As described in the Draft EIS, the MAM Plan identifies potential ways in which the LA TIG may reduce impacts to dolphins. The MAM Plan in the Final EIS has been updated to provide more detail about the strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols. However, the adaptive management strategies and actions are largely reliant upon data that would be collected during either the pre-construction monitoring period or once operations commence. Once operational data are available, they would be used to evaluate the potential Project modifications to further minimize impacts to marine mammals. There are limited minimization measures available that would reduce impacts on marine mammals and those limited measures would likely only benefit dolphins residing the furthest from the diversion structure (for example, the Island strata).

However, the LA TIG recognizes that despite these operational strategies, dolphins within Barataria Bay would likely experience significant impacts, as described in the EIS, given the purposes of the proposed Project. In response, the LA TIG has developed a Marine Mammal Intervention Plan that outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia (see Appendix R5 to the Final EIS). While the more severe actions such as euthanasia may not offset the ultimate outcome of mortality, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, the Mitigation and Stewardship Plan and MAM Plan include actions that would occur prior to operations to improve understanding of the BBES dolphins as well as improvement of stocks across the state (see Appendices R1 and R2 to the Final EIS).

In arriving at the mitigation and stewardship actions included in the Mitigation and Stewardship Plan, the LA TIG worked with experts within NOAA with expertise on marine mammals to ensure the consideration of all potential mitigation actions. In terms of operational strategies to reduce marine mammal impacts, as noted above, those strategies cannot be further defined at this time as they are largely reliant upon data that would be collected during the pre-construction monitoring

period or once operations commence. One goal of the proposed Project is to deliver sediment, fresh water, and nutrients into the basin and the design of all of the action alternatives would accomplish that goal. Alternative diversion designs that accomplish that goal on the desired scale would not address dolphin impacts, as those impacts are largely related to salinity changes, which are driven by the transmission of fresh water into the basin.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62925

Increased stranding response capacity is unlikely to be effective because there are insufficient stranding response and rehabilitation resources, rehabilitation is expensive and results are unknown, and rehabilitated dolphins released in other estuaries will compete with established populations (Deming et

al., 2020; Fougères, 2015; Garrison et al., 2020; Gluch, 2004; Mazzoil et al., 2008; McHugh et al., 2021; Thomas et al., 2021; Wells et al., 2013; Wells, 2014).

Response ID: 16543

Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock of the EIS and Section 3.2.1.5 (Avoids Collateral Injury) of the LA TIG's Restoration Plan acknowledge that a large number of dolphins would become ill and strand or die in Barataria Bay as a result of the Project.

Two citations mentioned by the commenter (Garrison et al., 2020 and Wells, 2014) were included in the Draft EIS. Other citations mentioned by the commenter (Deming et al., 2020; Fougères, 2015; Gluch, 2004; Mazzoil et al., 2008; McHugh et al., 2021; Wells et al., 2013) were reviewed and would not change the findings of the EIS, but they have been added to Section 4.11 (Marine Mammals). As noted in other responses, the Final EIS has also been updated to reflect the results of Thomas et al (2021), which did not change the conclusions of the EIS.

To address bottlenose dolphin impacts, the LA TIG has developed a Marine Mammal Intervention Plan that has been included in the Final EIS and Final Restoration Plan (Appendix R5 to the EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions such as euthanasia may not offset the ultimate outcome of mortality, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized. However, the LA TIG recognizes that the number of animals able to be relocated will likely be very small in comparison to the number impacted by the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in

instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62930

Commenter noted that commercial fishing is the primary cause of marine mammal bycatch and should be considered over rod and reel (recreational) fishing during further development of CPRA's Mitigation and Stewardship Plan.

Response ID: 16546

The threat of commercial fishing to marine mammals was discussed and considered in Chapter 3, Section 3.11.4 (Existing Threats) of the Draft EIS; therefore, no related edits were made to the Final EIS. Stewardship measures that would be implemented as part of the Applicant's Preferred Alternative are designed to address some anthropogenic threats to bottlenose dolphins in Louisiana waters including interaction with recreational and commercial fishing (see the Mitigation and Stewardship Plan in Appendix R1 to the EIS).

As stated in the PDARP, the Deepwater Horizon Trustees will continue to advance bycatch reduction measures in the commercial fisheries across the Gulf of Mexico.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the

additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62931

Commenter noted agreement with the assessment of effects that mitigation and monitoring may have on the BBES dolphins, specifically in consideration of the broader impact this Project will have on the BBES dolphins. Commenter agreed that as long as measures are conducted with due care, any effects that flow from the enhanced monitoring would be warranted.

Response ID: 16547

The commenter's support of the need for marine mammal related mitigation and monitoring for the Project is acknowledged.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated

Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63823

Commenters noted that the proposed mitigation will not actually reduce impacts on dolphins, and there is no way to mitigate those impacts. Commenters noted that reducing human interaction will not reduce or address impacts of the projects on the local population.

Response ID: 16550

Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock of the EIS acknowledges that according to Thomas, et al. (2021) most of the approximately 2,300 dolphins within the Barataria Basin will perish within the first 10 years of start of operations of the proposed Project (comparing the anticipated Barataria Basin 2027 dolphin population [2,307 dolphins] to the projected 2038 population under the Preferred Alternative [644 dolphins] indicates that approximately 72 percent of the dolphins would perish). That section further acknowledges that the anticipated dolphin mortality would be due to reductions in salinity levels rather than other stressors and that mitigation and stewardship measures that would not reduce the salinity impacts, would be unlikely to reduce the projected dolphin mortality.

With respect to the Restoration Plan, in Section 3.2.1.5 (Avoids Collateral Injury) the LA TIG acknowledges that a large number of dolphins would become ill and strand in Barataria Bay as a result of the Project. The Mitigation and Stewardship Plan also acknowledges that the proposed mitigation may not minimize impacts of the Project on dolphins (see Appendix R1 to the EIS). Measures described in the MAM and Mitigation and Stewardship Plan were developed in

recognition of the anticipated effects of the Project and to provide valuable data to inform adaptive management actions that could be considered to minimize adverse impacts on BBES dolphins while being consistent with the Project's purpose (see Appendices R1 and R2 to the Final EIS).

The LA TIG does not agree that there is no effective mitigation for this Project but recognizes that the mitigation will be limited (that is, primarily for dolphins around Grand Isle), depending on how operations are managed. Similar to mitigation, the stewardship measures described in the Mitigation and Stewardship Plan will primarily benefit other Louisiana stocks of dolphins outside of the Barataria Basin, though they will provide some benefit to BBES dolphins. For example, minimizing dolphin feeding will protect dolphins from vessel interactions. As noted in Chapter 4, Section 4.11 (Marine Mammals) of the EIS, a remnant BBES dolphin population is expected to remain near the barrier islands. Efforts to reduce anthropogenic stressors other than those from the Project through the Stewardship and Mitigation Plan will benefit the existing and future population in the Barataria Basin and throughout the state. However, the LA TIG recognizes that the impacts of the Project will likely be significant on marine mammals even with the proposed mitigation and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as

conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63826

Commenters suggested that no one will be able to mitigate dolphin impacts if Project activities kill them.

Response ID: 16551

The stewardship measures described in the Mitigation and Stewardship Plan are intended for implementation prior to and during diversion operations. Although these measures may not minimize impacts from the proposed Project on BBES dolphins, they could enhance individual dolphin survival threatened by other anthropogenic sources, such as by funding a state-wide stranding program (the current funding of which is set to expire in 2026; see Appendix R1 to the EIS).

Regarding the operation of the diversion, CPRA also developed a detailed MAM Plan to evaluate the proposed MBSD Project's effects on the Barataria Basin as they occur and consider how the management of the diversion may be adapted to better meet Project goals (see Appendix R2 [Monitoring and Adaptive Management Plan] to the EIS). In addition to performance monitoring to measure progress toward the proposed MBSD Project's restoration objectives, and to better understand the ecological functions and services provided by habitat created by the Project, the Monitoring and Adaptive Management (MAM) Plan also includes monitoring to document changes to the abundance, distribution, population demography, density, survival, health and reproduction of the BBES Stock of bottlenose dolphins, their prey, and their habitat that may result from the operation of the Project and resulting low salinity.

Adaptive management strategies in CPRA's MAM Plan to minimize impacts to BBES dolphins from Project operations include a framework for coordinating stranding response activities during operations, and a commitment to evaluate whether diversion operations could be modified to meet Project goals while reducing impacts to marine mammals. Marine mammal related MAM activities have been updated since the release of the Draft EIS to include more details regarding the process through which operational data would be used to evaluate potential modifications to those strategies and protocols.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range

of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63828

It is unclear from the Draft EIS what effort was made by the State of Louisiana to meet the statutory responsibility under the Bipartisan Budget Act in its selection of alternatives.

Response ID: 16553

Chapter 3, Section 3.11.1 Marine Mammals in the Northern Gulf of Mexico of the Final EIS has been revised to discuss the Marine Mammal Protection Act waiver that was issued for the proposed Project.

There is no requirement that CPRA evaluate alternatives other than the Project. The Bipartisan Budget Act of 2018, Section 20201 requires the State of Louisiana, in consultation with the Secretary of Commerce (delegated to NMFS), to the extent practicable and consistent with the purposes of the Project, to minimize impacts on marine mammal

species and population stocks, and monitor and evaluate the impacts of the proposed Project on such species and population stocks.

The Monitoring and Adaptive Management (MAM) Plan (Appendix R2 of the Final EIS) includes measures for minimizing and monitoring impacts of the Project on marine mammals. As described in the Federal Register notice announcing issuance of the MMPA waiver, the State's consultation with NMFS would be ongoing to appropriately address the evolving Project planning and design for the construction, operation, and maintenance phases. This ongoing consultation is described in the MAM Plan as well as the Marine Mammal Intervention Plan (see Appendices R2 and R5 to the Final EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63835

The Draft Restoration Plan is unclear about how information about noise, vessels and other direct threats will be used. However, even if the Project provides benefits through reduced anthropogenic threats, any positive impacts will be small compared to the many larger negative impacts that are occurring to BBES dolphins.

Response ID: 16554

As explained in Section 2.0 of this Appendix B2 DEIS Public Review and Public Meetings, USACE is not involved in the process to restore damages caused by the DWH oil spill. Response content pertaining to the LA TIG's Draft Restoration Plan has been addressed solely by the LA TIG and represent the views of the LA TIG, not USACE.

The LA TIG acknowledges the anticipated significant adverse impacts to the BBES dolphins in Section 3.2.1.5 (Avoids Collateral Injury - Alternative 1) of the Draft Restoration Plan; thus, no related edits were made to the Final Restoration Plan. The stewardship measures described in the Mitigation and Stewardship Plan, which addresses existing and future anthropogenic effects, including noise, on BBES dolphins, would reach beyond the area that would be affected by the Project, as the measures would be implemented state-wide (that is, in areas where the Barataria Basin stock of dolphins does not reside; see Appendix R1 to the EIS). NMFS is currently using existing data to identify where noise and other anthropogenic stressors that present direct threats to marine mammals (for example, fishing entanglement, intentional shootings) are high to target specific areas for action to reduce such stressors. The LA TIG recognizes that state-wide stewardship measures such as reducing noise impacts, vessel and fishery interactions, etc. will not minimize impacts from the Project nor is this implied in the EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA)

Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62923

Commenter suggests monitoring of dolphin pods after any future large oil spill be required and that polluters be held liable as responsible parties under the Oil Pollution Act.

Response ID: 16542

The LA TIG's investments in monitoring and adaptive management and stewardship of key resources through the proposed Project and other recent and future efforts by the Deepwater Horizon Natural Resource Trustees have and will continue to enhance the robust marine mammal response network across the Gulf of Mexico. The Mitigation and Stewardship and Monitoring and Adaptive Management (MAM) Plans (see Appendices R1 and R2 to the Final EIS) include additional dedicated monitoring and response efforts in the Barataria Basin and across Louisiana. These resources will enhance the ability of Trustee agencies to respond to all threats to marine mammals and facilitate data collection in response to future spills. Under OPA, the LA TIG is tasked with holding responsible parties accountable for the damages to natural resources injured through discharges and threats of discharge.

Concern ID: 62926

Funding for a stranding program and UME response could be helpful for dolphins but will not help BBES dolphins.

Response ID: 16544

Chapter 4, Section 4.11.5.2 Barataria Bay Estuarine Stock of the EIS and Section 3.2.1.5 (Avoids Collateral Injury) of the LA TIG's Restoration Plan acknowledge that a large number of dolphins would become ill and strand or die in Barataria Bay as a result of the Project. Funding for the stranding program and elevated stranding response for the Barataria Basin dolphins has been developed in recognition of the anticipated effects of the Project; those efforts would provide valuable data to inform adaptive management actions that CPRA could consider to further minimize adverse impacts on BBES dolphins while meeting Project goals. These investments are necessary to effectively implement the Marine Mammal Intervention Plan developed by the LA

TIG and included in the Final EIS and Final Restoration Plan (see Appendix R5 to the EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions such as euthanasia may not offset the ultimate outcome of mortality, it can alleviate animal suffering. Where relocation is possible, the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

As described in the Draft EIS, the Monitoring and Adaptive Management (MAM) Plan identifies potential ways in which the LA TIG may reduce impacts to dolphins. The MAM Plan in the Final EIS has been updated to provide more detail about the strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols. However, the adaptive management strategies and actions are largely reliant upon data that would be collected during either the pre-construction monitoring period or once operations commence. Once operational data are available, they would be used to evaluate the potential Project modifications to further minimize impacts to marine mammals.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in these Plans, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if

one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62929

Commenters suggested that the Project should consider moving the Menhaden Fishery to reduce interactions with BBES dolphins.

Response ID: 16545

The location of the Menhaden fishery is outside of the authority of the USACE or LA TIG. The LA TIG suggests that existing fishery task forces within the State of Louisiana, including the Joint Fisheries Task Force Working Group within the Louisiana Department of Wildlife and Fisheries and the Finfish Task Force would be an appropriate forum to suggest the re-examination of laws and policies related to the menhaden fishery, given the many factors involved in decision making around that fishery.

Concern ID: 62933

Commenter suggests monitoring of dolphin pods after any future large oil spill be required and that polluters be held liable as responsible parties under the Oil Pollution Act.

Response ID: 16548

The suggested actions are not within USACE's authorities.

The LA TIG's investments in monitoring and adaptive management and stewardship of key resources through the proposed Project and other recent and future efforts by the Deepwater Horizon Natural Resource Trustees have and will continue to enhance the robust marine mammal response network across the Gulf of Mexico. The Mitigation and Stewardship and Monitoring and Adaptive Management (MAM) Plans (see Appendices R1 and R2 to the Final EIS) include additional dedicated monitoring and response efforts in the Barataria Basin and across Louisiana. These resources will enhance the ability of Trustee agencies to respond to all threats to marine mammals and facilitate data collection in response to future spills. Under OPA, the LA TIG is tasked with holding responsible parties accountable for the damages to natural resources injured through discharges and threats of discharge.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and

refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62934

A commenter noted the role of gathering scientific information under the MMPA and stated that the research undertaken as part of the Project would be consistent with MMPA policies by calling for monitoring and follow-up research, long-term habitat improvement, and actions for the health and stability of the Gulf ecosystem.

Response ID: 16549

The Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Final EIS) contains a monitoring program. Congress required the State of Louisiana to establish a monitoring program to “[m]onitor and evaluate the impacts of the projects on [marine mammal] species and population stocks” as part of the legislation that required the Secretary of Commerce to issue a waiver for MMPA Sections 101(a) and 102(a). See Bipartisan Budget Act of 2018, Section 20201(a).

Concern ID: 63827

CPRA should consider constructing landscape features to provide higher-salinity refuge areas within the basin.

Response ID: 16552

Based on Coastal Master Plan modeling, CPRA does not anticipate that ridge restoration would effectively deflect freshwater flows from the larger basin. The size and scope of ridges necessary to isolate areas

in the basin from fresh water makes this solution infeasible. Construction of outfall features, including ridges, was identified as an alternative that was considered but eliminated in Section 2.6 Summary of Alternatives Considered but Eliminated from Detailed Analysis. No related edits have been made to the Final EIS.

SMM12000 - Oysters (Commercial Fisheries) SMM

Concern ID: 62961

Project mitigation must adequately compensate impacts on the oyster industry, including financial compensation for economic losses. Commenters provided suggestions for mitigation such as compensating for increased costs of travel, providing direct financial payments to lease holders whose areas become unproductive, supporting new oyster leases or lease swaps, investing in research and development, using devices to move oysters to higher-salinity water, providing loans to oystermen to develop alternative income streams, providing support for elderly fisherfolk and buying out boats and businesses.

Response ID: 16532

The Draft EIS evaluates how the Project would impact commercial, recreational, and subsistence fishers as compared to No Action conditions in Chapter 4, Sections 4.10 (Aquatic Resources), 4.14 (Commercial Fisheries), 4.15 (Environmental Justice) and 4.16 (Recreation and Tourism).

In response to public comments and resource agency input about the proposed mitigation efforts, CPRA has expanded and refined the oyster mitigation and stewardship measures. CPRA's mitigation and stewardship strategies and associated expenditures would focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to oyster fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for oysters in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to oyster fisheries in the early years of the Project's operational life. The revised mitigation and stewardship measures include allocating \$4 million to establish new public seed grounds, \$15 million to enhance public and private oyster grounds, \$4 million to enhance broodstock reefs and \$8 million for alternative oyster culture.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62963

Mitigation compensation should prioritize those most affected, likely those who rely on oyster leases in the mid-basin areas or smaller operations, as well as economically vulnerable oyster fishers.

Response ID: 16533

The Draft EIS evaluates how the Project would impact commercial, recreational, and subsistence fishers as compared to No Action conditions in Chapter 4, Sections 4.10 Aquatic Resources, 4.14 Commercial Fisheries, 4.15 Environmental Justice and 4.16 Recreation and Tourism.

In response to public comments and resource agency input about proposed mitigation efforts, CPRA has expanded and refined the oyster mitigation and stewardship measures. CPRA's mitigation and

stewardship strategies and expenditures focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to oyster fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for oysters in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to oyster fisheries in the early years of the Project's operational life. The revised mitigation and stewardship measures include allocating \$4 million to establish new public seed ground, \$15 million to enhance public and private oyster grounds, \$4 million to create or enhance broodstock reefs and \$8 million for alternative oyster culture. While the focus of the proposed mitigation and stewardship measures are on establishing sustainable fisheries, oyster mitigation and stewardship measures have been crafted to focus on those impacted by the Project specifically. For example, a portion of each of the stewardship measures for impacts to oyster harvesters would be expressly designated for use by low-income and minority oyster harvesters. See the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as

conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62967

Commenters noted that moving reefs would not help oyster fishers because it takes years to develop a productive oyster reef.

Response ID: 16535

A productive oyster reef would take years to develop, which may include finding a suitable location for a new reef, establishing suitable substrate for oyster attachment and growth, and oyster growth to sack size (requiring about 18 months, or less if seed oysters are placed; see Chapter 3, Section 3.10.5 and Chapter 4, Section 4.10.4.5 of the EIS). Section 4.14.4.2.3 Eastern Oyster Fishery of the Final EIS has been updated to identify the timeframe for establishment for new oyster reefs. CPRA's oyster mitigation strategies are focused on establishing a sustainable oyster fishery for the long term, not on alleviating the short-term impacts to individual oyster growers. CPRA's oyster mitigation program allocates funding for public seed ground establishment, public and private seed ground enhancement prior to and after commencement of Project operations, creation or enhancement of broodstock reefs, and reimbursement for cultch or spat/shell to leaseholders choosing to rehabilitate leases. See the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA)

Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62971

Commenter recommends CPRA use oyster shells for reef construction.

Response ID: 16537

CPRA's oyster mitigation strategies recommend use of native materials, such as native oyster shell, where and when feasible. This is explained in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as

conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62976

Oyster growers and other stakeholders must be involved and informed about Project progress, construction timing, and operation.

