) the Project's impacts on bottlenose [dolphins]. Given the dynamic conditions of any estuarine system, and the uncertainty around future conditions, the minimization measures will rely on the MBSD Monitoring and Adaptive Management Plan to inform future implementation." The Monitoring and Adaptive Management (MAM) Plan for bottlenose dolphins (section 3.7.3.19 of the draft RP #3.2 Appendix A) states that "adaptive management strategies include a framework for coordinating during operations, and a *post-operational* commitment to evaluate the ability of diversion operations to be modified to meet project goals while reducing impacts to marine mammals." Although these statements recognize the ongoing responsibility of the state to minimize impacts on dolphins and other marine mammals under the terms of Public Law 115-123, it appears to be limiting its review only to how operations can be adjusted once construction is complete. The state also should be reviewing whether the design and construction of the project can be modified to minimize impacts on marine mammals and whether there are alternatives with lesser impacts on marine mammals that would still satisfy the purposes of the project. Waiting to adapt MBSD operations until *after* dolphins are exposed to dangerously low salinity conditions is not a practicable or effective means to minimize those impacts or prevent freshwater exposure-related mortality.

The DEIS evaluated three alternative flow scenarios for the MBSD, but did not specifically discuss whether there were other sediment diversion-related alternatives that could be adopted that would minimize impacts on dolphins (including alternative design, construction, or operational features), and if so, whether any of the other alternatives were practicable and could be implemented consistent with meeting the purposes of the project. Therefore, the Commission recommends that the Louisiana TIG and the USACE expand the EIS to include a much more thorough identification and vetting of possible alternatives that could reduce impacts on dolphin stocks, along with a

<sup>9</sup> Section 20201 of Public Law 115-123 (the Bipartisan Budget Act of 2018).

<sup>10</sup> The Mid-Breton Sound Sediment Diversion and the Calcasieu Ship Channel Salinity Control Measures project.

discussion of whether each such alternative is practicable and would be consistent with meeting the purposes of the project.

If the proposed MBSD project were to move forward under the APA, as currently drafted, the Commission recommends that the Louisiana TIG and the USACE operate the MBSD in a way that minimizes the duration and amount of freshwater entering Barataria Bay via the MBSD so as to avoid adverse impacts on dolphins and other marine resources. This might be achieved through less frequent diversion openings or shorter duration diversion openings. It might also be achieved through a change in the trigger for opening the diversion from one based on exceeding a specific upriver flow rate (proposed as 450,000 CFS at the Belle Chasse water gage, which would result in an estimated 177 days of diversion openings annually, with the largest number of days open during the months from January and June) to one designed to avoid exceeding the dose-response threshold recommended by the expert elicitation (Booth and Thomas 2020), i.e., not allowing salinity levels of less than 5 ppt to persist for more than 21 days.

Another operational alternative that should be considered is management of the timing of freshwater influxes to minimize impacts on dolphin reproductive success. Bottlenose dolphins give birth to a single calf that remains with its mother generally for the first three to six years of its life (Wells et al. 1987). A study of Fiordland bottlenose dolphins exposed to freshwater discharge in New Zealand showed a higher prevalence of lesions in females and smaller-sized calves, suggesting that females and calves are particularly susceptible to health disorders in low-salinity conditions (Rowe et al. 2010). Although calves can be born at any time during the year, newborn calf sightings in the northern Gulf of Mexico are highest in spring and summer (Urian et al. 1996; Mattson et al. 2006; Miller et al. 2010, 2013), indicating that these may be periods when freshwater influxes should be minimized. The estimated bioenergetic requirements of lactating females are ~72 percent greater than non-lactating adult females, meaning that disruptions to prey availability during this crucial period of early calf rearing could adversely impact both the mother and new calf (Bejarano et al. 2017).

### **Avoiding collateral injury**

The projected near-loss of the stock anticipated under any of the alternatives considered in the DEIS would be inconsistent with the screening criteria for restoration projects under section 990.54(a)(4) of the Oil Pollution Act, which provides that evaluation of the proposed restoration alternatives must be based on, at a minimum, the extent to which each alternative will prevent future injury, and *avoid collateral injury*, as a result of implementing the alternative. Recognizing that collateral injury would occur to bottlenose dolphins, the Louisiana TIG has proposed to implement three stewardship measures to benefit dolphins in Louisiana: (1) support of a statewide stranding program for 20 years to improve the survival and health outcomes of marine mammals injured by the DWH oil spill, especially coastal and estuarine stocks of bottlenose dolphins; (2) support of activities to reduce stressful interactions between dolphins and humans (e.g., recreational fishery interactions, illegal “fishing” of dolphins, and impacts of marine vessels, noise, and other threats in Barataria Bay), and (3) funding to support stranding response surge capacity during UMEs.

Although these stewardship measures would normally be welcome, and would serve as critical supplements to a broader restoration plan to address injuries to dolphins caused by the

DWH oil spill, they do not alleviate in any appreciable way the immediate, or the even more severe long-term, deleterious impacts on the Barataria Bay dolphins expected to occur for the 50-year life of the project under each of the alternatives being considered for operation of the MBSD. Increased stranding response capacity directed at rescuing dolphins in poor health as a result of low-salinity exposure is unlikely to be effective, even with the proposed support for additional stranding response capacity in the event of a UME. This is due to the vast area expected to be inundated by fresh water, the distance between freshwater-exposed dolphin habitat in Barataria Bay and potential response facilities (once established), and the large number of dolphins expected to be acutely and continuously impacted by operation of the MBSD project (as predicted by the Garrison et al. 2020 and Thomas et al. 2021 models). Given that the stranding program in Louisiana is minimally functional at present, and efforts to rebuild the program will take several years<sup>11</sup>, the likelihood is low that a significant portion of stranded animals would be detected, let alone rescued and successfully treated, once operations commence in 2027. Even if animals were rescued in a timely manner, rehabilitation facilities in the Gulf of Mexico are extremely limited, as are options for release of rehabilitated animals into other habitats<sup>12</sup>. Rehabilitated dolphins from Barataria Bay could not be released back to their original habitat, due to ongoing low salinity conditions, and so would need to be released into adjacent estuaries or coastal waters. That is likely to prompt competition with established long-term resident bottlenose dolphins for prey, space, and other resources, and potentially lead to disruptions of multi-decadal, multi-generational dolphin community social systems (Wells 2014). Few studies have been carried out on the survivorship of estuarine bottlenose dolphins that have been rescued, rehabilitated, and released into other habitat (Mazzoil et al. 2008; Wells et al. 2013; McHugh et al. 2021), and even fewer studies involving dolphins that have experienced prolonged exposure to, and deleterious effects from, freshwater have been conducted (Deming et al. 2020). The published results of these studies make it clear that the rescue, rehabilitation, and release of hundreds of freshwater-exposed dolphins such that they remain functioning members of what now is a discrete population is neither feasible nor practical. To date, there has only been one successful release of a rehabilitated bottlenose dolphin back into the wild in Louisiana<sup>13</sup>. The proposed support of activities to reduce stressful interactions between dolphins and humans would also be largely ineffective in the long term given that impacts of MBSD operations are expected to result in significant, widespread, and immediate mortality, thereby negating any possible benefits resulting from such efforts.

<sup>11</sup> Marine mammal stranding networks are largely implemented by volunteer organizations, along with local, tribal, state, and federal government agencies. Given LDWF's 2019 decision to no longer participate in marine mammal stranding response activities, and the limited capacity for stranding response by the Audubon Nature Institute (the only other stranding network member currently authorized in Louisiana), NMFS recently hired a stranding coordinator in Louisiana to increase stranding response capacity by identifying and recruiting new potential stranding response partners. Funding alone is not likely to result in immediate capacity increases; staffing, training, and infrastructure requirements are expected to take several years before sufficient capacity is available for effective response to marine mammal strandings throughout Barataria Bay as well as in other parts of Louisiana where gaps in stranding response capabilities are a long-standing issue (Fougeres 2015).

<sup>12</sup> Issues associated with release of rehabilitated marine mammals include conflict with fisheries for resources; inadequate knowledge regarding the demography, behavior, and ecology of the recipient population; supporting survival of genetically not-so-fit individuals; introduction of novel or antibiotic-resistant pathogens into the marine environment; harm to human health; and cost (Moore et al. 2007). NMFS estimated that the cost of rehabilitating a cetacean may range from \$50,000-\$120,000 depending on the period that the animal must be captive and the type of care it requires (as cited in Gluch 2004).

<sup>13</sup> By the Audubon Coastal Wildlife Network in 2016 (<http://auduboncwn.org/octavius/>).

Given the direct, long-term, adverse impacts of MBSD operations on Barataria Bay bottlenose dolphins and other marine resources, the Commission recommends that the Louisiana TIG reject the identified action alternatives and instead revise the purpose and need statement such that alternatives other than operation of a large-scale sediment diversion at various flow rates are considered. Those alternatives should include land-building approaches that have proven to be effective at combating land loss in other coastal areas and that are less harmful to marine resources, including bottlenose dolphins. Functional alternatives for land building could include, for example, (1) the creation of barrier islands and marshes using dredged material, (2) the use of smaller-scale diversions, and (3) the backfilling of canals and spoil banks (Turner and McClenachan 2018). The last would directly mitigate and reverse some of the adverse results from previous engineering efforts that have contributed to the current land loss situation (Olea and Coleman 2014; Turner and McClenachan 2018; Turner et al. 2019). Those types of projects have been or are currently being implemented for habitat restoration elsewhere in Louisiana. The Commission recommends that the Louisiana TIG and the USACE further evaluate these and other functional alternatives to the MBSD as a means of reducing impacts and avoiding collateral injury to bottlenose dolphins and other marine resources.

### **Monitoring measures**

The DEIS states that five years prior to operations, several methods will be used to collect baseline information on the abundance, distribution, density, health, stranding rates/types/causes, survival and fecundity of the resident bottlenose dolphin population to be able to identify changes needed to the project once it is operational. The Commission agrees with the pre-operations sampling plan outlined for marine mammals in the DEIS Appendix R: Mitigation & Monitoring and Adaptive Management (MAM) Plans, which includes enhanced stranding response and investigations, capture-mark-recapture surveys, visual assessment surveys, health assessments, tagging, remote biopsy sampling, prey assessment, and collection of habitat data. However, the Commission is not aware of any pre-operation monitoring that has been initiated to date, beyond the studies that were conducted through 2019 and discussed herein. The Commission recommends that, if the MBSD project goes forward, the Louisiana TIG and CPRA work with NMFS to initiate the pre-operations sampling program for marine mammals in Barataria Bay by the end of 2021 to ensure a minimum five years of baseline information is collected on bottlenose dolphins and their prey species and habitat, prior to the implementation of the MBSD, as outlined in the MAM plan.

### **Inadequate restoration planning for marine mammals**

The Commission is concerned that the Louisiana TIG has yet to fully implement restoration activities that would facilitate recovery of bottlenose dolphins from the DWH oil spill. To date, the Louisiana TIG has implemented only one marine mammal project from its \$50 million budget for restoring marine mammals. That project would increase capacity and expand partnerships along the Louisiana coastline for marine mammal stranding response.

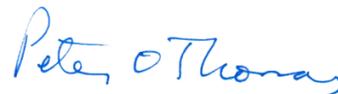

Other projects submitted to the NRDA portal that should be considered for restoration of marine mammals include—

- Reducing bycatch in state-based commercial and recreational fisheries<sup>14</sup>;
- Research on dolphin prey species and their availability;
- Support for the Gulf of Mexico Dolphin Identification System (to share information from photo-identification studies among researchers and stranding network members throughout the Gulf);
- Development and testing of alternative survey techniques (i.e., unmanned aerial vehicles (e.g., drones) and passive acoustic monitoring);
- Removal of debris and other harmful materials from high-use habitat;
- Documenting and preventing illegal feeding and harassment, and enhancing enforcement of protection measures;
- Increasing resources for responding to, and caring for, out-of-habitat or injured dolphins; and
- Developing and distributing appropriate outreach materials for commercial fishermen, anglers, and recreational boaters<sup>15</sup>.

Although we recognize the enormity of the impact of the oil spill on Louisiana's natural resources, and acknowledge that the Louisiana TIG is continuing to work on marine mammal restoration planning, that process seems unnecessarily slow, restrictive, and inefficient. It has delayed funding of projects to facilitate restoration of marine mammals in an area that suffered significant injury. The Commission recommends that the Louisiana TIG immediately (1) identify which of the restoration approaches for marine mammals identified in the PDARP are priorities for restoration in Louisiana and (2) prepare and publish a restoration plan to address high-priority restoration projects that can be implemented without delay.

The Commission appreciates the opportunity to review the draft RP #3.2/DEIS and hopes that the Louisiana TIG and the USACE consider these comments carefully before moving forward to approve this project. Please contact me if you have any questions concerning any issues raised in this letter.

Sincerely,

Peter O. Thomas, Ph.D.,  
Executive Director

## Summary

1. The proposed Mid-Barataria Sediment Diversion (MBSD) project will result in decreased levels of salinity in Barataria Bay, Louisiana. This decreased salinity has been predicted by the National Oceanographic and Atmospheric Administration (NOAA) to cause increased mortality of bottlenose dolphins in the Barataria Bay Estuarine System (BBES) Stock.
2. We used an existing model for the population dynamics of this stock to predict the population consequences of the increased mortality. We compared population projections under two scenarios (described in the Draft Environmental Impact Statement for the proposed project), “Applicants Preferred Alternative” (APA) and “No Action Alternative” (NAA), using the same four geographic regions (“strata”) as NOAA and assuming no movement of animals among strata.
3. The model predicts an immediate and severe population-level decline under the APA. In the first year of operation under the APA (2027), median predicted excess mortality under the APA is 585 dolphins (95% confidence interval [CI] 131-1459), leading to a median stock decline of 23% (95% CI 3-55). By contrast, under the NAA the stock is predicted to increase by 3% (95% CI 1-5) – the increase is because the stock is estimated to still be in recovery from the *Deepwater Horizon* oil spill. Therefore, after one year of operation, the stock is predicted to be 25% smaller (95% CI 6-56) under the APA than under the NAA.
4. After 10 years of operation, the parts of the stock in the Central and West strata are predicted to be functionally extinct (probability of < 30 animals remaining is 1 in the Central stratum and 0.99 in the West stratum). The part in the Southeast stratum, while not extinct, is predicted to be 82% lower (95% CI 44-96) under the APA than under the NAA. The Island stratum is less severely affected with a median predicted decline of 38% (95% CI 9-84).
5. After the planned 50 years of operation, dolphins in three out of the four strata are predicted to be functionally extinct under the APA, with the remaining Island stratum being severely reduced relative to the NAA (median predicted population size of Island stratum is 85% lower [95% CI 28-99] under the APA than under the NAA). Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the APA is 143 dolphins (95% CI 11-706) compared to 3363 (95% CI 2831-4289) under the NAA. In other words, the stock is predicted to be 96% smaller (95% CI 80-100) under the APA than then NAA.

## Introduction

The Barataria Bay Estuarine System (BBES) Stock of bottlenose dolphins was heavily impacted by the *Deepwater Horizon* (DWH) oil spill. A population model (Schwacke et al. 2017) was developed to quantify the impact, and this model has recently been updated as part of a Gulf of Mexico Research Institute consortium project (CARMMHA) to collect additional information and refine the impact quantification (Schwacke et al. in preparation).

One proposed habitat restoration effort is the proposed Mid-Barataria Sediment Diversion (MBSD) project, which proposes to intermittently release water from the Mississippi River into the upper Barataria Basin. This will result in decreased levels of salinity in the basin that, in turn, will cause mortality of dolphins in the BBES Stock. The potential extent of this mortality was examined in a recent report by the National Oceanographic and Atmospheric Administration (NOAA; Garrison et al. 2020). That report gave predictions of annual survival rates in four geographic regions (“strata”) within the Barataria Basin (Island, Southeast, Central and West) under two scenarios presented in the Draft Environmental Impact Statement for the proposed project: the “Applicants Preferred Alternative”, where the MBSD is constructed and begins operation in 2027, and the “No Action Alternative”, where the MBSD is not constructed.

In this report, we integrate the annual survival of dolphins in each of the four strata from the two scenarios of Garrison et al. (2020) into the population model developed under the CARMMHA project, and use this to predict the consequences of the proposed MBSD project for the dolphin stock.

## Methods

### Impact on survival from NOAA analysis

We obtained from NOAA 1,000 replicate predictions of estimated annual survival under APA and NAA scenarios in each of the four strata, derived from the model of Garrison et al. (2020). The replicate predictions represent the range of scientific uncertainty on possible impacts, accounting for factors such as uncertainty on the salinity field for a given set of hydrographic conditions, uncertainty on animal movement and hence exposure, and uncertainty on the effect of low salinity on dolphin survival (see Garrison et al. 2020 for details). Note that all predictions are based on a single assumed annual hydrograph, that for 1970 (Garrison et al. 2020), and so do not account for uncertainty in future hydrographic conditions (see Discussion).

For each replicate prediction and stratum, we calculated the percentage difference in survival between the APA and the NAA as follows:

$$\% \text{ difference in survival} = \frac{\text{survival under APA} - \text{survival under NAA}}{\text{survival under NAA}} \times 100$$

The resulting distribution of percentage difference in survival in each stratum is shown in Figure 1, with associated summary statistics in Table 1. For the Island stratum, the median prediction is of a 2% decline in survival under the APA relative to the NAA, although in 10% of replicates the predicted survival decline is greater than 20%. For the Southeast stratum, the median prediction is of a 14% decline in survival with 40% of replicates predicting a survival decline of greater than 20%. Note, however, that 24% of replicates in this stratum predict an increase in survival under APA relative to the NAA. For the Central and West strata there is a large predicted decline in survival under almost all replicates.

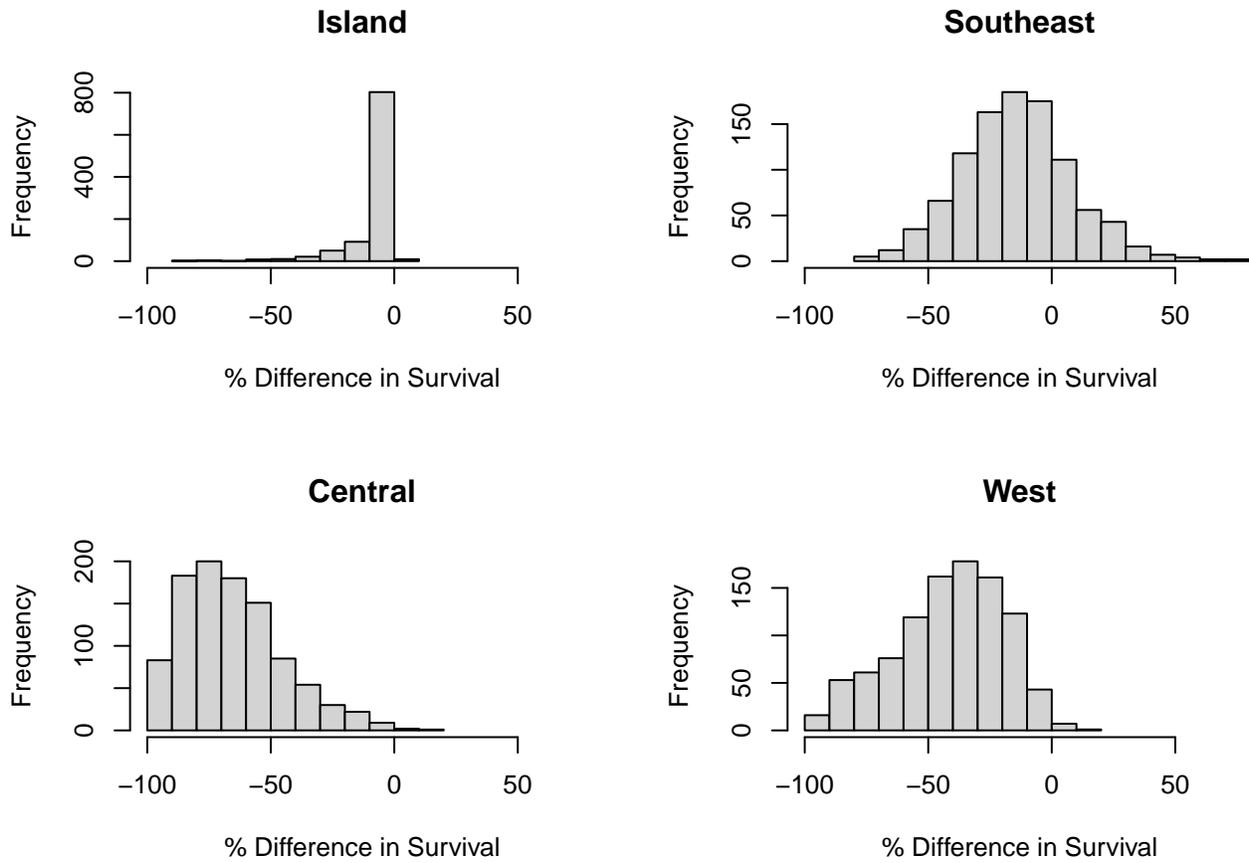

Figure 1: Predicted percentage difference in dolphin annual survival under the Applicant Preferred Alternative (APA) compared with the No Action Alternative (NAA). One thousand predicted survival rates were provided by NOAA and were derived from the model of Garrison et al. (2020).

Table 1: Summary statistics on predicted percentage difference in dolphin annual survival under the APA relative to the NAA. First column is median predicted percentage difference, second is percentage of replicates that predict a decline in survival of 20% or more, third is percentage of replicates that predict an increase in survival.

| Stratum   | median % diff | % (diff < -20%) | % (diff > 0) |
|-----------|---------------|-----------------|--------------|
| Island    | -2            | 10              | 1            |
| Southeast | -14           | 40              | 24           |
| Central   | -68           | 97              | 0            |
| West      | -39           | 83              | 1            |

## Population consequences

The population model of Schwacke et al. (in prep.) gives estimates of the population trajectory of BBES dolphins from 2010 onwards, accounting for the estimated effect of the DWH oil spill. We used this model as the basis to predict the estimated effect of the proposed MBSD project (APA) on the dolphin population. Like the APA survival predictions from Garrison et al. (2020), the population model accounts for scientific uncertainty in predictions by allowing multiple replicates to be drawn. We therefore based our predictions on 1,000 replicate samples.

For each sample, we partitioned the BBES dolphin population into the same four strata as Garrison et al. (2020), using estimates of the proportion of the total population with home range centers in each of the four strata. These estimates come from a spatial capture recapture analysis (Glennie et al. in prep.) that forms part of the inputs to the Schwacke et al. model. For the purposes of this analysis, we assumed that each stratum is demographically independent – i.e., that dolphins in the BBES stock do not move from one stratum to another. For each stratum, we ran the Schwacke et al. model for 75 years (2010-2076), under two scenarios. In the first scenario, representing the APA, for each year after the proposed MBSD project begins in 2027 we adjusted the survival values from the Schwacke et al. model using a random draw from the 1,000 values of percentage difference in survival for that stratum. In the second scenario, representing the NAA, we ran the Schwacke et al. model without modification.

We calculated the following metrics to summarize outcomes from the population model:

- In the first year of operation of the MBSD (i.e., 2027-2028)
  - Excess mortality: the total number of dolphins that are expected to die this year under the APA minus the number that are expected to die in the same year under the NAA.
  - Change in population size under the APA and under the NAA.
  - Percentage difference in population size in 2028 between APA and NAA.
- After 10 years of operation of the MBSD (i.e., in 2037)
  - Probability of functional extinction, where functional extinction is defined as < 30 animals.
  - Percentage difference in population size in 2037 between the APA and NAA.
- In the final year of operation the MBSD operations planning horizon (i.e., 2076)
  - Probability of functional extinction.
  - Population size under the APA and under the NAA.

In each case, we report the median value from the 1,000 replicate simulations, together with the lowest 2.5th and highest 97.5th percentile – these latter values represent a 95% confidence interval on the prediction.

## Results

We first present graphical representations and a qualitative description of the results, before presenting the summary metrics described in the Methods.

Figure 2 summarizes the population trajectories over all 1,000 realizations under APA (red) and NAA (black) scenarios. The populations follow the same trajectory under both scenarios up until 2027, when proposed MBSD operations start. During this period (2010-2027) the populations experience the negative effect of the DWH oil spill and, starting around 2020, begin to recover. After 2027 under the NAA, the populations continue to recover and reach a steady state long before the end of the simulation time period. Under the APA the median prediction for the Island stratum is of a steady decline, while the other strata experience rapid declines to extinction. The prediction at stock level, i.e., summing across strata, is shown in Figure 3. Under the APA, the stock is predicted to decline precipitously at first and then more gradually, reaching very low levels relative to the NAA by the end of the simulation time period.

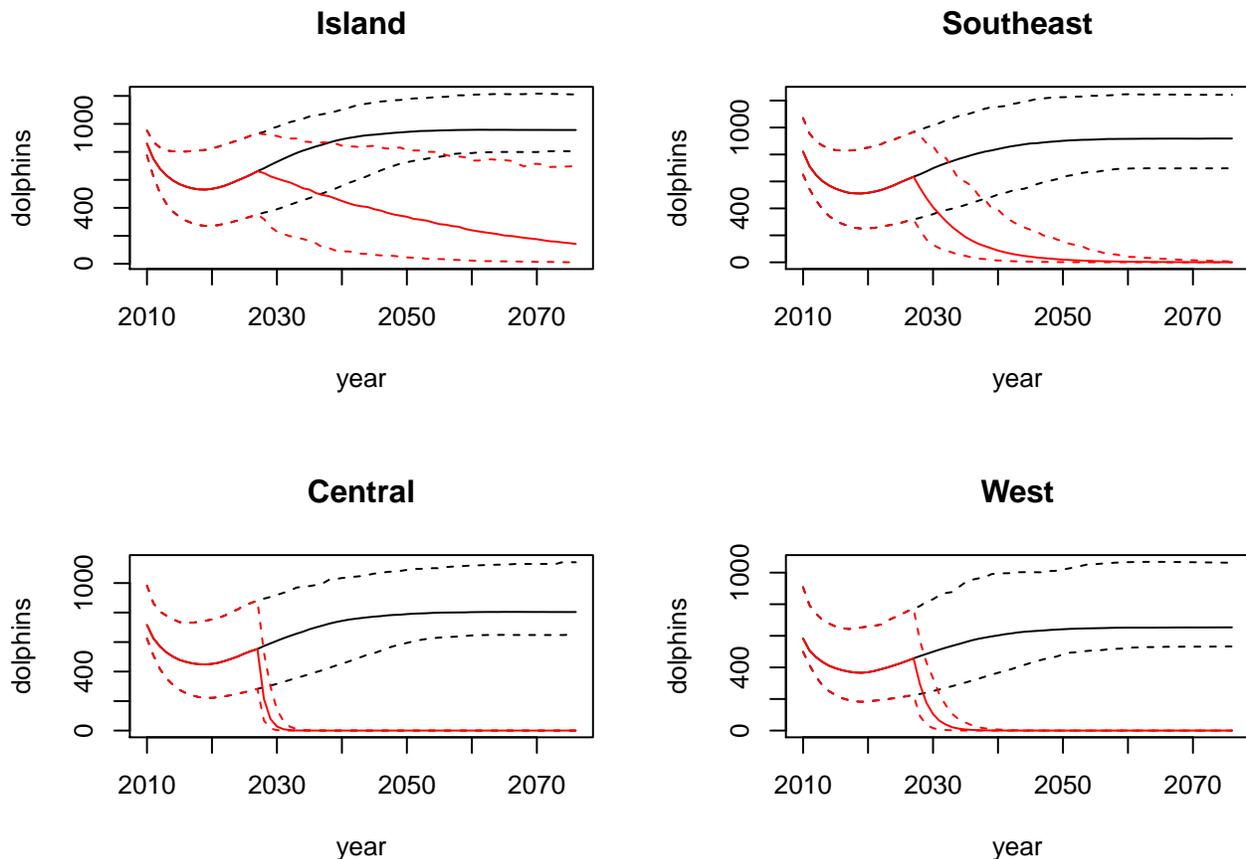

Figure 2: Summary of predicted population trajectories by stratum under the Applicant Preferred Alternative (red) and No Action Alternative (black) scenarios. Solid line shows median; dashed lines show 95% confidence limits.

The summaries given in Figures 2 and 3 are computed from 1,000 random realizations of the model. Figure 4 shows 10 example realizations. The part of the stock in the Island stratum experiences occasional large population decreases associated with years where there is a large decline in survival under the APA; in most years, however, there is little or no decline. After 50 years of operation, all realizations have experienced an overall decline and none are at the level of the corresponding NAA. The part of the stock in the Southeast stratum experiences frequent stronger declines, but also occasional increases associated with survival increase under the APA. Nevertheless, after 50 years of operation, all realizations are at or close to zero. The parts of the stock in the Central and West strata experience rapid declines towards zero in all realizations.

Quantitative summaries of the results are given in Tables 2-6<sup>1</sup>. Table 2 shows the predicted mortalities in the first year of the proposed MBSD operation (2027) under APA, NAA and the difference between the

<sup>1</sup>Note that in all these tables, the median shown in the “Total” row is calculated by first aggregating the strata and then calculating the median. This is not the same as simply summing the stratum medians. The same is true for the confidence limits.

### Barataria Bay Estuarine System Stock

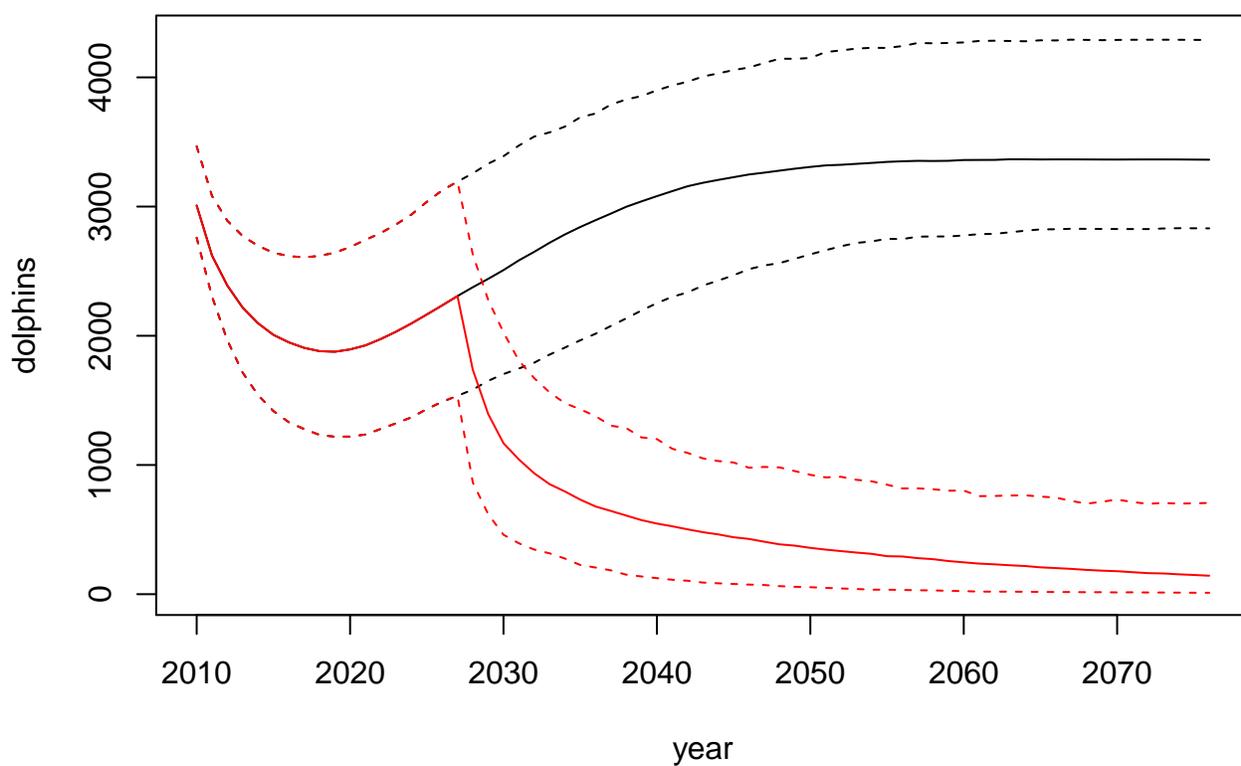

Figure 3: Summary of predicted stock trajectory under the Applicant Preferred Alternative (red) and No Action Alternative (black) scenarios. Solid line shows median; dashed lines show 95% confidence limits.

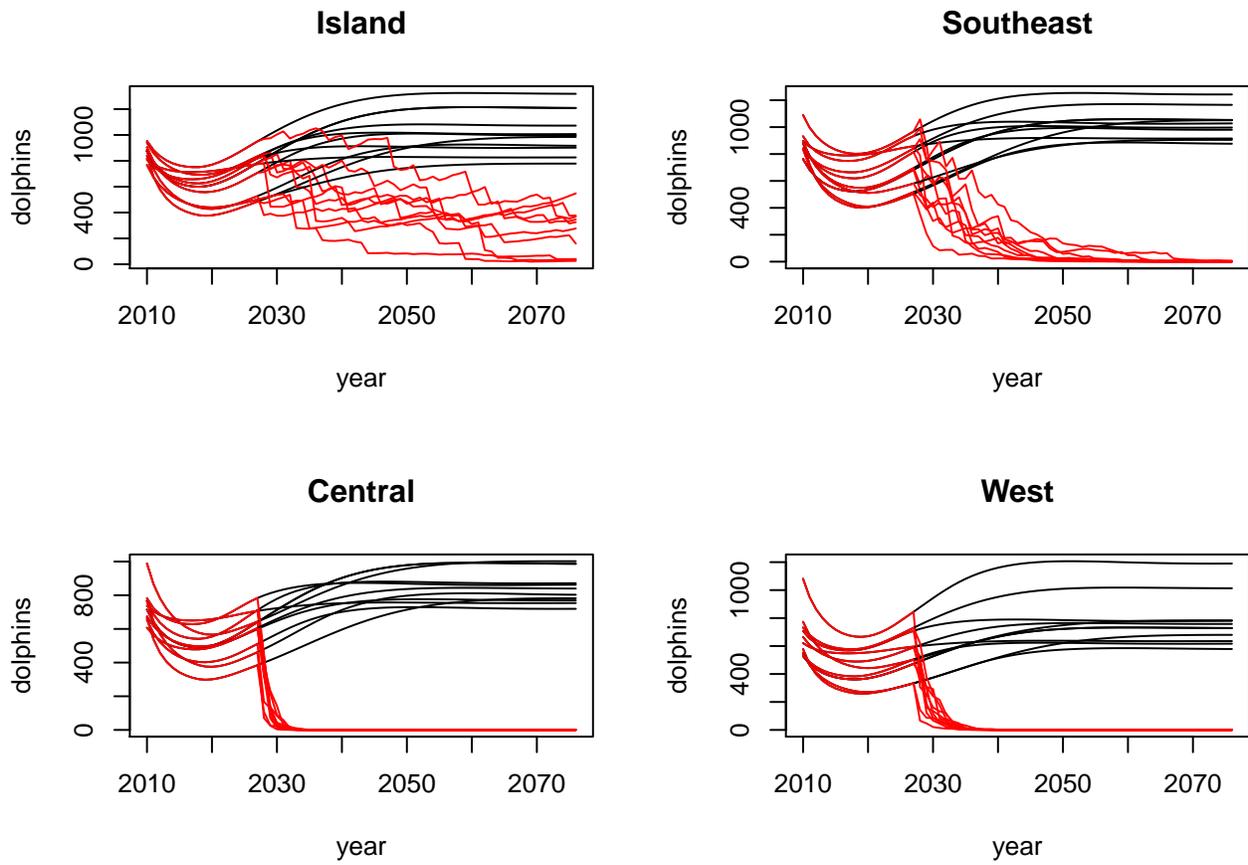

Figure 4: Ten example realizations of the population simulation under the Applicant Preferred Alternative (red) and No Action Alternative (black) scenarios.

two, which represents the predicted excess mortalities under the APA scenario. In this first year of MBSD operation, the median predicted excess mortality under the APA is 585 dolphins with 95% CI 131-1459. This excess mortality represents a median of 26% of the stock (95% CI 6-58) killed by the MBSD in its first year of operation.

Table 2: Predicted dolphin mortality in 2027 under APA and NAA scenarios. Last column shows excess mortality – i.e., mortality under APA minus mortality under NAA. Values are medians from the model simulations, with 95% confidence intervals in brackets.

| Stratum   | APA mortality   | NAA mortality | excess mortality (APA-NAA) |
|-----------|-----------------|---------------|----------------------------|
| Island    | 59 (26 — 261)   | 44 (23 — 64)  | 12 (0 — 217)               |
| Southeast | 111 (0 — 424)   | 42 (22 — 66)  | 69 (-50 — 367)             |
| Central   | 364 (120 — 715) | 37 (19 — 59)  | 326 (92 — 656)             |
| West      | 186 (53 — 461)  | 30 (15 — 52)  | 154 (31 — 420)             |
| Total     | 740 (26 — 261)  | 156 (23 — 64) | 585 (131 — 1459)           |

Estimated stock size in the 2027, before operation of the proposed MBSD, was 2307 animals (95% CI 1535-3193). Estimated stock sizes in 2028 under the APA and NAA are shown in Table 3. Under the APA, the stock is predicted to decline by 23% (95% CI 3-55) due to mortalities caused by the MBSD operation. By contrast, under the NAA the stock is predicted to increase by 3% (95% CI 1-5) – the increase is because the stock is estimated be still in recovery from the DWH oil spill. Therefore, by the end of the first year of MBSD operations, the stock is predicted to be 25% smaller (95% CI 6-56) under the APA than under the NAA (Table 3).

Table 3: Predicted number of dolphins in 2028 (after 1 year of operation of the MBSD) by stratum and overall under APA and NAA scenarios, and percentage difference between scenarios. Values are medians with 95% confidence intervals in brackets.

| Stratum   | APA dolphins      | NAA dolphins       | % difference    |
|-----------|-------------------|--------------------|-----------------|
| Island    | 648 (320 — 926)   | 683 (366 — 942)    | -2 (-31 — 0)    |
| Southeast | 551 (237 — 939)   | 653 (330 — 983)    | -12 (-49 — 7)   |
| Central   | 214 (68 — 528)    | 573 (294 — 894)    | -61 (-87 — -17) |
| West      | 291 (90 — 567)    | 472 (232 — 789)    | -35 (-79 — -7)  |
| Total     | 1736 (864 — 2629) | 2376 (1584 — 3258) | -25 (-56 — -6)  |

Tables 4 and 5 show the predicted population size in 2038 and 2076 respectively (i.e., after 10 years of operation of the MBSD and at the end of the 50 year planning horizon) under APA and NAA, as well as the difference between the two scenarios.

Table 4: Predicted number of dolphins in 2038 (after 10 years of operation of the MBSD) by stratum and overall under APA and NAA scenarios, and percentage difference between scenarios. Values are medians with 95% confidence intervals in brackets.

| Stratum   | APA dolphins     | NAA dolphins       | % difference       |
|-----------|------------------|--------------------|--------------------|
| Island    | 491 (118 — 868)  | 852 (503 — 1070)   | -38 (-84 — -9)     |

| West      | 0.99               | 1.0                |

## Discussion

Under the assumptions of this model, there is predicted to be a severe decline in stock size caused by the MBSD under the APA scenario. The stock is predicted to become functionally extinct in three out of four strata and severely reduced in the fourth. The declines are more severe than those estimated to have been caused by the DWH oil spill and will take place just as the stock is starting to recover from the oil spill. While the stock is estimated to recover fully from the DWH oil spill under the NAA scenario, this will not happen under the APA scenario.

We set a limit for “functional extinction” of 30 animals. To our knowledge there is no agreed threshold, and other reasonable values could have been used to indicate the point at which there are so few animals they no longer form a functioning part of the ecosystem. Regardless of the value used, the above findings would be

qualitatively the same

These results were generated by combining two separate analyses: the survival predictions from Garrison et al. (2020) and the population model of Schwacke et al. (in prep., updating Schwacke et al. 2017). These use some overlapping information – the photo-ID surveys undertaken in Baratara Bay from 2010-2019. Hence it would be possible, with more modelling effort, to integrate the two more closely by building components of the Garrison et al. model into the population model. However, this is not expected to make a qualitative difference to the population predictions.

The analysis undertaken here sampled values at random each year from the predicted survival effects under the APA and NAA generated by Garrison et al. (2020). This is equivalent to assuming the factors driving the uncertainty in predicted survival effects vary each year. While this is correct for some sources of uncertainty (e.g., uncertainty in salinity field given hydrography; animal movement and hence exposure), it is not fully correct for others (e.g., uncertainty on dolphin survival response given exposure). Ideally, the different components of uncertainty in the Garrison et al. model would be separated and then we could sample as appropriate at the annual level or just once per population projection. This reduction in annual variability would be expected to produce a somewhat more positive population projection, particularly in the Island stratum. However, one very important source of annual variability was neglected in these simulations: annual change in hydrography. The predictions we used from Garrison et al. model were based on a single annual hydrograph, from 1970 (cycle0, Garrison et al. 2020), when in reality hydrography is expected to vary substantially between years. This variability will mean that there are years of worse survival than predicted by Garrison et al. and years of better survival. The overall effect of this on the dolphin population will be to produce a more negative trajectory, because years of poor survival produce large decreases in population size, but in years of good survival the population can only increase by a small amount as it is constrained by the birth rate. The population can decline by 25% in a bad year but it cannot increase by 25% in a good year. Given this, we anticipate that addressing all of the issues related to uncertainty discussed in this paragraph will lead overall to more negative population predictions.

Another factor that makes our projections optimistic is that the population dynamics model is deterministic – it does not account for the random nature of births and deaths, and also allows non-integer population counts. Incorporating demographic stochasticity in the model, and restricting population sizes to be whole numbers will produce more negative predictions, although the difference will not be significant until the populations become small.

The analysis also assumed that the four strata are demographically independent. If dolphins move away from the three more affected strata into the Island stratum in response to low salinity then the stock-level effects may be lower; on the other hand, if dolphins disperse between strata without regard to salinity changes then more animals will move into the strongly-affected strata from the less-affected Island stratum and the stock-level effects may be greater. Genetic analyses have supported spatial structure within the Baratara Basin population, and have identified genetically distinct dolphin groups in the Western, East/Central, and Island portions of the basin (Rosel et al. 2017, Speakman et al. in prep.). Tracking of Baratara Basin dolphin movement patterns via satellite-linked tags has shown multi-year site fidelity to small home ranges (Wells et al. 2017), and have not shown changes in movement that are coincident with fluctuating salinity (Takeshita et al. submitted).

---

**Concern ID: 61879**

**Commenters questioned why other alternatives are not being considered other than No Action and a sediment diversion with various levels of flow rates. CEQ's regulations require that the EIS rigorously explore and objectively evaluate all reasonable alternatives, which is a requirement that the Draft EIS does not meet. Consider analyzing a range of other alternatives, options, and tools that better preserve and protect the environment and minimize the severe impacts to Louisiana fisheries, the communities, and the entire Gulf Coast ecosystems.**

**Response ID: 15835**

The range of reasonable alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2 of the Draft EIS (Alternatives), an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in its SRP/EA #3 and found that a combination of “marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats” (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in its Restoration Plan. The LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG’s Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

---

**Concern ID: 61894**

**Consider the alternative of tearing down spoil banks and backfilling abandoned canals before, in addition to, or instead of implementing the proposed MBSD Project.**

**Response ID: 15987**

This suggested alternative would not meet the goals and objectives as stated in the purpose and need and described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives. It would not re-establish deltaic processes between the Mississippi River and Barataria Basin through the delivery of sediment, fresh water, and nutrients. However, the EIS acknowledges the influence of canals and spoil banks on wetland losses in Barataria Basin (see Chapter 3, Section 3.6.2.2 in Wetland Resources and Waters of the U.S. of the Final EIS), and has updated the analysis to include additional technical references regarding the influence of canals on the existing environment in the Barataria Basin. The EIS does not describe the proposed Project as a solution to fully reverse ongoing land-loss trends. The EIS recognizes that the proposed Project is projected to create and maintain only a portion of the wetlands that would otherwise be lost in the absence of the proposed Project over the next 50 years.

This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Other similar restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan and the LA TIG through Natural Resources Damage restoration planning.

---

**Concern ID: 61906**

**The MBSD Project would cause loss and detrimental impacts on the recreational and sport fishing industry in the Barataria Basin.**

**Response ID: 16236**

The issues raised by the commenters were considered in the Draft EIS. EIS Chapter 4, Section 4.16.5.2 in Recreation and Tourism acknowledges that the proposed Project would impact recreational and sport fishing in the Barataria Basin. Relative to the No Action Alternative, the proposed Project would cause minor, permanent, adverse impacts on

---

recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts on these species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips.

---

**Concern ID: 61912**

**CPRA should consider alternative flow triggers, designs, and features in the operations plan and design of the proposed MBSD Project in order to minimize impacts. CPRA should also consider adjusting diversion design elements such as triggers, peak flows, volumes, and nutrient loads over the first years of operation to minimize impacts. These adjustments could minimize impacts to dolphins, oysters, brown shrimp, and other aquatic organisms. Some commenters suggested limits be imposed by USACE, others suggested an operating plan that is tied to specifics, while others emphasized flexibility tied to real-world experiences. CPRA should also consider alternative methods of operating the proposed MBSD Project, such as operating the diversion during winter when water levels in the basin are lower and can accept high volumes of water from the diversion.**

**Response ID: 15999**

The proposed MBSD Operations Plan can be found in Appendix F2 Preliminary Operations Plan of the Final EIS. As stated in the Chapter 4, Section 4.4.4.2.4 Sediment Transport in Chapter 4 Surface Water and Coastal Processes, sediment transported by the Mississippi River is primarily comprised of fine sediments, with higher river flows (typically occurring in the spring) suspending more coarse-grained sediment that are important in delta building (see Chapter 3, Section 3.4 Surface Water and Coastal Processes). Fine-sediment transport through the diversion would be generally proportional to water flow in the river. The intake channel was modeled and designed to divert a high sediment-to-water ratio while minimizing energy loss (to maintain flow and sediment transport through the diversion complex) and impacts on the river. The amount of sediment carried through the diversion would vary by year, depending on flow rates in the river and the corresponding variation of diversion operations. As explained in Chapter 2, Section 2.8.1.3 Project Operations in Action Alternatives Carried Forward for Detailed Analysis, the Mississippi River discharge of 450,000 cfs would be the standard operations “trigger to open the diversion for flow (above the base flow)”. Operations (with the exception of a base flow up to 5,000 cfs) would cease when the river discharge falls below 450,000 cfs or when certain emergency triggers are met (such as in advance of hurricanes or when a spill of hazardous substances occur in the river). When the Mississippi River flows exceed 450,000 cfs, the gates would be fully opened (above base flow). At river flows of 450,000 cfs, the diversion flow would be approximately 25,000 cfs, and flows would increase proportionally as the river flow increases. This ramp would continue up to maximum diversion capacity flow of 75,000 cfs when the river reaches a flow of 1,000,000 cfs.

An alternative related to operational triggers specific to sediment concentration was considered but determined not to be technically feasible or reasonable because data and

technology do not currently exist to support this operational regime (refer to the Eliminated Alternatives Matrix in Appendix D2 of the EIS). According to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS, as part of the adaptive management and monitoring process, CPRA would consider potential ways to optimize diversion operations based on Project performance and success and would assess potential operational changes that may minimize impacts to basin resources where practicable after sufficient operational data become available for analysis.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62009**

**The negative socioeconomic consequences would devastate southeast Louisiana, destroy people's livelihoods, displace people living near the diversion, and destroy property in the areas impacted by the proposed MBSD Project.**

**Response ID: 16207**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana, including impacts on population, property values, and community cohesion. As noted in these sections, the proposed Project would have both beneficial and adverse socioeconomic impacts on the people and communities within the Project area. Minor to moderate, permanent adverse socioeconomic impacts are expected to occur near the immediate outfall area outside of flood protection. Minor to moderate, permanent, beneficial socioeconomic impacts are expected to occur in the west bank New Orleans area north of the

---

diversion. Moderate to major, beneficial, temporary impacts from job creation and economic activity in the proposed Project area are anticipated. In addition, the Socioeconomics Technical Report in Appendix H1 provides additional details on these projected effects.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the DWH oil spill.

The commenters' concern regarding the potential impacts of the diversion were considered by CPRA and the LA TIG in developing the Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included mitigation to address and offset some of the projected impacts of the Project on fisheries and surrounding communities outside levee protection including providing structural mitigation and stewardship measures for increased water levels that are projected to result due to the Project, such as raising roads or improving bulkheads. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

In communities south of the Project site outside of federal levee protection where the proposed Project is projected to cause increased water levels, CPRA plans to take one of two approaches. In Myrtle Grove, CPRA is planning to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision. By improving this bulkhead, CPRA would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions without the Project. See Table 1 in the Final Mitigation and Stewardship Plan for more details. CPRA plans to acquire a temporary right-of-way to permit improvement of the bulkhead, voluntarily or through eminent domain if necessary, from the property owners in the Myrtle Grove Marina Estates Subdivision.

In other communities south of the Project site outside of federal levee protection, from Woodpark south to the communities of Grand Bayou and Happy Jack, CPRA plans to elevate the portions of public roads outside of levee protection that provide access to each of these communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to

implement flood mitigation measures. As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62077**

**The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide**

---

**approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.**

**Response ID: 16242**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

---

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62634**

**The proposed Project would cause excessive harm to fisheries (for example, oysters and brown shrimp), dolphins, communities and recreational uses, which is unacceptable and would make its implementation a clear violation of OPA. OPA regulations states that proposed restoration actions should be evaluated by “the extent to which each alternative will prevent future injury as a result of the incident, and avoids collateral injury as a result of implementing the alternative”. Because the Project would injure species that were harmed by the Deepwater Horizon oil spill, it should not be implemented, even if it does benefit some habitats and species. Some commenters argued it was also inconsistent or in violation of the 2013 U.S. Court Consent Decree and the BP plea agreement relevant to the National Fish & Wildlife Foundation (NFWF) funds.**

**Response ID: 16650**

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is not evaluating the proposed Project for compliance with OPA and not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG's Draft Restoration Plan, OPA, or NRDA processes represent solely the views of the LA TIG, not USACE.

The potential collateral injuries of the proposed Project were considered in the LA TIG's Draft Restoration Plan.

---

OPA requires that Trustees develop and implement a plan for restoration, rehabilitation, replacement, or acquisition of the equivalent, of the injured natural resources under their trusteeship. See 33 U.S.C. § 2706(c). OPA further requires federal agencies to propose regulations for the “assessment of natural resource damages.” See § 2706(e). Under 2707(e)(2), any assessment of natural resource damages made in accordance with these regulations creates a rebuttable presumption on behalf of a Trustee in any administrative or judicial proceeding under the Act.

As required by OPA 2706(e), NOAA developed regulations outlining a process for the assessment of natural resource damages. These regulations (hereinafter “NRDA regulations” at 15 CFR Part 990) also include a process for restoration planning, including the development and evaluation of restoration alternatives.

The 2016 U.S. Consent Decree with BP provides that monies received under the settlement for natural resource damages will be spent as outlined in restoration plans adopted by the Trustees consistent with 15 CFR 990. See Paragraph 19, and Appendix 2. The LA TIG’s Restoration Plan is consistent with 15 CFR 990.

Title 15 CFR §990.54 of the regulations outlines a number of areas in which a reasonable range of alternatives should be evaluated to select the preferred alternative. Recognizing that almost all restoration comes with some potential for collateral injury, one factor for evaluation is the extent to which each alternative will prevent future injury and avoid collateral injury. The potential for collateral injury does not preclude an alternative from selection, rather the Trustees must evaluate each alternative under multiple factors, and select a preferred alternative to meet the outlined restoration objectives.

The LA TIG, in selecting the Preferred Alternative in the Restoration Plan, evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 (Identification of a Preferred Alternative), 3.2.1.5 (Alternative 1 – Avoids Collateral Injury), and 3.2.2.5 (Alternatives 2–6 – Avoids Collateral Injury) of the Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems and necessarily entails reverting the current ecosystem to a more natural state that was altered when Mississippi River flows were cut off by construction of levees. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the Preferred Alternative in the Restoration Plan.

The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As

described in Section 3.2.1.6 (Alternative 1 – Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as the Preferred Alternative in the Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project would meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the spill.

The BP Plea Agreement as it applies to NFWF funds is not relevant here as the LA TIG is not authorizing the use of those funds for this Project. Even if it were applicable, the criminal plea agreement expressly contemplates the use of criminal penalties for sediment diversion in Louisiana.

---

**Concern ID: 62636**

**Despite concerns expressed about the potential harm that a large-scale sediment diversion could have on bottlenose dolphins in the Barataria Basin, the LA TIG finalized the SRP/EA #3 in March 2018, selecting as its Preferred Alternative a suite of restoration approaches that included the proposed Project.**

**Response ID: 16608**

USACE was not involved in the SRP/EA #3. USACE is not involved in the process to restore damages caused by the DWH oil spill.

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views.

In the SRP/EA #3, the LA TIG evaluated the extent to which the alternatives would prevent future injury as a result of the Deepwater Horizon (DWH) oil spill and avoid collateral injury including furthering impacts to bottlenose dolphins in the Barataria Basin. It found that marsh creation projects in Barataria Basin can help prevent future erosion injuries to marsh vegetation and soils in areas that suffered increased erosion as a result of the DWH oil spill. Restoration of marsh habitat also helps prevent future injury to estuarine-dependent resources, such as fish, crustaceans, and marsh birds that lost supporting habitat through the oil spill and through subsequent increased erosion. The SRP found that the operation of a large-scale sediment diversion would result in reductions in salinity in the Barataria Basin, and

---

that reduction would adversely impact BSE marine mammals, including the stock of bottlenose dolphins in Barataria Bay, possibly resulting in illness and death.

USACE's Draft EIS evaluated impacts to bottlenose dolphins in Chapter 4, Section 4.11 Marine Mammals. As stated in that section, changes in salinity projected to occur as a result of operating the diversion are anticipated to have major, adverse, permanent impacts on the bottlenose dolphin population within the Barataria Basin. No edits based on this comment were made to Chapter 4 of the Final EIS.

These potential impacts to marine mammals were also included and considered by the LA TIG in its Draft Restoration Plan (see Section 3.2.1.5 [Avoids Collateral Injury]). As with the EIS, because these impacts were considered in the Draft Restoration Plan, no related edits were made to the main body of the Final Restoration Plan.

In recognition of the potential collateral injury to bottlenose dolphins and in response to public comments on this issue, CPRA would be responsible for ensuring the implementation of four key stewardship measures as part of the proposed Project to benefit dolphins in Louisiana; the last of these has been developed since the release of the Draft Restoration Plan in response to public concerns about potential marine mammal impacts. They are:

- A state-wide stranding program for 20 years intended to improve the survival and health outcomes of marine mammal populations injured by the DWH spill, especially coastal and estuarine stocks of bottlenose dolphins. Enabling a more rapid response to a live stranded cetacean would increase that animal's chance of survival by reducing the time spent on the beach, reducing stress on the animal, providing rapid treatment, and, if appropriate, transport to an authorized rehabilitation facility for additional treatment and care. In addition, this program would improve diagnoses of the causes of illness and death in cetaceans to better understand natural and anthropogenic threats, which would inform restoration planning and monitoring and adaptive management (see Section 3.2.1.1.5 [Associated Stewardship Measures – Alternative 1] of the Final Restoration Plan).
- Activities that would reduce stressful interactions between dolphins and humans, such as: reducing dolphin mortalities associated with recreational fishing; reducing illegal fishing of dolphins; and assessing and mitigating the impacts of marine vessels, noise, and other threats on marine mammals in the Barataria Basin. See Section 3.2.1.1.5 (Associated Stewardship Measures – Alternative 1) of the Final Restoration Plan for more details.
- Additional stranding surge capacity in response to unusual marine mammal mortality events (see Section 3.2.1.1.5 [Associated Stewardship Measures – Alternative 1] of the Final Restoration Plan).
- A Marine Mammal Intervention Plan, which outlines a spectrum of response actions for dolphins affected by the operation of the diversion, ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. For more information, see Appendix R5 to the Final EIS.

In considering the operation of the diversion, CPRA developed a detailed MAM Plan to evaluate the proposed MBSD Project's benefits and impacts on the Barataria Basin and consider how the management of the diversion may be adapted to better meet Project goals (see Appendix R2 [Monitoring and Adaptive Management Plan] to the EIS). In addition to performance monitoring to measure progress toward the proposed MBSD Project's restoration objectives, and to better understand the ecological functions and services provided by the proposed Project, the MAM Plan also includes monitoring to characterize the nature and extent of potential collateral injuries. CPRA's adaptive management strategies to minimize impacts to BBES dolphins from Project operations include a framework for coordinating stranding response activities during operations, and a post-operational commitment to evaluate the ability of diversion operations to be modified to meet Project goals while reducing impacts to marine mammals. Marine mammal related monitoring and adaptive management activities have been updated since the release of the Draft EIS to include more details regarding the process through which operational data would be used to evaluate potential modifications to those strategies and protocols.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62665**

**Commenters suggested that the proposed Project would achieve some benefits relative to the No Action Alternative, but that even if the modeling is correct (which it probably is not), the projected benefits provided by the Project would be very small compared to amount of habitat that is expected to be lost in the Barataria Basin over**

---

**50 years. If the models used for the EIS turn out to be accurate, more than 43 percent of the land in the Barataria Basin will have disappeared even with the Project in 30 years. During that time, 105,000 acres of land will be lost, with the Project sustaining only 17,300 more acres than the No Action Alternative (5 percent of the basin's current land area). Because of this background of large land loss, the proposed Project could only be considered a stop-gap measure. Further, commenters cited sources indicating ongoing debate about the effectiveness of large-scale sediment diversions as a land-building strategy and recommended those uncertainties be addressed in the Draft EIS (Blaskey, 2020; Blum and Roberts, 2009; Chamberlain et al., 2018; DeLaune et al., 2013; Suir et al., 2014; Turner et al., 2019).**

**Response ID: 16624**

The issues raised by the commenters were considered in the Draft EIS. For example, the proposed Project's long-term influence on land building and wetland creation has been modeled extensively through engineering and design and the impacts (beneficial and adverse) are described in Sections 4.2 (Geology and Soils), 4.4 (Surface Water and Coastal Processes) and 4.6 (Wetland Resources and Waters of the U.S.) of the EIS. With regard to modeling conducted to determine impacts of the proposed Project, the Delft3D Basinwide Model projections of Project impacts include uncertainties. Uncertainties are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 (Model Limitations and Uncertainty), and in detail in Appendix E (Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties). Uncertainty in model results is recognized in Table 4.2-4 found in Section 4.2.3.2.2.1 Geology, which indicates that land areas are considered accurate within +/- 200 acres and that the error in land gains is +/-300 acres.

As part of developing the EIS, the USACE, together with members of the LA TIG (including cooperating agencies and CPRA), reviewed the Delft3D Basinwide Model, including its

parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives. The cited studies were reviewed and included in relevant analyses in the Draft EIS.

The LA TIG acknowledges the commenters' concerns. As described in the LA TIG's Draft Restoration Plan, the Project would reestablish deltaic processes that deliver sediment, fresh water, and nutrients; improve the function of existing habitats; and develop deltaic habitats that connect nearshore and offshore ecosystems. The LA TIG expects that the Project would result in the creation of a maximum of 17,300 acres of land in the Barataria Basin by year 30 of operations; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 [Alternative 1 Description] of the Restoration Plan). The LA TIG agrees that, with or without the Project, coastal Louisiana and the Barataria Basin would experience tremendous land loss. However, the LA TIG believes this background of large land loss makes the habitat created by the proposed Project even more important. Relative to other types of incremental approaches (for example, marsh creation through the application of dredged sediment), the Project would reconnect and reestablish sustainable deltaic processes and support the long-term viability of existing and planned coastal restoration efforts. All citations referenced by the commenters were included in the Final EIS and thus were considered by the LA TIG in the Final Restoration Plan.

---

**Concern ID: 62866**

**A commenter recommends that, if the MBSD Project goes forward, the LA TIG and CPRA work with NMFS to initiate the pre-operations sampling program for marine mammals in Barataria Bay by the end of 2021 to ensure a minimum five years of baseline information is collected on bottlenose dolphins and their prey species and habitat, prior to the implementation of the MBSD, as outlined in the MAM Plan.**

**Response ID: 16675**

The dolphin monitoring measures raised by commenters were considered in Section 6.3.6 (Public Interest Mitigation - Marine Mammals) of CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) and Section 3.7.3.19 (Atlantic Bottlenose Dolphins [Tursiops truncatus]) of the Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS). The revised MAM Plan included in Appendix R2 of the Final EIS describes proposed dolphin monitoring during the 5 years prior to operations. The LA TIG coordinated with NMFS in the development of these measures.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances

---

where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62876**

**Commenter supports the pre-operations sampling plan outlined for marine mammals in the Draft EIS Appendices R1 and R2 (Mitigation and Stewardship Plan, and MAM Plan), which include enhanced stranding response and investigations, capture-mark-recapture surveys, visual assessment surveys, health assessments, tagging, remote biopsy sampling, prey assessment, and collection of habitat data.**

**Response ID: 16683**

Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) and Appendix R1 (Mitigation and Stewardship Plan) to the Draft EIS contained the information on marine mammal monitoring noted by the commenter. In addition, since the publication of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention (MMI) Plan to be implemented by CPRA to further respond to and recognize expressed public concerns about the potential impacts of the Project on marine mammals (see new Appendix R5 to the Final EIS). The MMI Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are

---

identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62921**

**Commenters suggested that the State of Louisiana must comply with the MMPA waiver and minimize impacts to marine mammal population stocks in ways that are practicable and consistent with the purposes of the Project. This includes considering alternative actions and modifications to Project operations to reduce or mitigate impacts to BBES dolphins while still meeting the Project purpose. The Mitigation Plan incorrectly suggests that actions to reduce impacts to dolphins is not necessary because it would negatively impact Project performance. The Trustees should research all possible mitigation actions to reduce impacts to BBES and invest in the restoration projects that effectively reduce this impact. These may include alternative construction designs or operational strategies, such as reduced diversion flow or salinity thresholds, that would reduce impacts to bottlenose dolphins.**

**Response ID: 16703**

CPRA prepared a Mitigation and Stewardship Plan and a Monitoring and Adaptive Management (MAM) Plan. Chapter 3, Section 3.11.1 Marine Mammals in the Northern Gulf of Mexico of the Final EIS has been revised to discuss the Marine Mammal Protection Act waiver that was issued for the proposed Project.

There is no requirement in the Bipartisan Budget Act that CPRA evaluate alternatives other than the Project. The Bipartisan Budget Act of 2018, Section 20201 requires the State of Louisiana, in consultation with the Secretary of Commerce (delegated to NMFS), to the extent practicable and consistent with the purposes of the proposed Project to minimize impacts on marine mammal species and population stocks, and monitor and evaluate the impacts of the proposed Project on such species and population stocks.

CPRA's updated MAM Plan (Appendix R2 of the Final EIS) includes measures and frameworks for minimizing and monitoring impacts of the proposed Project on marine mammals. In addition, the LA TIG has developed a Marine Mammal Intervention Plan. As described in the Federal Register notice announcing issuance of the MMPA waiver, the State's consultation with NMFS will be ongoing to appropriately address the evolving Project planning and design for the construction, operation, and maintenance phases. This ongoing

---

consultation is described in the MAM Plan as well as the Marine Mammal Intervention Plan (see below and Appendices R2 and R5 to the Final EIS for more details).

As described in the Draft EIS, the MAM Plan identifies potential ways in which the LA TIG may reduce impacts to dolphins. The MAM Plan in the Final EIS has been updated to provide more detail about the strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols. However, the adaptive management strategies and actions are largely reliant upon data that would be collected during either the pre-construction monitoring period or once operations commence. Once operational data are available, they would be used to evaluate the potential Project modifications to further minimize impacts to marine mammals. There are limited minimization measures available that would reduce impacts on marine mammals and those limited measures would likely only benefit dolphins residing the furthest from the diversion structure (for example, the Island strata).

However, the LA TIG recognizes that despite these operational strategies, dolphins within Barataria Bay would likely experience significant impacts, as described in the EIS, given the purposes of the proposed Project. In response, the LA TIG has developed a Marine Mammal Intervention Plan that outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia (see Appendix R5 to the Final EIS).

While the more severe actions such as euthanasia may not offset the ultimate outcome of mortality, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, the Mitigation and Stewardship Plan and MAM Plan include actions that would occur prior to operations to improve understanding of the BBES dolphins as well as improvement of stocks across the state (see Appendices R1 and R2 to the Final EIS).

In arriving at the mitigation and stewardship actions included in the Mitigation and Stewardship Plan, the LA TIG worked with experts within NOAA with expertise on marine mammals to ensure the consideration of all potential mitigation actions. In terms of operational strategies to reduce marine mammal impacts, as noted above, those strategies cannot be further defined at this time as they are largely reliant upon data that would be collected during the pre-construction monitoring period or once operations commence. One goal of the proposed Project is to deliver sediment, fresh water, and nutrients into the basin and the design of all of the action alternatives would accomplish that goal. Alternative diversion designs that accomplish that goal on the desired scale would not address dolphin impacts, as those impacts are largely related to salinity changes, which are driven by the transmission of fresh water into the basin.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement.

Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Response ID: 16543**

Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock of the EIS and Section 3.2.1.5 (Avoids Collateral Injury) of the LA TIG's Restoration Plan acknowledge that a large number of dolphins would become ill and strand or die in Barataria Bay as a result of the Project.

Two citations mentioned by the commenter (Garrison et al., 2020 and Wells, 2014) were included in the Draft EIS. Other citations mentioned by the commenter (Deming et al., 2020; Fougères, 2015; Gluch, 2004; Mazzoil et al., 2008; McHugh et al., 2021; Wells et al., 2013) were reviewed and would not change the findings of the EIS, but they have been added to Section 4.11 (Marine Mammals). As noted in other responses, the Final EIS has also been updated to reflect the results of Thomas et al (2021), which did not change the conclusions of the EIS.

To address bottlenose dolphin impacts, the LA TIG has developed a Marine Mammal Intervention Plan that has been included in the Final EIS and Final Restoration Plan (Appendix R5 to the EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions such as euthanasia may not offset the ultimate outcome of mortality, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. However, the LA TIG recognizes that the number of animals able to be relocated will likely be very small in comparison to the number impacted by the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally,

---

impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62986**

**The Project would drive decreases in salinity that would reduce the overall health, survival, and reproduction of bottlenose dolphins that reside in the Barataria Basin, a species that was negatively affected by the Deepwater Horizon oil spill (NMFS, 2013). Some commenters felt that because of this, the Project should either not move forward or its operation should be altered.**

**National Marine Fisheries Service (NMFS). 2013. Roy Crabtree (NMFS) to Elizabeth Davoli (CPRA). <https://s3.documentcloud.org/documents/726710/national-marine-fisheries-service-comments-on.pdf>**

**Response ID: 16701**

The concerns raised by the commenters about the projected decreases in salinity and resulting effects on Barataria Bay dolphins were considered in the Draft EIS. More specifically, Chapter 4, Section 4.11.5.2 in Marine Mammals of the EIS acknowledges that the proposed Project would likely have significant, adverse impacts to Barataria Basin dolphins, a species that suffered significant impacts from the DWH oil spill. This section also discusses the physiological changes caused by exposure to low-salinity water, the duration of those changes that leads to mortality, and the anticipated mortality of a large portion of the dolphin population in the Barataria Basin within the first decade. These sections of the EIS provide a more in-depth analysis of potential impacts to dolphins than the letter cited by the commenter.

The concerns raised by the commenters were also considered in the LA TIG's Draft Restoration Plan (see Section 3.2.1.5 [Collateral Injury]); the Final Restoration Plan has been edited consistent with changes made to the Final EIS and see below regarding new, related content included in Appendix R.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources, like dolphins, that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan).

---

The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible (if it is possible), the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins in Louisiana (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include

more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63067**

**The majority of the bottlenose dolphin population of this area will be destroyed... not just killed but sentenced to a horrific death. Freshwater releases at Bonnet Carré Spillway in 2019 resulted in an unusual mortality event (UME), demonstrating the harm that freshwater releases can cause to dolphins. A study by the Galveston Bay Dolphin Research Program also found that dolphins in upper Galveston Bay developed skin lesions after flooding from Hurricane Harvey. Additional studies further support the harm that the diversion could cause by demonstrating negative impacts to dolphins from exposure to low-salinity conditions (Deming and Garrison, 2021; Duignan et al., 2020; McClain et al., 2020).**

Deming, A., and L. Garrison. 2021. 2019 Northern Gulf of Mexico bottlenose dolphin unusual mortality event. **Response ID: 16590**

The Draft EIS included an analysis based on extensive literature and soon-to-be published data (now published) demonstrating the impacts of low-salinity conditions on dolphins. These data were considered as part of an Expert Elicitation (a garnering of expert opinions to determine or quantify an unknown) that resulted in dose-response curves (Booth et al. 2020) and summarized in Chapter 4, Section 4.11.3 (Marine Mammals - Overview of Impact Analysis Approach) of the EIS. While Deming and Garrison (2021) was presented after the release of the Draft EIS, the presentation was based on data that were fully considered in the Draft EIS, including as part of the Expert Elicitation. Along with other relevant data (for example, BBES tagging studies), the analysis contained in the Draft EIS determined that there would be a significant, adverse, permanent impact on the BBES Stock. Further, the analysis in the Draft EIS concluded that if the 75,000 cfs Alternative were implemented, impacts would be immediate and only a remnant population would be likely to exist near the barrier islands after 50 years of operation.

After release of the Draft EIS, at the request of the Marine Mammal Commission, the National Marine Mammal Foundation and University of St. Andrews released a population impact projection based on the information presented in the Draft EIS (including annual survival rates from Garrison et al. 2020) coupled with an updated population model for BBES dolphins (Schwacke et al.2022, Thomas et al. 2021). This new, additional analysis has been incorporated into the Final EIS in Chapter 4, Sections 4.11.5.2 Barataria Bay Estuarine Stock and supports the original determination in the Draft EIS of major, permanent, adverse impacts on the BBES dolphin population. The research presented in the McClain et al. (2020) study cited by commenters was considered in the Draft EIS [cited at the time as McClain et al. (in prep)]; the research presented by Duignan et al. (2020) is consistent with the established literature and does not change the conclusions of the Draft EIS, but this study has been incorporated in Chapter 4, Section 4.11.5.2.2.1 General Effects on Dolphin Health of the Final EIS. Similarly, the information included in the Deming and Garrison presentation was considered in the Draft EIS, is consistent with the conclusions of the Draft EIS, and the presentation has now been cited in Section 4.11.5.2.2.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully

avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include specific marine mammal response triggers that may affect Project operation mitigation efforts; see Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63070**

**A recent study suggests that the proposed Project would not only prevent the recovery of the BBES Stock, but it would result in the functional extinction of dolphins in the West, Central, and Southeast strata of the stock area (Thomas et al., 2021). The only dolphins remaining in the basin would live adjacent to the barrier islands, and even this group would become severely reduced over the 50-year planning horizon of the proposed Project. Additionally, an expert elicitation (Booth and Thomas, 2021) building on previous studies (Garrison et al., 2020; Schwacke et al., 2017; Thomas et al., 2021) suggests that while dolphins can endure some periods of exposure to low salinity, the period of tolerable exposure shortens for dolphins exposed to acute changes in salinity, and the median time to death is 22 days with continuous exposure to water with salinity levels below 5 ppt.**

**Thomas, L., Marques, T., Booth, C., Takeshita, R., and L. Schwacke. 2021. Predicted population consequences of low salinity associated with the proposed Mid-Barataria Sediment Diversion Project on bottlenose dolphins in the Barataria Bay Estuarine System Stock.**

**Response ID: 16593**

The Draft EIS included an analysis of the impacts to marine mammals, including BBES dolphins in Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock. This analysis incorporated the Booth and Thomas (2021), Garrison et al. (2020), and Schwacke et al. (2017) studies, and the Final EIS includes additional analyses that were completed by Thomas et al. (2021) after the Draft EIS was released for public comment. The impact conclusions in the Draft EIS were based in large part on Garrison et al. (2020), which predicts that only a remnant population of dolphins would continue to exist in Barataria Basin after diversion operations commenced. The conclusion of major, permanent, adverse impact to bottlenose dolphins is also supported by Thomas et al. (2021), which built on these earlier studies and concludes that, after 1 year of operation of the Applicant's Preferred Alternative, there would be 61 percent fewer dolphins in the Central stratum than under the No Action Alternative, 35 percent fewer in the West stratum, 12 percent fewer in the Southeast stratum, and 2 percent fewer in the Island stratum, with 25 percent fewer overall. Thomas, et al. further concluded that after 10 years of operation, there would be 100 percent reduction in the populations of dolphins in the Central and West strata, an 82 percent reduction in the population of the Southeast stratum dolphins, and a 34 percent reduction in the population of the Island stratum dolphins as compared against the No Action Alternative, with an overall difference in population of 78 percent. (Note that Thomas, et al. 2022 slightly refined some of these projections.) After 50 years of operation, in three out of the four strata, dolphins are predicted to be functionally extinct (defined as less than or equal to dolphin in Thomas, et al. 2022) under the Applicant's Preferred Alternative, with the remaining Island stratum being 85 percent lower [95 percent CI -28 -- -99] under the Applicant's Preferred Alternative than under the No Action Alternative. Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the Applicant's Preferred Alternative is projected to be 143 dolphins (95 percent CI 11-706) compared to a predicted 3,363 dolphins (95 percent CI 2,831-4,289) predicted to inhabit the Barataria Bay under the No Action Alternative. In other words, the BBES dolphin stock is projected to be 96 percent smaller (95 percent CI -80 -- -100) under the Applicant's Preferred Alternative than then No Action Alternative. Chapter 4, Section 4.11

---

Marine Mammals of the Final EIS has been updated to reflect the results of Thomas et al. (2021).