Response ID: 16538

CPRA has engaged numerous stakeholders, including oyster growers, throughout the development of the Project. USACE has ensured public participation during its permitting and environmental review. The LA TIG has invited public participation in its OPA Restoration Plan process. Chapter 7 Public Involvement of the Final EIS contains a summary of the various engagement efforts by CPRA, the LA TIG and USACE regarding the Project. In response to comments, CPRA has added a dashboard website (<https://cims.coastal.louisiana.gov/default.aspx>) to the measures included in CPRA's final Monitoring and Adaptive Management (MAM) Plan (Appendix R2 to the Final EIS). The dashboard would allow CPRA to keep those interested informed about Project construction, operation, and monitoring.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by

USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62978

Collaboration is needed to minimize impacts on oyster industry, including developing innovative uses for bottom oysters and supporting collaboration between CPRA and LDWF.

Response ID: 16539

CPRA and other state agencies, such as LDWF, recognize the importance of collaboration to support the fishing industry in adapting the ongoing changes in the environment. As explained in Section 4.14.4.1 Commercial Fisheries of the Draft EIS, without the Project, adverse impacts to oyster fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for oysters in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to oyster fisheries in the early years of the Project's operational life. CPRA and LDWF worked together with numerous oyster fishers as part of Louisiana Sea Grant's Seafood Futures Initiative to develop mitigation and stewardship measures aimed at maintaining a sustainable oyster fishery. CPRA anticipates working with other agencies, such as Louisiana Economic Development, on the workforce development, education and training programs included in the Mitigation and Stewardship Plan (see Appendix R1 to the Final EIS). In addition, CPRA engaged the fishing community potentially impacted by the Project through public meetings to solicit input on mitigation and stewardship strategies and engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures from affected fishers. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Refer to the Mitigation and Stewardship Plan for mitigation and stewardship measures to be implemented as a result of these engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63961

The EIS' description of the negative impacts to commercial industries is very vague, lacking necessary information and any acceptable plan to mitigate, relocate, or adequately compensate affected individuals.

Response ID: 16540

The Draft EIS contains a detailed analysis on Project impacts to commercial fishing resources in Chapter 4, Sections 4.10 (Aquatic Resources) and 4.14 (Commercial Fisheries). The commenter has not identified which commercial industries he believes were not sufficiently evaluated or otherwise indicated any specific information or analysis missing from the Draft EIS; accordingly, no changes to this analysis were made in the Final EIS.

CPRA's mitigation strategies focus on establishing sustainable fisheries, particularly oysters and shrimp, rather than on compensating individual fishers for their particularized economic losses. In response to comments, CPRA has expanded and refined the Mitigation and Stewardship Plan since publication of the Draft EIS and LA TIG's Draft Restoration Plan. These additions, including a \$54 million funding allocation, can be found in the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62966

The MAM Plan and Mitigation Plan provide significant resources that can help the oyster industry adapt to Project impacts.

Response ID: 16534

The Mitigation and Stewardship Plan (Appendix R1) included in the Draft EIS proposed mitigation and stewardship measures to assist the

oyster industry to adapt to changing conditions. Since issuance of the Draft EIS, CPRA further expanded and refined the Mitigation and Stewardship Plan based on community and resource agency input (see Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62970

Commenters suggested that alternative off-bottom oyster culture is not a viable mitigation strategy for the oyster fishers who will be harmed by the diversion.

Response ID: 16536

Off-bottom culture is not intended to fully offset impacts on oysters from the Project. Rather, CPRA would fund alternative culture techniques as one piece of a multi-pronged strategy for establishing a long-term, sustainable oyster fishery. This would allow for individual decisions with

regard to strategies that are most effective in a particular area. See the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

SMM13000 – Brown Shrimp, Crabs, and Finfish (Commercial Fisheries)

SMM

Concern ID: 63131

Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation and stewardship measures, including: developing a formula to calculate lost

income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF 2016), and providing low cost internet.

Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.

Response ID: 16515

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63132

Organizations, such as GNO, Inc., Coastal Communities Consulting, and community-based organizations should serve as connectors between CPRA, other state and federal agencies, and fishers and the seafood industry to plan and implement mitigation, and to ensure mitigation reflects environmental, economic, and community needs and changes over time. Mitigation should include funding for community-based organizations to provide this support in developing and carrying out mitigation.

Response ID: 16516

CPRA engaged the fishing community potentially impacted by the Project through public meetings to solicit input on mitigation strategies. Further, CPRA engaged community-based organizations including Coastal Communities Consulting to assist in engaging minority fishers in reviewing and commenting on the Draft EIS, and soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded. CPRA also plans to create outreach materials in easy to read and understand formats for distribution to the public. This would include translated materials for members of the community who do not speak or read English.

CPRA's Mitigation and Stewardship Plan does not currently provide for use of community-based organizations to distribute mitigation funds or to implement mitigation and stewardship measures. However, community-based organizations have been engaged to assist in providing information to community members regarding available programs, to assist in developing eligibility criteria, and to assist in completing any application processes. CPRA will continue to coordinate with community-based organizations in implementing the Final Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies

which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63133**Commenters support the proposed mitigation and stewardship measures for the commercial fishing industry.****Response ID: 16517**

The comments received in support of the Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) are acknowledged. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)

- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63134

Commenters suggested that job training would not be helpful for older workers or for those facing language or technological barriers. Direct payments should be considered for these fisherman that cannot change careers easily.

Response ID: 16518

The Draft EIS considered how changes in the Project area both with and without implementation of the Project would potentially impact commercial fisheries, including shrimp, in Chapter 4, Section 4.14

(Commercial Fisheries). In response to public comments and resource agency input about proposed mitigation and stewardship measures, CPRA has expanded and refined the fisheries mitigation and stewardship measures since the release of the Draft EIS. CPRA's mitigation and stewardship strategies and expenditures focus on establishing sustainable fisheries for oysters and shrimp rather than on compensating individual shrimpers or oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for fisheries in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to fisheries in the early years of the Project's operational life.

The revised mitigation and stewardship measures allocate approximately \$54 million to commercial fisheries, which supplement other restoration actions and programs being funded by the LA TIG and by the State through LDWF. This includes \$2 million for Workforce/Business training which can be used for older workers facing language or technical assistance barriers (see Appendix R1 to the Final EIS). Additionally, if the MBSD Project is permitted by the USACE and funded by the LA TIG, it would take approximately 5 years to complete construction of the Project and to begin operations. This relatively long period would provide affected senior fishers with the time and opportunity to decide how they want to go forward, ranging from taking advantage of the adaptation opportunities offered through the Mitigation and Stewardship Plan to transition out of the fishing industry. The final fishery mitigation plan can be found in the Mitigation and Stewardship Plan (Appendix R1 to the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any

mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63136

Commenters were concerned that proposed mitigation does not include measures for crab fishermen.

Response ID: 16520

As noted in Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS, impacts on blue crab from the Project are anticipated to be neutral to beneficial. In addition, as stated in Section 4.14 Commercial Fisheries impacts on the blue crab fishery are anticipated to be negligible to minor beneficial. This determination considers potential impacts on blue crab abundance as well as the anticipated response from the commercial fishing industry. In response to public comments, CPRA has included \$1 million in funding for a crab marketing and outreach program and improvements to crab fishing gear as part of the Final Mitigation and Stewardship Plan (see Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in

instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63137

A commenter noted that the coast and shrimpers should be saved simultaneously and suggested that when USACE placed rocks behind Grand Isle, it should have left a channel behind Grand Isle for use by the fishers and placed the fill from that channel on Grand Isle as a levee.

Response ID: 16521

The commenter's suggestion to save the coast and fishers at the same time is noted. The Grand Isle work is not related to this Project.

Concern ID: 63139

Commenters noted that work is needed to promote Louisiana seafood, including collaborating with restaurants and distributors, and enforcing House Bill No. 335 (Regular Session 2019).

Response ID: 16522

Since publication of the Draft EIS and in response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). In its Mitigation and Stewardship Plan appended to the Final EIS, CPRA has included a total of \$5 million in funding for shrimp, crab, oyster, and finfish marketing as part of its Mitigation and Stewardship Plan (see Appendix R1 to the Final EIS). The expenditure of those funds would be directed by LDWF, in coordination with the LDWF Crab, Shrimp, Oyster and Finfish task forces. Those groups would determine whether collaboration with restaurants and enforcement of House Bill 335/Act 372 (adopted as Louisiana RS 40.5.5.4 and which requires any food service establishment that serves imported shrimp or crawfish to post a notice that informs patrons that the seafood has been imported from a foreign place) is the best use of those funds.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63140

Commenters requested restoration assistance such as safe haven sites to offer protection to boats and assistance with dredging channels for safe vessel passage, including shrimp boats.

Response ID: 16523

The commenter's concern regarding vessel passage was considered in the Draft EIS. Chapter 4, Section 4.21 Navigation provided that the USACE would continue to maintain federal navigation channels in the Project area during Project operations. In response to public comments, CPRA's Mitigation and Stewardship Plan includes measures that CPRA states it would implement to mitigate impacts on navigation resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation

channels (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The impact analysis in the Final EIS does not suggest that the Project would create the need for safe haven sites.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63141

Commenter requests additional information on the \$33 million for the stewardship to fisheries.

Response ID: 16524

The Draft Mitigation and Stewardship Plan published with the Draft EIS (Appendix R1) contained mitigation and stewardship measures proposed by CPRA. In response to comments and resource agency input, CPRA has expanded and refined these measures, including allocating \$54 million for fisheries mitigation and stewardship measures. Details regarding these measures are set forth in the Final

Mitigation and Stewardship Plan published in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63142

Commenter requests information on how brown shrimp would shift in distribution in the basin and raised concern about the impact it would have on smaller shrimping boats that could not travel the added distance to catch them.

Response ID: 16525

Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS analyzed Project impacts on brown shrimp, including the decrease in habitat suitability of portions of Barataria Basin for brown shrimp and the potential of a shift in location for future brown shrimp fishing. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discusses impacts of the proposed MBSB Project on commercial fisheries. As

summarized in Section 4.14.2, under the Applicant's Preferred Alternative, brown shrimp are expected to experience major, permanent, adverse impacts earlier, while white shrimp are expected to experience negligible to minor, permanent, beneficial impacts, relative to the No Action Alternative. However, because a number of the same commercial fishers catch both brown and white shrimp during different seasons, overall impacts on the shrimp industry as a whole (including brown and white shrimp) would be expected to be moderate to major, permanent, and adverse, with the potential for a substantial loss of income in some months due to the decreased abundance of brown shrimp. Section 4.14.4.2 Applicant's Preferred Alternative discusses the potential adaptive responses of fishermen to changes in species abundance, including the potential for substitution of species and need for gear upgrades, as well as increasing the length of fishing trips. CPRA's Mitigation and Stewardship Plan includes measures to mitigate some Project impacts on the brown shrimp fishery, including funding to assist shrimpers with gear improvements necessary to travel farther distances (see Section 6.3 [Other Mitigation and Stewardship Measures] of Appendix R1 to the EIS). In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1), including allocating \$15 million] for vessel and facility improvements. There is no plan to relocate brown shrimp.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as

conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63144

A commenter recommended that additional cold storage in the seafood supply chain is needed.

Response ID: 16526

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included vessel refrigeration as a proposed measure to address the anticipated impacts of the Project. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1), including allocating \$15 million for vessel and facility improvements. This funding could be used to provide additional cold storage, as suggested by the commenters.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63145

Mississippi fisheries should also be included in mitigation compensation.

Response ID: 16527

Chapter 3, Section 3.1.1 Project Area of the Draft EIS identifies the analysis area for the EIS. This is the area in which the Project is anticipated to have discernable effects. For Commercial Fisheries, the Project area includes two basins (the Barataria Basin and a portion of the Mississippi River Basin). The proposed Project is not anticipated to have discernable effects on aquatic resources outside of the Project area. Mississippi was not included in the analysis because no more than negligible impacts were projected to occur for Mississippi resources. See Chapter 3, Section 3.14 Commercial Fisheries of the EIS. All measurable impacts of the Project, both beneficial and adverse, are anticipated to occur in Louisiana and within Louisiana coastal waters. As a result, CPRA has not included mitigation for impacts to fisheries in Mississippi coastal waters in the Mitigation and Stewardship Plan (Appendix R1 to the EIS).

Commercial fishers that travel to Barataria Basin to fish for species that would be adversely affected, particularly shrimp and oysters, could also be adversely affected by the proposed Project. The Final EIS has been revised to acknowledge this in Section 4.14.4.2 Commercial Fisheries. The Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) provides a suite of mitigation and stewardship strategies applicable to fishers that may be impacted by the Project. Those mitigation and stewardship programs would be equally available to any impacted fisher who relies on fisheries in the Barataria Basin, regardless of whether or not they reside in the Basin.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally,

impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63147

Commenter requests information on steps being taken before Project construction to protect commercial and recreational fisheries.

Response ID: 16529

CPRA's Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) contained information on fisheries mitigation, including mitigation and stewardship measures that would be undertaken before and during Project construction. In response to public comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS, including providing additional detail on several fisheries mitigation and stewardship efforts that would be undertaken before Project construction, including funding for public and private oyster seed ground enhancement, funding for alternative oyster aquaculture, marketing, shrimp vessel and facility improvements, workforce and business training, and subsistence fishing access (see Appendix R1 to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and

Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63148

Commenter prefers implementation of alternative 1 (75k diversion) only when the low-income fishing communities surrounding Barataria Bay have established resilient, secure economies given their reliance on the commercial fishing industry. The commenter recommended emphasis on support for low-income, vulnerable communities and the need for a strategy for resiliency in the future ecosystem.

Response ID: 16708

The commenters' request that the implementation of the proposed Project occur only once the low-income fishing communities surrounding Barataria Bay have established secure and resilient economies is acknowledged.

While the Draft EIS acknowledged that oyster and brown shrimp fisheries would be adversely impacted by the proposed Project, it also concludes that the Project would create and maintain wetlands, and increase the abundance of SAV, that would provide refugia, foraging, and resting habitats, including essential fish habitats that support multiple managed species (see Chapter 4, Section 4.10 Aquatic Resources of the EIS). In addition, while the proposed Project would have minor to moderate increases in storm surge in areas south of the diversion, it would also help reduce the impacts of storm surge on

communities north of the diversion by creating and nourishing coastal marshes that would provide natural storm protection; see Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Reduction of the EIS for more details. The proposed Project is projected to have some temporary, moderate to major, beneficial impacts on the regional economy expected as a result of construction related spending, as described in Section 4.13 Socioeconomics of the EIS. Fishing communities in the Barataria Basin may experience some of these benefits.

As explained in the analysis of the No Action Alternative in the EIS and Section 1.6 (No Action Alternative) of the LA TIG's Restoration Plan, conditions in Barataria Basin would continue to deteriorate and destabilize under the No Action Alternative. While the proposed Project would not stop subsidence and sea-level rise and their associated impacts in the Barataria Basin, the proposed Project is projected to create and/or maintain approximately 12,700 acres of wetland by the year 2070 when compared with the No Action Alternative. In its Restoration Plan, the LA TIG has determined that slowing land loss in the Barataria Basin is essential to the overall ecological and economic sustainability of the Basin. More specifically, the proposed Project would help nearshore marine ecosystems, water column resources (including fish and invertebrates), and birds and terrestrial wildlife.

In recognition of the potential impacts that would occur due to the proposed Project, CPRA included mitigation and stewardship measures to address vulnerable communities in the Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS). In response to public comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of

the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63254

To ensure that fishers have the best chance of maintaining their industries over the life of the MBSD Project, restrictions that prevent them from working in federal waters must be lifted.

Response ID: 16530

The federal moratorium will be up for renewal in 2025, and NOAA is committed to reviewing all relevant facts and circumstances at that time; however, adjustment to federal fishing moratoria is outside the purview of NRDA actions and USACE permitting actions.

Concern ID: 63135

Commenters state that they plan to sell their vessels.

Response ID: 16519

Because the Project is projected to impact commercial fisheries, the CPRA has developed a range of measures in its Mitigation and Stewardship Plan to minimize adverse effects on commercial fisheries resources. The intention of CPRA's mitigation and stewardship measures is to establish sustainable fisheries for oysters and shrimp. These measures are described in more detail in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), and include funding allocations for new oyster public seed grounds, to enhance public and private oyster seed grounds, for Alternative Oyster Cultures, and for oyster broodstock reefs. In addition, the mitigation and stewardship measures are aimed at assisting fishers to continue in the industry through measures such as equipping shrimping vessels with refrigeration to extend the time the vessel can transit to and remain on the fishing grounds (or fish new areas), marketing and outreach support, workforce training, and grants to help offset costs of rigging vessels with different types of gear or to substitute gear to improve efficiency and lower costs.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation,

stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63146

Commenters suggested that CPRA should consider restoring natural landscapes such as ridges to minimize impact on oysters, shrimp, and other species (as well as the fisherman and communities that rely on them).

Response ID: 16528

As part of the Louisiana Coastal Master Plan, CPRA has funded a number of projects to restore landscapes such as natural ridges in appropriate locations, such as Spanish Pass Ridge and Marsh Restoration, and anticipates continuing to fund such projects in the future. However, based on Coastal Master Plan modeling, CPRA does not believe that ridge restoration would effectively deflect freshwater flows from the larger basin. The size and scope of ridges necessary to isolate areas in the basin from fresh water makes this solution infeasible. Therefore, no changes have been made to the Final EIS in response to this comment.

Concern ID: 63959

CPRA's stated \$300 million fund for mitigation of Project damages is wholly inadequate to mitigate the actual damages to the State's shrimp and shellfish industries as those speculative funds would only account for half of the seafood landings in the past 2 years.

Response ID: 16531

The Draft EIS considered how changes in the Project area both with and without implementation of the Project would potentially impact commercial fisheries, including shrimp and oyster fisheries, in Chapter 4, Sections 4.14 Commercial Fisheries. Without the Project, adverse impacts on fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for fisheries in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts on fisheries in the early years of the Project's operational life.

In response to public comments and resource agency input about the proposed mitigation and stewardship measures, CPRA has expanded and refined its fisheries mitigation and stewardship measures since the release of the Draft EIS. CPRA's mitigation and stewardship strategies and expenditures focus on establishing sustainable fisheries for oysters and shrimp rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS).

The provisions of CPRA's fishery mitigation plan, valued at approximately \$54 million, along with other restoration actions and programs being funded by the LA TIG and the State through LDWF, would alleviate some impacts of the Project. CPRA's final fishery mitigation plan can be found in its Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required

by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

SMM14000 – Recreational and Subsistence Use SMM

Concern ID: 63090

A commenter requests an explanation of steps that will be undertaken before construction to protect sustainability of commercial and recreational fisheries.

Response ID: 16513

The commenter's requested explanation of the steps that will be undertaken before construction of the Project to protect fisheries was addressed in CPRA's Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS). For example, CPRA's oyster mitigation program allocates a portion of the \$15 million in public and private seed ground enhancement funding to providing enhancement in areas adjacent to Barataria Basin prior to commencement of Project operations and to reimburse for cultch or spat/shell to leaseholders choosing to rehabilitate leases, or create new leases, in Lower Barataria Basin. In total, \$54 million has been allocated for mitigation and stewardship measures to address impacts to commercial and recreational fisheries. In addition, details on CPRA monitoring activities pre- and post-operations can be found in the MAM Plan (Appendix R2 to the Final EIS). In response to comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63091

The proposed mitigation to provide access points farther down the basin will not adequately address the impacts to subsistence fishers (for example, increased costs of fuel or additional wear and tear on vessels associated with the additional travel). CPRA should use community expertise to co-design community-specific adaptation programs to ensure that disparately impacted communities are able to effectively respond to Project near-term and long-term impacts.

Response ID: 16514

CPRA is including funding for additional access points within the basin as part of its Mitigation and Stewardship Plan (Appendix R1 to the EIS). As part of developing and evaluating this measure, CPRA engaged the subsistence fishing community potentially impacted by the Project through public meetings and utilized community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement

meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS.

Locations for the additional access points have not yet been selected, and CPRA would work with impacted subsistence fishers to ensure those access points are placed in appropriate locations. In addition, fishers would have access to other fisheries mitigation and stewardship measures, such as gear improvements and retraining, aimed at assisting them to adapt to changing conditions. See Sections 6.3.3 (Aquatic/Fisheries Impacts) and 6.3.8 (Environmental Justice) of the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 64832

A commenter is concerned about the negative impacts of the diversion on fishing near their home and request compensation for this loss.

Response ID: 16700

The Draft EIS considered how changes in the Project area both with and without implementation of the Project will potentially impact commercial fisheries in Chapter 4, Sections 4.14 (Commercial Fisheries) and recreational fisheries in Section 4.16 (Recreation and Tourism).

CPRA's proposed Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) contained information on potential fisheries mitigation, including mitigation that would be undertaken before Project construction. In response to public comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS, including providing additional detail on several fisheries mitigation and stewardship efforts that would be undertaken before Project construction, including funding for public and private oyster seed ground enhancement, marketing, shrimp vessel and facility improvements, workforce and business training, and subsistence and recreational fishing access (see Appendix R1 to the Final EIS for additional details). Specific to recreational fishing, CPRA will provide public access opportunities within the Barataria Basin and Mississippi River Basin. This is intended to address effects on proximity of resources for both consumptive and non-consumptive use. These effects will be primarily addressed through the provision of public shoreline access and watercraft launching around the Project area to assist recreational and subsistence fishing. In total, \$54 million would be allocated for mitigation and stewardship measures to address impacts to commercial and recreational fisheries.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA)

Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

SMM15000 – Property Acquisition SMM

Concern ID: 63092

Further development of the Mitigation Plan is needed for properties that would be impacted by flooding caused by Project operations. Multiple commenters made specific requests for how their property should be handled (for example, through sales or easements), while others wondered why a more detailed, “real estate plan” for impacted communities was not available.

Response ID: 16511

The Draft Mitigation and Stewardship Plan included with the Draft EIS (Appendix R1) included CPRA's initial framework for mitigation and stewardship measures to assist property owners in these communities impacted by increased tidal flooding and to address the Project impacts of Project operations on water levels. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

CPRA states that it is interested in assisting affected communities to remain in place as long as they would like. Mitigation would include a combination of structural measures (for example, raising roads, boat houses, docks and utilities) and non-structural measures. Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

Where the proposed Project would cause increased water levels and/or increased incidence of flooding, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures. As an alternative to purchasing a flowage servitude, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property (rather than a servitude) would be made on a case-by-case basis depending on the particular circumstances.

A complete listing of the mitigation and stewardship measures that CPRA would implement if the proposed Project is approved and funded is included in CPRA's Mitigation and Stewardship Plan included in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know

whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63719

The valuation of any properties acquired for the construction of the Project should account for the value of borrow materials that could be excavated and sold by the owners of these properties.

Response ID: 16512

As part of any property rights acquisition to construct the Project, CPRA would compensate landowners for the property interest acquired in accordance with applicable law. Determining the appropriate amount that CPRA would pay for properties and rights it acquires for the Project is outside of the scope of the USACE EIS process and the LA TIG's OPA Restoration Plan.

SMM16000 – Environmental Justice SMM

Concern ID: 62878

The EIS and Mitigation Plan does not adequately consider or mitigate for impacts to Ironton. The EIS should include air pollution buffers for Ironton and flood protection easement areas for Ironton and other vulnerable communities outside of levee protection.

Response ID: 16505

The concerns raised by the commenters were considered in the Draft EIS in Chapter 3, Section 3.7.2 Air Quality, Existing Conditions; and Chapter 4, Sections 4.8 Noise, 4.13 Socioeconomics, 4.15 Environmental Justice, 4.22 Land-Based Transportation and 4.25 Cumulative Impacts. Chapter 3, Section 3.7.2 Air Quality - Existing Conditions identifies the existing air quality in the proposed Project area and provides that Plaquemines Parish is designated as "unclassifiable/in attainment" for all criteria pollutants. The resource sections in Chapter 4 address potential air quality, noise, transportation, and tidal flooding impacts specifically concerning the community of Ironton. In addition, Chapter 2 of Appendix H1 Socioeconomics Technical Report to the EIS provides contextual information about the Ironton community.

CPRA committed to implementing best management practices (BMPs) to minimize construction impacts in the EIS in Chapter 4, Section 4.27.1 Avoidance and Minimization and Appendix R1 Mitigation and Stewardship Plan; additional information on BMPs is also included in the Mitigation Summary Table in Appendix R3. Construction emissions would be highly localized, and consequently the Project is only anticipated to impact air quality within 0.5 mile of the construction footprint; however, Ironton is located approximately 0.5 mile from the construction footprint (see EIS, Chapter 4, Section 4.7.1 Area of Potential Impacts). As stated in the EIS in Chapter 4, Section 4.15 Environmental Justice, populations in Ironton would experience minor to moderate, temporary adverse, impacts due to increased noise levels, dust, and transportation delays during the approximately 5-year construction period. During operations, air emissions would be negligible since the diversion structure would be electric-powered (see EIS Chapter 4, Section 4.7.4.2).

Beyond the near-term impacts of construction, operation of the Applicant's Preferred Alternative may have impacts on Ironton. Because it is within the New Orleans to Venice (NOV) Non-Federal Levee (NFL) W-05a.1 (La Reussite to Myrtle Grove levee reach) levee system, Ironton is not expected to be impacted by increases in frequency and duration of tidal flooding due to Project operations (see Section 4.15.4.2.2 Storm Hazards and 4.20.4.2 Public Health and Safety). Further, guide levees constructed parallel to the diversion channel will be constructed to an elevation of approximately 15.6 feet and will serve as hurricane and storm damage risk reduction against storm surges. However, negligible to minor increases in risk of NOV-NFL Levee overtopping south of the immediate outfall area (following the delta formation in the outfall area) due to storm surge during certain 1 percent storms, may impact low-income and minority populations within Ironton. These potential impacts may be exacerbated to the extent that Ironton residents experience unique vulnerabilities.

To ensure that impacts on the community of Ironton have been adequately disclosed and to make that analysis readily accessible in one location within the EIS (rather than throughout the various resource sections), a section has been added to the Final EIS that provides a summary of impacts on the community of Ironton under the Applicant's Preferred Alternative (see Chapter 4, Section 4.15.5.1 Environmental Justice).

CPRA is not proposing specific mitigation to address or offset the negligible to minor increased risk in levee overtopping that could affect the community of Ironton inside the NOV-NFL system because this potential increased risk does not accrue until Project operations have resulted in the development of a delta (wetlands and marsh) in the area outside the NOV-NFL Levee adjacent to Ironton (circa 2040), and

because this risk was identified for only one of the 100-year storm scenarios modeled. However, to help Ironton prepare for and mitigate flood risk from storms generally, CPRA would designate a liaison to work with residents in Ironton prior to commencing operations of the Project on community preparedness for storm-based flooding and damage.

CPRA has engaged in public outreach meetings with the communities projected to be impacted by the MBSD to solicit input on mitigation and stewardship strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts were undertaken to better understand and address potential impacts on communities with environmental justice concerns, such as low-income and minority populations, that may be disproportionately impacted by the Project, as discussed in Chapter 7 of the Final EIS. This included meetings in the community of Ironton. CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project. CPRA will continue to engage with potentially impacted environmental justice communities and organizations concerning the implementation of the mitigation and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any

particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63703

Commenters request that the agencies involved with developing the EIS meaningfully engage with affected communities/organizations with EJ concerns to inform the development of EJ mitigation and stewardship measures. Specifically, it was requested that relevant materials are translated and presented in plain, non-technical language.

Response ID: 16508

CPRA engaged the communities potentially impacted by the Project, including low-income and minority communities, through public meetings to solicit input on mitigation strategies. Further, CPRA engaged community-based organizations to assist in soliciting additional feedback from low-income and minority community members on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 of the Final EIS. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). CPRA will continue to engage with potentially impacted communities and organizations with EJ concerns concerning the implementation of the mitigation and stewardship measures. Additionally, CPRA has and will continue to provide requested translation and provide key documents and information on the Project in English, Spanish, and Vietnamese.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated

Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63693

Commenter requests that the EIS and Mitigation Plan include more details about EJ mitigation and stewardship measures specifically related to the construction of the diversion.

Response ID: 16506

The Draft EIS considered impacts to low-income and minority communities due to Project construction in Chapter 4, Section 4.15.3 Construction Impacts in Environmental Justice. The majority of construction impacts would be experienced within 0.5 miles of the Project construction footprint. The nearest community to the construction footprint is Ironton, which has a majority African American population. As explained in the EIS, populations in Ironton would experience minor to moderate, temporary, adverse impacts due to increased noise levels, dust and transportation delays during the approximately five-year construction period (see Chapter 4, Section 4.15.3.2 Applicant's Preferred Alternative).

CPRA committed to implementing best management practices (BMPs) to minimize construction impacts in the EIS in Chapter 4, Section 4.27.1 (Avoidance and Minimization) and Appendix R1 (Mitigation and Stewardship Plan); additional information on BMPs is also included in the Mitigation Summary Table in Appendix R3. In addition, since publication of the Draft EIS and the LA TIG's Draft Restoration Plan, CPRA undertook additional outreach to low-income and minority communities potentially affected by the Project to solicit their feedback regarding the mitigation and stewardship measures proposed by CPRA. Based on the feedback received through that process and

other sources of public comment, CPRA updated the Final Mitigation and Stewardship Plan to include those measures that CPRA would implement if the Project is approved and funded (see Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63697

Commenters request that the EIS and Mitigation Plan include more details about planned EJ mitigation and stewardship measures for diversion operations.

Response ID: 16507

The Draft EIS considered impacts to low-income and minority communities due to Project operations in Chapter 4, Section 4.15.4 Operational Impacts in Environmental Justice.

In addition, since completion of the Draft EIS and the LA TIG's Draft Restoration Plan, CPRA engaged the communities potentially impacted

by the Project, including low-income and minority community members, through public meetings to solicit input on CPRA's mitigation strategies. Further, CPRA engaged community-based organizations to assist in soliciting additional feedback from low-income and minority community members on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is provided in Chapter 7 of the Final EIS. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (see Appendix R1). This includes additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project. CPRA will continue to engage with potentially impacted EJ communities and organizations concerning the implementation of the mitigation and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as

part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63706

A commenter noted that traditional notions of fair market value might not be sufficient or fair compensation for low-income and minority populations affected by the diversion.

Response ID: 16509

As part of any property acquisition to implement the Project, CPRA would compensate landowners for projected impacts to their properties caused by the Project in accordance with Louisiana and Federal law, including the Louisiana Constitution and the Fifth Amendment of the U.S. Constitution.

Recognizing the limitations on the degree of compensation permitted by federal and state law for property acquisition, CPRA's Mitigation and Stewardship Plan, Appendix R1 to the EIS, outlines numerous additional mitigation and stewardship measures aimed at assisting low-income and minority populations potentially affected by the Project. In particular, CPRA's Final Mitigation and Stewardship Plan (EIS, Appendix R1) includes additional mitigation and stewardship measures for the community of Grand Bayou, which is home to members of the Atakapa-Ishak Nation/Chawasha Tribe, including a ridge restoration canal backfilling project, and sidewalks and floating gardens. In addition, CPRA's Final Mitigation and Stewardship Plan prioritizes portions of funding from several of the mitigation and stewardship measures for low-income and minority community members.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any

particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63710

Commenter requests that EJ mitigation efforts be made specifically for economically vulnerable oyster fishermen, potentially by providing them with alternate lease locations.

Response ID: 16510

The Draft EIS (Chapter 4, Section 4.15.4.2 - Environmental Justice - Operational Impacts) identified the potential for the Project to result in disproportionately high and adverse impacts on some low-income and minority commercial oyster fishers. In response to these identified impacts and based on public comments, CPRA expanded and refined its Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan. CPRA's Mitigation and Stewardship Plan included with the Final EIS provides additional details on specific mitigation and stewardship measures for impacts on oysters (see Appendix R1 of the EIS, Section 6.3.3). According to CPRA, a portion of the funding for several of these mitigation and stewardship measures would be prioritized for low-income and minority fishers to ensure that such fishers receive the benefits of these programs. Additionally, rulemaking by LDWF effective April of 2020 ended a moratorium on new leases on state-owned water bottoms enacted in 2002. The LDWF oyster lease process establishes a phased approach for settling previous applications and providing for new lease opportunities. More information on this program is available at <https://www.wlf.louisiana.gov/page/oyster-lease-moratorium-lifting> or within the LDWF Rule found in LAC 76:VII.505.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies

which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Long overdue. After viewing the draft EIR, I am in favor of implementation of the Mid-Barataria Sediment Diversion project as proposed, post-haste! The positive benefits of the project far outweigh any potential negative impacts and will be a step in the right direction of restoring the natural habitat.

Concern ID: 63333

Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.

Response ID: 16289

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Correspondence ID:4

Todd Matherne

I understand that CPRA has expended substantial sums on Coastal Restoration. Many projects have been worthwhile.

Sadly, the subject project provides essentially zero benefit to anything in the Barataria Basin south of Lafitte. The Lafitte ecosystem was minimally impacted by the Deepwater Horizon Spill (the 'Spill') when compared to other areas.

The MBSD design should be enhanced to provide regular water flows and sediment loading (via moveable slurry pipelines, or similar systems) to areas that can benefit most between Lafitte and Grand Isle. Otherwise substantially all of the marsh islands will vanish between Lafitte and Grand Isle. These marsh islands are eroding daily and serve as speed bumps for storms and provide habitat supporting Louisiana's commercial and recreational fishing and hunting activities.

Bay Jimmy, the Cat Islands near 4 Bayou Pass, Elephant Island & Dutch Island, both N of Grand Isle, Beauregard and Mendicant Island, among others, have been materially and adversely impacted directly by the Spill. Elephant and the Cat Islands are now 100% gone, like the 'Last Mastodons'. CPRA spent exactly ZERO attempting to restore these islands. Why is that? Instead CPRA has chosen inland projects that have had zero or minimal direct impacts from the Spill. These islands were previously safe refuge for various nesting birds and enhanced the marsh estuary with habitat for various juvenile fish species.

CPRA should also aggressively hold to account (with the help of the state AG and federal agencies), each E&P company who, though their failure to maintain coastal zone structures (dams, canals, levies, etc) has exacerbated the exponential erosion now suffered by the LA Coastal marsh. Not holding them to properly account is simply irresponsible. It is akin to a super-fund site with PRPs, or, for example, holding a landfill owner responsible for its failure to maintain its structures, including the leachate collection system that has failed for decades.

Offshore, for example, BSSE requires the E&P companies to return the ocean floor to the 'condition that existed prior to the commencement of operations'. Apply the same standard to the coastal zone.

Please consider the essence of the foregoing comments and a consider an appropriate re-alignment of CPRA priorities to use the Spill settlement funds to directly restore areas primarily impacted by the Spill. To use such funds for projects North of the impact zone seems to be outside of what is currently urgent and proper, despite the potential merits of such other projects.

Respectfully submitted.

Concern ID: 61991

CPRA has chosen an inland project in an area where there was zero or minimal direct impacts from the DWH oil spill. Consider an appropriate realignment of CPRA priorities to use DWH oil spill settlement funds to directly restore areas directly impacted by the spill, such as Bay Jimmy, the Cat Islands, Elephant Island, Dutch Island, Beauregard Island, and Mendicant Island. To use funds outside the impact zone seems outside of what is urgent and proper.

Response ID: 16017

Chapter 2, Section 2.4.1 in Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow of the Draft EIS described the screening analysis conducted to evaluate the alternatives based on geographic location. In addition, the EIS considered a barrier island alternative as a functional alternative to the proposed Project. While the EIS acknowledges that barrier islands play a critical role in reducing land loss, this alternative was determined not to meet the purpose and need. Refer to Chapter 2, Section 2.3.4 in Step 1: Evaluation of Functional Alternatives for details on why this barrier island alternative was eliminated from further analysis in the EIS.

The LA TIG identified the Barataria Basin in the SRP/EA #3 as the location for the proposed Project because within Louisiana, the Barataria Basin suffered the most severe and persistent oiling from the DWH oil spill. It is also an “area of critical need” due to its significant and continuing land loss. As part of the LA TIG’s restoration planning efforts, the Restoration Plan describes their coordination with other Gulf Restoration Programs to maximize the overall ecosystem impact of DWH NRDA restoration efforts through use of DWH oil spill funds (see Section 1.8 in SRP/EA #3).

The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining marsh ecosystem in the Barataria Basin that more closely resembles historic conditions. This sustained marsh ecosystem is expected to benefit many fish and wildlife species in the basin south of Lafitte, including many of those negatively affected by the spill, such as red drum, largemouth bass, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species.

In addition, the LA TIG’s Restoration Plan indicates that these benefits would not only accrue throughout the Barataria Basin but, through the transport of marsh productivity, also in the offshore ecosystems of the northern Gulf of Mexico. As stated in the Restoration Plan, by reestablishing deltaic processes, the proposed MBSD Project is expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

Concern ID: 62000

The proposed MBSD Project design should be enhanced to provide regular water flows and sediment loading (via moveable slurry pipelines, or similar systems) to areas that can benefit most between Lafitte and Grand Isle.

Response ID: 16016

Chapter 2, Section 2.3.6 in Step 1: Evaluation of Functional Alternatives of the Draft EIS evaluated an alternative that includes a sediment diversion with marsh creation. Refer to this section for additional details on why this alternative was eliminated from detailed analysis. It was determined that marsh creation activities have been and are likely to continue to be implemented in the basin and are reasonably foreseeable. Reasonably foreseeable marsh creation activities are considered in the cumulative impact sections of the EIS (see Chapter 4, Section 4.25 Cumulative Impacts).

If this comment is referring to piping sediment directly into the conveyance channel to maximize sediment/water ratio, such an alternative was determined not to be practical or feasible from a technical or economic standpoint. Utilizing the lateral bar adjacent to the diversion in the Mississippi River as a sediment source for the piped sediment would

decrease the efficiency of the diversion and availability of sediment. Piping sediment from a more distant source would not be cost efficient due to the distance and maintenance of the pipeline and could result in impact to navigation. Further, piping sediment directly into the conveyance channel could alter the movement of sediment within the channel, increasing maintenance costs. (See EIS Chapter 2, Section 2.4.4 in Step 2: Evaluation of Operational Alternatives - Location, Operational Trigger, Capacity, and Base Flow and Appendix D2 Eliminated Alternatives Matrix.

The LA TIG notes that it has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Restoration Plan 3.3: Upper Barataria Large-Scale Marsh Creation Project). These activities would complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

Concern ID: 62318

CPRA, with assistance of Attorney General and federal agencies, should hold E&P companies accountable for failure to maintain coastal zone structures that has led to coastal marsh loss. Louisiana should hold profit making companies accountable for the damages they cause.

Response ID: 15772

The Draft EIS recognized causes and impacts of coastal land loss (see EIS Chapter 3, Section 3.6.2 Wetland Loss). The suggestions regarding accountability are outside the scope of this EIS.

Concern ID: 62803

The proposed Project provides essentially zero benefit to anything in the Barataria Basin south of Lafitte.

Response ID: 16377

There would be both adverse and beneficial impacts on the wider Barataria Basin, including beneficial impacts on areas south of Lafitte, Louisiana. These adverse and beneficial impacts are discussed throughout Chapter 4 Environmental Consequences. Although the EIS recognizes the specific adverse impacts in the Lafitte area from increased tidal flooding (see Section 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction), the benefits south of Lafitte include (but are not limited to) regional economic benefits from the job creation and expenditures associated with construction of the diversion (see Section 4.13.4 in Socioeconomics), as well as the maintenance or restoration of wetlands in the immediate outfall area (see Figures 4.6-9 through 4.6-14 in Wetland Resources and Waters of the U.S.), which would result in benefits to various aquatic species in the Barataria Basin (such as white shrimp, blue crab, and red drum; see Table 4.10-6 in Aquatic Resources). Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Correspondence ID:5

Matt D

Given the expected impacts to bottle nose dolphins and other animals and plants that are in barataria basin, do operation plans have input from experts about limiting year-to-year changes in salinity or other water quality parameters? Capping diversion peak flows, volumes, or nutrient loads over the first years of operation should be considered.

Concern ID: 61912

CPRA should consider alternative flow triggers, designs, and features in the operations plan and design of the proposed MBSD Project in order to minimize impacts. CPRA should also consider adjusting diversion design elements such as triggers, peak flows, volumes, and nutrient loads over the first years of operation to minimize impacts. These adjustments could minimize impacts to dolphins, oysters, brown shrimp, and other aquatic organisms. Some commenters suggested limits be imposed by USACE, others suggested an operating plan that is tied to specifics, while others emphasized flexibility tied to real-world experiences. CPRA should also consider alternative methods of operating the proposed MBSD Project, such as operating the diversion during winter when water levels in the basin are lower and can accept high volumes of water from the diversion.