Booth and Thomas (2021) evaluated multiple scenarios with different salinity changes, and in one of those scenarios' where bottlenose dolphins experience a change in salinity within 0 to 5 days from typical salinity environment (that is, mean 15 to 25 ppt) down to an atypical environment with salinity below 5 ppt for an extended period, the median time to death would be 22 days.

---

**Concern ID: 63075**

**The estimates of bottlenose dolphin survival rates provided in the Draft EIS may be inaccurate due to key modeling assumptions and limitations, which were acknowledged in the Draft EIS and associated studies (Garrison et al., 2020). For example, because the models used by the Draft EIS did not look at the cumulative effect of multiple stressors and exposure to low-salinity waters over many years, the Draft EIS likely underestimates the impact of the proposed Project on bottlenose dolphins.**

**Garrison, L.P, Litz, J. and Sinclair, C. 2020. Predicting the effects of low salinity associated with the MBSD Project on resident common bottlenose dolphins (*Tursiops truncatus*) in Barataria Bay, LA. NOAA Technical Memorandum NOAA NMFS-SEFSC-748: 97 p.**

**Response ID: 16596**

USACE and the LA TIG acknowledge the assumptions and limitations of the modeling, and the resulting uncertainties (including potential underestimation of adverse impacts) noted by the commenter. In addition to the Delft3D modeling, published, peer-reviewed studies (and in some cases, pre-published data available only to the NMFS EIS authors) were reviewed in conjunction with development of the EIS's evaluation of projected impacts to bottlenose dolphin populations in the Project area. The Final EIS includes additional analyses that were completed by Thomas et al. (2021) after the Draft EIS was released for public comment. The EIS considers multiple sources of stress for bottlenose dolphins including salinity and temperature; sedimentation and land loss; contaminant and nutrients; food web and ecological interactions; and dolphin prey. While quantitative analysis regarding the combined effects of multiple stressors and prolonged salinity exposure are not currently available, the qualitative analysis supports the permanent, major, adverse impact on BBES dolphins found in the EIS (the most significant adverse impact category of the EIS).

**Response ID: 16705**

Impacts on dolphin reproduction were considered in the Draft EIS. More specifically, Chapter 4, Sections 4.11.5.1 and 4.11.5.2 in Marine Mammals included an analysis of the potential impacts of harmful algal blooms, spring flows, and multiple stressors on reproductive health. Section 4.11.5.2 also considered the potential impacts of reduced reproductive health on the recovery trajectory of BBES Stock population. Some citations mentioned by the commenter (Bejarano et al., 2107; Miller et al., 2013; and Urian et al., 1996) were included in the Draft EIS. The other citations mentioned by the commenter (Mattson et al., 2006; Miller et al., 2010; Rowe et al., 2010, and Wells et al., 1987) were reviewed and would not change the findings of the EIS, but they have been added to Section 4.11.

As discussed in Chapter 2, Section 2.4.2 Evaluation of Operational Trigger, in developing the proposed Project, CPRA considered different operational triggers for the diversion, including using pulsing operational regimes, to determine whether various operational alternatives would meet the purpose and need of the Project and which would best meet those purposes. CPRA concluded that a simple on/off operational trigger with no pulsing provides the greatest total volume of sediment.

Section 4.11.5.2 of the Draft EIS finds that the timing of the proposed Project operations would result in the lowest salinity levels in the BBES Stock area at the peak of dolphin calving and that this would represent a serious threat to dolphin reproductive success.

With respect to approaches that CPRA could use to mitigate potential impacts to dolphins, the LA TIG and CPRA have developed three documents that address the issue.

First is CPRA's Mitigation and Stewardship Plan, which includes support for a state-wide stranding program, a program to reduce non-diversion related stressors to dolphins, and additional stranding surge capacity in response to unusual marine mammal mortality (see

---

Section 3.2.1.1.5 [Associated Stewardship Measures – Alternative 1] of the Final Restoration Plan).

Second is the MAM Plan, which CPRA expanded in response to public comments to include more details regarding the process through which operational data would be used to evaluate potential modifications to those strategies and protocols (see Appendix R2 to the Final EIS). As stated in the MAM Plan, adaptive management strategies, such as timing of freshwater influxes, are largely reliant upon data that would only be available once operations commence but may also be informed by new information gained during the preoperational period. At that time, these data would be used to evaluate potential operational actions, including timing and magnitude of freshwater influxes, that may further minimize impacts to marine mammals and dolphin reproductive success while achieving Project goals.

Third is the Marine Mammal Intervention Plan, which outlines a spectrum of response actions for dolphins affected by the operation of the diversion, ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. For more information, see Appendix R5 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63078**

---

**The impact of increased freshwater inputs from the Mississippi River into coastal areas of Louisiana in 2019 caused a die-off leading to an unusual mortality event (UME). The Louisiana Department of Wildlife and Fisheries (LDWF) was winding down its involvement in the marine mammal stranding network during that time. While a group called Audubon Coastal Wildlife Network attempted to fill the void left by the LDWF, critical data were missed. It is estimated that only 33 percent of stranded animals were reported for Louisiana during the whole of the 2019 UME.**

**Response ID: 16598**

Chapter 4, Section 4.11.5.2.2.1 General Effects on Dolphin Health of the Final EIS has been revised to acknowledge the limitations of data collection by the LDWF during the 2019 UME. Analysis in the Final EIS is based on additional expert opinion regarding effects on dolphins from freshwater exposure compiled for Booth & Thomas (2021) and new data reported in Thomas, et al. (2021). This additional information supported the impact conclusions in the Draft EIS. NOAA has assumed coordination of the Louisiana Marine Mammal Stranding Network. Independent of this Project, the LA TIG has funded a project to support stranding network enhancements. Further, through the Project, the LA TIG would support an additional 20 years of funding for the Louisiana Marine Mammal Stranding Network.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63629**

---

**Operation of the MBSD will adversely affect dolphin prey species, such as spotted sea trout, as well as other important marine resources, such as submerged aquatic vegetation, benthic algae and other benthic fauna, brown shrimp, southern flounder, and eastern oyster.**

**Response ID: 16603**

The impact of the Project on dolphin prey species was discussed and considered in detail in Chapter 4, Section 4.11.5.1 (Marine Mammals - General Impacts on Habitat and the Environment) of the Draft EIS, which notes:

Certain marine mammal prey species are more tolerant of lower salinity waters than others. Of the 10 key species analyzed in Section 4.10 Aquatic Resources that are known BBES dolphin prey (representing 75 percent of the stomach prey content), the Applicant's Preferred Alternative would result in overall minor beneficial impacts on six species (red drum, Gulf menhaden, bay anchovy, blue crab, white shrimp, and bass) and a major adverse impact on brown shrimp, minimal adverse impact of spotted seatrout, negligible to minimal adverse impact on southern flounder, and neutral impacts on Atlantic croaker. Oysters are not known to be a prey item for BBES dolphins.

Further, as discussed in Section 4.11.5.1 (General Impacts on Habitat and the Environment in Marine Mammals), initial adverse impacts on SAV would be temporary, with permanent beneficial impacts to overall coverage and biomass of SAV once the salinity regime stabilizes. Although the specific timing of these changes cannot be predicted, Section 4.10.4.1.2 in Submerged Aquatic Vegetation has been updated in the Final EIS to indicate that SAV colonized mudflats relatively quickly (within 2 years), once conditions were suitable, at Mardi Gras Pass (on the east side of the Mississippi River). The resulting increase in SAV biomass would result in increased primary productivity, increased nursery habitat for aquatic species, and shifts in the food web would play a role in the impacts on dolphin prey species. Impacts on benthic algae would be adverse or beneficial, depending on the salinity tolerance of a given species (see Section 4.10.4.2 [Benthic Resources]).

---

**Concern ID: 63752**

**Commenters questioned the slow pace of LA TIG restoration planning for marine mammals and noted several restoration actions that have already been submitted to the NRDA restoration project idea portal. They suggested that the LA TIG identify priorities for marine mammal restoration in Louisiana and prepare a Restoration Plan to implement those priorities without delay.**

**Response ID: 16652**

USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore the damage caused by the DWH oil spill. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH oil spill in the Louisiana Restoration Area. As explained in the Final EIS, Appendix B2 Draft EIS Public Review: Public Meetings Summary and Responses to Public Comments, Section 2.0 Agency Roles in the Responses to Public Comments, response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views. The LA TIG acknowledges the comments and notes that because the discussion of specific marine mammal restoration project ideas is beyond the

---

scope of this particular restoration planning effort, no related edits have been made to the LA TIG's Restoration Plan.

The LA TIG recognizes the importance of expediency in restoration of all resources injured by the DWH oil spill, including marine mammals. In the 2016 NRDA settlement with BP, \$50M was allocated to the restoration of Marine Mammals in the Louisiana Restoration Area. Settlement payments from BP began in 2017 and will occur every year for 15 years. Therefore, considerations must be made regarding the priority for expenditures of restoration dollars. There are additional implementation considerations that help to set the pace for restoration for all resources across the Gulf. Since the settlement, the LA TIG has approved two projects from the Marine Mammal allocation: the Assessment of Marine Mammal Physiological Responses to Low Salinity Exposure and the Louisiana Enhanced Marine Mammal Stranding Network. The LA TIG has also funded the Louisiana Marine Mammal Abundance, Distribution, and Density project from the Monitoring and Adaptive Management allocation.

It is imperative that the LA TIG maximize the effectiveness of restoration efforts for all resources, including marine mammals. Thoughtful, intentional restoration planning is the first step in that process. Considerable data needs exist in regard to the identification and prioritization of marine mammal stressors in Louisiana. In the LA TIG Monitoring and Adaptive Management Strategy (LA TIG 2021), the LA TIG identified fundamental objectives for marine mammals in Louisiana and data needs to support the development of SMART (smart, measurable, achievable, realistic, and time-bound) objectives. These objectives will guide the expenditure of monitoring and adaptive management funding to support better understanding of marine mammal needs in Louisiana and, in turn, support the prioritization of restoration actions for that resource.

The LA TIG will consider the Project suggestions submitted to the DWH project portal when planning for future restoration efforts. The LA TIG appreciates the submission of thoughtful ideas based on the experience and knowledge of our partners and citizens.

---

**Concern ID: 63823**

**Commenters noted that the proposed mitigation will not actually reduce impacts on dolphins, and there is no way to mitigate those impacts. Commenters noted that reducing human interaction will not reduce or address impacts of the projects on the local population.**

**Response ID: 16550**

Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock of the EIS acknowledges that according to Thomas, et al. (2021) most of the approximately 2,300 dolphins within the Barataria Basin will perish within the first 10 years of start of operations of the proposed Project (comparing the anticipated Barataria Basin 2027 dolphin population [2,307 dolphins] to the projected 2038 population under the Preferred Alternative [644 dolphins] indicates that approximately 72 percent of the dolphins would perish). That section further acknowledges that the anticipated dolphin mortality would be due to reductions in salinity levels rather than other stressors and that mitigation and stewardship measures that would not reduce the salinity impacts, would be unlikely to reduce the projected dolphin mortality.

With respect to the Restoration Plan, in Section 3.2.1.5 (Avoids Collateral Injury) the LA TIG acknowledges that a large number of dolphins would become ill and strand in Barataria Bay

---

as a result of the Project. The Mitigation and Stewardship Plan also acknowledges that the proposed mitigation may not minimize impacts of the Project on dolphins (see Appendix R1 to the EIS). Measures described in the MAM and Mitigation and Stewardship Plan were developed in recognition of the anticipated effects of the Project and to provide valuable data to inform adaptive management actions that could be considered to minimize adverse impacts on BBES dolphins while being consistent with the Project's purpose (see Appendices R1 and R2 to the Final EIS).

The LA TIG does not agree that there is no effective mitigation for this Project but recognizes that the mitigation will be limited (that is, primarily for dolphins around Grand Isle), depending on how operations are managed. Similar to mitigation, the stewardship measures described in the Mitigation and Stewardship Plan will primarily benefit other Louisiana stocks of dolphins outside of the Barataria Basin, though they will provide some benefit to BBES dolphins. For example, minimizing dolphin feeding will protect dolphins from vessel interactions. As noted in Chapter 4, Section 4.11 (Marine Mammals) of the EIS, a remnant BBES dolphin population is expected to remain near the barrier islands. Efforts to reduce anthropogenic stressors other than those from the Project through the Stewardship and Mitigation Plan will benefit the existing and future population in the Barataria Basin and throughout the state. However, the LA TIG recognizes that the impacts of the Project will likely be significant on marine mammals even with the proposed mitigation and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63826**

**Commenters suggested that no one will be able to mitigate dolphin impacts if Project activities kill them.**

**Response ID: 16551**

The stewardship measures described in the Mitigation and Stewardship Plan are intended for implementation prior to and during diversion operations. Although these measures may not minimize impacts from the proposed Project on BBES dolphins, they could enhance individual dolphin survival threatened by other anthropogenic sources, such as by funding a state-wide stranding program (the current funding of which is set to expire in 2026; see Appendix R1 to the EIS).

Regarding the operation of the diversion, CPRA also developed a detailed MAM Plan to evaluate the proposed MBSD Project's effects on the Barataria Basin as they occur and consider how the management of the diversion may be adapted to better meet Project goals (see Appendix R2 [Monitoring and Adaptive Management Plan] to the EIS). In addition to performance monitoring to measure progress toward the proposed MBSD Project's restoration objectives, and to better understand the ecological functions and services provided by habitat created by the Project, the Monitoring and Adaptive Management (MAM) Plan also includes monitoring to document changes to the abundance, distribution, population demography, density, survival, health and reproduction of the BBES Stock of bottlenose dolphins, their prey, and their habitat that may result from the operation of the Project and resulting low salinity.

Adaptive management strategies in CPRA's MAM Plan to minimize impacts to BBES dolphins from Project operations include a framework for coordinating stranding response activities during operations, and a commitment to evaluate whether diversion operations could be modified to meet Project goals while reducing impacts to marine mammals. Marine mammal related MAM activities have been updated since the release of the Draft EIS to include more details regarding the process through which operational data would be used to evaluate potential modifications to those strategies and protocols.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not

---

know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63828**

**It is unclear from the Draft EIS what effort was made by the State of Louisiana to meet the statutory responsibility under the Bipartisan Budget Act in its selection of alternatives.**

**Response ID: 16553**

Chapter 3, Section 3.11.1 Marine Mammals in the Northern Gulf of Mexico of the Final EIS has been revised to discuss the Marine Mammal Protection Act waiver that was issued for the proposed Project.

There is no requirement that CPRA evaluate alternatives other than the Project. The Bipartisan Budget Act of 2018, Section 20201 requires the State of Louisiana, in consultation with the Secretary of Commerce (delegated to NMFS), to the extent practicable and consistent with the purposes of the Project, to minimize impacts on marine mammal species and population stocks, and monitor and evaluate the impacts of the proposed Project on such species and population stocks.

The Monitoring and Adaptive Management (MAM) Plan (Appendix R2 of the Final EIS) includes measures for minimizing and monitoring impacts of the Project on marine mammals. As described in the Federal Register notice announcing issuance of the MMPA waiver, the State's consultation with NMFS would be ongoing to appropriately address the evolving Project planning and design for the construction, operation, and maintenance phases. This ongoing consultation is described in the MAM Plan as well as the Marine Mammal Intervention Plan (see Appendices R2 and R5 to the Final EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of

---

the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

U.S. Army Corps of Engineers

New Orleans District

Attn: CEMVN-ODR-E; MVN-2012-2806-EOO

7400 Leake Avenue

New Orleans, LA 70118

RE: Park: Federal Agencies - other than NPS  
Project: Mid-Barataria Sediment Diversion  
Draft Restoration Plan 3.2 and  
Environmental Impact Statement (ID: 100083)  
Document: Draft Restoration Plan and  
Environmental Impact Statement:  
Mid-Barataria Sediment Diversion (ID: 110454)

Dear Sirs:

The Mid-Barataria Sediment Diversion (MBSD) is guaranteed to destroy the coastal environment and habitat for many species. The MBSD is also guaranteed to come with a price tag of over \$2 billion. What the Louisiana Coastal Protection and Restoration Authority (CPRA) **cannot** guarantee, however, is whether the MBSD will even have a net positive creation of marshland in the Barataria Basin. The Environmental Impact Statement (EIS) fails to recognize the certain damages that will result from the MBSD (destroy wildlife and seafood industries) in exchange for only the hopeful creation of marshland.

1. The MBSD Provides Minimal Benefits to Coastal Restoration.

CPRA has overstated the benefits of the MBSD. The No Action Alternative proposal in the EIS (i.e. no construction of the diversion) projects the Barataria Basin to have 72,800 acres of wetlands in 2070.<sup>1</sup> With the MBSD, CPRA projects only 85,500 acres in the Barataria Basin, if all goes according to plan.<sup>2</sup> These projections indicate that the anticipated net gain of the \$2 billion MBSD is only 12,700 acres at cost of \$150,000 per acre.

---

1 See Mid Barataria Sediment Diversion EIS Executive Summary, Page ES-9.

2 *Id.*

2. Other Diversions Have Not Created Land As Expected.

Plaquemines Parish is home to numerous river diversions, both natural and man-made. These diversions include Caernarvon, Davis Pond, Mardi Gras Pass, West Bay, the Jump, Baptiste Collette, and Cubpits Gap.

The Caernarvon and Davis Pond diversions were hailed by CRPA's predecessor as diversions that would grow marshland and help the local eco-systems. However, the anticipated benefits of these diversions were never realized. In both instances, no land growth was achieved and the local seafood industries in those areas were decimated.

The Jump, Baptiste Collette, and Cubpits Gap divert the equivalent amount of water as expected by the MBSD. However, none of these diversions has created any new land over the last 150 years of their existence. The West Bay project created less than 10% of the land it was projected to create.

Despite numerous historical examples showing failed land growth, CPRA believes the MBSD will somehow perform differently. However, in 2020, CPRA cut the MBSD estimate of the net gain of marshland from 30,000 acres down to 12,000 acres.

3. The Mississippi River Contains Harmful Pollutants and Fertilizers.

CPRA touts the MBSD as a re-creation of the natural historical process of the river's sediment dispersion. However, the Mississippi River is not the sediment-rich water source from 100 years ago. Throughout the Mississippi River watershed footprint, fertilizer runoff, pollutants, plastics and other waste are dumped into the river and sent downstream. Nutrients in the river, including nitrogen and phosphorus, cause marsh plants to grow too fast leading to erosion.

Recently, PCS Nitrogen in Ascension Parish has sought permission to dump 90 to 100 million gallons of highly acidic phosphogypsum waste water into the Mississippi River.<sup>3</sup> This waste water contains harmful nutrients, heavy metals, radioactive elements and other contaminants. CPRA's diversion would take this polluted water and dump it into the Barataria Basin. Similarly, Plaquemines Liquids Terminal proposes to construct an oil terminal just north of the MBSD.<sup>4</sup> Any accidental or emergency discharge from this facility would empty into the Barataria Basin through the MSBD.

---

3 *Where will these 90-100 million gallons of treated acid water end up? Probably the Mississippi River*, Apr 26, 2021, [https://www.theadvocate.com/baton\\_rouge/news/article\\_b130c278-9ec0-11eb-bcbe-0738666077c3.html](https://www.theadvocate.com/baton_rouge/news/article_b130c278-9ec0-11eb-bcbe-0738666077c3.html).

4 *Amid climate change, controversial \$2.5B oil terminal moves forward in Plaquemines Parish*, April 18, 2021, [https://www.nola.com/news/environment/article\\_3c619b70-9c95-11eb-82c0-b7113194838f.html](https://www.nola.com/news/environment/article_3c619b70-9c95-11eb-82c0-b7113194838f.html).

The pollutants in the Mississippi River have created a large expanse of hypoxic water, resulting in the annual “Dead Zone” in the Gulf of Mexico. The MBSD would relocate or replicate the Gulf of Mexico “Dead Zone” and move it closer to Louisiana’s coast by dumping it directly into the Barataria Basin.

4. CPRA Overestimates the Amount of Sediment Derived from the Mississippi River.

The water expected to flow through the MBSD contains very little sediment. In order to obtain the amount of sediment required to build marshland, CPRA must flood the Barataria Basin with millions of gallons of water.

R. Eugene Turner, a coastal ecologist at LSU, has stated that river diversions destroy more wetlands than they save by sending harmful fertilizer nutrients into the wetlands which overgrow vegetation and cause soil erosion.<sup>5</sup> Likewise, Ed Richards, a law professor and director of Louisiana State University’s Climate Change Law and Policy Project, believes that the U.S.A.C.E. and CPRA favor the MSBD because of political and economic incentives, rather than scientific and ecological outcomes.<sup>6</sup>

Additionally, CPRA’s modeling assumes that sufficient sediment will travel from the Mississippi River through the MBSD. However, upriver dams are blocking sediment.<sup>7</sup> Before the existence of the dams, levees, river dredging and other efforts to control the Missouri and Mississippi Rivers, more than 440 million tons of sediment found its way to the Louisiana coast each year, according to the U.S. Geological Survey.<sup>8</sup> Dams and other control structures have reduced the historical river sediment by half. As more upriver dams are created, the sediment contained in the Mississippi River and the estimated amount of sediment traveling through the MBSD will decrease. This results in more water and less land in the Barataria Basin.

Without sufficient sediment, the MBSD is nothing more than a freshwater diversion. This freshwater diversion will destroy the brackish water ecosystem and destroy the natural habitat for brown shrimp, bottlenose dolphins, and oysters.

---

7 *Louisiana coastal restoration curbed by too little sediment; these states have too much*, March 29, 2021, [https://www.nola.com/news/environment/article\\_497596b2-8d69-11eb-85a0-5f157115365e.html](https://www.nola.com/news/environment/article_497596b2-8d69-11eb-85a0-5f157115365e.html).

8 *Id.*

5. The MBSD Will Destroy the Natural Habitat for Brown Shrimp, Oysters, and Bottlenose Dolphins.

The diversion will funnel 75,000 cubic feet per second of river water into the Barataria Basin on average of 177 days per year. This massive influx of freshwater will eliminate the current brackish water ecosystem and result in a salinity level of less than 5 ppt (parts per thousand). This major drop in salinity will destroy oyster crops and bottlenose dolphins in the Barataria Basin. Oysters require a water salinity of 15 ppt to thrive. After construction of the MBSD, the 200-year old oyster industry in Plaquemines Parish will be eliminated. Further, recently-developed oyster hatcheries and alternative oyster aquaculture will also be destroyed.

A new study from researchers at the University of St. Andrews, Scotland, found that the MBSD would cause the bottlenose dolphins in the Barataria Basin to become functionally extinct.<sup>9</sup> CPRA falsely estimates that the MBSD would only kill 34% of the bottlenose dolphins in the Barataria Basin. However, other biologists estimate the number is closer to 75%. This will result in the extinction of the bottlenose dolphin in southeast Louisiana. Because of these adverse effects on these animals, CPRA sought exemption from the Marine Mammal Protection Act, which forbids such killings of dolphins.

The Barataria Basin is home to the Delta National Wildlife Refuge and the Pass-a-Loutre Wildlife Management Area. The MBSD is expected to result in the loss of 2,000 to 3,000 acres of wetlands by 2070 in these areas. The EIS does not discuss the expected land loss in these wildlife areas and the effects on the wildlife which rely upon this natural habitat.

In 2019, the Bonnet Carre Spillway was opened for 123 days. This influx of river water into Lake Pontchartrain eventually traveled into the brackish estuaries resulting in the death of over 300 bottlenose dolphins and the loss of massive amounts of Louisiana oyster crops in St. Bernard and Plaquemines Parish. The local oyster industries are still struggling to recover from the 2019 Bonnet Carre Spillway opening.

The MBSD will replicate on a larger scale the harmful effects of the Bonnet Carre Spillway opening. However, the MBSD will dump the freshwater directly into the Barataria Basin, rather than through Lake Pontchartrain. The MBSD will also replicate these damages on an annual basis. This freshwater influx will destroy the ecosystem and wildlife of the Barataria Basin.

---

<sup>9</sup> *Bottlenose dolphins might go 'functionally extinct' here due to Mid-Barataria diversion*, May 18, 2021, [https://www.nola.com/news/environment/article\\_6c367c68-b747-11eb-bc8f-0f92f53cc26d.html](https://www.nola.com/news/environment/article_6c367c68-b747-11eb-bc8f-0f92f53cc26d.html).

6. The Environmental Impact Statement Fails to Include Any Dredging Alternatives.

The EIS provides a No Action Alternative and six other Diversion Alternatives (75,000 cfm, 50,000 cfm, and 150 cfm, with and without marsh terracing). The EIS does not contain any study of a dredging alternative. At the same time that CPRA proposes the MBSD, CPRA touts three dredging projects: West Grand Terre, Spanish Pass, and Golden Triangle.<sup>10</sup> These dredging projects are expected to build 2,900 acres of marshland at a cost of \$256.6 million or \$88,500/acre. These dredging projects cost 40% less than the MBSD. Further, unlike the unproven benefits of the MBSD, dredging projects have been undertaken and accomplished by CPRA at almost half the cost.

In addition to the cost savings, the dredging projects do not require fifty years to wait to see if there will be any results. Instead, dredging alternatives provide immediate benefits and marsh creation.

7. The MBSD Will Destroy Local Seafood Industries and Cause Unneeded Property Flooding.

CPRA touts the MBSD as a job creator. Contrary to their economic assertions, the MBSD will only create 12,000 *temporary* construction jobs, which will cease to exist after 3 to 5 years. These temporary jobs will only result in a boost of \$650 million or \$130 million per year.

At the same time, the MBSD will destroy entire industries and the local communities surrounding these industries. The oyster industry accounts for 4,000 direct permanent jobs with economic impact of \$317 million. The MBSD will destroy the most productive area of Louisiana's oyster industry. The MBSD will also destroy shrimp and crab industries in the Barataria Basin.

In addition to the destruction of the local seafood industry, the MBSD will cause additional annual flooding to property owners in Plaquemines Parish. Contrary to its efforts to create land, CPRA acknowledges that the MBSD will cause flooding to occur on an annual basis in the current lower-lying areas in Plaquemines Parish. This submerged land and the erosion caused by the flooding are not accounted for in the EIS.

Additionally, the flooding of existing property will result in a lower tax basis and lower tax revenue for Plaquemines Parish and other local municipalities. These same local municipalities will also lose tax revenue as a result of the lost jobs from the destruction of the local seafood industries.

---

10 *Gov. Edwards Announces Three Large-Scale Coastal Restoration Projects in Southeast Louisiana*, May 19, 2021, <https://mailchi.mp/la.gov/large-scale-projects-051921?e=078c947cb3>.

8. CPRA Proposes, but Does Not Guarantee Any Mitigation Damages.

CPRA has only proposed \$305 million towards mitigation damages resulting from the MBSD. However, the damages caused to the seafood industries, property owners, and the aquatic wildlife will far exceed this amount. The \$305 million amount accounts for less than one year of the economic impact on the oyster industry. No mitigation efforts are proposed for local residents who survive off of local seafood.

More importantly, the mitigation proposal is just that, a proposal. The funds have not been allocated or appropriated. Instead, the funds are only proposed. As a result, there is no guarantee that these funds would even be disbursed to those affected by the MBSD. Bren Haase of CPRA indicated that later this summer he would provide additional details on the mitigation payments.<sup>11</sup> This unfortunately is CPRA's standard tactic, providing details after the comment period is over. CPRA should be required to provide the details of its plans before the public comments are solicited.

9. The MBSD is Opposed by All Affected Local Governments.

The local communities most affected by the MBSD diversion have all voted to reject its approval. The local parish councils of the Parishes of Plaquemines and St. Bernard both passed resolutions opposing the MBSD. Further, the Louisiana Lieutenant Governor Billy Nungesser, who oversees the promotion of Louisiana's wildlife and seafood and industries, opposes the MBSD as an improper expenditure with damages exceeding its benefits. Nungesser ultimately agrees there is a need to restore the coast, but says the diversion project is not the way to do it.<sup>12</sup> Nungesser further stated, "We've already spent over \$100 million and we don't have a permit yet? Does that not seem a little odd?"<sup>13</sup>

The MSBD is a \$2 billion unnecessary and overpriced project which will require 50 years to determine whether it is a successful idea. Meanwhile, the MBSD is guaranteed to destroy the heart of Louisiana's seafood industry and sportsman's paradise soon after implementation. CPRA is aware of and able to implement more cost-effective and proven coastal restoration strategies,

---

<sup>13</sup> *Billy Nungesser emerges as the most prominent opponent of a large coastal project*, May 24, 2021, <https://www.fox8live.com/2021/05/24/billy-nungesser-emerges-most-prominent-opponent-large-coastal-project/>

such as dredging projects. The MBSD EIS fails to consider these dredging alternatives and fails to address the details of the mitigation efforts necessary if the freshwater diversion is constructed. For these reasons, I ask that the U.S.A.C.E. reject the Mid-Barataria Sediment Diversion plan until the Environmental Impact Statement addresses these issues.

Sincerely,

*Mitchell B. Jurisich, Jr.*

Mitchell B. Jurisich, Jr.  
Jurisich Oysters, LLC

**Concern ID: 61782**

**Commenters expressed concern that there's not enough sediment in the river to achieve wetland and land creation goals of the proposed Project.**

**Response ID: 16412**

The commenter's concerns regarding the sediment load of the river and whether the river carries sufficient sediment to achieve the land projected to be built during diversion operation were considered in the Draft EIS. The Mississippi River carries much less sediment than it did in the past. It still carries a massive sediment load, but not as massive as before. As explained in Chapter 3, Section 3.4.2.5 Sediment Transport, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes. Quantifying the relative contributions of multiple factors to the diminished sediment load is beyond the scope of the Draft EIS. The Draft EIS (Appendix E Delft3D Modeling, Delft3D Modeling Section 5.2.2) takes this diminished sediment load into account when computing the sediment that would be delivered to the Barataria Basin. To help clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations, discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

---

**Concern ID: 61812**

**Commenters expressed concern that the proposed Project would have adverse water quality impacts in the Barataria Basin due to the introduction of nitrate and phosphate from the Mississippi River. Several commenters questioned whether the proposed Project would create harmful algal blooms and hypoxia in the Barataria Basin similar to the hypoxic "dead zone" in the Gulf of Mexico that exists due to nutrients in Mississippi River waters. One commenter expressed concern that the EIS does not adequately assess the potential for the proposed Project to create algal blooms and hypoxia in the basin, other than acknowledging it.**

**Response ID: 16425**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA's Mississippi River/Gulf of Mexico Hypoxia Task Force "Hypoxia 101" webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi

---

flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone “water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen” (<https://www.epa.gov/ms-htf/northern-gulf-mexico-hypoxic-zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.>)

Dissolved oxygen concentrations associated with the Applicant’s Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model’s dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.5.2 Applicant’s Preferred Alternative in Surface Water and Sediment Quality of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section is included in Section 4.5.5.3 in Surface Water and Sediment Quality and has been added to Section 4.5.5.4.2 Applicant’s Preferred Alternative of the Final EIS. Finally, the EIS acknowledges the potential for major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) if warranted, in the Barataria Basin during Project operations to guide CPRA’s management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship,

monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61819**

**Commenters expressed concern that the proposed Project would have adverse impacts on Barataria Basin's water quality, wetlands, fisheries, recreational uses, and eroding coastlines due to chemicals, oil and hazardous waste, and/or pollutants in the Mississippi River that would be routed to the Barataria Basin via the proposed diversion.**

**Response ID: 16429**

The impacts raised by the commenters were considered in the Draft EIS. As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality of the Draft EIS, the segment of the Mississippi River where the proposed diversion river intake structure would be located (subsegment LA070301\_00) fully supports its designated uses. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. LDEQ's water quality assessment indicates that regulated substances are not present in concentrations that would cause a water quality impairment at the location of the intake structure. In response to this concern expressed by commenters, a new subsection has been added to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of nearby industrial facilities on river water routed to the basin during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills from Industrial Sites. As described in the EIS, Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed.

---

---

**Concern ID: 61852**

**The cost per acre of marsh creation by the diversion is far higher than a corresponding alternative of marsh creation through the use of dredged material. Marsh creation through a diversion takes 50 years unlike marsh creation through dredging. In addition, brackish/salt marshes (which would be created by dredging) are more resilient than freshwater marshes, and thus marsh created through dredging would be a more sound investment of restoration funding than a sediment diversion.**

**Response ID: 16617**

The timing of marsh benefits created by the proposed diversion was considered in the Draft EIS in Chapter 4, Section 4.6.5 Wetland Resources, Operational Impacts. In response to these comments, additional detail has been added regarding the resiliency of fresh marsh compared to brackish marsh in the Final EIS, Sections 4.6.5.1.2.3 Soil Shear Strength and 4.6.5.1.2.4 Land Accretion. Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

While the commenters suggest that marsh creation through dredging would cost less than the proposed Project, the LA TIG does not believe that comparing the costs of a sediment diversion to marsh creation projects using dredged material is relevant for several reasons. Most importantly, as explained in the LA TIG's Restoration Plan, the goal of the Project is to create a long-term sustainable ecosystem through the reestablishment of deltaic process. Marsh creation through the use of dredged material would not bring fresh water or nutrients to the basin on an ongoing basis. The benefits of marsh created with dredged material would diminish over time without maintenance in the form of additional pumping events due to subsidence and sea-level rise; thus, the temporal nature of Project benefits in the absence of periodic maintenance would also be very different. The costs and benefits of the Project were fully considered by the LA TIG and are discussed in the Draft Restoration Plan in Section 3.2.1.2 Cost to Carry Out the Alternative.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi

---

River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62029**

**The EIS describes immediate, major, and permanent adverse impacts on several critical species in the Barataria Basin, including shrimp and oysters. The health of**

---

**commercial fisheries and the socioeconomic well-being of coastal communities are closely intertwined. Such impacts would inflict economic harm on businesses, families, and individuals.**

**Response ID: 16225**

The issues raised by the commenters were considered in the Draft EIS. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted. The EIS also acknowledges the importance of commercial fisheries to the Louisiana economy and communities, as described by commenters. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana and Section 4.14 Commercial Fisheries describes impacts to commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts to shrimp and oyster fisheries in the proposed Project area are anticipated under the Applicant's Preferred Alternative. Changes in abundance may exacerbate trends of aging fishers leaving the industry and would have adverse impacts on the overall fishery. Adverse impacts may be partially offset by changes in fisher behavior. Additional details on the regional and community level economic impacts on commercial fisheries due to the proposed MBSD Project can be found in Section 4.14 Commercial Fisheries.

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact

---

determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62077**

**The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.**

**Response ID: 16242**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRP has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRP has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62079**

---

**Commenters are concerned that impacts similar to those caused by the fresh water from Bonnet Carré Spillway openings would affect fisheries in the Barataria Basin with the proposed MBSD Project.**

**Response ID: 16244**

The Project area for the MBSD EIS includes the Barataria Basin and the Mississippi River birdfoot delta. Existing operations and influences of rivers and diversions, including but not limited to the Bonnet Carré Spillway, were incorporated into the baseline conditions of the No Action Alternative and action alternatives assessed in the Draft EIS, Chapter 4 Environmental Consequences, Sections 4.2 through 4.24. Reasonably foreseeable future (but not existing) diversions, such as the Mid-Breton Diversion, were analyzed for impacts in combination with existing diversions and the proposed MBSD diversion in Chapter 4, Section 4.25 Cumulative Impacts.

A summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and to discuss their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS. Note that the Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological purposes.

---

**Concern ID: 62103**

**The Draft EIS does not fully address the anticipated destruction of multiple components of the commercial oyster fishery, including oyster habitat, off-bottom oyster farms, and the oyster hatchery at Grand Isle resulting from impacts to water quality and changes in salinity.**

**Response ID: 16258**

Impacts of the proposed Project on eastern oysters are discussed in the Aquatic Resources section of the EIS in Chapter 4, Section 4.10.4.5, Key Species. The section identifies that most adverse impacts on oysters are anticipated at mid-basin locations, while some beneficial impacts may occur in the lower basin, including the Grand Isle area. The off-bottom and hatchery components of the oyster fishery would not be affected by the Project, or may benefit from it. Specifically, the only significant off-bottom oyster fisheries in Barataria Basin occurs in the lower basin. As indicated in Chapter 3, Section 3.14.6, Aquaculture, the Mike Voisin Oyster Hatchery in Grand Isle is the only commercially available source of oyster larvae and seed. These areas could benefit from the Project. Final EIS Chapter 4, Section 4.14 Commercial Fishing has been revised to discuss these effects.

CPRA's Mitigation and Stewardship Plan includes measures to increase funding for the development of broodstock reefs, enhancing public and private oyster areas, creating a new public oyster seed ground and to further develop alternative oyster culture methods, including off-bottom oyster culture. See the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the

final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62268**

**The Barataria Basin is home to the Delta National Wildlife Refuge and the Pass A Loutre Wildlife Management Area. The proposed MBSD Project is expected to result in the loss of 2,000 to 3,000 acres of wetlands by 2070 in these areas. The EIS should discuss the expected land loss in these wildlife areas and the effects on the wildlife that rely upon this natural habitat.**

**Response ID: 16440**

The projected loss of wetlands in the Delta NWR and the Pass A Loutre WMA is discussed in Chapter 4, Section 4.17.4 Operational Impacts in Public Lands. Information about the effects of this loss on wildlife that rely on the wetland habitat in these public lands has been added to Section 4.17.4.2 in Public Lands in response to this comment. As part of its responsibilities under the Fish and Wildlife Coordination Act and as operator of the Delta NWR, the USFWS recommended the creation of crevasses to build land in the birdfoot delta to offset MBSD Project-induced wetland losses of 926 acres in the Delta NWR and 37 acres in the Pass A Loutre WMA (see Appendix T USFWS Coordination Act Report (CAR) of the Final EIS). In response to USFWS' CAR Recommendation, CPRA agreed that "Within 5 years of the commencement of Project operations, CPRA or the LA TIG will provide \$10,000,000 of additional funding for wetland preservation and restoration work in the Delta NWR and the [Pass A Loutre] PAL WMA to offset modeled acres of indirect wetland losses in those areas. That funding may be accomplished through additional funding through the CWPPRA program, through additional restoration work sponsored by the LA TIG (for example, construction of the Engineering and Design work discussed in the DWH LA TIG's Restoration Plan and Environmental Assessment #7), or through a direct contribution for additional work. The funding will be proportioned between the Delta NWR and the PAL WMA based on the magnitude of the predicted wetland loss in each area" (Final EIS, Appendix R1 Mitigation and Stewardship Plan, Section 4.6 Fish and Wildlife Coordination Act).

This information was updated in the Final EIS, Chapter 4, Section 4.27.1 in Mitigation Summary and in the Final EIS, Section 4.17.4.2.2 Birdfoot Delta in Public Lands.

---

**Concern ID: 62639**

**The proposed Project is unlikely to succeed because similar types of projects have failed to build land, and have caused a range of other issues, like destroying habitat, exacerbating flooding, and reducing water quality. Specific examples of similar, problematic projects include the Mississippi River Gulf Outlet, Bonnet Carré Spillway, Caernarvon Freshwater Diversion, Davis Pond, West Bay, Baptiste Collette, Fort St. Philip, and Cubits Gap. In fact, data show that the Caernarvon Diversion in particular was unable to show sustained land gains in the face of Hurricane Katrina-driven losses in wetland habitat (Underwood 1994, Kearney et al. 2011). Davis Pond has seen increased land loss inside the diversion compared to a reference area (Couvillion et al. 2017). Fort St. Philip has lost large areas of wetlands (Suir et al. 2014). While the Atchafalaya River is building land in the Atchafalaya and Wax Lake Deltas, the Atchafalaya River carries more sediment than the Mississippi River does currently (Blum and Roberts 2009), and more of the Atchafalaya River is diverted to each of these deltas and marshes farther south. Additionally, one study identified poor performance of diversions due to many periods of inoperation due to socioeconomic uncertainties (Caffey et al. 2014).**

**Response ID: 16631**

The issues raised by the commenters were considered in the Draft EIS. The EIS states in Chapter 2, Section 2.1.1 Overview of Sediment Diversions, that CPRA considered information from other diversions in its assessment of the Project alternatives, but because the projects mentioned by the commenters had been designed to discharge primarily water, not sediment, they are not fully comparable to the proposed Project. As explained in the EIS Chapter 4, Section 4.1.3 (Environmental Consequences, Overview of Delft3D Basinwide Model for

---

Impact Analysis), Delft3D Basinwide Modeling software was used to assess impacts of the Project on hydrology, land gains and losses, water quality, and vegetation in the Barataria Basin and birdfoot delta. Using standard professional practice, this physics-based model was validated to the West Bay Sediment Diversion. The West Bay Sediment Diversion is useful for validating the physical processes of erosion and deposition of sediment because it, like the proposed MBSD Project, is a sediment diversion that extracts relatively more sediment in the river. The other diversions cited were designed to primarily deliver water, not sediment, and are less useful comparisons.

The West Bay Sediment Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, “A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that diversions do not lead to appreciable sediment accumulation” (Kolker, A. S., Miner, M. D. and Weathers, H. D. 2012. Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, Estuarine, Coastal and Shelf Science, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005> ).

Comparing diversions outside of physics-based numerical modeling has limited value because diversions and receiving environments often exhibit unique behaviors that correlations do not account for. For that reason, the physics-based Delft modeling, even with its limitations and uncertainties, is a better predictor than anecdotal comparisons to Fort St. Phillip or other sites. Uncertainties associated with the validation and application of the Delft3D Basinwide Modeling conducted for the proposed Project were assessed by the West Bay application, sensitivity tests, and by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in EIS Appendix E Delft3D Modeling and incorporated into the EIS conclusions throughout Chapter 4 Environmental Consequences. While most citations mentioned by commenters were already included in the Draft EIS, the Final EIS has been edited to include Caffey and Petrola (2014) to Chapter 4, Section 4.6.5.1.2.4 Land Accretion.

The likelihood of success of the Project and information from other freshwater diversions was also considered in the LA TIG’s Draft Restoration Plan, Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. The proposed MBSD Project’s goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the geomorphological features of the Lower Mississippi River as of 2012, including data from the referenced projects. All citations referenced by the commenters were included in the Final EIS and were considered by the LA TIG in the Final Restoration Plan.

---

**Concern ID: 62659**

**The proposed Project is an experiment, and it is not possible to guarantee its alleged benefits.**

**Response ID: 16632**

---

The uncertainties associated with the Project's success were considered in the Draft EIS. While the benefits of the Project cannot be guaranteed, the EIS uses state-of-the-art modeling, including but not limited to the Delft3D Basinwide Model, to project the Project's beneficial and adverse impacts. These modeling projections of Project impacts include uncertainties. Following standard professional practice, model uncertainties are clearly stated in the EIS with respect to the model's quantitative results. Uncertainties are incorporated into the EIS impact conclusions and are briefly summarized in EIS Chapter 4, Section 4.1.3.3 Model Limitations and Uncertainty, and in detail in Section 8.0 Model Limitations and Uncertainties of EIS Appendix E Delft3D Modeling.

The likelihood of success of the Project was also considered in the LA TIG's Draft Restoration Plan. While recognizing the innovative nature of the proposed Project, the Restoration Plan discusses in detail the factors that would contribute to the Project's success. More specifically, Sections 3.2.1.4 (Likelihood of Success - Alternative 1) and 3.2.2.4 (Likelihood of Success - Alternatives 2-6) of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, such a sediment diversion has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Section 3.2.1.4 [Likelihood of Success - Alternative 1] of the Restoration Plan). The Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62696**

---

**Oysters are not well adapted to prolonged periods of low salinity and would experience higher mortality and lower reproductive success as a result of the proposed Project.****Response ID: 16075**

The commenter correctly notes the impacts on oysters from low salinity. As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the Draft EIS, operation of the proposed Project would result in a permanent, major adverse impact on oysters, due in large part to decreases in salinity.

To address Project impacts, CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). Mitigation measures aimed at oyster impacts include establishment of new oyster seed grounds in appropriate areas of the basin, enhancing existing public and private seed ground, enhancement of broodstock reefs, and funding to support off-bottom oyster culture.

Although not being implemented to mitigate the effects of the MBSD, the LA TIG also continues to address oil spill related injuries to oysters through various non-Project-related restoration/fishery improvement actions, including: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, and the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS (Appendix R) were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

---

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62781**

---

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62794**

**This poorly planned and executed proposed Project is being pushed forward for the financial gain of politicians and contractors because taxpayer dollars are being used. Private investment dollars would entail more deliberation and a full impact study, including more natural options with less risk and more overall benefits.**

**Response ID: 16375**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance and constitutes a full impact analysis. A variety of alternatives assessed in the EIS are identified in Chapter 2 Alternatives. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

The LA TIG's Restoration Plan evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG has selected Alternative 1 as the LA TIG's Preferred Alternative.

---

**Concern ID: 62986**

**The Project would drive decreases in salinity that would reduce the overall health, survival, and reproduction of bottlenose dolphins that reside in the Barataria Basin, a species that was negatively affected by the Deepwater Horizon oil spill (NMFS, 2013).**

---

**Some commenters felt that because of this, the Project should either not move forward or its operation should be altered.**

**National Marine Fisheries Service (NMFS). 2013. Roy Crabtree (NMFS) to Elizabeth Davoli (CPRA). <https://s3.documentcloud.org/documents/726710/national-marine-fisheries-service-comments-on.pdf>**

**Response ID: 16701**

The concerns raised by the commenters about the projected decreases in salinity and resulting effects on Barataria Bay dolphins were considered in the Draft EIS. More specifically, Chapter 4, Section 4.11.5.2 in Marine Mammals of the EIS acknowledges that the proposed Project would likely have significant, adverse impacts to Barataria Basin dolphins, a species that suffered significant impacts from the DWH oil spill. This section also discusses the physiological changes caused by exposure to low-salinity water, the duration of those changes that leads to mortality, and the anticipated mortality of a large portion of the dolphin population in the Barataria Basin within the first decade. These sections of the EIS provide a more in-depth analysis of potential impacts to dolphins than the letter cited by the commenter.

The concerns raised by the commenters were also considered in the LA TIG's Draft Restoration Plan (see Section 3.2.1.5 [Collateral Injury]); the Final Restoration Plan has been edited consistent with changes made to the Final EIS and see below regarding new, related content included in Appendix R.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources, like dolphins, that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the

---

proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible (if it is possible), the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins in Louisiana (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63015**

**There are misrepresentations in the EIS about how nutrients in the river would spread out far from the sand deposition area to lower plant biomass belowground. Increasing nutrient loads from diversions would weaken soils, not strengthen soils.**

**The modern Mississippi River has nutrient concentrations that are much higher than when the mostly organic soils were created centuries ago (Turner et al. 2007) and may weaken soils by 30 percent, resulting in less belowground biomass, and change vegetation from being comprised of perennials to annuals (Turner et al. 2011). Increased flooding inundation, which is a consequence of river diversions, also weakens the belowground biomass of wetland plants (Morris et al. 2017) that may erode during high water events or from hurricanes (Kearney et al. 2011, Howes et al. 2010). Individual roots become weaker when exposed to ambient levels of nutrients found in the river (Hollis and Turner 2019a, b; Hollis and Turner 2021). The soil becomes degraded, accumulates less biomass, and decomposes and erodes faster (Swarzenski et al. 2008, Hebert et al. 2020). The diversion of river water into the nearby marshes would almost certainly weaken soils, making them less resistant to wave energy and hurricanes. A striking example is the net loss of wetlands in the Davis Pond Diversion where increased land loss occurred beginning the year after the diversion opened (Turner et al. 2019). This is an area that has no significant sediment input.**

---

**Concern ID: 63070**

A recent study suggests that the proposed Project would not only prevent the recovery of the BBES Stock, but it would result in the functional extinction of dolphins in the West, Central, and Southeast strata of the stock area (Thomas et al., 2021). The only dolphins remaining in the basin would live adjacent to the barrier islands, and even this group would become severely reduced over the 50-year planning horizon of the proposed Project. Additionally, an expert elicitation (Booth and Thomas, 2021) building on previous studies (Garrison et al., 2020; Schwacke et al., 2017; Thomas et al., 2021) suggests that while dolphins can endure some periods of exposure to low salinity, the period of tolerable exposure shortens for dolphins exposed to acute changes in salinity, and the median time to death is 22 days with continuous exposure to water with salinity levels below 5 ppt.

**Thomas, L., Marques, T., Booth, C., Takeshita, R., and L. Schwacke. 2021. Predicted population consequences of low salinity associated with the proposed Mid-Barataria Sediment Diversion Project on bottlenose dolphins in the Barataria Bay Estuarine System Stock.**

**Response ID: 16593**

The Draft EIS included an analysis of the impacts to marine mammals, including BBES dolphins in Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock. This analysis incorporated the Booth and Thomas (2021), Garrison et al. (2020), and Schwacke et al. (2017) studies, and the Final EIS includes additional analyses that were completed by Thomas et al. (2021) after the Draft EIS was released for public comment. The impact conclusions in the Draft EIS were based in large part on Garrison et al. (2020), which predicts that only a remnant population of dolphins would continue to exist in Barataria Basin after diversion operations commenced. The conclusion of major, permanent, adverse impact to bottlenose dolphins is also supported by Thomas et al. (2021), which built on these earlier studies and concludes that, after 1 year of operation of the Applicant's Preferred Alternative, there would be 61 percent fewer dolphins in the Central stratum than under the No Action Alternative, 35 percent fewer in the West stratum, 12 percent fewer in the Southeast stratum, and 2 percent fewer in the Island stratum, with 25 percent fewer overall. Thomas, et al. further concluded that after 10 years of operation, there would be 100 percent reduction in the populations of dolphins in the Central and West strata, an 82 percent reduction in the population of the Southeast stratum dolphins, and a 34 percent reduction in the population of the Island stratum dolphins as compared against the No Action Alternative, with an overall difference in population of 78 percent. (Note that Thomas, et al. 2022 slightly refined some of these projections.) After 50 years of operation, in three out of the four strata, dolphins are predicted to be functionally extinct (defined as less than or equal to dolphin in Thomas, et al. 2022) under the Applicant's Preferred Alternative, with the remaining Island stratum being 85 percent lower [95 percent CI -28 -- -99] under the Applicant's Preferred Alternative than under the No Action Alternative. Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the Applicant's Preferred Alternative is projected to be 143 dolphins (95 percent CI 11-706) compared to a predicted 3,363 dolphins (95 percent CI 2,831-4,289) predicted to inhabit the Barataria Bay under the No Action Alternative. In other words, the BBES dolphin stock is projected to be 96 percent smaller (95 percent CI -80 -- -100) under the Applicant's Preferred Alternative than then No Action Alternative. Chapter 4, Section 4.11 Marine Mammals of the Final EIS has been updated to reflect the results of Thomas et al. (2021).

Booth and Thomas (2021) evaluated multiple scenarios with different salinity changes, and in one of those scenarios' where bottlenose dolphins experience a change in salinity within 0 to

5 days from typical salinity environment (that is, mean 15 to 25 ppt) down to an atypical environment with salinity below 5 ppt for an extended period, the median time to death would be 22 days.

---

**Concern ID: 63182**

**Proposed mitigation is insufficient and not guaranteed, and the amount of funding for mitigation is not clearly stated.**

**Response ID: 16559**

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

---

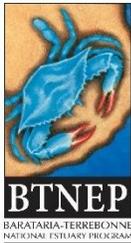

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Mid-Barataria Sediment Diversion Draft Environmental Impact Statement and Draft Restoration Plan and Draft Restoration Plan - Submitted on behalf of the Barataria-Terrebonne National Estuary Program (BTNEP) Management Conference**

**Introduction:**

The Barataria-Terrebonne National Estuary Program (BTNEP) Office appreciates the opportunity to participate in the Draft Mid-Barataria Sediment Diversion Environmental Impact Statement and Draft Restoration Plan public comment process.

BTNEP is part of a network established by Congress in 1987 within the Clean Water Act consisting of 28 individual National Estuary Programs (NEPs). Our mission is to act on behalf of a broad and diverse group of citizens and stakeholders in 14 parishes who call the estuary home. The estuary contains more than 4.2 million acres that are bounded by the Mississippi River to the east and the Atchafalaya River to the west. The estuary extends down across the coast and beyond the barrier islands rimming the bottom of the Terrebonne, Timbalier, and Barataria bays.

For historical reference, our federal, state, and local partnership agreement acknowledged that the Barataria and Terrebonne systems, consisting of the area between the Mississippi and Atchafalaya rivers, were both of national significance and critically threatened. The Environmental Protection Agency (EPA), on behalf of the federal government, has pledged to continue to elevate and maintain the status of this entire region as that of a National Estuary. The State of Louisiana continues to fulfill its

part of this pledge by supporting the program that convenes hundreds of representatives from business and industry, universities and other educational institutions, local governments, federal and state agencies, NGOs, farmers, agriculture, and fisheries. This active group called the BTNEP Management Conference is a deep and diverse group of stakeholders that has been gathering together since 1991 to implement a science-based, consensus-driven comprehensive plan to restore and preserve the federally recognized Barataria-Terrebonne National Estuary.

One of BTNEP's primary goals is to engage the members of the public and multi-constituent user groups in confronting the environmental and sustainability challenges facing the estuary. We seek to reach consensus by providing everyone with an opportunity to participate in environmental decisions as we advance local communities. We compliment the USACE and CPRA for its efforts to make this comment process accessible to many people.

No other geographic region of the State will be more affected by the impacts of the Mid-Barataria Sediment Diversion than the Barataria basin. No other people will be more affected economically in the short-term, at a minimum, by the impacts of the Mid-Barataria Sediment Diversion than those who make their living in the Barataria basin. For many stakeholders in the BTNEP Management Conference, whatever benefits the diversion brings will never outweigh the negative impacts they anticipate.

However, most members of the BTNEP Management Conference recognize and understand the existential threat of unchecked land loss. Most know that 85 percent of all land loss in Louisiana occurs in the Barataria-Terrebonne Estuarine Basins. And the vast majority accept that the CPRA Coastal Master Plan is driven by science and adapted by study, observation and as circumstance demands. We give very high marks to CPRA for their tireless efforts to meet with citizens across the coast and throughout our estuary to hear citizen concerns.

The Barataria-Terrebonne National Estuary Program (BTNEP) has long supported the idea of a sediment diversion into the Barataria basin. Our Comprehensive Conservation and Management Plan (CCMP) contains an "Action Plan" supporting riverine reintroductions to the estuary, and was written over 20 years ago. Over the years, however, the concept of diversions seems to have grown in scope and scale. Generally speaking, the land-building and sustaining effects of a sediment diversion have increased with scale, but so too have the **impacts** to the estuary and its peoples.

It must be acknowledged that besides the benefit this diversion may bring, there are numerous potentially important adverse impacts that must be considered throughout the planning and evaluation process. These impacts generally increase with scale, as do user conflicts and sociopolitical opposition to implementation. The following is a brief discussion of some of these impacts.

## **Fisheries - Impacts to Commercial fisheries**

Implementation of major diversions will involve some adverse impacts to living resources. Shrimpers anticipate having to incur difficulties and expense as their shrimping grounds will be pushed farther away. This could well necessitate assisting commercial shrimpers and fishermen with tools and equipment that will allow them to continue to earn a livelihood.

Another concern are impacts to current oyster growing areas. The duration, seasonal timing, and degree of freshening will affect the breeding, growth, and harvesting of the eastern oyster in some areas. This serious concern must be addressed as this diversion will be constructed in areas where oyster leases will be impacted. In order to diminish the likelihood of litigation, renewed attention to public engagement is necessary. It is important to ensure that these oyster growers – and all other stakeholders – continue to be involved with and informed about the progress and timing of construction and the operation of projects. The preferred path forward is consensus on operational plans whenever possible.

Modeling results suggest that a 75,000 cfs controlled sediment diversion into mid-Barataria Bay would have significant impacts on oysters, finfish, and shellfish (i.e. shrimp). Some of these projected impacts would be negative (i.e. lethally low salinities for oyster beds close to the project), and some positive. Many of the modeled resources show negative trends early in the 50-year project life but a positive trend later. Models of various seasonal operational regimes show a potential to mitigate some of these impacts to resources. For example, diversions limited to winter and early spring operations could potentially diminish spring spawning and spat and favor a more successful fall oyster spat set, and would more closely mimic historical freshwater introductions in the basin.

We want vigilant monitoring of conditions and believe we must be willing to adjust as needed if impacts overwhelm ecological transition.

## **Impacts to other living resources – Possible Increase in Invasive Species**

Another potential biotic impact important to the health of our estuaries is the introduction of invasive species, or the facilitation of their spread. The majority of Louisiana's most troublesome invasive species are freshwater-dependent aquatic organisms. These species may expand their range as new diversions come online and create new freshwater habitat. These include the floating and submerged aquatic plants giant salvinia, water hyacinth, and hydrilla; mollusks such as apple snails, zebra mussels, and Asian clams; several species of Asian carp; and even the marsh-destroying nutria. Diversions could potentially be vectors for the introduction of new invaders to the

estuary such as the Northern snakehead, an Asian fish currently found in tributaries of the Mississippi River in Arkansas.

These invasive species could be an impediment to navigation, impact boat launches, displace native species, and have a general negative change on other living resources. Significant attention and resources must be invested in monitoring these changes in the near and long-term.

### **Wetland Impacts Caused by Nutrients and Contaminants**

Other issues to be addressed during the planning and subsequent monitoring of freshwater and sediment diversions include the impact of increased nutrient levels and the potential for increased eutrophication in coastal bays. There is some debate as to the potential effects of increased nutrients on wetland plants and algae growth along the effects of the introduction of other contaminants. Contaminants are always of concern when diverting waters. Even micro-plastics may become a greater concern with such large volumes of water shunted into the wetlands. The MBSD should be operated in a way to minimize unacceptable levels of eutrophication and contaminant introduction. Water quality must be monitored throughout construction, implementation, and beyond in as near to real time as possible.

### **Possible Impacts to Navigation**

Another diversion impact is siltation of navigable waterways generating a need for increased maintenance dredging in channels near diversion structures. Waterways affected could be federally maintained navigation channels, oil field access channels, and/or natural streams. Anticipated increases in the cost of maintenance dredging induced by diversion operations must be accounted for in the early stages of diversion planning so that accurate cost-benefit ratios can be considered. Additionally, in order to reduce the likelihood of litigation, full disclosure of anticipated effects to the navigation community is required. Consensus on the question of who is responsible for induced dredging costs must be reached ahead of implementation.

- Shipping  
Water level in the Mississippi River is recognized as another critical issue that must be addressed. If multiple diversions are to be operated simultaneously, or if the river experiences a period of very low stages, sufficient draft for shipping could be threatened. The Port of Baton Rouge, Port of New Orleans, and the Port of South Louisiana are three of the ten largest shipping ports in the nation. These shipping and associated transportation industries could be impacted unless careful planning assures that critical water volumes and navigation channels are maintained.

## Possible Flooding

In recent years, computer modeling from various studies looking at predicted increases in water levels caused by diversion operations have shown wildly varying results. Some models indicate that the increase in flood risk to nearby communities should be minimal with a moderately-sized diversion. Other models show significant increases in water levels that would increase flood risk in populated areas. Models have not yet examined the cumulative impacts of multiple proposed diversions operating simultaneously.

Models also have not taken into account the influence of wind, which is a significant driver of water levels in the estuary. In winter, storm fronts generally move north to south and water levels in the basins are typically lower, providing an opportunity for seasonal diversion operations. This is particularly true in the Barataria Basin, where backwater flooding from a high river has not been a significant concern. However, in the Terrebonne Basin, backwater flooding from a high Atchafalaya River has historically been a major concern. It is plausible that higher water levels in Barataria could translate to higher water levels in Terrebonne via the GIWW, diversion operations timed to “optimize” sediment capture would conflict directly with flood fighting efforts there, i.e. operating diversions in the spring. Furthermore, southerly winds begin in spring and often last through fall, causing higher water levels and coastal flooding issues regardless of river stage. It will be difficult, from both a physical standpoint of high basin-side water levels as well as a sociopolitical standpoint of the perception of flood risk, to operate large-scale diversions during these months. Real-time monitoring will be a necessity.

The threat of community flooding obviously increases with diversion discharge and proximity to the area of outfall. Additionally, some models suggest that outfall areas will be more prone to flooding in the early years of operations, and will need time for channels to evolve in order to expand capacity. If projects are properly designed and appropriately scaled, it is unlikely that water elevations will increase significantly as a result of freshwater and sediment diversions. However, this critical issue of flood risk must be addressed throughout the process from the project's conceptual phase through to its operation.

## Environmental Justice

Executive Order 12898 (1994) addresses environmental justice in minority and low-income populations. The order acknowledges the disproportionate adverse impacts that federal actions have historically had on certain communities. It also commits the federal government to promoting nondiscrimination in future federal actions that may impact environmental quality.

As most of the funds that are suggested for this project would come from the federal funding streams this issue should be addressed. Attention must be paid to communities such as the Native Americans in Grand Bayou, Vietnamese fishermen, and low-income

resident fishers of Plaquemines, Jefferson, and Lafourche who may be negatively impacted by this project.

In conclusion, most people know that inaction is unacceptable. The MBSD has been studied, planned and reviewed for years. Implementation is imminent. Our prime concern at BTNEP is the realization that we are delving into the unknown with this project of unprecedented scope. We must admit that we cannot anticipate all the impacts - both positive and negative - that may result. We must fully develop protocols for real time monitoring, and ever adapting mitigation strategies that match the ambition of this effort.

Our estuary is both fragile and resilient. It has adapted to change for millennia and can adapt again. It has provided a bounty to our state and nation since this land was first inhabited. But we must be prepared to mitigate those negative impacts to our greatest ability as they arise.

Thank you for the opportunity to comment and express views shared by members of the BTNEP Management Conference.

Sincerely,

T. Bradley Keith  
Director, Barataria-Terrebonne National Estuary

---

**Concern ID: 61906**

**The MBSD Project would cause loss and detrimental impacts on the recreational and sport fishing industry in the Barataria Basin.**

**Response ID: 16236**

The issues raised by the commenters were considered in the Draft EIS. EIS Chapter 4, Section 4.16.5.2 in Recreation and Tourism acknowledges that the proposed Project would impact recreational and sport fishing in the Barataria Basin. Relative to the No Action Alternative, the proposed Project would cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts on these species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips.

---

**Concern ID: 61912**

**CPRA should consider alternative flow triggers, designs, and features in the operations plan and design of the proposed MBSD Project in order to minimize impacts. CPRA should also consider adjusting diversion design elements such as triggers, peak flows, volumes, and nutrient loads over the first years of operation to minimize impacts. These adjustments could minimize impacts to dolphins, oysters, brown shrimp, and other aquatic organisms. Some commenters suggested limits be imposed by USACE, others suggested an operating plan that is tied to specifics, while others emphasized flexibility tied to real-world experiences. CPRA should also consider alternative methods of operating the proposed MBSD Project, such as operating the diversion during winter when water levels in the basin are lower and can accept high volumes of water from the diversion.**

**Response ID: 15999**

The proposed MBSD Operations Plan can be found in Appendix F2 Preliminary Operations Plan of the Final EIS. As stated in the Chapter 4, Section 4.4.4.2.4 Sediment Transport in Chapter 4 Surface Water and Coastal Processes, sediment transported by the Mississippi River is primarily comprised of fine sediments, with higher river flows (typically occurring in the spring) suspending more coarse-grained sediment that are important in delta building (see Chapter 3, Section 3.4 Surface Water and Coastal Processes). Fine-sediment transport through the diversion would be generally proportional to water flow in the river. The intake channel was modeled and designed to divert a high sediment-to-water ratio while minimizing energy loss (to maintain flow and sediment transport through the diversion complex) and impacts on the river. The amount of sediment carried through the diversion would vary by year, depending on flow rates in the river and the corresponding variation of diversion operations. As explained in Chapter 2, Section 2.8.1.3 Project Operations in Action Alternatives Carried Forward for Detailed Analysis, the Mississippi River discharge of 450,000 cfs would be the standard operations “trigger to open the diversion for flow (above the base flow)”. Operations (with the exception of a base flow up to 5,000 cfs) would cease when the

---

river discharge falls below 450,000 cfs or when certain emergency triggers are met (such as in advance of hurricanes or when a spill of hazardous substances occur in the river). When the Mississippi River flows exceed 450,000 cfs, the gates would be fully opened (above base flow). At river flows of 450,000 cfs, the diversion flow would be approximately 25,000 cfs, and flows would increase proportionally as the river flow increases. This ramp would continue up to maximum diversion capacity flow of 75,000 cfs when the river reaches a flow of 1,000,000 cfs.

An alternative related to operational triggers specific to sediment concentration was considered but determined not to be technically feasible or reasonable because data and technology do not currently exist to support this operational regime (refer to the Eliminated Alternatives Matrix in Appendix D2 of the EIS). According to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS, as part of the adaptive management and monitoring process, CPRA would consider potential ways to optimize diversion operations based on Project performance and success and would assess potential operational changes that may minimize impacts to basin resources where practicable after sufficient operational data become available for analysis.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61936**

**Environmental Justice Executive Order 12898 (1994) addresses environmental justice in minority and low-income populations. The order acknowledges the disproportionate adverse impacts that federal actions have historically had on certain communities. It also commits the federal government to promoting nondiscrimination in future federal**

---

**actions that may impact environmental quality. As most of the funds that are suggested for this Project would come from the federal funding streams this issue should be addressed. The Draft EIS cites federal policies mandating that issues of environmental justice be given full consideration, in particular the long standing Executive Order (12898) on Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations and comparable Department of Defense directives. Attention must be paid to communities such as the Native Americans in Grand Bayou, Vietnamese fishermen, and low-income resident fishers of Plaquemines, Jefferson, and Lafourche who may be negatively impacted by this Project. In the parishes closest to the Project site, Plaquemines and Jefferson, minority populations respectively constitute 36 and 60 percent of the overall population.**

**Response ID: 16293**

The EIS Chapter 4, Section 4.15 Environmental Justice acknowledges that disproportionately high and adverse impacts on low-income and minority populations could occur in some communities where reductions in abundance of oysters, brown shrimp, and certain fish species are anticipated as a result of the proposed Project. These impacts would depend in part on the extent to which affected populations engage in or are heavily reliant on commercial and subsistence fishing for these species. The EIS Chapter 4, Section 4.15, Environmental Justice recognizes the presence of low-income and minority populations in communities that depend on shrimp and oyster fishing in Barataria Bay, including Grand Isle, Galliano, the Lafitte area, Barataria, Belle Chasse, Live Oak, West Pointe à la Hache, Ironton, Grand Bayou, and Port Sulphur. However, as discussed in the EIS, there are insufficient data to correlate fisheries harvests with specific low-income and minority populations. Consequently, the precise extent to which impacts on shrimp and oyster fisheries would affect specific low-income and minority populations cannot be determined.

CPRA has expanded and refined its Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. CPRA's mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not

---

be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61962**

**The commenters commend the USACE and LA TIG for their efforts to ensure robust awareness and input into this process. Such engagement is critical to a successful restoration effort, and the commenters recognize the difficulty of designing an engagement process around a project of this scale and scope. The more than 200 public outreach and engagement events referenced in the Draft EIS and NRDA plan demonstrate a notable effort made by CPRA. It is essential that CPRA continue to maintain strong levels of engagement and transparent communication with affected stakeholders as this process progresses. The Final EIS should include a summary of comments and responses and should uphold and further elaborate upon the commitment stated in the Draft EIS (Appendix R2 Monitoring and Adaptive Management Plan, Section 2) for regular stakeholder engagement through the adaptive management program.**

**Response ID: 15907**

USACE and LA TIG acknowledge the comment. Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan. Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration Plan and the Draft EIS in its decision-making process. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

USACE and LA TIG conducted public outreach and provided public comment opportunities throughout the development of the EIS and the LA TIG's Restoration Plan. Details on USACE's and the LA TIG's outreach activities and the opportunities provided for public participation can be found in Chapter 7 Public Involvement in the Final EIS. The Final EIS includes a Public Meeting Report which includes all comments submitted and the responses to those comments.

Examples of public outreach provided by USACE for the EIS include providing special public notices for the permit application, the scoping process, and for the Draft EIS through Federal Register notices, press releases, newspapers, mail outs to distribution lists, and provision of

hard copies of the Executive Summary and other materials to local libraries. USACE and the LA TIG also coordinated with the SELA Voice organizations to understand the needs of the local communities regarding the best ways to reach out to these communities prior to the release of the Draft EIS and the LA TIG's Draft Restoration Plan and during the public comment period.

Language interpretation and translation in Spanish, Vietnamese, and Khmer were provided at each of the virtual public meetings on the Draft EIS and the LA TIG's Draft Restoration Plan. Also, the Public Notice to announce the Draft EIS Notice of Availability, the Executive Summary for the Draft EIS, and the Executive Summary for the LA TIG's Draft Restoration Plan, were translated into Spanish and Vietnamese. The consolidated pre-recorded public meeting presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage.

Throughout the public comment period and concurrent with the preparation of the Final EIS and the LA TIG's Final Restoration Plan, CPRA has engaged the public through meetings with the communities and groups projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities and groups. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward.

In addition, the Programmatic Agreement developed for the proposed Project through the NHPA 106 consultation sets forth the alternative mitigation to be implemented by CPRA as part of implementing the Project. A website and public education materials are included as products to be developed through the alternative mitigation. See Section 4.9 of the Final Mitigation and Stewardship Plan for the proposed Project (in Appendix R1 to the Final EIS).

Refer to Appendix R1 for the Final Mitigation and Stewardship Plan which describes mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts. Also refer to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 for a description of the adaptive management, governance, and monitoring that CPRA has committed to along with stakeholder engagement during the adaptive management process if the proposed MBSD Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of

publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62263**

**Commenters expressed concern that plastics and microplastics (including but not limited to PFAS) in the Mississippi River would be introduced into the basin through the proposed MBSD diversion, causing adverse impacts on wildlife and humans. Commenters stated that plastics never fully disintegrate, are poorly regulated, and have made their way into every part of the food chain. One commenter witnessed a major spill in the river of plastic pellets called “nurdles” that was never fully cleaned up.**

**Response ID: 16435**

The USACE acknowledges that microplastics and PFAS in surface water are currently not regulated. There are currently no data to determine whether PFAS concentrations in the Mississippi River are significantly different from concentrations in the Barataria Basin. There are no standards to evaluate whether PFAS concentrations are unacceptably elevated in the river or the basin.

The Draft EIS acknowledges that accidents and spills can occur unexpectedly in the river or in the basin. Public and private emergency response teams are available to minimize damage from such accidental releases. As described in Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed. Also in response to this concern, the USACE has added a new subsection to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of accidental

---

spills of hazardous substances in the river during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills in the Mississippi River.