Response ID: 15999

The proposed MBSD Operations Plan can be found in Appendix F2 Preliminary Operations Plan of the Final EIS. As stated in the Chapter 4, Section 4.4.4.2.4 Sediment Transport in Chapter 4 Surface Water and Coastal Processes, sediment transported by the Mississippi River is primarily comprised of fine sediments, with higher river flows (typically occurring in the spring) suspending more coarse-grained sediment that are important in delta building (see Chapter 3, Section 3.4 Surface Water and Coastal Processes). Fine-sediment transport through the diversion would be generally proportional to water flow in the river. The intake channel was modeled and designed to divert a high sediment-to-water ratio while minimizing energy loss (to maintain flow and sediment transport through the diversion complex) and impacts on the river. The amount of sediment carried through the diversion would vary by year, depending on flow rates in the river and the corresponding variation of diversion operations. As explained in Chapter 2, Section 2.8.1.3 Project Operations in Action Alternatives Carried Forward for Detailed Analysis, the Mississippi River discharge of 450,000 cfs would be the standard operations “trigger to open the diversion for flow (above the base flow)”. Operations (with the exception of a base flow up to 5,000 cfs) would cease when the river discharge falls below 450,000 cfs or when certain emergency triggers are met (such as in advance of hurricanes or when a spill of hazardous substances occur in the river). When the Mississippi River flows exceed 450,000 cfs, the gates would be fully opened (above base flow). At river flows of 450,000 cfs, the diversion flow would be approximately 25,000 cfs, and flows would increase proportionally as the river flow increases. This ramp would continue up to maximum diversion capacity flow of 75,000 cfs when the river reaches a flow of 1,000,000 cfs.

An alternative related to operational triggers specific to sediment concentration was considered but determined not to be technically feasible or reasonable because data and technology do not currently exist to support this operational regime (refer to the Eliminated

Alternatives Matrix in Appendix D2 of the EIS). According to the Monitoring and Adaptive Management (MAM) Plan in Appendix R2 of the Final EIS, as part of the adaptive management and monitoring process, CPRA would consider potential ways to optimize diversion operations based on Project performance and success and would assess potential operational changes that may minimize impacts to basin resources where practicable after sufficient operational data become available for analysis.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:6

Matt D

Is this project expected to create a new "dead zone" in the barataria basin similar to what happens at the mouth of the river? Will messaging about the project's impacts highlight that some of the adverse effects can be sourced to the nitrogen and phosphorus from farming practices upstream in the Mississippi River basin?

Concern ID: 61812

Commenters expressed concern that the proposed Project would have adverse water quality impacts in the Barataria Basin due to the introduction of nitrate and phosphate from the Mississippi River. Several commenters questioned whether the proposed Project would create harmful algal blooms and hypoxia in the Barataria Basin similar to the hypoxic "dead zone" in the Gulf of Mexico that exists due to nutrients in Mississippi River waters. One commenter expressed concern that the EIS does not adequately assess the potential for the proposed Project to create algal blooms and hypoxia in the basin, other than acknowledging it.

Response ID: 16425

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA's Mississippi River/Gulf of Mexico Hypoxia Task Force "Hypoxia 101" webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone "water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen" (<https://www.epa.gov/ms-htf/northern-gulf-mexico-hypoxic-zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.>)

Dissolved oxygen concentrations associated with the Applicant's Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf

through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section is included in Section 4.5.5.3 in Surface Water and Sediment Quality and has been added to Section 4.5.5.4.2 Applicant's Preferred Alternative of the Final EIS. Finally, the EIS acknowledges the potential for major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) if warranted, in the Barataria Basin during Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Eric Johnson

Personally, I am very much in favor of restoring natural sediment deposition and river flows to the bayous in and around the Mississippi River delta. These are crucial ecosystems for local fisheries, they sequester carbon, and they help buffer the mainland against storm surges.

That said, I would also like to see these precious areas better protected from nutrient runoff - - some from as far away as the northern Midwest - - that cause the 'dead zone' where the Mississippi enters the Gulf of Mexico.

Growers in the Midwest need solutions to their crop fertility needs that do not require as much nitrogen and phosphorus fertilizer. They can do this in part by planting cover crops, improving soil porosity, and bolstering the soil microbiome. We badly need reform of the crop insurance program to allow for cover crops on most acreages for most crops. Let growers who want to use these strategies use them.

Concern ID: 61812

Commenters expressed concern that the proposed Project would have adverse water quality impacts in the Barataria Basin due to the introduction of nitrate and phosphate from the Mississippi River. Several commenters questioned whether the proposed Project would create harmful algal blooms and hypoxia in the Barataria Basin similar to the hypoxic “dead zone” in the Gulf of Mexico that exists due to nutrients in Mississippi River waters. One commenter expressed concern that the EIS does not adequately assess the potential for the proposed Project to create algal blooms and hypoxia in the basin, other than acknowledging it.

Response ID: 16425

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA's Mississippi River/Gulf of Mexico Hypoxia Task Force "Hypoxia 101" webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone "water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen" (<https://www.epa.gov/ms-hf/northern-gulf-mexico-hypoxic->

[zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.\)](#)

Dissolved oxygen concentrations associated with the Applicant's Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.5.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section is included in Section 4.5.5.3 in Surface Water and Sediment Quality and has been added to Section 4.5.5.4.2 Applicant's Preferred Alternative of the Final EIS. Finally, the EIS acknowledges the potential for major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) if warranted, in the Barataria Basin during Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the

proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62316

Growers in the Midwest need solutions to their crop fertility needs that do not require as much nitrogen and phosphorus fertilizer.

Response ID: 15770

Comment noted, but is outside the scope of this EIS. This EIS is focused on CPRA's proposed Mid-Barataria Sediment Diversion Project. The scope of this EIS is limited to areas in which the Project is expected to have more than negligible effects on the environment, particularly the Barataria Basin and the Mississippi River birdfoot delta in Louisiana.

Concern ID: 63340

The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.

Response ID: 16298

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

RESTORE

Michael Tritico

I have not been able to determine how significant will be the alteration of velocity of the Mississippi River upstream of the diversion. I have tried to figure that out from the Appendices E and F. Although I suspect that the alteration in force upstream would not be enough to set up some kind of erosion or collapse of a levee with consequent sudden inundation of neighborhoods, it is a question that crossed my mind. What do you think? Please respond to me at my email. Thank you, Michael Tritico 03/08/2021.

Concern ID: 61830

The commenter stated that information regarding how the proposed Project would impact the velocity of the Mississippi River upstream of the proposed diversion is not clear in Appendix E (Delft3D Basinwide Modeling) and Appendix F (MBSD Design Information).

Response ID: 16477

The Project's impacts on the velocity of the Mississippi River upstream of the diversion intake was considered in the Draft EIS in Appendix E (Delft3D Basinwide Modeling Appendix), Attachment B (Velocity Contour Maps and Velocity Direction Figures), Figures VEL 1 - VEL 6 (No Action Alternative) and Figures VEL 25 - VEL 30 (Applicant's Preferred Alternative). These figures display no discernable differences in velocity contours in the Mississippi River upstream of the proposed diversion structure. In Chapter 4 of the Draft EIS, Section 4.4 (Surface Water and Coastal Processes), Figure 4.4-37 shows that cross-channel velocities immediately adjacent to the diversion structure would increase by up to 0.3 m/sec (1 foot per second) and by less than 0.03 m/sec (0.1 foot per second) a short distance away. Although these model data are not high-resolution, the USACE concludes that river velocities upstream of the diversion would change by less than 1 foot per second. For greater clarity, a sentence summarizing this has been added to the Final EIS in Section 4.4.4.2.3.2 Applicant's Preferred Alternative in Surface Water and Coastal Processes and in Appendix E, Section 7.2 Water Velocity Outputs.

Concern ID: 62223

The alteration of Mississippi River flows and/or MRL could cause erosion or collapse of the MRL and result in catastrophic flooding.

Response ID: 15749

Section 14 of the Rivers and Harbors Act of 1899 (33 USC 408), referred to as Section 408, authorizes the Secretary of the Army, through the Chief of Engineers, to grant permission for the alteration, occupation, or use of a USACE Civil Works project if the Secretary determines that the activity will not be injurious to the public interest and will not impair the usefulness of the project. Because the proposed Project has the potential to directly and/or indirectly impact the Mississippi River Levee, New Orleans to Venice Levee, and the Mississippi River Navigation Channel, which are USACE Civil Works projects, CPRA has requested Section 408 permission to construct and operate the Project. The USACE 408 Review process includes a review of the technical adequacy of the Project design, including all appropriate

technical analyses, including geotechnical, structural, hydraulic and hydrologic, construction, safety and operations and maintenance requirements. A Section 408 permission would not be granted unless the proposed modifications to the civil works projects would not limit the ability of the USACE Project to function as authorized and would not compromise or change any authorized Project conditions or purposes. The USACE Section 408 review is ongoing and the findings of this review will be disclosed in the Record of Decision.

Correspondence ID:11

Ellsworth Pilie, Jr.

Were models run to determine where the heavy (sands) material will settle out with regards to distances from the structure? Will this require dredging to remove the sand? Are pump station(s) included in the outfall channel levees? What elevation will the guide levees be constructed to and how many lifts will be required? Is the design grade for the guide levees for hurricane surge or project flood stage on the Mississippi River?

Ellsworth J. Pilie, Jr., P.E.

Retired Civil Engineer

U.S. Army Corps of Engineers, New Orleans District

Concern ID: 61781

The commenter questioned whether modeling was conducted for the Draft EIS to determine where sand would settle in the basin, whether it would settle out near the diversion channel, and whether dredging would be required to remove the sand. Another commenter questioned whether water from the bottom of the river, where sediments are coarser, would be diverted to the basin.

Response ID: 16411

The issues raised by the commenter were considered in the Draft EIS. The Delft3D Basinwide Modeling conducted by the Water Institute of the Gulf for CPRA for the EIS distinguishes the types of sediment that would be deposited in the basin. Yes, sands were included in the modeling. Table 5.2-1 in Appendix E Delft3D Modeling of the EIS lists the sediment classes included in the model. The model's physics-based computations showed that the coarser sands would settle out before the finer classes, as the commenter suggests. The model reproduces the natural process of delta building in which successive waves of sediment push farther out, either forming land/marsh or creating a base upon which land/marsh can be formed (without a need to move it by dredging and placement). CPRA plans to dredge specific areas within the proposed Project limits and within Barataria Basin as needed to operate and maintain the proposed Project, as described in Section 3.2 of EIS Appendix F MBSD Design Information and in EIS Appendix R2 Monitoring and Adaptive Management (MAM) Plan. Likewise, dredging of navigation channels would be assessed and managed through CPRA's MAM Plan (Appendix R2 to the EIS). Dredging in the Barataria Basin is expected to maintain certain dredged navigation channels but not the emerging deltaic front. However, the MAM Plan (Appendix R2) does include consideration of additional measures should they be necessary.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are

identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61911

Commenter inquired about design and operational features of the proposed MBSD Project including pump station(s) and elevation and design grade of the guide levees.

Response ID: 15998

Chapter 2, Section 2.8.1.1 in Action Alternatives Carried Forward for Detailed Analysis of the Final EIS includes a description of the proposed MBSD Project including Project design features, which has been updated based on 60 percent designs since the Draft EIS. Also refer to the Design Documentation Report in Appendix F1 of the Final EIS for additional information regarding the proposed Project design.

Correspondence ID:13

Timothy Bond

Please proceed with this project.

Concern ID: 63332**A large number of commenters expressed general support for the proposed Project.****Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Good evening. This is professor Charles Vincent of Southern University Baton Rouge where I work. I was just wondering if there was going to be any kind of colorful history done prior to this proposed diversion on the African American community that may have existed there, or if impact on the African American community. If so, I'm interested in assisting with the research of that because of my past relationship with the Corps of Engineers and Bonnet Carre Spillway. My number is [REDACTED]. I tried your emails, but I'm unable to go online. My system will not pull that out. I will call next week during your business hours and hope that I can speak to someone, but you have my number. Please get back in touch with me. Thank you. Bye.

Concern ID: 61926

Commenter inquires if there will there be any kind of history done on the African American community that may have existed there prior to the proposed Project, or if there are any impacts on the African American community.

Response ID: 16271

The Draft EIS (Chapter 2 of Appendix H1, Socioeconomics Technical Report) included information about the history of communities in the affected area, with attention to the Black and African American populations of those communities. The Draft EIS Chapter 4, Section 4.15 Environmental Justice also described potential impacts on low-income and minority populations from construction and operation of the proposed Project. In the Final EIS, Section 4.15.5.1 in Environmental Justice has been added to provide a summary of impacts on the majority-Black community of Ironton, which is the closest community to the diversion, to assist understanding the projected impacts of the proposed Project on that community.

B&J Fisheries, LLC

Long' Nguyen

Shrimping is my livelihood and I am the sole source of income for my family. The implementation of the MBSD project will cause a significant decrease in my annual income. While the proposed mitigation measures listed in the Plan address some of fishermen grievances, they still won't address the loss of income issue to make commercial shrimper fishermen/women whole. I think the appropriate stakeholders (CPRA, the State) should develop a formula to use when calculating how much to compensate fishermen for lost income to pay in the form of a check at the end of each shrimping season.

Concern ID: 63131

Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.

Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.

Response ID: 16515

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)

- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

I am a commercial fisherman that harvests shrimp. The proposed draft mitigation measures to help commercial fishermen (shrimpers) listed in the Plan are fair to me. If I can't get funding for the refrigeration program, then I would apply for funding to upgrade my gears.

Concern ID: 63133**Commenters support the proposed mitigation measures for the commercial fishing industry.****Response ID: 16517**

The comments received in support of the Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) are acknowledged. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that

USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Oray Savoie

I support the diversion. I don't care about these guide fisherman. They are short sighted and only care about today. The oysters will be further south and the white shrimp will love it. The bass will love it as well. It is only nature doing it's thing. This is what we need!

Concern ID: 62700

The oysters would move further south and the white shrimp and bass would benefit from the freshwater diversion.

Response ID: 16078

The commenter correctly notes the potential for oysters to use more southern areas of Barataria Bay, and the proposed Project benefits to white shrimp and bass, as described in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the Draft EIS. This benefit, among others, was also described in Chapter 3, Section 3.2.1.6 in OPA Evaluation of the Alternatives of the LA TIG's Draft Restoration Plan.

Concern ID: 63332

A large number of commenters expressed general support for the proposed Project.

Response ID: 16288

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Correspondence ID:28

Kenneth Ragas

The science behind the diversions is flawed. The model validation process was based on data from the West Bay Diversion. That project isn't a valid comparison due to the fact that the footprint of the project received several dredgings from the Mississippi River which distorts the actual performance of the diversion. There are no other comparable sources of data from projects now on record.

Also the project will not provide the necessary storm surge protection in a timely manner and will decimate the salt/fresh ecosystem which abounds with flora/fauna. The negative socioeconomic consequences will devastate Southeast Louisiana.

Concern ID: 61829

The Delft3D Basinwide Modeling conducted for the Draft EIS is flawed because its validation process was based on the West Bay Sediment Diversion, which is not a valid comparison because the footprint of that project received several lifts via sediment dredged and pumped from the Mississippi River, which would not occur for the proposed MBSD Project.

Response ID: 16476

Validating the Delft3D Basinwide Model to a large sediment diversion in the Barataria Basin would have been ideal; however, there are no other large-scale sediment diversions on the landscape at this time. Because the other existing diversions (Davis Pond and Caernarvon Diversions) are freshwater diversions designed to extract water from the top of the river and discharge primarily water, not sediment, they are not applicable for validating the Delft3D Model for the MBSD Project. The West Bay Sediment Diversion, in contrast, is useful for validating the physical processes of erosion and deposition of sediment because although some dredging occurs for that project, it, like the proposed MBSD Project, is a sediment diversion that extracts sediment from deeper in the river. The modelers used standard professional practice by validating the Delft3D Basinwide Model (a well-proved, public-domain, physics-based model) with the West Bay Sediment Diversion to properly reproduce the primary physical processes of sediment erosion and deposition. In that manner, the modelers were able to examine how diversion flows would affect the process of sediment erosion and deposition separate from dredged material disposal.

As part of developing the Draft EIS, the USACE, together with the members of the LA TIG, reviewed the Delft3D Basinwide Model, including its parameters, methods of validation and calibration, inputs for the alternative production runs used in the EIS, and outputs, and concluded that the Delft3D Basinwide Model production runs and outputs were adequate and sufficient to inform the MBSD EIS impacts analysis of the alternatives.

Concern ID: 62009

The negative socioeconomic consequences would devastate southeast Louisiana, destroy people's livelihoods, displace people living near the diversion, and destroy property in the areas impacted by the proposed MBSD Project.

Response ID: 16207

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of

Louisiana, including impacts on population, property values, and community cohesion. As noted in these sections, the proposed Project would have both beneficial and adverse socioeconomic impacts on the people and communities within the Project area. Minor to moderate, permanent adverse socioeconomic impacts are expected to occur near the immediate outfall area outside of flood protection. Minor to moderate, permanent, beneficial socioeconomic impacts are expected to occur in the west bank New Orleans area north of the diversion. Moderate to major, beneficial, temporary impacts from job creation and economic activity in the proposed Project area are anticipated. In addition, the Socioeconomics Technical Report in Appendix H1 provides additional details on these projected effects.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the DWH oil spill.

The commenters' concern regarding the potential impacts of the diversion were considered by CPRA and the LA TIG in developing the Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included mitigation to address and offset some of the projected impacts of the Project on fisheries and surrounding communities outside levee protection including providing structural mitigation and stewardship measures for increased water levels that are projected to result due to the Project, such as raising roads or improving bulkheads. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

In communities south of the Project site outside of federal levee protection where the proposed Project is projected to cause increased water levels, CPRA plans to take one of two approaches. In Myrtle Grove, CPRA is planning to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision. By improving this bulkhead, CPRA would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions without the Project. See Table 1 in the Final Mitigation and Stewardship Plan for more details. CPRA plans to acquire a temporary right-of-way to permit improvement of the bulkhead, voluntarily or through eminent domain if necessary, from the property owners in the Myrtle Grove Marina Estates Subdivision.

In other communities south of the Project site outside of federal levee protection, from Woodpark south to the communities of Grand Bayou and Happy Jack, CPRA plans to elevate the portions of public roads outside of levee protection that provide access to each of these communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be the case in the

future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62221

The Project would not provide substantial protection from hurricanes or storm surge, nor would storm surge protection be provided in a timely manner. The area most likely to experience some increase in protection would be subject to increased water levels from diversion operations. The current diversion Project needs to be reengineered to create meaningful storm surge protection. The Project is a misuse of funds based on what the diversion would do versus what it purports to do, in part due to the Mississippi River not having enough sediment to build substantial land.

Response ID: 15756

While the proposed Project would impact storm surge, the purpose and need of the Project is not storm surge protection. As described in the Draft EIS in Chapter 1, Section 1.4 Purpose and Need, the purpose of the Project is to restore injuries caused by the DWH oil spill and help restore habitat and ecosystem services injured by the spill by reestablishing deltaic processes. However, as described in the Draft EIS in Chapter 4, Section 4.20.4 Public Health and Safety, the Project would have the ancillary benefit of storm damage risk reduction on communities north of the diversion due to the creation and maintenance of wetland habitat within the delta formation area; the increase in topography and land acreage would induce greater hydraulic friction and resistance, reducing the inland extent of storm surge and limiting wave heights in some communities north of the diversion, as compared to the No Action Alternative. The EIS acknowledges that storm surge and wave height reduction benefits for some communities north of the diversion would not be instantaneous, but that these benefits would increase over time as more land is created and maintained within the delta formation area. The EIS also acknowledges that some of the same communities that would experience storm surge reduction benefits, such as Lafitte, would experience an increase in non-storm inundation frequency due to increased water levels from diversion operations. At the same time, operation of the Project would have permanent, minor to moderate, adverse impacts on storm hazards in communities south of the diversion, with anticipated increases in storm surge of up to 1.7 feet near Myrtle Grove (as compared to the No Action Alternative). Section 4.20.4.2.2.2 in Public Health and Safety of the Final EIS has been revised to include additional information and figures further explaining the impacts of the Project on storm surge and wave height.

The EIS recognizes the role of sediment load in land building. The river still carries a massive sediment load, but not as massive as it historically carried. As explained in Chapter 3, Section 3.4.2.5 in Surface Water and Coastal Processes, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes as described in Section 3.4.2.5 Sediment Transport. The Delft3D Basinwide Model used Mississippi River sediment loads when computing the sediment load that would be delivered

to the Barataria Basin. This is described in detail in the EIS, Appendix E Delft3D Modeling, Section 5.2.2.

Concern ID: 62690

The proposed Project would destroy the ecosystem and its flora and fauna, including oyster, shrimp, crabs, fish, sea turtles, and dolphins.

Response ID: 16073

As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated to those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts on the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. For example, the decrease in salinity that would occur upon initial operation of the proposed Project would result in major adverse impacts on various species (oysters, brown shrimp, bottlenose dolphins) over a relatively short period of time; however, the accumulating fresh water and sediments would create or maintain wetlands over long-term or permanent basis (that is, extending through the remainder of the 50-year period of analysis) which would benefit other commercially or recreationally important aquatic species such as white shrimp, blue crab, and Gulf menhaden, and would increase storm protection for communities north of the immediate outfall area; the Delft3D Basinwide Model projects these benefits to increase over time and to be greatest in the 2060s (see Chapter 4, Sections 4.6.5.1 in Wetland Resources and Waters of the U.S., 4.10.4.5 in Aquatic Resources, 4.11.5.2 in Marine Mammals, and 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction). As discussed in Section 4.12.2.2 Sea Turtles, the proposed Project would have negligible to minor adverse impacts on hawksbill and leatherback sea turtles, but minor to moderate adverse impacts on Kemp's ridley, green, and loggerhead sea turtles due to the potential for increased interactions between sea turtles and commercial shrimp fishing efforts, if shrimp and shrimp fishers move from mid-basin locations to locations lower in the basin or in nearshore/offshore waters (where more sea turtles would be present). However, NMFS has determined that these impacts would not jeopardize the continued existence of sea turtles (see Appendix O4 NMFS Biological Opinion of the Final EIS).

The USACE and the LA TIG are evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the LA TIG's Restoration Plan). The intended restoration of fresh water flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would

result in collateral injury to species that depend on the current higher-salinity conditions in the basin. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin. The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. The LA TIG's Restoration Plan indicates that by reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Final Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the NRDA Trustees' Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

The CPRA has revised its Mitigation and Stewardship Plan and Monitoring and Adaptive Management (MAM) Plan in response to public concerns about these impacts. See Appendices R1 and R2 to the Final EIS for more information.

Hoang Nguyen

I am a Vietnamese commercial fisherman and I'm a client at a nonprofit in Gretna, LA that provides business services to commercial fishermen. There I can receive assistance in Vietnamese. One of the ladies read the proposed mitigation plans to help us after the diversion is in operation and I actually think they are good plans.

Concern ID: 63151**Some commenters stated general support and appreciation for the mitigation plan.****Response ID: 16555**

Comments offering general support and appreciation for the Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) are acknowledged. CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the Final EIS, since publication of the Draft EIS and LA TIG's Draft Restoration Plan based on community and resource agency input.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:30

Kevin Khorum

I am a commercial fisherman that harvests shrimp out of Buras, LA. I'm getting older and won't be able to fish much longer so I'd rather transition out of the industry altogether. I would need money to start a new business, a donut shop, and I'd like it to be out of state because I don't want to stay in Buras any longer especially if my community is going to be subjected to nuisance flooding. I would also need assistance with selling my boat.

Concern ID: 63134

Commenters suggested that job training would not be helpful for older workers or for those facing language or technological barriers. Direct payments should be considered for these fisherman that cannot change careers easily.

Response ID: 16518

The Draft EIS considered how changes in the Project area both with and without implementation of the Project would potentially impact commercial fisheries, including shrimp, in Chapter 4, Section 4.14 (Commercial Fisheries). In response to public comments and resource agency input about proposed mitigation and stewardship measures, CPRA has expanded and refined the fisheries mitigation and stewardship measures since the release of the Draft EIS. CPRA's mitigation and stewardship strategies and expenditures focus on establishing sustainable fisheries for oysters and shrimp rather than on compensating individual shrimpers or oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for fisheries in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to fisheries in the early years of the Project's operational life.

The revised mitigation and stewardship measures allocate approximately \$54 million to commercial fisheries, which supplement other restoration actions and programs being funded by the LA TIG and by the State through LDWF. This includes \$2 million for Workforce/Business training which can be used for older workers facing language or technical assistance barriers (see Appendix R1 to the Final EIS). Additionally, if the MBSD Project is permitted by the USACE and funded by the LA TIG, it would take approximately 5 years to complete construction of the Project and to begin operations. This relatively long period would provide affected senior fishers with the time and opportunity to decide how they want to go forward, ranging from taking advantage of the adaptation opportunities offered through the Mitigation and Stewardship Plan to transition out of the fishing industry. The final fishery mitigation plan can be found in the Mitigation and Stewardship Plan (Appendix R1 to the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS

Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:31

Shannon Gross

This diversion project will negatively impact our seafood industry. Please DREDGE, stop the Diversion Project!

Concern ID: 61966

The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.

Response ID: 15971

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation

(dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

Concern ID: 62071

The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.

Response ID: 16241

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)

- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:33

Kimme Serigne

To whom this may concern!

I kimmie serigne a life long resident of st bernard parish, living and providing for my family as a commercial fisherman for over 35yrs have seen what we once had before the inception of the fresh water diversion in the carnarvon area. allowing fresh water to inondate our marsh is not the answer, just look at what land we had in carnarvon diveron area before hurricane Katrina and after. We all know sediment is needed to rebuild our coast but allowing polluted river water into the area is only going to cause much harm the area, and thats not to mention putting an economic burden on our local commercial and sport fisherman and related businesses .

Concern ID: 61819

Commenters expressed concern that the proposed Project would have adverse impacts on Barataria Basin's water quality, wetlands, fisheries, recreational uses, and eroding coastlines due to chemicals, oil and hazardous waste, and/or pollutants in the Mississippi River that would be routed to the Barataria Basin via the proposed diversion.

Response ID: 16429

The impacts raised by the commenters were considered in the Draft EIS. As discussed in Chapter 3, Section 3.5.1.1 in Surface Water and Sediment Quality of the Draft EIS, the segment of the Mississippi River where the proposed diversion river intake structure would be located (subsegment LA070301_00) fully supports its designated uses. Designated uses for this subsegment include swimming, boating, fishing, and drinking water supply. LDEQ's water quality assessment indicates that regulated substances are not present in concentrations that would cause a water quality impairment at the location of the intake structure. In response to this concern expressed by commenters, a new subsection has been added to Chapter 4, Section 4.5 Surface Water and Sediment Quality clarifying the potential impacts of nearby industrial facilities on river water routed to the basin during proposed Project operations. The new section is called 4.5.5.11 Hazardous Spills from Industrial Sites.

As described in the EIS, Chapter 2, Section 2.8.1.4 in Action Alternatives Carried Forward for Detailed Analysis and in Appendix F MBSD Design Information, in the event of oil spills and other hazardous discharges into the Mississippi River upstream of the proposed MBSD intake structure, the diversion structure would be closed.

Concern ID: 62071

The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.

Response ID: 16241

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No

Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be

listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62077

The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.

Response ID: 16242

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRAs has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRAs has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)

- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63016

The Carnarvon Diversion (and other diversions, such as the Naomi Siphon) did not build marsh but rather caused damage to the existing marsh, such as through the introduction of freshwater invasive plant species that clog available waterways, suffocating natural marsh grass, restricting water flow.

Response ID: 16029

A summary of select natural and man-made diversions in southeastern Louisiana, including the Caernarvon Diversion and Naomi Siphon, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and discuss their recorded impacts on the natural environment. This summary, which includes a discussion on changes to marsh extent and the presence of invasive plants, is available in Appendix U of the Final EIS.

Correspondence ID:34

Jason Lowrance

This large scale river diversion will be the death of our estuary. It's already been proven by scientific research that it will do more harm than good. This is a terrible idea and will kill our marsh and fisheries. Small more controlled diversions. Keep on dredging and pumping. You have all the spoil you need in the river to rebuild. Damn shame the spoil from the river was dumped in deep water the past how many years. We could have been re building all this time. NO Mid Breton diversion.

Concern ID: 61966

The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.

Response ID: 15971

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated

Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRAs and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

Concern ID: 62320**The commenter is opposed to Mid-Breton Sediment Diversion****Response ID: 15774**

The focus of this EIS is the proposed Mid-Barataria Sediment Diversion. The impacts of the proposed Mid-Breton Sediment Diversion are considered in this EIS as part of the cumulative impacts analysis, which analyzes the incremental impacts of the proposed Project when added to other past, present, and reasonably foreseeable future actions (see Chapter 4, Section 4.25 Cumulative Impacts). Additionally, there would be an opportunity for the public to provide comments on the proposed Mid-Breton Sediment Diversion when the USACE releases the Draft EIS for that proposed project.

Concern ID: 62777**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).****Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the

Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62780

Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.

Response ID: 16362

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15

CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:35

Johnathan Camnetar

The spillway is gonna destroy more than it will create. The best thing would be to pump spoils to build land.

Concern ID: 61966

The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.

Response ID: 15971

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation

(dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

Concern ID: 62780

Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.

Response ID: 16362

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures

contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID: 36

University of South Florida

Steven Murawski

The Mid-Barataria Bay sediment Diversion is an ambitious project to divert sediment and fresh water from the lower Mississippi River main stem into the surrounding marshlands with the intent to stem wetlands losses due to land subsidence and sea level rise. The project duration is 50 years.

According to Appendix N of the EIS document, the analysis of impacts of the project uses the Delft3D model to consider the following existing diversions and river inputs when evaluating the cumulative effects of the MBBSD: Davis Pond, Bonnet Carre Spillway, Caernarvon Freshwater Diversion, Mardi Gras Pass, the West Point A La Hache Siphon and various passes in the Birdfoot Delta. However, according to Louisiana's Coastal Master Plan, an additional seven river diversions are planned for the lower Mississippi River region, including: Lower Breton Diversion (50,000 cfs), Central Wetlands Diversion (5,000 cfs), East Maurepas Diversion (2,000 cfs), Manchac Landbridge Diversion (2,000 cfs), Union Freshwater Diversion (25,000 cfs), Mid-Breton Sound Diversion (35,000 cfs), Mid-Barataria Diversion (75,000 cfs).

Together these additional diversions will add a maximum of 194,000 cfs to existing diversions. This is approximately 10x the maximum freshwater flow that occurred when the Davis Pond and Caernarvon Diversions were opened in 2010 to forestall the Deepwater Horizon oil spill. The research published by my colleagues and me looking at the trawl survey data from these regions pre- and post-Deepwater Horizon indicates a significant regime shift in the fish and mega-invertebrate community that was associated with reduced salinity and lower water turbidity, beginning in 2010 (Murawski et al. 2021).

According to the EIS, the USACE public interest review and EPA's CWA (Clean Water Act) 404(b)(1) guidelines currently require evaluation of cumulative effects which include both current operational projects and those that are reasonably foreseeable. Clearly the MBBSD project is the first of seven additional projects planned. It is unconscionable that cumulative effects analyses do not include these other diversions as well. I recommend that such modeling and impact analyses on biota be conducted before proceeding with this project.

Reference:

Murawski SA, Kilborn JP, Bejarano AC, Chagaris D, Donaldson D, Hernandez FJ Jr, MacDonald TC, Newton C, Peebles E and Robinson KL (2021) A Synthesis of Deepwater Horizon Impacts on Coastal and Nearshore Living Marine Resources. *Front. Mar. Sci.* 7:594862. doi: 10.3389/fmars.2020.594862

Concern ID: 61847

The commenter requested that the Draft EIS include analyses of several river diversions that are included in CPRA's Master Plan that would have impacts on proposed Project-area resources associated with reduced salinity and lower water turbidity, including the Lower Breton Diversion (50,000 cfs), Central Wetlands Diversion (5,000 cfs), East Maurepas Diversion (2,000 cfs), Manchac Landbridge Diversion (2,000 cfs), Union Freshwater Diversion (25,000 cfs), Mid-Breton Sound Diversion (35,000 cfs), and Mid-Barataria Diversion (75,000 cfs).

Response ID: 16461

Although the Lower Breton Diversion (50,000 cfs), Central Wetlands Diversion (5,000 cfs), Manchac Landbridge Diversion (2,000 cfs), and Union Freshwater Diversion (25,000 cfs) are included in CPRA's 2017 Master Plan, they are not included in the cumulative impacts analysis of the EIS because they do not meet the definition of reasonably foreseeable as defined and agreed to by the consulting agencies in Section 4.25.1 Methodology for Assessing Cumulative Impacts. This section states, "Projects that would require a Department of the Army permit application, including but not limited to projects proposed for the Project area in CPRA's 2017 Coastal Master Plan, were considered reasonably foreseeable if a permit application had been submitted to the USACE by May 2020." Additionally, as further stated in that section, the cumulative impacts analysis was restricted to projects and actions that would contribute impacts on resources within the same geographic area as the Mid-Barataria Sediment Diversion Project. That geographic area is illustrated in Chapter 3, Section 3.1.1 Project Area.

The proposed Maurepas Diversion is being studied by USACE and a Draft EIS for that project will be published in 2022. Due to its small scale (2,000 cfs) and its location outside of the Mid-Barataria Sediment Diversion Project area of impact, anticipated cumulative effects with that diversion in place would be negligible.

Concern ID: 62319

The Mid-Barataria Bay Sediment Diversion is an ambitious Project to divert sediment and fresh water from the Lower Mississippi River main stem into the surrounding marshlands, and Project duration is 50 years.

Response ID: 15773

Comment noted. The commenter is correct regarding the intent of the proposed Project, as was described in the Draft EIS Chapter 1 Introduction and Purpose and Need. The period of analysis for analyzing impacts of the proposed Project is 50 years. If implemented, Project operation is anticipated to extend beyond 50 years.

Concern ID: 67232

The opening of the Davis Pond and Caernarvon diversions to combat effects of the DWH oil spill has had significant impacts on the fish and mega-invertebrate community associated with reduced salinity and lower water turbidity.

Response ID: 16952

The impacts that the DWH oil spill had on fish and mega-invertebrates in the Barataria Basin, and the drivers of those impacts, were considered in the Draft EIS. These impacts are discussed throughout Chapter 3 Affected Environment, including time series representations of LDWF fisheries independent data for key species that cover the period of the DWH oil spill.

As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the Project is to restore for injuries caused by the DWH oil spill by implementing a large-scale sediment diversion in the Barataria Basin that would reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned

coastal restoration efforts. This EIS serves as the environmental review required by NEPA to inform the LA TIG's OPA decision regarding funding the construction of the proposed MBSD Project using damages paid by BP following the DWH oil spill (see Section 1.6.1 The OPA and DWH NRDA Decisions of the EIS).

Danny Tran

I am a crabber from Larose, LA. I had someone help me read and understand the proposed mitigation measures in the draft plan and noticed that there wasn't much to help crabbers. The freshwater will kill crabs for about four months, but they will come back yes but we will still need help during those four months. On a good month I can make about \$6,000, but without those crabs for those few months I will have suffered a tremendous loss of income. I'd like to see something in the plan that will compensate us crabbers for our monetary losses every season until we retire. I would even be ok with being compensated at least half of what I could make during the times when the crabs wouldn't be there.

Concern ID: 63136**Commenters were concerned that proposed mitigation does not include measures for crab fishermen.****Response ID: 16520**

As noted in Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS, impacts on blue crab from the Project are anticipated to be neutral to beneficial. In addition, as stated in Section 4.14 Commercial Fisheries impacts on the blue crab fishery are anticipated to be negligible to minor beneficial. This determination considers potential impacts on blue crab abundance as well as the anticipated response from the commercial fishing industry. In response to public comments, CPRA has included \$1 million in funding for a crab marketing and outreach program and improvements to crab fishing gear as part of the Final Mitigation and Stewardship Plan (see Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Shane Aycock

Hi, I live in Woodpark subdivision and in my opinion due to a lack of coastline and south winds during the warmer months the tidal flow has become higher . With the diversion running also making the water higher, our streets and yards will be flooded quite often. What is going to be done to mitigate this obvious problem that we will have once the flow starts ?

Thanks, Shane Aycock [REDACTED]

Concern ID: 62951

CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.

Response ID: 16711

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations.

The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review,

Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Charlie Munro

No hard science to prove the diversions work. And plenty of science to prove they don't. I'm against the Diversion.

Concern ID: 62782**A large number of commenters expressed general opposition to the proposed Project.****Response ID: 16364**

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 62784**Prior or proposed diversions and diversion-like projects (including the Caernarvon Diversion, MRGO, Mardi Gras Pass, Maurepas Bonnet Carré Spillway openings) did not work or caused adverse impacts on area resources.****Response ID: 16366**

The commenter's concern regarding the effectiveness and adverse impacts of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the Caernarvon Diversion, MRGO, Mardi Gras Pass, and Bonnet Carré Spillway, is available in Appendix U of the Final EIS. The Maurepas Diversion is subject to an ongoing NEPA analysis, which is anticipated to be finalized in 2022.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The referenced projects all had unique goals, and, where goals existed, each of those projects have achieved their goals. Those achievements increase confidence in the ability of the LA TIG to set goals and select approaches appropriate for achieving those goals. The proposed Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the current geomorphological features of the Lower Mississippi River, as well as data and knowledge gained from the referenced projects.

Theodore Mackenroth

I have a home on Martin Lane. This is not my primary resident. I am a part time commercial fishermen. So I stay here more then 50% of the time. I also don't have homestead exception here so that means I pay full property tax. I have home and flood insurance. Our flood elevation was just raised from 11' to 13'. Because of this I am now below the flood level.

The new diversion is predicted to raise our tide level by 1/2'to 1'. Martin Lane averages about 2.5' above sea level. I have documents that show how many times the road has been flooded for the last three years. 2018 51 times, 2019 77 times, and 2020 66 times. If the diversion raises our tide then I will see more flooding. Wednesday the 17 2020 the tide was at 2.8' from a south wind. This a normal and happens a lot.

I am not the only one on this lane that will have the same problem. There are 95 homes on the lane. Some are above the new flood elevation but many are not. One thing we all have in common is Martin Lane and getting to our homes. Many times I had to leave my car on the levee and walk to my home.

WILL THERE BE MONIES AVAILABLE TO RAISE THE ROAD, HOME AND PROPERTIES?
I worked hard to keep this up and stay out of water.

If diversions works and builds land what will happen to our main bayou? If they silt in will you come back and dredge them out?

Are you planning to narrow 4 bayou pass and bay long pass to slow the tide water down?
This is causing the most erosion problem.

Since I was a little boy my father always talked about a storm coming up Barataria Bay. How bad will it be for the Parish. With 4 bayou and bay long passes as big as there are it is getting worst. Less chances of stopping a storm. The diversion will open a canal to Barataria Bay before it builds land. In the long run it may help but until then are you going to dredge more?

They closed the Mr. Go because the storm flooded New Orleans by backing up. What is going to happen to Plaquemines Parish after the diversion is in? Will the water back up and flood everyone below the diversion? Will you close it after the first flood if we live thru it?

I am also worried about the wildlife and fishing. This is going to be a huge impact on our area. I enjoy salt water fishing but I think this will kill most of that. I know some species will survive better but we will lose a lot. Will we gain more then we lose?

I believe in progress but at what cost? I know we need to build land but will you destroy more then you help. I maybe a little selfish but I am 66 years old and hope you don't take away my last few years of enjoyment.

thanks for now

Concern ID: 62224

Communities like Happy Jack, Lake Hermitage and Myrtle Grove, some of which have homes that are not above the new base flood elevation, already experience some degree of flooding which would be made worse by the diversion. This would affect the ability of residents to access and enjoy their homes and communities.

Response ID: 15757

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discuss the anticipated increased flooding impacts outside of federal levee systems to be caused by the operation of the diversion. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes, which would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or

adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62225

Plaquemines Parish could experience flooding from the diversion similar to flooding due to the Mississippi River Gulf Outlet. Commenter asked if the diversion would be closed if it causes such flooding.