---

**Concern ID: 62278**

**Models have not taken into account the influence of wind, which is a significant driver of water levels in the estuary. In winter, storm fronts generally move north to south and water levels in the basins are typically lower, providing an opportunity for seasonal diversion operations. This is particularly true in the Barataria Basin, where backwater flooding from a high river has not been a significant concern.**

**Response ID: 16485**

Wind is an important factor in the estuary. The Delft3D Basinwide Model simulations included wind as described in the Draft EIS Appendix E (Delft3D Basinwide Model, Section 3.2.2 Atmospheric Forcing) and summarized in Chapter 4, Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis. Meteorological data recorded throughout 2014, including wind speed and direction recorded at 6-hour intervals in the basin over the course of the year, was used in the model. That data reflects the seasonal variation in wind speed and direction that occurred in the basin in 2014 and was factored into model outputs with respect to water levels. Appendix E, Section 3.2.2 Atmospheric Forcing has been edited in the Final EIS to clarify this.

As part of developing the EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

---

**Concern ID: 62290**

**The commenter expressed concern that if multiple diversions are to be operated simultaneously, or if the river experiences a period of very low stages, sufficient draft for shipping could be threatened. The Port of Baton Rouge, Port of New Orleans, and the Port of South Louisiana are three of the ten largest shipping ports in the nation. These shipping and associated transportation industries could be impacted unless careful planning assures that critical water volumes and navigation channels are maintained.**

**Response ID: 16447**

The Draft EIS considered the commenter's concern about the importance of the safety and efficiency of vessel traffic. Operation of the proposed diversion above 5,000 cfs would be limited to periods of higher flows in the river, as stated in Draft EIS Chapter 2, Section 2.8.1.4 Project Operations, when water levels, water depth, and vessel clearance are less of an issue. However, the EIS recognizes that changes to sedimentation rates might persist into the low-water season, as the commenter correctly notes. The several modeling efforts described in the EIS Chapter 4, Section 4.4 Surface Water and Coastal Processes and 4.21 Navigation, as well as in Appendix E Delft3D Basinwide Modeling and Appendix Q Navigation/Dredging analysis, include projections of water levels, adequate navigation draft, and channel sedimentation impacts resulting from operation of the proposed diversion. The models showed no navigation draft impacts from Venice to New Orleans and above, including at the Port of Baton Rouge, the Port of South Louisiana, and the Port of New Orleans. The

conclusion stated in those sections is that operation of the Applicant's Preferred Alternative is projected to cause "moderate, permanent, adverse impacts on dredging operations from Venice to the Gulf of Mexico."

Potential future projects, including the Mid-Breton Sediment Diversion and other diversions, considered for Cumulative Impacts, were modeled and are listed in the Draft EIS Table 4.25.1-1. Cumulative effects on navigation are discussed in Section 4.25.21 Cumulative Impacts - Navigation. The conclusion is that there will be no navigation draft impacts from Venice to New Orleans and above, but "The combined cumulative impacts on dredging ... in the Mississippi River from Venice to the Gulf will be moderate to major, adverse and permanent."

---

**Concern ID: 62304**

**Computer modeling from various studies looking at predicted increases in water levels caused by diversion operations have shown wildly varying results.**

**Response ID: 15802**

USACE and the LA TIG acknowledge that various modeling efforts may produce different water level projections in the Barataria Basin depending on the model boundary conditions (for example, diversion discharge, tide and sea level) and geometric data (bathymetry/topography and boundaries); however, we are not aware of any unexplainable large differences in water level predictions among the other various models used. Production-level models, such as the Delft3D used for the Draft EIS, produce very similar projections when using the same boundary conditions and geometric data.

---

**Concern ID: 62305**

**The threat of community flooding obviously increases with diversion discharge and proximity to the area of outfall. Additionally, some models suggest that outfall areas would be more prone to flooding in the early years of operations, and would need time for channels to evolve in order to expand capacity.**

**Response ID: 15824**

Water level impacts in the basin were projected by the Delft3D Basinwide Model, as explained in Chapter 4, Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis and Section 4.4.4.2 Surface Water and Coastal Processes, Operational Impacts, Water Levels of the Draft EIS. Draft EIS Sections 4.4.4.2 Surface Water and Coastal Processes and Section 4.20.4.2 Public Health and Safety, Operational Impacts, Floodplains and Tidal Flooding both acknowledged that higher water levels and the risk of community flooding increase with proximity to the diversion outfall. As stated in Section 4.4.4.2, maximum monthly average water levels nearest to the diversion outfall are projected to be highest in the first three modeled decades as compared to the No Action Alternative in the first three modeled decades. Additionally, in Section 4.2.3.2 Geomorphology in Geology and Soils, the Draft EIS discussed previous studies and modeling which indicate development of channel networks early (within 5 to 10 years) have occurred for other diversions in south Louisiana. These other diversions have both similarities and differences with the proposed MBSD Project but help inform potential impacts of the Project on geomorphology. MBSD Project diversion operations may result in a different land building and morphologic evolution than these examples.

---

**Concern ID: 62307**

**Operating the diversion in the spring could cause increased water levels in the Terrebonne Basin through the GIWW, directly conflicting with flood fight efforts in Terrebonne. Real-time monitoring would be necessary.**

**Response ID: 15808**

The Terrebonne Basin was not included in the Project area because no impacts are anticipated in that basin from the Project operations. As a result, Delft3D Basinwide Model water level projections were not modeled for this area. However, as shown in Figure 4.4-11 in Section 4.4 Surface Water and Coastal Processes of the Draft EIS, water levels were projected to increase less than one foot in the GIWW during spring operation of the proposed Project. As part of CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Final EIS), the existing USGS water level gage near Larose would be used for monitoring of water levels during diversion operation. However, the MAM Plan explains that this monitoring data would be used to inform Project partners as to whether, and to what extent, Project operations result in marsh inundation patterns that could potentially cause inundation stress on wetland vegetation. The MAM Plan does not include real-time monitoring for water levels within the GIWW for the purpose of diversion operational adjustments.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. The USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62464**

---

**The commenter expressed concern that models have not yet examined the cumulative impacts on flooding from multiple proposed diversions operating simultaneously.**

**Response ID: 16473**

The Draft EIS considered the potential flooding impacts of multiple proposed diversions operating simultaneously. Potential flooding impacts of the proposed MBSD Project combined with impacts of *existing* Mississippi River diversions on the west bank including the Davis Pond Freshwater Diversion, and the West Pointe A La Hache Siphon and on the east bank (Bonnet Carré Spillway, Caernarvon Freshwater Diversion, and Mardi Gras Pass) were projected by the Delft3D Basinwide Model baseline conditions and 50-year projections for the MBSD No Action and action alternatives for hydrology, flooding, hydrodynamics, water quality, vegetation/wetlands, and other resources in the Project area. The added impacts of the MBSD Project action alternatives in combination with these existing freshwater influences are discussed by resource topic in Chapter 4, Sections 4.2 through 4.24.

The added flooding impacts of the proposed MBSD Project action alternatives on existing diversion operations were qualitatively or quantitatively analyzed and discussed in the Draft EIS in Chapter 4, Section 4.4.3 in Surface Water and Coastal Processes, Section 4.13 Socioeconomics, and Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction. The Draft EIS Section 4.20.4 Storm Surge and Flooding concluded that in conjunction with the operation of existing diversions, the proposed Project would have negligible impacts on flooding in Project area communities within federal levee systems and minor to major, adverse, long-term impacts on flooding in Barataria Basin communities not protected by federal levees (for example, Lafitte, Myrtle Grove, and Grand Bayou).

Operational impacts, including risk for increased flooding, of reasonably foreseeable future projects including diversions such as the Mid-Breton Sediment Diversion combined with proposed MBSD Project operations were assessed by the Delft3D Basinwide Model and discussed in Section 4.25.1 Methodology for Assessing Cumulative Impacts and in Section 4.25.20 Cumulative Impacts - Public Health and Safety, Including Flood and Storm Hazard Risk Reduction. As described in Section 4.25.20, Delft 3D Basinwide modeling projected that the reasonable foreseeable projects modeled would have a negligible impact on water levels during non-storm conditions in the birdfoot delta and Barataria Basin. Also see EIS, Appendix E Delft3D Modeling for information on the setup of the Delft 3D Basinwide Modeling for the impact analysis of the EIS alternatives. No related edits have been made to the Final EIS.

---

**Concern ID: 62692**

**The proposed Project would introduce or facilitate the spread of invasive species (for example, carp, zebra mollusks, apple snails, Asian clams, water hyacinth, giant salvinia, hydrilla, nutria, northern snakehead) and freshwater pathogens to the basin, which could affect other living resources and impede navigation.**

**Response ID: 16074**

The commenter correctly notes the potential for the proposed Project to introduce or facilitate the spread of invasive species from the Mississippi River into the Barataria Basin and resulting from the alteration of existing habitat characteristics, which is consistent with discussions in the EIS in Chapter 3, Section 3.10.6 and Chapter 4, Section 4.10.4.6 in Aquatic Resources; Sections 3.6.3 and 4.6.5.2 in Wetland Resources and Waters of the U.S.; and Sections 3.9.4 and 4.9.4.2 in Terrestrial Wildlife and Habitat. The sections in Chapter 4 also

---

identify how the introduction or spread of invasive species may negatively impact other living resources. The northern snakehead is not currently known to occur in Louisiana; however, if its presence is later identified in the Mississippi River, its introduction or spread via the proposed Project would result in similar impacts on the environment as those described in Section 4.10.4.6 Aquatic Invasive Species of the EIS. The potential introduction of pathogens (specifically, fecal coliform [not typically pathogenic, but an indicator for other pathogenic bacteria] and Enterocci) is discussed in Section 4.5.5.8 Fecal Coliform; a discussion of fecal coliform has been added to Section 4.10.4.4.2.5 Dissolved Oxygen of the Final EIS. Section 4.10.4.6.2.1 Aquatic Invasive Species has also been supplemented to discuss potential threats to navigation in the Final EIS.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement.

Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

---

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62816**

**BTNEP has long supported the idea of sediment diversion, but the scale of the diversions continues to grow and correspondingly, the scale of adverse impacts grows with it; it must be acknowledged that besides the benefit this diversion may bring, there are numerous potentially important adverse impacts that must be considered throughout the planning and evaluation process.**

**Response ID: 16389**

The commenter's input is noted. As discussed throughout Chapter 4 Environmental Consequences, there are both beneficial and adverse effects of each of the alternatives carried forward, which include 50,000, 75,000, and 150,000 cfs alternatives (with and without terraces). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62836**

**What are the conditions for closure of the diversion? For example, would the diversion be shut down if there is community flooding or a large amount of wetland loss in the first 5 years? CPRA's stated commitment to adaptive management may eventually result in the agency making substantial adjustments to the operational regime of the proposed Project without providing recourse for affected stakeholder groups.**

**Response ID: 16663**

Information regarding Project operations, including the plan for when the diversion would be shut down for emergencies and storm events, is set forth in CPRA's Operations (Water Control) Plan issued with the Draft EIS (Appendix F2).

With regard to community flooding, the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) details mitigation strategies that would address increased water levels in impacted communities. With regard to ensuring Project performance, in accordance with the Monitoring and Adaptive Management (MAM) Plan, CPRA would monitor Project performance over the life of the Project and adaptively manage the Project to ensure Project success (for examples of potential adaptive management actions, see Tables 4.1-1 through 4.1-3 in the MAM Plan in Appendix R2 to the Final EIS). If the Project is implemented, CPRA would continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of

---

publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62838**

**Near-term, long term, and real-time monitoring in the Barataria Basin will be essential to the operation of the diversion as well as to public communication about the performance, over space and time, of the diversion and its area of influence. Governance and decision making for the Project should be a science-based, inclusive, and transparent process with genuine engagement and input from external experts and community stakeholders.**

**Response ID: 16665**

According to the LA TIG, the monitoring issues raised by the commenter were considered in CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS), which was jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan included input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]). In response to public comments, CPRA would develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

With specific regard to the inclusion of scientific expertise, in addition to the expertise within CPRA, the governance provisions of the MAM Plan call for establishing a Technical Focus Group/Peer Review Group with subject matter expertise to provide technical support on long-term Project planning, assist in the evaluation and interpretation of monitoring data, and

---

evaluate the state of the science concerning adaptive management. See Section 2.2.2.3 (Technical Focus Group(s)/Peer Review) of the MAM Plan (Appendix R2 to the Final EIS). The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62857**

**The complexity of the proposed Project, and the multitude of uncertainties that have been identified while estimating its benefits and impacts, demonstrates the importance for real-time monitoring protocols in the adaptive management program to reduce uncertainties over time.**

**Response ID: 16667**

According to the LA TIG, the monitoring measures raised by the commenters were considered in CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS). Monitoring, including collection of real-time data, is essential for increasing the likelihood of achieving desired Project outcomes given the uncertainties inherent to predicting the Project's effects. For example, post-construction, hydrographic station readings in the Mississippi River would be posted in real time and accessible from remote networks to enable forecasting water and sediment arrival. Along the gradient from the Mississippi River through the diversion and into the basin, CPRA is planning for the use of real-time data for key hydrographic variables (turbidity, stage, velocity, and water quality). As CPRA's plan to perform real-time monitoring was included in the Draft EIS, no changes have been made in the Final EIS in response to this comment. See CPRA's MAM Plan (Appendix R2 to the EIS)

---

for additional details regarding the monitoring efforts planned in anticipation of and during Project operations.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A

---

summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some

property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62968**

**If operation of the diversion causes infill of various canals used to access surrounding communities, who will be responsible for dredging to maintain access? For example, if Wilkinson Canal is filled with silt then the canal cannot be used and waterfront property owners with boat lifts in Myrtle Grove will not be able to get out using their**

---

**boats; the EIS does not require a remedy or provide a funded maintenance plan for this issue (including who would pay for dredging).**

**Response ID: 16642**

The impacts raised by the commenters were considered in the Draft EIS. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the Project area during Project operations.

In acknowledgement of commenters' concerns regarding maintenance of non-federal navigation channels and canals impacted by sedimentation of the proposed diversion, the Mitigation and Stewardship Plan includes measures to mitigate impacts on navigation resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62976**

**Oyster growers and other stakeholders must be involved and informed about Project progress, construction timing, and operation.**

**Response ID: 16538**

CPRA has engaged numerous stakeholders, including oyster growers, throughout the development of the Project. USACE has ensured public participation during its permitting and

---

environmental review. The LA TIG has invited public participation in its OPA Restoration Plan process. Chapter 7 Public Involvement of the Final EIS contains a summary of the various engagement efforts by CPRA, the LA TIG and USACE regarding the Project. In response to comments, CPRA has added a dashboard website (<https://cims.coastal.louisiana.gov/default.aspx>) to the measures included in CPRA's final Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Final EIS). The dashboard would allow CPRA to keep those interested informed about Project construction, operation, and monitoring.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62982**

**Anticipated increases in the cost of maintenance dredging induced by diversion operations and anticipated effects on the navigation community must be accounted for in the early stages of diversion planning so that accurate cost-benefit ratios can be considered.**

**Response ID: 16620**

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its decision. As part of its

---

permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

The impacts of the Project on maintenance dredging requirements and on the navigation community were addressed and considered in the Draft EIS, in Chapter 4, in the Mississippi River and Barataria Basin “Maintenance Dredging” subsections of Section 4.21 Navigation. USACE has engaged the navigation industry to get its input on the proposed Project’s anticipated effects on navigation, including increased sedimentation in the Mississippi River, as part of the EIS process.

In the LA TIG’s Restoration Plan, the LA TIG considers the cost to carry out the Project consistent with the Restoration Plan alternatives evaluation criteria, 15 CFR §990.54. The Project budget in the Draft Restoration Plan (see Section 3.2.1.2 Cost to Carry Out the Alternative) included the cost of additional maintenance dredging that would be induced by the Project. Also, monitoring to identify the need for additional maintenance dredging induced by the Project is addressed in the Restoration Plan Appendix R2: Monitoring and Adaptive Management Plan for the proposed MBSD Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG’s funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63006**

**The commenter suggests that southerly winds begin in spring and often last through fall, causing higher water levels and coastal flooding issues regardless of river stage. The commenter asserts that it will be difficult, from both a physical standpoint of high basin-side water levels as well as a sociopolitical standpoint of the perception of flood**

---

**risk, to operate large-scale diversions during these months, noting that real-time monitoring will be a necessity.**

**Response ID: 15763**

The Delft3D Basinwide Model simulations, which were used in the Draft EIS to project flood risk, included wind as one input as described in the EIS Appendix E Delft3D Modeling, Section 3.2.2 Atmospheric Forcing and summarized in Chapter 4, Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis. Meteorological data recorded throughout 2014, including windspeed and direction recorded at 6-hour intervals in the basin over the course of the year, was used in the model. That data reflects the seasonal variation in wind speed and direction that occurred in the basin in 2014 and was factored into model outputs with respect to water levels. Appendix E Delft3D Modeling, Section 3.2.2 Atmospheric Forcing has been edited in the Final EIS to clarify this. Further, as part of CPRA's proposed Monitoring and Adaptive Management (MAM) Plan, Appendix R2 to the Final EIS, real-time monitoring of water levels during diversion operation would be collected at stations in the Mississippi River and Barataria Basin. However, the MAM Plan explains that this monitoring data would be used to inform Project partners as to whether, and to what extent, Project operations result in marsh inundation patterns that could potentially cause inundation stress on wetland vegetation. The MAM Plan does not include real-time monitoring for water levels for the purpose of diversion operational adjustments. CPRA's operation of the diversion based on Mississippi River flows is described in Chapter 2, Section 2.8.1.4 Project Operations of the EIS.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. The USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

---

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63024**

**The Draft EIS failed to properly capture the state of the science on the effects of nutrient inputs on wetlands. While the views indicating the detrimental effects of nutrient input are included, few opposing views are described, and the science is not settled on this issue.**

**Response ID: 16034**

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS acknowledges uncertainty regarding the effects of nutrient inputs on wetlands. Additional analysis regarding the impact of nutrients that would be transported by the proposed Project on vegetation communities and soil shear strength has been incorporated into Chapter 4, Section 4.6.5.1.2 Applicant's Preferred Alternative of the Final EIS.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)

- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63185**

---

**Additional development of mitigation plans and accountability for mitigation commitments is needed.****Response ID: 16562**

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63805****Water quality must be monitored throughout construction, implementation, and beyond in as near to real-time as possible.****Response ID: 16689**

The pre- and post-operations water quality monitoring noted by the commenter was considered in CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS). CPRA would collect water quality data in real time from existing Coastwide Reference Monitoring System (CRMS), Louisiana Department of Environmental Quality (LDEQ), and United States Geological Survey (USGS) stations in the Barataria Basin (see Figures 3.7-5 and 3.7-6 in the MAM Plan for water quality sampling locations). The MAM Plan states that collected data will inform future Project management decisions aimed at improving Project effectiveness and limiting ecological and/or human impacts when possible. Therefore, no changes were made in the Final EIS on water quality monitoring.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship,

---

monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63844**

**The MAM Plan should address increased nutrient levels and the potential for increased eutrophication in coastal bays.**

**Response ID: 16693**

Monitoring nutrients in diverted water was considered in CPRA's Monitoring and Adaptive Management (MAM) Plan included with the Draft EIS (Appendix R2).

Chapter 4, Sections 4.5.5.3 Nitrogen and 4.5.5.4 Phosphorus in Section 4.5 Surface Water and Sediment Quality of the Draft EIS discussed how wetlands created by the Project could absorb the additional nutrients diverted to the basin, thereby reducing the potential negative impacts within the Barataria Basin from nutrients introduced into the basin from Mississippi River water. Section 4.10.4.4 General Impacts on Habitat and the Environment, Applicant's Preferred Alternative, Nutrient Loading and Dissolved Oxygen of the Draft EIS discussed the potential for algal blooms and resulting dissolved oxygen levels due to nutrient loading in Barataria Basin waters and bays.

In response to commenters' concerns, a discussion of the Gulf Hypoxia Action Plan has been added to Chapter 4, Section 4.25.5 (Cumulative Impacts - Surface Water and Sediment Quality) of the Final EIS. This discussion includes the Nutrient Reduction Strategies developed by the 12 member states of the Hypoxia Task Force. Louisiana's Nutrient Reduction and Management Strategy has highlighted the important role that river diversions could play in reducing nutrient loads. The wetlands created by the diversion would take up nutrients, thus assisting in the reduction of impacts in the Gulf of Mexico from excess nutrients introduced through the Mississippi River water.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Joni Tuck

To Whom It May Concern:

I am writing in strong support of the Louisiana Coastal Protection and Restoration Authority's (CPRA) Mid-Barataria Sediment Diversion project proposed for Plaquemines Parish on the Louisiana coast.

As a native and resident of Louisiana and someone who has worked as an advocate and practitioner of coastal restoration and protection for over 20 years, I have seen the unravelling of our Working Coast here in Louisiana for decades.

That unravelling threatens far more than the few populated areas immediately in the footprint of the proposed Diversion structure and outfall area - it threatens all of Louisiana, our people, our culture, our infrastructure, and our economy. As such, the need to address this existential threat to our continued existence in Louisiana has to be tailored to the benefit of the most people and systems, not one or two narrow bands of people or industries.

Of the project alternatives explored in the Draft Environmental Impact Statement (DEIS), the preferred alternative provides the most appropriate, balanced, and valuable opportunity to set Louisiana's most consequential basin on a course of sustainability in the face of subsidence, sediment starvation, sea level rise and climate change for decades beyond when the funding runs out.

Louisiana's land loss crisis is fundamentally driven by the disconnection of the Mississippi River from the delta through the construction of the Federal river levee system greatly accelerating the subsidence and degradation of the Delta and exacerbated by other human interventions over centuries. The Mid Barataria Sediment Diversion affords us the opportunity to make the necessary intervention to preserve and protect this Delta in a way that works with and mimics nature as well as the natural environmental and fisheries conditions which were present in these communities just a few short generations ago.

This project has been conceived, studied, and carefully considered for three decades. In that time, the Barataria Basin has lost square miles of land, been deeply impacted by the Deepwater Horizon oil spill, and seen population migrations and vital economic infrastructure continue to be built in the communities along and protected by this Basin. The DEIS provides yet another robust accounting of the potential impacts of this proposed project, and it is clear that the benefits far outweigh the potential negative impacts - even without the robust suite of mitigation measures proposed in the mitigation measures proposed.

With respect to the mitigation measures proposed, up-front monetary allocations to commercial fishermen for offsetting increased fuel costs and gear should be implemented in addition to lifetime gear licenses granted to commercial and recreational fishermen whose business or residential address is within the outfall of the proposed diversion once a favorable Record of Decision is approved. Similarly, up front allocations for offsetting increased fuel costs as well as any additional gear upgrades, surface right leasing, marketing/promotions etc for charter fishermen should also be made on a similar timeframe as well as marketing funds directed through both the regional Convention Center and Visitors Bureaus and the Louisiana Seafood Marketing and Promotions Board to maintain and increase tourism, recreation and the charter fishing trade across the Barataria Basin. Additional mapping and residential

nonstructural flood risk mitigation measures specific to individual properties should similarly be developed to best inform potentially impacted residents on a similar timetable.

The Barataria Basin is essential to the culture, communities, economy and character of Louisiana and the American South, which is why billions of dollars have already been spent from a variety of sources including oil and gas and mineral revenues, local, state and federal general fund dollars, Coastal Wetlands Planning, Protection and Restoration Act (CWPPRA) dollars, private industry and landowners, and Deepwater Horizon fines and settlement dollars to engineer, design and construct scores of projects utilizing alternative methods such as dredging, pumping, rock placement, terracing, siphons, small scale sediment diversions, Christmas tree cribs, etc.

One could say that the Barataria Basin and Plaquemines Parish in particular are at the heart of innovation in coastal restoration and the sandbox in which we learn how best to manage both the threats we face and the resources we have been blessed with. What we have learned through that long history of learning at both large and small scales is that funding sources will deplete, dredged sediments pumped and shaped into land subside often within a few decades, but the River will continue to flow for generations and the sediments, nutrients and fresh water continue to build land as long as we allow it to flow.

Similarly, Plaquemines Parish and the surrounding communities are also being afforded the opportunity with this project to further capitalize on well over \$1 billion in economic impact through the construction of the project, adding hundreds of higher than average wage jobs to their communities. These jobs also will allow these communities to build a workforce pipeline of talent to continue to perform civil construction, earthworks, environmental restoration and surveying work in complex and challenging environments - all disciplines and skill sets which provide stable, lucrative incomes for workers and their families and flow on benefits of vibrant communities and a stable tax base for local governments.

In short - the time for studies and delaying decisions should come to an end. The time for doing is now. Safely reconnecting the River in a manner which is carefully monitored and managed while still mimicking the natural processes which built the Delta will free the rest of our Working Coast from our dim, sediment and nutrient starved future - and will allow us all to continue to flourish for generations to come. I strongly urge you to approve the implementation of this project without delay, and to continue to encourage the CPRA to work in collaboration with communities, residents and impacted commercial and charter fishermen to develop additional granularity around mitigation measures proposed.

If you have questions or need clarification on any of the points raised in this correspondence, please feel free to contact me via email at: [REDACTED]

Sincerely,

Joni Tuck

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial**

---

**and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

---

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

---

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

**Concern ID: 63345**

**Local communities are being afforded the opportunity to capitalize on well over \$1 billion in economic impact through the construction of the proposed Project, adding hundreds of higher wage jobs to their communities. These jobs also would allow these communities to build a workforce pipeline of talent to continue to perform civil construction, earthworks, environmental restoration, and surveying work in complex and challenging environments, each of which would provide stable, lucrative incomes for workers and their families and that benefit would flow to the vibrant communities and add a stable tax base for local governments.**

**Response ID: 16306**

The commenter's support for the proposed Project is noted. The comment is consistent with the content of Chapter 4, Section 4.13.4.2 in Socioeconomics of the Draft EIS, which identified up to major economic benefits within the proposed Project area during construction of the proposed Project.

---

**Concern ID: 63346**

**Through a long history of coastal restoration, it has become clear that funding sources will deplete, and dredged sediments pumped and shaped into land subside often within a few decades; however, the river will continue to flow for generations and the sediments, nutrients, and fresh water will continue to build land as long as it is allowed it to flow.**

**Response ID: 16307**

---

The commenter's support for the proposed Project is noted. Consistent with the comment, Chapter 4, Section 4.2.3.2 in Geology and Soils of the Draft EIS discussed the long-term and sustained source of sediment that would be provided by the proposed Project for the replenishment and restoration of lands (including wetlands) within the outfall area.

---

**Concern ID: 63347**

**The commenter strongly urges that the proposed Project be approved without delay, and that CPRA continue to work in collaboration with communities, residents, and impacted commercial and charter fishermen to develop additional granularity around mitigation measures proposed.**

**Response ID: 16309**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

CPRA engaged the fishing community potentially impacted by the Project through public meetings to solicit input on mitigation and stewardship strategies and engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures from affected fishers. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. In response to comments, CPRA has expanded and refined the Final Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated proposed Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Re: Mid-Barataria Sediment Diversion (MBSD) Draft Environmental Impact Statement (DEIS)**

Gentlemen:

By way of background, Apache Louisiana Minerals LLC (ALM) is a large corporate landowner in coastal Louisiana, holding title to approximately 270,000 acres of land within Cameron, Vermilion, Iberia, Terrebonne, Lafourche and Plaquemines parishes. These properties are predominately wetlands. ALM takes stewardship of these lands very seriously and the entire staff of our Houma, LA office is and has always been dedicated to the preservation and conservation of these properties. We recognize that a prudent landowner has an obligation to the next generation of Louisianians to conserve and protect these fragile wetlands as well as the flora and fauna which inhabit it. This wetland preservation and protection provides the citizens of Louisiana with enhanced storm surge protection along with viable nurseries for recreational and commercial fisheries.

Apache Louisiana Minerals owns title to 52,000 acres of property in Plaquemines Parish on the west side of the MS river just downstream of the contemplated diversion. Approximately half of the wetlands on that property has been lost to the approaching Gulf. Although these lands are located further downstream than the planned diversion, we know from experience that the plume of freshwater and sediment which this project will provide is the only viable tool available for any hope of preserving the remaining lands on a large scale.

Some portions of the Louisiana coast are harder to protect than others. As managers of these wetland properties for decades, we know that lands located close to a sediment and freshwater source are more sustainable than any other. That's why we offer this letter of SUPPORT for the U.S. Army Corps of Engineers' *Draft Environmental Impact Statement for the Proposed Mid-Barataria Sediment Diversion Project*, as well as the Louisiana Trustee Implementation Group's (LA TIG) *Draft Phase II Restoration Plan #3.2: Mid-Barataria Sediment*

*Diversion.* The wetlands of southeast Louisiana were built by the Mississippi River. There is no excuse for NOT harnessing the river to again rebuild the wetlands it once created.

The *Draft Phase II Restoration Plan #3.2: Mid-Barataria Sediment Diversion* is a project which will provide ecosystem-wide benefits which far outweigh the short-term impacts. We know without this project our property is destined to continue its current rapid land-loss trajectory. A course that will end in complete conversion of these wetlands to open water, which would be an avoidable travesty to the citizens of Louisiana.

In conclusion, we respectfully request the selection of the preferred alternative in the Draft EIS and ask that this plan be implemented with the greatest sense of urgency allowable by the public process.

Sincerely,

A handwritten signature in black ink, appearing to read 'Timothy J. Allen', written in a cursive style.

**Correspondence ID:40548**

Jakov Jurisic

To whom it may concern, RE: Comments to Mid Barataria Sediment Diversion Draft EIS, I am writing regarding the Mid-Barataria Sediment Diversion Project. As a commercial oyster fisherman, I have grave concerns about this diversion. The diversion should be redesigned to achieve two objectives: build storm surge protection, as well as create the environmental conditions for the expansion of the oyster industry. The current design of the diversion will not be as effective as possible at building storm surge protection and will destroy much of the oyster industry. The reasons for my saying such are as follows:

1. There is not enough sediment (mg/ft) in the Mississippi River water to build more than a small portion of the coastal zone being lost over the SO-year life of the project;
2. The amount of water required to transport the desired amount of sediment will change salinity regimes and destroy existing fisheries;
3. The current design does not protect the delivered sediment from the erosion by wind and waves, thus only 5% to 35% of the delivered sediment will form storm surge protection structures.

This diversion project will cause more harm than good because the impact zone has been underestimated. The permit application notes the project will destroy or alter 7,530 acres of essential fish habitat. What is not addressed is the expected destruction of oyster habitat alongside associated crab, shrimp, and sports fishing habitats which, total, is several times larger than 7,530 acres.

I believe the diversion, as currently designed, is a misuse of public resources since it does not maximize the benefits expected from the investment and assumes the destruction of a major portion of the oyster industry. The loss in total seafood production is not justified by the increased value of storm protection created. I also believe sediment placement or dredging would build storm protection immediately and would create the conditions favorable to the expansion of the oyster industry.

Also, the Deepwater Horizon agreement states that the monies are to be used for fisheries restoration and to not further injure the fisheries resources in Barataria Bay, therefore this would be a misuse of public funds.

I have faith we can combine coastal zone protection and restoration with the protection, restoration, and expansion of the seafood industries for an optimized end result.

Sincerely,

Jakov Jurisic

---

**Concern ID: 61782**

**Commenters expressed concern that there's not enough sediment in the river to achieve wetland and land creation goals of the proposed Project.**

**Response ID: 16412**

The commenter's concerns regarding the sediment load of the river and whether the river carries sufficient sediment to achieve the land projected to be built during diversion operation

---

were considered in the Draft EIS. The Mississippi River carries much less sediment than it did in the past. It still carries a massive sediment load, but not as massive as before. As explained in Chapter 3, Section 3.4.2.5 Sediment Transport, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes. Quantifying the relative contributions of multiple factors to the diminished sediment load is beyond the scope of the Draft EIS. The Draft EIS (Appendix E Delft3D Modeling, Delft3D Modeling Section 5.2.2) takes this diminished sediment load into account when computing the sediment that would be delivered to the Barataria Basin. To help clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations, discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

---

**Concern ID: 61923**

**The proposed MBSD Project should be redesigned to achieve two objectives: build storm surge protection as well as create the environmental conditions for the expansion of the oyster industry.**

**Response ID: 16010**

Storm surge protection is not a purpose of the proposed Project but it is a projected benefit for some areas, while it will increase storm surge and flooding risk for other areas (see EIS Chapter 4, Section 4.20.4.2, Operational Impacts, Storm Hazards in Public Health and Safety, including Flood and Storm Hazard Risk Reduction). Restoring for oysters does not meet the intent of the proposed Project, which is to reestablish sustainable deltaic processes and help restore habitat and ecosystem services injured by the DWH oil spill. The Project is projected to help positively impact habitat for numerous species impacted by the spill and to negatively impact habitat for other species impacted by the spill.

---

**Concern ID: 62666**

**It would be inappropriate, and contrary to the stated purpose of restoring injured resources, to use DWH settlement funds to implement a project that would harm the same wildlife (for example, shrimp, oysters, bottlenose dolphins, *Spartina alterniflora*) and ecological services that were negatively affected by the oil spill.**

**Response ID: 16625**

USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore the damage caused by the DWH oil spill. USACE's involvement with the proposed Project is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under the CWA Section 404 and RHA Sections 10 and 14 (33 USC Section 408). USACE is not executing any DWH restoration actions under the OPA. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH spill in the Louisiana Restoration Area. As explained in the Final EIS, Appendix B2 DEIS Public Review and Public Meetings, Section 2.0 Agency Roles in the Responses to Public

Comments, response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views.

In the Restoration Plan, the LA TIG explained that the DWH oil spill resulted in the oiling of more than 1,100 kilometers of wetlands, nearly all of which were located in coastal Louisiana (DWH NRDA Trustees, 2016). The heaviest oiling occurred in the Barataria Basin, resulting in substantial injuries to natural resources in the basin (DWH NRDA Trustees, 2016). Recognizing that the resulting loss of marsh productivity affected resources throughout the northern Gulf of Mexico ecosystem, the State of Louisiana and the federal Trustees that negotiated the DWH Natural Resource Damages settlement allocated \$4 billion, almost half of the total settlement amount, to restoring Louisiana's wetland, coastal, and nearshore habitats. The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree of collateral injuries, to natural resources injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the LA TIG's Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, as noted in the LA TIG's Restoration Plan, without the proposed Project, sea-level rise, subsidence, and other existing stressors would result in additional marsh loss over time reducing the suitability of habitat for many of the same species.

The LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing a deltaic process, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Final Restoration Plan because the LA TIG believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the NRDA Trustee's Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

In its Strategic Restoration Plan for Barataria Basin (2018), the LA TIG evaluated the potential and extent of collateral injury for a range of restoration techniques. Unfortunately, almost all

large-scale restoration comes with some potential for collateral injury. The LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54. In the Restoration Plan, the LA TIG strives to identify an alternative that would provide what it considers the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. Again, see Section 3.2.4 of the Restoration Plan for a discussion of how the LA TIG came to its decision.

In recognition of the potential for collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA will implement a suite of stewardship measures (see Section 3.2.1.1.5 [Associated Stewardship Measures] of the Restoration Plan and Appendix R1 to the EIS). The LA TIG is also committed through these measures to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 62702**

**The movement from an estuary to a delta-building system would adversely impact commercially-harvested species.**

**Response ID: 16080**

The movement from an estuary to a delta-building system would result in either adverse or beneficial impacts on commercially-harvested species, based on habitat preferences and life histories, as summarized in Chapter 4, Section 4.10 Aquatic Resources, Table 4.10-6 of the Draft EIS. In the LA TIG's Draft Restoration Plan, commercially-harvested species that could

---

experience collateral injury from the proposed Project were also described in Chapter 3, Section 3.2.1.5 in OPA Evaluation of the Alternatives, and species that could benefit from the proposed Project were discussed in Section 3.2.1.6 Benefits Multiple Resources.

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 62782**

---

**A large number of commenters expressed general opposition to the proposed Project.****Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62812**

**The permit application notes the proposed Project would destroy or alter 7,530 acres of essential fish habitat. The commenter expressed concern that this acreage excludes oyster habitat, as well as crab, shrimp, and sport fishing habitats which, in total, is several times larger than 7,530 acres.**

**Response ID: 16385**

As discussed in Appendix N2 Essential Fish Habitat Assessment of the EIS, operation of the proposed Project is projected to convert EFH from one EFH habitat type to another, rather than result in habitat loss of EFH. The habitat conversion generally would result in a conversion of the more ubiquitous soft bottom habitats (19,545 acres) to more structured habitats (see the Executive Summary, Table ES-1). The adverse (and beneficial, as applicable) impacts on the habitats for specific species, including blue crab, brown and white shrimp, oysters, and select sport fish, are discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

*Submitted via email to: CEMVN-Midbarataria@usace.army.mil*

To whom it may concern:

On behalf of the Animal Welfare Institute, the Center for Biological Diversity, Cetacean Society International, the International Marine Mammal Project of the Earth Island Institute, the Humane Society of the United States, the Humane Society Legislative Fund, NY4Whales, Ocean Conservation Research, and the Oceanic Preservation Society, we submit these comments to the Louisiana Trustee Implementation Group (TIG) and the US Army Corps of Engineers, New Orleans District (Corps) on the Draft Restoration Plan and Environmental Impact Statement: Mid-Barataria Sediment Diversion. 86 FR 12915 (Mar. 5, 2021), 86 FR 22397 (Apr. 28, 2021). We thank the Corps and the TIG for this opportunity to comment. We note that before preparing these comments, we reviewed the Draft Environmental Impact Statement (DEIS) and associated documents and attended the online presentation, "Effects of Low Salinity Exposure on Bottlenose Dolphins," hosted by the Marine Mammal Commission (MMC) on March 23, 2021.<sup>1</sup>

In the context of the Mid-Barataria Sediment Diversion, our organizations have worked together in the past to advocate for protections of the marine mammals affected by this project, particularly the Barataria Bay Estuarine System (BBES) Stock of dolphins. This project's significant impact on this stock are the reason for, and will be the focus of, this letter. In submitting these comments, we also aim to dispel prior media mischaracterizations indicating that "the NGO community" is fully supportive of this project.<sup>2</sup> We support Gulf of Mexico restoration, but in light of the information presented in the DEIS, we cannot support the proposed sediment diversion.

As a technical matter, we note that the National Park Service website provided for online public comment is less than straightforward and does not allow for the uploading of documents. In order to receive a broad range of stakeholder comments while also making the process seamless, it would have been ideal for the Corps and the Louisiana TIG to host this comment collection through a more user-friendly federal website such as *regulations.gov*. We thank the TIG for adding an email option for transmission of comments when it extended the comment period deadline.

## I. Introduction

At the outset, we acknowledge the great need for restoration of the Mississippi River Delta (MRD) ecosystem, and within that, the Barataria Bay Estuary. The Barataria Basin has lost more than 276,000 acres of land since the 1930s, and the Basin's wetlands were the most heavily affected by the Deepwater Horizon (DWH) oil spill, which hastened the severe land loss trend threatening Louisiana's estuaries. The oil spill and response activities also accelerated the rate of wetland loss in the area.<sup>3</sup>

The purpose of this project is "to restore for injuries caused by the DWH oil spill by implementing a large-scale sediment diversion in the Barataria Basin that would reconnect and re-establish sustainable deltaic processes between the Mississippi River (MR) and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts." DEIS Abstract. See also, DEIS at 1.3–1.4; DEIS Appendix R at 1-2.

Yet the DWH oil spill is one of multiple events caused by humans that have damaged the MRD. Over time, humans have altered and damaged this environment in numerous substantial ways. As the Corps and TIG have acknowledged, the Barataria Basin has been altered by: storm and hurricane events; erosion, subsidence and sea-level rise (all exacerbated by global climate change); industrial, commercial and residential development; as well as flood risk management and drainage efforts. Then in 2019, just one year after a Congressionally-mandated waiver of the Marine Mammal Protection Act (MMPA) was issued for this project (see below), a significant amount of melted snow pack, combined with excessive precipitation within the MR watershed and increased runoff from levee systems and spillways, created such an influx of freshwater runoff into the Gulf of Mexico that an unusual mortality event (UME) of dolphins occurred, in record numbers from Louisiana to Florida. Unfortunately, the State of Louisiana was in the process of leaving the marine mammal stranding response network at this time, leading to a loss in critical data during the UME that would have better illuminated the impacts to this population.

At a cost of up to \$2 billion, the Draft Restoration Plan would implement the Mid-Barataria Sediment Diversion project, which would reconnect the MR to Louisiana's Barataria Basin. The project would restore and sustain a significant amount of wetland habitat—tens of thousands of acres—and the resources that depend on them, over the next several decades. At peak capacity, the proposed preferred alternative would transport up to 75,000 cubic feet per second of freshwater and its sediment and

nutrients—harnessing nature through engineering to re-establish the natural process that originally built Louisiana’s coastal wetlands.<sup>4</sup>

It is a worthy endeavor for the Trustees to attempt to restore the Barataria Basin. Nevertheless, we oppose the project, given the inevitable and devastating impact of the project on the BBES Stock. They will not only be decimated in number through mortality, but their deaths will be agonizing and slow, given how chronic exposure to low salinity affects dolphins and the high likelihood that they will continue to exhibit strong site fidelity throughout the lifetime of the project. This strategic stock’s already poor state and cumulative impacts beyond this project will compound this project’s negative effects. It is extraordinarily unfortunate that should this sediment diversion proceed, the BBES dolphins will pay the price for the past mistakes of humans.

Furthermore, we are deeply disturbed by the fact that in 2018, federal legislation was used to circumvent the standard process required to obtain a waiver of the MMPA, in order to allow this project to move forward despite the major impacts it will have on the BBES Stock. As we further explain below, the Bipartisan Budget Act of 2018, Public Law 115-123 at Title II, Sec. 20201 (hereinafter BBA-18) directed the National Oceanic and Atmospheric Administration (NOAA) to issue a waiver for this project without on-the-record rulemaking before an administrative law judge, and without consideration of the conservation-based factors that the MMPA would have otherwise required. The proposed mitigation and monitoring measures, although required under BBA-18, will do little to offset the harm that awaits the BBES dolphins should this project move forward. We believe this was a powerfully damaging precedent for Congress and the State of Louisiana to set; we strongly urge Congress to never again allow such a waiver.

## II. Background on the Barataria Bay Estuarine System Stock of Dolphins

The Northern Gulf of Mexico is home to 21 cetacean species managed as 59 discrete stocks, as well as one sirenian species, the West Indian manatee. DEIS at 3.11. All of these species and stocks are protected under the MMPA. Bottlenose dolphins are currently managed as 37 distinct stocks within the Gulf, most of which are found only in shallower coastal waters. DEIS at 3-141–3-142. Of these 37 stocks, five were considered for potential impact by the proposed project: three bay, sound, and estuary (BSE) stocks: the MRD Stock, the Terrebone Bay/Timbalier Bay Stock, the BBES Stock, and two coastal stocks, the Northern and Western Coastal Stocks. *Id.*

NMFS manages the BBES dolphins as a strategic stock, meaning a marine mammal stock for which the level of direct human-caused mortality exceeds the Potential Biological Removal level (PBR) and which, based on the best available scientific information, is declining and is either already listed under the Endangered Species Act of 1973 [16 U.S.C. 1531 et seq.] (ESA), is likely to be listed as a threatened species under the ESA within the foreseeable future, or is designated as depleted under the MMPA. 16 U.S.C. 1362(19). As the DEIS states, “Strategic stocks are those with declining populations for which the level of direct human-caused mortality exceeds the Potential Biological Removal level (PBR, the maximum number of animals that may be removed from a stock, excluding natural mortality, which allows it to reach or maintain its optimum sustainable population).” DEIS at 3-143. The BBES Stock has an estimated population of 2,071 and is considered strategic. *Id.* at 3-144. They are generally year-round residents, with localized, small usage areas of less than 43.5 square miles, although some individuals’ ranges extend throughout the middle/lower parts of the basin. *Id.* Some BBES dolphins live near the barrier islands and into Gulf of Mexico waters and may overlap with dolphins from the Western Coastal Stock, but the BBES Stock is demographically independent. *Id.* In its 2018 Stock Assessment Report,

NOAA stated “it is plausible” that there are multiple demographically independent populations within the BBES Stock, but further studies are needed to understand habitat partitioning within the bay. *Id.*

The BBES dolphins are known to exhibit high site fidelity, despite periodic or even long-term negative environmental factors. For example, following the DWH oil spill in 2010, the BBES dolphins remained in Barataria Bay despite heavy oiling of their habitat. *Id.* at 4-437. The DWH oil spill caused a minimum of 850 miles of shoreline oiling in coastal Louisiana, with the most widespread oiling occurring in Barataria Bay salt marshes and resulting in adverse impacts on aquatic resources such as marsh vegetation, intertidal biota, and shoreline erosion. *Id.* at 3-74. The BBES dolphins were the hardest hit amongst the Gulf of Mexico dolphins following the DWH spill, having exhibited an increased rate of lung disease and other illnesses over the past decade.<sup>5</sup> Therefore, it is a near certainty that the BBES dolphins will not leave Barataria Bay to escape the low salinity facing them once the project becomes operational.

Environmental factors such as salinity and temperature influence bottlenose dolphin habitat, with one model indicating an optimum foraging suitability is water temperatures in the 68 to 75 degree Fahrenheit (20 to 24 degree Celsius) range, about 6/mg/L dissolved oxygen, turbidity in the 20 to 28 NTU range, salinity of about 20 ppt, distance from shore in the 656–1,650-foot (200–500 meter) range, and water depths between 13 and 20 feet (4 to 6 meters). *Id.* at 3-148.

### III. Impacts on BBES Stock of Dolphins from Construction and Operation

Table 2.9-1 summarizes the project’s impacts by alternative. For marine mammals, the construction of this project is going to cause “negligible to minor, temporary, indirect, and adverse impacts on bottlenose dolphins from construction noise and dredging.” DEIS at 2-75, Section 4.11. The operation of this project, however, is going to cause “major adverse impacts on BBES dolphins and dolphin habitat (due mostly to salinity) that would continue throughout the lifetime of the Project. Immediate decreases in salinity levels within the BBES Stock area, which would persist throughout the analysis period, would cause permanent, major adverse impacts on BBES dolphin health, survival and reproduction. Dolphins north of the Barrier Islands would be especially adversely impacted, while Barrier Island-associated dolphins would be less-adversely impacted; however, all groups would be more adversely impacted than compared to conditions under the No Action Alternative. Based on the projected decreases in survival rates due to prolonged low-salinity exposure, there would be a substantial reduction in population numbers.” DEIS at 2-75–2-76, Section 4.11. With the exception of the No Action Alternative, the provided alternatives “would have substantially similar impacts.” *Id.*

#### a. Construction Impacts from Applicant’s Preferred Alternative

Although the primary mode of take will be from the decreased salinity once the diversion is operational, auditory impacts will be ongoing for approximately 3.5 years during the project’s construction. “Pile driving, dredging and vessel noise calculations identify adverse behavioral effects on marine mammals within a large [zone of influence] during construction.” DEIS at 4-436. Given the land masses present in the vicinity of the construction areas, pile driving and dredging sounds are not anticipated to propagate beyond about 2 miles. Increased noise from these sources is therefore not likely to affect areas that are highly used by dolphins. Consequently, the DEIS states that “based on the limited PTS [zone of influence], no noise-related injury on dolphins would be anticipated from construction.” *Id.*

However, noise impacts from construction are in fact possible, due to increased vessel traffic transiting throughout the project area. We therefore question the DEIS claims that noise-producing construction activities have minimal overlap with the BBES dolphins' range and thus are anticipated to have negligible to minor, temporary, indirect and adverse impacts on bottlenose dolphins. DEIS at 4.11.4. We want to take this opportunity to note the possibility that the increased exposure to underwater noise due to increased vessel traffic in Baratara Bay during the construction period will in all likelihood exacerbate the dolphins' stress and health problems, setting them up for a harder fall once the diversion is operational. The increased vessel traffic also, of course, introduces an increased risk of collision.

b. Operational Impacts of Applicant's Preferred Alternative

Based on literature and case study review; the Delft3D Basinwide Model; the BBES Stock survey and existing data from previous BBES Stock surveys; and a number of other sources of data, the DEIS analyzed the expected impact on the BBES dolphins. DEIS at 4.11.3. The analysis period spans from 2020 to 2070, with the expectation that by 2070, approximately 12,700 acres of wetlands will be created and sustained. *Id.* at 4-446. "Overall, the Applicant's Preferred Alternative would have immediate, major adverse effects on BBES dolphin habitat (due mostly to low salinity) that would continue throughout the lifetime of the proposed Project." *Id.*

While bottlenose dolphins can tolerate some level of exposure to lower-than-optimal salinity, large scale changes in salinity, including longer-term exposure, lead to physiological effects and survival impacts. "The barrier island dolphin usage pattern would see an 8 ppt reduction in salinity from March to May, and the model projected that they would experience between 0 to 5 ppt waters from April to June." *Id.* at 4-447. "The following decades show a similar trend, but the length of time dolphins would be exposed to low salinity would increase and salinity values would get even closer to 0 ppt compared to the No Action Alternative." *Id.* Thus, under the Preferred Alternative, "immediate and permanent major adverse impacts on BBES dolphin habitat and environment" can be expected. *Id.* at 4-466.

Prolonged exposure to low salinity without breaks can rapidly (within 24 to 72 hours) lead to the formation of skin lesions, sores, and sloughing. The compromised skin barrier can in turn lead to overgrowth of external mats comprised of fungi, algae, and/or bacteria. This deterioration may cause secondary infections and extracellular uptake of water. "Recovery may require extended periods of time depending on the nature of the lesion and whether the animal is subject to other stressors," which we know these dolphins are. *Id.* DEIS at 4-429, *see also Id.* at 4-466.

Ingestion of low-salinity water may also alter intracellular and extracellular water absorption in the gut, contributing to osmotic imbalance, cellular damage and susceptibility for localized and/or systemic infections. *Id.* at 4-466–4-467. Physiological and pathological changes such as electrolyte or hormone imbalances, decreased osmolality, over-hydration, and cellular hemolysis/anemia may occur after freshwater uptake by the skin or gut lining. Osmotic imbalance, cellular damage, and/or secondary infection can change from mild to severe, leading to systemic impacts such as hemolysis, anemia, septicemia/toxemia, and cerebral or pulmonary edema, which may lead to death. *Id.* at 4-467. After about 10–15 days of exposure to low-saline waters, dolphins' survival starts to be affected. The time to death has been calculated at a mean of 62 days for a relatively poor environment and 75 days for a good environment.<sup>6</sup> As noted above, this manner of death is prolonged and agonizing, the epitome of inhumane.

These dolphins exhibit high site fidelity, continuously, even after prior periods of lower salinity. Therefore, as we noted above, we cannot expect BBES dolphins to move out of the Barataria Basin or otherwise shift their range following purposeful introduction of freshwater into their environment. DEIS at 4-430. In addition to the DWH oil spill, other incidents have shown this strong site fidelity. *Id.* at 4-468–4-475.

The models used show that while under the No Action Alternative, simulated BBES dolphins have an 89 percent likelihood of surviving in any given year from 2020 to 2030, under the Applicant’s Preferred Alternative, simulated BBES dolphins have only a 59 percent likelihood of surviving any given year from 2020 to 2030 based on the projected decreased salinity levels from the proposed project. *Id.* at 4-475. See also Table 4.11-5, Projected Mean Annual Survival Rates Due to Low-salinity Exposure for a Simulated BBES Dolphin Population under the No Action Alternative and Applicant’s Preferred Alternative. Under no circumstances is such a shift in survivorship sustainable and indeed merely the first year of operation of the diversion is likely to almost halve the BBES dolphin population size, given the other stressors they face and the additional possibility of impacts such as prey shifts from the freshwater influx. Clearly the projected increased mortality from the project far exceeds PBR for this impaired stock, but even a robust stock of dolphins could not sustain such mortality.

Further, a recent analysis from the University of St. Andrews shows that after 50 years of sediment diversion as proposed, three of the four Barataria Bay dolphin population strata will be functionally extinct.<sup>7</sup> The only remaining dolphins will be along the barrier islands and even they will be severely reduced. The model predicts a total of 143 dolphins remaining after 50 years of sediment diversion operation as outlined in the preferred alternative. By comparison, given the potential rate of recovery, there would be approximately 3300 dolphins at the end of the same time period under the no action alternative.<sup>8</sup>

#### c. The 2019 Unusual Mortality Event

In 2019, just one year after the passage of BBA-18, the MR watershed experienced its wettest spring in 126 years. A significant amount of melted snow pack, combined with precipitation within the watershed and increased water flow from the levee systems and spillways, created such an influx of freshwater runoff into the Gulf of Mexico that a die-off ensued. A reported 337 dolphins stranded and died from Louisiana to Florida, and the National Marine Fisheries Service (NMFS) declared a UME. DEIS at 4-470. Six different stranding networks covered the region of the UME. Unfortunately, at the same time dolphins were washing up on the beach, the Louisiana Department of Fish and Wildlife was winding down its involvement in the marine mammal stranding network. While a group called Audubon Coastal Wildlife Network attempted to fill the void, by the time transition was occurring, critical data were missed. It is estimated that only 33% of stranded animals were reported for Louisiana during the whole of the 2019 UME.<sup>9</sup>

#### d. Multiple Threats Mean More Dolphins Will Die Than Anticipated

In its discussion of multiple stressors on marine mammals, the DEIS states, “Given the number of and various types of threats marine mammals face in the northern Gulf of Mexico, and the potential for interactive effects of these threats, it can be even more difficult to determine impacts from multiple stressors.” DEIS at 4-428. The document goes on to explain that while the DEIS looked at how “multiple stressors may affect impact assessments at a qualitative level,” “a quantitative assessment of effects or

potential synergistic or antagonistic interactions in a multiple stressor scenario was not undertaken.” *Id.* Models only looked at single years and did not analyze repeated annual exposure to low-salinity water over many years. DEIS at 4-429.

All of these elements, including the possibility that another “wet year” such as 2019 may recur, strongly suggest that there will be a substantially higher individual mortality risk to the BBES dolphins each year than what they will clearly face in just the first year from the initial exposure to freshwater influx. In short, this already unhealthy stock is likely to be even harder hit than the DEIS’s analysis determined, which was devastating even so.

#### IV. The Marine Mammal Protection Act (MMPA) and Bipartisan Budget Act of 2018 (BBA-18), Public Law 115-123, Title II, Sec. 20201

Section 101(a) of the MMPA establishes a moratorium on the taking and importation of marine mammals and marine mammal products, subject to certain limited exceptions. 16 U.S.C. § 1371(a). However, under Section 101(a)(3), the Secretary “is authorized and directed, from time to time, to determine when, to what extent, if at all, and by what means it is compatible with [the MMPA] to waive the requirements of section 101 [the moratorium] so as to allow taking, or importing of any marine mammal, or any marine mammal product ...” 16 U.S.C. § 1371(a)(3).

Section 101(a)(3)(A) sets the standards for a waiver, including a decision made upon the best available science, in consultation with the MMC, with “due regard” to marine mammal biological factors. The decision must be compatible with the MMPA and must be “assured that the taking of such marine mammal is in accord with sound principles of resource protection and conservation as provided in the purposes and policies of [the MMPA].” In issuing a waiver, the Secretary also must make determinations under sections 102, 103, 104 and 111 of the Act. 16 U.S.C. § 1371(a)(3)(A). Pursuant to Section 103(d), the Secretary shall issue regulations for the take of marine mammals to implement the waiver, based upon the best available scientific evidence and in consultation with the MMC. The take shall not be to the disadvantage of the species or stock, meaning that the take cannot cause a species to fall below its optimum sustainable population, or OSP. It also must be consistent with the purpose of the MMPA. The Secretary is to develop regulations on the record after a hearing before an administrative law judge, also known as formal rulemaking, and make available to the public: a statement of estimated levels of the species and population stocks, a statement of expected impact of the proposed regulations on the OSP of such species or population stock, a statement describing evidence used as the basis for proposing the regulation, and any studies or recommendations related to the establishment of such regulations. These findings are subject to periodic review. 16 U.S.C. § 1373(d).

Waivers of the MMPA are exceedingly rare, and Congressionally-mandated waivers are even rarer. On just two occasions since the MMPA was passed, Congress called for such waivers, in the form of permits, to address bycatch of marine mammals in foreign fisheries.<sup>10</sup> These legislative permits proved to be utter failures of the MMPA’s core principles, as they halted the progress that was being made up to that point under the MMPA’s then-existing fisheries scheme. They cut off the ability of the administrative process to establish science-based limits on marine mammal take in fisheries by applying a burden of proof that the fishers had to meet. The MMPA was later amended substantially to address these problems by creating a new management scheme for marine mammal take by commercial fisheries.

Due to the science-based requirements inherent in the MMPA, at some point in the planning process of the Barataria Bay diversion project, it became apparent that the project would not be able to move forward without a waiver of the MMPA. The waiver process is known for being challenging, time-consuming, and adversarial,<sup>11</sup> and the MMPA's conservation bias applies throughout. We presume that the proponents of this project did not feel that this project's timeline could afford a substantial delay, particularly when a waiver at the end of that delay was far from guaranteed. The State of Louisiana therefore set about obtaining a legislative fix, pursuant to BBA-18, which states:

*(a) In recognition of the consistency of the Mid-Barataria Sediment Diversion, Mid-Breton Sound Sediment Diversion, and Calcasieu Ship Channel Salinity Control Measures projects, as selected by the 2017 Louisiana Comprehensive Master Plan for a Sustainable Coast, with the findings and policy declarations in section 2(6) of the Marine Mammal Protection Act (16 U.S.C. 1361 et seq., as amended) regarding maintaining the health and stability of the marine ecosystem, within 120 days of the enactment of this section, the Secretary of Commerce shall issue a waiver pursuant to section 101(a)(3)(A) and this section to section 101(a) and section 102(a) of the Act, for such projects that will remain in effect for the duration of the construction, operations and maintenance of the projects. No rulemaking, permit, determination, or other condition or limitation shall be required when issuing a waiver pursuant to this section. (b) Upon issuance of a waiver pursuant to this section, the State of Louisiana shall, in consultation with the Secretary of Commerce: (1) To the extent practicable and consistent with the purposes of the projects, minimize impacts on marine mammal species and population stocks; and (2) Monitor and evaluate the impacts of the projects on such species and population stocks.*

See also DEIS at Appendix S, Compliance Documentation. In simple terms, BBA-18 directed NOAA to issue an MMPA waiver for this project without the relevant parties having to go through the standard administrative process that obtaining a waiver entails. *Id.* As a result, on March 15, 2018, the Director of the Office of Protected Resources issued a decision memorandum for the "Waiver of Requirements Under Section 101(a) and 102(a) of the [MMPA] for the Mid-Barataria Bay Sediment Diversion, the Mid-Breton Sound Sediment Diversion, and Calcasieu Ship Channel Salinity Control Measures Projects." *Id.* The decision memorandum notes that "[t]hrough section 20201, Congress removed NMFS's discretion and the requirements to consider the statutory factors, provide the required statements, make the required findings, and determine whether issuance of a waiver meets the statutory standards under sections 101(a)(3)(A) and 103," and "eliminated the agency's discretion to consider the best available scientific evidence, factors relevant to determining impacts on affected species or stocks, and whether issuance of a waiver and associated takings would be compatible with the MMPA, not to the disadvantage of the affected species and stocks, and consistent with the purposes and policies of the Act." *Id.*

We appreciate that NMFS consulted with the MMC prior to issuing the waiver as directed by BBA-18. During that consultation, the MMC properly noted that "Although not an obstacle to issuance of this waiver, it remains unclear whether those projects are consistent with other stated purposes and policies of the MMPA, including maintaining marine mammal species and stocks at optimum sustainable population levels and ensuring that species and stocks do not diminish to the point where they cease to be significant functioning elements in the ecosystems of which they are a part."<sup>12</sup>

In its simplest characterization, the proposed sediment diversion is an ecosystem restoration project.

*[T]he Project is anticipated to have major, permanent benefits on wetlands and other U.S. jurisdictional waters in the Barataria Basin. The purpose of the diversion of fresh water, sediments and nutrients into the Barataria Basin is to build, sustain and maintain wetlands and riverine deltaic processes in an area that has been isolated from natural flooding inputs from the Mississippi River. A consistent and large magnitude input of sediment will lead to accumulation of diverted sediments and formation of new sub-areal features available for plant colonization. Direct deposition within existing wetlands contributes to surface accretion helping to offset the effects of sea level rise and subsidence.*

DEIS Appendix R at 2. However, as stated above, the nature of the project does not mean it is compatible with all aspects of the MMPA. At the same time, in the sense that this project would be ecologically beneficial, the waiver obtained here is distinguishable from the other legislative waivers of the MMPA that have involved commercial fishing, and thus, ecological exploitation. Nonetheless, BBA-18, the legislative fix utilized to make this diversion project possible, has created a situation where the Corps and the TIG have circumvented a legal process intended to conserve marine mammals and protect ecosystems. This waiver does not even establish a quota for how many dolphin can be taken, including killed, by this project, and yet it is clear that the level of take for this stock will be grossly unsustainable, in clear violation of the MMPA (absent BBA-18). The legislative waiver, quite simply, was Congressional permission to break the law. While this comment is directed as much to Congress as it is to the TIG and the Corps, we want to take this opportunity once again (see above) to insist that this legislative waiver be a one-off occurrence.

#### V. Mitigation

At the outset, we wish to state that there is no effective mitigation for this project. It will kill and negatively affect the health of BBES dolphins and the applicants and all involved in promoting this project should simply acknowledge this upfront, without equivocation. Any “mitigation” will in reality be monitoring only—monitoring the health impacts and the mortality caused by the low salinity resulting from the project.

We do note, however, that at Sec. 20201(b), BBA-18 requires both minimization of impacts, and monitoring and evaluation of the impacts of the projects, on marine mammal species and population stocks. Whether or not all proponents of this project completely understood this in 2018 is unclear, but the reality that is evident now is that each of the proposed action alternatives is likely to similarly and significantly harm the BBES dolphins, and there is little that the proposed mitigation can actually do to prevent or even minimize this harm.

The Mitigation and Stewardship Plan (Appendix R-1) calls for examination of “operational strategies to minimize (to the extent practicable consistent with the purposes and performance of the project) the Project’s impact on bottlenose [sic]. Given the dynamic conditions of any estuarine system, and the uncertainty around future conditions, the minimization measures will rely on the MBSD Monitoring and Adaptive Management Plan to inform future implementation.” DEIS Appendix R-1 at 6.3.6 (p. 31–32). This plan also calls for statewide stewardship measures, supported by the Louisiana Coastal Protection and Restoration Authority (CPRA), in order to “reduce existing and future threats to BSE and coastal dolphins throughout Louisiana. While these measures may not minimize impacts from the Project on BBES dolphins, they could enhance individual dolphin survival from other anthropogenic stressors.” *Id.* These measures include funding of the statewide stranding program, human interaction/anthropogenic stressor reduction, and contingency funding for UMEs. With respect to anthropogenic threats, the plan

aims to reduce bottlenose dolphin mortalities from rod and reel fishing gear, reduce intentional injury and mortality (e.g. shooting) to bottlenose dolphins, reduce illegal feeding of bottlenose dolphins, and evaluate the potential impacts of noise, vessels, and other direct threats to identify and implement stewardship measures designed to address these threats. *Id.* While laudable goals, there is no explanation in the plan for how they will be achieved, or whether they can even feasibly be achieved (e.g., very few perpetrators of shootings and other targeted vandalism of dolphins in the Gulf of Mexico have been brought to justice<sup>13</sup>).

These and other interactions with humans have affected dolphins and other marine mammals for decades. While some strides have been made by involved industries, governmental bodies, and NGOs, many anthropogenic threats have proven resistant to existing mitigation. Therefore, the Mitigation and Stewardship Plan should provide specifics as to how each goal will be achieved. For example, if the idea behind reducing intentional injury to and mortality of, as well as illegal feeding of, bottlenose dolphins is that with more monitoring teams in place, there will be less opportunity for people to harass dolphins, and if monitors witness such activity then they will be empowered to intervene, the plan should say so.

With respect to mitigation from fishing impacts, it is primarily *commercial* fishing that tends to lead to bycatch of marine mammals. In the Gulf of Mexico, shrimp trawlers would be the primary source of concern for marine mammal bycatch.<sup>14</sup> While rod and reel fishing—often characterized as recreational fishing—can pose a threat,<sup>15</sup> the threat is less significant than that posed by commercial fishing primarily because it is conducted on a smaller scale than commercial fishing.<sup>16</sup> With regard to *evaluation* of potential effects of noise, vessels, and other direct threats, it is unclear what will be *done* with that information. If this plan actually inspires better efforts to protect Gulf dolphins from the multitude of anthropogenic threats they face, it would be a thin silver lining to this proposal that is otherwise exceedingly grim for BBES dolphins.

With respect to Atlantic bottlenose dolphins generally, the Monitoring and Adaptive Management Plan (MAMP) exists to “document changes to the abundance, distribution, population demography, density, survival, health and reproduction of the” BBES dolphins, as well as “their prey, and their habitat that may result from the operation of the Project and resulting low salinity.” DEIS Appendix R-2 at 3.7.3.19 (p. 61–63). The MAMP calls for use of adaptive management strategies, including “a framework for coordinating during operations, and a post-operational commitment to evaluate the ability of diversion operations to be modified to meet project goals while reducing impacts to marine mammals.” *Id.* Monitoring and evaluation under the MAMP will take place for five years pre-operation, followed by ten years during the post-construction period. During the first five years, this framework will involve enhanced stranding response and investigations, capture-mark-recapture surveys, visual assessment surveys, capture release health assessment sessions, tagging, biopsies, prey data, pairing of sensors with eDNA continuous sensors, and baseline dolphin prey and habitat (water quality) monitoring. During the ten year post-construction period, additional measures such as CMR surveys bay-wide will be added to the list. *Id.* Federal and State agencies, NGOs, and academic institutions will be among the parties responsible for the core monitoring team handling data collection for 15 years.

For both of these plans, it is striking that, just when it was about to embark on a series of sediment diversions that will result in significant dolphins deaths, the State of Louisiana pulled itself out of the stranding response business. As Dr. Deming pointed out in her presentation to the MMC, during the transitional period in stranding response monitoring of the UME in 2019, only an estimated 33% of Louisiana dolphin strandings were recorded.<sup>17</sup> Yet in his presentation to the MMC, Mr. Brian Lezina, Chief of Planning for the CPRA, gave the impression that the monitoring program is robust. While we recognize that increased stranding response funding will be available, it is not clear to whom this funding

will be given and thus how effectively the funding will be utilized. What is apparent is that most stranded dolphins in Barataria Bay will already be dead.

Finally, Section 7 of the Mitigation Measures Environmental Analysis covers mitigation measures for unavoidable impacts on bottlenose dolphins, reiterating various mitigation measures and the enhanced stranding response, but also discussing how the enhanced monitoring will sometimes involve direct contact with distressed animals, in consideration of how marine mammals are directly affected by “close vessel approach, tagging, marking, restraint, handling, capture, transport and relocation, tissue sampling, and other activities associated with monitoring and stranding response.” Appendix R-4 (p. 14–16). This analysis considers the potential effects of this heightened stress “relative to the broader intent of animal rescue measures.” *Id.* We appreciate this analysis of the affects that mitigation and monitoring may have on the dolphins and agree with the overall assessment that in consideration of the broader impact this project will have on the BBES dolphins, as long as conducted with due care, any effects that flow from the enhanced monitoring would be warranted.

#### VI. The DEIS Provides a Lack of Reasonable Alternatives Under the National Environmental Policy Act (NEPA)

We appreciate that the planning for this project thus far has been a massive undertaking. In his presentation to the MMC, Mr. Lezina stated that “a lot of work and over 30 years of [both state and federal] planning led to this project in this location.” The National Environmental Policy Act (NEPA) process for this project officially began in 2013 with the Notice of Intent to Prepare an EIS. See e.g., DEIS at 1.2.2. However, the most significant decision with respect to which project would be implemented was made via the publication of SRP/EA #3, where the “LA TIG Trustees selected the proposed project as part of a suite of restoration projects that constitutes the Trustees’ preferred alternative for restoring DWH oil spill injuries through restoration in the Barataria Basin.” DEIS at 1-15.

SRP/EA #3 apparently identified a combination of sediment diversions and marsh creation projects as the preferred restoration strategy for the Barataria Basin. DEIS Appendix R at 4. A notice of availability for the draft SRP/EA #3 was published in the Federal Register by the TIG on December 8, 2017, a 45-day comment period was held through February 8, 2018, and a public meeting was held in New Orleans on January 24, 2018. DEIS at 1-16 – 1-17. In March 2018, the TIG published a Notice of Availability of the Deepwater Horizon Oil Spill Louisiana Trustee Implementation Group Final Strategic Restoration Plan and Environmental Assessment #3, wherein it identified and, in conjunction with the associated Finding of No Significant Impact (FONSI), selected a restoration strategy. 83 FR 12340 (Mar. 21, 2018). While the public was at least invited to comment on SRP/EA #3, it goes without saying that an EA is not as detailed an analysis as an EIS; we believe the decision that was made via the EA should have been made via an EIS. “The purpose of an EIS is to apprise decisionmakers of the disruptive environmental effects that may flow from their decisions at a time when they ‘retain[] a maximum range of options.’” *Conner*, 848 F.2d at 1446. Taking actions in the interim that could limit those options undermines the purpose and effectiveness of the NEPA process. Thus, while preparing an EIS, an agency cannot make any “irreversible and irretrievable commitment of resources.” *Conner v. Burford*, 848 F.2d 1441, 1446 (9th Cir. 1986). See also *Pacific Rivers Council v. Thomas*, 30 F.3d 1050, 1056-57 (9th Cir. 1994), cert. denied, 115 S. Ct. 1793 (1995) (interpreting identical language in ESA); *Lane County Audubon Soc. v. Jamison*, 958 F.2d 290 (9th Cir. 1992) (ESA). Yet that is precisely what was done *before* the issuance of this draft EIS.

Therefore, we are disenchanted by the lack of meaningful consideration of a reasonable range of alternatives provided in this DEIS, as NEPA requires. 42 U.S.C. §§ 4332(2)(C)(iii), 4332(2)(E) (2006). *Monroe Cnty. Conservation Council, Inc. v. Volpe*, 472 F.2d 693, 697-98 (2d. Cir. 1972) (“The requirement for a thorough study and a detailed description of alternatives, which was given further Congressional emphasis in § 4332(2)(D), is the linchpin of the entire impact statement.”) We are not engineers and we do not purport to have the expertise to be able to recommend particular alternatives to this project. However, it is evident that because the real alternatives decision was made during the review of SRP/EA #3, what this DEIS really provides is two alternatives: the No Action Alternative, and an action alternative—the sediment diversion—with multiple options in terms of the cubic footage of water that will flow through the structure, with or without terrace outfall features.

It is unclear, for example, why the DEIS does not analyze the alternative of dredging sediment directly from the river and pumping it into place. It has been suggested in the media that this method would be expensive and would require regular replenishment.<sup>18</sup> At the same time, such an option might spare the BBES dolphins from the grim fate brought on by the Preferred Alternative, and for that reason alone, it would have been appropriate under NEPA for the Corps and the TIG to analyze such an option *in the DEIS*, subjecting it to thorough environmental analysis and public input.<sup>19</sup> *See also Metcalf v. Daley*, 214 F.3d 1135, 1142 (9<sup>th</sup> Cir. 2000) (“In summary, the comprehensive ‘hard look’ mandated by Congress and required by the statute must be timely, and it must be taken objectively and in good faith, not as an exercise in form over substance, and not as a subterfuge designed to rationalize a decision already made.”) It is incumbent upon the TIG and the Corps to consider more alternatives than what the agencies have contemplated in the DEIS. To this end, we are aware of the MMC’s comments<sup>20</sup> on the DEIS and endorse and incorporate its alternatives recommendations by reference.

## VII. Conclusion

We are deeply concerned, given the certain death facing many, if not most of, the BBES dolphins over the course of the project, that there is no guarantee the proposed sediment diversion will be sufficient to bring ecological stabilization to Barataria Bay. BBA-18 provides waivers for two additional diversion projects, but the area covered by these projects represents a fraction of the greater MRD. If this project is to move forward, we very much do not want the losses and suffering of these dolphins to be in vain. It is disturbing that we cannot in fact be confident that their sacrifice will result in Barataria Bay restoration.

Therefore, while we reiterate that we recognize the intended benefits of this project for the MRD, it is simply not right or just—and is legally inconsistent with the MMPA—for ecosystem restoration to come at the expense of what will, over time, potentially be the entire BBES Stock of dolphins. It was legally inconsistent for Congress to order NMFS to issue a waiver for this project in order to avoid the thorough science-based assessment that a waiver to the MMPA would have otherwise required. As is evident from the above-referenced information found in the DEIS, an overwhelming number of dolphins will die because of this project, and it will not be quick and painless. The Corps and the TIG should be careful not to “greenwash” any aspects of this project, but instead be clear and upfront about the negative aspects in addition to the ecosystem benefits it could bring. Ultimately the Corps and the TIG should come to the realization that there *must* be a better way forward. If that better way can be determined, everyone involved should take a hard look at that option.

<sup>14</sup> See e.g., Soldevilla, M. S., Garrison, L. P., Scott-Denton, E., Nance, J. M. (2015). Estimation of Marine Mammal Bycatch Mortality in the Gulf of Mexico Shrimp Otter Trawl Fishery. NOAA Technical Memorandum NMFS-SEFSC-672, 70 p. doi:10.7289/V5SF2T46; see also NOAA Fisheries, Southeastern U.S. Atlantic, Gulf of Mexico Shrimp Trawl Fishery—MMPA List of Fisheries, at <https://www.fisheries.noaa.gov/national/marine-mammal-protection/southeastern-us-atlantic-gulf-mexico-shrimp-trawl-fishery-mmpa> (last visited Apr. 22, 2021), noting that “This fishery targets shrimp species with various gear types, but mainly utilizes skimmer or otter trawls. These gear types likely entangle marine mammals, particularly bottlenose dolphins, in very similar ways. The common entangling mechanism of these gear types are the “lazy” or “easy” line. The most commonly employed gear in this fishery is a double-rig otter trawl, which normally includes a lazy line attached to each bag’s codend. The lazy line floats free during active trawling, and as the net is hauled back, it is retrieved with a boat- or grappling-hook to assist in guiding and emptying the trawl nets. Shrimp trawl soak time is about three hours.”

<sup>15</sup> See NOAA Fisheries, Common Bottlenose Dolphin, <https://www.fisheries.noaa.gov/species/common-bottlenose-dolphin> (last visited Apr. 22, 2021), noting that “One of the main threats to bottlenose dolphins is getting caught in fishing gear. Dolphins can become entangled or captured in commercial fishing gear such as gillnets, seines, trawls, trap pots, and longlines. In addition to interactions with commercial fisheries, dolphins may also encounter rod-and-reel gear used by recreational anglers or for-hire fishing vessels (such as charter boats and headboats). This problem is increasing, especially in the southeast United States and is largely the result of dolphins taking the bait and the catch directly from fishing gear, eating discarded fish, or being fed fish (illegally) by humans causing them to associate anglers with food. These interactions can cause dolphins to be injured or killed by entanglement in or ingestion of the gear. In addition, fishermen sometimes become frustrated when dolphins take their catch, and can retaliate with violence towards dolphins.”

<sup>16</sup> While several of our organizations work to curtail marine mammal bycatch in commercial fisheries, we also recognize that shrimp fisheries will themselves be affected by this project.

2021), available at <https://www.mmc.gov/wp-content/uploads/21-06-02-Louisiana-TIG-USACE-Draft-RP3.2-DEIS-MBSD-with-enclosure.pdf>.

---

**Concern ID: 61879**

**Commenters questioned why other alternatives are not being considered other than No Action and a sediment diversion with various levels of flow rates. CEQ's regulations require that the EIS rigorously explore and objectively evaluate all reasonable alternatives, which is a requirement that the Draft EIS does not meet. Consider analyzing a range of other alternatives, options, and tools that better preserve and protect the environment and minimize the severe impacts to Louisiana fisheries, the communities, and the entire Gulf Coast ecosystems.**

**Response ID: 15835**

The range of reasonable alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2 of the Draft EIS (Alternatives), an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in its SRP/EA #3 and found that a combination of “marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats” (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in its Restoration Plan. The LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG’s Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter’s opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project’s stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62919**

**Commenters suggested that the proposed Project should include additional details and measures to minimize adverse impacts on dolphins, including additional adaptive management measures, such as operational minimization measures (and other measures to minimize short-term impacts from lower salinity levels) as well as additional details about human interaction/anthropogenic stressor reduction stewardship measures, and about how the goals of those measures will be achieved. One commenter noted that while the alternatives evaluated in the Draft EIS, including those rejected for further review, are adequate for purposes of an Final EIS and Record of Decision, more information on minimization measures that may be considered to address impacts to dolphins through the adaptive management process is needed**

**Response ID: 16707**

In recognition of the potential collateral injury to bottlenose dolphins and in response to public comments on this issue, the CPRA has revised the Monitoring and Adaptive Management (MAM) Plan included in the Draft EIS (see Appendix R2 [Monitoring and Adaptive

Management Plan] to the Final EIS) to include more specific details regarding strategies and protocols to be used to minimize impacts on dolphins at the onset of operations and the process through which operational data would be used to evaluate potential modifications to those strategies and protocols. As stated in the MAM Plan, adaptive management strategies are largely reliant upon data that would only be available once operations commence, but may also be informed by new information gained during the preoperational period. At that time, such data would be used to evaluate modifications to operations that may further minimize impacts to marine mammals while achieving Project goals. In the updated MAM Plan, the CPRA has included a framework by which recommendations on operational management actions designed to minimize impacts on marine mammals would be made and CPRA's final determination on whether they would implement those measures.

The LA TIG has also developed a Marine Mammal Intervention Plan (see Appendix R5 to the Final EIS), which outlines a spectrum of response actions for dolphins affected by the operation of the diversion, ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. With respect to achieving the goals of the stewardship measures that are incorporated in the Mitigation and Stewardship Plan addressing other anthropogenic stressors, the NMFS' Southeast Regional Office and Southeast Fisheries Science Center will lead those efforts. The Final Mitigation and Stewardship Plan has been updated to include additional information regarding this topic (see Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62921**

**Commenters suggested that the State of Louisiana must comply with the MMPA waiver and minimize impacts to marine mammal population stocks in ways that are practicable and consistent with the purposes of the Project. This includes considering alternative actions and modifications to Project operations to reduce or mitigate impacts to BBES dolphins while still meeting the Project purpose. The Mitigation Plan incorrectly suggests that actions to reduce impacts to dolphins is not necessary because it would negatively impact Project performance. The Trustees should research all possible mitigation actions to reduce impacts to BBES and invest in the restoration projects that effectively reduce this impact. These may include alternative construction designs or operational strategies, such as reduced diversion flow or salinity thresholds, that would reduce impacts to bottlenose dolphins.**

**Response ID: 16703**

CPRP prepared a Mitigation and Stewardship Plan and a Monitoring and Adaptive Management (MAM) Plan. Chapter 3, Section 3.11.1 Marine Mammals in the Northern Gulf of Mexico of the Final EIS has been revised to discuss the Marine Mammal Protection Act waiver that was issued for the proposed Project.

There is no requirement in the Bipartisan Budget Act that CPRP evaluate alternatives other than the Project. The Bipartisan Budget Act of 2018, Section 20201 requires the State of Louisiana, in consultation with the Secretary of Commerce (delegated to NMFS), to the extent practicable and consistent with the purposes of the proposed Project to minimize impacts on marine mammal species and population stocks, and monitor and evaluate the impacts of the proposed Project on such species and population stocks.

CPRP's updated MAM Plan (Appendix R2 of the Final EIS) includes measures and frameworks for minimizing and monitoring impacts of the proposed Project on marine mammals. In addition, the LA TIG has developed a Marine Mammal Intervention Plan. As described in the Federal Register notice announcing issuance of the MMPA waiver, the State's consultation with NMFS will be ongoing to appropriately address the evolving Project planning and design for the construction, operation, and maintenance phases. This ongoing consultation is described in the MAM Plan as well as the Marine Mammal Intervention Plan (see below and Appendices R2 and R5 to the Final EIS for more details).

As described in the Draft EIS, the MAM Plan identifies potential ways in which the LA TIG may reduce impacts to dolphins. The MAM Plan in the Final EIS has been updated to provide more detail about the strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols. However, the adaptive management strategies and actions are largely reliant upon data that would be collected during either the pre-construction monitoring period or once operations commence. Once operational data are available, they would be used to evaluate the potential Project modifications to further minimize impacts to marine mammals. There are limited minimization

---

measures available that would reduce impacts on marine mammals and those limited measures would likely only benefit dolphins residing the furthest from the diversion structure (for example, the Island strata).

However, the LA TIG recognizes that despite these operational strategies, dolphins within Barataria Bay would likely experience significant impacts, as described in the EIS, given the purposes of the proposed Project. In response, the LA TIG has developed a Marine Mammal Intervention Plan that outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia (see Appendix R5 to the Final EIS). While the more severe actions such as euthanasia may not offset the ultimate outcome of mortality, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. In addition, the Mitigation and Stewardship Plan and MAM Plan include actions that would occur prior to operations to improve understanding of the BBES dolphins as well as improvement of stocks across the state (see Appendices R1 and R2 to the Final EIS).

In arriving at the mitigation and stewardship actions included in the Mitigation and Stewardship Plan, the LA TIG worked with experts within NOAA with expertise on marine mammals to ensure the consideration of all potential mitigation actions. In terms of operational strategies to reduce marine mammal impacts, as noted above, those strategies cannot be further defined at this time as they are largely reliant upon data that would be collected during the pre-construction monitoring period or once operations commence. One goal of the proposed Project is to deliver sediment, fresh water, and nutrients into the basin and the design of all of the action alternatives would accomplish that goal. Alternative diversion designs that accomplish that goal on the desired scale would not address dolphin impacts, as those impacts are largely related to salinity changes, which are driven by the transmission of fresh water into the basin.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62930**

**Commenter noted that commercial fishing is the primary cause of marine mammal bycatch and should be considered over rod and reel (recreational) fishing during further development of CPRA's Mitigation and Stewardship Plan.**

**Response ID: 16546**

The threat of commercial fishing to marine mammals was discussed and considered in Chapter 3, Section 3.11.4 (Existing Threats) of the Draft EIS; therefore, no related edits were made to the Final EIS. Stewardship measures that would be implemented as part of the Applicant's Preferred Alternative are designed to address some anthropogenic threats to bottlenose dolphins in Louisiana waters including interaction with recreational and commercial fishing (see the Mitigation and Stewardship Plan in Appendix R1 to the EIS).

As stated in the PDARP, the Deepwater Horizon Trustees will continue to advance bycatch reduction measures in the commercial fisheries across the Gulf of Mexico.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

---

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62931**

**Commenter noted agreement with the assessment of effects that mitigation and monitoring may have on the BBES dolphins, specifically in consideration of the broader impact this Project will have on the BBES dolphins. Commenter agreed that as long as measures are conducted with due care, any effects that flow from the enhanced monitoring would be warranted.**

**Response ID: 16547**

The commenter's support of the need for marine mammal related mitigation and monitoring for the Project is acknowledged.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62986**

**The Project would drive decreases in salinity that would reduce the overall health, survival, and reproduction of bottlenose dolphins that reside in the Barataria Basin, a species that was negatively affected by the Deepwater Horizon oil spill (NMFS, 2013). Some commenters felt that because of this, the Project should either not move forward or its operation should be altered.**

---

**National Marine Fisheries Service (NMFS). 2013. Roy Crabtree (NMFS) to Elizabeth Davoli (CPRA).** <https://s3.documentcloud.org/documents/726710/national-marine-fisheries-service-comments-on.pdf>

**Response ID: 16701**

The concerns raised by the commenters about the projected decreases in salinity and resulting effects on Barataria Bay dolphins were considered in the Draft EIS. More specifically, Chapter 4, Section 4.11.5.2 in Marine Mammals of the EIS acknowledges that the proposed Project would likely have significant, adverse impacts to Barataria Basin dolphins, a species that suffered significant impacts from the DWH oil spill. This section also discusses the physiological changes caused by exposure to low-salinity water, the duration of those changes that leads to mortality, and the anticipated mortality of a large portion of the dolphin population in the Barataria Basin within the first decade. These sections of the EIS provide a more in-depth analysis of potential impacts to dolphins than the letter cited by the commenter.

The concerns raised by the commenters were also considered in the LA TIG's Draft Restoration Plan (see Section 3.2.1.5 [Collateral Injury]); the Final Restoration Plan has been edited consistent with changes made to the Final EIS and see below regarding new, related content included in Appendix R.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources, like dolphins, that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and

---

improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible (if it is possible), the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins in Louisiana (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63070**

**A recent study suggests that the proposed Project would not only prevent the recovery of the BBES Stock, but it would result in the functional extinction of dolphins in the West, Central, and Southeast strata of the stock area (Thomas et al., 2021). The only dolphins remaining in the basin would live adjacent to the barrier islands, and even this group would become severely reduced over the 50-year planning horizon of the proposed Project. Additionally, an expert elicitation (Booth and Thomas, 2021) building on previous studies (Garrison et al., 2020; Schwacke et al., 2017; Thomas et al., 2021) suggests that while dolphins can endure some periods of exposure to low salinity, the period of tolerable exposure shortens for dolphins exposed to acute changes in salinity, and the median time to death is 22 days with continuous exposure to water with salinity levels below 5 ppt.**

**Booth, C., and L. Thomas. 2021. An expert elicitation of the effects of low-salinity water exposure on bottlenose dolphins. *Oceans* 2(1):179-192.**

**Garrison, L.P, J. Litz, and C. Sinclair. 2020. Predicting the effects of low salinity associated with the Mid-Barataria Sediment Diversion Project on resident common bottlenose dolphins (*Tursiops truncatus*) in Barataria Bay, Louisiana. NOAA Technical Memorandum NOAA NMFS- SEFSC-748. 97 pages.**

**Schwacke, L.H., L. Thomas, R.S. Wells, W.E. McFee, A.A. Hohn, K.D. Mullin, E.S. Zolman, B.M. Quigley, T.K. Rowles, and J.H. Schwacke. 2017. **Thomas, L., Marques, T., Booth, C., Takeshita, R., and L. Schwacke. 2021. Predicted population consequences of low salinity associated with the proposed Mid-Barataria Sediment Diversion Project on bottlenose dolphins in the Barataria Bay Estuarine System Stock.**

**Response ID: 16593**

The Draft EIS included an analysis of the impacts to marine mammals, including BBES dolphins in Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock. This analysis incorporated the Booth and Thomas (2021), Garrison et al. (2020), and Schwacke et al. (2017) studies, and the Final EIS includes additional analyses that were completed by Thomas et al. (2021) after the Draft EIS was released for public comment. The impact conclusions in the Draft EIS were based in large part on Garrison et al. (2020), which predicts that only a remnant population of dolphins would continue to exist in Barataria Basin after diversion operations commenced. The conclusion of major, permanent, adverse impact to bottlenose dolphins is also supported by Thomas et al. (2021), which built on these earlier

studies and concludes that, after 1 year of operation of the Applicant's Preferred Alternative, there would be 61 percent fewer dolphins in the Central stratum than under the No Action Alternative, 35 percent fewer in the West stratum, 12 percent fewer in the Southeast stratum, and 2 percent fewer in the Island stratum, with 25 percent fewer overall. Thomas, et al. further concluded that after 10 years of operation, there would be 100 percent reduction in the populations of dolphins in the Central and West strata, an 82 percent reduction in the population of the Southeast stratum dolphins, and a 34 percent reduction in the population of the Island stratum dolphins as compared against the No Action Alternative, with an overall difference in population of 78 percent. (Note that Thomas, et al. 2022 slightly refined some of these projections.) After 50 years of operation, in three out of the four strata, dolphins are predicted to be functionally extinct (defined as less than or equal to dolphin in Thomas, et al. 2022) under the Applicant's Preferred Alternative, with the remaining Island stratum being 85 percent lower [95 percent CI -28 -- -99] under the Applicant's Preferred Alternative than under the No Action Alternative. Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the Applicant's Preferred Alternative is projected to be 143 dolphins (95 percent CI 11-706) compared to a predicted 3,363 dolphins (95 percent CI 2,831-4,289) predicted to inhabit the Barataria Bay under the No Action Alternative. In other words, the BBES dolphin stock is projected to be 96 percent smaller (95 percent CI -80 -- -100) under the Applicant's Preferred Alternative than then No Action Alternative. Chapter 4, Section 4.11 Marine Mammals of the Final EIS has been updated to reflect the results of Thomas et al. (2021).

Booth and Thomas (2021) evaluated multiple scenarios with different salinity changes, and in one of those scenarios' where bottlenose dolphins experience a change in salinity within 0 to 5 days from typical salinity environment (that is, mean 15 to 25 ppt) down to an atypical environment with salinity below 5 ppt for an extended period, the median time to death would be 22 days.

---

**Concern ID: 63075**

**The estimates of bottlenose dolphin survival rates provided in the Draft EIS may be inaccurate due to key modeling assumptions and limitations, which were acknowledged in the Draft EIS and associated studies (Garrison et al., 2020). For example, because the models used by the Draft EIS did not look at the cumulative effect of multiple stressors and exposure to low-salinity waters over many years, the Draft EIS likely underestimates the impact of the proposed Project on bottlenose dolphins.**

**Garrison, L.P, Litz, J. and Sinclair, C. 2020. Predicting the effects of low salinity associated with the MBSD Project on resident common bottlenose dolphins (*Tursiops truncatus*) in Barataria Bay, LA. NOAA Technical Memorandum NOAA NMFS-SEFSC-748: 97 p.**

**Response ID: 16596**

USACE and the LA TIG acknowledge the assumptions and limitations of the modeling, and the resulting uncertainties (including potential underestimation of adverse impacts) noted by the commenter. In addition to the Delft3D modeling, published, peer-reviewed studies (and in some cases, pre-published data available only to the NMFS EIS authors) were reviewed in conjunction with development of the EIS's evaluation of projected impacts to bottlenose

---

dolphin populations in the Project area. The Final EIS includes additional analyses that were completed by Thomas et al. (2021) after the Draft EIS was released for public comment. The EIS considers multiple sources of stress for bottlenose dolphins including salinity and temperature; sedimentation and land loss; contaminant and nutrients; food web and ecological interactions; and dolphin prey. While quantitative analysis regarding the combined effects of multiple stressors and prolonged salinity exposure are not currently available, the qualitative analysis supports the permanent, major, adverse impact on BBES dolphins found in the EIS (the most significant adverse impact category of the EIS).

---

**Concern ID: 63077**

**The Draft EIS underestimates the harm to bottlenose dolphins that would be caused during the construction of the proposed Project. More specifically, increased exposure to underwater noise due to increased vessel traffic in Barataria Bay during the construction period will in all likelihood exacerbate the dolphins' stress and health problems. There also will be a greater risk of vessel strikes during construction.**

**Response ID: 16597**

The impacts to dolphins of increased vessel traffic in Barataria Basin were acknowledged and discussed in Chapter 4, Section 4.11.4.2 (Marine Mammals - Construction Impacts) of the Draft EIS. That discussion concluded by noting that, while vessel traffic in the Barataria Basin would increase with construction activities, that "noise-producing construction activities [like vessel traffic] have minimal overlap with the BBES Stock range and thus are anticipated to have negligible to minor, temporary, indirect, and adverse impacts on bottlenose dolphins." The Draft EIS also states that impacts on marine mammals from construction would be predominantly due to risks of strikes from transiting construction vessels. Because this was previously addressed in the Draft EIS, no related edits were made in the Final EIS.

---

**Concern ID: 63078**

**The impact of increased freshwater inputs from the Mississippi River into coastal areas of Louisiana in 2019 caused a die-off leading to an unusual mortality event (UME). The Louisiana Department of Wildlife and Fisheries (LDWF) was winding down its involvement in the marine mammal stranding network during that time. While a group called Audubon Coastal Wildlife Network attempted to fill the void left by the LDWF, critical data were missed. It is estimated that only 33 percent of stranded animals were reported for Louisiana during the whole of the 2019 UME.**

**Response ID: 16598**

Chapter 4, Section 4.11.5.2.2.1 General Effects on Dolphin Health of the Final EIS has been revised to acknowledge the limitations of data collection by the LDWF during the 2019 UME. Analysis in the Final EIS is based on additional expert opinion regarding effects on dolphins from freshwater exposure compiled for Booth & Thomas (2021) and new data reported in Thomas, et al. (2021). This additional information supported the impact conclusions in the Draft EIS. NOAA has assumed coordination of the Louisiana Marine Mammal Stranding Network. Independent of this Project, the LA TIG has funded a project to support stranding network enhancements. Further, through the Project, the LA TIG would support an additional 20 years of funding for the Louisiana Marine Mammal Stranding Network.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63080**

**The Corps and the TIG have circumvented a legal process intended to conserve marine mammals and protect ecosystems by obtaining a Congressionally-mandated MMPA waiver for the proposed Project. The waiver does not establish a quota for how many dolphins can be taken by the proposed Project, and it is clear that the level of take for this stock will be grossly unsustainable, in clear violation of the MMPA (absent BBA-18). The legislative waiver, quite simply, provided Congressional permission to break the law. It is critical for the protection of marine mammals that such a legislative waiver be a one-off occurrence.**

**Response ID: 16599**

The U.S. Army Corps had no role in seeking a Marine Mammal Protection Act waiver for this Project from Congress, nor did any federal agencies on the LA TIG. CPRA sought the waiver.

Title II, section 20201 of the Bipartisan Budget Act of 2018 provides: "(a) In recognition of the consistency of the Mid-Barataria Sediment Diversion, Mid-Breton Sound Sediment Diversion, and Calcasieu Ship Channel Salinity Control Measures projects, as selected by the 2017 Louisiana Comprehensive Master Plan for a Sustainable Coast, with the findings and policy declarations in section 2(6) of the Marine Mammal Protection Act (16 U.S. C. 1361 et seq., as amended) regarding maintaining the health and stability of the marine ecosystem, within 120 days of the enactment of this section, the Secretary of Commerce shall issue a waiver pursuant to section 101(a)(3)(A) and this section to Section 101(a) and Section 102( a) of the Act, for such projects that will remain in effect for the duration of the construction, operations

---

and maintenance of the projects. No rulemaking, permit, determination, or other condition or limitation shall be required when issuing a waiver pursuant to this section. (b) Upon issuance of a waiver pursuant to this section, the State of Louisiana shall, in consultation with the Secretary of Commerce: (1) To the extent practicable and consistent with the purposes of the projects, minimize impacts on marine mammal species and population stocks; and (2) Monitor and evaluate the impacts of the projects on such species and population stocks.”

The National Marine Fisheries Service issued the waiver in March 2018. Since that waiver in 2018, CPRA has not requested any additional waivers for coastal restoration projects. More information on the waiver can be found at <https://www.fisheries.noaa.gov/action/marine-mammal-protection-act-waiver-select-louisiana-coastal-master-plan-projects>.

---

**Concern ID: 63327**

**The Draft EIS lacks a reasonable range of alternatives under the National Environmental Policy Act (NEPA) because the LA TIG’s Environmental Assessment (EA) conducted through SRP/EA #3 was insufficient. While the public was invited to comment on the TIG SRP/EA#3, it goes without saying that an EA is not as detailed as an EIS. The commenter stated that the decision making conducted in the TIG’s SRP/EA #3 should have been conducted by the TIG in an EIS instead of an EA because the purpose of an EIS is to apprise decision makers of the disruptive environmental effects that may result from their decisions during that stage of the planning process when there are a maximum range of options (see Conner, 848 F.2d at 1446). Taking actions in the interim that could limit those options undermines the purpose and effectiveness of the NEPA process.**

**Response ID: 16609**

The range of reasonable alternatives evaluated in the EIS was based on alternatives that would satisfy the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. The LA TIG and CPRA crafted CPRA’s statement of purpose and need, which built on the LA TIG’s analyses in SRP/EA #3, including its initial screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA’s purpose and need statement and considered the public’s and other perspectives, including input from the LA TIG and cooperating agencies and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the purpose and need.

As described in Chapter 2 of the EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were evaluated, including other available coastal restoration tools and methods. The screening criteria included key concepts from the purpose and need including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; and supporting the long-term viability of existing and planned coastal restoration projects; and consistency with the SRP/EA #3 and the Louisiana Coastal Master Plan. Based on a review of the various alternatives against these criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the

Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2 Alternatives, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were eliminated from further detailed analyses as described in Chapter 2, Section 2.6 (Summary of Alternatives Considered But Eliminated From Detailed Analysis). Refer to Appendix D2 (Eliminated Alternatives Matrix) of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

With respect to analyses conducted in the SRP/EA #3, the LA TIG built on the Final PDARP/PEIS and its recommendation that strategic restoration planning could be beneficial to focus on a particular region. The SRP was utilized to transition from the PDARP/PEIS's programmatic, comprehensive scale to a tiered, geographically specific evaluation that assessed restoration strategies that could restore injuries in the Barataria Basin. This resulted in the preparation of SRP/EA #3. The LA TIG found, based on its evaluation in the EA portion of the SRP/EA that: (1) the PDARP/PEIS included a thorough evaluation of the potential range of environmental effects that could result from the various restoration approaches and techniques analyzed in the PDARP/PEIS; (2) the analysis of the environmental consequences of those approaches and techniques in the PDARP/PEIS remains valid; (3) the effects of the restoration approaches and techniques, including the projects selected for further planning and environmental review, evaluated in the SRP/EA were within the range of impacts evaluated in the PDARP/PEIS; and (4) any new information regarding the environmental consequences of the restoration approaches and techniques, including the projects selected for further planning and environmental review, evaluated within SRP/EA #3 were within the range of and consistent with the environmental impacts identified and analyzed within the PDARP/PEIS. The LA TIG's review of the environmental effects of the restoration techniques considered in SRP/EA #3, as well as comments submitted by the public, did not reveal any substantial change in the action evaluated in the PDARP/PEIS; or any new information indicating significant environmental issues or circumstances presented by application of the restoration techniques and approaches specifically in the Barataria Basin. As a result, the LA TIG concluded that the EA completed with the SRP was sufficient and consistent with applicable NEPA requirements.

---

**Concern ID: 63626**

**The success of the Project is uncertain, but the Project would cause dolphin deaths regardless of its success or failure.**

**Response ID: 16600**

Chapter 4, Section 4.11.5.2 (Barataria Bay Estuarine Stock) of the Draft EIS acknowledged that the MBSD would result in mortality and severely compromised health of a significant number of individuals belonging to the Barataria Bay estuarine stock (BBES) of bottlenose dolphins. This section has been updated to incorporate research by Thomas, et al. (2021) that was completed after release of the Draft EIS. According to data published by Thomas, et al. (2021) most of the approximately 2,300 dolphins within the Barataria Basin would perish within the first 10 years of start of operations of the proposed Project (comparing the anticipated Barataria Basin 2027 dolphin population (2,307 dolphins) to the projected 2038 population under the Preferred Alternative (644 dolphins) indicates that approximately 72

---

percent of the dolphins would perish). These additional data built on earlier studies analyzed, and support the impact conclusions, in the Draft EIS.

The commenter's concern that Project success is uncertain is acknowledged. The value of fresh water, sediment, and nutrients in the ecological productivity and sustainability of the Barataria Basin is discussed throughout Chapter 4 (Environmental Consequences) of the EIS. Each of the Alternatives analyzed in the EIS, except for the No Action Alternative, are expected to meet the purpose and need of the Project, and uncertainties in the overall impacts of the Project, both beneficial and adverse, are incorporated into the analyses included in Chapter 4 Environmental Consequences of the EIS. More specifically, salinity impacts of the Project are assessed using the Delft3D Basinwide Model, and this model's projections of future conditions include uncertainties. Uncertainties are incorporated into the EIS impact conclusions and are briefly summarized in the EIS in Chapter 4, Section 4.1.3.3 (Model Limitations and Uncertainty), and in detail in Appendix E (Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties). Uncertainties related to the Marine Mammals impact analysis are summarized in detail in Chapter 4, 4.11.3.1 (Marine Mammals, General Caveats to Impact Analysis Approach).

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include specific marine mammal response triggers that may affect Project operation mitigation efforts; see Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit

and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

With respect to the LA TIG's Restoration Plan, the LA TIG's conclusion that the Project is likely to succeed in providing the predicted Project benefits is detailed discussed in Section 3.2.1.4 (Likelihood of Success) of the Final Restoration Plan.

---

**Concern ID: 63823**

**Commenters noted that the proposed mitigation will not actually reduce impacts on dolphins, and there is no way to mitigate those impacts. Commenters noted that reducing human interaction will not reduce or address impacts of the projects on the local population.**

**Response ID: 16550**

Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock of the EIS acknowledges that according to Thomas, et al. (2021) most of the approximately 2,300 dolphins within the Barataria Basin will perish within the first 10 years of start of operations of the proposed Project (comparing the anticipated Barataria Basin 2027 dolphin population [2,307 dolphins] to the projected 2038 population under the Preferred Alternative [644 dolphins] indicates that approximately 72 percent of the dolphins would perish). That section further acknowledges that the anticipated dolphin mortality would be due to reductions in salinity levels rather than other stressors and that mitigation and stewardship measures that would not reduce the salinity impacts, would be unlikely to reduce the projected dolphin mortality.

With respect to the Restoration Plan, in Section 3.2.1.5 (Avoids Collateral Injury) the LA TIG acknowledges that a large number of dolphins would become ill and strand in Barataria Bay as a result of the Project. The Mitigation and Stewardship Plan also acknowledges that the proposed mitigation may not minimize impacts of the Project on dolphins (see Appendix R1 to the EIS). Measures described in the MAM and Mitigation and Stewardship Plan were developed in recognition of the anticipated effects of the Project and to provide valuable data to inform adaptive management actions that could be considered to minimize adverse impacts on BBES dolphins while being consistent with the Project's purpose (see Appendices R1 and R2 to the Final EIS).

The LA TIG does not agree that there is no effective mitigation for this Project but recognizes that the mitigation will be limited (that is, primarily for dolphins around Grand Isle), depending on how operations are managed. Similar to mitigation, the stewardship measures described in the Mitigation and Stewardship Plan will primarily benefit other Louisiana stocks of dolphins outside of the Barataria Basin, though they will provide some benefit to BBES dolphins. For

example, minimizing dolphin feeding will protect dolphins from vessel interactions. As noted in Chapter 4, Section 4.11 (Marine Mammals) of the EIS, a remnant BBES dolphin population is expected to remain near the barrier islands. Efforts to reduce anthropogenic stressors other than those from the Project through the Stewardship and Mitigation Plan will benefit the existing and future population in the Barataria Basin and throughout the state. However, the LA TIG recognizes that the impacts of the Project will likely be significant on marine mammals even with the proposed mitigation and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63835**

**The Draft Restoration Plan is unclear about how information about noise, vessels and other direct threats will be used. However, even if the Project provides benefits through reduced anthropogenic threats, any positive impacts will be small compared to the many larger negative impacts that are occurring to BBES dolphins.**

**Response ID: 16554**

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG's Draft Restoration Plan has been addressed solely by the LA TIG and represent the views of the LA TIG, not USACE.

---

The LA TIG acknowledges the anticipated significant adverse impacts to the BBES dolphins in Section 3.2.1.5 (Avoids Collateral Injury - Alternative 1) of the Draft Restoration Plan; thus, no related edits were made to the Final Restoration Plan. The stewardship measures described in the Mitigation and Stewardship Plan, which addresses existing and future anthropogenic effects, including noise, on BBES dolphins, would reach beyond the area that would be affected by the Project, as the measures would be implemented state-wide (that is, in areas where the Barataria Basin stock of dolphins does not reside; see Appendix R1 to the EIS). NMFS is currently using existing data to identify where noise and other anthropogenic stressors that present direct threats to marine mammals (for example, fishing entanglement, intentional shootings) are high to target specific areas for action to reduce such stressors. The LA TIG recognizes that state-wide stewardship measures such as reducing noise impacts, vessel and fishery interactions, etc. will not minimize impacts from the Project nor is this implied in the EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63970**

**A commenter, when commenting on the MAM Plan, expressed concern that just as the State of Louisiana is about to embark on a series of sediment diversions that will result in significant dolphins deaths, the State of Louisiana has pulled itself out of the stranding response business. While the commenter recognized that increased stranding response funding would be available through the Project, it is not clear to**

---

**them to whom this funding will be given and thus how effectively the funding will be utilized. They are worried that most stranded dolphins in Barataria Bay would already be dead.**

**Response ID: 16694**

The LA TIG, in recognition of the need to improve stranding response in Louisiana, finalized Restoration Plan #5 in August of 2020, which included the use of non-MBSD Deepwater Horizon Natural Resource Damages funding for enhancement of the Louisiana Marine Mammal Stranding Network. NOAA is the lead implementing Trustee on this enhancement project and has assumed the stranding network coordination role in Louisiana. These enhancements would be extended through stranding network investments noted in the MBSD Mitigation and Stewardship Plan (Appendix R1 to the EIS). NOAA would lead implementation of stewardship measures for marine mammals including the continued enhancement of the stranding network. CPRA would lead any Project operational mitigation actions considered as part of the Monitoring and Adaptive Management (MAM) Plan, in consultation with NOAA.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:40550**

Big River Coalition

Sean Duffy, Sr.

U.S. Army Corps of Engineers (New Orleans District),

Please accept these comments on behalf of the Big River Coalition documenting our concerns about the lack of compensatory mitigation to maintain the Mississippi River Ship Channel from the negative impacts of the Mid-Barataria Sediment Diversion.

The Big River Coalition (BRC) was created in Fiscal Year 2011 in response to the announcement by the Commander of the United States Army Corps of Engineers' (USACE) Mississippi Valley Division that channel maintenance on the Mississippi River Ship Channel, Gulf to Baton Rouge (Louisiana) would be limited by the dedicated funding (Operations and Maintenance [O&M] budget). Prior to this position change the Mississippi River Ship Channel received preferential treatment and often received additional funding from other USACE projects. After the 1989 grounding of the M/V MARSHAL KONYEV (Pilottown) that virtually closed the Ship Channel to all traffic, the USACE's Headquarters announced in a position statement that it would maintain the nation's most critical navigation channel. The BRC originally focused on obtaining additional funding to supplement the shortfall in the Corps' O&M budget, to strive to establish a legislative firewall around the Harbor Maintenance Trust Fund and to represent members of the Mississippi River navigation industry in matters related to coastal restoration. As our membership grew and continued to make effective progress on these initiatives, members supported the Coalition's commitment to actively advocate for the deepening of the Mississippi River Ship Channel Gulf to Baton Rouge to 50 feet.

The Big River Coalition appreciates the opportunity to file comments on this project and reviewed in detail the Executive Summary, Appendix Q: Navigation/Dredging Analysis and Appendix R: Mitigation & Monitoring and Adaptive Management Plans. The Big River Coalition is concerned by the negative impacts this project would have on the Mississippi River Ship Channel and that the Coastal Protection and Restoration Authority does not include any Compensatory Mitigation to address the self-reported negative impacts. The Coalition reviewed this Draft Environmental Impact Statement in detail but was unable to find any Compensatory Mitigation measures offered to counter the negative impacts the diversion would have on the Mississippi River Ship Channel. The Mississippi River Ship Channel is an economic superhighway and the proposed diversion would have negative impacts on the main line navigation channel responsible for the movement of 500 million tons of cargo on an annual basis.

The Big River Coalition is committed to ensuring the future of navigation on the Mississippi River Ship Channel (MRSC) as one of the nation's fundamental natural resources and true economic powerhouse. The Mississippi River has an estimated \$ 735.7 billion annual impact on the nation's economy and is responsible for approximately 2.4 million jobs (585,000 jobs on the Lower River - Cairo, IL to the Gulf of Mexico and

1.86 million plus jobs on the Upper River-Lake Itasca, MN to Cairo, IL and including the IL River).

The Coalition's immediate responses to this lengthy document are limited to the negative impacts to the Ship Channel and requests for the establishment of sufficient Compensatory Mitigation funding to maintain the status quo of the Ship Channel.

#### COMPENSATORY MITIGATION FOR THE IMPACTS TO NAVIGATION

1) The requirement to maintain a sufficient Picket Boat during the construction and operation of the diversion structure to protect maritime commerce, transiting vessels and the diversion structure(s) must be included. This requirement meets with protocols for the U.S. Army Corps of Engineers during the operation of the Bonnet Carré and Morganza Spillways. The picket boat requirement adds a layer of protection to assist with passing vessel traffic, in case a transiting vessel loses steering or power. The Coalition believes that picket boat contract should be a conditional requirement for a towboat vessel to stand picket outside the diversion structure to fend off loose barges or vessels. The standard picket boat requirements for operation at Bonnet Carré Spillway include a twin screen vessel with a minimum propulsion of 2,000 horsepower to a maximum of 5,000 horsepower with a licensed pilot and crew onboard for 24-hour operations. The requirement for the picket boat during the waterside construction and during the operation of the proposed structure for the lifetime of the project should be a regulatory requirement to protect and promote navigational safety.

"In the Mississippi River, operational impacts under the Applicant's Preferred Alternative on the existing flow of the Mississippi River would be permanent, moderate, and adverse due to the creation of cross-stream (perpendicular to the existing general downstream flow) velocity component near the proposed diversion site."

The request for the Picket Boat would seem to match with some of the challenges for shallow-draft tows that were experienced and recorded during the vessel modeling.

"This indicates that upbound loaded slow-moving tows were vulnerable to the effects of the project intake flow."

2) The Draft Environmental Impact Statement indicates that if constructed the Mid-Barataria Sediment Diversion will lead to the loss of approximately 3,000 acres in the environmentally sensitive birds'-foot delta.

As reproduced from the Executive Summary:

"By contrast in the birdfoot delta, operation of the MBSD Project is estimated to induce approximately 3,000 acres of land loss by 2070 (a 45 percent reduction as compared to the No Action Alternative), representing permanent, moderate, adverse impacts. These impacts in the birdfoot delta may be partially abated by improving the capture of sediment that is lost to the Gulf through other targeted restoration projects."

The Compensatory Mitigation request is for the restoration of 3,000 acres of land in the birdfoot delta, to ensure no additional land loss is attributable to the Mid-Barataria Sediment Diversion. The CPRA and state of Louisiana should actively be engaged with the navigation industry in order to work cooperatively with the USACE to protect the economic superhighway that flows through the Mississippi River Ship Channel. The birdfoot delta is critical to maritime commerce and protecting or restoration efforts along the Mississippi River delta and Southwest Pass provides tremendous environmental benefits.

Through the beneficial use of dredged material over the last twelve years the navigation industry has worked closely with the USACE and dredge contractors to restore over 13,000

acres of land below Venice (Louisiana). In 2021 the USACE estimates it beneficially used over 30 million cubic yards of material and restored more than 2,330 acres at a significant elevation above the waterline.

3) The Coalition could not find any specific mention of channel maintenance dredging in the area of the proposed diversion, although it is widely agreed that diversions do incur localized shoaling. The Coalition request that the applicant detail how it will dredge and fund dredging on the Mississippi River Ship Channel in the vicinity of the Mid-Barataria Sediment Diversion.

The information reproduced below from the Executive Summary (Page ES-8) offers alignment with the requested funding to maintain the Ship Channel in the proximity of the diversion:

"In the Mississippi River, the Project would have permanent, moderate, and adverse impacts, with general trends of increased erosion immediately upstream of the diversion and increased deposition immediately downstream of the diversion. The driving force for these impacts would be the reduced flow and consequently slower water velocity downstream of the diversion from the rerouting of river water through the diversion."

The navigation industry requests that historic channel depths are maintained in the immediate area of the project and that compensatory mitigation with sufficient funding to maintain channel depths for the life of the project in the immediate area of the Mid-Barataria Sediment Diversion are secured. This request and legitimate concerns are more significant because the USACE does not have to dredge in the area of the Mid-Barataria Sediment Diversion and any shoaling or channel degradation in this area must be mitigated for over the life of the project.

The following comments are reproduced from noted sections and detail concerns relevant to navigation and limitations of the vessel modeling:

#### EXECUTIVE SUMMARY

Concerns documented on Page ES-20:

"During construction, the Project would have moderate, temporary, adverse impacts on the safety and efficiency of shallow-draft vessels transiting past the proposed Project site in the Mississippi River due to waterway obstructions associated with the proposed cofferdam of the river intake system. During operations, the Project would have moderate, intermittent but permanent, adverse impacts on marine traffic efficiency and safety for shallow-draft vessels in the Mississippi River due to cross-currents extending into the channel from the proposed intake of water into the diversion. Some congestion may be unavoidable and could cause transit delays. The Project would also cause minor to moderate, permanent, adverse increases in dredging requirements in some portions of the Mississippi River navigation channel downriver of the proposed Project site and in the birdfoot delta due to Project-induced changes to shoaling patterns and locations."

The navigation industry must request that proper mitigation and sufficient compensatory funding to dredge or perform channel maintenance be linked to this project. The above paragraph details the validity of the concerns the Big River Coalition has about the installation of this project with no mitigation at all to address the negative impact on the navigation channel.

#### APPENDIX Q1:DREDGING ANALYSIS AND Q2: NAVIGATION STUDY REPORTS

The following details specific concerns from the Navigation/Dredging section, Appendix Q:

## "4.1 MODEL LIMITATIONS

### 4.1.1 General Limitations

Every model has limitations that are dependent on its dimensionality, equations solved, spatial and temporal resolution, and assumptions made. Every model is, at best, an approximation of the real world and requires careful, informed application and interpretation before the results are used to help inform decision making."

As reproduced from Page 5 of Appendix Q:

"In addition, during construction a cofferdam and temporary protective cells will be placed in the river to facilitate construction of the intake structure. Barges will likely be placed around the protective cells, and work boat(s) could be moving around these barges to assist in the construction. These will all cause constriction of the navigable portion of the Mississippi River at the location of the project, which could affect vessel traffic. The cofferdam will also affect local flow patterns along that side of the bank."

The constriction of the navigable portion of the Mississippi River at the project location would in all likelihood require significant communication, information sharing and transit restrictions. This proposal would require significant discussion with the navigation industry to ensure that commerce is not disrupted and that navigational safety is prioritized around the project's construction activities. Especially given the construction timeline, estimated to last two years, ensuring minimal impacts to vessel operations will be a pivotal component during this phase of work.

Specific Concerns About the Pilot Cards from Vessel Modeling from Appendix C of: "2018 Ship Simulations Report"

"Four ship models were included in these simulation tests, a loaded and a ballast Suezmax Tanker and a loaded and a ballast Panamax Bulk Carrier."

Please note in the description above that there is no mention of a Very Large Crude Carrier or VLCC although a pilot card is added that suggest the vessel is a VLCC. The posted pilot cards from Appendix C are not clearly posted, the posted pages are blurry making them hard to read or decipher. Specifically: Page 63 (1 of

1) listed as Bulk Panamax MMX with a draft believed to be 42 feet 9 inches and an apparent length overall of 242 meters. Page 64 appears to show same vessel (Bulk Panamax MMX) with a draft of possibly 32 feet and 10 inches for both vessels the documented information is blurry and most unreadable. Page 65 is reported to be a Pilot Card for a VLCC, "VLCC 4 Suez" but the word after that is blurred beyond recognition and of interest here the VLCC draft shows what appears to be a draft of "13 m / 42 feet 9 inches" which would be an exceptionally low draft for a VLCC. Also, the length overall does not match the length overall of a true VLCC, appears to read 280 meters or 918.68 feet. The listing figures do not match VLCC characteristics, standard VLCC dimensions are in the 300-330 meters range and drafts in the range of 30 meters or greater are common.

"2014 Ship Simulations Report"

The following entry on Page 15 raises relevant concerns about programmed conditions for the ship modeling. "4.1.5 Environment on Page 15 the following data is entered:

Because the focus of this study was to determine if the currents generated by the diverted water from the Mississippi River would impact marine navigation through this reach, it was

concluded that no other environmental conditions would be included in the testing program. Therefore, no wind or waves were included in the testing program."

The removal of wind greatly reduces the integrity of the limited deep-draft modeling especially as wind was found to be problematic during shallow-draft simulations. True vessel modeling would include outside factors like wind, maritime operations on the Mighty Mississippi do not occur in a bubble or vacuum. The recent tragedy of the SEACOR POWER identifies the need to properly account for winds, especially as stronger systems have increased in strength and frequency. Wind is also one of the factors that led to the disruption to the world's supply chain caused by the grounding of the M/V EVER GIVEN at entry to the Suez Canal, these examples highlight the need for addressing true conditions in modeling efforts designed to mimic real world situations.

It is safe to assume that vessels transiting the Mississippi River in the area of the proposed diversion would be impacted by prevailing winds. At times tropical storm force winds should be expected to impact the area of the proposed diversion and the modeling should include operations in severe weather scenarios to be realistic.

The Coalition acknowledges that wind was included in the modeling done in 2018 but continues to raise questions with and agree that additional ship modeling should be required. The details and information should also be peer reviewed with navigation industry representatives and the U.S. Army Corps of Engineers.

The following is reproduced from the Q2: NAVIGATION STUDY REPORTS:

This statement seems to align with the position listed above:

"The proposed Mid-Barataria Sediment Diversion Project design details are shown in Figure 3 & Figure 4. This is the 15% design; therefore, the simulation study timing was relatively early in the design process. If future project design changes create significant changes in the currents at the project intake, consideration should be given to repeating the simulation study."

Also, curiously the drafts noted on the Pilot Cards do not match the drafts listed for the vessel simulations in Table 2 on Page 15.

The drafts are listed at either 30 feet or 50 feet while those on the pilot cards show: 42 feet 9 inches, 32 feet 10 inches, 47 feet 0 inches and 32 feet 10 inches on a VLCC. The assumption is made that the reference to Crescent City pilots is attributable to pilots representing the Crescent River Port Pilots Association. The details are hard to follow since the tables use industry terms like Suezmax and Panamax but none of the modeling seems specifically referenced to the VLCC mentioned before and no pilot card shows a vessel draft of 30 or 50 feet.

The following is reproduced to document the questions about the pilot cards in more detail.

"6 Appendix A: Ship Model Pilot Cards

Bulk Panamax\_MMX with a length overall of 242 meters (794 feet) and an even keel draft of 13 m (42 ft 9 in) listed and then the same apparent vessel with an even keel draft of 10 m (32 ft 10 in). Representing the vessel with two drafts one inbound and one outbound.

VLCC 4\_Suez Statoil with a length overall of 280 meters (918.68 ft) and an even keel draft of 14.3 m (47 ft 0 in) and then the same apparent vessel with an even keel draft of 10 m (32 ft 10 in). Representing the vessel with two drafts one inbound and one outbound.

Once again oddly neither Pilot Card shows drafts matches the numbers portrayed in Table 4 on Page 23 of 30 feet and 50 feet.

The Big River Coalition is only aware of two meetings with the modelers and offers that no reviews or briefings were offered to the navigation stakeholders after either modeling effort was conducted. The participants did share that not all of their concerns were addressed or allowed to be incorporated into the modeling. A review of the information and discussion with the USACE should have been part of the process, before releasing the results.

"Identified diversion discharge quantities associated with negative navigation impacts were to be addressed. In addition, if such negative impacts are found, what vessel types and load conditions will be impacted the most were to be identified."

"Additionally, proposed construction conditions that have been defined by the CPRA will be programmed and simulated to evaluate the safety of navigation operational conditions during project construction."

This first statement seems to suggest that the modelers themselves intended to review the results with the navigation industry and the USACE who participated in the two meetings with navigation stakeholders (2013 and 2018). The second statement is confusing as it suggests that additional meetings or modeling will take place when construction conditions are known, and navigation operational conditions would be best determined by the USACE, U.S. Coast Guard and navigation stakeholders.

The Big River Coalition is concerned about this project based on experience with the creation of the West Bay Diversion at Mile 4.7 Above Head of Passes on the right descending bank (western side). The maritime industry voiced their concerns prior to the creation of that diversion, knowing that it would increase shoaling in the Mississippi River Ship Channel below the diversion and increase river currents above the diversion site. The main concern was specific to shoaling within the Pilottown Anchorage (Mile 6.7 Above Head of Passes [AHP] to Mile 1.5 AHP) as the U.S. Army Corps of Engineers (USACE) does not have the authority to dredge outside of the Ship Channel. Because of this the maritime industry only agreed to the West Bay Diversion's construction because of the approved conditions included in the document titled:

"COST SHARING AGREEMENT BETWEEN THE DEPARTMENT OF THE ARMY AND THE STATE OF LOUISIANA, FOR CONSTRUCTION, OPERATION, MAINTENANCE, REPAIR, REPLACEMENT, REHABILITATION AND MONITORING OF THE WEST BAY SEDIMENT DIVERSION PROJECT (MR-03) PLAQUEMINES PARISH, LOUISIANA."

The Cost Sharing Agreement (CSA) was executed on August 29, 2002 by the Department of Natural Resources, State of Louisiana and the USACE. The following is reproduced from Page #3 of the CSA:

..."Included as a Project feature is the maintenance of the outermost (eastern) 250-foot wide strip of the Pilottown Anchorage area and the entire width of the adjoining access area between the strip of Pilottown Anchorage and the Mississippi River navigation channel.

Advanced maintenance of the Pilottown Anchorage area shall be undertaken to account for

the anticipated shoaling induced by the Project (Emphasis supplied). Below the conveyance channel, the anchorage and access areas shall be maintained at the depth existing at the time the Phase One interim conveyance channel is constructed. Above the cut, three 45-foot deep by 1,500 feet long anchorage berths shall be constructed and/or maintained..."

In 2009 the Coastal Wetlands Planning, Protection and Restoration Act passed a motion that removed this commitment from the operational structure of the CSA. The navigation industry is concerned about the impact the proposed Mid-Barataria Sediment Diversion would have on the Ship Channel, especially based on a maximum discharge of 75,000 cubic feet per second which is 25,000 cubic feet per second higher than the maximum proposed rate for the West Bay Diversion. There is no doubt this diversion would incur deposition in the Ship Channel and unlike the West Bay Diversion it is not in an area the USACE performs channel maintenance dredging. Therefore, any shoaling in the channel and within the Wills Point Anchorage should be removed by the applicant, the Coastal Protection and Restoration Authority. The Coalition requests that the USACE lead an effort to properly model the impact of the hydrology changes and shoaling in the vicinity of the proposed diversion structure before approving the Permit Application. According to recent surveys of the Pilottown Anchorage done by the USACE and the Coastal Protection Restoration Authority there are over 60 million cubic yards of material within the Pilottown Anchorage.

The Coalition strives to maximize the economic efficiencies that promote increased maritime commerce and international trade. The Lower Mississippi River Deep-Draft Ports Complex (Baton Rouge, South Louisiana, New Orleans, St. Bernard, and Plaquemines) is an economic superhighway of international trade and the nation's busiest port system. The cargoes moved through these five ports account for nearly 70 percent of the Nation's grain exports and more than 20 percent of the Nation's coal and petroleum cargoes. The economic impact of the Lower Mississippi River Deep-Draft Ports Complex is nationally significant.

Sincerely,

Sean M. Duffy, Sr.

Executive Director

---

**Concern ID: 62293**

**The commenter noted that the vessel simulation model in the Draft EIS Appendix Q Navigation/Dredging Analysis includes pilot cards that are inconsistent with vessel drafts listed for the vessel simulations.**

**Response ID: 16448**

Suezmax, Panamax and VLCC vessels were used in the navigation simulations as described in the Draft EIS, Appendix Q2 Navigation and were correctly identified in the text. "Suezmax" and "Panamax" are dimension classifications and "VLCC" is a tonnage classification. The ship simulator operator, Maritime Institute of Technology & Graduate Studies (MITAGS) indicated that what was listed as a "pilot card" was actually a filename for the model simulation, which was meant for internal use. To avoid confusion, the USACE has added the following note to page 25 of Appendix A of Appendix Q2 of the Final EIS: "NOTE: The 'Ship Name' on the following Pilot Cards is an internal file name to the ship simulation computer and does not necessarily correspond to the vessel nomenclature used in the descriptive text. In all cases, the main body text description of vessel characteristics is correct."

---

**Concern ID: 62969**

**To ensure commerce is not disrupted and navigation safety is prioritized, the CPRA and Louisiana should engage and communicate with the navigation industry concerning Project impacts to the Mississippi River Ship Channel, birdfoot delta, and Southwest Pass.**

**Response ID: 16643**

The EIS Appendix Q2 Navigation Study Reports included CPRA's coordination with Mississippi River pilots to evaluate impacts on navigation safety during proposed Project construction and operations. Appendix Q2 Navigation Study Reports has been updated with additional details of CPRA's efforts.

USACE agrees that maintaining safe and efficient navigation is a top priority. USACE has engaged the navigation industry in meetings on August 2, 2018, September 5, 2018, and February 3, 2022 and will continue to coordinate with the navigation industry regarding the industry's concerns about the proposed Project. .

CPRA's Operational Plan for the proposed Project states, "In the event diversion operations cause an unintended and severe impediment to navigation, as determined by the U.S. Coast Guard in consultation with CPRA, CPRA will coordinate with the U.S. Coast Guard and CEMVN and determine what, if any, changes in diversion operations are warranted to address the impediment" (see the Draft EIS, Appendix F2 Preliminary Operations Plan).

CPRA has proposed the following measures in its Final Mitigation and Stewardship Plan (Appendix R1) to address concerns about navigation impacts in the Mississippi River during Project construction. These measures have been forwarded to the U.S. Coast Guard for their review and input.:

- CPRA would coordinate the location of Mississippi River Aids to Navigation (ATONS) associated with the MBSD structure with the USCG. The ATONs would be visually inspected each day and the operability recorded in the Daily Report and would be maintained for the duration of the Project.
- Whenever flow through the structure is started or stopped, on-site personnel shall notify the USCG via a Navigation Bulletin so that traffic is informed of the Project's operating condition.
- Before raising or lowering any gate at the entrance to the diversion channel, the operator should check the vicinity of the inflow, conveyance and outflow channels for boats, fishermen and swimmers and alert them to clear the area. Methods for these alerts may include horns, lights and/or audio messages.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the

---

EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63032**

**The requirement to maintain a sufficient picket boat during the construction and operation of the diversion structure to protect maritime commerce, transiting vessels and the diversion structure(s) must be included.**

**Response ID: 16644**

The commenter's concerns regarding the impacts of the Project on navigation safety in the Mississippi River were considered and addressed in the Draft EIS navigation section in Chapter 4, Section 4.21.4 Mississippi River. This section explains that during construction, the Project would have moderate, temporary, adverse impacts on the safety and efficiency of shallow-draft vessels transiting past the proposed Project site in the Mississippi River and intermittent but permanent, moderate, adverse, impacts on navigation safety and efficiency during operations. Since issuance of the Draft EIS, CPRA's 60-percent designs for the proposed Project have decreased the extent to which the Project's intake structure (including the temporary construction cofferdam) would extend into the Mississippi River during construction. The Final EIS has been updated to reflect this reduced impact on navigation safety and efficiency during construction. Therefore, the impact determination on navigation safety and efficiency during construction has been revised to "minor, temporary, and adverse impacts" in Chapter 4, Section 4.21.4.1.2.2 Traffic in the Navigation section of the Final EIS. Prior to any issuance of a permit for the Project by USACE, the USACE would coordinate with the U.S. Coast Guard to establish special permit conditions to address vessel safety in the Mississippi River during construction and operation of the proposed Project.

CPRA's Operational Plan for the proposed project states, "In the event diversion operations cause an unintended and severe impediment to navigation, as determined by the U.S. Coast Guard in consultation with CPRA, CPRA will coordinate with the U.S. Coast Guard and CEMVN and determine what, if any, changes in diversion operations are warranted to address the impediment" (see the EIS, Appendix F2 Preliminary Operations Plan).

---

Further, CPRA has proposed the following measures in its Final Mitigation and Stewardship Plan (Appendix R1) to address concerns about navigation impacts in the Mississippi River during Project construction. These measures have been forwarded to the U.S. Coast Guard for their review and input.

- CPRA would coordinate the location of Mississippi River Aids to Navigation (ATONS) associated with the MBSD structure with the USCG.
- Whenever flow through the structure is started or stopped, on-site personnel shall notify the USCG via a Navigation Bulletin so that traffic is informed of the Project's operating condition.
- Before raising or lowering any gate at the entrance to the diversion channel, the operator should check the vicinity of the inflow, conveyance and outflow channels for boats, fishermen and swimmers and alert them to clear the area. Methods for these alerts may include horns, lights and/or audio messages.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63407**

**The MBSD Project would cause sediment deposition in the ship channel and, unlike the West Bay Diversion, it is not in an area where the USACE performs channel maintenance dredging. Therefore, any shoaling in the channel and within the Wills Point Anchorage should be removed by the Applicant (the Coastal Protection and**

---

**Restoration Authority). Commenter requests that the USACE lead an effort to properly model the impact of the hydrology changes and shoaling in the vicinity of the proposed diversion structure before approving the permit application. According to recent surveys of the Pilottown Anchorage done by the USACE and CPRA, there are over 60 million cubic yards of material within the Pilottown Anchorage.**

**Response ID: 16450**

The issue raised by the commenter was considered in the Draft EIS in Chapter 4, Section 4.4.3 Hydrology and in Appendix Q1 Dredging Analysis, Section 5.1. With regard to the Wills Point Anchorage Area, about 6 miles above the proposed diversion, it is in the area of which paragraph 5.1 of the Draft EIS Appendix Q1 Navigation says, "... the models agree ... may experience negligible net erosion." Therefore, the USACE believes no deposition would occur and no further detailed modeling of that area is required. While increased deposition below the diversion is anticipated, HEC-6T modeling predicts that accumulation would primarily occur in the lateral bars. Because the navigation channel (above Venice) is naturally much deeper than navigation depth, any increased deposition within the channel would not threaten the authorized navigation depth and no dredging would be needed to maintain the navigation channel.

With regard to the channel below Venice, including the Pilottown Anchorage, paragraph 5.4 of the Draft EIS Appendix Q1 Navigation notes that the HEC-6T model, considered the most reliable of those applied to the Mississippi River above Head of Passes, showed a small decrease in channel dredging between Venice and Head of Passes for the first 44 years of the proposed Project with a small increase possible after that time. The AdH model showed that the presence of multiple upstream sediment diversions resulted in a net reduction in sediment deposition, and an upstream shift in the location of deposition in the vicinity of Head of Passes (similar to the No Action Alternative). The modeling indicated a risk of some additional deposition at or upstream of Venice, but did not indicate such a risk for the Pilottown Anchorage. These results are consistent with the 1D HEC-6T model results. The USACE considers these results for the channel to be applicable to the adjacent anchorages and channels. No additional modeling for this issue has been conducted for the Final EIS.

USACE acknowledges that the West Bay Diversion increased the amount of shoaling that was occurring in the Pilottown Anchorage. However, the applicability of the West Bay Diversion to the MBSD Project is limited since the West Bay Diversion was essentially adjacent to the dredged area instead of approximately 60 miles upstream.

---

**Concern ID: 63408**

**Additional ship modeling should be required because the ship simulation in the Draft EIS, Appendix Q was based on 15-percent design. The details and information should also be peer reviewed with navigation industry representatives and the USACE.**

**Response ID: 16449**

The USACE's independent team of reviewers reviewed the ship simulation in Appendix Q Navigation/Dredging Analysis and determined it is sufficient for USACE's evaluation of impacts for the EIS. CPRA's 60 percent designs for the proposed Project have decreased the extent to which the Project's intake structure (including the temporary construction cofferdam and the permanent protection cells) would extend into the Mississippi River. Therefore, although the simulation was based on 15 percent designs, those designs represent a worse-

---

case scenario of potential impacts on vessels transiting past the diversion when it is in operation. . No related revisions were made to the Final EIS.

---

**Correspondence ID:40551**

Coalition to Restore Coastal Louisiana

Kimberly Reyher

To the U.S. Army Corps of Engineers and the Louisiana Trustee Implementation Group:

The Coalition to Restore Coastal Louisiana (CRCL) appreciates the opportunity to comment on the Mid- Barataria Sediment Diversion Draft Environmental Impact Statement (MBSD DEIS). CRCL was established over thirty years ago, and in some of our first reports in the eighties<sup>1</sup>, we advocated for the construction of sediment diversions. These projects have been a cornerstone of restoration plans for decades. On behalf of our staff and board members, both past and present, we are very excited that this project is finally moving forward. It is truly a culmination of decades of advocacy.

This project will have many positive, long-term benefits for coastal communities, including increased storm surge protection from restored wetlands, job creation and regional economic impact during construction, and increased productivity of natural resources. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. We applaud the commitment of approximately \$300 million by the Federal Trustees and Louisiana's Coastal Protection and Restoration Authority to address impacts that could result from the construction and operations of the project.

Broadly speaking, we believe that the DEIS is very comprehensive, and it is clear how years of public meetings and scoping on behalf of CPRA was incorporated into the report. We support the preferred alternative in the DEIS and also support funding the project using Deepwater Horizon settlement funds as outlined in the LA TIG draft restoration plan.

With that being said, we do have some comments and issues that we encourage the Corps and the Louisiana Trustee Implementation Group to address before the final EIS is released.

We ask the following of the Army Corps and the Louisiana Trustee Implementation Group:

- Develop robust mitigation measures in close collaboration with affected populations: As has been made apparent during public meetings, although the DEIS has a large mitigation section, there have been many questions about mitigation from the general public, namely, which mitigation measures will be used and what community members can expect. We encourage CPRA and the TIG to work collaboratively and openly with affected community members during the development of project mitigation measures. We encourage the state to use local non- profits to facilitate any mitigation measures that are decided upon. Additionally, we think it is important that CPRA and the LA TIG continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. We also urge early action, as possible, before there is damage to mitigate.
- More in-person meetings: Although we understand the limitations that existed due to the COVID-19 public health crisis, public engagement was severely constricted during the public hearings for the DEIS, with many attendees on the virtual public meetings having difficulties giving comments verbally. When safe, we advise the Corps and the TIG to resume having public meetings in person.

1 Including in "No Time to Lose" and "Coastal Louisiana: Here Today, Gone Tomorrow?"  
Found at <https://www.crcl.org/policy-advocacy>

- Utilize scientifically-sound, community backed adaptive management plans: The DEIS has a section on adaptive management but more work will be needed to develop a plan when the project is constructed and implemented. Currently, all roles and responsibilities for project governance in the DEIS are proposed to be held by CPRA. We encourage the development of stakeholder groups which could advise CPRA on adaptive management of the project, to ensure that community members needs are being met.
- Ongoing, real-time monitoring: We encourage the DEIS to address creating ongoing, real-time monitoring in the diversion outfall area. Currently, little real-time monitoring exists in the bay but when the diversion is operational it will be very beneficial to see, in real time, how the bay is responding to the input of freshwater and sediment. Similar real-time monitoring regimes exist in other parts of the country, including in dam operations.
- Greater clarity regarding mitigating environmental justice concerns: Currently the DEIS has very specific plans with costs for mitigating for oyster and dolphin losses expected from the construction and operation of the diversion. However, there is less clarity regarding mitigation for environmental justice concerns expected from the construction of the diversion, especially regarding communities that may see increased flooding due to operation of the diversion. We encourage CPRA and the TIG to more clearly articulate how much funding will be available for mitigation for environmental justice concerns and how funding plans will be developed.
- Commitment to public engagement and involvement: CPRA should create a recreation and education area near the diversion with a viewing platform, trails, bike paths, along with a boat launch into the diversion outfall area. This would provide amenities for the communities near the structure, provide eco-tourism opportunities, and provide an opportunity for people to learn about coastal restoration and watch the growth of a delta over time. This area could also include educational materials such as signage to explain what the diversion is, how it operates, and what it is intended to do.
- Utilize recycled oyster shells for mitigation measures: the TIG proposes re-establishing public seed grounds and creating broodstock reefs as mitigation measures for the construction of the diversion. As much as possible, we urge CPRA to utilize recycled oyster shell to construct these reefs. Oyster shell is a renewable resource and provides valuable habitat for fisheries, as well as providing shoreline stabilization.
- Credit from the Corps: The DEIS projects that the project will have a potential negligible to minor beneficial impact on the NOV-NFL and WBV levee systems by reducing surge elevation and wave height. We encourage CPRA to request credit from the Corps when the project is built for providing protection and decreasing maintenance needs on these levee systems.
- Potential inconsistency of the proposed Plaquemines Liquids Terminal project (PLT) with MBSD: We remain concerned that the proposed PLT project could cause a decrease in effectiveness of the MBSD. We believe that a draft sediment study conducted for this proposed project indicates that operation of this project could drastically reduce the amount of available sediment available for MBSD. We oppose the location of the project to be sited adjacent to the MBSD.

We support the preferred alternative outlined in the draft Environmental Impact Statement and the expenditure of Deepwater Horizon settlement dollars to pay for the project's construction and associated mitigation and stewardship activities.

Thank you,

Kimberly Davis Reyher

---

**Concern ID: 61756**

**The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.**

**Response ID: 15891**

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive

---

management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61760**

**Public meetings for this proposed Project, which would drastically alter our estuary forever, should have been in-person since the State of Louisiana is in a modified stage 3 and public gatherings are allowed. Holding virtual public meetings for a project of this importance is unfair to the hundreds that do not have computer skills or accessibility. Commenter requests that USACE and TIG hold in-person meetings regarding the proposed Project.**

**Response ID: 15895**

USACE and the LA TIG held three joint public meetings for the Draft EIS and the LA TIG's Draft Restoration Plan in April 2021. These meetings were held virtually based on COVID-related restrictions in place at the time. Anyone interested in participating in the NEPA or OPA processes, or who wanted to learn more about the proposed MBSD Project and/or provide comments on the Draft EIS and/or the LA TIG's Draft Restoration Plan was able to participate in the meetings via an internet/web-based conferencing application or via toll-free

---

telephone line. Spanish, Vietnamese, and Khmer translators facilitated participation by non-English speakers; key messages from the meeting presentations were translated during the meetings, and the translators were available to interpret participant comments in any of those languages.

At the beginning of the public comment period, CEMVN posted several pre-recorded presentation videos consisting of an explanation of how to comment on the Draft EIS and/or Draft Restoration Plan, an update on the proposed MBSD Project design, information concerning the ongoing restoration planning efforts and the LA TIG's Draft Restoration Plan, and details about how to navigate and review the contents of the Draft EIS on CEMVN's Project webpage. These pre-recorded presentation videos were then consolidated and played at the beginning of each of the three public meetings. This consolidated pre-recorded presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage. In addition, dedicated toll-free numbers were provided during the public comment period on the Draft EIS and Draft Restoration Plan through which Spanish, Vietnamese, and Khmer-speaking individuals could listen to the translated pre-recorded presentation rather than watching the presentation on a computer.

Multiple ways to comment during the public review period were available including verbally during the virtual meetings, verbally by toll-free telephone number, written via the postal service, and electronically via email and on the comment portal website. In addition, CPRA offered opportunities through local non-profit organizations for the public to sit with representatives from local non-profit organizations who assisted the public in preparing comments regarding the Draft EIS and LA TIG's Draft Restoration Plan.

Printed copies of the Executive Summary of the Draft EIS and the LA TIG's Draft Restoration Plan in English, Spanish, and Vietnamese were provided to libraries and community centers/organizations (see list in Chapter 7 Public Involvement of the Final EIS and Chapter 6 of the LA TIG's Restoration Plan) for those able to visit those locations in person.

All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project. Any future public engagement meetings held regarding the proposed MBSD Project would follow applicable agency guidance for the safety of all participants.

---

**Concern ID: 61850**

**Commenters expressed concern that reasonably foreseeable industrial facilities like the Plaquemines Liquids Terminal and pipelines that may be built near the proposed MBSD Project structure or in the Barataria Basin would cause adverse impacts on the marsh ecosystem restored by the MBSD Project operations. One commenter expressed the opinion that industrial facilities that may be constructed near the proposed MBSD Project should be denied permit because they would be inconsistent with the objectives of the proposed MBSD Project.**

**Response ID: 16464**

The commenters' concern about the potential impact of future industrial development and activity on the habitat that would be created by the proposed Project was considered in Chapter 4, Sections 4.25.4 and 4.25.6 in the Cumulative Impacts section of the Draft EIS. These sections explain that reasonably foreseeable industrial facilities and infrastructure that

---

may be constructed in the proposed MBSD Project area are expected to have negligible impacts on proposed Project-area resources because the facilities would be required to adhere to permit conditions imposed by regulating agencies such as wetland mitigation, SWPPP, and SPCC plans in order to be constructed and operated.

Furthermore, CPRA entered into a Memorandum of Understanding with the Plaquemines Port Harbor & Terminal District (PPHTD) and the Plaquemines Liquid Terminal, LLC (PLT) requiring PPHTD and PLT to perform sediment transport modeling and a navigation study to determine the impact, if any, that the PLT Project may have on the proposed MBSD Project, and to agree to certain terms and conditions, as needed, to ensure that the PLT, once constructed and operated, does not have unreasonable adverse impacts on the design, construction, or operation of the proposed MBSD Project. These steps would help ensure that the PLT Project remains consistent with the Louisiana Coastal Master Plan.

Since publication of the Draft EIS, the Tallgrass/PLT facility's sponsors PPHTD/PLT have withdrawn their Joint Permit application (Louisiana Department of Natural Resources Coastal Use Permit [CUP] number P20180379 and DA Permit number MVN-2012-0123-EPP), and terminated the Memorandum of Understanding (MOU) (originally dated April 24, 2019) between CPRA and PPHTD/PLT pertaining to the facility. A footnote has been added in Section 4.25.1.3.2 Reasonably Foreseeable Future Projects of the Final EIS to reflect the withdrawal of the PLT Project.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA

---

intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62838**

**Near-term, long term, and real-time monitoring in the Barataria Basin will be essential to the operation of the diversion as well as to public communication about the performance, over space and time, of the diversion and its area of influence. Governance and decision making for the Project should be a science-based, inclusive, and transparent process with genuine engagement and input from external experts and community stakeholders.**

**Response ID: 16665**

According to the LA TIG, the monitoring issues raised by the commenter were considered in CPRA's Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS), which was jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan included input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]). In response to public comments, CPRA would develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

With specific regard to the inclusion of scientific expertise, in addition to the expertise within CPRA, the governance provisions of the MAM Plan call for establishing a Technical Focus Group/Peer Review Group with subject matter expertise to provide technical support on long-term Project planning, assist in the evaluation and interpretation of monitoring data, and evaluate the state of the science concerning adaptive management. See Section 2.2.2.3 (Technical Focus Group(s)/Peer Review) of the MAM Plan (Appendix R2 to the Final EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship,

---

monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62971**

**Commenter recommends CPRA use oyster shells for reef construction.**

**Response ID: 16537**

CPRA's oyster mitigation strategies recommend use of native materials, such as native oyster shell, where and when feasible. This is explained in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any

---

particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63185**

**Additional development of mitigation plans and accountability for mitigation commitments is needed.**

**Response ID: 16562**

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63203**

**Proposed Project will have a potential negligible to minor impact on levee systems and CPRA should request Corps credits for proposed Project.**

**Response ID: 16571**

---

The Project would have a negligible to minor beneficial impact on the NOV-NFL and WBV levee systems by reducing surge elevation and wave height to the north of created and maintained wetlands. The proposed Project would have a negligible to minor adverse impact on the NOV-NFL Levee system by increasing surge elevation to the south of the outfall. CPRA notified USACE in writing that work in-kind credit is not being pursued for MBSD; however, CPRA reserves the right to pursue work in-kind credit in the future. CPRA is not eligible for credit under Engineer Regulation 1165-2-208 and the existing NOV-NFL Project Partnership Agreement.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

**Concern ID: 63697**

**Commenters request that the EIS and Mitigation Plan include more details about planned EJ mitigation measures for diversion operations.**

**Response ID: 16507**

---

The Draft EIS considered impacts to low-income and minority communities due to Project operations in Chapter 4, Section 4.15.4 Operational Impacts in Environmental Justice.

In addition, since completion of the Draft EIS and the LA TIG's Draft Restoration Plan, CPRA engaged the communities potentially impacted by the Project, including low-income and minority community members, through public meetings to solicit input on CPRA's mitigation strategies. Further, CPRA engaged community-based organizations to assist in soliciting additional feedback from low-income and minority community members on the proposed mitigation measures. A summary of these public engagement meetings and other outreach efforts is provided in Chapter 7 of the Final EIS. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (see Appendix R1). This includes additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project. CPRA will continue to engage with potentially impacted EJ communities and organizations concerning the implementation of the mitigation measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:40552**

Karen Barron

To Whom it may Concern:

I am writing in support of the Mid-Barataria Basin Sediment Diversion. As a resident of New Orleans, I am all too aware of the effects of the erosion of the marshlands and know that this erosion is mostly caused by the levee system and the canals built for the oil companies to increase their efficiency. Diverting/returning Mississippi river sediment to the marshes makes so much sense that the plan overpowers the real concerns of the people who fear they will be adversely affected by the diversion. Alas, people have often been moved from their land for the greater good, and though not wanting to be harsh and cruel, I feel the greater good with its square miles of restoration is the diversion project. Please proceed with the Mid-Barataria Basin Sediment Diversion.

Thank you for your attention.