Response ID: 15758

As described in Draft EIS Chapter 2, Section 2.8 Action Alternatives Carried Forward for Detailed Analysis, the proposed Project design includes earthen guide levees that would be constructed along both sides of the diversion conveyance channel. The portion of the guide levees on the protected side of the New Orleans to Venice Levee system (NOV-NF-W-05a.1) would be designed and built as hurricane and storm damage risk reduction levees against storm surges that may enter the diversion channel. A gated control structure would also be built on the Mississippi River side of the conveyance channel, and the gate would be closed prior to and during storm events. Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discusses the increased flooding impacts potentially caused by the operation of the diversion.

CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project

servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62322

Commenter asserts that more land needs to be built, but the Project may do more harm than good.

Response ID: 15775

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The purpose and need of the proposed Project is to restore injuries caused by the DWH oil spill by reestablishing deltaic processes, to ultimately restore habitat and ecosystem services injured by the DWH oil spill. The EIS recognizes that in fulfilling this purpose and need, the proposed Project would have both beneficial and adverse impacts on several resources. See Section 2.9 in Chapter 2 for a summary of the projected effects of the Project.

Title 15 CFR §990.54 of the NRDA regulations outlines the criteria against which reasonable alternatives are evaluated to select the LA TIG's Preferred Alternative. Recognizing that almost all restoration comes with some potential for collateral injury, one factor for evaluation is the extent to which each alternative would prevent future injury and avoid collateral injury. The potential for collateral injury does not preclude an alternative from selection, rather the LA TIG must evaluate each alternative under multiple factors, and select a Preferred Alternative to meet the outlined restoration objectives.

The LA TIG, in identifying the Preferred Alternative in the Restoration Plan, evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Sections 3.2.4.7 Identification of a Preferred Alternative, 3.2.1.5 Alternative 1 - Avoids Collateral Injury, and 3.2.2.5 Alternatives 2-6 - Avoids Collateral Injury of the LA TIG's Restoration Plan. A project can harm species also harmed by the spill and still be an appropriate project. This is especially true for projects like sediment diversions that seek to reestablish deltaic processes that shaped the historic delta ecosystem that was altered when Mississippi River flows were cut off by construction of levees. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

Concern ID: 62701

The commenter expressed concern regarding impacts on fishing and questions if a net gain or loss of survival would occur if the increased survival of certain fish species due to the freshwater input were compared to the decreased survival of others.

Response ID: 16079

As described throughout Chapter 4, Section 4.10 Aquatic Resources of the EIS, operation of the proposed Project would affect fish species in the Barataria Basin in both beneficial and adverse ways, with the overall impacts to a given species being dependent on that species' habitat preferences and tolerances. The proposed Project is not anticipated to result in the loss of individual species throughout the Barataria Basin, but rather would cause a shift in the species assemblages to account for the modified habitat present in the basin. For example, species with higher-salinity requirements that are currently present (for example, brown shrimp, oysters) would remain during operation of the proposed Project but would likely move

further south to account for changing salinities (see Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS).

As discussed in Sections 4.16.5.1 and 4.16.5.2 in Recreation and Tourism, the proposed Project would cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts to these species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips. Section 4.16.5.2.3 Recreational Fishing of the Final EIS has been updated to acknowledge that some recreational fishers may need to modify their traditional fishing locations to target specific species that may modify habitat use (either temporarily or permanently) based on changing salinities.

Concern ID: 62896

Some wildlife species would have higher survival, but the survival of others would decrease. Commenter expressed concern regarding impacts on wildlife and questioned if there would be more gains than losses.

Response ID: 16194

As described in Chapter 4, Section 4.9 Terrestrial Wildlife and Habitat of the Draft EIS, wildlife would experience both adverse and beneficial impacts during proposed Project construction and operations, with specific impacts depending on the individual life history and tolerances of a given species. The proposed Project is not anticipated to result in the loss of individual species throughout the Barataria Basin, but rather would cause a shift in the species assemblages to account for the modified habitat present in the basin. For example, species with higher-salinity requirements that are currently present would remain during operation of the proposed Project, but would likely move further south to account for changing salinities. These potential impacts of the proposed Project on various species and wildlife groups are analyzed and described in detail in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat, 4.10 Aquatic Resources, 4.11 Marine Mammals, and 4.12 Threatened and Endangered Species in the EIS.

As discussed in Sections 4.16.5.1 and 4.16.5.2 in Recreation and Tourism, the proposed Project would cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts to these species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips. Section 4.16.5.2.3 Recreational Fishing of the Final EIS has been updated to acknowledge that some recreational fishers may need to modify their traditional fishing

locations to target specific species that may modify habitat use (either temporarily or permanently) based on changing salinities.

Concern ID: 62951

CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.

Response ID: 16711

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the

Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or

adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62968

If operation of the diversion causes infill of various canals used to access surrounding communities, who will be responsible for dredging to maintain access? For example, if Wilkinson Canal is filled with silt then the canal cannot be used and waterfront property owners with boat lifts in Myrtle Grove will not be able to get out using their boats; the EIS does not require a remedy or provide a funded maintenance plan for this issue (including who would pay for dredging).

Response ID: 16642

The impacts raised by the commenters were considered in the Draft EIS. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the Project area during Project operations.

In acknowledgement of commenters' concerns regarding maintenance of non-federal navigation channels and canals impacted by sedimentation of the proposed diversion, the Mitigation and Stewardship Plan includes measures to mitigate impacts on navigation resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the

Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Siekleng Kiek

I am a commercial fisherwoman harvesting brown and white shrimp out of Buras, LA. When the diversion comes, I still want to harvest shrimp but I would need financial assistance with starting an alternative business to work during the times the white shrimp season is closed since that would be the only time that I could harvest shrimp. The white shrimp season is typically from August to December and that's not enough time to make a decent living salary, so that's why I would need another business. I'd like financial assistance with starting an Airbnb-type business. Of course I would also need business training in the type of business. And to alleviate the stressors of opening a new business, I'd like the government to purchase the land and possibly construct a home to rent out for the Airbnb business to support eco-tourism in the area. I envision people coming down there for recreational fishing, to attend festivals, etc. What I'd also like is financial assistance with constructing a new home that is fortified to withstand stronger hurricanes.

Concern ID: 63131

Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.

Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.

Response ID: 16515

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)

- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Stephen White

Good day,

Thank you for your time. This plea comes from a place of passion tempered with practical solution(s) regarding a March 10, 2021 NOLA.com article(Environment) To build wetlands, Louisiana's largest sediment diversion would shock seafood communities.

If the author's facts are correct, the basin alone has lost 430 sq miles over the last century. This plan is, " a key piece of Louisiana's 50-year, \$50 billion effort to save the southern third of the state... The Mid-Bataria project estimated at \$2 billion would rebuild and nourish 27 square miles over 24 years, backers say."

This laughable ruse equates to nearly \$75,000,000 per mile.

I am not in the seafood industry. I am not a government employee or consultant for oil/gas or any environmental (pro/con) agency. I am a dad, and a school principal who deeply cares about Louisiana the environment. This proposal reeks of "classic" Louisiana bureaucratic nepotism.

If given the opportunity, I KNOW, I could accomplish this goal at a fraction of the cost and time. Furthermore, I am confident this can be done without negative environmental impacts.

Where do I go from here? The dramatic loss of estuaries as hurricane buffers, home to unique cultural and economic identities for generations is undeniable. The opportunity to act now is now.

Repeated thanks, Stephen White [REDACTED]

Concern ID: 66342**The cost of the diversion is not justified and the project is questionable.****Response ID: 16772**

The NEPA regulations do not require a cost-benefit analysis for the EIS unless such an analysis is relevant to an agency's decision. USACE generally assumes that a permit applicant has made its own economic evaluation regarding the costs of a proposed project. However, as part of its public interest review, USACE will weigh the harms that would be caused by the Project against its potential benefits.

In the LA TIG's Restoration Plan, the LA TIG considers the cost to carry out the Project consistent with the Restoration Plan alternatives evaluation criteria, 15 CFR §990.54.

Concern ID: 62323**There has to be a different way to do it that does not have negative environmental impacts, at a fraction of the cost and time.****Response ID: 15956**

The EIS recognizes that the proposed Project would have both beneficial and adverse impacts on several resources. See Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative for a summary of the projected effects of the proposed Project. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public

interest review, which weighs the probable harms of the proposed action against its potential benefits.

The alternatives evaluated in the EIS were based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2, an alternatives screening process was conducted where screening criteria were identified and a wide range of alternatives were evaluated including other available coastal restoration tools and methods. The screening criteria included key concepts from the purpose and need including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan.

The Project-specific purpose and need built on analyses in the LA TIG's SRP/EA #3, including its initial screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin.

After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2 Alternatives, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018, page 3-32) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in this Restoration Plan. Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

Walter Lark

Certainly, many folks are having the same sinking feeling as I am having today as I write this. My way of life for decades will be forever affected by the influx of freshwater due to the Mid Barataria Diversion, I was taught to fish, crab, shrimp, and live off of the water as a way of life from my father and grandfather and have taught my sons to do the same, as well as thousands of adults like me.

More importantly, I have made a substantial investment in my retirement and the dreams to teach my grandchildren which are invested in the home at [REDACTED] in the Happy Jack community.

It is my understanding that not only will my future enjoyment of the saltwater marsh be greatly affected by the rising water but the tremendous influx of river water will cause additional flooding. It's amazing that man just will continuously make poor decisions regarding our coastal areas.

The place that I have continuously improved for many years to provide a happy and satisfying retirement will basically be destroyed by the diversion.

It is my calculated estimate that after several years the diversion project will be a failure and man once again will have another knee-jerk reaction to fix the failure.

What happens to the saltwater grasses that now protect us to some extent have a foot or more of fresh water on top of it. They die then we have no marsh, and on and on.

Buy my camp and I will go and enjoy another activity during retirement and beyond.

Thanks for the memories.

Jim Lark

Concern ID: 61905

Commenters expressed that residents' way of life including living off of and recreating in the water would be impacted by an influx of fresh water due to the MBSD Project.

Response ID: 16235

The issues raised by the commenters were considered in the Draft EIS. As described in the Existing Conditions in Chapter 3, Section 3.16 Recreation and Tourism, as well as Appendix H1 Socioeconomics Technical Report, the Draft EIS acknowledges the importance of recreational use in the region, describing many types of outdoor recreational activities, including fishing, hunting, boating, wildlife viewing, and general shoreline use, among others. The EIS further acknowledges that extensive estuarine and freshwater wetlands provide habitat for many kinds of fish, birds, reptiles, and mammals that are an integral component of recreation in the region. The evaluation of environmental changes in the basin under the No Action Alternative shows that the abundance of target recreational species, including spotted seatrout and red drum, would decline over time. Access to recreational boating sites would also increase from negligible impacts in the early decades to major, adverse impacts in the later decades, leading to decreases in recreational use in the southern portions of the basin even without the Project. Chapter 4, Sections 4.16.4.2 and 4.16.5.2 in Recreation and Tourism describe how changes in the amount of fresh water due to the MBSD Project would impact recreation and tourism. As noted, there would be adverse impacts on-site

accessibility, recreational boating, and boat-based recreational fishing due to tidal flooding, sedimentation, and invasive plants. There would be adverse impacts on recreational fishing for spotted seatrout and beneficial impacts on recreational fishing for red drum.

CPRA has developed a suite of mitigation and stewardship measures to help address and offset Project impacts (see the Draft Mitigation and Stewardship Plan in Appendix R1 to the Draft EIS). In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62226

The diversion would destroy the property in which commenters have made substantial investment.

Response ID: 15750

Draft EIS Chapter 4 Section 4.13.5.3 in Socioeconomics discussed impacts of the proposed Project on property values. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitude. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The

Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62659

The proposed Project is an experiment, and it is not possible to guarantee its alleged benefits.

Response ID: 16632

The uncertainties associated with the Project's success were considered in the Draft EIS. While the benefits of the Project cannot be guaranteed, the EIS uses state-of-the-art modeling, including but not limited to the Delft3D Basinwide Model, to project the Project's beneficial and adverse impacts. These modeling projections of Project impacts include uncertainties. Following standard professional practice, model uncertainties are clearly stated in the EIS with respect to the model's quantitative results. Uncertainties are incorporated into the EIS impact conclusions and are briefly summarized in EIS Chapter 4, Section 4.1.3.3 Model Limitations and Uncertainty, and in detail in Section 8.0 Model Limitations and Uncertainties of EIS Appendix E Delft3D Modeling.

The likelihood of success of the Project was also considered in the LA TIG's Draft Restoration Plan. While recognizing the innovative nature of the proposed Project, the Restoration Plan discusses in detail the factors that would contribute to the Project's success. More specifically, Sections 3.2.1.4 (Likelihood of Success - Alternative 1) and 3.2.2.4 (Likelihood of Success - Alternatives 2-6) of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, such a sediment diversion has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Section 3.2.1.4 [Likelihood of Success - Alternative 1] of the Restoration Plan). The Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63027

Saltwater grasses and marsh would die when exposed to (or inundated by) fresh water, and would cease protecting the public.

Response ID: 16035

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS acknowledges that the fresh water transported by the diversion may result in the loss of some wetlands in the immediate outfall area due to inundation during the initial period following commencement of operations; those impacts would be offset by later marsh building in the area. While saline and brackish species are associated with salinity ranges of greater than 18 ppt and between 18 and 5 ppt, respectively (see Chapter 3, Section 3.6.1.2 in Estuarine Wetlands of the EIS), brackish marsh can fluctuate from fresh to saline conditions depending on tidal movement, and species such as *Spartina alterniflora* are common in both salt and brackish marsh (Connor and Day 1987). Salt is a stressor affecting osmosis and cell structure. Plants occurring in saline and brackish marshes have developed adaptations to either exclude uptake or excrete salt; however even salt marsh species grow better at lower salinities (Mitsch and Gosselink 2000; Teal et al. 2012). Therefore, salt and brackish marsh vegetation would not be subjected to direct mortality due to the lower salinity of transported water. Chapter 3, Section 3.6.2.1 of the EIS was revised to include additional information regarding the salinity tolerance of brackish and salt marsh vegetation.

Concern ID: 63092

Further development of the Mitigation Plan is needed for properties that would be impacted by flooding caused by Project operations. Multiple commenters made specific requests for how their property should be handled (for example, through sales or easements), while others wondered why a more detailed, “real estate plan” for impacted communities was not available.

Response ID: 16511

The Draft Mitigation and Stewardship Plan included with the Draft EIS (Appendix R1) included CPRA’s initial framework for mitigation and stewardship measures to assist property owners in these communities impacted by increased tidal flooding and to address the Project impacts of Project operations on water levels. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

CPRA states that it is interested in assisting affected communities to remain in place as long as they would like. Mitigation would include a combination of structural measures (for example, raising roads, boat houses, docks and utilities) and non-structural measures. Structural measures in CPRA’s Mitigation and Stewardship Plan are not included in CPRA’s DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

Where the proposed Project would cause increased water levels and/or increased incidence of flooding, CPRA plans to acquire the right to add and/or increase water flow on landowners’ properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner’s property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to purchasing a flowage servitude, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property (rather than a servitude) would be made on a case-by-case basis depending on the particular circumstances.

A complete listing of the mitigation and stewardship measures that CPRA would implement if the proposed Project is approved and funded is included in CPRA’s Mitigation and Stewardship Plan included in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final

Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

New Orleans, LA 70118

RE: Mid-Barataria Sediment Diversion Draft Restoration Plan 3.2 and Environmental Impact Statement

Good Afternoon,

We live at the Lake Hermitage Community, if this is build our access road and property will be under water numerous times during the year. We will have to have our dock and slab under our house raised due to increase water levels. Also our road west bayou lane will also have to be raised including but not limited to the main blacktop Lake Hermitage Road for our property to be access.

Emergency services will be unable provide us with any service during increase tides. Unless road ways are raised.

Our Federal Government just build us a new blacktop road (5 million), New Fire House (3.5million) and a new bridge (1.5 million) all will be lost.

Also communities of Lafitte, Myrtle Grove, Woodpark, Suzzie Bayou, Deer Range, Grand Bayou and Happy Jack will be effected the same.

Our salt water marsh will be destroyed along with oyster, shrimp, crabs, fish, endangered sea turtles and bottlenose dolphins will die. Recent, scientific study, said up to a third of bottlenose dolphins will die. The red tide in the Gulf of Mexico will double triple in size who knows and this will kill more sea life for years to come.

If and when this project is completed our home will not be live able. Does the U.S. Army Corps of Engineers have plans to purchase our property because we will have to relocate or raise docks, slab under house and road ways?

This 1.4 billion dollars being spend building such a small amount of land in thirty years with no hurricane protection, or buffers at such a great cost is foolish and waste of BPs monies. Monies would be better spend dredging the river (which needs to dredged to 50 feet) and pumping sand, building land and buffers to stop incoming hurricanes tidal surges.

Possible to build 100,000 acres of land and tidal surge buffers with 1.4 Billion Dollars. This would lower hurricane storm surge 5 feet or more from southern most Plaquemines Parish to New Orleans. Thus save our endangered sea turtles, seafood and the bottlenose dolphins.

This will go down in history as one of biggest environment disaster of our life time and waste of money. Kill 34% of our bottlenose dolphins, endangered sea turtles, oysters, shrimp and crabs.

We have one time to get it right. Never again will our state have the monies to build this much land at no cost to the taxpayers and save our coast.

We also have two cemeteries that will be under water, one at Lake Hermitage and other at Deer Range, Louisiana. The deceased will not rest in peace.

Sincerely,

John Bruce Gasquet

Concern ID: 61812

Commenters expressed concern that the proposed Project would have adverse water quality impacts in the Barataria Basin due to the introduction of nitrate and phosphate from the Mississippi River. Several commenters questioned whether the proposed Project would create harmful algal blooms and hypoxia in the Barataria Basin similar to the hypoxic “dead zone” in the Gulf of Mexico that exists due to nutrients in Mississippi River waters. One commenter expressed concern that the EIS does not adequately assess the potential for the proposed Project to create algal blooms and hypoxia in the basin, other than acknowledging it.

Response ID: 16425

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA’s Mississippi River/Gulf of Mexico Hypoxia Task Force “Hypoxia 101” webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone “water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen” (<https://www.epa.gov/ms-hf/northern-gulf-mexico-hypoxic-zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.>)

Dissolved oxygen concentrations associated with the Applicant’s Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project

operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.5.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section is included in Section 4.5.5.3 in Surface Water and Sediment Quality and has been added to Section 4.5.5.4.2 Applicant's Preferred Alternative of the Final EIS. Finally, the EIS acknowledges the potential for major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) if warranted, in the Barataria Basin during Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61966

The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.

Response ID: 15971

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated

Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

Concern ID: 62220

The Project would inundate access roads and properties, some of which are newly built infrastructure projects.

Response ID: 15755

Draft EIS Chapter 4, Section 4.13.5.1 (Socioeconomics, Economy, Employment, Business, and Industrial Activity, Flooding and Storm Hazards) and 4.20.4.2 Public Health and Safety, Operational Impacts, Floodplains and Tidal Flooding discussed the increased flooding impacts outside of federal levee systems, including road inundation and infrastructure damage, potentially caused by the operation of the diversion. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and/or other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. The USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62227

The diversion would flood access roads, damage vehicles, cause siltation/sludge, cause cancellation of flood insurance, inundate cemeteries, stress levees, impact provision of emergency services, and increase the cost to raise homes, slabs and wharves.

Response ID: 15820

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discusses the increased flooding impacts outside of federal levee systems, including road inundation and infrastructure damage, anticipated to be caused by the operation of the diversion. Sections 4.13.5.1.2.1 and 4.13.5.3.2.1 in Socioeconomics of the Final EIS has been updated to include potential impacts such as vehicle damage, accumulation of siltation and sludge, cemetery inundation and interruption of emergency services. Recognizing the potential for these impacts, CPRA has developed a comprehensive inventory of potentially

affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Final EIS concludes that the proposed Project would not have impact on the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent

anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62493

The proposed Project operations will flood two cemeteries in the towns of Lake Hermitage and Deer Range, Louisiana.

Response ID: 16451

The potential flooding impacts raised by the commenters were considered in the Draft EIS. According to the Louisiana State Historic Preservation Office (LA SHPO) database, the Lake Hermitage cemetery is identified as the Bieber Cemetery and the Deer Range Cemetery in Suzy Bayou is identified as the Deer Range Cemetery. As compared to the No Action Alternative, operation of the proposed Project would increase tidal flooding and storm surge in communities outside of federal levees within 20 miles of the outfall area, including the towns of Lake Hermitage and Suzie Bayou South (Deer Range) in which these cemeteries are located. Such events may result in sediment deposition (burial) and/or erosion of soils at each of these cemeteries. Chapter 4, Section 4.4.4 in Surface Water and Coastal Processes and Section 4.13.3.1 in Socioeconomics detail these impacts.

Concern ID: 62690

The proposed Project would destroy the ecosystem and its flora and fauna, including oyster, shrimp, crabs, fish, sea turtles, and dolphins.

Response ID: 16073

As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated to those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts on the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. For example, the decrease in salinity that

would occur upon initial operation of the proposed Project would result in major adverse impacts on various species (oysters, brown shrimp, bottlenose dolphins) over a relatively short period of time; however, the accumulating fresh water and sediments would create or maintain wetlands over long-term or permanent basis (that is, extending through the remainder of the 50-year period of analysis) which would benefit other commercially or recreationally important aquatic species such as white shrimp, blue crab, and Gulf menhaden, and would increase storm protection for communities north of the immediate outfall area; the Delft3D Basinwide Model projects these benefits to increase over time and to be greatest in the 2060s (see Chapter 4, Sections 4.6.5.1 in Wetland Resources and Waters of the U.S., 4.10.4.5 in Aquatic Resources, 4.11.5.2 in Marine Mammals, and 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction). As discussed in Section 4.12.2.2 Sea Turtles, the proposed Project would have negligible to minor adverse impacts on hawksbill and leatherback sea turtles, but minor to moderate adverse impacts on Kemp's ridley, green, and loggerhead sea turtles due to the potential for increased interactions between sea turtles and commercial shrimp fishing efforts, if shrimp and shrimp fishers move from mid-basin locations to locations lower in the basin or in nearshore/offshore waters (where more sea turtles would be present). However, NMFS has determined that these impacts would not jeopardize the continued existence of sea turtles (see Appendix O4 NMFS Biological Opinion of the Final EIS).

The USACE and the LA TIG are evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the LA TIG's Restoration Plan). The intended restoration of fresh water flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions in the basin. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin. The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only

accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. The LA TIG's Restoration Plan indicates that by reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Final Restoration Plan because it believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the NRDA Trustees' Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

The CPRA has revised its Mitigation and Stewardship Plan and Monitoring and Adaptive Management (MAM) Plan in response to public concerns about these impacts. See Appendices R1 and R2 to the Final EIS for more information.

Concern ID: 62783

Commenters noted that the cost of designing and building the proposed MBSD Project is too high for the small amount of land anticipated to be built.

Response ID: 16365

The commenter's opposition to the cost of the proposed Project is noted. Under NEPA, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that the permit applicant has conducted its own economic evaluation of a proposed project. Consequently, a cost-benefit analysis is not relevant to USACE's permitting decisions. As part of evaluating the proposed Project, the LA TIG considered the costs associated with developing, constructing, and managing the Applicant's Preferred Alternative consistent with the Restoration Plan alternatives evaluation criteria in 15 CFR §990.54. This discussion is in Chapter 3, Section 3.2.1.2 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan.

Concern ID: 62951

CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.

Response ID: 16711

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project

effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62986

The Project would drive decreases in salinity that would reduce the overall health, survival, and reproduction of bottlenose dolphins that reside in the Barataria Basin, a species that was negatively affected by the Deepwater Horizon oil spill (NMFS, 2013). Some commenters felt that because of this, the Project should either not move forward or its operation should be altered.

National Marine Fisheries Service (NMFS). 2013. Roy Crabtree (NMFS) to Elizabeth Davoli (CPRA). <https://s3.documentcloud.org/documents/726710/national-marine-fisheries-service-comments-on.pdf>

Response ID: 16701

The concerns raised by the commenters about the projected decreases in salinity and resulting effects on Barataria Bay dolphins were considered in the Draft EIS. More specifically, Chapter 4, Section 4.11.5.2 in Marine Mammals of the EIS acknowledges that the proposed Project would likely have significant, adverse impacts to Barataria Basin dolphins, a species that suffered significant impacts from the DWH oil spill. This section also discusses the physiological changes caused by exposure to low-salinity water, the duration of those changes that leads to mortality, and the anticipated mortality of a large portion of the dolphin population in the Barataria Basin within the first decade. These sections of the EIS provide a more in-depth analysis of potential impacts to dolphins than the letter cited by the commenter.

The concerns raised by the commenters were also considered in the LA TIG's Draft Restoration Plan (see Section 3.2.1.5 [Collateral Injury]); the Final Restoration Plan has been edited consistent with changes made to the Final EIS and see below regarding new, related content included in Appendix R.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources, like dolphins, that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational

users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible (if it is possible), the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins in Louisiana (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included

in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63096

Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).

Response ID: 16699

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the

funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63110

The commenters are concerned with the impacts that this proposed Project would have on threatened and endangered species in the area and indicated that there are

likely to be minor to moderate adverse effects for the Kemp's ridley, loggerhead and green sea turtles, and the pallid sturgeon in the area.

Response ID: 16253

The adverse effects on these species from the proposed Project were further evaluated by the USFWS (pallid sturgeon) and the NMFS (sea turtles in Barataria Basin waters) in their Biological Opinions; the respective Biological Opinions have been included in Appendices O3 and O4 of the Final EIS. Both agencies have determined that the construction and operation of the proposed Project would not be likely to jeopardize the continued existence of these species. NMFS has authorized a take of up to 783 Kemp's ridley, loggerhead, and green sea turtles (total) per year (including up to 57 mortalities per year). The USFWS has authorized the loss (by death or serious injury) of 48 pallid sturgeon per year.

Correspondence ID: 45

Theodore Mackenroth

Lets get to the bottom line of this diversion. They are only building this diversion to save NEW ORLEANS from being water front property, to line the pockets of the politicians with money, to give away has much money in an attempt to show you care, destroy the seafood industry in our area, and destroy more land then you will build in my life time.

If you were concerned about saving the land, then why haven't you narrowed Bay Long and 4 Bayou Pass? If you slow the tide down then you save land. This would help more then a diversion that will destroy land. You could build islands in Barataria Bay and Bay Long to divert the tide and slow it down. You could dredge the main bayou to close off the water that cut across the bayous and have tides going back down main bayous like it did years ago. Close the pipe lines that the oil industry cut thru all of the marsh. There are a lot of different projects that could be done before you put this diversion in and destroy land.

Don't understand how everyone who lives, works, and enjoys this area is telling you not to do the diversion doesn't have more say so then someone behind a desk. Don't care how many engineers you have unless they lived this life they have no idea what is going on. Models don't cover everything. What may work on paper doesn't always work in real life. Weather is a real factor in all of this and you can not predict that.

You had a great model to look at. Mr. Go It was great for shipping and some fishing. Took out acres of cypress and marsh where people used to make a living in. Then a storm comes thru and you spend million to close a mistake after it flooded New Orleans. Didn't care about St. Bernard or Plaquemines JUST NEW ORLEANS..

Well what do you think is going to happen with this diversion. You are going to blow a hole all the way from Myrtel Grove thru Barataria into the gulf. You claim that we will have protection from storms with the new levees but what will stop a surge of water from a storm? Just like Mr. Go we will be flooded. If we are lucky the storm surge won't take out your structure on the river and send the river in a new direction.

For the people that make a living out here. You say that you have money to help them. We don't want hand outs or charity. We want out lively hoods in tact so we can live and enjoy our heritage. We are proud people. We want to fend for our selves. Not government buy outs.

With the diversion you claim our water will rise. We are already fighting high water. We spend a lot of money to raise our lands to stay a head of the water. Are you planning to help us raise our land and homes to beat the rising water that you will cause? A statement I keep hearing is that there are only a few homes that have homestead exemption in our area. This is bullshit. I am a part time commercial crabber. I live here on Martin Lane over 50% of my time. My wife lives at our other home which has homestead exemption. There are many of us that have 2 homes. We have to claim homestead exemption at our primary home. Because we don't claim exemption at our second home we pay full property value. Which means we pay more in taxes. Why doesn't this mean anything to you? We invested a lot of money in our homes and should deserve the help that everyone gets to elevate our homes. Especially since you are going to raise the water elevation and flood us more.

How can you sleep at night and believe the bullshit that you are handing us. The facts are not there. You can make up anything to make it look good. Knowing that you are going to destroy

are seafood industry. Look at the East bank of Plaquemines. There was a great oyster industry. Where is it now?

I understand you are planning a big diversion on the east bank. You would build another big diversion before you have proof that this one will work? Again you don't care what happen to us or Plaquemines Parish. It's all about NEW ORLEANS.

Everyone has heard that you have plans to stop spending money in Plaquemines if we don't agree on the diversion. This is normally considered blackmail. However I understand if the government does this, it doesn't fit the description of blackmail.

I hope I am dead before a storm destroys our area because this diversion. I just hope my family lives thru it. Would like to see my grand kids and great grand kids enjoy the life I have had living here. I could go on and on about this but the chances of anyone listening to this is slim to none. You have probably quit reading this letter before you got to this point. If you haven't then I hope you think about all this that you will destroy.

This project is like the Belle Chasse Bridge. We don't have a choice about it. We may need one but there should have been many projects done before the new bridge. During construction of the bridge it will destroy Plaquemines. The only difference is that we may see benefit from bridge in my life time. Can not say that about the diversion.

Concern ID: 61703

Locals who live and work in the affected area and would be adversely impacted by the proposed Project are disregarded by decision makers for the Project.

Response ID: 15733

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan. Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration Plan and the Draft EIS in its decision-making process. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project. For a summary of public outreach efforts related to the Draft EIS refer to Chapter 7 Public Involvement of the Final EIS and for restoration planning see Section 1.8 of the LA TIG's Final Restoration Plan.

CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area over the past several years. In addition, since the release of the Draft EIS, CPRA has engaged the public through numerous meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61753

Commenter is concerned that the government would stop spending money in Plaquemines Parish if the parish doesn't support the proposed Project.

Response ID: 15889

USACE is neither a proponent nor an opponent of the proposed MBSD Project. USACE's ongoing and future work in Plaquemines Parish has no connection to this Section 10/404/408 permit review.

CPRA and LA TIG decisions regarding funding for restoration projects, including in Plaquemines Parish, would be handled separately from the decisions related to the proposed MBSD Project. The LA TIG has previously funded restoration projects in Plaquemines Parish through the Natural Resource Damage restoration planning process, and would consider future projects based on the same OPA NRDA criteria that has been used in the past. CPRA's Coastal Master Plan includes both ecosystem restoration and flood protection projects in Plaquemines Parish.

Concern ID: 61754

Commenter expressed the view that decision makers prioritize the proposed Project benefits for New Orleans and disregard how the Project would impact Plaquemines Parish residents.

Response ID: 15890

As discussed throughout Chapter 4 Environmental Consequences of the EIS, operation of the proposed Project would have various beneficial (and adverse) impacts throughout the

Barataria Basin that would not be restricted to those experienced by the greater New Orleans area. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. Further, based on the evaluation in the EIS and its OPA evaluation, the LA TIG considers the impacts of the proposed Project, both beneficial and negative to both the environment and the community, including Plaquemines Parish.

Concern ID: 61885

Consider the alternative of reducing the size of Bay Long Pass and 4 Bayou Pass to slow the tide water and save land instead of implementing the proposed MBSD Project.

Response ID: 15981

This alternative as presented, specifically reducing or narrowing the passes, would not meet the goals and objectives as stated in the purpose and need as described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Other similar restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan, which will be updated in 2023, and by the LA TIG through Natural Resource Damage restoration planning.

Concern ID: 67234

Part of the purpose of the diversion is to spend money on the problem of the sinking coast and to line the pockets of politicians.

Response ID: 16954

The purpose of the proposed Project is discussed in Chapter 1, Section 1.4 Purpose and Need of the EIS. As stated in Chapter 4, Section 4.13 Socioeconomics, total construction expenditures (spending) during construction of the proposed Project were estimated in the Draft EIS to be \$1.309 billion under the Applicant's Preferred Alternative, of which 17 percent would be spent during the design phase, and 83 percent would be spent during the construction phase (2020 dollars) and would take approximately 5 years. These costs are subject to adjustment prior to the start of construction if the Project is permitted and funded. The spending that construction would generate is anticipated to benefit the region and the area. Assuming design and construction occur over a 10-year period, the proposed Project, including indirect and induced impacts, would support employment that would be equivalent to 29 percent of the workforce in Plaquemines Parish. However, although a portion of expenditures and employment would occur in the parish, much of the spending and employment supported by the proposed Project is anticipated to be distributed throughout the Project area. Regardless, the employment and expenditures on the proposed Project would be substantial and represent a major benefit.

Concern ID: 62009

The negative socioeconomic consequences would devastate southeast Louisiana, destroy people's livelihoods, displace people living near the diversion, and destroy property in the areas impacted by the proposed MBSD Project.

Response ID: 16207

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana, including impacts on population, property values, and community cohesion. As noted in these sections, the proposed Project would have both beneficial and adverse socioeconomic impacts on the people and communities within the Project area. Minor to moderate, permanent adverse socioeconomic impacts are expected to occur near the immediate outfall area outside of flood protection. Minor to moderate, permanent, beneficial socioeconomic impacts are expected to occur in the west bank New Orleans area north of the diversion. Moderate to major, beneficial, temporary impacts from job creation and economic activity in the proposed Project area are anticipated. In addition, the Socioeconomics Technical Report in Appendix H1 provides additional details on these projected effects.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the DWH oil spill.

The commenters' concern regarding the potential impacts of the diversion were considered by CPRA and the LA TIG in developing the Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included mitigation to address and offset some of the projected impacts of the Project on fisheries and surrounding communities outside levee protection including providing structural mitigation and stewardship measures for increased water levels that are projected to result due to the Project, such as raising roads or improving bulkheads. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

In communities south of the Project site outside of federal levee protection where the proposed Project is projected to cause increased water levels, CPRA plans to take one of two approaches. In Myrtle Grove, CPRA is planning to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision. By improving this bulkhead, CPRA would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions without the Project. See Table 1 in the Final Mitigation and Stewardship Plan for more details. CPRA plans to acquire a temporary right-of-way to permit improvement of the bulkhead, voluntarily or through eminent domain if necessary, from the property owners in the Myrtle Grove Marina Estates Subdivision.

In other communities south of the Project site outside of federal levee protection, from Woodpark south to the communities of Grand Bayou and Happy Jack, CPRA plans to elevate the portions of public roads outside of levee protection that provide access to each of these communities. In addition, CPRA plans to acquire the right to add and/or increase water flow

on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62071

The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.

Response ID: 16241

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-

based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62225

Plaquemines Parish could experience flooding from the diversion similar to flooding due to the Mississippi River Gulf Outlet. Commenter asked if the diversion would be closed if it causes such flooding.

Response ID: 15758

As described in Draft EIS Chapter 2, Section 2.8 Action Alternatives Carried Forward for Detailed Analysis, the proposed Project design includes earthen guide levees that would be constructed along both sides of the diversion conveyance channel. The portion of the guide levees on the protected side of the New Orleans to Venice Levee system (NOV-NF-W-05a.1) would be designed and built as hurricane and storm damage risk reduction levees against storm surges that may enter the diversion channel. A gated control structure would also be built on the Mississippi River side of the conveyance channel, and the gate would be closed prior to and during storm events. Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discusses the increased flooding impacts potentially caused by the operation of the diversion.

CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water

levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62311

Weather is a major factor in how the diversion impacts communities, and the weather cannot be predicted.

Response ID: 15817

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties were incorporated into the EIS impact conclusions and are briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 Model Limitations and Uncertainty, and in detail in Appendix E Delft3D Modeling, Section 8.0 Model Limitations and Uncertainties.

Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or as predictions of actual future conditions. The outputs are instead used to compare the degree of difference between the impacts projected for each alternative as compared to the model outputs projecting the changes that would occur for the No Action Alternative.

Concern ID: 62793

The proposed Project is only being built to save New Orleans from being waterfront property.

Response ID: 16374

The commenter's opposition to the proposed Project is noted. As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the proposed Project is to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts. As discussed throughout Chapter 4 Environmental Consequences of the EIS, operation of the proposed Project would have various beneficial (and adverse) impacts throughout the Barataria Basin that would not be restricted to those experienced by the greater New Orleans area. Fifty years after the start of operations, the proposed Project is projected to have built or maintained 20.9 square miles of land in the vicinity of Myrtle Grove and Ironton. Communities to the north of that area are projected to benefit from reduced hurricane and storm surge. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62951

CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.

Response ID: 16711

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove

Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department

of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 64184

Commenter is concerned with the planning and construction of another big diversion on the east bank of the Mississippi River before there is proof that the proposed MBSD Project would work.

Response ID: 16401

The concern regarding the future success of the proposed Project is noted. The likelihood of success of the proposed Project was discussed in the LA TIG's Draft Restoration Plan. While recognizing the innovative nature of the proposed Project, the LA TIG's Restoration Plan discusses in detail the factors that would contribute to the Project's success. More specifically, Sections 3.2.1.4 (Likelihood of Success - Alternative 1) and 3.2.2.4 (Likelihood of Success - Alternatives 2-6) address the likelihood of success of the proposed Project and other action alternatives considered by the LA TIG in its Restoration Plan. In addition, such a sediment diversion has been extensively studied over several decades with the objective of designing and operating a diversion in the vicinity of the proposed Project to provide a combination of land building and ecosystem benefits (see Section 3.2.1.4 [Likelihood of Success - Alternative 1] of the LA TIG's Restoration Plan). The proposed Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management [MAM] Plan, Appendix R2 of the EIS). The Mid-Breton Sediment Diversion Project is not the focus of this EIS; however, the potential cumulative impacts of the two diversions are addressed in Chapter 4, Section 4.25 Cumulative Impacts of the EIS and no related edits to the Final EIS have been made.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in

the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:46

John Mudge

I am writing to voice my concern and disapproval of the MBSD being proposed in Plaquemines Parish, La. I am a property owner - [REDACTED]. We have owned a fishing camp there since 1981. We have had many family gatherings there enjoying the surrounding wetlands, bays and waterways. We have made hundreds of fishing trips and have enjoyed the fish caught with our family and friends. We are not commercial fishers, just private property owners.

We are opposed to this project for many reasons, but primarily on the effects that it will have on our local recreational & commercial fishing. We have many friends who make a living on the area waters who would lose their livelihood with the destruction of this diversion. Most are still trying to overcome the effects of the oil spill many years ago. Many have lost businesses and even more have had to leave the parish. Adding the diversion would literally wipe out the way of living here for so many.

Also, the effects on the primary road leading to my camp would be detrimental to our enjoyment and access to our property. It is unfair for the federal government to make these changes without regard to the resident being affected. Who will restore our road when it is washed away from High tides? Who will restore our docks when they are under water and washed away. How will we access our camp when it is surrounded by water? Who will compensate me for the lost value of my waterfront property?

Believe me we are aware of the land loss happening from coastal erosion. However, there has to be another way to mitigate this loss without destroying people's lives, and property going forward. These are concerns that MUST be looked at BEFORE going forward with this project. Please consider the livelihood of people and the property this will destroy.

Sincerely, John & Susan Mudge

Concern ID: 61905

Commenters expressed that residents' way of life including living off of and recreating in the water would be impacted by an influx of fresh water due to the MBSD Project.