Sincerely yours,

Karen D Barron

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

### **Mid-Barataria Sediment Diversion – Comments**

Plaquemines Parish Government (Parish) has been an active participant in coastal restoration and hurricane protection initiatives affecting our Parish and region. As one of the hardest hit regions in U.S. by natural and man-made disasters, including but not limited to coastal erosion, subsidence, and sea-level rise, we are supportive of common-sense coastal restoration efforts throughout Louisiana. However, we must ensure that all proposed restoration projects do more good than harm to our residents, businesses, and communities.

As we have previously stated, we have valid concerns over the stated efficacy, size, location, and management of the Mid-Barataria Sediment Diversion and its potential negative impacts to crab, shrimp, oyster, and finfish fisheries, our seafood industry, generally, and our hurricane protection system. The true costs and benefits of this diversion's implementation and operations should be determined and all alternatives, such as dredging, should be considered. A specific plan, not a general one, with an emphasis on the many livelihoods at stake must be developed to address all of the project's potential negative effects.

As such, the Parish opposes the Draft Environmental Impact Statement until a clearer path forward can be identified. Furthermore, we submit the following comments:

#### Financial & Safety Impacts to Plaquemines Parish residents and businesses

- Diversions will drastically alter the productivity of commercial and recreational fisheries, causing significant job losses, undue hardships, and cost increases to people who have for generations made their living from fisheries in the Parish.

- Changes in fisheries will require changes to business operations – new/larger vessels, increased fuel costs, collapsed market, etc. – which will likely lead to loss of businesses, jobs, and revenues for our local economy.
- Parish communities that heavily rely on commercial and recreational fishing will be devastated.
- Persons whose jobs and livelihoods will be significantly impacted will require education and job training to transition to other trades guaranteeing sustainable future employment.
- As understood in the near term, diversions may cause additional land loss, especially within the vicinity of the proposed outfall. What is the State’s plan to compensate landowners for their property and use and enjoyment losses, as a result of diversion construction and operation?
- What will the impacts to the base flood elevations be for West Bank residents? If the base flood elevations are increased due to the additional water in Barataria Sound, how will this impact flood insurance rates, home elevation programs, and existing homes elevated in the past 10 years?
- What is the State’s plan to ensure the safety of inland marine traffic over the course of the project’s life? Assuming the project will work as intended, historic maritime canals, bayous, inlets, and other similar maritime channels will continually shoal in and change course. This plan should address the potential loss of access for homes, camps, and businesses due to the increased shoaling.
- In summary, what is the State’s plan to address economic impacts and safety concerns of affected populations, which may include job losses, business closures, loss/reduction in property values, etc. Sufficient funding must be set aside in advance to develop plans and programs that will mitigate/compensate impacted individuals, businesses, and communities.

#### Impacts to Fisheries - Altered Salinity, Turbidity, Hypoxia, Pollution, & Invasive Species

- Diversions will decrease salinity and increase turbidity in the Barataria Basin and Mississippi Delta estuaries, decreasing the commercial and recreational productivity of important finfish and shellfish species such as crab, oyster, white and brown shrimp, red drum, black drum, speckled trout, flounder, just to name a few.
- Diversions will further introduce nitrates, phosphates, and other pollutants, such as heavy metals, into the estuary, significantly increasing the likelihood of “dead” or oxygen deficient zones and potentially making fish and shellfish more harmful for public consumption.
- Diversions will further increase the likelihood of invasive species, such as the Asian carp and water hyacinths, into the estuary, increasing adverse effects to native aquatic species.

- In summary, how will the proposed diversion on Barataria Bay, Mississippi Delta, affect fisheries productivity? This analysis should include an assessment of the data from the Davis Pond.
- How will the proposed Diversion's operations plan take into consideration the collective direct and indirect impacts of the freshwater contributors to the Barataria Basins?

#### Rising Water Levels and Increased Storm Risks

- The proposed Diversion will likely increase the water levels on the basin side against the levee system by as much as 3-6 feet, thus decreasing the current system's protective benefits. This will cause severe and devastating impacts to protected sacred **Tribal lands**, and other communities located in the Barataria Basin.
- Higher water levels over extended periods of time would damage the levees through under-seepage, erosion, and saturation, thus increasing maintenance costs and the likelihood of levee failure.
- Increased artificial water levels that continuously inundate the surrounding marshes will further drive wildlife, especially feral hogs, onto the current levee system. These feral hogs create significant damage to the levee system, which will only be exacerbated. How will this be addressed?
- As understood in the near term, diversions may potentially cause land loss and then will create freshwater marshes that are highly susceptible to saltwater impacts due to storm surges, creating a further loss of a multiple line of natural defense and thus increasing future storm damage impacts.
- What will the impacts to the Parish's forced drainage pump stations on the West Bank be?
- What are the proposed operation and maintenance budgets for the project and supporting and impacted infrastructure to ensure structural integrity and navigation safety, and how will they be funded?

#### Diversion vs. Dredging Alternative

- As currently proposed, the alternatives to be considered for this project only include variations in diversion size - 35,000 cubic feet per second (cfs), 75,000 cfs (CPRA's preferred alternative), & 115,000 cfs - and a No-Action scenario. A dredging alternative must be included. References to previous studies that address this option are not sufficient and outdated.
- Dredging alternatives should address and be contrasted with diversions, which may in the near-term cause land loss, current modeling indicates that diversions do not show a net land gain until multiple years after the commencement of operations. Additionally, the

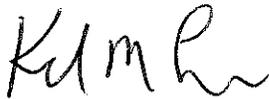

alteration of the system to a freshwater ecosystem is more susceptible to the impacts of storm surge.

#### Financial Impact to Plaquemines Parish Government

- Loss of tax revenue from potential job losses, business closures, and displaced residents and business will adversely impact Parish budgets and the Parish's ability to provide essential health and safety services to its residents.
- The Parish will be responsible for increased roadway maintenance during construction. Are alternative routes being considered for construction access? Or a grant to offset expected damages resulting from construction.
- The Parish will be partially responsible for increased workforce development, job training, education, social, and other support services to assist those adversely impacted. Does the State have a plan to assist the Parish in these efforts?
- With the above in mind, what will be the long-term Parish O&M and other responsibilities that will be born as a result of this project? And, by how much will the cost of the Parish's O&M responsibilities for levees and flood protection increase by?

We appreciate the opportunity to submit these comments for further consideration in the Mid-Barataria Sediment Diversion Draft EIS process and look forward to the development of a comprehensive and unbiased analysis for this proposed project.

Sincerely,

Kirk M. Lepine  
President  
Plaquemines Parish Government

---

**Concern ID: 61879**

**Commenters questioned why other alternatives are not being considered other than No Action and a sediment diversion with various levels of flow rates. CEQ's regulations require that the EIS rigorously explore and objectively evaluate all reasonable alternatives, which is a requirement that the Draft EIS does not meet. Consider analyzing a range of other alternatives, options, and tools that better preserve and protect the environment and minimize the severe impacts to Louisiana fisheries, the communities, and the entire Gulf Coast ecosystems.**

**Response ID: 15835**

The range of reasonable alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2 of the Draft EIS (Alternatives), an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in its SRP/EA #3 and found that a combination of “marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats” (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in its Restoration Plan. The LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG’s Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

---

**Concern ID: 61912**

**CPRA should consider alternative flow triggers, designs, and features in the operations plan and design of the proposed MBSD Project in order to minimize impacts. CPRA should also consider adjusting diversion design elements such as triggers, peak flows, volumes, and nutrient loads over the first years of operation to minimize impacts. These adjustments could minimize impacts to dolphins, oysters, brown shrimp, and other aquatic organisms. Some commenters suggested limits be imposed by USACE, others suggested an operating plan that is tied to specifics, while others emphasized flexibility tied to real-world experiences. CPRA should also consider alternative methods of operating the proposed MBSD Project, such as operating the diversion during winter when water levels in the basin are lower and can accept high volumes of water from the diversion.**

**Response ID: 15999**

The proposed MBSD Operations Plan can be found in Appendix F2 Preliminary Operations Plan of the Final EIS. As stated in the Chapter 4, Section 4.4.4.2.4 Sediment Transport in Chapter 4 Surface Water and Coastal Processes, sediment transported by the Mississippi River is primarily comprised of fine sediments, with higher river flows (typically occurring in the spring) suspending more coarse-grained sediment that are important in delta building (see Chapter 3, Section 3.4 Surface Water and Coastal Processes). Fine-sediment transport through the diversion would be generally proportional to water flow in the river. The intake channel was modeled and designed to divert a high sediment-to-water ratio while minimizing energy loss (to maintain flow and sediment transport through the diversion complex) and impacts on the river. The amount of sediment carried through the diversion would vary by year, depending on flow rates in the river and the corresponding variation of diversion operations. As explained in Chapter 2, Section 2.8.1.3 Project Operations in Action Alternatives Carried Forward for Detailed Analysis, the Mississippi River discharge of 450,000 cfs would be the standard operations “trigger to open the diversion for flow (above the base flow)”. Operations (with the exception of a base flow up to 5,000 cfs) would cease when the river discharge falls below 450,000 cfs or when certain emergency triggers are met (such as in advance of hurricanes or when a spill of hazardous substances occur in the river). When the Mississippi River flows exceed 450,000 cfs, the gates would be fully opened (above base flow). At river flows of 450,000 cfs, the diversion flow would be approximately 25,000 cfs, and

flows would increase proportionally as the river flow increases. This ramp would continue up to maximum diversion capacity flow of 75,000 cfs when the river reaches a flow of 1,000,000 cfs.

An alternative related to operational triggers specific to sediment concentration was considered but determined not to be technically feasible or reasonable because data and technology do not currently exist to support this operational regime (refer to the Eliminated Alternatives Matrix in Appendix D2 of the EIS). According to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS, as part of the adaptive management and monitoring process, CPRA would consider potential ways to optimize diversion operations based on Project performance and success and would assess potential operational changes that may minimize impacts to basin resources where practicable after sufficient operational data become available for analysis.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61919**

**Commenter requested information on the proposed annual operation and maintenance budgets for the proposed MBSD Project and how would they be funded.**

**Response ID: 16006**

If the proposed Project is permitted and funded, CPRA states that information on the proposed annual operation and maintenance budgets for MBSD Project will be provided to the public through CPRA's Annual Plan. Details on the state funding cycle, CPRA's request

---

for operations funding, and inclusion in CPRA's Annual Plan can be found in the CPRA's Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts

and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62010**

**Sediment transported by the diversion into the basin would cause the main waterways to have increased shoaling, become too shallow to pass through, and would require dredging in order to access personal properties. This plan should address the potential loss of access for homes, camps, and businesses due to the increased shoaling.**

**Response ID: 16208**

The impacts raised by the commenters were considered in the Draft EIS; therefore, no related edits have been made to the Final EIS. The EIS describes impacts on marine transportation and maintenance dredging in Chapter 4, 4.21 Navigation. This section also describes potential impacts on access due to delays when dredging. In addition, refer to Section 4.13 Socioeconomics for a discussion of socioeconomic impacts due to potential sedimentation in Barataria Basin navigation channels and canals. The proposed Project would have moderate, intermittent but permanent, adverse impacts on marine traffic efficiency and safety for shallow-draft vessels. The proposed Project would also cause minor to moderate, permanent, adverse impacts in dredging requirements for portions of the Mississippi River Navigation Channel and the birdfoot delta due to Project-induced changes to typical shoaling patterns and locations. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the proposed Project area during Project operations. In acknowledgement of commenters' concerns regarding sediment and shoaling impacting navigation, the Mitigation and Stewardship Plan in Appendix R1 in the Final EIS includes measures to mitigate impacts on navigation in the basin resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the

final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62014**

**The proposed MBSD Project would reduce tax revenue for the parishes located in the impacted area and the funds to support vital services in these areas.**

**Response ID: 16211**

The EIS considers and describes impacts on tax revenue in Chapter 4, Section 4.13.4 and 4.13.5 in Socioeconomics. There is also a discussion of Public Services and Utilities in this chapter (Section 4.13 Socioeconomics). As described, the proposed Project construction would have minor to moderate short-term benefits on sales and use taxes in local jurisdictions and the state associated with construction spending. Negligible to minor permanent adverse impacts on tax revenues from sales and use taxes, including associated with impacts on commercial fishing activities, as well as property tax collections associated with reduced property values are anticipated in Plaquemines Parish due to operation of the proposed Project. Potential adverse effects on utilities associated with reduced property taxes are also anticipated during the operations phase of the proposed Project.

---

**Concern ID: 62029**

**The EIS describes immediate, major, and permanent adverse impacts on several critical species in the Barataria Basin, including shrimp and oysters. The health of commercial fisheries and the socioeconomic well-being of coastal communities are closely intertwined. Such impacts would inflict economic harm on businesses, families, and individuals.**

**Response ID: 16225**

The issues raised by the commenters were considered in the Draft EIS. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted. The EIS also acknowledges the importance of commercial fisheries to the Louisiana economy and communities, as described by commenters. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the

proposed Project on the economy of Louisiana and Section 4.14 Commercial Fisheries describes impacts to commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts to shrimp and oyster fisheries in the proposed Project area are anticipated under the Applicant's Preferred Alternative. Changes in abundance may exacerbate trends of aging fishers leaving the industry and would have adverse impacts on the overall fishery. Adverse impacts may be partially offset by changes in fisher behavior. Additional details on the regional and community level economic impacts on commercial fisheries due to the proposed MBSD Project can be found in Section 4.14 Commercial Fisheries.

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as

conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62227**

**The diversion would flood access roads, damage vehicles, cause siltation/sludge, cause cancellation of flood insurance, inundate cemeteries, stress levees, impact provision of emergency services, and increase the cost to raise homes, slabs and wharves.**

**Response ID: 15820**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discusses the increased flooding impacts outside of federal levee systems, including road inundation and infrastructure damage, anticipated to be caused by the operation of the diversion. Sections 4.13.5.1.2.1 and 4.13.5.3.2.1 in Socioeconomics of the Final EIS has been updated to include potential impacts such as vehicle damage, accumulation of siltation and sludge, cemetery inundation and interruption of emergency services. Recognizing the potential for these impacts, CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits

---

prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Final EIS concludes that the proposed Project would not have impact on the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62283**

**The commenter questioned who would be responsible for maintaining/dredging the navigation channels in the areas impacted by proposed diversion operations.**

**Response ID: 16445**

---

As stated in the Draft EIS in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the Project area during Project operations. Other non-federal channels and facilities (for example, marinas, anchorages) near these channels would be expected to also experience increased sedimentation (see Section 4.21.5.2 in Navigation).

CPRA plans to mitigate the effects of the Project on boat access from Myrtle Grove and Woodpark to the basin as explained in Appendix R1 Mitigation & Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62301**

**The commenter asked what the impacts to the base flood elevations would be for Plaquemines Parish West Bank residents. The commenter also asked how such changes would impact flood insurance rates, home elevation programs, and existing homes elevated in the past 10 years.**

**Response ID: 15814**

Because both the existing level of drainage and federal flood risk reduction would be maintained, there would be no anticipated change to the FEMA FIRM designation or base flood elevations due to the construction of the diversion. Chapter 4, Section 4.13.5.3 Housing and Property Values in Socioeconomics has been revised in the Final EIS

---

to provide additional discussion of the provision of flood insurance and other programs due to MBSD impacts.

---

**Concern ID: 62302**

**The diversion would cause land loss, then create freshwater marshes which are more susceptible to saltwater impacts of storm surge and increasing future storm surge impacts.**

**Response ID: 15815**

Additional analysis regarding the potential impacts of conversion from saline marsh and brackish marsh to fresh and intermediate marsh and on susceptibility to hurricanes and saltwater inundation in the Project area during operations has been added to Chapter 4, Section 4.6.5.1 Wetland Types and Extent of the Final EIS.

---

**Concern ID: 62303**

**The commenter asked what the impacts to the Plaquemines Parish's forced drainage pump stations on the West Bank of the Mississippi River would be.**

**Response ID: 15819**

As described in Draft EIS Section 4.4.5 Stormwater Management and Drainage, impacts on stormwater management and drainage between the MR&T- Levee and NOV-NFL Levee would be negligible. The proposed conveyance channel would bisect the existing drainage area served by the Wilkinson Canal Pump Station. To address this, the proposed Project would connect the bisected area by a siphon routed beneath the proposed conveyance channel. To maintain siphon flow, water levels within drainage canals within this drainage area south of the proposed diversion, including Timber Canal, would need to be lowered through operation of the Wilkinson Canal Pump Station.

USACE will consider whether this alteration of the Wilkinson Canal Pump Station operations meet 33 U.S.C. Section 408 standards as part of its Section 408 evaluation.

---

**Concern ID: 62692**

**The proposed Project would introduce or facilitate the spread of invasive species (for example, carp, zebra mollusks, apple snails, Asian clams, water hyacinth, giant salvinia, hydrilla, nutria, northern snakehead) and freshwater pathogens to the basin, which could affect other living resources and impede navigation.**

**Response ID: 16074**

The commenter correctly notes the potential for the proposed Project to introduce or facilitate the spread of invasive species from the Mississippi River into the Barataria Basin and resulting from the alteration of existing habitat characteristics, which is consistent with discussions in the EIS in Chapter 3, Section 3.10.6 and Chapter 4, Section 4.10.4.6 in Aquatic Resources; Sections 3.6.3 and 4.6.5.2 in Wetland Resources and Waters of the U.S.; and Sections 3.9.4 and 4.9.4.2 in Terrestrial Wildlife and Habitat. The sections in Chapter 4 also identify how the introduction or spread of invasive species may negatively impact other living resources. The northern snakehead is not currently known to occur in Louisiana; however, if its presence is later identified in the Mississippi River, its introduction or spread via the proposed Project would result in similar impacts on the environment as those described in Section 4.10.4.6 Aquatic Invasive Species of the EIS. The potential introduction of pathogens (specifically, fecal coliform [not typically pathogenic, but an indicator for other

pathogenic bacteria] and Enterocci) is discussed in Section 4.5.5.8 Fecal Coliform; a discussion of fecal coliform has been added to Section 4.10.4.4.2.5 Dissolved Oxygen of the Final EIS. Section 4.10.4.6.2.1 Aquatic Invasive Species has also been supplemented to discuss potential threats to navigation in the Final EIS.

---

**Concern ID: 62708**

**The release of polluted river water into the Barataria Basin would create harmful algal blooms and/or large areas of low dissolved oxygen that could negatively affect aquatic fauna including mortality of adults and juveniles that may not be able to escape impacted areas.**

**Response ID: 16086**

As discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS, the input of nutrients from the Mississippi River is generally anticipated to be beneficial to the food web, although there is an acknowledged potential for harmful algal blooms. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and well-mixed by wind and tidal action, such that it is not typically prone to stratification that promotes hypoxic (dissolved oxygen of less than 2 to 3 mg/L) conditions. Further, as discussed in Section 4.10.4.4 in Aquatic Resources, the Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below 5 mg/L on an average monthly basis; therefore, although sporadic and limited areas of low dissolved oxygen may occur, mainly in the summer months, no large or prolonged periods/layers of low dissolved oxygen are projected by the Delft3D Basinwide Model, nor anticipated based on the Barataria Basin's identification as a largely well-mixed estuary. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to Project implementation has been added to Section 4.5.5.5.2 in Dissolved Oxygen of the Final EIS.

The Monitoring and Adaptive Management (MAM) Plan (Appendix R2), which has been updated for the Final EIS in response to public comments, includes CPRA's plan to implement a monitoring program for phytoplankton species composition, including harmful cyanobacterial/algal bloom species (and associated toxins) (see Sections 3.7.3.10 and 3.7.3.11 of Appendix R2 of the Final EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section

---

10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62773**

**The decreased salinity and increased turbidity in the proposed Project area would decrease the commercial and recreational productivity of important finfish and shellfish species, including crab, oyster, white and brown shrimp, red drum, black drum, speckled trout, and flounder.**

**Response ID: 16151**

Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS discusses the effects of decreased salinity and increased turbidity on select commercially and recreationally important species, where applicable. In light of the number of species present, these key species were chosen to use as representative species for impact analyses. These species were selected to cover a range of different feeding guilds, habitat usage, and life histories, and to describe how the individual effects of the proposed Project, as described in Section 4.10.4.4, could combine to cumulatively affect a given species. As summarized in Table 4.10-6, the proposed Project would be expected to decrease the abundance of oysters, brown shrimp, spotted trout, and southern flounder, but could result in increased abundance of blue crab, white shrimp, and red drum. Although black drum was not selected as a key species for evaluation in the EIS, its life history has similarities to that of the red drum and Atlantic croaker, and it is likely to experience a similar range of impacts (negligible impacts to moderate benefits) from operation of the proposed Project. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)

- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62774**

**The commenter questioned how the proposed diversion would affect fisheries productivity in the Project area and indicated that the analysis should include an assessment of the data from the Davis Pond.**

**Response ID: 16152**

Impacts of the diversion on aquatic species would vary by species and are discussed in Chapter 4, Sections 4.10.4.5 and 4.10.5.5 in Aquatic Resources and 4.14.4 in Commercial

---

Fisheries of the EIS. The Delft 3D Basinwide Model includes Davis Pond operations and the results capture how the Project operations are projected to affect Davis Pond operations. A summary of select natural and man-made diversions in southeastern Louisiana (including Davis Pond) has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and to describe their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement.

Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

---

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62895**

**Feral hogs significantly damage levee systems and the increased water levels surrounding marshes would drive them (and other wildlife) further onto the current levee system, exacerbating the damage. Commenter asked how the issue would be addressed.**

**Response ID: 16166**

As noted in Chapter 4, Section 4.9 in Terrestrial Wildlife and Habitat of the Draft EIS, while feral hogs are sometimes found in marsh habitat, they are more common in forested habitat. As described in Section 4.4 Surface Water and Coastal Processes, water level increases from the proposed Project are not expected in northern portions of the basin or within federal levee systems. As shown in Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S., Figure 3.6-1, and Section 3.18.2 Existing Land Use/Land Cover, Figure 3.18-1 forested lands/wetlands are located primarily in these areas. Therefore, increased water levels from the diversion are not expected to appreciably increase feral hog use of and damage to levees in the proposed Project area. Construction of the proposed Project would be expected to destroy and remove approximately 149 acres of forested lands (about 20 acres of which are forested wetlands) from within the Project construction footprint. Feral hogs using those forests would be displaced during construction and operation and would be expected to move to other areas. See Sections 4.9.3.2 and 4.9.4.2 of the Draft EIS. Section 4.9.4.2.3.2 Terrestrial Invasive Animals was updated for the Final EIS to discuss the potential for feral hogs to damage levees during periods of increased water levels.

---

**Concern ID: 62968**

**If operation of the diversion causes infill of various canals used to access surrounding communities, who will be responsible for dredging to maintain access? For example, if Wilkinson Canal is filled with silt then the canal cannot be used and waterfront property owners with boat lifts in Myrtle Grove will not be able to get out using their boats; the EIS does not require a remedy or provide a funded maintenance plan for this issue (including who would pay for dredging).**

**Response ID: 16642**

The impacts raised by the commenters were considered in the Draft EIS. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the Project area during Project operations.

In acknowledgement of commenters' concerns regarding maintenance of non-federal navigation channels and canals impacted by sedimentation of the proposed diversion, the Mitigation and Stewardship Plan includes measures to mitigate impacts on navigation resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

---

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63096**

**Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).**

**Response ID: 16699**

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove

---

compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently

contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63185**

**Additional development of mitigation plans and accountability for mitigation commitments is needed.**

**Response ID: 16562**

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63208**

**Additional information is needed on who will pay for the increased costs for flooding and levee protection that will be needed due to the Project.**

**Response ID: 16576**

---

The Draft EIS summarizes whether and the degree to which construction and operation of the Project would cause increases in water levels and corresponding inundation in Table 4.20-15 in Chapter 4, Section 4.20 Public Health and Safety. Further, a draft of CPRA's Mitigation and Stewardship Plan was issued with the Draft EIS (Appendix R1) and explained CPRA's mitigation and stewardship measures to address increases in water levels and inundation projected to result from Project operations. Between completion of the Draft EIS and publication of the Final EIS, CPRA expanded and refined those mitigation and stewardship measures based on input received on the Draft EIS and during direct community outreach (see Chapter 7 [Public Involvement] of the Final EIS). As explained in CPRA's Final Mitigation and Stewardship Plan issued with the Final EIS (Appendix R1), CPRA would allocate funding to address and avoid some adverse effects due to the projected increases in inundation, including construction of structural mitigation and stewardship measures such as improving bulkheads, elevating roads, and raising homes. Increases in tidal flooding are not projected to exceed existing levee protection, therefore, CPRA does not intend to raise levees or to construct new levees. CPRA also would use Project funds to acquire Project servitudes over certain properties projected to be affected by Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. For additional details regarding CPRA's mitigation and stewardship measures, see the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

If the LA TIG decides to fund the Project, that funding authorization would also include funding for mitigation and stewardship measures.

Structural measures contained in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under this DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulatory agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the

Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 64508**

**The proposed Project would introduce contamination that could potentially make fish and shellfish more harmful for public consumption.**

**Response ID: 15825**

Chapter 4, Sections 4.5.5.3 through 4.5.5.9 of the EIS discuss anticipated changes in chemical concentrations in the Barataria Basin due to the proposed Project. The general impacts of these chemical compounds/nutrients on aquatic resources are discussed in Section 4.10.4.4 General Impacts on Habitat and the Environment. Potential contaminants, including sulfate, atrazine, and fecal coliform were also modeled and discussed in Sections 4.5.5.7 Sulfate and 4.5.5.9 Atrazine. The Delft3D Basinwide Model projects that the proposed Project would result in beneficial decreases in sulfate and would have negligible impacts on atrazine levels and they are therefore not specifically discussed in Section 4.10. A discussion of fecal coliform has been added to Section 4.10.4.4.2.5 Dissolved Oxygen of the Final EIS; however, it is not harmful to fish and shellfish themselves. Chapter 4, Section 4.10.4.4 General Impacts on Habitat and the Environment has also been supplemented in the Final EIS to discuss the potential for bioaccumulation of river water contaminants in biota of the Barataria Basin.

Section 4.14.4.2.3 in Commercial Fisheries has been updated in the Final EIS to discuss the National Shellfish Sanitation Program and the Louisiana Department of Health's oversight of shellfish harvesting in order to prevent harvest of oysters that may contain unsuitable levels of fecal coliform or toxins harmful to human health. Additionally, Appendix R2 in the Final EIS includes CPRA's Monitoring and Adaptive Management (MAM) Plan that describes monthly fecal coliform monitoring (Section 3.7.5.1) and periodic sampling for Contaminants of Concern in fish, shellfish, and wildlife (Section 3.7.3.23).

Go FISH Coalition

Tracy Kuhns

Re: Comments Mid-Barataria Sediment Diversion Draft Environmental Impact Statement

These comments are submitted on behalf of Gulf Organized Fisheries In Solidarity and Hope, Inc (GO FISH) related to Mid-Barataria Sediment Diversion Draft Environmental Impact Statement. GO FISH is a non-profit coalition of Louisiana's leading commercial fishing advocacy organizations. The members include thousands of commercial fishermen from from and through the Louisiana Oystermen Association, Louisiana Shrimp Association, Louisiana United Crabbers Alliance, Association of Family Fishermen, United Commercial Fishermen, Louisiana Bayoukeeper and their partners. The members of these organizations are a diverse group of fishermen, including descendants of the Native Americans, African Americans, Asian Americans, Latin Americans, Cajun Americans and European Americans.

The citizens of Louisiana are culturally and economically tied to our state's bountiful seafood and people come to Louisiana, from all over the U.S. and the world, to share in our seafood and culture. While we fully support the utilization of NERDA fines to restore habitat, fisheries, marine life, wildlife, injured and/or destroyed in the Northern Gulf of Mexico, and particularly in the Barataria Basin, we have serious concerns as to the proposed Mid-Barataria Sediment Diversion Project ability to meet the legal and practical restoration requirements.

We are requesting an additional 90 day extension on the Mid-Barataria Sediment Diversion Draft Environmental Impact Statement comment period.

The release of the Mid-Barataria Sediment Diversion Draft Environmental Impact Statement in March 2021 came at a time when the most highly impacted individuals and small businesses, who live and work within the Barataria Basin outside the levee system; as well, as those individuals and small businesses reliant on their products and services, were facing losses from a fisheries disaster, Covid 19 impacts, and Income Tax Filing deadlines, and the opening of the brown shrimp season May 24, 2021 in Louisiana. A series of public meetings sponsored, in April, by the CPRA, presented the perspective of those supporting and promoting the Mid-Barataria Sediment Diversion Project and held at times difficult for ordinary working individuals to attend. When request have been made, in the past, to allow others to present opposing views, CPRA denied the requests. This individuals and small businesses, for the most part do not understand the legal and technical nature of the documentation included in the EIS and do not have Pro Bono or financial ability to hire legal or scientific experts. We would like to hold public meetings during the closed shrimp season between approximately July 1 and Mid to late August for the purpose in order to have speakers explain the EIS and allow participants to ask questions and submit verbal and/or written comments.

The following is a list of some of our concerns:

- The Mid-Barataria Sediment Diversion Project states its purpose is to restore injuries caused by the BP DWH oil spill. The Mid- Barataria Sediment Diversion Draft Environmental Impact Statement confirms this purpose can not be met and, in fact will cause further harm to habitat and resources NERDA fines were are intended to restore. Including, but not limited to, salt marsh, wildlife habitat, fisheries, fisheries food sources, and marine life food sources,

dolphins, turtles, brown shrimp and oysters. The opening of the Bonnie Carre Spillway in 2019 demonstrated exactly what the Mid-Barataria Sediment Diversion will do to dolphins, and other marine species; as well as, water quality. In addition, a recent letter from the Marine Mammal Commission states that the project would cause the Barataria Dolphin Pods to become extinct. The Marine Mammal Protection Act waiver granted to allow this project to circumvent compliance with the Marine Mammal Protection Act should be rescinded and the project should be forced to go through the entire permitting process.

- No real alternatives are evaluated in the Mid-Barataria Sediment Diversion Draft Environmental Impact Statement. Although a viable alternative project was submitted by Chris McLindon, the only alternatives clearly evaluated are simple different versions of the Mid-Barataria Sediment Diversions. Once again, the ruling saying the funds can only be used for diversions needs to be rescinded, as it violates the intent of NERDA and OPA.
- Socioeconomic Impacts are based on faulty data and need to be completely redone using data applicable to individuals and businesses which will be most highly impacted by failure to restore and further damage injured resources, which have been utilized for generations to support fishing families, recreational and charter fishing, wetland and wildlife tourism and all the related and extended businesses and occupations. The use of census data fails to accurately identify the % of individuals and businesses economically reliant on the Barataria Basin resources and does not reflect long term or more recent income levels of those directly involved in businesses or jobs related to the resources. In addition, while Lafitte, Barataria, and Crown point do identify as one community each community has a different zip code. Temporary jobs related to Mid-Barataria Sediment Diversion can not and will not replace multi-generation businesses and jobs related to the natural resources
- We would like additional time to submit more comprehensive comments and allow others to do the same.
- GO FISH member organizations and their members adamantly oppose the construction and implementation of the Mid- Barataria Sediment Diversion Project, as designed. Thank you for considering these comments.

Sincerely,

Tracy Kuhns, President

**Concern ID: 61879**

**Commenters questioned why other alternatives are not being considered other than No Action and a sediment diversion with various levels of flow rates. CEQ's regulations require that the EIS rigorously explore and objectively evaluate all reasonable alternatives, which is a requirement that the Draft EIS does not meet. Consider analyzing a range of other alternatives, options, and tools that better preserve and protect the environment and minimize the severe impacts to Louisiana fisheries, the communities, and the entire Gulf Coast ecosystems.**

**Response ID: 15835**

The range of reasonable alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As

described in Chapter 2 of the Draft EIS (Alternatives), an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in its SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in its Restoration Plan. The LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be

provided by the proposed MBSD Project. Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

---

**Concern ID: 62009**

**The negative socioeconomic consequences would devastate southeast Louisiana, destroy people's livelihoods, displace people living near the diversion, and destroy property in the areas impacted by the proposed MBSD Project.**

**Response ID: 16207**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana, including impacts on population, property values, and community cohesion. As noted in these sections, the proposed Project would have both beneficial and adverse socioeconomic impacts on the people and communities within the Project area. Minor to moderate, permanent adverse socioeconomic impacts are expected to occur near the immediate outfall area outside of flood protection. Minor to moderate, permanent, beneficial socioeconomic impacts are expected to occur in the west bank New Orleans area north of the diversion. Moderate to major, beneficial, temporary impacts from job creation and economic activity in the proposed Project area are anticipated. In addition, the Socioeconomics Technical Report in Appendix H1 provides additional details on these projected effects.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the DWH oil spill.

The commenters' concern regarding the potential impacts of the diversion were considered by CPRA and the LA TIG in developing the Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included mitigation to address and offset some of the projected impacts of the Project on fisheries and surrounding communities outside levee protection including providing structural mitigation and stewardship measures for increased water levels that are projected to result due to the Project, such as raising roads or improving bulkheads. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

In communities south of the Project site outside of federal levee protection where the proposed Project is projected to cause increased water levels, CPRA plans to take one of two approaches. In Myrtle Grove, CPRA is planning to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision. By improving this bulkhead, CPRA would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions without the Project. See Table 1 in the Final Mitigation and Stewardship Plan for

---

more details. CPRA plans to acquire a temporary right-of-way to permit improvement of the bulkhead, voluntarily or through eminent domain if necessary, from the property owners in the Myrtle Grove Marina Estates Subdivision.

In other communities south of the Project site outside of federal levee protection, from Woodpark south to the communities of Grand Bayou and Happy Jack, CPRA plans to elevate the portions of public roads outside of levee protection that provide access to each of these communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures

contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62028**

**Commenters suggest integrating more current data and information before the release of the Final EIS, including and especially the 2020 Census data. This data would show important population shifts to communities in Jefferson, Lafourche, and Plaquemines Parish, as well as the major metropolitan area of greater New Orleans. However, the use of census data may not accurately identify the individuals and businesses economically reliant on the Barataria Basin resources and does not reflect long-term or more recent income levels of those directly involved in businesses or jobs related to the resources.**

**Response ID: 16224**

The EIS uses a variety of data sources to best describe the regional economy and populations, including relatively recently released statistics from the U.S. Census Bureau American Community Survey (ACS), data from 2010 Decennial Census, as well as a variety of state and local sources. Initial data from the 2020 Decennial Census was released in fall 2021 for Congressional redistricting purposes, with the bulk of the remaining 2020 Decennial Census data projected to be released over the next few years. The Final EIS has been revised to update the 2010 Decennial Census data to 2020 Census data. This update provides the most recent population and demographic data available for the some of the very small communities described in the EIS. Data for particular industries that may be affected by the Project, such as commercial fishing, are presented using state sources or other local data as available.

---

**Concern ID: 62487**

**Several commenters requested additional time to submit comments on the LA TIG's Draft Restoration Plan and Draft EIS.**

**Response ID: 15768**

The public comment period for the LA TIG's Draft Restoration Plan and Draft EIS was originally 60 days (March 5, 2021 through May 4, 2021). On April 23, 2021, USACE and the LA TIG issued a special public notice, announcing a 30-day extension of the public comment periods. With this addition, the public comment period for both documents was 90 days (March 5, 2021 through June 3, 2021).

---

**Concern ID: 62502**

---

**The Marine Mammal Protection Act waiver granted to allow this Project to circumvent compliance with the Marine Mammal Protection Act should be rescinded and the Project should be forced to go through the entire permitting process.**

**Response ID: 15968**

The Bipartisan Budget Act of 2018, Public Law 115-123, included a requirement that the Secretary of Commerce (as delegated to the Assistant Administrator of the NMFS) “shall issue a waiver of (MMPA prohibitions and requirements)” for three projects, including the proposed MBSD Project. In accordance with this Congressional directive, NMFS issued the waiver on March 15, 2018. As directed by Congress, the waiver operates “for the duration of the construction, operation, or maintenance of the . . . projects.” Congress would need to act to allow rescission of the waiver. More information on the waiver can be found at <https://www.fisheries.noaa.gov/action/marine-mammal-protection-act-waiver-select-louisiana-coastal-master-plan-projects>. The MMPA waiver does not alter USACE’s or the LA TIG’s NEPA responsibility to evaluate anticipated impacts of the proposed Project on marine mammals. The EIS analyzes and discloses the environmental and economic impacts of the proposed Project, including anticipated effects on marine mammals (see Chapter 4, Section 4.11 Marine Mammals). The NEPA process was not abbreviated to expedite review. All steps in the NEPA process have been followed to allow for public participation and transparency, including scoping, public review and comment periods.

---

**Concern ID: 62666**

**It would be inappropriate, and contrary to the stated purpose of restoring injured resources, to use DWH settlement funds to implement a project that would harm the same wildlife (for example, shrimp, oysters, bottlenose dolphins, *Spartina alterniflora*) and ecological services that were negatively affected by the oil spill.**

**Response ID: 16625**

USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore the damage caused by the DWH oil spill. USACE’s involvement with the proposed Project is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under the CWA Section 404 and RHA Sections 10 and 14 (33 USC Section 408). USACE is not executing any DWH restoration actions under the OPA. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH spill in the Louisiana Restoration Area. As explained in the Final EIS, Appendix B2 DEIS Public Review and Public Meetings, Section 2.0 Agency Roles in the Responses to Public Comments, response content pertaining to the LA TIG’s Draft Restoration Plan, the OPA and/or NRDA processes or other Trustee Planning was developed by the LA TIG and states only the LA TIG’s views.

In the Restoration Plan, the LA TIG explained that the DWH oil spill resulted in the oiling of more than 1,100 kilometers of wetlands, nearly all of which were located in coastal Louisiana (DWH NRDA Trustees, 2016). The heaviest oiling occurred in the Barataria Basin, resulting in substantial injuries to natural resources in the basin (DWH NRDA Trustees, 2016). Recognizing that the resulting loss of marsh productivity affected resources throughout the northern Gulf of Mexico ecosystem, the State of Louisiana and the federal Trustees that

---

negotiated the DWH Natural Resource Damages settlement allocated \$4 billion, almost half of the total settlement amount, to restoring Louisiana's wetland, coastal, and nearshore habitats.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree of collateral injuries, to natural resources injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the LA TIG's Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, as noted in the LA TIG's Restoration Plan, without the proposed Project, sea-level rise, subsidence, and other existing stressors would result in additional marsh loss over time reducing the suitability of habitat for many of the same species.

The LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing a deltaic process, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Final Restoration Plan because the LA TIG believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the NRDA Trustee's Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

In its Strategic Restoration Plan for Barataria Basin (2018), the LA TIG evaluated the potential and extent of collateral injury for a range of restoration techniques. Unfortunately, almost all large-scale restoration comes with some potential for collateral injury. The LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54. In the Restoration Plan, the LA TIG strives to identify an alternative that would provide what it considers the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. Again, see Section 3.2.4 of the Restoration Plan for a discussion of how the LA TIG came to its decision.

In recognition of the potential for collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA will implement a suite of stewardship measures (see Section 3.2.1.1.5 [Associated Stewardship Measures] of the

Restoration Plan and Appendix R1 to the EIS). The LA TIG is also committed through these measures to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:40555**

LA Crab, Shrimp, Oyster Task Force

Mitch Jurisich

Dear Mr. LaBorde:

On behalf of the Louisiana Crab Task Force, Louisiana Shrimp Task Force and Louisiana Oyster Task Force please accept our joint comments regarding the above referenced Mid-Barataria Sediment Diversion draft EIS.

Note please that these three organizations, established by the State of Louisiana to represent the interests of our respective seafood industry segments, strongly and unambiguously stand in opposition to approval of the referenced draft EIS and to the Mid-Barataria Diversion Project as scoped and proposed.

Our reasons for such strong opposition are well documented and based on our long and deep history and knowledge of Louisiana's commercial fisheries, as well as our experienced understanding of the harsh and overwhelmingly negative impacts this \$2 billion project will have on both the economy and ecology of southeast Louisiana.

Representatives of our industries stand ready to answer any questions you may have in this regard or to provide additional detail as requested. Thank you in advance for your consideration or our points of view on this important topic.

Sincerely, Mitch Jurisich,

Chair, Joint Fisheries Task Force, State of Louisiana

Louisiana's Commercial Fishing Community Stands United Against Mid-Barataria Freshwater Diversion

Over the past many months, the Coastal Protection and Restoration Authority (CPRA) has launched a vigorous and well-funded campaign to convince Louisiana residents, media and policy makers that its Mid Barataria Diversion Plan is the sure shot solution to solving our state's land loss problems. They have even gone so far as to put lipstick on this pig, re-branding the nearly \$2 billion project as a

"sediment" diversion to disguise what it really is: a freshwater diversion of polluted river water that just happens to contain very limited amounts of sediment.

As representatives of Louisiana's commercial fisheries organizations, stewards of these valuable but limited resources for generations and employers of many of the thousands people who harvest, process and ship America's best seafood, we remain unconvinced. Put another way: We know better. And we stand united in opposition to this ill-conceived and counterproductive project that will do little to rebuild our coast but much to destroy our fisheries, our fisheries economy and our way of life.

Joining us in our strong opposition to this freshwater flood are the Parish Councils for Plaquemines, St. Bernard and St. Tammany, all of which know the demonstrated risks that come with such large-scale freshwater diversions. These Councilmembers know what we know - that better options exist and that this project will create more misery than land. They know that this project is a job killer for many residents of southeast Louisiana and a dagger for local economies. That is why these three councils voted so strongly in opposition to this latest freshwater flood.

From almost any rational point of view, the Mid Barataria Freshwater Diversion makes no sense.

First, this project touts its ability to build a new river delta where one has never existed. That is not

coastal "restoration". Second, even the Corps of Engineers' Draft Environmental Impact Statement (EIS) acknowledges (but downplays) the fact that freshwater flooding disrupts the ecology and renewable resources such as seafood. As the EIS does make clear, it will take decades (if ever) for our oyster, crab, shrimp and shellfish resources to recover from the negative impacts of freshwater intrusion even if those persons who make their livings on the water never do.

The people who live and work in the potentially impacted area simply don't have decades to cool their heels while waiting for the resource to recover from an economic and ecological tsunami of unimaginable proportions. Third, while the dispersion of sandy river sediment through diversions will deceptively impact the optics, making the basin look green and lush due to a disproportionate nutrient influx from freshwater, in reality, because of poor root growth and low soil strength, the addition will do nothing more than provide very low-quality storm protection.

Lest anyone actually believe the environmental and marine life impacts will be minimal and of limited consequence and duration, consider the recently revealed state report that indicates that bottlenose dolphins would become "functionally extinct" in two of four areas of Barataria Bay, and the number of dolphins will drop dramatically in the rest of the bay, within 10 years of the start of operations of the proposed project. Put another way, a project trumpeted by many as the most reliable way to save the coastal environment, will actually serve to help decimate the marine mammals that live there. And this is helpful how?

Lastly, and of critical importance to every taxpayer, this freshwater diversion project is a colossal waste of money. The draft EIS clearly states that the Barataria Basin will create an estimated 85,500 acres of wetlands by 2070 with the diversion yet with no action, the basin will still gain an additional 72,800 acres. At a sticker shock price of nearly \$2 billion that means this project will cost more than \$150,000 per acre to generate a mere 12,700 acres of new marshland over an extended 50-year period.

And although proponents of this project are quick to say that technically speaking, tax dollars aren't being used to plan and implement it, that statement belies the fact that that same money could in fact be better used to undertake projects that actually do more good than harm and by being of better value to the people of Louisiana.

To be clear, we, and our colleagues, friends and neighbors support responsible and well-designed projects that will save our coast and reduce land loss. Those projects include sediment dredging which has routinely and effectively been used all over coastal Louisiana with impressive results and without wrecking coastal economies, the lives of coastal residents or decimating an entire community of marine mammals.

As if all these negative impacts aren't enough, consider the deep economic impact a lack of seafood availability will have on our restaurants, on tourists who come to Louisiana in part to enjoy our bountiful seafood fresh from our coastal waters, on local residents who will

undoubtedly pay far more to feed their families on our shrimp, crab, oysters and finfish than ever before, and on Louisiana's reputation as America's seafood market of choice.

As representatives of our state's crab, shrimp, and oyster industries, and employers of thousands of south Louisianians who may well lose their jobs in the diversion's flood waters, and who may not qualify for the kind of jobs CPRA claims will be created by the project, we urge the people, media and policy makers of Louisiana to join us in saying "no" to this massive, expensive and poorly designed project. Instead Louisiana should be exploring more viable and less intrusive options such as dredging, which has already been proven to reduce land loss and rebuild suitable habitat that protects our coast and coastal residents, and green tree reservoirs surrounded by levees which will have immediate storm protection without having the wait the estimated 50-years touted by CPRA's diversion plan.

In summary, those who know best - those who live in, work in and govern the communities that will be dramatically and irreparably impacted by this massive freshwater flood - urge CPRA and the Corps of Engineers to listen closely to our experienced voices, step back from the abyss they are pushing us toward, and thoughtfully and objectively review other alternatives that will actually do more good than harm.

Mitch Jurisich

**Concern ID: 61782**

**Commenters expressed concern that there's not enough sediment in the river to achieve wetland and land creation goals of the proposed Project.**

**Response ID: 16412**

The commenter's concerns regarding the sediment load of the river and whether the river carries sufficient sediment to achieve the land projected to be built during diversion operation were considered in the Draft EIS. The Mississippi River carries much less sediment than it did in the past. It still carries a massive sediment load, but not as massive as before. As explained in Chapter 3, Section 3.4.2.5 Sediment Transport, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes. Quantifying the relative contributions of multiple factors to the diminished sediment load is beyond the scope of the Draft EIS. The Draft EIS (Appendix E Delft3D Modeling, Delft3D Modeling Section 5.2.2) takes this diminished sediment load into account when computing the sediment that would be delivered to the Barataria Basin. To help clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations, discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

**Concern ID: 61852**

**The cost per acre of marsh creation by the diversion is far higher than a corresponding alternative of marsh creation through the use of dredged material. Marsh creation**

---

**through a diversion takes 50 years unlike marsh creation through dredging. In addition, brackish/salt marshes (which would be created by dredging) are more resilient than freshwater marshes, and thus marsh created through dredging would be a more sound investment of restoration funding than a sediment diversion.**

**Response ID: 16617**

The timing of marsh benefits created by the proposed diversion was considered in the Draft EIS in Chapter 4, Section 4.6.5 Wetland Resources, Operational Impacts. In response to these comments, additional detail has been added regarding the resiliency of fresh marsh compared to brackish marsh in the Final EIS, Sections 4.6.5.1.2.3 Soil Shear Strength and 4.6.5.1.2.4 Land Accretion. Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

While the commenters suggest that marsh creation through dredging would cost less than the proposed Project, the LA TIG does not believe that comparing the costs of a sediment diversion to marsh creation projects using dredged material is relevant for several reasons. Most importantly, as explained in the LA TIG's Restoration Plan, the goal of the Project is to create a long-term sustainable ecosystem through the reestablishment of deltaic process. Marsh creation through the use of dredged material would not bring fresh water or nutrients to the basin on an ongoing basis. The benefits of marsh created with dredged material would diminish over time without maintenance in the form of additional pumping events due to subsidence and sea-level rise; thus, the temporal nature of Project benefits in the absence of periodic maintenance would also be very different. The costs and benefits of the Project were fully considered by the LA TIG and are discussed in the Draft Restoration Plan in Section 3.2.1.2 Cost to Carry Out the Alternative.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern

---

Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62029**

**The EIS describes immediate, major, and permanent adverse impacts on several critical species in the Barataria Basin, including shrimp and oysters. The health of commercial fisheries and the socioeconomic well-being of coastal communities are**

---

**closely intertwined. Such impacts would inflict economic harm on businesses, families, and individuals.**

**Response ID: 16225**

The issues raised by the commenters were considered in the Draft EIS. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted. The EIS also acknowledges the importance of commercial fisheries to the Louisiana economy and communities, as described by commenters. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana and Section 4.14 Commercial Fisheries describes impacts to commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts to shrimp and oyster fisheries in the proposed Project area are anticipated under the Applicant's Preferred Alternative. Changes in abundance may exacerbate trends of aging fishers leaving the industry and would have adverse impacts on the overall fishery. Adverse impacts may be partially offset by changes in fisher behavior. Additional details on the regional and community level economic impacts on commercial fisheries due to the proposed MBSD Project can be found in Section 4.14 Commercial Fisheries.

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without

implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62078**

**The proposed MBSD Project would cause the loss of Louisiana shrimp, oyster, crab and finfish production which would impact the seafood based supply chain of southern Louisiana, including corresponding impacts on restaurants in New Orleans and southern Louisiana.**

**Response ID: 16243**

The impacts raised by the commenters were considered in the Draft EIS. The EIS acknowledges in Chapter 3, Section 3.14.7 in Commercial Fisheries that the seafood industry represents a major source of jobs and income in Louisiana, which includes commercial harvesters, seafood processors and dealers, seafood wholesalers and distributors, and retail sales. Chapter 4, Section 4.14 Commercial Fisheries discusses regional economic impacts and community impacts on the shrimp, oyster, crab, and finfish fisheries, noting that communities with a high reliance on these landings may be most heavily impacted, and that indirect effects may include impacts to fish license holders, crew, dealers, suppliers, and seafood processors. While availability of shrimp and oysters from the basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's Preferred Alternative than under the No Action Alternative. This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS

---

(Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62173**

**This Project touts its ability to build a new river delta where one has never existed. That is not coastal "restoration."**

**Response ID: 16407**

The issues raised by the commenter were considered in the Draft EIS. As shown in Figure 3.2-1 in Chapter 3, Section 3.2 Geology and Soils, much of the Barataria Basin was wetland and terrestrial habitat in the past. Historically, Mississippi River overbank flooding deposited sediment, fresh water, and nutrients into the Barataria Basin during annual flooding cycles, nourishing and sustaining wetland habitats. The EIS Chapter 1, Section 1.2.1 History of the Barataria Basin describes this historic process. To clarify this, discussions of the delta cycle in the Project area have been added to the Final EIS in Chapter 3, Sections 3.1.4.2 Barataria Basin and 3.2.1.1 Historical Context. Additional discussion related to the Project's impacts on geomorphology and historic deltaic landforms has been added to Chapter 4, Section 4.2.3.2.2.3 Geomorphology of the Final EIS.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement.

---

Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62792**

---

**CPRA is using soundbites and marketing to convince the Louisiana public and legislature to allow them to dole out contracts for over \$2 billion in limited coastal restoration dollars on these projects. In reality, Barataria Bay is already connected to the river with existing diversions at Davis Pond, West Pointe á la Hache, and Naomi.**

**Response ID: 16373**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, the Draft EIS assesses the environmental and socioeconomic impacts of the proposed Project. To the extent construction spending would serve as an economic driver, those anticipated impacts are discussed in Chapter 4, Section 4.13.4.2 Economy, Employment, Business, and Industrial Activity. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Delft3D Basinwide Model, which was used in developing the proposed MBSD Project EIS, accounts for the existing diversions at Davis Pond, West Pointe a la Hache, and Naomi (see Appendix E [Delft3D Modeling], Section 5.1.1 of the EIS).

The USACE is neither a proponent nor an opponent of the proposed Project. It will make its decisions regarding the proposed Project based on the evaluations in the EIS and considering public comments and its determinations with respect to the public interest review, compliance with the CWA Section 404(b)(1) guidelines, compliance with other laws and Executive Orders, whether the Project would affect the ability of Corps projects to meet their authorized purposes and whether the project is injurious to the public interest. USACE's decisions will not be based in any respect on CPRA's public communications regarding the proposed Project.

---

**Concern ID: 63015**

**There are misrepresentations in the EIS about how nutrients in the river would spread out far from the sand deposition area to lower plant biomass belowground. Increasing nutrient loads from diversions would weaken soils, not strengthen soils.**

**The modern Mississippi River has nutrient concentrations that are much higher than when the mostly organic soils were created centuries ago (Turner et al. 2007) and may weaken soils by 30 percent, resulting in less belowground biomass, and change vegetation from being comprised of perennials to annuals (Turner et al. 2011). Increased flooding inundation, which is a consequence of river diversions, also weakens the belowground biomass of wetland plants (Morris et al. 2017) that may erode during high water events or from hurricanes (Kearney et al. 2011, Howes et al. 2010). Individual roots become weaker when exposed to ambient levels of nutrients found in the river (Hollis and Turner 2019a, b; Hollis and Turner 2021). The soil becomes degraded, accumulates less biomass, and decomposes and erodes faster (Swarzenski et al. 2008, Hebert et al. 2020). The diversion of river water into the nearby marshes would almost certainly weaken soils, making them less resistant to wave energy and hurricanes. A striking example is the net loss of wetlands in the Davis**

---

Pond Diversion where increased land loss occurred beginning the year after the diversion opened (Turner et al. 2019). This is an area that has no significant sediment input.

The literature cited by the commenters has been reviewed, including Turner et al. 2007, Turner et al. 2011, Morris et al. 2017, Kearney et al. 2011, Howes et al. 2010, Hollis and Turner 2019, Swarzenski et al. 2008, Hebert et al. 2020, Turner et al. 2019, and Mo et al. 2020, and Chapter 4, Section 4.6.5.1.2 Applicant's Preferred Alternative of the Final EIS has been revised to include additional analysis regarding the impact of nutrient input from the proposed Project on vegetation communities and soil shear strength.

---

**Concern ID: 63070**

**A recent study suggests that the proposed Project would not only prevent the recovery of the BBES Stock, but it would result in the functional extinction of dolphins in the West, Central, and Southeast strata of the stock area (Thomas et al., 2021). The only dolphins remaining in the basin would live adjacent to the barrier islands, and even this group would become severely reduced over the 50-year planning horizon of the proposed Project. Additionally, an expert elicitation (Booth and Thomas, 2021) building on previous studies (Garrison et al., 2020; Schwacke et al., 2017; Thomas et al., 2021) suggests that while dolphins can endure some periods of exposure to low salinity, the period of tolerable exposure shortens for dolphins exposed to acute changes in salinity, and the median time to death is 22 days with continuous exposure to water with salinity levels below 5 ppt.**

**Booth, C., and L. Thomas. 2021. An expert elicitation of the effects of low-salinity water exposure on bottlenose dolphins. *Oceans* 2(1):179-192.**

**Garrison, L.P, J. Litz, and C. Sinclair. 2020. Predicting the effects of low salinity associated with the Mid-Barataria Sediment Diversion Project on resident common bottlenose dolphins (*Tursiops truncatus*) in Barataria Bay, Louisiana. **Thomas, L., Marques, T., Booth, C., Takeshita, R., and L. Schwacke. 2021. Predicted population consequences of low salinity associated with the proposed Mid-Barataria Sediment Diversion Project on bottlenose dolphins in the Barataria Bay Estuarine System Stock.**

**Response ID: 16593**

The Draft EIS included an analysis of the impacts to marine mammals, including BBES dolphins in Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock. This analysis incorporated the Booth and Thomas (2021), Garrison et al. (2020), and Schwacke et al. (2017) studies, and the Final EIS includes additional analyses that were completed by Thomas et al. (2021) after the Draft EIS was released for public comment. The impact conclusions in the Draft EIS were based in large part on Garrison et al. (2020), which predicts that only a remnant population of dolphins would continue to exist in Barataria Basin after diversion operations commenced. The conclusion of major, permanent, adverse impact to bottlenose dolphins is also supported by Thomas et al. (2021), which built on these earlier studies and concludes that, after 1 year of operation of the Applicant's Preferred Alternative, there would be 61 percent fewer dolphins in the Central stratum than under the No Action

Alternative, 35 percent fewer in the West stratum, 12 percent fewer in the Southeast stratum, and 2 percent fewer in the Island stratum, with 25 percent fewer overall. Thomas, et al. further concluded that after 10 years of operation, there would be 100 percent reduction in the populations of dolphins in the Central and West strata, an 82 percent reduction in the population of the Southeast stratum dolphins, and a 34 percent reduction in the population of the Island stratum dolphins as compared against the No Action Alternative, with an overall difference in population of 78 percent. (Note that Thomas, et al. 2022 slightly refined some of these projections.) After 50 years of operation, in three out of the four strata, dolphins are predicted to be functionally extinct (defined as less than or equal to dolphin in Thomas, et al. 2022) under the Applicant's Preferred Alternative, with the remaining Island stratum being 85 percent lower [95 percent CI -28 -- -99] under the Applicant's Preferred Alternative than under the No Action Alternative. Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the Applicant's Preferred Alternative is projected to be 143 dolphins (95 percent CI 11-706) compared to a predicted 3,363 dolphins (95 percent CI 2,831-4,289) predicted to inhabit the Barataria Bay under the No Action Alternative. In other words, the BBES dolphin stock is projected to be 96 percent smaller (95 percent CI -80 -- -100) under the Applicant's Preferred Alternative than then No Action Alternative. Chapter 4, Section 4.11 Marine Mammals of the Final EIS has been updated to reflect the results of Thomas et al. (2021).

Booth and Thomas (2021) evaluated multiple scenarios with different salinity changes, and in one of those scenarios' where bottlenose dolphins experience a change in salinity within 0 to 5 days from typical salinity environment (that is, mean 15 to 25 ppt) down to an atypical environment with salinity below 5 ppt for an extended period, the median time to death would be 22 days.

Re: Mid-Barataria Sediment Diversion EIS

Dear Mr. Brad Laborde:

On behalf of the Louisiana Oyster Task Force, I am pleased to formally submit our response to and comments on the Mid-Barataria Sediment Diversion draft Environmental Impact Statement (EIS) for the record.

After careful review of the draft EIS, we continue to hold strong reservations as to the “purpose and need” of the MBSD to rebuild our coast at the expense of our fisheries and essential fish habitat, our industry’s jobs and our coastal heritage and way of life. We believe this EIS as currently scoped, and CPRA’s proposed plan of action is incompatible with both a healthy environment and a healthy economy for southeast Louisiana. Over the years, we have pleaded for alternatives to be considered that would lessen the impact on our fisheries and communities, and yet, all six alternatives considered by CPRA involve mass amounts of freshwater to overflow into Barataria Basin. CPRA has not looked at a single alternative – dredge projects, small diversions, or other – that would limit the destruction to the estuary within. Thus, in our view, they have failed the people of Louisiana and that failure is written large throughout the draft EIS.

The irreversible impacts outlined within this response and the draft EIS itself cannot be overstated. Louisiana’s oyster industry has been a major fishery for over 150 years, providing for almost 4,000 direct jobs with an economic impact of \$317 million annually. Altogether, Louisiana’s commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually.

It should be no surprise that joining us in our strong opposition to this freshwater flood are Louisiana's Shrimp and Crab Task Forces, the Parish Councils for Plaquemines, St. Bernard and St. Tammany, and Louisiana Lieutenant Governor Billy Nungesser, all of whom know the demonstrated risks that come with such large-scale freshwater diversions.

It will cost the state billions in damages over 50 years compared to the erroneous and insultingly low \$300 million in mitigation money suggested by CPRA. We implore the Army Corps of Engineers to consider the complete cost of the negative impacts as part of the total cost of the project before allowing this plan to advance.

Within the first five years, the impacted area will lose much of our salt and brackish water marine life including dolphins in exchange for the chance we *might* build land by 2070. If the real concern is protecting our coast, then we need to make an impact immediately. We need to build land now, not maybe build land in 50 years.

As stewards of the coast, we believe deeply in protecting and restoring our coastline, however, not at the expense of our most valuable natural resources. The Louisiana Oyster Task Force and our colleagues who shrimp, crab and fish for a living believe we can rebuild the coast without sacrificing the diversity of our estuaries and destroying current fish and wildlife habitat.

We are grateful to the scientists and academics devoted to protecting Louisiana's coast, but with all respect, science gets you so far. At some point, we have to look at real life experience and listen to the experts that have been protecting our estuaries for generations.

Sincerely,

Mitch Jurisich, Chairman  
Louisiana Oyster Task Force

## **SUMMARY OF THE LOUISIANA OYSTER TASK FORCE'S OBJECTIONS TO USACE DRAFT EIS FOR THE MID-BARATARIA DIVERSION PROJECT**

- Louisiana's oystermen and women have been champions of protecting and restoring our damaged coastal environment for decades. As representatives of the more than 4,000 residents who rely directly on oyster harvesting and processing for their livelihoods, we are active and vocal advocates for policies and projects that work responsibly toward saving our coastal communities. Investing our own funds and resources through building cultch and coastal water bottoms more than demonstrates our commitment to a common goal we can share with CPRA and others.
- The Mid Barataria Diversion Project defies its own Purpose and Need by intending to use funds obtained and earmarked for damages incurred by the 2010 Deepwater Horizon oil spill for purposes that have nothing to do with mitigating damages caused by the spill. There is no claim, legitimate or inferred, that the DWH spill has played any role in coastal land loss. As such, it is our strongly held contention that these funds will be misappropriated if applied to the MBSD project.
- This project has been purposefully and deceptively mis-named by CPRA to deceive the public: As a project that will move 99% fresh river water and only 1% sediment (of which somewhere between 5-30% will remain in place), it is clearly a freshwater diversion and not a sediment diversion project. Sediment movement is merely a limited by-product of the movement of vast amounts of water. Notably, CPRA accurately terms other diversion projects they have undertaken such as the Caernarvon and David Pond diversions as freshwater diversions. Rebranding MBSD as a sediment diversion insults the intelligence of policy makers and the people of Louisiana.
- In its zeal to tout and build "the largest project of its kind in the world" CPRA intentionally failed to give legitimate study or credence to any other viable alternatives to massive freshwater floods. All seven options considered by CPRA either call for massive freshwater intrusions or no action at all. That "no action at all" should be considered a responsible approach to solving what CPRA has termed a critical problem that must be addressed is the height of cynicism and flies directly in the face of numerous other CPRA projects that utilize alternative methods such as sediment dredging and shoreline protection.
- Any advantages gained through diverting massive amounts of chemical-laden river water into the region's prime oystering, shrimping, crabbing and commercial and recreational fishing grounds will be more than offset by damages done to the estuaries and these industries and the people and communities that depend on our natural resources.
- Necessary mitigation funding estimated by CPRA and identified in the draft EIS is woefully inadequate to compensate for the economic and resources damages that will actually be incurred, leaving it to the taxpayers of Louisiana to pick up the tab to mitigate the true damages.

- The opinions of those who know best are intentionally ignored or downplayed by CPRA and thus by the draft EIS. Parish governments in Plaquemines, St. Bernard and St. Tammany and leaders of each of the state's commercial fishing task forces vehemently object to this project and draft EIS as scoped.
- Destroying numerous natural or environmental resources in an ill-conceived attempt to protect another is not, by anyone's standards, sound public policy. Doing so at a cost of \$2 billion is nothing short of folly.

## **POSITIONING STATEMENT**

The Louisiana oyster industry has been a major fishery in Louisiana for over 150 years. Shellfish are an invaluable sustainable resource that are culturally and economically important to many of Louisiana's coastal communities, and by extension, to Louisiana's tourism-driven economy and reputation as a producer of many of America's most beloved seafood products. Louisiana's commercial oyster industry provides for almost 4,000 jobs and has an economic impact of \$317 million annually. Looking at Louisiana's oyster, crab, and shrimp industries the state produces and sells \$2.4 billion of seafood annually.

In fact, Louisiana produces  $\frac{1}{3}$  of all seafood consumed in the United States, making Louisiana the second largest producer of seafood in the country. Broadly speaking, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents. That amounts to approximately one job out of every 70 jobs in the state.

In looking at the net loss of \$258 million to our state's commercial fisheries by the 2016 opening of the Bonnet Carre' spillway to a freshwater flood alone, there is little uncertainty about what will lie in store for our state's fisheries by opening the floodgates on the massive MBSD project (*November 20, 2019, Seafood Source*).

Louisiana's oystermen and women have long been among the most active advocates for saving and restoring our coast. Decades before coastal protection and restoration were deemed of any real importance by state and federal government agencies, the people who earned their livings on the water had been spending their own funds on building coastal water bottoms through using the resource itself to build cultch and strengthen against storm surge or sea level rise. We continue to do so today, nearly every day of the week, in fact.

And, while we support broader efforts to restore the wetlands and to provide for coastal flood protection, those of us who live and work in our coastal communities and depend on the natural fisheries and wildlife resources of Louisiana's estuaries, and whose culture is intertwined with those resources, deserve to have the guarantee that all efforts will be taken to preserve these natural renewable resources for generations to come.

The huge volumes of river water that will flood Barataria Basin with this project would completely inundate and overly freshen the entire estuary, destroying the current eco-habitat. This is a fact beyond

any dispute or trivializing. Historically productive oyster reefs would be swamped with upriver sediment, wiping out the marine life habitat that currently exists and has existed for centuries. River water also contains industrial and traces of biological pollutants which can degrade water quality within the estuary and will adversely affect all marine life.

Important assets like historical oyster reefs should be protected. Louisiana's coastal communities depend on the health of the estuaries for economic sustenance. There are other proven ways to rebuild the coastal wetlands that can help to restore and enhance the Barataria Basin without destroying livelihoods, increasing local flooding risks, and hurting our coastal communities. CPRA has deliberately and cynically failed to explore any of them. CPRA should be instructed by the Corps of Engineers to further explore other viable options beyond freshwater diversions before the Corps is permitted to submit its final EIS.

We should not have to destroy our natural resources, the marine resources, and our estuaries, to save them. Doing so makes no sense. We can do better, and we believe that the U.S. Army Corps of Engineers can and should help us do so by rejecting this poorly conceived freshwater flood initiative.

#### **1.4 PURPOSE AND NEED**

CPRA has promoted the assertion that a large-scale river diversion is important and necessary to restore the Barataria Basin for damages resulting from the Deep-Water Horizon Oil Spill (DWH). The Purpose and Need as currently scoped in the draft EIS clearly states that the Mid Barataria diversion is intended to “restore for injuries caused by the DWH oil spill” and that the project will “reconnect and re-establish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water and nutrients”. Additionally, the statement of Purpose and Need indicates that the “the project is intended to restore habitat and ecosystem services in the northern Gulf of Mexico as a result of the DWH oil spill.”

This positioning statement of Purpose and Need is simply not true. It is merely an attempt to justify using funds generated from punitive measures related to the Deepwater Horizon spill for purposes that suit the needs of the CPRA in pursuit of an enormously expensive project no government or combination of governments (federal, state, or local) would ever expend funds for on their own.

More specific evidence of CPRA's duplicity in promoting and justifying this project in the context of DWH is LATIG's Strategic Restoration Plan and Environmental Assessment #3 which categorically and unequivocally focuses on the historic (pre DWH and in fact pre 20<sup>th</sup> and 21<sup>st</sup> century condition of the Mid Barataria area) and states that “historically Mississippi River channel migration, crevasses, and overbank flooding deposited sediment, freshwater, and nutrients in the Barataria Basin, building land and sustaining wetland habitats”.

Other direct references to causation unrelated to DWH in the statement of Purpose and Need include: the levee-induced channelization of the Mississippi River which has “altered natural fluvial interaction and sediment transport from the river into the basin...”, “exacerbated wetland loss including the

excavation of canals for transportation and oil exploration, the introduction of invasive species, and sea level rise.” “Recent hurricane events” are also identified as culprits in the condition of Louisiana’s coast in the statement of Purpose and Need as well as the placement Mississippi River flood control structures (again, totally unrelated to damages caused by DWH), as well as dredging itself, a frequent weapon used by state and federal authorities to restore lost land and prevent future land loss.

More consensus around the real causes of coastal land loss can be found in the May 31, 2021 New Orleans Advocate article and graphical depiction of causes of land loss by Dan Swenson (These six factors explain why Louisiana is rapidly losing land; see graphics). Specifically, six, and only six, factors are documented in the article:

1. Levees and jetties
2. Canals and channels
3. Subsidence
4. Saltwater intrusion
5. Invasive species
6. Sea level rise

Nowhere is the Deepwater Horizon oil spill (or any other oil spill) mentioned as a primary or contributing factor in Louisiana’s coastal land loss.

Specific evidence showing levees as a real culprit in the causation of land loss can be found in the fact that prior to the Deepwater Horizon oil spill, CPRA long held that Mississippi River flood control projects were the primary causes of coastal land loss. Notably, for decades the U.S. Army Corps of Engineers has spent hundreds of millions of dollars building these levees which, and while serving to protect surrounding acreage from water intrusion and flooding, have also served to make that surrounding acreage sink due to the sheer weight of the levees themselves (evidence of subsidence).

Louisiana’s estuaries, and the marshlands that connect them, have endured many man-made changes over the past 50 years, much of it directly in the interests of the oil and gas exploration industry yet these causes of land loss are not addressed by CPRA. Approximately 80% of the acreage projected to be reclaimed or built through implementation of the Mid Barataria Diversion Plan is privately owned by oil and gas production, exploration, or pipeline companies, which are widely acknowledged to be largely responsible for land loss due to the construction of hundreds of miles of canals and cuts used by those companies to service their well and pipeline sites. Essentially and ironically MBSD is designed in large part to rebuild land owned by some of the very interests that are responsible for land loss in the first place. CPRA should explain to the people of Louisiana why this actually makes sense.

To provide additional weight to these facts, a study by the Louisiana Mid-Continent Oil and Gas Association concluded oil and gas canals were "the overwhelming cause" of land loss. Another study by the U.S. Geological Survey stated the industry caused 36 percent of land loss. And another study by the American Petroleum Institute found that the industry caused 34 percent of the land loss. Dr. R Eugene

Turner, an LSU coastal scientist, concluded the industry caused over 80 percent of the land loss. Other published papers have attributed 20 to 33 percent of the land loss was caused by the industry. For the sake of this response, let's settle on an average between all these studies and conclude 44% land loss is attributed to the oil and gas industry.

Land companies, which own much of the coastal wetlands, profited handsomely from mineral royalties at the expense of losing the surface wetlands because of a poorly planned government coastal permitting process that looked only for maximizing short-term gains. For too long, the state and local governments have turned a blind eye to the environmental problem that was being created by the oil and gas industry, enabling unaccounted for damages to the wetlands to accumulate – meanwhile no one accepts or even suggests any responsibility. Damages to our coastal wetlands, bays and bayous are still allowed to continue today.

Instead, CPRA is seeking to spend nearly \$2B to build a new river delta where one never existed for over 1,000 years. Building *a new* river delta in Barataria Bay is not restoration by anyone's standards no matter how much money they have spent to pretend otherwise. CPRA and their allies are misleading the public by twisting the facts to better sell a lame and transparent narrative. In reality, Barataria Bay is already connected to the river with existing diversions at Davis Pond, West Pointe à la Hache and Naomi. Rather than restoration, what CPRA seeks to do is re-create the coast in an image of its own bureaucratic imagining.

#### **1.6.1 THE OPA AND DWH NRDA DECISION**

This project is in clear violation of OPA 15 CFR Sect 990.54 which states that the restoration alternatives be evaluated by: *"The extent to which each alternative will prevent future [injury](#) as a result of the [incident](#), and avoid collateral [injury](#) as a result of implementing the alternative"*.

The proposed MBSD will without question cause additional injury and collateral injury to many of the same eco-resources damaged by the DWH oil spill, like bottlenose dolphins, seafood fisheries, Essential Fish Habitat, and others. We strongly believe, as do Louisiana Lieutenant Governor, Plaquemines, St. Tammany, and St. Bernard Parish governments and others, that this proposed project violates OPA because OPA regulations clearly state that no expenditure of oil spill-related fines or penalties can be used to exacerbate the effects of an oil spill. This project, as scoped, does just that.

It is also demonstrable that CPRA's diversion plan *claims* to be designed to restore impacts caused by the Deepwater Horizon Oil Spill. Such a claim only exists to justify spending fines and penalties from the spill on CPRA's pet freshwater flood project.

In truth, the CPRA, Corps of Engineers, and others know, but fail to publicly acknowledge, that this claim has no basis since the DWH spill is not, by anyone's standards, a principal cause of wetlands loss, especially when compared to other major and more important and on-going contributing causes as outlined in Dan Swenson's May 31<sup>st</sup> article for *The New Orleans Advocate: These six factors explain why*

*Louisiana is rapidly losing land; see graphics.* Of those main causes include levees and jetties, canals and channels, subsidence, saltwater intrusion, invasive species, and sea level rise, **NOT** the Deepwater Horizon oil spill.

## **2.0 ALTERNATIVES**

CPRA has failed to adequately consider any viable alternatives to a large-scale freshwater diversion that would minimize the impact on our fisheries. This all or nothing approach is an insult to all of us whose livelihoods rely on the fisheries. We are referring to generations of fishermen and women. While we all agree that we cannot do nothing, but why, out of six alternatives, did CPRA or its allies not consider a single approach that would save our fisheries or at the very least give us a fighting chance?

Neither CPRA nor the Corps of Engineers seem to have given serious enough consideration to viable alternatives although several certainly exist. For reasons of their own CPRA and its proponents are locked into a large-scale freshwater diversion. In effect, they have given us only one approach to managing and mitigating these issues despite the proven track record of other approaches in addressing these challenges in south Louisiana.

### *Dredging*

Dredging has been purposefully ignored by CPRA and therefore is disregarded as a viable option in the draft EIS. Yet, it is well known and agreed upon that dredging has numerous and immediate beneficial results that do not entail generating the harsh and negative impacts of a freshwater flood.

It is clear that diversions will not produce a net gain of land for 20 years or more, while dredging shows a much more promising and instantaneous net gain on land and storm surge protection. Negative impacts from dredging operations are minimal – almost nonexistent – compared to diversions and dredge materials can be strategically and accurately placed where desired and needed and as high as needed to build ridges, islands, etc. This level of specificity and cannot be accomplished with diversions, especially like the high volume floods being considered by the Corps under this EIS. And of course, there is no argument that the true cost of acreage created by diversions is higher than acreage created by dredging because the cost of adverse negative impacts to our seafood industry among other things.

CPRA touts its support and direct involvement in implementing dozens of coastal dredging projects, pumping “more than 157 million cubic yards of sediment to benefit 48,894 acres of coastal habitat, created 60 miles of coastal barrier islands and berms and improved 336 miles of levees”, according to the agency’s own press release of December 11, 2020.

Recent examples of large dredge projects, undertaken by CPRA include:

- \$32 million marsh restoration in Cameron Parish (“1.9 million cubic yards of sediment dredged from the Gulf of Mexico...to build 308 acres of marsh.”)
- \$16.4 million dredge project on Rabbit Island in Cameron Parish to “restore 88 acres.”

- \$167 million dredge of Trinity-East Island in Terrebonne Parish designed to create 2.5 miles of land and 1100 acres of marsh and dune (using 9.2 cubic yards of sand pumped more than 15 miles).
- Whiskey Island dredge of 13.4 million cubic yards to construct 1,100 acres of barrier islands (also using BP spill money).

Moreover, based on experience in projects such as these, there should be little doubt that the method of flood diversion called for in the draft EIS will not be anywhere nearly as effective or immediate at building storm surge protection because, among other factors, there is not enough sediment from the Mississippi River to build more than a very small portion of the coastal zone over the 50-year life of the project.

There is also no doubt, as conceded but perhaps underplayed by project supporters, that the enormous amount of water required to transport the desired amount of sediment will change salinity regimes and destroy existing commercial fisheries. Additionally, as designed, this project does nothing to protect the small amount of sediment that will be delivered from erosion by wind and wave action, essentially minimizing the effectiveness of the marginal amounts of sediment deposited over the project's lifespan.

In reference to the planned Mid Breton diversion project, even CPRA's Ken Savastano concedes this fact, saying that "CPRA decided several years ago the lower two diversions (Mid Barataria and Mid Breton) weren't feasible to build."

#### *Storm Surge Protection Barriers*

The current diversion plan needs to be reengineered to create meaningful storm surge protection. Even CPRA acknowledges that the amount of land to be built by the project through diverted river sediment over 50 years will not keep pace with the amount of land lost through erosion by wind and waves over that same time. This reality is due to the absence of real storm surge protection offered by the diversion plan. As such, based on what the diversion will do versus what it purports to do, this plan is an egregious misuse of available funds.

#### *Encircled Diversion*

An encircled diversion, which can operate as a surge reservoir provides a better opportunity to achieve the stated goal of protecting and restoring the coast. Encircling the downstream sides of the diversion area with sediment and water containment bulkheads or levees will allow the enclosed area to be quickly filled with sediment through a combination of controlled diversion and dredging. The process is simple: rising flood water will fill the reservoir, dropping sediment at the end of the flood period. During non-flood times, dredging can be used to infuse the encircled area with sediment material. Doing so will protect marine resources and the commercial fishing interests that depend upon them and result in more effective storm surge protection in much less time.

### **3.0 AFFECTED ENVIRONMENTS**

Louisiana oyster reefs provide innumerable benefits to the health and productivity of our estuaries.

Oyster reefs provide habitat for many other species including recreational and commercial fish, creating nursery habitat for fish and crabs, and providing small animals shelter from larger predators.

In addition to offering shelter and food, oyster reefs provide many benefits that promote healthy coastal environments including buffering coasts from waves, reducing erosion, and creating calmer waters that support the growth of coastal marshes and seagrass beds, which can in turn provide their own flood and erosion reduction benefits. Oysters are also extremely effective filter feeders, improving their surrounding water quality and clarity and further enhancing the health of the larger bay or estuarine systems in which they reside.

Studies from the Gulf of Mexico have found that oyster reefs can reduce the energy of high-power waves by as much as 76 to 93 percent.

Oyster reefs, shrimp, finfish, turtles, dolphins and these important fisheries and nurseries and their delicate marsh grasses known as spartina patens will be obliterated by the vast amount of river water released by this diversion project. The amount of released river water will far exceed the volume of sediment that will be released and will devastate the entire estuary in the northern Gulf of Mexico. In fact, early production runs used in the draft EIS predicted the accelerated land loss as the mortality rate of the brackish marsh grasses were greater than 50-60% in the first 10-60 days as these delicate plants cannot tolerate voluminous river water inundation.

Experiences on the east side of the river from the discharge of river water through the Caernarvon Diversion and the breach at the old Bohemia Spillway known as Mardi Gras Pass has killed brackish marsh grass only to be replaced with invasive species such as giant salvinia, hyacinth and lilies that are not indigenous to the area and choke up brackish marsh.

Further evidence of the negative consequence we can expect can be readily and scientifically observed. Many life cycles of different marine species have been affected on the east side included impacts from the release of river water through the Bonnet Carre' Spillway which killed over 300 dolphins in 2019 from back-to-back openings of the spillway releasing river water into the Mississippi Sound.

#### **3.11 MARINE MAMMALS**

The wildlife that occupies Louisiana's coastal environment has always been a critical element of and contributor to the health and vitality of our state's ecosystem. The enormous quantity of freshwater that will flow into Barataria Bay over the proposed 50-year operation of the MBSD, will reduce salinity to dangerous levels and is predicted to be a very real threat to the survival of several species that inhabit this area including the bottlenose dolphin.

The dolphin population in this region has already suffered significant damage almost to the point of decimation. According to a letter issued by the federal Marine Mammal Commission on February 5,

2018, part of the fallout of the BP Oil Spill in 2010 was “35 percent of the dolphins in Barataria Bay died, and 46 percent of remaining female dolphins had experienced reproductive failures.” A study published by the Society of Environmental Toxicology and Chemistry also suggests the effects of the BP Spill even a decade later, may also extend to multigenerational effects to dolphins' immune responses. (Ironically but tellingly, while funds from the BP spill fund are supposedly to be earmarked to mitigate damages from the DWH spill, this project will use those same funds to make a problem attributed in part to the spill even worse.)

Another study issued by the National Marine Fisheries Service, indicated the 2019 rerouting of Mississippi River water through the Bonnet Carre Spillway and into Lakes Pontchartrain and Borgne and the Mississippi Sound for more than 123 days led to dolphins enduring prolonged exposure to dangerously low salinity levels and was linked to an “unusual mortality event” where 337 were stranded along the Louisiana, Mississippi, and Alabama coasts. Furthermore, legislation designed to safeguard wildlife such as The Marine Mammal Protection Act passed in 1972 has also come under threat. Again in 2018, at the direction of Congress, a waiver was granted by the U.S. Department of Commerce to two Mississippi River diversion projects which meant they could progress without adhering to federal measures in place aimed at protecting species such as the bottlenose dolphin from death, injury, or health effects.

The proposed MBSD Project now represents another possibly disastrous endeavor for bottlenose dolphins. As detailed in a March 2 article on NOLA.com, a study issued by the National Marine Fisheries Service has examined the predicted damaging effects on the bottlenose dolphin population because of the proposed diversion. With potentially as much as 75,000 cubic feet per second of freshwater, sediment and nutrients being infused into the northeastern part of Barataria Bay during high river periods, salinity is expected to drop to alarming levels for an average 177 days a year. The study forecasts, in the central and western parts of the bay, dolphin survival rates “are expected to decline by 65.9% and 41.9%, respectively”. Further to this, a May 17 article on NOLA.com went on to describe the findings of another study conducted, under instruction from the federal Marine Mammal Commission, by the University of St. Andrews in Scotland, SMRU Consulting and the National Marine Mammal Foundation. This study also anticipates the diversion will cause a significant reduction in dolphin numbers to the point of “functional extinction”, as well as health issues such as skin lesions that can cover much of the dolphins’ body leading to sickness or death. The report goes further to suggest dolphin numbers will see a steady increase of about 3% a year over the same 50-year period without the diversion.

Detailed in a 2015 letter to the Army Corps of Engineers, the National Marine Fisheries Service documented that dolphin commonly live in water with salinity levels ranging from 20 to 35 parts per thousand. The letter went on to say "The proposed Barataria Bay and Breton Sound Mississippi River diversions are expected to reduce salinity to less than 4 parts per thousand throughout the majority of the resident dolphin habitat for more than four months of the year, depending on the diversion scenario. The extent of the freshwater would essentially eliminate suitable estuarine and nearshore coastal habitats for the Barataria Bay and Mississippi River Delta dolphin stocks."

### **3.13 SOCIOECONOMIC**

Strongly held concerns regarding this proposed project are well documented by scientific studies including the US Army Corps of Engineers own body of work such as *Pictorial Account and Landscape Evolution of the Crevasses near Fort St. Philip Louisiana* and *USACE Perspective on Mississippi River Sediment Diversions*. The Corps and other scientific studies by Howes and others, which are based on empirical data and not conjecture, show that this project will most likely negatively impact the environment and residents who depend on it.

The public is being badly misled by those who promote this counterproductive and wasteful project.

First, the proposed Mid Barataria Sediment Diversion plan will not build land. It will, however, build freshwater marsh and grass that will fail to be sustainable in the face of large hurricanes and storms that will inevitably strike coastal Louisiana. If anything, three prior freshwater diversion projects including the Caernarvon diversion (the largest freshwater diversion created thus far) have proven that an influx of nutrient-rich freshwater and inundation of marsh plants will make the Barataria Basin more susceptible to storm surge.

Building a single acre of marshland serves no direct or positive economic purpose as opposed to the historically prolific fisheries of coastal Louisiana which generate an estimated \$2.4 billion in economic benefits for the State of Louisiana and the people of south Louisiana.

The Corps of Engineers' draft EIS states the planned diversion will create 85,500 acres of wetland by 2070 and yet without the planned diversion, 72,800 acres will still be created. Therefore, this diversion project will cost nearly \$2 billion to create just 12,700 additional acres, which equates to the inefficient and cost-unproductive creation of new wetlands to the tune of more than \$150,000 per acre and take 50 years to do so.

Recognizing the high potential for significant negative and irreparable impacts on residents, Parish Councils in Plaquemines, St. Bernard, and St. Tammany have collectively voiced their opposition to this project. The St. Bernard Parish Council stated in part that the project will "do permanent harm to the wildlife of Plaquemines and St. Bernard parishes and their respective seafood industries", "destroy the livelihoods of countless businesses and people", and result in the "loss of local tax revenues to fund vital services".

The Council's resolution of opposition also notes that the EIS demonstrates that "potential benefits in minimal land development that is predicted are far outweighed by unremediated damage to the parishes and their people". St. Tammany's resolution identifies numerous problems with the proposed plan including its lack of cost-effectiveness, inefficiency as a means of rebuilding the coast, minimal results as measured against costs, and "long-term damage" to "wildlife and fisheries of St. Bernard and Plaquemines Parishes" which will "destroy the livelihoods of countless" residents of those parishes.

Notably, St. Tammany's resolution also points out that CPRA failed to consider any other valid options including dredging which have been proven to be a cost-effective and useful means of rebuilding or sustaining Louisiana's coastal acreage and wetlands.

Lt. Governor Billy Nungesser, Plaquemines Parish resident and longtime champion of coastal restoration also questions the EIS findings and opposes the MBSD Project.

Nungesser served eight years as Plaquemines Parish President and has consistently opposed this project throughout his governmental career, recommending instead that the Corps and CPRA pursue building wetlands and ridge projects with dredged and pumped sediment from the Mississippi River as has been done in dozens of other Louisiana coastal restoration and protection projects.

Nungesser, in part is quoted as dismissing "the Mid-Barataria draft environmental impact statement's estimate that the diversion would kill 34% of the Barataria basin's bottlenose dolphins" (Garrison et al, December 2020). Instead, Nungesser cites data presented by the Marine Mammal Institute which found that numerous freshwater openings of the Bonnet Carre' Spillway resulted in dolphin killings of closer to 70%. Nungesser also correctly points out that Louisiana and coastal Mississippi are home to the world's largest population of bottlenose dolphins. He also questioned why the state of Louisiana encouraged Congress to exempt the MBSD project and the Mid Breton Sound Diversion from compliance with the Marine Mammal Protection Act. And he raised serious questions regarding how the project could be paid for with funding from the BP Deepwater Horizon restoration settlement as he believes those funds are to be allocated to address damage the oil spill inflicted on Louisiana's fisheries.

Finally, Lt. Governor Nungesser points out that CPRA's stated \$300 million fund for mitigation of damages incurred from the diversion project by the state's shrimp and shellfish industries is not only speculative, but wholly inadequate to mitigate the actual damages which will be incurred. He notes as well that those speculative funds would only account for half of the seafood landings in the past two years.

The draft EIS acknowledges that measuring economic and socio-economic impacts over an extended period is an inexact science, noting among other things, that "economic markets adjust over time in response to changing economic conditions" and that it is "particularly difficult to anticipate over long-time horizons." Yet, that is exactly what CPRA has done (and what is captured and presented to the public in the draft EIS). This acknowledgement is hardly reassuring for the coastal communities and the people of southeast Louisiana who may be negatively and long-term impacted. It also fails to build confidence in a project that claims to be based in such detailed and exact science.

As relates to prospective economic impacts of Louisiana's oystermen and women, the draft EIS does demonstrate that the oyster fishery in the impacted area makes up slightly more than one-third of all statewide landings and that the "activity within the Barataria Basin has actually increased in recent years." Based on anticipated damage to be done to the industry, the fact that these harvest grounds are otherwise becoming more important to the state's oyster production, it only stands to reason that costs

of mitigation for economic and socio-economic damages will only increase over time. A fact not considered in the low ball estimate provided by CPRA.

The draft EIS provides some commentary on workplace “substitutions” i.e. the types of industries and occupations that MAY provide job opportunities for area residents who may be displaced courtesy of MBSD. Importantly though, as stated in the draft EIS: “However, these types of substitution are not likely to fully offset the adverse impacts.” The draft also acknowledges that the uncertainty of true negative impacts from the project “may result in further accelerations in exits from the industry” especially for older members of the workforce for whom job re-training may not be as easily undertaken.

### **3.14 COMMERCIAL FISHERIES**

More than 35,000 Louisiana residents earn part or all their livings through commercial fisheries, the very industry which will be most heavily impacted by the MBSD Project. Yet, in its zeal to build what it touts as the “largest project of its kind in the world” CPRA and its allies treat those employed in commercial fishing and the seafood resource itself as collateral damage that is secondary to their mission of recreating the coast.

The Louisiana Department of Wildlife and Fisheries (LDWF) published an economic report for Barataria Bay titled *An Assessment of the Principal Commercial Fisheries in Barataria Bay and Its Environs* in April 2021. The report used commercial fishing data collected by the LDWF for three areas in Barataria Bay.

The areas covered in this report, adjacent to the site of the proposed MBSD, account for much of the area’s commercial fishery production.

According to the report, the average cumulative volume and real dockside value in these identified areas between 2000 and 2017 were 4.6 million pounds and \$4.5 million for blue crabs, 12.3 million pounds and \$14.5 million for brown shrimp, 12.6 million pounds and \$21.0 million for white shrimp, and 3.2 million pounds and \$16.6 million for oysters.

Also noted in the report that the dockside values of seafood landings within the three areas were influenced by changes in the value per pound which were likely to have been driven by market forces beyond the confines of Barataria Bay. Recent increases in the value per pound of oysters, for example, have amplified the effect of increases in landings on the bivalves’ dockside values.

This assessment is based entirely on the volume and real dockside value of the six specified seafood types harvested from three sections of Louisiana’s waters. It does not include the value added from additional elements of the seafood marketing chain, such as processing or retailing, and does not consider changes in employment.

A glaring weakness in the draft EIS as relates to CPRA’s MBSD proposal relates directly to vastly low and inadequate estimates of what funding will be necessary to compensate the state’s commercial fisheries for dramatic and toxic changes to the coastal ecosystem. Specifically, the estimated \$300 million in mitigation funds which would be allocated for lost fisheries earnings is unrealistically low, especially as measured against shrimp and oyster landings values over just the last two years. Forcing shrimpers to

travel greater distances to ply their trades will require significant and expensive vessel upgrades including larger freezer capacities as well as put more revenues into fuel costs. Pushing damages and negative impacts out over a fifty-year period, it becomes easy to see how short sighted CPRA's mitigation funding estimates are and why their plans for this diversion project should be placed on hold pending further detailed and realistic economic damage and mitigation estimates.

Also, while the permit application acknowledges that the project will alter or destroy 7,530 acres of Essential Fish Habitat, not fully addressed is the anticipated destruction of oyster habitat and associated shrimp, crab and sports fishing habitat several times larger than the projected 7,530 acres. More specifically, public oyster seed reefs in Breton Sound and Eloi Bay run to 40,000 acres alone (nearly 5 times more than the projected 7,530 acres), with private oyster leases in Breton Sound amounting to several times more than the public reefs.

As accurately stated by John Dale "Zach" Lea, PhD in his April 2019 comments to the Corps, the project as currently designed is a "misuse of public resources because it does not maximize the benefits expected from the investment and assumes the destruction of a major portion of the oyster industry. The loss in oyster production and related crab, shrimp and sport fish production are not justified by the increased value of storm production created."

CPRA, an agency that pretends it can accurately predict every minute detail of the positive impacts of its pet project, should be held accountable for developing a detailed economic assessment and job creation and retraining program for those who will or may be displaced or economically or socially impacted by the Mid Barataria freshwater diversion before the Corps of Engineers or state of Louisiana permit this project.

### **3.14.3 OYSTER FISHERIES**

For more than 150 years, oyster harvesting and processing have been important to Louisiana's economy and coastal communities. Oystering is central to our state's culture, heritage, and reputation as a food mecca for people around the world. Ours is a \$317 million business annually, working in concert with our colleagues who crab (\$293 million annual impact) and shrimp (\$13 billion annual impact). And yet, as documented, though underplayed in the MBSD draft EIS, this plan will do irreparable "near-term and long-term harm" to the industry and the more than 4,000 men and women and their families who make their living in the industry. Sadly, the draft EIS treats likely damage from implementation and operation of this massive freshwater flood project as "collateral" and just another cost of doing business, well worth the project's \$2 billion price tag.

While CPRA and the draft EIS attempt to skirt too much discussion, detail or inquiry into the harsh impacts which will befall the state's oyster industry, here is what we know:

- Shellfish (and crab, shrimp, and finfish) harvests will drop quickly and precipitously and won't recovery for years or even decades.

- Louisiana will lose its place in the upper echelon of seafood producing states; product from Texas, Alabama, Mississippi and elsewhere will fill the void, perhaps permanently.
- The local economy will suffer.
- Significant near- and long-term job losses will occur.
- Jobs that CPRA claims will be created because of MBSD will not be those that displaced oyster harvesters or processors will necessarily qualify to do.
- Many of those highly touted new jobs will be filled by consultants, engineers, and others from outside the area who have no vested interest beyond that in our coastal communities.
- Mitigation funds will be wholly inadequate to the task of making whole those who have lost their businesses, their jobs, and their way of life. The paltry \$300 million CPRA plans to set aside for mitigation fails to even cover one year of current oyster landings and sales and is an insult to the people who work and live on oyster producing communities.
- Availability of product for local restaurants will be limited and prices for local consumers and tourists will rise, creating further space in the market for out of state competitors.
- While CPRA hopes to build 20-40 square miles over 50 years, our local economy will be slow to recover, our jobs in seafood harvesting and processing will be lost, and our coastal quality of life will change forever.

The Corps of Engineers should make no mistake in interpreting the strongly held opinions of the Louisiana Oyster Task Force and our colleagues in other commercial fisheries organizations. We support and encourage efforts to save, protect and rebuild Louisiana's coast and we know that with the right approach and the right collaboration, Louisiana can rebuild and protect our coast without sacrificing the diversity of our estuaries or destroying our abundant marine life and fisheries.

Louisiana's oystering community has been a champion of protecting and restoring our damaged coastal environment for decades. Investing our own funds and resources through building cultch and coastal water bottoms more than demonstrates our commitment to a common goal we can share with CPRA and others. However, based on our more than 150 years of experience living and working in the very community the project will impact, we know with certainty that MBSD will wreak havoc on the local environment, the marine species that populate area waters, and on the livelihoods and cultural heritage and way of life of those who live in and near Plaquemines Parish. We also know, but deeply regret that CPRA has been intransigent in its unwillingness to give our depth of experience and knowledge of how the river and our coastal estuaries work, any credibility at all as they have weighed the (very limited options) they have ultimately considered to present to the people of Louisiana and the Corps of Engineers.

We respectfully ask that the Corps demand that CPRA provide it and the people of Louisiana with a detailed economic impact and loss/benefit study so that a truly informed decision can be made regarding the efficacy and future of this project so that actual costs of mitigating damage caused by it can be a central part of the discussion rather than an inconvenient afterthought.

Oyster reefs provide innumerable benefits to the health and productivity of our coastal estuaries. These reefs provide habitat for many other species including recreational and commercial fish, creating

nursery habitat for fish and crabs, and providing small animals shelter from large predators. Oyster reefs promote healthy coastal environments including buffering coasts and shoreline from waves, reducing erosion, and creating calmer waters that support the growth of coastal marshes and seagrass beds. Studies have indicated that oyster reefs can reduce the energy and impact of high-power waves in the Gulf of Mexico by as much as 76% to 93%.

Our concerns regarding this proposed freshwater flood are rooted in other similar experiences, also undertaken courtesy of CPRA (with Corps approval) including the Davis Pond and Caernarvon diversion projects, which, according to PDRAP/PEIS documentation caused “collateral injuries” to estuarine organisms such as oysters and brown shrimp. We have also witnessed the breach at Mardi Gras Pass decimate oyster reefs in Breton Sound and Black Bay. We know from firsthand experience that high volume diversions, whether man-made or created by nature, serve to obliterate marsh grass or spartina patens and disrupt the natural ecology and marine life in those impacted areas and that recovery is a painstaking and long-term process.

## **APPENDICES**

### ***Appendix 1 - Letter to the Editor New Orleans Advocate***

February 2021

To The Editor:

In reference to the article “‘The Einstein of our coast’ reflects on decades of Louisiana environmental work,” by Halle Parker on February 13, I would like to first applaud John Lopez for his extraordinary work in coastal sciences as well as his work on the Multiple Lines of the Defense Strategy.

While Lopez has earned national acclaim for much of his work, science and protecting the coast at all costs has come at a considerable price. The policies he has long sought to implement have in fact had hugely negative impacts on the state’s commercial fishing, shrimping and oystering communities, doing far more damage to the state’s economy and coastal employment than any lasting good to our coastal infrastructure.

To be clear, the Louisiana oyster industry supports efforts to restore the wetlands and provide for coastal flood protection. Communities who have depended on the natural fisheries and wildlife resources of Louisiana’s estuaries, and whose culture is intertwined with those resources, deserve to have the guarantee that all efforts will be taken to preserve those natural renewable resources.

The Louisiana Oyster Industry believes that we can achieve coastal rebuilding without sacrificing the diversity of our estuaries and destroying current fish and wildlife habitat. Where we have disagreed with Mr. Lopez are the tens of thousands of acres of historic public oyster seed ground on the east bank of the river in Plaquemines and St. Bernard Parishes that are being irreparably destroyed by damages from coastal restoration projects.

The industry has been a major fishery in Louisiana for over 150 years and is an invaluable sustainable resource that is culturally and economically important to many of Louisiana's coastal communities. In fact, Louisiana's commercial oyster industry, which provides for almost 4,000 jobs, has an economic impact of \$317 million annually. It is disheartening to see that when it comes to loss of jobs and damaging the economies of coastal communities, most scientists look the other way.

We cannot allow the state to take its most valuable renewable resource for granted.

Public seed grounds produced 60% of Louisiana's oysters. Today, it barely produces 2%. Ninety percent of oyster production today comes from private leases. Over the years, individual oystermen and growers have been the protectors of the natural coastal environment. The industry has invested millions of out-of-pocket expenses adding to the estuaries to help build reefs.

Sadly, Louisiana, for the first time, is close to losing its longstanding title as the number one oyster producer in the world to Texas. As a fourth-generation oysterman, my greatest fear is losing our livelihood for the next generation who can no longer sustain this living. Important assets like historical oyster reefs should be protected in future coastal plans. Louisiana's coastal communities depend on the health of the estuaries for economic sustenance.

Mitch Jurisich, Chair, Louisiana Oyster Task Force

***Appendix 2 - Letter to the Editor (sent to numerous newspapers throughout Louisiana)***

May 2021

To The Editor:

June 3<sup>rd</sup> closes the public comment period on the Army Corps of Engineer's draft environmental impact statement (EIS) for the proposed \$2 billion Mid Barataria freshwater diversion project, the latest and largest effort to help protect and restore Louisiana's coastline by flooding vast amounts of acreage in Plaquemines Parish.

Proponents have traveled the state to convince the public that this plan is the only one that will work and that nothing else deserves consideration. Those of us who live and work in coastal communities,

including Parish Councils in St. Tammany, St. Bernard and Plaquemines, respectfully disagree for reasons that are strong, clear and without contradiction.

One look at the \$258 million loss to the state's fisheries inflicted by the 2016 flooding of the Bonnet Carre' spillway paints a stark picture of what will accompany this latest freshwater flood. In reality, the damage promises to be far, far worse.

While the state's seafood producer organizations oppose the current plan, we are strong advocates for smart coastal restoration and protection that actually does more good than harm. Louisiana oyster harvesters and processors and our colleagues who shrimp, crab and fish for a living believe we can rebuild the coast without sacrificing the diversity of our estuaries and destroying current fish and wildlife habitat. Alternative options we have urged the agencies to pursue instead include dredging, which has proven its effectiveness and cost-efficiency in Louisiana time and time again.

Sadly, the Coastal Protection and Restoration Authority is immovable from its plan to flood southeast Louisiana and do immense and irreparable economic, human, and cultural damage that could be avoided if other options were considered. We urge the Army Corps of Engineers to strongly consider the devastating realities facing our fisheries if this project moves forward as planned.

The oyster industry has been a major fishery in Louisiana for over 150 years, providing for almost direct 4,000 jobs with an economic impact of \$317 million annually and feeding tourists and residents alike. As a fourth-generation oysterman, my greatest fear is losing our livelihood for the next generation who can no longer sustain this legacy or way of life.

The comment period for the public to weigh in on this freshwater flood project closes on June 3<sup>rd</sup>. We respectfully request that all who share our concerns about the detrimental, unintended but very real consequences of this \$2 billion folly make their voices heard by commenting at [CEMVN-Midbarataria@usace.army.mil](mailto:CEMVN-Midbarataria@usace.army.mil).

Mitchell Jurisich, Chair, Louisiana Oyster Task Force

---

**Concern ID: 61782**

**Commenters expressed concern that there's not enough sediment in the river to achieve wetland and land creation goals of the proposed Project.**

**Response ID: 16412**

The commenter's concerns regarding the sediment load of the river and whether the river carries sufficient sediment to achieve the land projected to be built during diversion operation were considered in the Draft EIS. The Mississippi River carries much less sediment than it did in the past. It still carries a massive sediment load, but not as massive as before. As explained in Chapter 3, Section 3.4.2.5 Sediment Transport, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes. Quantifying the relative contributions of multiple factors to the diminished sediment load is beyond the scope of the Draft EIS. The Draft EIS (Appendix E Delft3D Modeling, Delft3D Modeling Section 5.2.2) takes this diminished sediment load into account when computing the sediment that would be delivered to the Barataria Basin. To help clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations, discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

---

**Concern ID: 61873**

**The proposed Project's impacts are in contradiction with the Project's stated purpose and need to restore habitat and ecosystems damaged by the DWH oil spill given the permanent adverse impacts on fisheries, marine mammals, and water quality. The proposed Project is incompatible with both a healthy environment and healthy economy.**

**Response ID: 15829**

USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities), and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. If implemented, the proposed Project would deliver sediment, fresh water, and nutrients into the Barataria Basin. While there would be short- and long-term, adverse and beneficial impacts to physical, biological, and socioeconomic resources in the Project area due to the proposed Project, the sediment, fresh water, and nutrients are expected to restore habitat and ecosystems services injured in the northern Gulf of Mexico as a result of the DWH oil spill.

---

**Concern ID: 61875**

**The purpose and need is false and misleading and does not follow NEPA guidelines for a concise, basic, essential, and irreducible purpose. The statement is misleading by making the proposed Project itself part of the purpose. The DWH oil spill, including**

---

**restoring for injuries caused by the DWH oil spill, has nothing to do with the proposed Project other than justifying its use as a source of funding.**

**Response ID: 15831**

As described in Chapter 1, Section 1.4 Purpose and Need of the EIS, NEPA regulations (40 CFR 1502.13) state that an EIS “shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action.” The purpose and need statement should be clear and concise in order to facilitate development of a reasonable range of alternatives. USACE generally focused on CPRA’s purpose and need for the proposed Project and considered the public’s and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities), and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project’s purpose and need for the EIS.

Separate from the USACE process, as discussed in the PDARP/PEIS, the SRP/EA #3, and the Restoration Plan, the LA TIG found that impacts of the injuries from the DWH oil spill were particularly detrimental to the resources of the Barataria Basin, which were already in peril as a result of the separation of sediment-loaded river water by levees, subsidence and a changing climate. In the Barataria Basin, marshes already suffering from significant coastal erosion experienced heavy oiling and subsequently experienced double or triple the rate of marsh loss. The Final PDARP/PEIS (DWH NRDA Trustees, 2016a) documented the nature, degree, and extent of injuries from the DWH oil spill to both natural resources and the services they provide, and the nexus between those injuries and need for restoration within the Barataria Basin. Evaluating restoration strategies that could restore for injuries in the Barataria Basin, the SRP/EA #3 found that a combination of “marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats” (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in the EIS and Restoration Plan. The LA TIG’s Restoration Plan concludes that the proposed Project would best restore for injuries caused by the DWH oil spill by reconnecting and reestablishing sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

---

**Concern ID: 61879**

**Commenters questioned why other alternatives are not being considered other than No Action and a sediment diversion with various levels of flow rates. CEQ’s regulations require that the EIS rigorously explore and objectively evaluate all reasonable alternatives, which is a requirement that the Draft EIS does not meet. Consider analyzing a range of other alternatives, options, and tools that better preserve and protect the environment and minimize the severe impacts to Louisiana fisheries, the communities, and the entire Gulf Coast ecosystems.**

**Response ID: 15835**

---

The range of reasonable alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2 of the Draft EIS (Alternatives), an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in its SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in its Restoration Plan. The LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is,

Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

---

**Concern ID: 61895**

**Commenters suggest using a sediment diversion to selectively build land by directing sediment to a contained area, such as a colmates system or large-scale marsh creation containment area. A controlled system of dredging to create dry land coupled with a system to contain sediment-infused river water in specific areas outside of the levee protection system would be most beneficial to create more land exactly where it's needed.**

**Response ID: 15988**

This method of sediment transport and/or sediment containment and land building would not meet the proposed Project's purpose and need of reconnecting and reestablishing sustainable deltaic process between the Mississippi River and the Barataria Basin. A colmate or other means of large-scale marsh creation using dewatered sediment would allow for sediment to be transported from the Mississippi River to the Barataria Basin and deposited into a location confined by containment berms, which would create an impoundment where the suspended sediment would settle out of the water column over time to create a marsh platform. Once the area dewateres and the platform stabilizes at an appropriate marsh elevation, the berms would be degraded or gapped to allow fish passage and hydrologic exchange. While this type of system would create marsh, it would not be a passive system and would require active management and maintenance, including potentially pumps to ensure sediment transport, mechanical gapping/degrading of the retention berms and periodic lifts to combat the effects of subsidence. It would not reestablish natural deltaic processes. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

---

**Concern ID: 61908**

**Commenters suggested that there will be detrimental impacts on the tourism economy and on restaurants, which are partly dependent on fisheries in the Barataria Basin. Commenters express concerns about adverse effects on Louisiana's attractiveness as a fishing area and place for swamp tours and authentic seafood.**

**Response ID: 16238**

EIS Chapter 4, Section 4.16.5.2 in Recreation and Tourism describes how the MBSD Project would impact the tourism economy that is dependent on fisheries. Relative to the No Action Alternative, the proposed Project would cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts on these species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less

---

than 2 percent of angling trips. As described in the EIS, these changes would not substantially impact the broad tourism economy, which includes more than fisheries.

While availability of shrimp and oysters from the basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's Preferred Alternative than under the No Action Alternative.

This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated

---

from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 61998**

**The true cost of acreage created by diversions is higher than acreage created by dredging because the cost of adverse negative impacts to our seafood industry among other things.**

**Response ID: 16015**

Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

The impacts on the seafood industry were considered in the Draft EIS. The EIS acknowledges in Chapter 3, Section 3.14.7 in Commercial Fisheries that the seafood industry represents a major source of jobs and income in Louisiana, which includes commercial harvesters, seafood processors and dealers, seafood wholesalers and distributors, and retail sales. Chapter 4, Section 4.14 Commercial Fisheries discusses regional economic impacts and community impacts on the shrimp, oyster, crab, and finfish fisheries, noting that communities with a high reliance on these landings may be most heavily impacted, and that indirect effects may include impacts to fish license holders, crew, dealers, suppliers, and seafood processors.

The cost effectiveness of the proposed Project was evaluated in the LA TIG's Restoration Plan. While the commenters suggest that marsh creation through dredging would cost less than the proposed Project, the LA TIG does not believe that comparing the costs of a sediment diversion to marsh creation projects using dredged material captures the benefits of the proposed Project. Most importantly, as explained in the LA TIG's Restoration Plan, the goal of the proposed Project is to create a long-term sustainable ecosystem through the reestablishment of deltaic process. Marsh creation through the use of dredged material would not bring fresh water or nutrients to the basin on an ongoing basis, and therefore would not nourish surrounding wetlands on an ongoing basis. Furthermore, assuming an initial dredge placement event with no further maintenance, the benefits of marsh created with dredged material would diminish relatively quickly compared to marsh created by the proposed Project due to subsidence, erosion, and sea-level rise; thus, the temporal nature of proposed Project benefits would also be markedly different. For these reasons, the LA TIG believes that comparing the costs of dredge placement to the costs of the diversion does not capture the full picture of the diversion's ecological benefits. The costs and benefits of the proposed Project were considered and discussed in the LA TIG's Draft Restoration Plan. No related edits have been made to the Final Restoration Plan.

Finally, while the proposed Project involves implementing a large-scale sediment diversion in the Barataria Basin, the Applicant also proposes to place suitable dredged and excavated material in three beneficial use areas, resulting in localized elevation increases that are expected to result in the establishment of wetland vegetation. Therefore, the Project is projected to provide marsh creation benefits using both the diversion of fresh water and sediment, as well as through dredged material placement.

---

**Concern ID: 62009**

**The negative socioeconomic consequences would devastate southeast Louisiana, destroy people's livelihoods, displace people living near the diversion, and destroy property in the areas impacted by the proposed MBSD Project.**

**Response ID: 16207**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana, including impacts on population, property values, and community cohesion. As noted in these sections, the proposed Project would have both beneficial and adverse socioeconomic impacts on the people and communities within the Project area. Minor to moderate, permanent adverse socioeconomic impacts are expected to occur near the immediate outfall area outside of flood protection. Minor to moderate, permanent, beneficial socioeconomic impacts are expected to occur in the west bank New Orleans area north of the diversion. Moderate to major, beneficial, temporary impacts from job creation and economic activity in the proposed Project area are anticipated. In addition, the Socioeconomics Technical Report in Appendix H1 provides additional details on these projected effects.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the

---

interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the DWH oil spill.

The commenters' concern regarding the potential impacts of the diversion were considered by CPRA and the LA TIG in developing the Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included mitigation to address and offset some of the projected impacts of the Project on fisheries and surrounding communities outside levee protection including providing structural mitigation and stewardship measures for increased water levels that are projected to result due to the Project, such as raising roads or improving bulkheads. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

In communities south of the Project site outside of federal levee protection where the proposed Project is projected to cause increased water levels, CPRA plans to take one of two approaches. In Myrtle Grove, CPRA is planning to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision. By improving this bulkhead, CPRA would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions without the Project. See Table 1 in the Final Mitigation and Stewardship Plan for more details. CPRA plans to acquire a temporary right-of-way to permit improvement of the bulkhead, voluntarily or through eminent domain if necessary, from the property owners in the Myrtle Grove Marina Estates Subdivision.

In other communities south of the Project site outside of federal levee protection, from Woodpark south to the communities of Grand Bayou and Happy Jack, CPRA plans to elevate the portions of public roads outside of levee protection that provide access to each of these communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA

permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62029**

**The EIS describes immediate, major, and permanent adverse impacts on several critical species in the Barataria Basin, including shrimp and oysters. The health of commercial fisheries and the socioeconomic well-being of coastal communities are closely intertwined. Such impacts would inflict economic harm on businesses, families, and individuals.**

**Response ID: 16225**

The issues raised by the commenters were considered in the Draft EIS. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted. The EIS also acknowledges the importance of commercial fisheries to the Louisiana economy and communities, as described by commenters. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the

---

proposed Project on the economy of Louisiana and Section 4.14 Commercial Fisheries describes impacts to commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts to shrimp and oyster fisheries in the proposed Project area are anticipated under the Applicant's Preferred Alternative. Changes in abundance may exacerbate trends of aging fishers leaving the industry and would have adverse impacts on the overall fishery. Adverse impacts may be partially offset by changes in fisher behavior. Additional details on the regional and community level economic impacts on commercial fisheries due to the proposed MBSD Project can be found in Section 4.14 Commercial Fisheries.

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as

conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62031**

**The Draft EIS acknowledges that measuring economic and socioeconomic impacts over an extended period is an inexact science and particularly difficult to anticipate over long-time horizons. Yet, that is exactly what CPRA has done and what is captured and presented to the public in the Draft EIS. It also fails to build confidence in a project that claims to be based in such detailed and exact science.**

**Response ID: 16227**

Pursuant to NEPA, the EIS has been prepared to evaluate the anticipated impacts on the human environment from the proposed Project and reasonable alternatives to it, including No Action. Accurate, high-quality data and scientific analysis was used in the EIS, including input from agencies' own experts. The EIS makes this information available to the public and to decision makers. Although its forecasts of economic and socioeconomic impacts are not certain, the agencies have endeavored to prepare an EIS containing full disclosure of anticipated impacts, as well as all information necessary for the decision makers to understand the environmental consequences of their decisions. Where information is unavailable or incomplete, those data gaps are disclosed in the document.

Appendix R2 in the Final EIS includes CPRA's Monitoring and Adaptive Management (MAM) Plan, which was jointly developed by CPRA and its federal partners in the LA TIG. The MAM Plan provides flexible, science-based approaches to monitor and assess Project success as well as potential adaptive management actions to minimize impacts of the proposed Project and decision points that could lead to changes in management.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be

---

implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62035**

**Important assets like historical oyster reefs should be protected. Louisiana's coastal communities depend on the health of the estuaries for economic sustenance.**

**Response ID: 16229**

The EIS discusses impacts on the local communities and impacts on local fisheries from the proposed Project in Section 4.14 Commercial Fisheries, Section 4.15 Environmental Justice, and Section 4.13 Socioeconomics, including Community Cohesion (Section 4.13.5.6).

Consistent with the concern of the commenter, the EIS does find potential major, permanent, adverse impacts on subsistence fishing for communities from the proposed Project compared to the No Action Alternative (Section 4.15.4.2). Additional details on oysters and designated oyster grounds in the Project area can be found in Section 4.10.4.5, Key Species in Aquatic Resources. The proposed Project is expected to have major, direct, permanent, adverse impacts on oysters.

CPRA has developed mitigation and stewardship measures which include increased funding for creation of broodstock reefs, funding for creation of new oyster seed grounds, funding for enhancing public and private oyster reefs and increased funding to further develop alternative oyster culture methods, including off-bottom oyster culture. These are detailed in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as

---

conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62077**

**The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.**

**Response ID: 16242**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the

---

Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required

as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62078**

**The proposed MBSD Project would cause the loss of Louisiana shrimp, oyster, crab and finfish production which would impact the seafood based supply chain of southern Louisiana, including corresponding impacts on restaurants in New Orleans and southern Louisiana.**

**Response ID: 16243**

The impacts raised by the commenters were considered in the Draft EIS. The EIS acknowledges in Chapter 3, Section 3.14.7 in Commercial Fisheries that the seafood industry represents a major source of jobs and income in Louisiana, which includes commercial harvesters, seafood processors and dealers, seafood wholesalers and distributors, and retail sales. Chapter 4, Section 4.14 Commercial Fisheries discusses regional economic impacts and community impacts on the shrimp, oyster, crab, and finfish fisheries, noting that communities with a high reliance on these landings may be most heavily impacted, and that indirect effects may include impacts to fish license holders, crew, dealers, suppliers, and seafood processors. While availability of shrimp and oysters from the basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's Preferred Alternative than under the No Action Alternative. This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

---

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62079**

**Commenters are concerned that impacts similar to those caused by the fresh water from Bonnet Carré Spillway openings would affect fisheries in the Barataria Basin with the proposed MBSD Project.**

**Response ID: 16244**

The Project area for the MBSD EIS includes the Barataria Basin and the Mississippi River birdfoot delta. Existing operations and influences of rivers and diversions, including but not limited to the Bonnet Carré Spillway, were incorporated into the baseline conditions of the No Action Alternative and action alternatives assessed in the Draft EIS, Chapter 4 Environmental Consequences, Sections 4.2 through 4.24. Reasonably foreseeable future (but not existing) diversions, such as the Mid-Breton Diversion, were analyzed for impacts in combination with existing diversions and the proposed MBSD diversion in Chapter 4, Section 4.25 Cumulative Impacts.

A summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and to discuss their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS. Note that the Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological purposes.

---

**Concern ID: 62083**

**Commenters suggested that shrimping, fishing, and oysters would disappear in the Barataria Basin because of the fresh water diluting the salinity to a level that cannot sustain breeding of these species.**

**Response ID: 16247**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS described impacts of the proposed Project on finfish and shrimp and oyster species. As described, impacts may include those associated with changes in salinity. As summarized in EIS Section 4.14.5 in Commercial Fisheries, as compared to the No Action Alternative moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative sometime after 2050. While abundance of shrimp and oysters would decline under the Applicant's Preferred Alternative (as compared to the No Action Alternative), the EIS impact analysis does not anticipate shrimp and oysters would disappear from the basin. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)

- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project. Impacts related to subsistence activities are discussed in Section 4.15 Environmental Justice.

---

**Concern ID: 62102**

**Commenter suggested that USACE consider a recent study by LDWF regarding the principal commercial fisheries in Barataria Bay (An Assessment of the Principal Commercial Fisheries in Barataria Bay and Its Environs in April 2021) as part of its analysis of the Project.**

**Response ID: 16254**

The LDWF study was not available at the time that the Draft EIS was being developed; however, LDWF provided the agencies with the preliminary data that was included in the referenced report. The data was used in development of the Draft EIS discussion of commercial fisheries. The reference to the LDWF Barataria Bay fisheries data has been revised in the Final EIS to acknowledge its relationship to the published study.

---

**Concern ID: 62103**

**The Draft EIS does not fully address the anticipated destruction of multiple components of the commercial oyster fishery, including oyster habitat, off-bottom oyster farms, and the oyster hatchery at Grand Isle resulting from impacts to water quality and changes in salinity.**

**Response ID: 16258**

Impacts of the proposed Project on eastern oysters are discussed in the Aquatic Resources section of the EIS in Chapter 4, Section 4.10.4.5, Key Species. The section identifies that most adverse impacts on oysters are anticipated at mid-basin locations, while some beneficial impacts may occur in the lower basin, including the Grand Isle area. The off-bottom and hatchery components of the oyster fishery would not be affected by the Project, or may benefit from it. Specifically, the only significant off-bottom oyster fisheries in Barataria Basin occurs in the lower basin. As indicated in Chapter 3, Section 3.14.6, Aquaculture, the Mike Voisin Oyster Hatchery in Grand Isle is the only commercially available source of oyster larvae and seed. These areas could benefit from the Project. Final EIS Chapter 4, Section 4.14 Commercial Fishing has been revised to discuss these effects.

CPRA's Mitigation and Stewardship Plan includes measures to increase funding for the development of broodstock reefs, enhancing public and private oyster areas, creating a new public oyster seed ground and to further develop alternative oyster culture methods, including off-bottom oyster culture. See the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but

not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62194**

**The passage of a MMPA waiver in Congress would allow the Project to move forward without adhering to federal measures to protect dolphins, and puts money and greed above the welfare of citizens and animals.**

**Response ID: 15967**

The USACE had no role in seeking a waiver from Congress, nor did any LA TIG federal agencies. The MMPA waiver does not alter USACE's or the LA TIG's NEPA responsibility to evaluate anticipated impacts of the proposed Project on marine mammals. The EIS analyzes and discloses the environmental and economic impacts of the proposed Project, including anticipated effects on marine mammals (see Chapter. 4, Section 4.11 Marine Mammals).

Congress passed the Bipartisan Budget Act of 2018, Public Law 115-123 (BBA-18), which recognized the consistency of the proposed Project, among other CPRA projects, with the findings and policy declarations in Section 2(6) of the MMPA. The BBA-18 included a requirement that the Secretary of Commerce, as delegated to the Assistant Administrator of the NMFS, issue a waiver of the MMPA moratorium and prohibitions for the proposed Project. As directed by Congress, on March 15, 2018, NMFS issued the waiver pursuant to BBA-18 and Section 101(a)(3)(A) of the MMPA: "National Marine Fisheries Service hereby issues this waiver pursuant to title II, section 20201 of the Bipartisan Budget Act of 2018 and section 101(a)(3)(A) of the MMPA for the three named projects, as selected by the 2017 Louisiana Comprehensive Master Plan for a Sustainable Coast. The requirements of sections 101(a) and 102(a) of the MMPA do not apply to any take of marine mammals caused by and for the duration of the construction, operation, or maintenance of the three named projects."

BBA-18 also required the State of Louisiana, in consultation with the Secretary of Commerce (delegated to NMFS), to the extent practicable and consistent with the purposes of the proposed Project, to minimize impacts on marine mammal species and population stocks, and monitor and evaluate the impacts of the proposed Project on such species and population stocks.

More information on the waiver can be found at <https://www.fisheries.noaa.gov/action/marine-mammal-protection-act-waiver-select-louisiana-coastal-master-plan-projects>.

---

**Concern ID: 62221**

**The Project would not provide substantial protection from hurricanes or storm surge, nor would storm surge protection be provided in a timely manner. The area most likely**

**to experience some increase in protection would be subject to increased water levels from diversion operations. The current diversion Project needs to be reengineered to create meaningful storm surge protection. The Project is a misuse of funds based on what the diversion would do versus what it purports to do, in part due to the Mississippi River not having enough sediment to build substantial land.**

**Response ID: 15756**

While the proposed Project would impact storm surge, the purpose and need of the Project is not storm surge protection. As described in the Draft EIS in Chapter 1, Section 1.4 Purpose and Need, the purpose of the Project is to restore injuries caused by the DWH oil spill and help restore habitat and ecosystem services injured by the spill by reestablishing deltaic processes. However, as described in the Draft EIS in Chapter 4, Section 4.20.4 Public Health and Safety, the Project would have the ancillary benefit of storm damage risk reduction on communities north of the diversion due to the creation and maintenance of wetland habitat within the delta formation area; the increase in topography and land acreage would induce greater hydraulic friction and resistance, reducing the inland extent of storm surge and limiting wave heights in some communities north of the diversion, as compared to the No Action Alternative. The EIS acknowledges that storm surge and wave height reduction benefits for some communities north of the diversion would not be instantaneous, but that these benefits would increase over time as more land is created and maintained within the delta formation area. The EIS also acknowledges that some of the same communities that would experience storm surge reduction benefits, such as Lafitte, would experience an increase in non-storm inundation frequency due to increased water levels from diversion operations. At the same time, operation of the Project would have permanent, minor to moderate, adverse impacts on storm hazards in communities south of the diversion, with anticipated increases in storm surge of up to 1.7 feet near Myrtle Grove (as compared to the No Action Alternative). Section 4.20.4.2.2.2 in Public Health and Safety of the Final EIS has been revised to include additional information and figures further explaining the impacts of the Project on storm surge and wave height.

The EIS recognizes the role of sediment load in land building. The river still carries a massive sediment load, but not as massive as it historically carried. As explained in Chapter 3, Section 3.4.2.5 in Surface Water and Coastal Processes, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes as described in Section 3.4.2.5 Sediment Transport. The Delft3D Basinwide Model used Mississippi River sediment loads when computing the sediment load that would be delivered to the Barataria Basin. This is described in detail in the EIS, Appendix E Delft3D Modeling, Section 5.2.2.

---

**Concern ID: 62416**

**Louisiana's oystermen and women have been champions of protecting and restoring our damaged coastal environment for decades, investing their own funds and resources through building cultch and coastal water bottoms which demonstrates their commitment to a common goal they can share with CPRA and others.**

**Response ID: 15867**

Commenter's input is noted.

---

**Concern ID: 62418**

**Louisiana's oystermen and women have long been among the most active advocates for saving and restoring our coast. And, while they support broader efforts to restore the wetlands and to provide for coastal flood protection, those who live and work in our coastal communities and depend on the natural fisheries and wildlife resources of Louisiana's estuaries, and whose culture is intertwined with those resources, deserve to have the guarantee that all efforts would be taken to preserve these natural renewable resources for generations to come.**

**Response ID: 15950**

The Draft EIS evaluates how the proposed Project would impact commercial, recreational, and subsistence fishers as compared to No Action/No Action conditions in Chapter 4, Sections 4.10 (Aquatic Resources), 4.14 (Commercial Fisheries), 4.15 (Environmental Justice) and 4.16 (Recreation and Tourism).

In response to public comments and resource agency input about the proposed mitigation efforts, CPRA has expanded and refined the oyster mitigation and stewardship measures. CPRA's mitigation and stewardship strategies and associated expenditures would focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to oyster fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for oysters in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to oyster fisheries in the early years of the Project's operational life. The revised mitigation and stewardship measures include allocating \$4 million to establish new public seed grounds, \$15 million to enhance public and private oyster grounds, \$4 million to enhance broodstock reefs and \$8 million for alternative oyster culture.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section

---

10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62419**

**The pursuit of Multiple Lines of Defense strategy and coastal protection at all costs has had negative impacts on the State's commercial fishing, shrimping and oystering communities, doing far more damage to the state's economy and coastal employment than any lasting good to our coastal infrastructure.**

**Response ID: 15861**

Comment noted. Chapter 4, Section 4.14.4.2 of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative, primarily by accelerating by decades the decline of species abundance that would also be anticipated under the No Action Alternative. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

---

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62420**

**Commenter requested that all who share their concerns about the detrimental, unintended but very real consequences of the proposed Project make their voices heard by commenting at CEMVN- Midbarataria@usace.army.mil.**

**Response ID: 15868**

Comment noted.

---

**Concern ID: 62634**

**The proposed Project would cause excessive harm to fisheries (for example, oysters and brown shrimp), dolphins, communities and recreational uses, which is unacceptable and would make its implementation a clear violation of OPA. OPA regulations states that proposed restoration actions should be evaluated by “the extent to which each alternative will prevent future injury as a result of the incident, and avoids collateral injury as a result of implementing the alternative”. Because the Project would injure species that were harmed by the Deepwater Horizon oil spill, it should not be implemented, even if it does benefit some habitats and species. Some commenters argued it was also inconsistent or in violation of the 2013 U.S. Court Consent Decree and the BP plea agreement relevant to the National Fish & Wildlife Foundation (NFWF) funds.**

**Response ID: 16650**

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is not evaluating the proposed Project for compliance with OPA and not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG's Draft Restoration Plan, OPA, or NRDA processes represent solely the views of the LA TIG, not USACE.

The potential collateral injuries of the proposed Project were considered in the LA TIG's Draft Restoration Plan.

OPA requires that Trustees develop and implement a plan for restoration, rehabilitation, replacement, or acquisition of the equivalent, of the injured natural resources under their trusteeship. See 33 U.S.C. § 2706(c). OPA further requires federal agencies to propose regulations for the “assessment of natural resource damages.” See § 2706(e). Under 2707(e)(2), any assessment of natural resource damages made in accordance with these regulations creates a rebuttable presumption on behalf of a Trustee in any administrative or judicial proceeding under the Act.

As required by OPA 2706(e), NOAA developed regulations outlining a process for the assessment of natural resource damages. These regulations (hereinafter “NRDA regulations” at 15 CFR Part 990) also include a process for restoration planning, including the development and evaluation of restoration alternatives.

The 2016 U.S. Consent Decree with BP provides that monies received under the settlement for natural resource damages will be spent as outlined in restoration plans adopted by the Trustees consistent with 15 CFR 990. See Paragraph 19, and Appendix 2. The LA TIG's Restoration Plan is consistent with 15 CFR 990.

Title 15 CFR §990.54 of the regulations outlines a number of areas in which a reasonable range of alternatives should be evaluated to select the preferred alternative. Recognizing that almost all restoration comes with some potential for collateral injury, one factor for evaluation is the extent to which each alternative will prevent future injury and avoid collateral injury. The potential for collateral injury does not preclude an alternative from selection, rather the Trustees must evaluate each alternative under multiple factors, and select a preferred alternative to meet the outlined restoration objectives.

The LA TIG, in selecting the Preferred Alternative in the Restoration Plan, evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 (Identification of a Preferred Alternative), 3.2.1.5 (Alternative 1 – Avoids Collateral Injury), and 3.2.2.5 (Alternatives 2–6 – Avoids Collateral Injury) of the Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems and necessarily entails reverting the current ecosystem to a more natural state that was altered when Mississippi River flows were cut off by construction of levees. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the Preferred Alternative in the Restoration Plan.

The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Alternative 1 – Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as the Preferred Alternative in the Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal,

and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project would meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the spill.

The BP Plea Agreement as it applies to NFWF funds is not relevant here as the LA TIG is not authorizing the use of those funds for this Project. Even if it were applicable, the criminal plea agreement expressly contemplates the use of criminal penalties for sediment diversion in Louisiana.

---

**Concern ID: 62660**

**Commenters stated that the proposed Project will not provide the benefits described in the Draft Restoration Plan and EIS. The proposed Project will not stop the problems of sea-level rise and marsh erosion.**

**Response ID: 16633**

How sea-level rise and marsh erosion would affect the proposed diversion's land-building capability has been considered in the Draft EIS in Chapter 4, Section 4.2.3.2 Operational Impacts in Geology and Soils. In addition, sea-level rise and subsidence are explicitly accounted for in the Delft3D Basinwide Model projection of Project impacts, as described in Sections 3.2.4 and 3.2.3, respectively, of EIS Appendix E (Delft3D Modeling).

The potential benefits of the Project and how those benefits relate to sea-level rise and marsh erosion have also been considered in the LA TIG's Draft Restoration Plan. The LA TIG agrees that the Project would not stop sea-level rise, subsidence or other erosive forces that result in marsh erosion. However, the Project is designed to counteract these forces by transporting sediment from the Mississippi River to create thousands of acres of marsh that would be sustained over decades, even in the face of erosion and rising sea levels (see Section 3.2.1.6 [Benefits Multiple Resources] in the Restoration Plan).

---

**Concern ID: 62666**

**It would be inappropriate, and contrary to the stated purpose of restoring injured resources, to use DWH settlement funds to implement a project that would harm the same wildlife (for example, shrimp, oysters, bottlenose dolphins, *Spartina alterniflora*) and ecological services that were negatively affected by the oil spill.**

**Response ID: 16625**

USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore the damage caused by the DWH oil spill. USACE's involvement with the proposed Project is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under the CWA Section 404 and RHA Sections 10 and 14 (33 USC Section 408). USACE is not executing any DWH restoration actions under the OPA. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH spill in the Louisiana Restoration Area. As explained in the Final EIS, Appendix B2 DEIS Public Review and Public Meetings, Section 2.0 Agency Roles in the Responses to Public Comments, response content pertaining to the LA TIG's Draft Restoration Plan, the OPA

---

and/or NRDA processes or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views.

In the Restoration Plan, the LA TIG explained that the DWH oil spill resulted in the oiling of more than 1,100 kilometers of wetlands, nearly all of which were located in coastal Louisiana (DWH NRDA Trustees, 2016). The heaviest oiling occurred in the Barataria Basin, resulting in substantial injuries to natural resources in the basin (DWH NRDA Trustees, 2016).

Recognizing that the resulting loss of marsh productivity affected resources throughout the northern Gulf of Mexico ecosystem, the State of Louisiana and the federal Trustees that negotiated the DWH Natural Resource Damages settlement allocated \$4 billion, almost half of the total settlement amount, to restoring Louisiana's wetland, coastal, and nearshore habitats.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree of collateral injuries, to natural resources injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the LA TIG's Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, as noted in the LA TIG's Restoration Plan, without the proposed Project, sea-level rise, subsidence, and other existing stressors would result in additional marsh loss over time reducing the suitability of habitat for many of the same species.

The LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing a deltaic process, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Final Restoration Plan because the LA TIG believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the NRDA Trustee's Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

In its Strategic Restoration Plan for Barataria Basin (2018), the LA TIG evaluated the potential and extent of collateral injury for a range of restoration techniques. Unfortunately, almost all large-scale restoration comes with some potential for collateral injury. The LA TIG evaluated

each alternative against a variety of factors, including those outlined in 15 CFR §990.54. In the Restoration Plan, the LA TIG strives to identify an alternative that would provide what it considers the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. Again, see Section 3.2.4 of the Restoration Plan for a discussion of how the LA TIG came to its decision.

In recognition of the potential for collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA will implement a suite of stewardship measures (see Section 3.2.1.1.5 [Associated Stewardship Measures] of the Restoration Plan and Appendix R1 to the EIS). The LA TIG is also committed through these measures to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62690**

**The proposed Project would destroy the ecosystem and its flora and fauna, including oyster, shrimp, crabs, fish, sea turtles, and dolphins.**

**Response ID: 16073**

As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts

---

anticipated to those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts on the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. For example, the decrease in salinity that would occur upon initial operation of the proposed Project would result in major adverse impacts on various species (oysters, brown shrimp, bottlenose dolphins) over a relatively short period of time; however, the accumulating fresh water and sediments would create or maintain wetlands over long-term or permanent basis (that is, extending through the remainder of the 50-year period of analysis) which would benefit other commercially or recreationally important aquatic species such as white shrimp, blue crab, and Gulf menhaden, and would increase storm protection for communities north of the immediate outfall area; the Delft3D Basinwide Model projects these benefits to increase over time and to be greatest in the 2060s (see Chapter 4, Sections 4.6.5.1 in Wetland Resources and Waters of the U.S., 4.10.4.5 in Aquatic Resources, 4.11.5.2 in Marine Mammals, and 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction). As discussed in Section 4.12.2.2 Sea Turtles, the proposed Project would have negligible to minor adverse impacts on hawksbill and leatherback sea turtles, but minor to moderate adverse impacts on Kemp's ridley, green, and loggerhead sea turtles due to the potential for increased interactions between sea turtles and commercial shrimp fishing efforts, if shrimp and shrimp fishers move from mid-basin locations to locations lower in the basin or in nearshore/offshore waters (where more sea turtles would be present). However, NMFS has determined that these impacts would not jeopardize the continued existence of sea turtles (see Appendix O4 NMFS Biological Opinion of the Final EIS).

The USACE and the LA TIG are evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the LA TIG's Restoration Plan). The intended restoration of fresh water flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions in the basin. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin. The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit

many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. The LA TIG's Restoration Plan indicates that by reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Final Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the NRDA Trustees' Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

The CPRA has revised its Mitigation and Stewardship Plan and Monitoring and Adaptive Management (MAM) Plan in response to public concerns about these impacts. See Appendices R1 and R2 to the Final EIS for more information.

---

**Concern ID: 62692**

**The proposed Project would introduce or facilitate the spread of invasive species (for example, carp, zebra mollusks, apple snails, Asian clams, water hyacinth, giant salvinia, hydrilla, nutria, northern snakehead) and freshwater pathogens to the basin, which could affect other living resources and impede navigation.**

**Response ID: 16074**

The commenter correctly notes the potential for the proposed Project to introduce or facilitate the spread of invasive species from the Mississippi River into the Barataria Basin and resulting from the alteration of existing habitat characteristics, which is consistent with discussions in the EIS in Chapter 3, Section 3.10.6 and Chapter 4, Section 4.10.4.6 in Aquatic Resources; Sections 3.6.3 and 4.6.5.2 in Wetland Resources and Waters of the U.S.; and Sections 3.9.4 and 4.9.4.2 in Terrestrial Wildlife and Habitat. The sections in Chapter 4 also identify how the introduction or spread of invasive species may negatively impact other living resources. The northern snakehead is not currently known to occur in Louisiana; however, if its presence is later identified in the Mississippi River, its introduction or spread via the proposed Project would result in similar impacts on the environment as those described in Section 4.10.4.6 Aquatic Invasive Species of the EIS. The potential introduction of pathogens (specifically, fecal coliform [not typically pathogenic, but an indicator for other pathogenic bacteria] and Enterocci) is discussed in Section 4.5.5.8 Fecal Coliform; a discussion of fecal coliform has been added to Section 4.10.4.4.2.5 Dissolved Oxygen of the Final EIS. Section 4.10.4.6.2.1 Aquatic Invasive Species has also been supplemented to discuss potential threats to navigation in the Final EIS.

---

**Concern ID: 62711**

**Sedimentation from the proposed Project would completely silt over oysters, resulting in 100 percent mortality in areas directly impacted.**

**Response ID: 16089**

As discussed in Chapter 4, Sections 4.10.4.4 and 4.10.4.5 in Aquatic Resources of the Draft EIS, portions of the Little Lake Public Oyster Seed Ground (POSG) would experience substantial sedimentation over time, likely converting hard substrates to soft bottom in those areas over time. However, the Little Lake POSG is not currently a productive oyster reef and the areas with live/productive oyster reef (further south) would experience less sedimentation from the proposed Project, and at rates that the oyster reef/oysters would be expected to survive.

To address some projected adverse Project impacts, CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see CPRA's Mitigation and Stewardship Plan in Appendix R1 of the Final EIS). CPRA's mitigation and stewardship measures aimed at oyster impacts include establishment of new oyster seed grounds in appropriate areas of the basin, enhancing existing public and private seed ground, enhancement of broodstock reefs, and funding to support off-bottom oyster culture. Although not being implemented to mitigate the effects of the MBSD, the LA TIG also continues to address oil spill related injuries to oysters through various non-Project-related restoration/fishery improvement actions, including: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, and the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62767**

**Reefs provide both ecological and economic benefits. Ecological benefits result from the water quality, erosion prevention and stabilization, and habitat services provided by reefs (Wilber 2002).**

**Response ID: 16145**

The benefits of oyster reefs are qualitatively discussed in Chapter 3, Section 3.10.5.2.11 Eastern Oysters; however, this section has been supplemented in the Final EIS with the identified reference (Wilber 2002) to further clarify the benefits of oyster reefs.

---

**Concern ID: 62769**

**River water contains industrial and biological pollutants which could degrade water quality within the estuary and would adversely affect all marine life.**

**Response ID: 16147**

Chapter 4, Sections 4.5.5.3 through 4.5.5.9 in Surface Water and Sediment Quality of the EIS discuss anticipated changes in chemical concentrations in the Barataria Basin due to the proposed Project. The general impacts of certain chemical compounds/nutrients on aquatic resources are discussed in Section 4.10.4.4 in Aquatic Resources. Other potential contaminants, including sulfate, atrazine, and fecal coliform were also modeled and discussed in Sections 4.5.5.7 and 4.5.5.9. The Draft EIS concludes that the proposed Project would result in beneficial decreases in sulfate and would have negligible impacts on atrazine levels. Sulfate and atrazine are therefore not specifically discussed in Section 4.10 Aquatic Resources; however, a discussion of fecal coliform has been added to Section 4.10.4.4.2.5 Dissolved Oxygen of the Final EIS.

Additionally, Appendix R2 in the Final EIS includes CPRA's Monitoring and Adaptive Management (MAM) Plan, which includes monthly fecal coliform monitoring (Section 3.7.5.1) and periodic sampling for Contaminants of Concern in fish, shellfish, and wildlife (Section 3.7.3.23).

At the time of publication of the Draft EIS for public review, the MAM Plan (Appendix R) contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62770**

**The commenters' concerns regarding this proposed diversion are rooted in other similar experiences. The PDARP/PEIS indicated "collateral injuries" to estuarine organisms such as oysters and brown shrimp, Mardi Gras Pass decimated oyster reefs, and high-volume diversions (natural or man-made) have obliterated marsh grass and the natural ecology in impacted areas.**

**Response ID: 16148**

As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS, the impact of the proposed Project on brown shrimp and oysters is anticipated to be major and adverse, due in part to salinity changes. Conversely, the proposed Project is anticipated to have a major beneficial impact on wetlands in the Barataria Basin from the diversion of sediment and fresh water. A summary of select natural and man-made diversions in southeastern Louisiana, including Mardi Gras Pass, has been developed to compare the purpose and/or characteristics of these diversions and their recorded impacts on the natural environment, including estuarine organisms and marsh grasses to the proposed MBSD Project. This summary is available in Appendix U Summary of Select Natural and Man-made Diversions in Southeastern Louisiana of the Final EIS.

The LA TIG's Final Restoration Plan recognizes the potential collateral injuries that could result from the proposed Project. In selecting the LA TIG's Preferred Alternative, the LA TIG evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 (Identification of a Preferred Alternative), 3.2.1.5 (Avoids Collateral Injury), and 3.2.2.5 (Avoids Collateral Injury) of the LA TIG's Final Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project under OPA and this is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems and which necessarily entails re-introducing freshwater flows that had historically characterized the Barataria Basin before construction of levees.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the LA TIG's Preferred Alternative.

The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which includes providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in

---

the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the spill.

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

At the time of publication of the Draft EIS for public review, the Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan (Appendix R) contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as

conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62779**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the fishing industry.**

**Response ID: 16361**

The commenter's opposition to the proposed Project is noted. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5 in Commercial Fisheries, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated from the proposed Project, primarily by accelerating the decline of species abundance that is also anticipated under the No Action Alternative after the year 2050. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently

contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement.

Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

---

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62781**

**Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.**

**Response ID: 16363**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 62783**

**Commenters noted that the cost of designing and building the proposed MBSD Project is too high for the small amount of land anticipated to be built.**

**Response ID: 16365**

The commenter's opposition to the cost of the proposed Project is noted. Under NEPA, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that the permit applicant has conducted its own economic evaluation of a proposed project. Consequently, a cost-benefit analysis is not relevant to USACE's permitting decisions. As part of evaluating the proposed Project, the LA TIG considered the costs associated with developing, constructing, and managing the Applicant's Preferred Alternative consistent with the Restoration Plan alternatives evaluation criteria in 15 CFR §990.54. This discussion is in Chapter 3, Section 3.2.1.2 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan.

---

**Concern ID: 62785**

**This type of freshwater and sediment diversion project is unproven and there are uncertainties with respect to what the diversion would do (that is, if it would work and, if so, to what extent).**

**Response ID: 16367**

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties have been incorporated into the EIS impact conclusions and were briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties.

Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or as predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the projected changes for the No Action Alternative.

In addition to the modeled data, Chapter 4 Environmental Consequences of the EIS includes additional analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in drafting the EIS. In response to public comments, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The LA TIG recognizes and acknowledges that a controlled sediment diversion of this scale has not been constructed in Louisiana previously. However, a sediment diversion at this location has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Chapter 3, Section 3.2.1.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan). The proposed Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management [MAM] Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or

adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62792**

**CPRA is using soundbites and marketing to convince the Louisiana public and legislature to allow them to dole out contracts for over \$2 billion in limited coastal restoration dollars on these projects. In reality, Barataria Bay is already connected to the river with existing diversions at Davis Pond, West Pointe à la Hache, and Naomi.**

**Response ID: 16373**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, the Draft EIS assesses the environmental and socioeconomic impacts of the proposed Project. To the extent construction spending would serve as an economic driver, those anticipated impacts are discussed in Chapter 4, Section 4.13.4.2 Economy, Employment, Business, and Industrial Activity. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Delft3D Basinwide Model, which was used in developing the proposed MBSD Project EIS, accounts for the existing diversions at Davis Pond, West Pointe a la Hache, and Naomi (see Appendix E [Delft3D Modeling], Section 5.1.1 of the EIS).

The USACE is neither a proponent nor an opponent of the proposed Project. It will make its decisions regarding the proposed Project based on the evaluations in the EIS and considering public comments and its determinations with respect to the public interest review, compliance with the CWA Section 404(b)(1) guidelines, compliance with other laws and Executive Orders, whether the Project would affect the ability of Corps projects to meet their authorized purposes and whether the project is injurious to the public interest. USACE's decisions will not be based in any respect on CPRA's public communications regarding the proposed Project.

---

**Concern ID: 62794**

**This poorly planned and executed proposed Project is being pushed forward for the financial gain of politicians and contractors because taxpayer dollars are being used. Private investment dollars would entail more deliberation and a full impact study, including more natural options with less risk and more overall benefits.**

**Response ID: 16375**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance and constitutes a full impact analysis. A variety of alternatives assessed in the EIS are identified in Chapter 2 Alternatives. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

The LA TIG's Restoration Plan evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG has selected Alternative 1 as the LA TIG's Preferred Alternative.

**Concern ID: 62797**

**Commenters questioned the goals and objectives for this Project. They noted that, given the potential for environmental and economic impacts on other resources from this Project, whether the MBSD meets the NRDA criteria to restore for damages caused by the DWH oil spill. They also questioned whether the proposed Project would be appropriate, given that the main driver of wetland loss is historical coastal oil and gas development, not the oil spill. They noted that 80 percent of the acreage projected to be reclaimed or built through the MBSD is privately owned by oil and gas companies.**

**Response ID: 16606**

USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore the damage caused by the DWH oil spill. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH spill in the Louisiana Restoration Area. As explained in the Final EIS, Appendix B2 DEIS Public Review and Public Meetings, Section 2.0 Agency Roles in the Responses to Public Comments, response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes, or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views.

In the Restoration Plan, the LA TIG explained that the DWH oil spill resulted in the oiling of more than 1,100 kilometers of wetlands, nearly all of which were located in coastal Louisiana (DWH NRDA Trustees, 2016). The heaviest oiling occurred in the Barataria Basin, resulting

in substantial injuries to natural resources in the basin (DWH NRDA Trustees, 2016). Recognizing that the resulting loss of marsh productivity affected resources throughout the northern Gulf of Mexico ecosystem, the State of Louisiana and the federal Trustees that negotiated the DWH Natural Resource Damages settlement allocated \$4 billion, almost half of the total settlement amount, to restoring Louisiana's wetland, coastal, and nearshore habitats. The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree of collateral injuries, to natural resources injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the LA TIG's Restoration Plan). The intended restoration of fresh water flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, as noted in the LA TIG's Restoration Plan without the proposed Project, sea-level rise, subsidence, and other existing stressors would result in additional marsh loss over time reducing the suitability of habitat for many of the same species that occur in Barataria Basin.

The LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative because the LA TIG believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

In its Strategic Restoration Plan for Barataria Basin (2018), the LA TIG evaluated the potential and extent of collateral injury for a range of restoration techniques. Unfortunately, almost all large-scale restoration comes with some potential for collateral injury. The LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54. In the Restoration Plan, the LA TIG strives to identify an alternative that would provide what it considers the right balance in terms of being cost-appropriate, meeting LA TIG goals, having

a high likelihood of success, and avoiding collateral injury. Again, see Section 3.2.4 of the Restoration Plan for a discussion of how the LA TIG came to its decision.

In recognition of the potential for collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA would implement a suite of mitigation and stewardship measures (see Section 3.2.1.1.5 [Associated Stewardship Measures] of the Restoration Plan and Appendix R1 to the EIS). The LA TIG is also committed through these measures to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The LA TIG acknowledges the concern regarding wetland loss drivers related to oil and gas activity, as well as the concern over the private ownership of the lands upon which wetlands would be created by the proposed Project. Regardless of the historic drivers of wetland loss, as explained in the Strategic Restoration Plan for Barataria Basin, because the Barataria Basin received the heaviest oiling from the DWH oil spill, the LA TIG believes that restoration activities in that basin are imperative.

With regard to the land ownership issue, the LA TIG's Restoration Plan details the reasoning supporting the location of the proposed Project, which is based on optimizing land building within the basin, regardless of ownership of the underlying land (see Section 2.3.3 [Restoration Planning Process – Proposed MBSD Project Location Alternatives] in the Restoration Plan). Private lands in the outfall area would be subject to the regular permitting processes required to conduct activities in the coastal zone. Activities on private lands would need to be in conformity with the Louisiana Coastal Zone Management Program, La. R.S. 49:214.21 and would be required to comply with the permitting requirements under the program. All coastal use permitting under the program must be consistent with the CPRA Master Plan projects. Additionally, private landowners would be required to comply with any other permitting requirements applicable to the area, including Department of the Army (DA) CWA Section 404 permits.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the DA Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62814**

**Strongly held concerns regarding the proposed Project are well documented by scientific studies including the USACE's own body of work such as Pictorial Account and Landscape Evolution of the Crevasses near Fort St. Philip Louisiana and USACE Perspective on Mississippi River Sediment Diversions. The USACE and other scientific studies by Howes and others, which are based on empirical data and not conjecture, show that this proposed Project would most likely negatively impact the environment and residents who depend on it.**

**Response ID: 16387**

The EIS evaluates both beneficial and adverse impacts of the proposed Project and includes a full and fair discussion of significant environmental impacts. In preparing the EIS, USACE utilized both its own high-quality information and information from other sources and ensured the professional and scientific integrity of the analyses. Of the references identified by the commenter, no specific study for Howes was provided for consideration. In addition, the "USACE Perspective on Mississippi River Sediment Diversions" was a presentation developed by the USACE during early Project planning. While the presentation was not used as a specific reference for the Draft EIS, multiple references used to create the presentation were. While the report discussing the Fort St. Philip crevasses (Suir et al., 2014) was not referenced in the Draft EIS, it has been reviewed and incorporated into the Final EIS, as part of the new Appendix U, described below.

A summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and to discuss their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS and includes an assessment of the crevasses near Fort St. Philip.

---

**Concern ID: 62815**

**Some commenters believe that CPRA has not listened to the experienced oyster community regarding the adverse impacts of the proposed Project and have presented very limited Project options to the people of Louisiana and to the USACE.**

**Response ID: 16388**

The Project's impacts on oysters and oyster habitat are evaluated in the Draft EIS in Chapter 4, Section 4.10.4.5 Key Species. The Project's impacts on oyster fishing are evaluated in Section 4.14.4.2 in Commercial Fisheries. Alternatives to the proposed Project are discussed in Chapter 2 Alternatives.

According to the LA TIG, CPRA and LDWF worked together with numerous oyster fishers as part of Louisiana Sea Grant's Seafood Futures Initiative to develop mitigation and stewardship measures aimed at maintaining a sustainable oyster fishery. In addition, CPRA

---

engaged the fishing community potentially impacted by the proposed Project through public meetings to solicit input on mitigation and stewardship strategies and engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures from affected fishers. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62824**

**A commenter asked for an explanation of why the State of Louisiana encouraged Congress to exempt the proposed MBSD Project and the Mid-Breton Diversion from the MMPA. Further, the commenter was not sure how the proposed Project could be funded by the DWH restoration settlement if those funds are to be allocated to address damage inflicted on Louisiana's fisheries and resources (including dolphins).**

**Response ID: 16394**

Chapter 3, Section 3.11.1 Marine Mammals in the Northern Gulf of Mexico of the Final EIS has been revised to discuss the Marine Mammal Protection Act waiver that was issued for the proposed Project.

USACE does not have information on the reasons for the State of Louisiana's support for legislation related to the MMPA waiver. As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is neither a proponent nor an opponent of the proposed Project. USACE's involvement with the proposed Project is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under the CWA Section 404 and RHA Sections 10 and 14 (33 USC Section 408). USACE is not a member of the LA TIG and is not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG's Draft Restoration Plan, or NRDA processes have been addressed solely by the LA TIG and represents the views only of the LA TIG, not USACE.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources injured by the spill. See Executive Summary and Chapter 3, Section 3.2.1.5 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan. The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin." The proposed Project will not stop all of that marsh loss; however, it is projected to create and maintain approximately 9,800 acres more than the No Action Alternative at year 2070 (see Table 4.6-4 of the EIS).

For its Restoration Plan decision, the LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Chapter 3, Section 3.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG has found that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem. The LA TIG selected the proposed Project because the LA TIG has found it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

In its Strategic Restoration Plan for Barataria Basin (March 2018), the LA TIG evaluated the potential and extent of collateral injury for a range of restoration techniques. Unfortunately, almost all large-scale restoration comes with potential for collateral injury. The LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR, §990.54. In the LA TIG's Final Restoration Plan, the LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. Again, see Chapter 3, Section 3.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan for a discussion of how the LA TIG came to its decision.

In recognition of the potential for collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA would implement a suite of stewardship measures in recognition of the collateral injury that is anticipated to result from the implementation of the proposed Project. See Section 3.2.1.1.5 (Associated Stewardship Measures) of the LA TIG's Restoration Plan, and Appendix R1 (Mitigation and Stewardship Plan) of the Final EIS. The LA TIG is also committed to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. [CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input.](#) The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 62852**

**CPRA's mitigation proposal is inadequate and the commenters implore the USACE to consider the complete cost of the negative impacts as part of the total cost of the proposed Project before allowing this plan to advance.**

**Response ID: 16398**

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. NEPA does not require that a cost-benefit analysis be included in the EIS unless it is relevant to an agency's decision. USACE generally assumes that a permit applicant has performed its own economic evaluation of the proposed project and therefore does not consider a financial justification analysis for its permit decisions. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

CPRA expanded and refined its Final Mitigation and Stewardship Plan (Appendix R1 of the Final EIS) in response to community and resource agency input. Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be

implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 62986**

**The Project would drive decreases in salinity that would reduce the overall health, survival, and reproduction of bottlenose dolphins that reside in the Barataria Basin, a species that was negatively affected by the Deepwater Horizon oil spill (NMFS, 2013). Some commenters felt that because of this, the Project should either not move forward or its operation should be altered.**

**National Marine Fisheries Service (NMFS). 2013. Roy Crabtree (NMFS) to Elizabeth Davoli (CPRA). <https://s3.documentcloud.org/documents/726710/national-marine-fisheries-service-comments-on.pdf>**

**Response ID: 16701**

The concerns raised by the commenters about the projected decreases in salinity and resulting effects on Barataria Bay dolphins were considered in the Draft EIS. More specifically, Chapter 4, Section 4.11.5.2 in Marine Mammals of the EIS acknowledges that the proposed Project would likely have significant, adverse impacts to Barataria Basin dolphins, a species that suffered significant impacts from the DWH oil spill. This section also discusses the physiological changes caused by exposure to low-salinity water, the duration of those changes that leads to mortality, and the anticipated mortality of a large portion of the dolphin population in the Barataria Basin within the first decade. These sections of the EIS provide a more in-depth analysis of potential impacts to dolphins than the letter cited by the commenter.

The concerns raised by the commenters were also considered in the LA TIG's Draft Restoration Plan (see Section 3.2.1.5 [Collateral Injury]); the Final Restoration Plan has been edited consistent with changes made to the Final EIS and see below regarding new, related content included in Appendix R.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources, like dolphins, that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible (if it is possible), the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins in Louisiana (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review,

Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63015**

**There are misrepresentations in the EIS about how nutrients in the river would spread out far from the sand deposition area to lower plant biomass belowground. Increasing nutrient loads from diversions would weaken soils, not strengthen soils.**

**The modern Mississippi River has nutrient concentrations that are much higher than when the mostly organic soils were created centuries ago (Turner et al. 2007) and may weaken soils by 30 percent, resulting in less belowground biomass, and change vegetation from being comprised of perennials to annuals (Turner et al. 2011). Increased flooding inundation, which is a consequence of river diversions, also weakens the belowground biomass of wetland plants (Morris et al. 2017) that may erode during high water events or from hurricanes (Kearney et al. 2011, Howes et al. 2010). Individual roots become weaker when exposed to ambient levels of nutrients found in the river (Hollis and Turner 2019a, b; Hollis and Turner 2021). The soil becomes degraded, accumulates less biomass, and decomposes and erodes faster (Swarzenski et al. 2008, Hebert et al. 2020). The diversion of river water into the nearby marshes would almost certainly weaken soils, making them less resistant to wave energy and hurricanes. A striking example is the net loss of wetlands in the Davis Pond Diversion where increased land loss occurred beginning the year after the diversion opened (Turner et al. 2019). This is an area that has no significant sediment input.**

**Response ID: 16028**

The literature cited by the commenters has been reviewed, including Turner et al. 2007, Turner et al. 2011, Morris et al. 2017, Kearney et al. 2011, Howes et al. 2010, Hollis and Turner 2019, Swarzenski et al. 2008, Hebert et al. 2020, Turner et al. 2019, and Mo et al. 2020, and Chapter 4, Section 4.6.5.1.2 Applicant's Preferred Alternative of the Final EIS has been revised to include additional analysis regarding the impact of nutrient input from the proposed Project on vegetation communities and soil shear strength.

**Concern ID: 63062**

**Early model runs used in the Draft EIS predicted accelerated loss of the brackish marsh in the first 10 to 60 days as these delicate plants cannot tolerate voluminous river water inundation.**

**Response ID: 16068**

Chapter 4, Section 4.6.5.1.2.4 Land Accretion of the Final EIS has been revised to include additional analysis regarding the loss of some wetlands in the immediate outfall area due to scouring and inundation during the initial period following commencement of operations.

**Concern ID: 63067**

**The majority of the bottlenose dolphin population of this area will be destroyed... not just killed but sentenced to a horrific death. Freshwater releases at Bonnet Carré Spillway in 2019 resulted in an unusual mortality event (UME), demonstrating the harm that freshwater releases can cause to dolphins. A study by the Galveston Bay Dolphin Research Program also found that dolphins in upper Galveston Bay developed skin lesions after flooding from Hurricane Harvey. Additional studies further support the harm that the diversion could cause by demonstrating negative impacts to dolphins from exposure to low-salinity conditions (Deming and Garrison, 2021; Duignan et al., 2020; McClain et al., 2020).**

**Response ID: 16590**

The Draft EIS included an analysis based on extensive literature and soon-to-be published data (now published) demonstrating the impacts of low-salinity conditions on dolphins. These data were considered as part of an Expert Elicitation (a garnering of expert opinions to determine or quantify an unknown) that resulted in dose-response curves (Booth et al. 2020) and summarized in Chapter 4, Section 4.11.3 (Marine Mammals - Overview of Impact Analysis Approach) of the EIS. While Deming and Garrison (2021) was presented after the release of the Draft EIS, the presentation was based on data that were fully considered in the Draft EIS, including as part of the Expert Elicitation. Along with other relevant data (for example, BBES tagging studies), the analysis contained in the Draft EIS determined that there would be a significant, adverse, permanent impact on the BBES Stock. Further, the analysis in the Draft EIS concluded that if the 75,000 cfs Alternative were implemented, impacts would be immediate and only a remnant population would be likely to exist near the barrier islands after 50 years of operation.

After release of the Draft EIS, at the request of the Marine Mammal Commission, the National Marine Mammal Foundation and University of St. Andrews released a population impact

projection based on the information presented in the Draft EIS (including annual survival rates from Garrison et al. 2020) coupled with an updated population model for BBES dolphins (Schwacke et al. 2022, Thomas et al. 2021). This new, additional analysis has been incorporated into the Final EIS in Chapter 4, Sections 4.11.5.2 Barataria Bay Estuarine Stock and supports the original determination in the Draft EIS of major, permanent, adverse impacts on the BBES dolphin population. The research presented in the McClain et al. (2020) study cited by commenters was considered in the Draft EIS [cited at the time as McClain et al. (in prep)]; the research presented by Duignan et al. (2020) is consistent with the established literature and does not change the conclusions of the Draft EIS, but this study has been incorporated in Chapter 4, Section 4.11.5.2.2.1 General Effects on Dolphin Health of the Final EIS. Similarly, the information included in the Deming and Garrison presentation was considered in the Draft EIS, is consistent with the conclusions of the Draft EIS, and the presentation has now been cited in Section 4.11.5.2.2.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include specific marine mammal response triggers that may affect Project operation mitigation efforts; see Appendix R2 (Monitoring and Adaptive Management [MAM] Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently

contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63070**

**A recent study suggests that the proposed Project would not only prevent the recovery of the BBES Stock, but it would result in the functional extinction of dolphins in the West, Central, and Southeast strata of the stock area (Thomas et al., 2021). The only dolphins remaining in the basin would live adjacent to the barrier islands, and even this group would become severely reduced over the 50-year planning horizon of the proposed Project. Additionally, an expert elicitation (Booth and Thomas, 2021) building on previous studies (Garrison et al., 2020; Schwacke et al., 2017; Thomas et al., 2021) suggests that while dolphins can endure some periods of exposure to low salinity, the period of tolerable exposure shortens for dolphins exposed to acute changes in salinity, and the median time to death is 22 days with continuous exposure to water with salinity levels below 5 ppt.**

**Thomas, L., Marques, T., Booth, C., Takeshita, R., and L. Schwacke. 2021. Predicted population consequences of low salinity associated with the proposed Mid-Barataria Sediment Diversion Project on bottlenose dolphins in the Barataria Bay Estuarine System Stock.**

**Response ID: 16593**

The Draft EIS included an analysis of the impacts to marine mammals, including BBES dolphins in Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock. This analysis incorporated the Booth and Thomas (2021), Garrison et al. (2020), and Schwacke et al. (2017) studies, and the Final EIS includes additional analyses that were completed by Thomas et al. (2021) after the Draft EIS was released for public comment. The impact conclusions in the Draft EIS were based in large part on Garrison et al. (2020), which predicts that only a remnant population of dolphins would continue to exist in Barataria Basin after diversion operations commenced. The conclusion of major, permanent, adverse impact to bottlenose dolphins is also supported by Thomas et al. (2021), which built on these earlier

studies and concludes that, after 1 year of operation of the Applicant's Preferred Alternative, there would be 61 percent fewer dolphins in the Central stratum than under the No Action Alternative, 35 percent fewer in the West stratum, 12 percent fewer in the Southeast stratum, and 2 percent fewer in the Island stratum, with 25 percent fewer overall. Thomas, et al. further concluded that after 10 years of operation, there would be 100 percent reduction in the populations of dolphins in the Central and West strata, an 82 percent reduction in the population of the Southeast stratum dolphins, and a 34 percent reduction in the population of the Island stratum dolphins as compared against the No Action Alternative, with an overall difference in population of 78 percent. (Note that Thomas, et al. 2022 slightly refined some of these projections.) After 50 years of operation, in three out of the four strata, dolphins are predicted to be functionally extinct (defined as less than or equal to dolphin in Thomas, et al. 2022) under the Applicant's Preferred Alternative, with the remaining Island stratum being 85 percent lower [95 percent CI -28 -- -99] under the Applicant's Preferred Alternative than under the No Action Alternative. Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the Applicant's Preferred Alternative is projected to be 143 dolphins (95 percent CI 11-706) compared to a predicted 3,363 dolphins (95 percent CI 2,831-4,289) predicted to inhabit the Barataria Bay under the No Action Alternative. In other words, the BBES dolphin stock is projected to be 96 percent smaller (95 percent CI -80 -- -100) under the Applicant's Preferred Alternative than then No Action Alternative. Chapter 4, Section 4.11 Marine Mammals of the Final EIS has been updated to reflect the results of Thomas et al. (2021).

Booth and Thomas (2021) evaluated multiple scenarios with different salinity changes, and in one of those scenarios' where bottlenose dolphins experience a change in salinity within 0 to 5 days from typical salinity environment (that is, mean 15 to 25 ppt) down to an atypical environment with salinity below 5 ppt for an extended period, the median time to death would be 22 days.

---

**Concern ID: 63182**

**Proposed mitigation is insufficient and not guaranteed, and the amount of funding for mitigation is not clearly stated.**

**Response ID: 16559**

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of

---

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63185**

**Additional development of mitigation plans and accountability for mitigation commitments is needed.**

**Response ID: 16562**

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be

implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63726**

**Some commenters felt that the amounts allocated for mitigation were insufficient, while others felt that no amount of mitigation would suffice, for example for the more senior fishers who won't be in a good position to adapt to the changing environment.**

**Response ID: 16702**

The Draft EIS considered how changes in the commercial fisheries, both with and without implementation of the proposed Project, would impact more senior fishers in Chapter 4, Section 4.14.4 in Commercial Fisheries. In response to public comments and resource agency input about the proposed mitigation efforts, CPRA has expanded and refined its fisheries mitigation and stewardship measures. CPRA's mitigation and stewardship strategies and associated expenditures would focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for fisheries in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to fisheries in the early years of the Project's operational life. The provisions of the fishery mitigation and stewardship plan, valued at approximately \$54 million, would help to achieve that goal and to mitigate the impacts of the proposed Project on oyster fishers. While not mitigation for the Project impacts, examples of other restoration/fishery improvement actions include: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, CPRA's allocation of \$2 million in adaptive management funding to support off-bottom oyster culture, the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery and the LA TIG's allocation of \$38 million in recreational use funds to support subsistence and recreational fisheries. The Final Mitigation and Stewardship Plan is included in Appendix R1 to the Final EIS.

The comments of more senior fishers who expressed concern about their ability to adapt to changing fishery conditions are acknowledged. If permitted by USACE and funded by the LA TIG, it would take CPRA approximately 5 years to complete construction of the proposed Project and to begin operations. This relatively long period provides those affected with the time and opportunity to decide how they want to go forward, ranging from taking advantage of

the adaptation opportunities offered through the Mitigation and Stewardship Plan (Appendix R1 to the EIS) to transitioning out of the fishing industry or retiring.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63758**

**Commenters noted that the Deepwater Horizon (DWH) oil spill is not a primary or contributing factor in Louisiana's coastal land loss and that instead, levees built for flood control purposes, including those built by the U.S. Army Corps of Engineers, have long been a cause of land loss and subsidence. They expressed that because the DWH oil spill is not a cause of wetland loss, there is no basis for the claim that the MBSD will restore impacts caused by the oil spill, and thus NRDA funds would be inappropriately used for the Project.**

**Response ID: 16607**

The many factors contributing to land loss in Louisiana were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 in Wetland Resources and Waters of the U.S. acknowledges the multiple factors contributing to land loss in the Project area.

USACE's involvement with the proposed Project is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under the Clean Water Act Section 404 and River and Harbors Act, Sections 10 and 14 (33 USC Section 408). USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the

process to restore damages caused by the DWH. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH spill in the Louisiana Restoration Area. Response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views, as explained in Section 2.0 Agency Roles in the Responses of this Appendix B2.

As discussed in the PDARP/PEIS, the SRP/EA #3, and the LA TIG's Final Restoration Plan, the LA TIG found that impacts of the injuries from the DWH oil spill were particularly detrimental to the resources of the Barataria Basin, which were already in peril as a result of the separation of sediment-loaded river water by levees, subsidence, and a changing climate. In the Barataria Basin, marshes already suffering from significant coastal erosion experienced heavy oiling and subsequently experienced double or triple the rate of marsh loss. The Final PDARP/PEIS (DWH NRDA Trustees, 2016a) documented the nature, degree, and extent of injuries from the DWH oil spill to both natural resources and the services they provide, and the nexus between those injuries and need for restoration within the Barataria Basin. For example:

- The DWH oil spill resulted in over 1,100 kilometers of wetland oiling Gulf-wide. Approximately 95 percent of this marsh oiling occurred in coastal Louisiana, with the heaviest oiling in the Barataria Basin (PDARP/PEIS, Table 4.6-2; Nixon et al., 2015). The heaviest oiling occurred in marshes dominated by *Spartina alterniflora*, a perennial deciduous grass, and *Juncus roemerianus*, a flowering plant species (Visser et al., 1998; Lin and Mendelssohn, 2012; Silliman et al., 2012). These marshes provide critical habitats for estuarine-dependent species throughout the Gulf of Mexico.
- The marsh edge was severely oiled and injured, and the impacts of this oiling were documented in the Barataria Basin. Growth rates of juvenile brown and white shrimp along this oiled marsh edge were reduced by up to 50 percent compared to those collected near shorelines that did not experience oiling (for example, Rozas et al., 2014; van der Ham and de Mutsert, 2014). Growth rates of red drum along heavily oiled marsh shorelines were also reduced by approximately 50 percent in 2010 relative to non-oiled shorelines, and these reduced growth rates persisted through at least 2013 (for example, Powers and Scyphers, 2016).
- Impacts of DWH oiling were ecosystem-wide, spanning multiple trophic levels. The negative effects of oiling on plants and lower trophic levels from the nearshore food web (for example, amphipods, shrimp, snails) caused a cascade of impacts on higher trophic levels.
- Substantial injury to marsh birds likely occurred. Birds that were present in the marsh habitat during the DWH spill were likely exposed to oil via multiple pathways. Heavily oiled marsh areas had extensive oiling on vegetation and soils, and contained oil-contaminated prey.
- Marsh grasses help maintain the habitat in the Barataria Basin by protecting the marsh edge from erosion. Extensive oiling and loss of marsh vegetation in the Barataria Basin created an acceleration of land loss following the oil spill. The accelerated erosion due to the spill resulted in the permanent loss of coastal wetlands over large portions of the

Barataria Basin (see Table 2-1; Silliman et al., 2012, 2015, 2016; McClenachan et al., 2013; Zengel et al., 2015; Turner et al., 2016).

- Marsh edge serves as the gateway for the movement of organisms and nutrients between intertidal and subtidal estuarine environments. Injuries to a specific resource in the nearshore marine ecosystem could cause direct and indirect effects on offshore resources. For example, Gulf killifish, a key connector of energy between marsh and open Gulf waters, are among the largest of the Gulf forage fish and are preyed upon by wildlife, birds, and many sport fish. Water column resources injured by the spill include species from all levels in the northern Gulf of Mexico food web, including estuarine-dependent species (DWH NRDA Trustees, 2016a).

Other examples of impacts on specific species and resources, as described in the PDARP/PEIS, demonstrate that the DWH oil spill created an ecosystem-level injury to the Gulf of Mexico that necessitates an ecosystem-level restoration strategy.

Evaluating restoration strategies that could restore for injuries in the Barataria Basin, SRP/EA #3 found that a combination of “marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats” in the basin and in the broader northern Gulf of Mexico (LA TIG, 2018, page 3-32). As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in the LA TIG’s Restoration Plan. The LA TIG finds that the proposed Project would best restore for injuries caused by the DWH oil spill by reconnecting and reestablishing sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

---

**Concern ID: 63959**

CPRA’s stated \$300 million fund for mitigation of Project damages is wholly inadequate to mitigate the actual damages to the State’s shrimp and shellfish industries as those speculative funds would only account for half of the seafood landings in the past 2 years.

**Response ID: 16531**

The Draft EIS considered how changes in the Project area both with and without implementation of the Project would potentially impact commercial fisheries, including shrimp and oyster fisheries, in Chapter 4, Sections 4.14 Commercial Fisheries. Without the Project, adverse impacts on fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for fisheries in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts on fisheries in the early years of the Project’s operational life.

In response to public comments and resource agency input about the proposed mitigation measures, CPRA has expanded and refined its fisheries mitigation and stewardship measures since the release of the Draft EIS. CPRA’s mitigation and stewardship strategies and expenditures focus on establishing sustainable fisheries for oysters and shrimp rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS).

The provisions of CPRA's fishery mitigation plan, valued at approximately \$54 million, along with other restoration actions and programs being funded by the LA TIG and the State through LDWF, would alleviate some impacts of the Project. CPRA's final fishery mitigation plan can be found in its Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 64089**

**Commenters asked that the jobs that are created by construction of the proposed Project spur inclusive and equitable economic development. The Louisiana State and local economic development authorities should focus efforts through communication, recruitment, and training activities, into creating jobs for local residents, including minority residents. The same type of focused workforce development effort is likely necessary in order for these local jobs to translate into longer term economic benefits for affected communities. Work with the community to identify future needs of this workforce, including: providing adequate emergency and routine medical care for workers, facilitating the start and growth of small business to provide services to this workforce, and educating skilled workers who can later pivot to other jobs along our coast long after construction is complete.**

**Response ID: 16234**

With respect to the award of contracts, CPRA is required to follow the provisions of the Louisiana Public Bid Law, including those contained in Title 39, Chapter 17 (the Louisiana Procurement Code) and in Title 38, Chapter 10 (Public Contracts). CPRA has sought and

regularly seeks engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS.

**Concern ID: 64119**

**Commenters note that building a single acre of marshland serves no direct or positive economic purpose as opposed to the historically prolific fisheries of coastal Louisiana which generate an estimated \$2.4 billion in economic benefits for the State of Louisiana and the people of south Louisiana.**

**Response ID: 16233**

The EIS recognizes the value of commercial as well as recreational fisheries in Chapter 3, Section 3.14 Commercial Fisheries and Section 3.16 Recreation and Tourism and considers adverse impacts that may occur due to the proposed Project on these activities in Chapter 4, Section 4.14 Commercial Fisheries and Section 4.16 Recreation and Tourism. Wetlands also serve important functions, including attenuation of wave and storm surges (in particular, refer to Chapter 3, Section 3.6 and Chapter 4, Section 4.6, which discuss Wetland Resources and Waters of the U.S. and Chapter 3, Section 3.14 and Chapter 4, Section 4.14 which discuss Commercial Fisheries). Wetland building itself does not conflict with commercial fishing uses of the basin, as wetlands provide a diverse set of functions, which include providing habitat for finfish, shellfish, as well as other aquatic organisms.

As explained in Section 2.0 of this Appendix B2, USACE's involvement with the proposed Project is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under the CWA Section 404 and RHA Sections 10 and 14 (33 USC Section 408). USACE is neither a proponent nor an opponent of the proposed MBSD Project, and USACE was not involved in the Restoration Plan. As explained in the Restoration Plan, the LA TIG is the group responsible for restoring natural resources and services within the Louisiana Restoration Area that were injured by the DWH oil spill; therefore, response content pertaining to the LA TIG's restoration planning has been addressed solely by the LA TIG, not USACE.

As part of the LA TIG's restoration planning efforts, the LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation,

replacement, or acquisition of the equivalent, of the natural resources injured by the DWH oil spill.

---

**Concern ID: 64168**

**Commenter questions the viability of workplace substitutions to other fishery species or industries and notes that these types of substitutions are not likely to fully offset the adverse impacts.**

**Response ID: 16265**

The impacts raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14 Commercial Fisheries of the Draft EIS discussed the potential impacts on commercial fishing activities, which includes a discussion of potential behavioral changes that fishers may make in response to changes in species availability, including substitution of fish species, taking longer trips, and upgrading gear. While substitution of species may occur, such changes have costs that the fishers would incur.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review,

---

Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 64171**

**Comments were received suggesting that the MBSD would have negative impacts on the fishing industry due to further accelerations in exits from the industry especially for older members of the workforce for whom job retraining may not be as easily undertaken and the fact that there are less young fisherman coming into the fishing industry to replace the aging fisherman. The invaluable traditional ecological knowledge that has been passed down from generations could be lost.**

**Response ID: 16267**

Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discusses impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts to shrimp and oyster fisheries in the Project area are anticipated. Section 4.14.4.2 Applicant's Preferred Alternative discusses the potential behavioral responses of fishermen to changes in species abundance, including the potential for substitution of species and need for gear upgrades, increasing the length of fishing trips, as well as exiting the industry.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)

- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 64180**

**The Draft EIS treated likely damage from implementation and operation of this massive freshwater flood project as “collateral” and just another cost of doing business, well worth the proposed Project’s \$2 billion price tag.**

**Response ID: 16399**

As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance to identify the direct and indirect impacts that would likely occur if the proposed Project were to be approved. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is neither a proponent nor an opponent of the proposed Project. USACE’s involvement with the proposed Project is limited to its permitting decisions and associated NEPA and other evaluations of the proposed Project under the CWA Section 404 and RHA Sections 10 and 14 (33 USC Section 408). USACE is not a member of the LA TIG and is not evaluating the proposed Project for compliance with OPA and is not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG’s Draft Restoration Plan, OPA, or NRDA processes have been addressed solely by the LA TIG and reflect only the views of the LA TIG, not USACE.

With respect to the Restoration Plan, the LA TIG evaluated a reasonable range of alternatives under the factors outlined in 15 CFR, §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5, and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG’s Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems, and necessarily entails re-introducing freshwater flows that had historically characterized the Barataria Basin before the construction of levees.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the LA TIG’s Preferred Alternative.

**Concern ID: 62634**

**The proposed Project would cause excessive harm to fisheries (for example, oysters and brown shrimp), dolphins, communities and recreational uses, which is unacceptable and would make its implementation a clear violation of OPA. OPA regulations states that proposed restoration actions should be evaluated by “the extent to which each alternative will prevent future injury as a result of the incident, and avoids collateral injury as a result of implementing the alternative”. Because the Project would injure species that were harmed by the Deepwater Horizon oil spill, it should not be implemented, even if it does benefit some habitats and species. Some commenters argued it was also inconsistent or in violation of the 2013 U.S. Court**

**Consent Decree and the BP plea agreement relevant to the National Fish & Wildlife Foundation (NFWF) funds.****Response ID: 16650**

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is not evaluating the proposed Project for compliance with OPA and not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG's Draft Restoration Plan, OPA, or NRDA processes represent solely the views of the LA TIG, not USACE.

The potential collateral injuries of the proposed Project were considered in the LA TIG's Draft Restoration Plan.

OPA requires that Trustees develop and implement a plan for restoration, rehabilitation, replacement, or acquisition of the equivalent, of the injured natural resources under their trusteeship. See 33 U.S.C. § 2706(c). OPA further requires federal agencies to propose regulations for the "assessment of natural resource damages." See § 2706(e). Under 2707(e)(2), any assessment of natural resource damages made in accordance with these regulations creates a rebuttable presumption on behalf of a Trustee in any administrative or judicial proceeding under the Act.

As required by OPA 2706(e), NOAA developed regulations outlining a process for the assessment of natural resource damages. These regulations (hereinafter "NRDA regulations" at 15 CFR Part 990) also include a process for restoration planning, including the development and evaluation of restoration alternatives.

The 2016 U.S. Consent Decree with BP provides that monies received under the settlement for natural resource damages will be spent as outlined in restoration plans adopted by the Trustees consistent with 15 CFR 990. See Paragraph 19, and Appendix 2. The LA TIG's Restoration Plan is consistent with 15 CFR 990.

Title 15 CFR §990.54 of the regulations outlines a number of areas in which a reasonable range of alternatives should be evaluated to select the preferred alternative. Recognizing that almost all restoration comes with some potential for collateral injury, one factor for evaluation is the extent to which each alternative will prevent future injury and avoid collateral injury. The potential for collateral injury does not preclude an alternative from selection, rather the Trustees must evaluate each alternative under multiple factors, and select a preferred alternative to meet the outlined restoration objectives.

The LA TIG, in selecting the Preferred Alternative in the Restoration Plan, evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 (Identification of a Preferred Alternative), 3.2.1.5 (Alternative 1 – Avoids Collateral Injury), and 3.2.2.5 (Alternatives 2–6 – Avoids Collateral Injury) of the Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems and necessarily entails reverting the current ecosystem to a more natural state that was altered when Mississippi River flows were cut off by construction of levees. However, without the proposed Project, there would also be

adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the Preferred Alternative in the Restoration Plan.

The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Alternative 1 – Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as the Preferred Alternative in the Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project would meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the spill.

The BP Plea Agreement as it applies to NFWF funds is not relevant here as the LA TIG is not authorizing the use of those funds for this Project. Even if it were applicable, the criminal plea agreement expressly contemplates the use of criminal penalties for sediment diversion in Louisiana.

---

**Concern ID: 63064**

**Marsh flora and fauna would die once the proposed Project operation begins and river water fills the estuary. Clarify how long it would take for other species to inhabit the area and how much land would wash away once the saltwater marsh that is currently present dies.**

**Response ID: 16070**

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. indicated that the fresh water transported by the diversion may result in the loss of some wetlands in the immediate outfall area due to inundation during the initial period following commencement of operations; however, those impacts would be offset by marsh building in the delta formation area. However, salt- and brackish marsh vegetation would not be adversely affected by the lower salinity of transported water. Chapter 4, Section 4.6.5.1.2.4 Land Accretion of the Final

EIS has been revised to include additional analysis regarding the extent and timing of wetland changes in the immediate outfall area.

As summarized in Chapter 4, Section 4.10.5 in Aquatic Resources of the EIS, the proposed Project would have both adverse and beneficial impacts on the flora and fauna of the Barataria Basin, based on the specific life history and habitat preferences of a given species.

Christine Stonbely

To Whom it may Concern:

While I have been living in the NY metropolitan area in recent decades, I grew up in Shreveport LA and I had family in New Orleans and children who went to Tulane University so have spent much time in southern Louisiana. I am sadly aware that this vast wetland Delta that is so important to the protection of coastal communities and its natural resources is deteriorating. A primary reason, as I understand it, is lack of sediment inputs with the Mississippi River levees preventing the River's sediments getting into the Delta. Since the Mid-Barataria Basin Sediment Diversion is designed to help rectify this situation by providing a means for sediment from the River to get into the Basin, I want to indicate my strong support for this project and its permitting by the Corps of Engineers.

Thank you for your attention.

Sincerely yours,

Christine Stonbely

---

**Concern ID: 61737**

**The construction of levees along the Mississippi River precluded land-building sediments from entering Louisiana estuaries, which has caused a loss of Louisiana's coastal wetlands and other problems, such as making properties more vulnerable to hurricane damage and decreasing property values.**

**Response ID: 16024**

The impacts raised by the commenters were considered in the Draft EIS. Information about historic causes of land loss can be found in Chapter 3, Section 3.1.4 Overview and History of the Project Area and Section 3.6.2 in Wetland Resources and Waters of the U.S. The importance of maintaining wetlands for the protection of coastlines, coastal communities, and wildlife resources is discussed in Sections 3.6 Wetland Resources and Waters of the U.S. and 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the EIS. As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the Applicant's Preferred Alternative is to implement a large-scale sediment diversion in the Barataria Basin that would reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

---

**Concern ID: 63334**

**The proposed MBSD Project would maintain and restore coastal lands and should move forward.**

**Response ID: 16291**

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the

LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

National Wildlife Federation

Jessie Ritter

Louisiana Trustee Implementation Group

Re: Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion Project, USACE Project MVN-2021-2806-EOO and Draft Phase II Restoration Plan#3.2: Mid-Barataria Sediment Diversion, Deepwater Horizon Natural Resource Damage Assessment Louisiana Trustee Implementation Group

Mr. Laborde and Mr. Landry:

On behalf of the National Wildlife Federation (NWF) and its six million members and supporters, I write today to urge adoption of the Preferred Alternative in the Corps' Draft Environmental Impact Statement and Alternative 1 in the Louisiana Deepwater Horizon Trustee Implementation Group's Mid-Barataria Sediment Diversion Draft Restoration Plan 3.2.

For 85 years NWF has been a leader in the fight to protect and enhance American wildlife and natural habitat. Toward that end we have dedicated resources and staff to the restoration of critically important landscapes including our western public lands, the Great Lakes, the Chesapeake, the Everglades, and the Mississippi River Delta.

No single restoration project in our nation's history is poised to have a greater positive impact on our nation's wildlife. The Mid-Barataria Sediment Diversion will begin the transition of the river's great delta from one that is sinking and eroding away to one that is once again allowed to begin patterns of growth and renewed vigor. The project is of critical importance for this transformation to waterfowl utilizing the Mississippi Flyway, to neotropical migratory birds crossing the Gulf of Mexico each spring and fall, to our nation's largest concentrations of nesting waders and seabirds, to a host of wetland species from alligators to river otters, and to one of our nation's most productive fisheries.

It is also of critical importance for the communities of the Louisiana coast, who face an existential threat from the combined forces of subsidence and climate change—rising seas, increased storm intensity and more frequent and catastrophic flooding from the river and local rainfall. A revived and growing delta, fed by the river, will provide natural and sustainable green infrastructure, to help buffer communities during the challenging times to come.

For our more detailed comments on the Draft Environmental Impact Statement and Draft Restoration Plan, please see the comments of the Restore the Mississippi River Delta campaign.

Sincerely,

Jessie Ritter

Director, Water Resources and Coastal Policy National Wildlife Federation

---

**Concern ID: 62089**

**The Barataria Estuary would be more productive as a result of the increased input of carbon and the vital building blocks of life, which would mean opportunities for increased seafood harvest. The proposed MBSD Project is of critical importance for this transformation to one of our nation's most productive fisheries.**

**Response ID: 16250**

---

The commenter's support of the proposed Project is acknowledged. Chapter 4, Section 4.10 Aquatic Resources in the Draft EIS describes anticipated impacts from the proposed Project on aquatic species. As described, impacts would range from adverse to beneficial, depending on the species.

---

**Concern ID: 62233**

**Restoration of coastal habitat and the delta would provide protection from storm damage.**

**Response ID: 15752**

While the intent of the proposed Project is to reestablish deltaic processes to restore resources injured by the DWH oil spill, the Draft EIS Chapter 4, Section 4.20.4.2 Public Health and Safety described the ancillary benefit of storm damage risk reduction on communities north of the proposed diversion due to the creation and maintenance of wetland habitat and increases in topography and land acreage within the delta formation area. At the same time, operation of the Project would have permanent, minor to moderate, adverse impacts on storm hazards in communities south of the diversion, with anticipated increases in storm surge of up to 1.7 feet near Myrtle Grove (as compared to the No Action Alternative). Section 4.20.4.2.2.2 in Public Health and Safety of the Final EIS has been revised to include additional information and figures further explaining the impacts of the Project on storm surge and wave height

---

**Concern ID: 62415**

**Commenter requested USACE and LA TIG review more detailed comments on the Draft Environmental Impact Statement and Draft Restoration Plan in the comments of the Restore the Mississippi River Delta campaign.**

**Response ID: 15866**

The comments of the Restore the Mississippi River Delta have been considered.

---

**Concern ID: 62892**

**The proposed MBSD Project would create wetlands supportive of birds (bald eagles, spring and fall migrants, waterbirds, and marsh birds) and other wildlife that are experiencing a high rate of coastal land (habitat) loss.**

**Response ID: 16191**

Chapter 4, Section 4.9.4.2 in Terrestrial Wildlife and Habitat of the Draft EIS, discussed the maintenance and creation of marsh that is projected to occur as part of the proposed Project, and identified that the net addition of wetlands would generally be beneficial to area birds. As identified in Section 4.12.3.2 in Threatened and Endangered Species of the Draft EIS, the creation and maintenance of wetlands could affect bald eagle aquatic foraging habitat and prey species, but would likely result in negligible effects on the bald eagle itself.

The potential benefits of the proposed Project to resources in the Gulf, including birds, are also described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan.

---

**Concern ID: 63332**

**A large number of commenters expressed general support for the proposed Project.**

**Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Louisiana Trustee Implementation Group (LaTIG) c/o of NOAA

**Re: Mid-Barataria Sediment Diversion (MBSD) Draft Environmental Impact Statement (DEIS)**

Mr. Laborde and Mr. Landry:

**I support the preferred alternative: Alternative 1, Variable Flow up to 75,000 CFS for the Mid-Barataria Sediment Diversion**--I write today to urge adoption of the Preferred Alternative in the Corps' Draft Environmental Impact Statement and Alternative 1 in the Louisiana Deepwater Horizon Trustee Implementation Group's (TIG) Mid-Barataria Sediment Diversion Draft Restoration Plan 3.2.

**This Project is Long Overdue**--For 40 years I have been waiting, with increasing frustration and a sense of helplessness, for my state and Federal governments to begin implementation of major diversions from the Mississippi River into its collapsing delta. It was clear in 1981, as it is clear now, that only nature can build a delta, and that we needed to once again allow nature to begin to replace the one we allowed to die, carelessly, foolishly, indeed, *recklessly*. In order for that to happen without massive dislocation of human communities—some combination of a diversion the approximate size of the Wax Lake Outlet, combined with some level of control at the point of outflow, would be necessary.

All of that was already abundantly clear to me and many others in the first decade of coastal restoration planning. And yet nearly four decades have gone by and no major new sub-delta is forming in the middle Barataria Basin, despite a long-standing consensus among policy makers and scientists that it needed to be done, and that there were no other options.

**Declining Barataria Basin**--I spent 30 years of my life, working for the National Park Service, helping to study, interpret, grow and manage a small piece of the delta, and in my first two decades at the Barataria Preserve I watched as it withered away, as the salt crept in, and the waves pounded its shorelines.

**Opening Davis Pond Reversed the Decline of the Barataria Preserve**--That changed, incredibly enough, in my final decade there. It changed because a few miles away a relatively tiny diversion (about 1% of peak flow) opened at Davis Pond just west of the Preserve boundary. I knew intellectually what *should happen* when river water was re-introduced to a moribund system, but I was unprepared for how quickly and dramatically it *did happen*. Experiencing it was bracing, uplifting and a cause for hope.

I watched as the marshes in the outfall went from thin mat *flotant* to firm, vibrant freshwater marshes, and I witnessed ponds fill with sediment and new marsh emerge. I watched recruitment of new trees colonizing the sunken fingers of natural levees of the Davis Crevasse—the first new trees to grow there in decades.

I saw Lake Cataouatche, then a murky, opaque soup churned by any wind, transformed at times of the year into a calm outdoor aquarium, with a riot of submerged aquatic vegetation growing in water so clear one could see, likely for the first time in over a century, the bottom of the lake, and schools of fish so abundant as to transform it into what was becoming one of the best largemouth bass lakes in Louisiana. In the decade before Davis Pond opened, speckled trout were creeping into Lake Cataouatche in late summer, something older fishers witnessed with astonishment and no little dread, knowing what the salt would leave in its wake.

In winter, thousands of ducks, pelicans, cormorants, gallinules, coots, loons and grebes took advantage of the bounty. Ospreys and bald eagles feasted on the explosion of forage fish. In spring alligators and white pelicans covered the surface of the flowing water, creating a vision that looked like a documentary filmed in the Okavango of Africa for public television, but was there in Louisiana before our eyes—though with different species of crocodilians and pelicans. In the outfall flocks of migrant shorebirds wheeled over the new mudflats, a spring phenomenon I had seen before in the Birdsfoot and Wax Lake.

I watched submerged vegetation migrate down-estuary through bayous Villars and Couba into Lake Salvador, and the explosion of life that followed. I watched as the shallow lake margins filled with vegetation, as waves were dampened, and shorelines of defenseless organic soils that had been eroding at a rate of 10-30 feet a year suddenly stabilized, and began to accrete.

I watched live oaks on lakeside middens and baldcypress in sunken swamps, formerly struggling to hang on in the increasingly saline soils, barely growing, now spring back to life, greening with renewed vitality. Measurements of leaf drop and tree rings proved that my impressions were correct—trees were growing faster.

**Renewal of Estuarine Vigor**--And Davis Pond was not an aberration. I have seen the same phenomenon at numerous small man-made and natural crevasses in the Birdsfoot, and at larger crevasses like West Bay, Fort St. Phillip, Mardi Gras Pass, Caernarvon, the Jaws, and Wax Lake: fecundity and life returning to systems that had laid dormant or dying, waiting for an ecological release.

In these landscapes now once again showing the species diversity that freshwater brings, I've also witnessed the magic of the deltaic estuarine process, as each summer and fall, when the river levels drop, as they do on an annual cycle that has played out for eons, the redfish, speckled trout, bottlenose dolphins and tens of thousands of birds—locally breeding waders and terns, herons, egrets, ibis and spoonbills, and southbound fall migrant shorebirds-- swoop in to devour the bounty as the brackish Gulf waters re-occupy the bays and marshes for a few months before the late fall rise in the river. Even in saline marshes dominated by *Spartina alterniflora* along the lower East Bank of the river and in western Terrebonne Parish, the spring influx brings plant vigor and soil stability. Because of the riverine cycle, saltwater plants continue to out-compete the freshwater vegetation because of the fall marine influx, supporting saltmarsh dependent species, like clapper rails and seaside sparrows.

**150,000 CFS and Adaptive Management**--For much of the last four decades government scientists and planners have touted a commitment to innovative ideas of “adaptive management,” but then have set up regulatory and policy guidance that renders the idea essentially meaningless, by hobbling restoration projects with myopic limitations preventing future modifications. Short-sighted to begin with, since the point of monitoring and adaptive management is to learn by doing and modify actions accordingly, such limitations are crippling in dynamic systems like deltas. In a delta facing climate change and accelerated

sea level rise, they are ruinous and completely contrary to the purposes of the acts of Congress upon which regulators are given authority.

The obvious benefits of a larger diversion are outlined in the DEIS, benefits that will only increase as future sea level rise accelerates at an unknown rate. Essentially, land building will track diversion size at a roughly one-to-one ratio: 150,000 cubic feet per second (cfs) builds about twice as much land as a 75,000 cfs diversion.

On the other hand, adverse effects are only marginally increased—you *can't freshen fresh water, and if you have mitigated for 100 days of induced flooding, you've mitigated for 200 days*. Indeed, mitigating for more flooding now will only increase the resilience of communities in the future, when the flooding is coming, diversion or not.

While I am not arguing for the 150,000 cfs alternative at this time given the political and bureaucratic reality, I would urge the TIG to build future adaptive management requirements into the current design to the extent it is affordable, so that if the need arises in the coming decades, regulatory authority for releases above 75,000 cfs could be sought and granted without incurring many hundreds of millions more in construction costs. Gates have their advantage.

**Shifting Baseline Syndrome**--I got a degree in history at the University of New Orleans in 1976. My lifetime study has been the Mississippi River delta, with a long concentration while with the National Park Service on the Barataria Basin.

My thesis, based on long study and observation, is this: *we don't even know what we have lost*. Because of man-made levees which date to the 1720s; distributary closures; meander cut-offs; dams and channel training upstream; channelization and jetties at the passes of the river and the bays; canal, road, and levee construction; drainage projects everywhere; dumping of toxic and harmful chemicals and effluents into the soil, water and air; and over two hundred years of slaughter of any creature that could be shot, trapped, netted or otherwise caught (only becoming effectively regulated in the middle of the last century), we today have no idea of what wildlife and fisheries abundance this delta is capable of supporting.

Our conceptual baseline of abundance has been shifting downward since European arrival, and is now so degraded by 300 years of short-sighted management that we have no conception of what it could be. But studying its history we have a glimpse of what it was like 300 years ago. If we let the river be the river, if we let the deltaic system be the deltaic system, if we let nature play itself out, we are going to be astonished. We can allow a new delta to flourish that is *more productive* than the physical delta we measure our losses from ninety years ago.

**Dolphins.** Concerns have been raised about the possible fate of bottlenose dolphins in Barataria Bay. The hypothesis is that exposure to prolonged freshwater pulses will result in the decline or even the extirpation of dolphins from the bay. I am not a scientist, but I have a lifetime of experience observing dolphins in the delta region. More importantly I know the history of the bay and its wildlife. I regard with extreme skepticism the idea that dolphins living in the delta region are ill-adapted to living there. I find the claim that dolphins will die from exposure to freshwater pulses based upon Bonnet Carré opening in 2019 logically wanting. If it were true, then dolphins should have died in previous spillway openings in the 12 major openings that occurred prior to 2019.

The argument that it was the duration of the opening in 2019 is also baseless since the Unexplained Mortality Event (UME) began *before* the spillway was opened in 2019 (UME began February 1, Bonnet Carré opened February 27)<sup>iii</sup>, and the UME was past its peak (June 1) long before the duration of the opening set any sort of record. At no time was the flow of water through Bonnet Carré in 2019 anywhere near the peak flows seen in 2011. Yet the UME affected dolphins from the Sabine River to Taylor County, Florida. Rainfall was near normal or below normal in the Spring of 2019 in all river systems draining to the area of the Gulf affected by the UME except the Mississippi River and Sabine-Calcasieu, and most of the unusual discharge came after the UME peaked. Indeed, portions of the Gulf experiencing the UME in Alabama and the Florida Panhandle were in drought. To suggest that unexplained dolphin mortality was the result of Mississippi River discharge stretches this layman's credulity.<sup>iii</sup>

**Barataria Bay, like all deltaic estuaries, routinely sees wild swings in salinity**--More importantly, for Barataria Bay itself, as any oyster farmer knows only too well, prolonged freshening events are routine, caused by everything from periods of excessive rainfall to winds and currents driving the Mississippi River's freshwater plume that flows from Southwest and Grand passes into the Barataria Bight and then back into the bay. In the last fifty years the bay has experienced numerous so-called "100 year" rainfall events, and has experienced years in which cumulative rainfall was well above normal for months on end (as we are experiencing this spring).

Until 1906 Barataria Bay was receiving riverine discharge from both Bayou Lafourche on the west and the western passes of the Birdsfoot on the east and south. Because of frequent levee breaks along both Bayou Lafourche and the mainstem, spring influxes of freshwater and sediment came often enough to sustain an estuarine balance. Marine processes and man-made canals severely disrupting hydrology had not yet occurred, so rainfall was retained and tidewater was still confined to waters near the passes.

**Barataria Bay is an Anthropogenic Creation**--What is now called Barataria Bay was a discrete embayment, separated from Bay Caminada, Bay des Ilettes, Bay Ronquille and other smaller embayments by marsh platforms which reached to or near the barrier islands and headlands. Human activity—perfecting the levee system after 1927; building of the jetties and armoring the river banks; dredging canals for navigation and oil and gas access and pipelines in the 1960s, 70s, and 80s; continuously extending jetties at Southwest Pass, Tiger Pass, the Empire Canal, Barataria Pass, Caminada Pass, and Belle Pass; and subsurface withdrawal of hydrocarbons leading to increased subsidence, fundamentally altered both the hydrology and ecology. Natural processes had little to do with the rapid changes of the 20<sup>th</sup> century. Anthropogenic changes caused massive land loss, and allowed oysters, brown shrimp, speckled trout and bottlenose dolphins to colonize the expanding bay.

All of these organisms are highly adaptable, as they must be to thrive in a deltaic environment where conditions can change in a geological instant—a saline embayment can freshen overnight and begin to fill with sediment after an avulsion on the river, or a freshwater wetland can be cut off from the river due to a course change. Nothing lives here that has not adapted to those conditions, except a few stubborn humans and their dependents and commensals.<sup>iv</sup>

**Congress acted in the best interest of dolphins when it mandated the issuance of a waiver**—*In my opinion, formed after review of the literature, a lifetime of wildlife observation, and a deep knowledge of the history of Barataria: few if any individual dolphins will be harmed by this project. But the failure to build this project, and many diversions after it, will unquestionably harm generations of dolphins, not*

just in Barataria Bay, but in the entire northern Gul of Mexico, because loss of the Barataria Estuary to sea level rise will result in the collapse of their prey base—not to mention the food web supporting arguably the single most important estuarine system in North America.

*I agree therefore with Congress—in order to fulfill the purpose of the Marine Mammal Protection Act, this project must go forward.*

*I have devoted my life to promoting the welfare of native species and the habitats that sustain them. I have not the slightest doubt about the need to build the Mid-Barataria Sediment Diversion for the benefit of dolphins.*

**Fisheries**--I fully realize that there is very real fear and concern among many residents of the Barataria Basin, especially those whose livelihood is tied up in harvesting seafood species that benefit from the ongoing conversion of the basin to a marine system. These fears and concerns are completely understandable. Though for the reasons outlined above I believe the fears of fisheries collapse will prove to be groundless, and indeed that the opposite will occur, there is no question but that species' abundance and location will shift, and that economic hardship might result unless the groundwork is laid by both government and fishers to facilitate a transition to the new fisheries reality.

**Davis Pond as an Adaptive Manage Tool**--One way to facilitate gradual estuarine transition to lower average salinities, if a favorable Record of Decision is reached, would be to begin to operate the Davis Pond diversion as an adaptive management tool, to gradually freshen the basin and monitor the response of estuarine organisms, including brown shrimp, oysters and, yes, bottlenose dolphins. The Water Resources Development Act of 2007 authorizes operational changes to Davis Pond.

**Public Investment Requires Public Access**—If public funds are spent to acquire rights to private property in the receiving basin, then the right to free and unfettered public access must be acquired as well. There is no question but that the water bottom in the network of distributary channels carved by the diversion will be state-owned, allowing for public access. The question of access to wetlands created or sustained by the diversion will presumably depend upon prior ownership. Private landowners that succeed in requiring the purchase of rights such as flowage easements in order to allow a project that will prevent their land from disappearing should not be allowed to profit from this massive beneficial investment beyond sale of their property to the people in fee simple at fair market value.

The DEIS identifies minor land-loss acceleration affecting public land in the Birdsfoot. The loss of Delta NWR and Pass a Loutre WMA is inevitable, given extreme local rates of subsidence and accelerating sea level rise. The recreational and ecological resource provided by these properties can be replaced as land is built, sustained and *acquired* in the MBSD receiving basin, beginning with one-to-one mitigation for the anticipated induced losses.

**Public Access and Educational Opportunities at the Diversion**—The MBSD diversion structure, outfall channel, and outfall area will constitute the world's single largest engineered restoration project. The opportunity for public education, recreation and enjoyment is unprecedented. The project should not be locked behind fences, barbed wire, and "No Trespassing" signs, the "welcome" that now greets the taxpayers who paid for the Caernarvon and Davis Pond diversions.

**Delta Communities.** People who live in communities outside the Federal levee systems are already experiencing the costs of land loss, and are, in a real sense, facing an existential threat because of our

historical mismanagement of the river, canal building and sub-surface mineral extraction throughout the marsh zone, all of which have led to the basin's precarious situation in the face of a changing climate, also brought about by human action. As is always the case, this burden falls most heavily upon those basin communities and individuals marginalized by historic economic and political injustice, including chronic mistreatment of Indigenous Americans and racism practiced towards many, including immigrants to the basin, and especially, formerly enslaved people.

This project will not change that reality—no single project could. But this project will increase, in the near term, the frequency of low-level flooding in some basin communities, which include low income residents and an American Indian village. Most of the residents of these communities are well adapted to life in the tidal zone. Their culture is based upon living with the rhythms, challenges and opportunities of the natural system of which their community is a part, and, in many cases, has been for generations. They will adapt, but the project is an opportunity for LaTIG to facilitate the adaptation for future change with mitigation funding now. Few contemporary communities have that opportunity.

Flooding in the basin has been increasing for decades, and will continue to increase with or without the project, as more land erodes, the land sinks, and the seas rise. Dealing with that *now* rather than incrementally in the coming decades would actually strengthen the resilience of those communities, and the mitigation funding offered by this project is a once in a lifetime opportunity to do something proactively. This project will, over the long term, decrease flooding in nearby basin communities, as well as in adjacent leveed communities like Ironton.

Justice and redress of past and ongoing wrongs requires a special commitment to many individuals and communities in the basin. That same commitment requires an honest assessment of what can be physically accomplished, all questions of cost and fairness aside. If we immediately and without reservation undid every transgression and mistake of the past, every imbalance in the current allocation of resources, the irreversible physical reality is that delta lands will continue to sink, the sea will continue to rise for decades (as the air and ocean reach temperature equilibrium), and land, including that which supports people's homes and is the source of their livelihood, will continue to be lost. This is because of climate change already guaranteed by the carbon long since released into the atmosphere.

Only by reversing the *process*, the deltaic process, from the riverine abandonment and re-occupation by the sea now underway, to riverine re-occupation and delta building, pushing back the sea, which this project can begin, is there any hope of a future for delta communities and the people that call them home.

In the meantime, *all* communities in southeast Louisiana, inside and outside levee systems, on both sides of the river and well up into the basins, will enjoy storm surge benefits in the long-term—the alternative is to be swallowed by the Gulf of Mexico.

**Mitigation**--LaTIG is to be commended for earmarking funds now to help both commercial fishers and the communities outside the levee system. Both will be better able to adapt and thrive in the coming decades if those funds are used appropriately to the maximum advantage. For that to happen, commercial fishers and communities must be convinced, and must be willing, to enter into a productive dialogue with the state, and everyone, regulators included, must also be willing to do more than just pay lip service to adaptive management and innovation.

**A Duty to Future Generations--** There is a way forward, if we make a commitment to cooperate, and nature gives us respite for a few years. We in southeast Louisiana had forty years between Hurricane Betsy in 1965 and Hurricane Katrina in 2005 to learn how to live with nature on a disappearing coast. We squandered those forty years, increasing our vulnerability and the number of people exposed to danger by expanding the footprint of development and doubling down on levees and pumps, and we've paid the price as storm after storm devastates community after community.

In 2005 my family lost a home. My neighborhood was shattered and a tiny diaspora ensued. My son lost his school, his circle of childhood friends, his neighborhood, and a significant part of his life. He was not alone, but like so many other children of 2005, his strength and determination, and that of his generation that have endured hurricanes, economic recession outdone only by the Great Depression, the country's largest oil spill, and political and social upheaval not seen since the 1960s, inspires me and others today.

**Reliance on Gray Infrastructure Alone Cannot Succeed--**We can't afford to make the mistake of ignoring natural processes again, and we are culpable if we do nothing to try to prevent disaster and undo our past mistake of relying solely on gray infrastructure's ability to hold nature at bay. We have to work with nature. We must all find a way to utilize this project and to dedicate these offered mitigation funds in a way that makes a difference, and that is maximally just to those most affected and most vulnerable. We have to strive to overcome distrust with honest dialog and engagement. I will not pretend to share the feelings of those who will be most directly affected by this project, but I will ask the State and the TIG to be open to a genuine dialog with them, one that is about solutions, and one that faces our very dire reality rather than paving it over with nostrums and unfulfillable promises.

But we must be clear and honest: there is no future for Delta communities without this project and river re-introduction projects to come under the Coastal Master Planning process. These diversion projects give us a chance, but they do not guarantee anything. There is much to do, both on the political and scientific side. And there is much needed dialogue ahead. But only by overcoming distrust and listening to authentic voices, from both communities and objective scientists, engineers, economists, social scientists and planners, who have no financial stake in the outcome, can we hope to get there.

**The MBSD is critical to the long-term physical and ecological sustainability of southeast Louisiana--**The truth is that for all of us living in and near the Barataria Basin, we are just one major hurricane away from disaster. Our ability to recover from a disaster is contingent, and there are no guarantees. This is as true for those living within the levee systems as it is for those living outside in Lafourche, St. Charles, St. James, Assumption, Jefferson, Orleans, Plaquemines, and beyond to those parishes outside the basin proper but dependent upon it, all the way to the Mississippi Coast and Baton Rouge. Our ability to survive and prosper is simply not guaranteed. Importantly, our state has come together through the Coastal Master Planning process under the Coastal Protection and Restoration Authority to devote whatever resources we have available to maximize our chances, by basing our choices and actions on the best science and analysis. Key to those chances are projects that restore the river's ability to build new deltaic wetlands and sustain those that still survive, like the MBSD. Without riverine re-introduction, the Master Plan cannot succeed.

Please, issue the permits and fund the project. Build the Mid-Barataria Sediment Diversion. Operate it for the maximum benefit.

Watch nature recover a delta, and the benefits to wildlife, humans and communities large and small, inside and outside, that accrue.

May it be the first major diversion of many to come.

Sincerely,

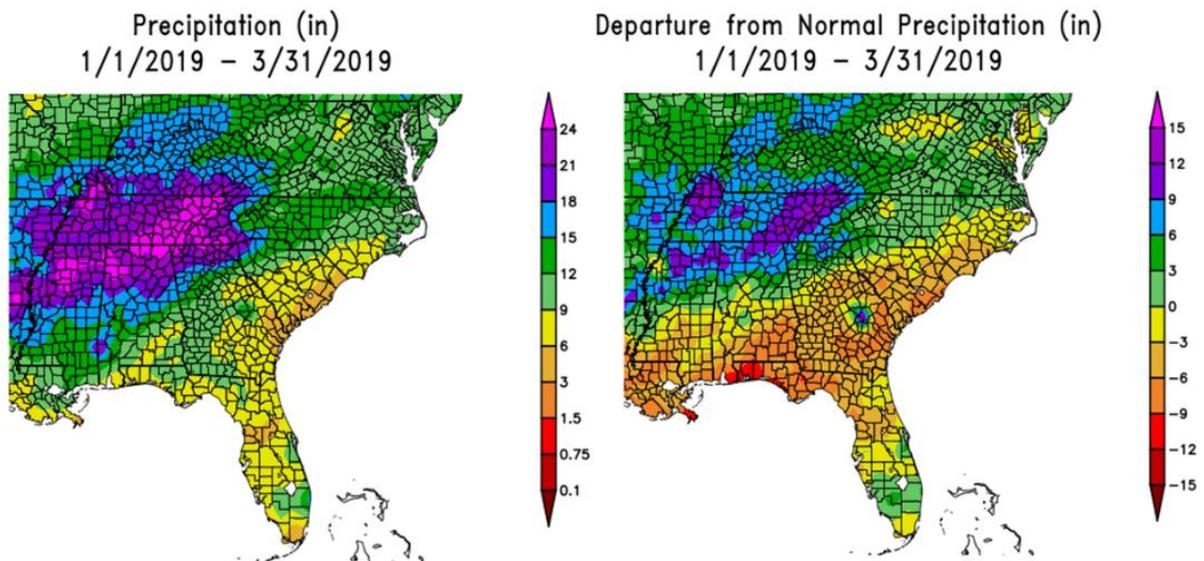

David P. Muth  
New Orleans, Louisiana

**Concern ID: 61737**

**The construction of levees along the Mississippi River precluded land-building sediments from entering Louisiana estuaries, which has caused a loss of Louisiana's coastal wetlands and other problems, such as making properties more vulnerable to hurricane damage and decreasing property values.**

**Response ID: 16024**

The impacts raised by the commenters were considered in the Draft EIS. Information about historic causes of land loss can be found in Chapter 3, Section 3.1.4 Overview and History of the Project Area and Section 3.6.2 in Wetland Resources and Waters of the U.S. The importance of maintaining wetlands for the protection of coastlines, coastal communities, and wildlife resources is discussed in Sections 3.6 Wetland Resources and Waters of the U.S. and 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the EIS. As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the Applicant's Preferred Alternative is to implement a large-scale sediment diversion in the Barataria Basin that would reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

---

**Concern ID: 61871**

**Alternative 5, Variable Flow up to 150,000 cfs, should be chosen for implementation because it provides substantially greater benefits at the higher flow, with only marginally increased adverse effects, most of which could be mitigated by the same measures being proposed for the 75,000 cfs Applicant's Preferred Alternative.**

**Response ID: 15944**

CPRA submitted a joint Section 10/404 permit application and Section 408 permission request to USACE for the construction, operation, and maintenance of a 75,000 cfs sediment diversion (Applicant's Preferred Alternative). The EIS evaluates the Applicant's Preferred Alternative and five additional action alternatives as well as the No Action Alternative in order to inform USACE's permit and permission decisions and the LA TIG's NRDA decision in compliance with the statutes, orders, and policies outlined in EIS Chapter 5 Consultation and Coordination.

In the Restoration Plan, the LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54, and made every effort to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. As noted in the LA TIG's Restoration Plan, while the 150,000 cfs Alternative was projected to provide greater ecological benefits than the LA TIG's Preferred Alternative, it was also expected to cause greater collateral injury and greater risks to public health and safety. See Chapter 3, Section 3.2.4 of the Final Restoration Plan for a discussion of how the LA TIG came to its decision. Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred

---

Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

The Mitigation and Stewardship Plan (Appendix R1 to the EIS) has been designed by CPRA to mitigate the projected impacts of the 75,000 cfs sediment diversion (Applicant's Preferred Alternative). Different or additional mitigation could be needed to address the projected impacts of the proposed Project if a large capacity diversion (150,000 cfs) were to be selected.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61921**

**Commenter supports the use of adaptive management, but notes that it has been poorly used in the past. Suggests building adaptive management requirements into the current design to allow for future releases above 75,000 cfs.**

**Response ID: 16008**

The proposed MBSD Project as designed would have a maximum diversion flow capacity of 75,000 cfs when the Mississippi River flow reaches approximately 1,000,000 cfs or higher. Therefore, the proposed MBSD Project would not have the capacity to transport more than 75,000 cfs, which precludes the suggested adaptive management of flows higher than 75,000 cfs. Refer to EIS Chapter 2, Section 2.8.1.3 Project Operations in Action Alternatives Carried Forward for Detailed Analysis for additional details regarding proposed Project operations. However, CPRA does intend to adaptively manage the proposed Project. CPRA's Monitoring

---

and Adaptive Management (MAM) Plan can be found in Appendix R2 of the Final EIS. CPRA's MAM Plan describes how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to Project operations, riverside management, monitoring, maintenance, and adaptive management actions.

In the Restoration Plan, the LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54 and strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting Trustee goals, having a high likelihood of success, and avoiding collateral injury. While a 150k cfs diversion would be expected to deliver more ecological benefits to land creation and marsh building than the LA TIG's Preferred Alternative, it would also incur more collateral injuries and pose a greater risk to human health and safety; thus, it was not selected as preferred. See Chapter 3, Section 3.2.4 of the Final Restoration Plan for a discussion of how the LA TIG came to its decision.

---

**Concern ID: 61927**

**The environmental justice aspects of the Project need further review because of the increase in flood conditions that would have disproportionate impacts on low-income or minority communities, including an American Indian village, outside of federal levee protection. These disproportionate impacts include devastating impacts on community culture.**

**Response ID: 16276**

The issues raised by the commenters were considered in the Draft EIS. The EIS Chapter 4, Section 4.15 Environmental Justice discusses potential impacts of the proposed Project on low-income and minority populations.

In addition, since the release of the Draft EIS, CPRA has engaged the public through outreach meetings with the communities projected to be impacted by the MBSD, including Grand Bayou, to solicit input on mitigation strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts undertaken to better understand and address potential impacts on low-income and minority populations, including cultural impacts, are discussed in Chapter 7 of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in

the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 61930**

**The proposed MBSD Project is an inequitable use of public funds because its negative impacts fall most directly on marginalized ethnic groups, including African American, Native American, Latin American, Asian American, Canary Islander American (Islenos), and Croatian American and unjustly places the burden on Louisiana's coastal fishers. Risks often fall disproportionately on low-income or minority communities due to ongoing institutional injustices. These low-income and minority communities, including homes, cultures, and livelihoods of Indigenous people and other people of color are often sacrificed for the benefit of the "greater good", particularly for the larger tax bases upstream of the proposed MBSD Project. For example, when the levee breached at Mardi Gras Pass, nothing was done to re-protect the mostly African American oyster farmers and fishers whose oyster farms in Breton Sound were destroyed by the fresh water from Mardi Gras Pass. But a levee breach anywhere else along the Mississippi River would be quickly rebuilt and the impacted people would be indemnified. Also, the most effective flood risk reduction solutions, like home buyouts, are not offered to low-income populations in areas south of New Orleans. Both the Draft EIS and the LA TIG's Draft Restoration Plan would benefit from additional reflections on the natural and human history of the Project geography that resulted in such fundamental changes to the landscape and set us on the course of the land-loss crisis that Louisiana faces today. The EIS should describe historic, systemic inequities affecting communities with environmental justice concerns in the Project area to provide authentic and more complete context for the discussions.**

**Response ID: 16281**

The Draft EIS (including Section 4.15 Environmental Justice and Appendix H, Socioeconomics Technical Report at Chapter 2) included a discussion of communities with low-income and minority populations, including information about factors that have contributed to historic and systemic inequities in southeast Louisiana. As discussed in the EIS, the Project may have disproportionately high and adverse, long-term impacts on some low-income and minority populations in communities engaged in commercial and subsistence fishing and dependent on adversely impacted fisheries, as well as communities located near the immediate outfall area (within approximately 10 miles north and 20 miles south) and outside of federal levee protection. In addition, negligible to minor, adverse impacts related to increased risk of levee overtopping during certain 1 percent storm events south of the

immediate outfall area may occur, which may impact the community of Ironton. Commenters also raised concerns about Mardi Gras Pass; however, the closure of Mardi Gras Pass is outside of the scope of the EIS.

CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62107**

**Commenters suggested that while it is understandable that residents who rely upon the current Barataria Basin fisheries have fear and concern regarding a conversion to more freshwater oriented species in the basin, these fears of collapse would prove groundless. The commenters suggest that the government should facilitate fishers' shift into the new fisheries that evolve from the shifting species and location.**

**Response ID: 16263**

The issues raised by the commenters were considered in the Draft EIS. EIS Chapter 4, Section 4.14 Commercial Fisheries discusses the potential impacts on commercial fishing activities, which includes a discussion of potential behavioral changes that fishers may make in response to changes in species availability, including substitution of fish species, taking longer trips, and upgrading gear in Section 4.14.4.2 Applicant's Preferred Alternative in

---

Commercial Fisheries. While substitution of species may occur, such changes have costs that the fishers must incur.

CPRA has developed a plan to mitigate some potential adverse Project impacts. CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined its Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently

contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62233**

**Restoration of coastal habitat and the delta would provide protection from storm damage.**

**Response ID: 15752**

While the intent of the proposed Project is to reestablish deltaic processes to restore resources injured by the DWH oil spill, the Draft EIS Chapter 4, Section 4.20.4.2 Public Health and Safety described the ancillary benefit of storm damage risk reduction on communities north of the proposed diversion due to the creation and maintenance of wetland habitat and increases in topography and land acreage within the delta formation area. At the same time, operation of the Project would have permanent, minor to moderate, adverse impacts on storm hazards in communities south of the diversion, with anticipated increases in storm surge of up to 1.7 feet near Myrtle Grove (as compared to the No Action Alternative). Section 4.20.4.2.2.2 in Public Health and Safety of the Final EIS has been revised to include additional information and figures further explaining the impacts of the Project on storm surge and wave height

---

**Concern ID: 62260**

**The commenter stated support for the Applicant's Preferred Alternative and expressed concern that the Draft EIS overstates adverse impacts of the proposed Project associated with the input of freshwater into the Barataria Basin. The commenter explained that in the last 50 years, the basin has experienced numerous 100-year rainfall events that caused prolonged freshening events.**

**Response ID: 16436**

The commenter's support for the proposed MBSD Project is acknowledged. The commenter's concerns about Project impacts on the salinity of the Barataria Basin waters were considered in the Draft EIS. As projected by Delft3D Basinwide Modeling conducted to assess potential impacts of the proposed Project on resources such as water quality and salinity, the Project area is projected to experience increasing salinity due to sea-level rise and subsidence, in spite of prolonged rainfall events (see Chapter 4, Section 4.5.5.1 in Surface Water and Sediment Quality). As compared to the No Action Alternative, the Applicant's Preferred Alternative would cause permanent, minor (detectable over a small area) to moderate (observable over a large area, readily detectable in local areas) reductions in salinity in the Barataria Basin and permanent, minor increases in salinity in the birdfoot delta during proposed Project operations. These Project impacts on salinity would be beneficial for some wetland types and aquatic species and adverse for others (see Section 4.6 Wetland Resources and Waters of the U.S. and Section 4.10 Aquatic Resources for

further details about the proposed Project's salinity impacts on wetlands and aquatic resources, respectively). No related edits have been made to the Final EIS.

---

**Concern ID: 62267**

**The commenter expressed concern that the proposed MBSD Project's adverse impacts on wetland loss in the birdfoot delta would cause a loss of public lands in the Delta National Wildlife Refuge (NWR) and in the Pass A Loutre Wildlife Management Area (WMA). The commenter recommended that these adverse impacts on public lands be mitigated by creating state and federal public lands in the Project outfall area.**

**Response ID: 16439**

The commenter's concern that the proposed Project would cause a loss of wetlands in the Delta NWR and in the Pass A Loutre WMA, both of which are located in the birdfoot delta, was addressed in the Draft EIS in Chapter 4, Section 4.17.4 Operational Impacts in Public Lands. As part of its responsibilities under the Fish and Wildlife Coordination Act and as operator of the Delta NWR, the USFWS recommended the creation of crevasses to build land in the birdfoot delta to offset MBSD Project-induced wetland losses of 926 acres in the Delta NWR and 37 acres in the Pass A Loutre WMA (see Appendix T, USFWS Coordination Act Report (CAR), of the Final EIS). In response to USFWS' CAR Recommendation, CPRA agreed that, "Within 5 years of the commencement of Project operations, CPRA or the LA TIG will provide \$10,000,000 of additional funding for wetland preservation and restoration work in the Delta NWR and the [Pass A Loutre] PAL WMA to offset modeled acres of indirect wetland losses in those areas. That funding may be accomplished through additional funding through the CWPPRA program, through additional restoration work sponsored by the LA TIG (for example, construction of the Engineering and Design work discussed in the DWH LA TIG's Restoration Plan and Environmental Assessment #7), or through a direct contribution for additional work. The funding will be proportioned between the Delta NWR and the PAL WMA based on the magnitude of the predicted wetland loss in each area" (Final EIS, Appendix R1 Mitigation and Stewardship Plan, Section 4.6 Fish and Wildlife Coordination Act).

This information was updated in the Final EIS, Chapter 4, Section 4.27.1 in Mitigation Summary and in the Final EIS, Section 4.17.4.2.2 Birdfoot Delta in Public Lands.

---

**Concern ID: 62410**

**Commenter asserts that if the deltaic system is fully restored, the results would be astonishing and that the new delta could be allowed to flourish that is more productive than the physical delta we measure our losses from 90 years ago.**

**Response ID: 15943**

Comment noted. Although the EIS recognizes that current conditions have changed over time, Chapter 4 Environmental Consequences of the EIS discusses how the proposed Project alternatives would affect the currently-existing natural environment, to which the human and animal populations have acclimated. Chapter 3 Affected Environment summarizes the historic context for each resource assessed in the EIS. Further, Sections 3.1.4.1 Mississippi River and 3.1.4.2 Barataria Basin of the EIS address the deltaic processes that formed the proposed Project area; these sections have been supplemented in the Final EIS to further discuss historic conditions.

---

**Concern ID: 62411**

---

**All of these organisms are highly adaptable, as they must be to thrive in a deltaic environment where conditions can change in a geological instant—a saline embayment can freshen overnight and begin to fill with sediment after an avulsion on the river, or a freshwater wetland can be cut off from the river due to a course change. Nothing lives here that has not adapted to those conditions.**

**Response ID: 15947**

As described throughout Chapter 4, Section 4.10 Aquatic Resources of the EIS, operation of the proposed Project would affect the existing flora and fauna of the Barataria Basin in both beneficial and adverse ways, with the overall impacts to a given species being dependent on that species' habitat preferences and tolerances.

---

**Concern ID: 62412**

**If public funds are spent to acquire rights to private property in the receiving basin, then the right to free and unfettered public access must be acquired as well. Private landowners that succeed in requiring the purchase of rights such as flowage easements in order to allow a project that would prevent their land from disappearing should not be allowed to profit from this massive beneficial investment beyond sale of their property to the people in fee simple at fair market value.**

**Response ID: 15952**

Ownership of any lands created or acquired related to construction or operation of the Project would be determined in accord with current state law, including ownership of mineral rights pursuant to La. R.S. 31:149 and La. R.S. 49:214.5.5(E). Pursuant to La. R.S. 49:214.5.5(B), the Project would not create any rights of access to the public in or on private property.

---

**Concern ID: 62413**

**The MBSD diversion structure, outfall channel, and outfall area would constitute the world's single largest engineered restoration project. The LA TIG and CPRA should include a recreation and education area near the diversion with a viewing platform, trails, bike paths, along with a boat launch into the diversion outfall area.**

**Response ID: 15951**

Due to concerns about safety of the public and security for the Project facilities, there is not a plan to make the diversion structure or immediate outfall area accessible for public use. CPRA is, however, planning to provide signage and other public space near the Project to educate the public regarding the purpose and functioning on the Project. Ownership of any lands created by operation of the Project would be determined in accord with current state law, including ownership of mineral rights pursuant to La. R.S. 31:149 and La. R.S. 49:214.5.5(E). Pursuant to La. R.S. 49:214.5.5(B), the Project would not create any rights of access to the public in or on private property.

---

**Concern ID: 62431**

**Commenter asserts that diversion projects give Mississippi Delta communities a chance to survive, but they do not guarantee anything. Community members must overcome distrust and listen to authentic voices, from both communities and objective scientists, engineers, economists, social scientists and planners, who have no financial stake in the outcome.**

**Response ID: 15873**

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan.

Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration Plan and the Draft EIS in its decision-making process. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project. For a summary of public outreach efforts related to the Draft EIS refer to Chapter 7 Public Involvement of the EIS and for restoration planning see Section 1.8 of the LA TIG's Restoration Plan.

---

**Concern ID: 62662**

**The proposed Project is likely to succeed because other diversions have also built land and restored ecosystems. Specific examples of land-building projects include the Caernarvon Freshwater Diversion, Davis Pond, West Bay, Fort St. Phillip, the Jaws, Wax Lake, and Mardi Gras Pass. Many of the benefits of the Project, in terms of soil creation and microbial processes, are not captured in the engineering of the modeling. Many of the fine sediments transported by the diversion cannot be dredged but are critical soil components.**

**Response ID: 16635**

The benefits to land building of fine sediments transported by the diversion were addressed in the Draft EIS in Chapter 4, Section 4.2.3.2 Operational Impacts in 4.2.3 Geology, Topography, and Geomorphology. The Delft3D modeling conducted for the EIS distinguishes the types of sediment (sands and fine sediments) that would be deposited in the basin. Table 5.2-1 in EIS Appendix E Delft3D Modeling lists the sediment classes included in the model. As described in EIS Chapter 4, Section 4.4.4 Hydrology and Hydrodynamics, sand and fine sediments would contribute to land building in the basin in two ways - by being resuspended and transported elsewhere for deposition and by forming a base layer upon which future pulses of sediment could form marsh or land. The model's physics-based computations showed that the coarser sands would settle out before the finer sediment. As the sediment builds up, discharge velocities would increase over the previously deposited sediment and resuspend it, pushing it farther into the basin. Thus, the model reproduces the natural process of delta building in which successive waves of sediment push farther out, either forming land/marsh or creating a base upon which land/marsh can be formed without moving it by dredging and placement. In addition, Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology of the EIS discusses the geomorphic impacts of diversion operations, including the Wax Lake Outlet, the Caernarvon Freshwater Diversion, the Davis Pond Freshwater Diversion, the Bohemia Spillway, and Bonnet Carré Spillway, and Mardi Gras Pass.

The likelihood of the Project's success and its potential benefits were considered in the LA TIG's Draft Restoration Plan. As part of evaluating the Project and alternatives, the LA TIG considered the likelihood that the Project would succeed and achieve the LA TIG's goals.

---

Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the LA TIG's Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, these sections note that the knowledge gained through the projects noted by the commenters has been applied in designing the Project and evaluating whether and how the Project would restore and sustain critical marshlands. A full description of the range of benefits that would be provided by the Project is also included in Section 3.2.1.6 Benefits Multiple Resources of the Restoration Plan.

---

**Concern ID: 62862**

**Taking advantage of operational changes authorized in WRDA 2007, Davis Pond should be used as an adaptive management tool to achieve a gradual transition to lower estuarine salinities in the Barataria Basin. During the transition, the response of estuarine organisms, including brown shrimp, oysters and bottlenose dolphins could be monitored.**

**Response ID: 16671**

The Draft EIS did not consider using Davis Pond as an adaptive management tool. Based on the comparative size and location of the Davis Pond Freshwater Diversion relative to the Project, operational limitations on Davis Pond during low river flows and existing limitations on the flexibility of Davis Pond's operational regime, Davis Pond cannot effectively be used to ease the transition to a fresher estuary. In addition, increasing flows from Davis Pond in advance of commencement of Project operations could reduce the pre-construction time period available for fishers to continue their fishing activities while beginning to adapt to changes that occur once Project operations commence. Accordingly, no changes have been made to the Final EIS.

---

**Concern ID: 62951**

**CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.**

**Response ID: 16711**

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of

the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again,

community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63002**

**The commenter states that residents of southeast Louisiana had 40 years between Hurricane Betsy in 1965 and Hurricane Katrina in 2005 to learn how to live with nature on a disappearing coast, and have squandered those 40 years, increasing the area's vulnerability and the number of people exposed to danger by expanding the footprint of development and doubling down on levees and pumps, paying the price as storm after storm devastates community after community.**

**Response ID: 15754**

Comment noted. EIS Section 3.20 (Public Health and Safety, Including Flood and Storm Hazard Risk Reduction) provides the historical context of storm surge impacts.

---

**Concern ID: 63066**

**It is not clear why the negative impacts to bottlenose dolphins are expected from the proposed Project when dolphin injuries and mortality have not been associated with other freshwater releases or diversion projects such as Wax Lake Delta. Dolphins may simply reduce their use of less saline environments as conditions change.**

**Response ID: 16589**

The potential for dolphins to simply reduce their use of damaging, less saline environments by moving to higher saline environments was considered in the Draft EIS. More specifically, Chapter 4, Section 4.11 (Marine Mammals) of the EIS describes the impacts on bottlenose dolphins from freshwater exposure; these impacts are well documented and include observations and data collected in Louisiana associated with the release of fresh water. Most recently, a freshening event in 2019 resulted in the declaration of a bottlenose dolphin unusual mortality event (UME) in the northern Gulf of Mexico. The Bonnet Carré Spillway, Pearl River, and Lower Mississippi River distributaries contributed to low salinity in the region, resulting in increased mortality and strandings of bottlenose dolphins. Existing data on low-salinity exposure were used to develop a dose-response model that forms the basis for the evaluation of impacts in the EIS (Booth et al., 2020). Existing populations of bottlenose dolphins in Louisiana are largely reflective of the predominant conditions in a given area. Within Barataria Bay, dolphins demonstrate site fidelity to small areas of the basin which, as described in the EIS, has led to the identification of distinct strata (for example, Takeshita et al., 2020). Some of the dolphins tolerate lower salinity waters within Upper Barataria Bay, but are not expected to survive the amount and duration of fresh water released from the diversion. The Barataria Bay bottlenose dolphin stocks' extreme site fidelity and estuarine nature also suggests the dolphins would not move to areas with higher salinity, such as near the barrier islands or Gulf of Mexico.

---

**Concern ID: 63071**

**The dire forecasts about the near-term effects on dolphin populations in parts of Barataria Bay depend upon a number of unproven and improbable assumptions about dolphin adaptability and tolerance for living in the delta (Garrison et al., 2020). Conversely, the continued collapse of the marsh platform in the Barataria Basin will eventually reach a tipping point at which the prey base of dolphins in the bay would shrink and could eventually collapse. The long-term health of dolphins in the northern Gulf of Mexico depends on reconnecting the river to the delta and reestablishing the deltaic cycle.**

**Garrison, L.P, Litz, J. and Sinclair, C. 2020. Predicting the effects of low salinity associated with the MBSD Project on resident common bottlenose dolphins (*Tursiops truncatus*) in Barataria Bay, LA. NOAA Technical Memorandum NOAA NMFS-SEFSC-748: 97 p.**

**Response ID: 16594**

The Draft EIS recognized that the loss of wetlands under the No Action Alternative would result in a gradually increasing, from negligible to moderate, adverse impact on dolphins (see

---

Chapter 4, Section 4.11.5.1 [Operational Impacts]). The impacts on bottlenose dolphins from freshwater exposure have been well documented, including observations and data collected in association with the release of fresh water in Louisiana (see Chapter 4, Section 4.11 [Marine Mammals] of the EIS for more details). Most recently, a freshening event in 2019 resulted in the declaration of an unusual mortality event (UME) in the northern Gulf of Mexico. Existing data on low-salinity exposure were used to develop a dose-response model that formed the basis for the evaluation of impacts in the Draft EIS (see Chapter 4, Section 4.11.3 [Overview of Impact Analysis Approach]). The dose-response model was coupled with an updated population model to evaluate potential changes in survival rates within BBES. These potential decreases in survival rates caused by the diversion were compared to future conditions without the diversion (the No Action Alternative). The analysis contained in the Draft EIS determined that there would be a major, adverse, long-term impact on the BBES Stock. That conclusion is also supported by Thomas et al. (2021), which built on earlier studies and concludes that, after 1 year of operation of the Applicant's Preferred Alternative, there would be 61 percent fewer dolphins in the Central stratum than under the No Action Alternative, 35 percent fewer in the West stratum, 12 percent fewer in the Southeast stratum, and 2 percent fewer in the Island stratum, with 25 percent fewer overall. Thomas, et al. 2021 further concluded that after 10 the planned 50 years of operation, there would be 100 percent reduction in the populations of dolphins in the Central and West strata, an 82 percent reduction in the population of the Southeast stratum dolphins, and a 34 percent reduction in the population of the Island stratum dolphins as compared against the No Action Alternative, with an overall difference in population of 78 percent. (Note that Thomas, et al. 2022 slightly refined some of these projections.) After 50 years of operation, in three out of the four strata, dolphins are predicted to be functionally extinct under the Applicant's Preferred Alternative, with the remaining Island stratum being severely reduced relative to the No Action Alternative (that is, the median predicted population size of the Island stratum would be 85 percent lower [95 percent CI 28-99] under the Applicant's Preferred Alternative than under the No Action Alternative). Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the Applicant's Preferred Alternative is 143 dolphins (95 percent CI 11-706) compared to a predicted 3,363 (95 percent CI 2,831-4,289) predicted to inhabit the Barataria Bay under the No Action Alternative. In other words, the BBES dolphin stock would be 96 percent smaller (95 percent CI 80-100) under the Applicant's Preferred Alternative than then No Action Alternative. Chapter 4, Section 4.11 Marine Mammals of the Final EIS has been updated to reflect the results of Thomas et al (2021). The impacts of Project-induced wetland changes on dolphins is discussed in Chapter 4, Section 4.11.5 Operational Impacts of the EIS.

---

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed

---

mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63332**

**A large number of commenters expressed general support for the proposed Project.**

**Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63341**

**The coastal wetland system creates multiple lines of natural defense from hurricanes and storm surge, and the ongoing wetland loss resulting from the lack of riverine input into the basin has resulted in increased storm risks to local communities (including decreases in property values and impacts to the electrical grid).**

**Response ID: 16300**

The commenter's support for the proposed Project is noted. The commenter correctly notes that coastal wetlands are natural defense against hurricanes and storm surge, and the damage they cause to local communities and infrastructure, as discussed in Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S. of the Draft EIS. The causes of wetland loss in the proposed Project area were discussed in Section 3.6.2 of the Draft EIS, and included subsidence, levees, storms, canals/spoil banks, herbivory, and the DWH oil spill. Chapter 4, Sections 4.6 Wetland Waters and Resources of the U.S. and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS explained how the proposed Project would create and maintain wetlands in the Barataria Basin, and discuss the corresponding impacts on storm surge and flooding.

---

**Concern ID: 63349**

**Commenters noted that it is clear that only nature can build a delta, and that nature should be allowed to begin to replace the one that was allowed to die. In order for that to happen without massive dislocation of human communities, some combination of a diversion the approximate size of the Wax Lake Outlet, combined with some level of control at the point of outflow, would be necessary.**

**Response ID: 16311**

The commenter's support for the proposed Project is noted. Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives of the Draft EIS explained how the proposed Project is designed to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin. Although the proposed Project is not designed to divert the maximum capacity of water diverted by the Wax Lake Outlet (about

440,000 cfs), its operation is projected to build maximum of 17,300 acres of land in the Barataria Basin by 2050, as discussed in Chapter 4, Section 4.2.3.2 in Geology and Soils. The capacity and operational triggers considered for the proposed Project are discussed in Chapter 2, Section 2.4 Step 2: Evaluation of Operational Alternatives - Location, Operational Triggers, Capacity, and Base Flow. The purpose of the proposed Project is also discussed in Chapter 3, Section 3.2.1.1 (Alternative 1 Description) of the LA TIG's Restoration Plan.

---

**Concern ID: 63631**

**A commenter questions whether the freshwater releases at Bonnet Carré Spillway led to an unusual mortality event (UME) that occurred in 2019.**

**Response ID: 16604**

Chapter 4, Section 4.11.5.2 (Barataria Bay Estuarine Stock) of the EIS summarizes the dolphin deaths, stranding numbers, and body conditions that led to the UME declaration in 2019. After analyzing various potential causes for the increase in dolphin mortality, scientists determined that the most likely cause of this UME was exposure to low-salinity waters in 2019 from the above average freshwater discharge into the Northern Gulf of Mexico. Prolonged exposure to low-salinity water (for example, less than 10ppt) has been documented to have harmful health impacts on bottlenose dolphins, ranging from skin lesions and serum electrolyte abnormalities to death.

Alexander Kolker

RE: Mid-Barataria Sediment Diversion (MBSD) Draft Environmental Impact Statement (DEIS)

We, the undersigned, are natural and physical scientists, and engineers, with decades of research and technical experience related to Louisiana's coast. Many of us have dedicated our careers to studying the socio-ecological system of the Mississippi River Delta. Our collective interdisciplinary work has informed the State's efforts on the Louisiana Coastal Master Plan, the Mid-Barataria Sediment Diversion Draft Environmental Impact Statement (DEIS) and other coastal restoration and protection efforts. We know all too well from our research and life experiences what is at stake for the ecosystems and people of coastal Louisiana.

There is an opportunity in Louisiana to invest in restoration to build a more climate resilient future for Louisiana's coast. Throughout the world, river deltas are under threat from rising sea levels, climate change, and other human impacts. With annual inputs of sediment and fresh water, river deltas can continue to provide valuable habitats and other benefits in the face of environmental changes. However, human activity has altered many deltas around the world and the Mississippi River Delta is no exception. Levees built along the river for flood control and navigation have severed much of the delta from the flow of sediment needed to sustain land in the face of rising sea level, changes resulting from the construction of canals, and a series of other direct and indirect impacts. The release of the DEIS for the Mid-Barataria Sediment Diversion project is a significant step forward in reintroducing flows of sediment back into the sediment-starved wetlands that are necessary for the Delta's future.

The idea of a river diversion at Myrtle Grove is not new. A diversion at this location was first explored more than 35 years ago in a 1984 feasibility study by the Army Corps of Engineers, but the concept for the project began to take firmer shape in 2001 under the Coastal Wetlands Protection and Restoration Act and in 2004 under Louisiana's Coastal Area Program. Since that time considerable research has been conducted to better understand how to maximize the land building and sustaining benefits of river diversions as well as the ecological consequences of increasing freshwater flows and sediment inputs to the basin. With the diversion there will be changes in the basin -changes in water levels, sediment accumulation, and the distribution of salinity and some species of fish and wildlife. Efforts to mitigate for these changes should be as transparent and inclusive as possible. But without the diversion major changes are also expected to occur and the ecosystem will continue to degrade with continued sea level rise and wetland loss.

The Mississippi River Delta is one of the most-studied deltas in the world, and the Mid-Barataria Sediment Diversion has been developed using the best available science and modeling, and reasonable assumptions about future conditions. However, once the diversion is built and being operated, the actual conditions will determine how complex interactions between physical, ecological and social aspects of the system play out. We must continue to invest in monitoring and research to measure the project's success and better understand the changing environment, the diversion impacts to people, and to inform the robust adaptive management program that will inform decisions related to project operations. In addition, we believe that an independent and multidisciplinary science and technical advisory group -

including physical scientists, ecologists, sociologists and other experts - should be established and engaged frequently to advise operation managers.

The future of Louisiana's deltaic wetlands depends on wise investment in restoration projects that provide long-term benefits to our coast. The Mid-Barataria Sediment Diversion will help address the injuries to wetland habitat associated with the 2010 Deepwater Horizon oil spill and is an important step towards a more climate-resilient future for Louisiana.

Signed,

**Concern ID: 63201**

**Mitigation should be transparent; changes to ecosystem would occur even without the proposed Project due to continued sea-level rise and wetland loss.**

**Response ID: 16569**

The Draft EIS evaluated anticipated changes to wetland and other resources due to sea-level rise and wetland loss if the proposed Project is not implemented in its evaluation of the No Action Alternative. Any mitigation measures that would be required by USACE would be special conditions of the DA permit, if one is issued. If a permit is issued, it would be made available to the public via the USACE website.

As described in Section 1.6 (No Action Alternative) of the LA TIG's Final Restoration Plan (as well as in greater detail in the SRP/EA #3), the loss of deltaic processes in this estuarine ecosystem has resulted in a steady decline in the health of natural resources in the Barataria Basin, which is indicated by metrics such as decreased plant health, high rates of erosion, and higher salinities farther north in the basin. Without the proposed MBSD Project, deterioration of injured resources within and beyond the Barataria Basin would continue (see the No Action Alternative Analyses in Chapter 4, Sections 4.2 [Geology and Soils] and 4.6 [Wetland Resources and Waters of the U.S.] of the EIS).

The measures set forth in CPRA's Mitigation and Stewardship Plan for the Project address changes directly attributable to the proposed MBSD Project, such as changes in salinity affecting fisheries. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that

---

USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

But without the diversion, major changes are also expected to occur and the ecosystem would continue to degrade with continued sea-level rise and wetland loss.**

**Response ID: 16358**

The commenter's support for the proposed Project is noted. The analyses in the EIS were developed using the best information and data available to USACE and the LA TIG at the time of writing. The impacts of both the proposed Project and the No Action Alternative are discussed throughout Chapter 4 Environmental Consequences. Appendix R of the Final EIS reflects CPRA's mitigation and stewardship strategies, which were refined based on public input received during the Draft EIS comment period.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure

---

that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63809**

**The Trustees must continue to invest in monitoring and research to measure the Project's success and better understand the changing environment, the diversion impacts to people, and to inform the robust adaptive management program that will inform decisions related to Project operations. An independent and multi-disciplinary science and technical advisory group - including physical scientists, ecologists, sociologists and other experts - should be established and engaged frequently to advise operation managers.**

Response ID: 16690

USACE is not a Trustee.

The LA TIG acknowledges the comment, and notes that, the robust monitoring and adaptive management measures raised by commenters were considered in the Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Draft EIS). In particular, the MAM Plan establishes a technical advisory group (see Section 2.2.2.3 [Technical Focus Group(s)/Peer Review] of the MAM Plan). As a result, no changes have been made to the MAM Plan included with the Final EIS in response to this comment. If the LA TIG funds the Project, the LA TIG would also fund the MAM Plan.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:40561**

Mississippi Commercial Fisheries United, Inc.

Ryan Bradley

TO WHOM IT MAY CONCERN,

Please accept this letter on behalf of the Mississippi Commercial Fisheries United, Inc. ("MSCFU") regarding the Louisiana Coastal Protection and Restoration Authority's ("CPRA") application to permit activities in relation to the Mid-Barataria Sediment Diversion Project ("MBSD"). MSCFU is a non-profit 501(c) 6 business alliance of commercial fishermen, seafood businesses, and consumers of the natural resources our members provide. A large number of MSCFU members are active participants in a variety of commercial fishing activities in Mississippi and Louisiana territorial waters as well as the federally managed waters of the Gulf of Mexico. As a result, our constituents are vitally dependent on healthy marine ecosystems; especially, those estuarine systems of the Mid-Barataria Basin that are proposed to be impacted by the sediment diversion project. The Mid-Barataria Bay is essential fish habitat for a wide variety of culturally and economically significant recreational and commercial marine resources that are vital to the heritage and sustainability of coastal communities. The proposed project and subsequent impact area has a high potential to cause severe economic injury to fishing dependent communities that both fish directly in the vicinity of the impacted area and those that depended on the Barataria Bay as estuary for healthy juvenile aquatic resources that can grow and move further offshore for further recreational and commercial exploitation.

The entire Gulf Coast seafood industry has experienced devastating setbacks over the past decade from natural and man-made disasters such as hurricanes, the BP Deepwater Horizon Oil Spill, Harmful Algae Blooms, freshwater and sediment diversions, excessive rainfall, and under reported prolonged hypoxic events that have diminished, displaced, and now threatens the very livelihood of multi- generational fishing families across the Gulf Coast. The proud heritage of the seafood industry is at stake more now, than it ever has been. The average age of the U.S. commercial fisherman is getting older every year as there are less and less young fishermen coming into the industry at an early age. Without incoming commercial fishermen to replace our aging veteran fishermen; the public at large stands to lose significant access to the bountiful natural resources of the Gulf Coast waters and along with it the invaluable traditional ecological knowledge that has been passed down from generation to generation. Therefore, MSCFU, hereby respectfully presents the following concerns and recommendations on the proposed project in hopes that the ultimate decision makers will duly consider the economic, cultural, and overall importance that the proposed projects impact area has on the entire Gulf Coast seafood industry.

**CONCERNS:**

Our members express sincere concerns over the health and reproductive capacity of Louisiana's marsh estuary systems that are extremely important to commercial fisheries should the proposed MBSD project become fully implemented. Estuarine systems throughout the marsh serve as critical habitat for a variety of natural resources such as shrimp, oysters, crabs, and fish. Commercial fishermen, seafood business and seafood consumers are greatly dependent on these resources being healthy, abundant, and consistently available. The

proposed MBSD project impact area is a primary estuary for these economically important resources. It should be noted that the year 2017 produced the largest dead zone at the mouth of the Mississippi River in recorded history according to the National Oceanic and Atmospheric Administration (NOAA). There are grave concerns that sediment and water diversion into upper estuaries will cause similar hypoxic dead zones in areas that are highly important to a variety of juvenile species. Essentially, the primary concern is that the MBSD project and similar projects will cause irreparable harm to the seafood industry by destroying essential fish habitat in the impacted zones. The project's intended outcomes are perceived as long-term (decades) and will greatly reduce the biodiversity and abundance of vitally important marine resources in the short-term. This project will likely contribute to a significant loss in revenue for oyster harvesters, shrimpers, and crabbers in the areas impacted and also in surrounding areas as well.

Example: In 2011, the Army Corps of Engineers opened up the Bonnet Carré Spillway in Louisiana for several weeks. The impact to the commercial fisheries in Mississippi as a result of this spillway opening was devastating. Oysters, crabs, and shrimp harvest plummeted in the western Mississippi Sound during the months following this event. The impact was so detrimental that the oyster and crab fishery in Mississippi was declared a disaster and the U.S. Congress dedicated nearly \$10.9 million in funding to restore and conserve natural resource habitats that were directly impacted.

Mississippi's oyster reefs continue to struggle to recover from this event and similar diversions to this day. The commercial fishing interest from Mississippi have seen firsthand the impacts these diversions can have and therefore express strong concerns over any future projects that aim to divert water and/ or sediment from the Mississippi River.

In 2019, the Army Corps of Engineers operated the Bonnet Carré Spillway for a record setting number of days causing catastrophic damage to marine life, marine mammals, and essential fish habitat amounting to more than \$500 million across the states of Louisiana, Mississippi, and Alabama. Losses continue to accrue from this event.

The proposed MBSD project will have multiple impacts to fisheries that commercial harvesters are dependent upon and that have not been fully evaluated or have been grossly underestimated thus far. These impacts include (A) continual sediment displacement that will smother essential oyster and shrimp habitat; (B) severe changes in water temperature that will directly affect the normal growth of a variety of juvenile marine species; (C) substantial increases in the frequency and duration of hypoxic events that will contribute to an increase in mortality of aquatic resources; and (D) the displacement of a variety of commercially important marine resources along with the fishermen whom harvest them. Overall, this project will have a devastating impact to both the culturally important marine resources and the fishing communities whom depend upon them. There are also legitimate concerns over the general feasibility of the proposed project and questions regarding if the proposed project's ecosystem services can actually be achieved in a reasonable time frame with minimal impact to fishing dependent communities that have a long history of operating in the impacted area.

(A) The impact to sediments in essential fish habitat from the proposed MBSD project will have substantial impacts in the short-term. Species such as oysters will be completely silted over on-bottom and will experience 100 % mortality in areas directly

---

impacted. Species such as shrimp which require years of undisturbed bottom habitat to be able bury in the sediments to evade depredation and to spawn.

(B) Severe changes in water temperature from the constant throttling of a cold Mississippi River discharge outflow at the maximum rate of up to 75,000 cfs will drastically alter the dynamics of essential fish habitat that is critically dependant on stable warm temperatures to optimally grow a plethora of marine species that are economically and culturally important.

(C) It is expected that a substantial increase in the frequency and duration of hypoxic events would be observed immediately following sediment discharges should this project be implemented. Similar conditions in water, sediments, and other pollutants have greatly contributed to an ever expanding dead zone. Legitimate concerns have been raised that if this diversion project is implemented that it would be expected to cause similar dead zone within vital estuarine habitat before a majority of the species could grow large enough to escape hypoxic zones in the areas directly impacted.

(D) Not only will a host of marine resources be critically displaced by this project; so will the hard working commercial fishermen and women as well as businesses whom greatly rely on healthy marine ecosystems. These seafood industry workers will bear the brunt of the proposed MBSD project and will pay severely with the loss of their livelihoods. Due to the increased distance that fishing dependent communities will have to travel to operate; expected diminished catch rates; and the inability to transition into other fisheries; these factors will culminate in a large number of fishing dependent enterprises to be essentially forced out of business.

Additional concerns include the fact that these types of sediment diversion are relatively new and untested. There is no guarantee that the proposed MBSD project will create any land at all or within any given time frame. There is also a strong argument that these types of projects will make wetlands more susceptible to erosion; especially, in the event of a hurricane. Moreover, concerns exist about the suitability for sediments from the Mississippi River to be inserted into the Mid-Barataria estuary. These concerns include the possibility for sediments to contain elevated levels of Poly-Aromatic Hydrocarbons and other chemical pollutants that have a high probability for being present in elevated levels due to the amount of shipping and industrial activities operating in the vicinity.

Lastly, the CPRA has failed to hold any meetings about the project in the State of Mississippi as they have publicly promised they would do. MSCFU argues that the detrimental impact that this project will have on Mississippi, its' residents, and business owners have not been adequately considered.

CPRA's seafood industry mitigation plan does not include mitigation measures for impacted stakeholders residing in the State of Mississippi, many of whom are duly licensed and permitted to operate in the State of Louisiana.

#### RECOMMENDATIONS:

The Mississippi Commercial Fisheries United, Inc. hereby recommends that the United States Army Corps of Engineers ("USACE") deny the Louisiana Coastal Protection and Restoration Authority's request for a permit in reference to any and all components of the Mid-Barataria Sediment Diversion project. The USACE must fully analyze and consider the direct and

lasting socio-economic impacts this proposed project would have on the seafood industry while considering the necessary approvals for this project.

Please duly consider the concerns and recommendations put forth by the Mississippi Commercial Fisheries United, Inc. regarding the proposed Mid-Barataria Sediment Diversion project being pursued by the Louisiana Coastal Protection and Restoration Authority. This project will have a devastating impact on coastal communities across the Gulf Coast. Please consider alternative methods to this sediment diversion project and similar projects. Please save the most endangered species, the commercial fishermen!

Sincerely,

Ryan Bradley/ Executive Director

Mississippi Commercial Fisheries United, Inc.

---

**Concern ID: 61879**

**Commenters questioned why other alternatives are not being considered other than No Action and a sediment diversion with various levels of flow rates. CEQ's regulations require that the EIS rigorously explore and objectively evaluate all reasonable alternatives, which is a requirement that the Draft EIS does not meet. Consider analyzing a range of other alternatives, options, and tools that better preserve and protect the environment and minimize the severe impacts to Louisiana fisheries, the communities, and the entire Gulf Coast ecosystems.**

**Response ID: 15835**

The range of reasonable alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2 of the Draft EIS (Alternatives), an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the

screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in its SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in its Restoration Plan. The LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

---

**Concern ID: 61964**

**CPRA has failed to hold any meetings about the proposed Project in the State of Mississippi as they have publicly promised they would do.**

**Response ID: 15909**

The joint public meetings for the Draft EIS and the LA TIG's Draft Restoration Plan in April 2021 were held virtually through an internet web-based conferencing application due to COVID-related restrictions in place at the time. Participation and comments were not geographically limited to any particular location. Anyone interested in learning more about the proposed MBSD Project and/or who wanted to participate in the NEPA or OPA processes or who wanted to provide comments on the Draft EIS or the LA TIG's Draft Restoration Plan was able to participate in the meetings via the internet and/or a toll-free telephone line – including anyone located in Mississippi.

During each of these meetings, USACE and the LA TIG played a pre-recorded presentation that included information about how to comment on the Draft EIS and/or the Draft Restoration Plan, an update on the proposed MBSD Project design, information concerning the ongoing restoration planning efforts and the LA TIG's Draft Restoration Plan and details about how to navigate and review the contents of the Draft EIS. This pre-recorded presentation was also available in several languages including Spanish, Vietnamese, and Khmer.

Further, public meetings were not the only forum through which concerns could be shared. Many means to comment during this the public review period were available including verbally during the virtual meetings, verbally by toll-free telephone number, written via the postal service, and electronically via email and on the comment portal website. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

---

**Concern ID: 62019**

**The Draft EIS fails to address extended economic and community impacts of this proposed Project. The proposed MBSD Project would not only affect localized Louisiana concerns, but would impact no less than three other Gulf Coast states including Texas, Mississippi, and Alabama.**

**Response ID: 16215**

EIS Chapter 3, Section 3.1.1 Project Area identifies the area of analysis for the EIS which includes the Barataria Basin and portions of Mississippi River birdfoot delta. For socioeconomic impacts, the EIS identifies the area of potential impacts as the 10-parish Project area due to indirect socioeconomic impacts. Most impacts would likely be concentrated in Plaquemines, Lafourche, and Jefferson Parishes, Louisiana. For commercial fisheries, the proposed Project area includes two basins (the Barataria Basin and a portion of the Mississippi River Basin birdfoot delta). The proposed Project is not anticipated to have discernable effects on aquatic resources outside of the Project area. Commercial fishermen that travel to Barataria Basin to fish for species that would be adversely affected, particularly shrimp and oysters, could also be adversely affected by the proposed Project. Chapter 4, Section 4.14.4 Operational Impacts in Commercial Fisheries in the Final EIS has been revised to acknowledge this.

In response to one commenter's request for supplemental environmental review to consider potential impacts of the Project on the Texas shrimp fishery, the NOAA Technical Memorandum cited in support of that request has been reviewed. The technical memo does not confirm the comment that shrimp from the Barataria Basin migrate to Texas. While that memo does report that tagged brown shrimp released in Louisiana were recovered in Texas, those recovered shrimp were released in offshore waters south of Calcasieu Lake. Tagged shrimp that were released in the Caillou Lake estuary, which is in the Terrebonne Basin (on the western side of the Barataria Basin) were not recovered in Texas.

---

**Concern ID: 62029**

**The EIS describes immediate, major, and permanent adverse impacts on several critical species in the Barataria Basin, including shrimp and oysters. The health of commercial fisheries and the socioeconomic well-being of coastal communities are closely intertwined. Such impacts would inflict economic harm on businesses, families, and individuals.**

**Response ID: 16225**

The issues raised by the commenters were considered in the Draft EIS. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted. The EIS also acknowledges the importance of commercial fisheries to the Louisiana economy and communities, as described

by commenters. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana and Section 4.14 Commercial Fisheries describes impacts to commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts to shrimp and oyster fisheries in the proposed Project area are anticipated under the Applicant's Preferred Alternative. Changes in abundance may exacerbate trends of aging fishers leaving the industry and would have adverse impacts on the overall fishery. Adverse impacts may be partially offset by changes in fisher behavior. Additional details on the regional and community level economic impacts on commercial fisheries due to the proposed MBSD Project can be found in Section 4.14 Commercial Fisheries.

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA

permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)

- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62077**

**The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.**

**Response ID: 16242**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD

---

Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in

the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62079**

**Commenters are concerned that impacts similar to those caused by the fresh water from Bonnet Carré Spillway openings would affect fisheries in the Barataria Basin with the proposed MBSD Project.**

**Response ID: 16244**

The Project area for the MBSD EIS includes the Barataria Basin and the Mississippi River birdfoot delta. Existing operations and influences of rivers and diversions, including but not limited to the Bonnet Carré Spillway, were incorporated into the baseline conditions of the No Action Alternative and action alternatives assessed in the Draft EIS, Chapter 4 Environmental Consequences, Sections 4.2 through 4.24. Reasonably foreseeable future (but not existing) diversions, such as the Mid-Breton Diversion, were analyzed for impacts in combination with existing diversions and the proposed MBSD diversion in Chapter 4, Section 4.25 Cumulative Impacts.

A summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and to discuss their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS. Note that the Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological purposes.

---

**Concern ID: 62082**

**Commenters noted that the proposed MBSD Project would have multiple impacts to fisheries that commercial harvesters are dependent upon and that have not been fully evaluated or have been grossly underestimated thus far. These impacts include (A) continual sediment displacement that would smother essential oyster and shrimp habitat; (B) severe changes in water temperature that would directly affect the normal growth of a variety of juvenile marine species; (C) substantial increases in the frequency and duration of hypoxic events that would contribute to an increase in mortality of aquatic resources; and (D) the displacement of a variety of commercially important marine resources along with the fishermen whom harvest them. Overall, this**

---

**proposed Project would have a devastating impact to both the culturally important marine resources and the fishing communities whom depend upon them.**

**Response ID: 16246**

The impacts raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.10.4.5 Key Species in Aquatic Resources in the Draft EIS described impacts of the proposed Project on finfish and shrimp and oyster species. As described, impacts may result from various factors, for example, increased sedimentation, changes in salinity, increased nutrients, changes in water temperature and dissolved oxygen (hypoxia) is discussed in Section 4.10.4.4 General Impacts on Habitat and the Environment in Aquatic Resources. These impacts on species and habitat conditions inform Section 4.14 Commercial Fisheries, which discussed the impacts of the proposed Project on commercial fishing activities in detail. As described, the proposed Project is anticipated to have adverse impacts on commercial shrimp and oyster fisheries, negligible to minor beneficial effects on the blue crab fishery, and a range of impacts on finfish fisheries, depending on the species. Impacts related to subsistence activities are discussed in Section 4.15 Environmental Justice.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined its Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded. Fishers who utilize the Barataria Basin would be eligible to participate in CPRA's MBSD fisheries mitigation program regardless of state

---

residency. Eligibility requirements for this program would include use within the Project area and may include information from trip tickets and vessel licenses.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62084**

**Commenters believe that the proposed MBSD Project would cause economic loss annually to other Gulf Coast states. The Mississippi Gulf Coast seafood and fishing industry would be devastated.**

**Response ID: 16248**

Chapter 3, Section 3.1.1 Project Area of the Draft EIS identifies the analysis area for the EIS. This is the area in which the Project is anticipated to have discernable effects. For socioeconomic impacts, the EIS identifies the area of potential impacts as the 10-parish Project area due to indirect socioeconomic impacts. Most impacts would likely be concentrated in Plaquemines, Lafourche and Jefferson Parishes, Louisiana. For Commercial Fisheries, the Project area includes two basins (the Barataria Basin and a portion of the Mississippi River Basin). The proposed Project is not anticipated to have discernable effects on aquatic resources outside of the Project area. Commercial fishermen that travel to Barataria Basin to fish for species that would be adversely affected, particularly shrimp and oysters, could also be adversely affected by the proposed Project. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Final EIS has been revised to acknowledge this. Those commercial fishermen would be eligible to participate in the fishery mitigation programs discussed in the Mitigation and Stewardship Plan (Appendix R1 to the EIS).

---

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project. Impacts related to subsistence activities are discussed in Section 4.15 Environmental Justice.

---

**Concern ID: 62105**

**Commenters expressed concerns over the health and reproductive capacity of Louisiana's marsh estuary systems that are extremely important to commercial fisheries should the proposed MBSD Project become fully implemented. The proposed MBSD Project impact area is a primary estuary for these economically important resources such as shrimp, oysters, crabs, and fish. Estuarine systems throughout the marsh serve as critical habitat for a variety of natural resources such as shrimp, oysters, crabs, and fish. Commercial fishermen, seafood business and seafood consumers are greatly dependent on these resources being healthy, abundant, and consistently available.**

**Response ID: 16260**

The EIS recognizes the value of estuarine habitats as well as the value of fisheries, and evaluated proposed Project impacts on estuarine habitats that would be adverse as well as beneficial (in particular, refer to Chapter 3, Section 3.6 and Chapter 4, Section 4.6, which discuss Wetland Resources, and Chapter 3, Section 3.14 and Chapter 4, Section 4.14, which discuss Commercial Fisheries). Beneficial impacts would include increases in primary productivity and available food sources, which could benefit or adversely affect fauna, depending on the organism's place in the food chain. However, increases in nutrient loading could also produce phytoplankton blooms, including HAB's, and die-offs of these blooms could in turn lead to decreases in dissolved oxygen. In addition, refer to the Essential Fish

Habitat (EFH) Assessment in Appendix N of the EIS for more details on the EFH in the Project area. Wetlands provide a diverse set of functions, which include providing habitat for finfish, shellfish, as well as other organisms. As such, wetland creation and commercial fishing are not mutually exclusive. The proposed Project is anticipated to have adverse effects on commercial fishing for some species (shrimp, oyster, southern flounder, spotted seatrout), primarily related to changes in salinity in the basin, the impacts of which are discussed in Chapter 4, Section 4.14 Commercial Fishing.

---

**Concern ID: 62255**

**Commenters expressed concern that during proposed MBSD diversion operations, contaminated sediments from the Mississippi River may be routed to the Barataria Basin, where they would cause adverse impacts. One commenter stated concern that because the dilution capacity of the basin is less than that of the Mississippi River, contaminants routed to the basin via the diversion would reach toxic levels because basin waters would not sufficiently dilute the sediment.**

**Response ID: 16434**

Impacts related to contaminated sediment raised by the commenters were considered in the Draft EIS. As noted in Chapter 4, Section 4.5.5.10 in Surface Water and Sediment Quality, recent evaluations of Mississippi River sediments in the vicinity of the proposed Project intake structure indicate that they are free from contaminants at concentrations that would result in detrimental impacts. The dilution referenced in Chapter 3, Section 3.5.3.1 in Surface Water and Sediment Quality refers to movement along the entire length of the river from Minnesota to Louisiana and is not meant to imply that dilution is occurring or needed to dilute elevated concentrations in the proposed Project area. In response to these comments, the USACE has edited Section 3.5.3.1 in Surface Water and Sediment Quality to make this clear in the Final EIS.

---

**Concern ID: 62634**

**The proposed Project would cause excessive harm to fisheries (for example, oysters and brown shrimp), dolphins, communities and recreational uses, which is unacceptable and would make its implementation a clear violation of OPA. OPA regulations states that proposed restoration actions should be evaluated by “the extent to which each alternative will prevent future injury as a result of the incident, and avoids collateral injury as a result of implementing the alternative”. Because the Project would injure species that were harmed by the Deepwater Horizon oil spill, it should not be implemented, even if it does benefit some habitats and species. Some commenters argued it was also inconsistent or in violation of the 2013 U.S. Court Consent Decree and the BP plea agreement relevant to the National Fish & Wildlife Foundation (NFWF) funds.**

**Response ID: 16650**

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is not evaluating the proposed Project for compliance with OPA and not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG's Draft Restoration Plan, OPA, or NRDA processes represent solely the views of the LA TIG, not USACE.

The potential collateral injuries of the proposed Project were considered in the LA TIG's Draft Restoration Plan.

OPA requires that Trustees develop and implement a plan for restoration, rehabilitation, replacement, or acquisition of the equivalent, of the injured natural resources under their trusteeship. See 33 U.S.C. § 2706(c). OPA further requires federal agencies to propose regulations for the "assessment of natural resource damages." See § 2706(e). Under 2707(e)(2), any assessment of natural resource damages made in accordance with these regulations creates a rebuttable presumption on behalf of a Trustee in any administrative or judicial proceeding under the Act.

As required by OPA 2706(e), NOAA developed regulations outlining a process for the assessment of natural resource damages. These regulations (hereinafter "NRDA regulations" at 15 CFR Part 990) also include a process for restoration planning, including the development and evaluation of restoration alternatives.

The 2016 U.S. Consent Decree with BP provides that monies received under the settlement for natural resource damages will be spent as outlined in restoration plans adopted by the Trustees consistent with 15 CFR 990. See Paragraph 19, and Appendix 2. The LA TIG's Restoration Plan is consistent with 15 CFR 990.

Title 15 CFR §990.54 of the regulations outlines a number of areas in which a reasonable range of alternatives should be evaluated to select the preferred alternative. Recognizing that almost all restoration comes with some potential for collateral injury, one factor for evaluation is the extent to which each alternative will prevent future injury and avoid collateral injury. The potential for collateral injury does not preclude an alternative from selection, rather the Trustees must evaluate each alternative under multiple factors, and select a preferred alternative to meet the outlined restoration objectives.

The LA TIG, in selecting the Preferred Alternative in the Restoration Plan, evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 (Identification of a Preferred Alternative), 3.2.1.5 (Alternative 1 – Avoids Collateral Injury), and 3.2.2.5 (Alternatives 2–6 – Avoids Collateral Injury) of the Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystems and necessarily entails reverting the current ecosystem to a more natural state that was altered when Mississippi River flows were cut off by construction of levees. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG selected Alternative 1 as the Preferred Alternative in the Restoration Plan.

The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Alternative 1 – Benefits Multiple Resources) of the Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as the Preferred Alternative in the Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project would meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the spill.

The BP Plea Agreement as it applies to NFWF funds is not relevant here as the LA TIG is not authorizing the use of those funds for this Project. Even if it were applicable, the criminal plea agreement expressly contemplates the use of criminal penalties for sediment diversion in Louisiana.

---

**Concern ID: 62659**

**The proposed Project is an experiment, and it is not possible to guarantee its alleged benefits.**

**Response ID: 16632**

The uncertainties associated with the Project's success were considered in the Draft EIS. While the benefits of the Project cannot be guaranteed, the EIS uses state-of-the-art modeling, including but not limited to the Delft3D Basinwide Model, to project the Project's beneficial and adverse impacts. These modeling projections of Project impacts include uncertainties. Following standard professional practice, model uncertainties are clearly stated in the EIS with respect to the model's quantitative results. Uncertainties are incorporated into the EIS impact conclusions and are briefly summarized in EIS Chapter 4, Section 4.1.3.3 Model Limitations and Uncertainty, and in detail in Section 8.0 Model Limitations and Uncertainties of EIS Appendix E Delft3D Modeling.

The likelihood of success of the Project was also considered in the LA TIG's Draft Restoration Plan. While recognizing the innovative nature of the proposed Project, the Restoration Plan discusses in detail the factors that would contribute to the Project's success. More specifically, Sections 3.2.1.4 (Likelihood of Success - Alternative 1) and 3.2.2.4 (Likelihood of Success - Alternatives 2-6) of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, such a sediment diversion has been extensively studied over several decades with the objective of designing and operating the

---

proposed Project to provide a combination of land building and ecosystem benefits (see Section 3.2.1.4 [Likelihood of Success - Alternative 1] of the Restoration Plan). The Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62708**

**The release of polluted river water into the Barataria Basin would create harmful algal blooms and/or large areas of low dissolved oxygen that could negatively affect aquatic fauna including mortality of adults and juveniles that may not be able to escape impacted areas.**

**Response ID: 16086**

As discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS, the input of nutrients from the Mississippi River is generally anticipated to be beneficial to the food web, although there is an acknowledged potential for harmful algal blooms. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and well-mixed by wind and tidal action, such that it is not typically prone to stratification that promotes hypoxic (dissolved oxygen of less than 2 to 3 mg/L) conditions. Further, as discussed in Section 4.10.4.4 in Aquatic Resources, the Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below 5 mg/L on an average monthly basis; therefore, although sporadic and limited areas of low dissolved oxygen may occur, mainly in the

---

summer months, no large or prolonged periods/layers of low dissolved oxygen are projected by the Delft3D Basinwide Model, nor anticipated based on the Barataria Basin's identification as a largely well-mixed estuary. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to Project implementation has been added to Section 4.5.5.5.2 in Dissolved Oxygen of the Final EIS.

The Monitoring and Adaptive Management (MAM) Plan (Appendix R2), which has been updated for the Final EIS in response to public comments, includes CPRA's plan to implement a monitoring program for phytoplankton species composition, including harmful cyanobacterial/algal bloom species (and associated toxins) (see Sections 3.7.3.10 and 3.7.3.11 of Appendix R2 of the Final EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62711**

**Sedimentation from the proposed Project would completely silt over oysters, resulting in 100 percent mortality in areas directly impacted.**

**Response ID: 16089**

As discussed in Chapter 4, Sections 4.10.4.4 and 4.10.4.5 in Aquatic Resources of the Draft EIS, portions of the Little Lake Public Oyster Seed Ground (POSG) would experience substantial sedimentation over time, likely converting hard substrates to soft bottom in those areas over time. However, the Little Lake POSG is not currently a productive oyster reef and the areas with live/productive oyster reef (further south) would experience less sedimentation

---

from the proposed Project, and at rates that the oyster reef/oysters would be expected to survive.

To address some projected adverse Project impacts, CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see CPRA's Mitigation and Stewardship Plan in Appendix R1 of the Final EIS). CPRA's mitigation and stewardship measures aimed at oyster impacts include establishment of new oyster seed grounds in appropriate areas of the basin, enhancing existing public and private seed ground, enhancement of broodstock reefs, and funding to support off-bottom oyster culture. Although not being implemented to mitigate the effects of the MBSD, the LA TIG also continues to address oil spill related injuries to oysters through various non-Project-related restoration/fishery improvement actions, including: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, and the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62760**

**Sedimentation in EFH would have substantial impacts in the short-term.**

**Response ID: 16138**

---

The impacts of sedimentation from the proposed Project on EFH are discussed in Chapter 4, Section 4.10.4.3 in Aquatic Resources and Appendix N2 (Section 6.6 [Project Effects to EFH]) of the EIS. Generally, the proposed Project would convert one type of EFH to another type. Over time, Project-related sedimentation would result in increased emergent marsh, and could affect sand/shell substrates and oyster reefs that are located higher in the basin by converting them to soft bottom EFH habitats. Both beneficial and adverse impacts from sedimentation would occur over time, with sediment building faster in the immediate outfall area. However, the effects of sediment deposition related to wetland creation and burial of structured habitat (for example shell or vegetation, which provide refugia for fauna) are not likely to be substantial in the short-term (generally defined as a 3-year period). Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS.

---

**Concern ID: 62761**

**Shrimp require years of undisturbed bottom habitat to be able bury themselves in the sediments to evade depredation and to survive to spawn.**

**Response ID: 16139**

Chapter 4, Sections 4.10.4.5.2.1 (Brown Shrimp) and 4.10.4.5.2.2 (White Shrimp) of the Final EIS have been supplemented to discuss predator avoidance through burial, and how the proposed Project could affect that potential.

---

**Concern ID: 62762**

**The continuous input of colder river water would drastically alter the dynamics of EFH that is critically dependent on stable warm temperatures for the optimal growth of marine species.**

**Response ID: 16140**

The impacts of decreased water temperatures from the proposed Project on EFH and managed species are discussed in Appendix N2 (Section 6.5.6 [Project Effects on Water Temperature]) of the EIS, which indicates the potential for faunal stress and mortality during opening of the diversion each year, as well as in areas near the outfall during winter. Similarly, Chapter 4, Sections 4.10.4.4 and 4.10.4.5 in Aquatic Resources discuss the potential impacts of water temperature on the water column (decreases of up to 11.9°F in certain months at mid-basin stations) and how changes in water temperature may affect aquatic fauna in general, and select managed species, respectively. However, Section 4.10.4.1.2 in Submerged Aquatic Vegetation of the Final EIS has been updated to discuss impacts on SAV from the lower temperatures associated with Mississippi River water input.

---

**Concern ID: 62778**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.**

**Response ID: 16360**

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the concern of the commenter, the Draft EIS did find potential minor to moderate, long-term

---

adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63015**

**There are misrepresentations in the EIS about how nutrients in the river would spread out far from the sand deposition area to lower plant biomass belowground. Increasing nutrient loads from diversions would weaken soils, not strengthen soils.**

**The modern Mississippi River has nutrient concentrations that are much higher than when the mostly organic soils were created centuries ago (Turner et al. 2007) and may weaken soils by 30 percent, resulting in less belowground biomass, and change vegetation from being comprised of perennials to annuals (Turner et al. 2011). Increased flooding inundation, which is a consequence of river diversions, also weakens the belowground biomass of wetland plants (Morris et al. 2017) that may erode during high water events or from hurricanes (Kearney et al. 2011, Howes et al. 2010). Individual roots become weaker when exposed to ambient levels of nutrients found in the river (Hollis and Turner 2019a, b; Hollis and Turner 2021). The soil becomes degraded, accumulates less biomass, and decomposes and erodes faster (Swarzenski et al. 2008, Hebert et al. 2020). The diversion of river water into the nearby marshes would almost certainly weaken soils, making them less resistant to wave energy and hurricanes. A striking example is the net loss of wetlands in the Davis Pond Diversion where increased land loss occurred beginning the year after the diversion opened (Turner et al. 2019). This is an area that has no significant sediment input.**

The literature cited by the commenters has been reviewed, including Turner et al. 2007, Turner et al. 2011, Morris et al. 2017, Kearney et al. 2011, Howes et al. 2010, Hollis and Turner 2019, Swarzenski et al. 2008, Hebert et al. 2020, Turner et al. 2019, and Mo et al. 2020, and Chapter 4, Section 4.6.5.1.2 Applicant's Preferred Alternative of the Final EIS has

---

been revised to include additional analysis regarding the impact of nutrient input from the proposed Project on vegetation communities and soil shear strength.

---

**Concern ID: 63945**

**The seafood industry mitigation plan does not provide mitigation measures to stakeholders in Mississippi who are licensed in Louisiana.**

**Response ID: 16585**

CPRA's Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) provides a suite of mitigation strategies applicable to fishers that may be impacted by the Project regardless of state of residence. CPRA has expanded and refined its Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The focus of those measures remains providing assistance to impacted users. Those mitigation programs will be equally available to any impacted fisher who relies on fisheries in the Barataria Basin, regardless of whether or not they reside in the Basin.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 64171**

**Comments were received suggesting that the MBSD would have negative impacts on the fishing industry due to further accelerations in exits from the industry especially for older members of the workforce for whom job retraining may not be as easily undertaken and the fact that there are less young fisherman coming into the fishing**

---

**industry to replace the aging fisherman. The invaluable traditional ecological knowledge that has been passed down from generations could be lost.**

**Response ID: 16267**

Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discusses impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, moderate to major adverse impacts to shrimp and oyster fisheries in the Project area are anticipated. Section 4.14.4.2 Applicant's Preferred Alternative discusses the potential behavioral responses of fishermen to changes in species abundance, including the potential for substitution of species and need for gear upgrades, increasing the length of fishing trips, as well as exiting the industry.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact

---

determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

I support the Mid-Barataria Sediment Diversion, which is the cornerstone of Louisiana's Coastal Master Plan and will enhance the lifespan of other coastal restoration and protection projects.

This project will have many positive, long-term benefits for coastal communities, including increased storm surge protection from restored wetlands, job creation, and regional economic impact during construction. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. Decision makers must work with potentially impacted communities to develop and implement ideas and proposals for adaptation and mitigation.

A future without the Mid-Barataria Sediment Diversion is a future we cannot afford.

---

Louisiana's Barataria Basin has experienced some of the highest rates of land loss on the planet, making our communities more vulnerable to hurricanes, threatening critical infrastructure and jobs, and decimating formerly diverse and abundant wildlife habitats.

The Mid-Barataria Sediment Diversion will build more wetlands than any other individual restoration project in the world. This project is a crucial first step in reversing the state's land loss crisis, protecting our communities from hurricanes and sea level rise, while also ensuring the long-term health of the ecosystem and wildlife.

The Army Corps is taking public comments on this project right now. **Be a voice of support for this critical restoration project! Sign up here to stay updated and help advance Louisiana's best shot at turning the tide on our land loss crisis.**

Louisiana's Barataria Basin has experienced some of the highest rates of land loss on the planet, making our communities more vulnerable to hurricanes, threatening critical infrastructure and jobs, and decimating formerly diverse and abundant wildlife habitats.

The Mid-Barataria Sediment Diversion will build more wetlands than any other individual restoration project in the world. This project is a crucial first step in reversing the state's land loss crisis, protecting our communities from hurricanes and sea level rise, while also ensuring the long-term health of the ecosystem and wildlife.

The Army Corps is taking public comments on this project right now. **Be a voice of support for this critical restoration project! Sign up here to stay updated and help advance Louisiana's best shot at turning the tide on our land loss crisis.**

Louisiana's Barataria Basin has experienced some of the highest rates of land loss on the planet, making our communities more vulnerable to hurricanes, threatening critical infrastructure and jobs, and decimating formerly diverse and abundant wildlife habitats.

The Mid-Barataria Sediment Diversion will build more wetlands than any other individual restoration project in the world. This project is a crucial first step in reversing the state's land loss crisis, protecting our communities from hurricanes and sea level rise, while also ensuring the long-term health of the ecosystem and wildlife.

with your email, you agree

Louisiana's Barataria Basin has experienced some of the highest rates of land loss on the planet, making our communities more vulnerable to hurricanes, threatening critical infrastructure and jobs, and decimating formerly diverse and abundant wildlife habitats.

The Mid-Barataria Sediment Diversion will build more wetlands than any other individual restoration project in the world. This project is a crucial first step in reversing the state's land loss crisis, protecting our communities from hurricanes and sea level rise, while also ensuring the long-term health of the ecosystem and wildlife.

The Army Corps is taking public comments on this project right now. **Be a voice of support for this critical restoration project! Sign up here to stay updated and help advance Louisiana's best shot at turning the tide on our land loss crisis.**

Louisiana's Barataria Basin has experienced some of the highest rates of land loss on the planet, making our communities more vulnerable to hurricanes, threatening critical infrastructure and jobs, and decimating formerly diverse and abundant wildlife habitats.

The Mid-Barataria Sediment Diversion will build more wetlands than any other individual restoration project in the world. This project is a crucial first step in reversing the state's land loss crisis, protecting our communities from hurricanes and sea level rise, while also ensuring the long-term health of the ecosystem and wildlife.

The Army Corps is taking public comments on this project right now. **Be a voice of support for this critical restoration project! Sign up here to stay updated and help advance Louisiana's best shot at turning the tide on our land loss crisis.**

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

Alisha Renfro

Re: Mid-Barataria Sediment Diversion (MBSD) Draft Environmental Impact Statement (DEIS)

I writing to support selection of the preferred alternative of a 75,000 cfs variable flow for the Mid-Barataria Sediment Diversion. I also support using Natural Resource Damage Funds allocated for restoring and conserving habitat to fund construction of the project as it will build and sustain critical wetland habitat and provide ecosystem scale benefits to the northern Gulf of Mexico ecosystem.

The Barataria Basin is changing and has been for a long time. Both with and without the Mid-Barataria Sediment Diversion the basin will continue to change, but, today we have an opportunity to start down a path of change towards a more sustainable future for the basin and Louisiana's coast. We don't have time to continue to only invest in half-measures that in just a decade or two will leave us with very little to show for all of our time, effort, and investment. The Mid-Barataria Sediment Diversion is a bold solution that will bring change to the system, but it a project backed by decades and decades of scientific research. This project is the first step towards building a more climate resilient Louisiana coast.

The Mississippi River built the Mississippi River Delta from sediments, fresh water, and nutrients that were washed off of the river's one million square drainage basin. The effort to tame the river to protect against floods and provide a reliable navigation route for a growing nation, cut off much of delta from the river. There are of course many factors that have contributed to the staggering loss of 400 square miles of land in the Barataria Basin alone, including storms, rising sea levels, subsidence, and erosion by waves. However, levees stemmed the flow of sediment, fresh water, and nutrients into the wetlands have hindered the ability of the basin's wetlands to recovery from being battered by storms and waves and to adequately increase their surface elevation in response to rising sea level and subsidence.

Using diversions of sediment and fresh water are not a new concept. There are already a few freshwater diversions in place, Davis Pond and Caernarvon, which were designed, built and operated to control salinity distribution in the basin. However, despite targeting fresh water, small sub-deltas are forming in their outfalls. In addition, we can look to places like the Wax Lake Delta which shows that a steady flow of sediment into an area can not only build new land, but can maintain it and it can recover from impacts such as hurricanes. Reconnecting the river and restoring deltaic processes that bring sediment, fresh water and nutrients in the Barataria Basin is key to restoring vital coastal habitat over the long term, including habitat injured by the oil spill.

The purpose and needs statement outlined in the draft Environmental Impact Statement (DEIS) is a solid foundation against which to measures alternatives. There are those that will argue that other restoration project types, such as marsh creation or canal backfilling can provide just as much land building and sustaining benefits as a sediment diversion without also changing much else about the current system. However, that is simply not the case. Marsh creation projects are powerful at building land in strategic locations, but, at the end of the day, not only does this type of project fail to sustainably address one of the causes of land loss (lack of continued sediment input), but the scale at which marsh creation is possible is severely limited due to restricted amount of suitable sand-sized borrow. Relying only on marsh creation to build land, also wastes more than 70% of the fine sediment that the river

carries in suspension, a wasteful proposition. Backfilling canals are also a useful restoration tool and can help restore the historical flow of fresh and saltwater through wetlands, but will do nothing to build and sustain land in the face of rising sea levels. In contrast, sediment diversions, by re-establishing deltaic processes address one of the underlying causes of land loss, building and sustaining land despite some amount of continued sea level rise as well as storm events.

As the DEIS outlines, construction and operation of the Mid-Barataria Sediment Diversion will bring immediate changes to the basin by increasing water levels and altering the distribution of salinity within the basin. This will impact several nearby communities and commercial fishers. The DEIS does outline some possible mitigation measures to address the project's impacts. However, these should be viewed as a place to start and continued conversations are absolutely essential to ensure that mitigation measures address the real needs of the community and are equitable. This requires community members to come to fully come to the table, ready to engage and find solutions. Given the difficult history between the state and community members, bringing in an outside facilitator to help explore these options, and thinking of creative solutions may be helpful. These solutions may include tangible things like buyouts or building new docks, but in some cases, it may actually be policy changes that help make transition and flexibility more possible than it is today. And this will not be a onetime occurrence, but will need to be an ongoing dialog through the first few years of the project's operation.

One species that the DEIS does document as likely to be significantly adversely impacted by the project are bottlenose dolphins. The population found in the Barataria Basin were heavily impacted by the Deepwater Horizon Oil spill. Unfortunately, this population of dolphins has largely been ignored over the years until oil began washing up into Basin. Since 2010 there has been considerable research on this population through the Natural Resource Damage Assessment and the Gulf of Mexico Research Initiative. While there has been modeling done to try to estimate the impact of changing salinities on the dolphins, there are currently large gaps in knowledge that may actually over estimate or even underestimate the impacts the project could have. The investment in pre-construction monitoring for the dolphins outlined in the DEIS may help address some of these gaps and that knowledge should be used to explore possible modifications to project operation that could reduce or minimize negative impacts to the population when possible. However, it also must be acknowledged that the status quo of continued land loss will also negatively impact these animals, as prey habitat is lost, and may very well result in catastrophic decreases in their overall population. Pretending this is a static system that has always been as it is today and will always be the same without the project would be failing to grasp even the most basic realities of life in a deltaic system.

One important aspect of this project is its ability to be adaptively managed so that the project can meet the expected goals, but also so that expected negative impacts that are outlined in the DEIS may be reduced by adjusted or limited flows. Adaptive management is a buzzword that is often thrown around in the restoration world with little thought about what that actually would look like with most restoration project types, but with this project the flow of water between the river and the basin can be controlled and adjusted as necessary. Monitoring the influence of the project is critical to understanding the system change associated with the project and for identifying how and when adaptive management of the project may be useful.

This requires ongoing investment in science which is often an afterthought, but is well outlined in the DEIS.

The Mid-Barataria Sediment Diversion is not a panacea for all of Louisiana's land loss, far from it. But it is a first step in using the full suite of tools that we have on hand, including the most important - river that actually built this landscape. Change has always been part of life living on a river delta. Change has happened and will continue regardless of whether or not we build this project. That change may be the next storm or the next flood, or that change could be us taking a proactive step to reconnect the river with the delta and start to really build a future for Louisiana's coast. This project is the first step, but often that first step is the hardest. We have an opportunity now to not only invest in our future, but to take care of those that would be most impacted by the continued collapse of our wetlands.

Sincerely, Alisha Renfro

New Orleans, Louisiana

---

**Concern ID: 62662**

**The proposed Project is likely to succeed because other diversions have also built land and restored ecosystems. Specific examples of land-building projects include the Caernarvon Freshwater Diversion, Davis Pond, West Bay, Fort St. Phillip, the Jaws, Wax Lake, and Mardi Gras Pass. Many of the benefits of the Project, in terms of soil creation and microbial processes, are not captured in the engineering of the modeling. Many of the fine sediments transported by the diversion cannot be dredged but are critical soil components.**

**Response ID: 16635**

The benefits to land building of fine sediments transported by the diversion were addressed in the Draft EIS in Chapter 4, Section 4.2.3.2 Operational Impacts in 4.2.3 Geology, Topography, and Geomorphology. The Delft3D modeling conducted for the EIS distinguishes the types of sediment (sands and fine sediments) that would be deposited in the basin. Table 5.2-1 in EIS Appendix E Delft3D Modeling lists the sediment classes included in the model. As described in EIS Chapter 4, Section 4.4.4 Hydrology and Hydrodynamics, sand and fine sediments would contribute to land building in the basin in two ways - by being resuspended and transported elsewhere for deposition and by forming a base layer upon which future pulses of sediment could form marsh or land. The model's physics-based computations showed that the coarser sands would settle out before the finer sediment. As the sediment builds up, discharge velocities would increase over the previously deposited sediment and resuspend it, pushing it farther into the basin. Thus, the model reproduces the natural process of delta building in which successive waves of sediment push farther out, either forming land/marsh or creating a base upon which land/marsh can be formed without moving it by dredging and placement. In addition, Chapter 4, Section 4.2.3 Geology, Topography, and Geomorphology of the EIS discusses the geomorphic impacts of diversion operations, including the Wax Lake Outlet, the Caernarvon Freshwater Diversion, the Davis Pond Freshwater Diversion, the Bohemia Spillway, and Bonnet Carré Spillway, and Mardi Gras Pass.

The likelihood of the Project's success and its potential benefits were considered in the LA TIG's Draft Restoration Plan. As part of evaluating the Project and alternatives, the LA TIG considered the likelihood that the Project would succeed and achieve the LA TIG's goals.

Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the LA TIG's Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, these sections note that the knowledge gained through the projects noted by the commenters has been applied in designing the Project and evaluating whether and how the Project would restore and sustain critical marshlands. A full description of the range of benefits that would be provided by the Project is also included in Section 3.2.1.6 Benefits Multiple Resources of the Restoration Plan.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

---

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63071**

**The dire forecasts about the near-term effects on dolphin populations in parts of Barataria Bay depend upon a number of unproven and improbable assumptions about dolphin adaptability and tolerance for living in the delta (Garrison et al., 2020). Conversely, the continued collapse of the marsh platform in the Barataria Basin will eventually reach a tipping point at which the prey base of dolphins in the bay would shrink and could eventually collapse. The long-term health of dolphins in the northern Gulf of Mexico depends on reconnecting the river to the delta and reestablishing the deltaic cycle.**

**Garrison, L.P, Litz, J. and Sinclair, C. 2020. Predicting the effects of low salinity associated with the MBSD Project on resident common bottlenose dolphins (*Tursiops truncatus*) in Barataria Bay, LA. NOAA Technical Memorandum NOAA NMFS-SEFSC-748: 97 p.**

**Response ID: 16594**

The Draft EIS recognized that the loss of wetlands under the No Action Alternative would result in a gradually increasing, from negligible to moderate, adverse impact on dolphins (see Chapter 4, Section 4.11.5.1 [Operational Impacts]). The impacts on bottlenose dolphins from freshwater exposure have been well documented, including observations and data collected in association with the release of fresh water in Louisiana (see Chapter 4, Section 4.11 [Marine Mammals] of the EIS for more details). Most recently, a freshening event in 2019 resulted in the declaration of an unusual mortality event (UME) in the northern Gulf of Mexico. Existing data on low-salinity exposure were used to develop a dose-response model that formed the basis for the evaluation of impacts in the Draft EIS (see Chapter 4, Section 4.11.3 [Overview of Impact Analysis Approach]). The dose-response model was coupled with an updated population model to evaluate potential changes in survival rates within BBES. These potential decreases in survival rates caused by the diversion were compared to future conditions without the diversion (the No Action Alternative). The analysis contained in the Draft EIS determined that there would be a major, adverse, long-term impact on the BBES Stock. That conclusion is also supported by Thomas et al. (2021), which built on earlier studies and concludes that, after 1 year of operation of the Applicant's Preferred Alternative, there would be 61 percent fewer dolphins in the Central stratum than under the No Action Alternative, 35 percent fewer in the West stratum, 12 percent fewer in the Southeast stratum, and 2 percent fewer in the Island stratum, with 25 percent fewer overall. Thomas, et al. 2021 further concluded that after 10 the planned 50 years of operation, there would be 100 percent reduction in the populations of dolphins in the Central and West strata, an 82 percent reduction in the population of the Southeast stratum dolphins, and a 34 percent reduction in the population of the Island stratum dolphins as compared against the No Action Alternative, with an overall difference in population of 78 percent. (Note that Thomas, et al. 2022 slightly refined some of these projections.) After 50 years of operation, in three out of the four strata,

dolphins are predicted to be functionally extinct under the Applicant's Preferred Alternative, with the remaining Island stratum being severely reduced relative to the No Action Alternative (that is, the median predicted population size of the Island stratum would be 85 percent lower [95 percent CI 28-99] under the Applicant's Preferred Alternative than under the No Action Alternative). Overall, by the year 2076, the median predicted stock size across all of Barataria Bay under the Applicant's Preferred Alternative is 143 dolphins (95 percent CI 11-706) compared to a predicted 3,363 (95 percent CI 2,831-4,289) predicted to inhabit the Barataria Bay under the No Action Alternative. In other words, the BBES dolphin stock would be 96 percent smaller (95 percent CI 80-100) under the Applicant's Preferred Alternative than then No Action Alternative. Chapter 4, Section 4.11 Marine Mammals of the Final EIS has been updated to reflect the results of Thomas et al (2021). The impacts of Project-induced wetland changes on dolphins is discussed in Chapter 4, Section 4.11.5 Operational Impacts of the EIS.

**Concern ID: 63179**

**Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.**

**Response ID: 16556**

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

---

**Concern ID: 63339**

**The Mid-Barataria Sediment Diversion is the largest individual ecosystem restoration project in our country's history, which is fitting since the Barataria Basin is experiencing one of the highest rates of land loss on the planet. Large-scale projects like the Mid-Barataria Sediment Diversion are just the kind of bold actions that are needed if there is to be any hope of a truly sustainable coast.**

**Response ID: 16297**

The commenters' support for the proposed Project is noted. Land and wetland loss along coastal Louisiana is described in EIS Chapter 3, Sections 3.1.4.1 and 3.1.4.2 in Introduction.

---

**Concern ID: 63348**

**The proposed MBSD Project is not a panacea for all of Louisiana's land loss, but it is a first step in using the full suite of tools on hand, including the most important tool, the Mississippi River, which actually built this landscape.**

**Response ID: 16310**

The commenter's support for the proposed Project is noted. Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives of the Draft EIS explained how

---

the proposed Project is designed to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin. This is also discussed in Chapter 3, Section 3.2.1.1 in Geology and Soils of the LA TIG's Restoration Plan.

---

**Concern ID: 63615**

**While marsh creation projects are powerful at building land in strategic locations, at the end of the day they fail to sustainably address one of the causes of land loss (lack of continued sediment input), and the scale is severely limited due to restricted amounts of suitable borrow material. In addition, the types of sediment that a sediment diversion will convey highlights a marked difference with marsh creation. Therefore, it is not the case that marsh creation projects provide the same benefits as diversions.**

**Response ID: 15840**

The commenters' support for the Project is acknowledged. Table 2.3-1 in EIS Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives describes whether various alternatives, including a large-scale sediment diversion into Barataria Basin and a large-scale marsh creation project, met the screening criteria for the proposed Project. Additional information related to the marsh creation alternative has been added to Section 2.3.5 Large-Scale Marsh Creation for the Final EIS.

---

**Concern ID: 63632**

**While modeling has been done to estimate the impact of changing salinities on dolphins, there are large gaps in knowledge that may result in over- or under-estimating Project impacts. The pre-construction dolphin monitoring outlined in the Draft EIS may help address these gaps and should be leveraged to explore modifications to Project operation that could reduce negative impacts to dolphins.**

**Response ID: 16605**