Response ID: 16235

The issues raised by the commenters were considered in the Draft EIS. As described in the Existing Conditions in Chapter 3, Section 3.16 Recreation and Tourism, as well as Appendix H1 Socioeconomics Technical Report, the Draft EIS acknowledges the importance of recreational use in the region, describing many types of outdoor recreational activities, including fishing, hunting, boating, wildlife viewing, and general shoreline use, among others. The EIS further acknowledges that extensive estuarine and freshwater wetlands provide habitat for many kinds of fish, birds, reptiles, and mammals that are an integral component of recreation in the region. The evaluation of environmental changes in the basin under the No Action Alternative shows that the abundance of target recreational species, including spotted seatrout and red drum, would decline over time. Access to recreational boating sites would also increase from negligible impacts in the early decades to major, adverse impacts in the later decades, leading to decreases in recreational use in the southern portions of the basin even without the Project. Chapter 4, Sections 4.16.4.2 and 4.16.5.2 in Recreation and Tourism describe how changes in the amount of fresh water due to the MBSD Project would impact recreation and tourism. As noted, there would be adverse impacts on-site

accessibility, recreational boating, and boat-based recreational fishing due to tidal flooding, sedimentation, and invasive plants. There would be adverse impacts on recreational fishing for spotted seatrout and beneficial impacts on recreational fishing for red drum.

CPRA has developed a suite of mitigation and stewardship measures to help address and offset Project impacts (see the Draft Mitigation and Stewardship Plan in Appendix R1 to the Draft EIS). In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62009

The negative socioeconomic consequences would devastate southeast Louisiana, destroy people's livelihoods, displace people living near the diversion, and destroy property in the areas impacted by the proposed MBSD Project.

Response ID: 16207

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics, discusses impacts of the proposed Project on the economy of Louisiana, including impacts on population, property values, and community cohesion. As noted in these sections, the proposed Project would have both beneficial and adverse socioeconomic impacts on the people and communities within the Project area. Minor to moderate, permanent adverse socioeconomic impacts are expected to occur near the immediate outfall area outside of flood protection. Minor to moderate, permanent, beneficial socioeconomic impacts are expected to occur in the west bank New Orleans area north of the diversion. Moderate to major, beneficial, temporary impacts from job creation and economic activity in the proposed Project area are anticipated. In addition, the Socioeconomics Technical Report in Appendix H1 provides additional details on these projected effects.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana. While recognizing the risks for collateral injury, the LA TIG believes the net benefits of the proposed Project meet OPA's requirement of restoration, rehabilitation, replacement, or acquisition of the equivalent, of the natural resources injured by the DWH oil spill.

The commenters' concern regarding the potential impacts of the diversion were considered by CPRA and the LA TIG in developing the Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. The Mitigation and Stewardship Plan issued with the Draft EIS included mitigation to address and offset some of the projected impacts of the Project on fisheries and surrounding communities outside levee protection including providing structural mitigation and stewardship measures for increased water levels that are projected to result due to the Project, such as raising roads or improving bulkheads. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

In communities south of the Project site outside of federal levee protection where the proposed Project is projected to cause increased water levels, CPRA plans to take one of two approaches. In Myrtle Grove, CPRA is planning to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision. By improving this bulkhead, CPRA would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions without the Project. See Table 1 in the Final Mitigation and Stewardship Plan for more details. CPRA plans to acquire a temporary right-of-way to permit improvement of the

bulkhead, voluntarily or through eminent domain if necessary, from the property owners in the Myrtle Grove Marina Estates Subdivision.

In other communities south of the Project site outside of federal levee protection, from Woodpark south to the communities of Grand Bayou and Happy Jack, CPRA plans to elevate the portions of public roads outside of levee protection that provide access to each of these communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions,

would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62077

The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.

Response ID: 16242

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)

- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62951

CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.

Response ID: 16711

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these

servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:47

Randall Rush

To Whom it May Concern,

Please take notice that this proposed Diversion project in lower Plaquemines Parish planned in the near future has some good planned ideas for saving the coastal areas of Southeast Louisiana, but doesn't appear to account for the major disruption that will impact the local communities that rely on fisheries for making a living along with all of the support companies and individual's that will be impacted down the food chain.

I have owned property in this area for over 30 years and before that I recreationally fished for Crabs, Shrimp and all of the local fish with my Father since the early 1970's while I was only 7 years old.

I have watched the enormous amount of land wash away and have also watched the mining and drilling operations being performed for over 50 years with no real regulatory agencies taking action to provide for the replacement of land that has caused the land to sink and wash away. Due to the many years of operations from these activities, this in a huge part is why the land has sunk and washed away. If the companies that participated in these activities would have been forced to replace land as it performed their operations the land mass would be in much better shape today and not require so much of a drastic, damaging process of that with the proposed Diversion. I would hope that if this were known about these operations 40 to 60 years ago that somewhere during this time frame the proper regulatory agencies would have taken action to try and slow this land from sinking and washing away by using the same pumping process that should be continued now in lieu of the Diversion, but increasing it by at least 10 fold.

I bring this up to propose not only continuing the pumping of the sand from under the waters to place the land back in place, but to also increase this process by ten fold to make the impact more immediate and a much more definitive outcome than the proposed Diversion. This would immediately impact the livelihood of so many people in a positive manner. If the funds were appropriated in the proper manner this could create land in a more immediate process unlike the proposed Diversion that would only possibly work over a 50 - 100 year time span and could possibly be destroyed by yearly Hurricanes damaging the Diversion process along with extending the whole process by many years without any certain outcome as pumping to make land masses would.

In closing I really doubt that anyone will listen to our words or thought's on this matter, but in our local community we are hoping that we can at least see funding to raise our only Road that gives us access to over 100 properties. We request for this operation provide funding for the raising of our land and houses since the projected higher water level's created by the Diversion will certainly impact our community. With the higher water levels without funding to raise the land we will also realize a drastic drop of property values and see our Flood and Homeowners Insurance increase to levels that we will not be able to afford.

Thanking you in advance for your attention and thoughts regarding this matter.

Sincerely,

Randall C Rush

Concern ID: 61727

One major cause for the loss of wetlands over the last 50 or 60 years is mining and drilling operations that were not required by regulatory agencies to replace the marsh loss they caused. So money from the oil and gas industries should be allocated for continued restoration efforts.

Response ID: 16027

The impacts of the oil and gas industry on wetland loss in the Barataria Basin were described in the Draft EIS. This EIS serves as the environmental review required by NEPA to inform USACE's decisions on the Section 10/404 permit and Section 408 permission and the LA TIG's OPA decision regarding funding the construction of the proposed MBSD Project via damages paid by BP following the DWH oil spill (see Section 1.6.1 The OPA and DWH NRDA Decisions of the EIS). USACE requires compensatory mitigation in the form of replacement habitat for its Section 10/404 permits (including those involving oil and gas exploration and production) that will result in wetland losses.

Concern ID: 61966

The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.

Response ID: 15971

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the

Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

Concern ID: 62077

The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.

Response ID: 16242

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS

acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as

conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62951

CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.

Response ID: 16711

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations.

The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review,

Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:48

Michael (Mike) Ford

I have been a camp/second home owner in Happy Jack La. for 20 years. Let me first say I appreciate the opportunity to comment although it seems minds are made up and this is just a feel good thing on your part.

First I am against the Mid Barataria Diversion because I believe more harm than good will come of it although I believe something needs to be done about our coast. In this day with all the technology there has to be a way to build marsh and not hurt our seafood and fish population.

Second since this appears to be a done deal, you must raise our roads so we can get to our homes / camps. Martin Lane is the road I am on but there are many that will be effected.

My final concern is the sediment causing the main waterways to be too shallow to pass through with our boats to get to any place left that I might catch a fish

Please consider us little people in making your dicisions

Mike Ford

Concern ID: 62010

Sediment transported by the diversion into the basin would cause the main waterways to have increased shoaling, become too shallow to pass through, and would require dredging in order to access personal properties. This plan should address the potential loss of access for homes, camps, and businesses due to the increased shoaling.

Response ID: 16208

The impacts raised by the commenters were considered in the Draft EIS; therefore, no related edits have been made to the Final EIS. The EIS describes impacts on marine transportation and maintenance dredging in Chapter 4, 4.21 Navigation. This section also describes potential impacts on access due to delays when dredging. In addition, refer to Section 4.13 Socioeconomics for a discussion of socioeconomic impacts due to potential sedimentation in Barataria Basin navigation channels and canals. The proposed Project would have moderate, intermittent but permanent, adverse impacts on marine traffic efficiency and safety for shallow-draft vessels. The proposed Project would also cause minor to moderate, permanent, adverse impacts in dredging requirements for portions of the Mississippi River Navigation Channel and the birdfoot delta due to Project-induced changes to typical shoaling patterns and locations. As stated in Chapter 4, Section 4.21 Navigation, the USACE would continue to maintain federal navigation channels in the proposed Project area during Project operations. In acknowledgement of commenters' concerns regarding sediment and shoaling impacting navigation, the Mitigation and Stewardship Plan in Appendix R1 in the Final EIS includes measures to mitigate impacts on navigation in the basin resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62780

Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.

Response ID: 16362

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects

without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62781

Although some form of coastal restoration is warranted and necessary for the long-term health of the Barataria Basin, the proposed Project is not the solution.

Response ID: 16363

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 2 Alternatives of the Draft EIS, an alternatives analysis was conducted to identify viable alternatives for the proposed action that would meet the proposed Project's stated purpose and need, as identified in Chapter 1, Section 1.4 Purpose and Need. Alternatives considered, but eliminated from consideration were summarized in Table 2.6-1. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 62951

CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.

Response ID: 16711

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to

comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:49

Edward Flanagan

With the past hurricane seasons resulting in land lost in the Barataria Basin the tides come in much quicker with south winds causing higher tidal surges on our property. With the diversion raising the water levels in the Lake Hermitage area combined with the higher tidal surges our property will be in flood water the majority of the time. We currently have the property up for sale but with increased flooding the potential for selling this property will be unlikely. Thank you for allowing us the opportunity to submit our comments.

Concern ID: 62013

The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.

Response ID: 16210

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in

the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62224

Communities like Happy Jack, Lake Hermitage and Myrtle Grove, some of which have homes that are not above the new base flood elevation, already experience some degree of flooding which would be made worse by the diversion. This would affect the ability of residents to access and enjoy their homes and communities.

Response ID: 15757

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discuss the anticipated increased flooding impacts outside of federal levee systems to be caused by the operation of the diversion. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes, which would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These

mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Luanne Neeb

I have a home on Martin Lane and am concerned about the impacts of this project. My husband and I are retired, and while this is not our primary residence, we spend about 50% of our time at this residence. We are being told that the water levels will rise 1/2 foot to 1 foot. This will cause a significant impact on homes like mine (below flood level) and on our access to our homes. I have been a homeowner here for almost 8 years; I have made improvements since my purchase of over \$30,000; I pay property taxes, and my home is covered by both homeowners and flood insurance, at significant cost, to protect my property.

My specific concerns are these:

1. Access due to road flooding
2. Damage to vehicles
3. Cancellation of flood insurance
4. Increased expense to raise home and slab
5. Increased expense to raise wharves
6. Decrease in property value
7. Inability to sell the property due to frequent flooding

Will funds be available to raise our only access to our home on Martin Lane? Will funds be available to raise our homes and wharves? Will funds be available to buy us out at current market rates?

I am also concerned for local commercial and sport fishermen and the environmental impacts on our area. I have witnessed coastal erosion during the 8 years I have owned this home, and fear this project will make things worse. I believe this project, in an effort to restore wetlands in one area, is putting our area at risk!

I appreciate the opportunity to provide my input on this issue and look forward to getting more information regarding the project and its impact to the homeowners of Martin Lane, Port Sulphur, LA. Thank you. Luanne and Dave Neeb

Concern ID: 62013

The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.

Response ID: 16210

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie

Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62077

The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.

Response ID: 16242

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact

determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62226

The diversion would destroy the property in which commenters have made substantial investment.

Response ID: 15750

Draft EIS Chapter 4 Section 4.13.5.3 in Socioeconomics discussed impacts of the proposed Project on property values. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitude. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62227

The diversion would flood access roads, damage vehicles, cause siltation/sludge, cause cancellation of flood insurance, inundate cemeteries, stress levees, impact provision of emergency services, and increase the cost to raise homes, slabs and wharves.

Response ID: 15820

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discusses the increased flooding impacts outside of federal levee systems, including

road inundation and infrastructure damage, anticipated to be caused by the operation of the diversion. Sections 4.13.5.1.2.1 and 4.13.5.3.2.1 in Socioeconomics of the Final EIS has been updated to include potential impacts such as vehicle damage, accumulation of siltation and sludge, cemetery inundation and interruption of emergency services. Recognizing the potential for these impacts, CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Final EIS concludes that the proposed Project would not have impact on the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review,

Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62324

Commenter appreciated the opportunity to provide input on this issue and looks forward to getting more information regarding the Project and its impact to the homeowners of Martin Lane, Port Sulphur, LA.

Response ID: 15776

The Draft EIS provides information regarding potential impacts to communities such as Port Sulphur, particularly in Section 4.13 Socioeconomics and Section 4.20 Public Health and Safety. Since issuance of the Draft EIS for public comment, CPRA has further developed its Mitigation and Stewardship Plan, which describes planned mitigation and stewardship measures for homeowners impacted by the proposed Project. Final EIS Appendix R1 contains the revised Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive

management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. The USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62951

CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.

Response ID: 16711

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final

EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Chris Cook

I am writing as a member of the public and resident of New Orleans. Before the river was engineered in response to the 1927 flood, Louisiana used to grow every spring and New Orleans enjoyed an immense buffer protecting it from storms. Restoring this wetland buffer is key to the city's survival.

Southeast Louisiana is already an engineered space, one that is not working for us. Let us engineer it for longevity. Please approve this diversion.

Concern ID: 63351

Before the river was engineered in response to the 1927 flood, Louisiana used to grow every spring and New Orleans enjoyed an immense buffer protecting it from storms. Restoring this wetland buffer is key to the city's survival. Southeast Louisiana is already an engineered space, but one that is not working for us. Let us engineer it for longevity. Please approve this diversion.

Response ID: 16313

The commenter's support for the proposed Project is noted. Chapter 2, Section 2.2.1 Define Project Objectives of the Draft EIS explained that the proposed Project is intended to reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin. This is also discussed in Chapter 3, Section 3.2.1.1 (Alternative 1 Description) of the LA TIG's Restoration Plan.

Correspondence ID:52

Craig Heyl

I have been a property owner for several years. I strongly oppose this diversion plan since it greatly impact my land and structure. The increase of 1.6 feet will put my property underwater.

Concern ID: 62227

The diversion would flood access roads, damage vehicles, cause siltation/sludge, cause cancellation of flood insurance, inundate cemeteries, stress levees, impact provision of emergency services, and increase the cost to raise homes, slabs and wharves.

Response ID: 15820

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discusses the increased flooding impacts outside of federal levee systems, including road inundation and infrastructure damage, anticipated to be caused by the operation of the diversion. Sections 4.13.5.1.2.1 and 4.13.5.3.2.1 in Socioeconomics of the Final EIS has been updated to include potential impacts such as vehicle damage, accumulation of siltation and sludge, cemetery inundation and interruption of emergency services. Recognizing the potential for these impacts, CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations.

The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Final EIS concludes that the proposed Project would not have impact on the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62778

Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on affected communities from flooding impacts, access issues, and cultural changes.

Response ID: 16360

The commenter's opposition to the proposed Project is noted. The Draft EIS discussed impacts to the local communities from the proposed Project in Chapter 4, Section 4.13 Socioeconomics including Community Cohesion in Section 4.13.5.6. Consistent with the

concern of the commenter, the Draft EIS did find potential minor to moderate, long-term adverse impacts on community cohesion from the proposed Project compared to the No Action Alternative. In addition, Sections 4.13 Socioeconomics and 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction discuss the increased flooding impacts, including potential flooding of homes outside of federal levee systems potentially caused by the operation of the diversion.

In Myrtle Grove, CPRA would improve the bulkhead around the Myrtle Grove Marina Estates Subdivision to reduce the incidence of tidal flooding in that community. In other communities from Woodpark to Happy Jack south of the Project site outside levee protection, CPRA would elevate the roadways and make other infrastructure improvements to maintain access and utilities within those communities. In addition, CPRA plans to acquire Project servitudes from landowners in these communities (Woodpark, Deer Range, Suzie Bayou, Hermitage, Happy Jack and Grand Bayou) whose property is projected to be impacted by increased water levels due to Project operations. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would compensate those landowners for the Project servitude. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. These property owners would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently

contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:53

Commenter

Reconnecting the River is a foolish plan. In 1991 Caernarvon diversion was created and run as a delta building project. No regard was given for the outcome of diverting nutrient rich freshwater into a brackish marsh. The result was the plants stopped rooting and the first major storm Katrina rolled up 40 square miles of produced wetland.

Reasons not to reconnect the River:

- 1) High nitrate and phosphate levels in the Mississippi River.
- 2) Only 1/4 of historical sediment that built the wetlands is currently in the Mississippi River.
- 3) Loss of highly valuable shrimp, oyster, crab and finfish.
- 4) Change of estuary system to delta building system for 25% of Louisiana seafood productivity zone.
- 5) Loss of the coastal community of Jean Lafitte.
- 6) Loss of the vacation island of Grand Isle, Louisiana.
- 7) Loss of Atlantic Bottle Nose Dolphin population in Barataria estuary.
- 8) Introduction of invasive species to Barataria estuary. Silver Carp, Zebra Mollusk, Hyacinth, Giant Salvinia, and freshwater pathogens.
- 9) Loss of larval recruitment of shrimp, oyster, crab and essential finfish.
- 10) Diversion outlet channels forming hurricane storm surge super highway for Westbank New Orleans. Effect not unlike MRGO in eastern St Bernard Parish.
- 11) Indirect financial impact of surrounding communities that support coastal community. Loss of community resiliency and sustainability.
- 12) Loss of 25% of Louisiana shrimp, oyster, crab and finfish production on tourist economy of the City of New Orleans.
- 13) Loss of 25%+ of Louisiana sportfishing industry most closely located to Louisianas major metropolitan areas of Jefferson and Orleans parishes.
- 14) Continued cost for bayside maintenance of diversion flood walls/channels.
- 15) Louisiana uncontrolled ambition to reconnect the River magnifying impacts (1-14) via uncontrolled Mardi Gras Pass, Maurepas Diversion, Caernarvon Diversion.
- 16) Use of flawed data from activist scientist and total disregard of coastal community in the past operation of Caernarvon Diversion.

Please accept this statement as comments on the proposed Mid Barataria Diversion.

-Concerned Citizen

Concern ID: 62983

There will be ongoing and continuing costs to maintain the structure. Will there be sufficient funds to maintain the Project into the future? Commenters questioned who would have responsibility for the Project's maintenance throughout its operation.

Response ID: 16621

As the Project Implementing Trustee, CPRA would ensure that there is sufficient funding to operate and maintain the Project into the future. Roles and responsibilities regarding the Project are set forth in the EIS in Sections 2 and 3 of Appendix R2 Monitoring and Adaptive Management Plan. CPRA has primary responsibility for the operations, maintenance, and monitoring of the Project.

Concern ID: 61707

Commenter is concerned that adverse impacts on coastal communities would be disregarded when operating the proposed MBSD diversion, similar to how coastal communities were disregarded in past operation of the Caernarvon Diversion.

Response ID: 15734

Public input is an integral part of the NEPA process, the OPA process, and the DWH oil spill restoration planning effort. USACE and the LA TIG undertook a coordinated and concurrent public review process for the EIS and the LA TIG's Restoration Plan. Allowing submission of comments on either document to the same locations provided commenters a "one-stop shop" and was done to reduce confusion by commenters about where to direct their comments regarding the MBSD Project. Additionally, this ensured the LA TIG reviewed and considered all relevant comments to both the Restoration Plan and the Draft EIS in its decision-making process. All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project.

CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area over the past several years. In addition, since the release of the Draft EIS, CPRA has engaged the public through numerous meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts. For a summary of public outreach efforts related to restoration planning see Section 1.8 of the LA TIG's Restoration Plan.

CPRA would operate the proposed MBSD Project as described in their Operations Plan. See Appendix F2, Preliminary Operations Plan in the Final EIS. In addition, see Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments,

perspectives, and insights on the annual operations plans. The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures, except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61707a

Commenter is concerned that adverse impacts on coastal habitats are being disregarded and that adverse impacts similar to those associated with the Caernarvon Diversion would occur.

Response ID: 15734a

Chapter 4 of the EIS contains a summary of the impacts that the Project is anticipated to have on coastal habitats. The commenter's concern regarding the effects of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the Caernarvon Diversion is available in Appendix U of the Final EIS.

Concern ID: 61782

Commenters expressed concern that there's not enough sediment in the river to achieve wetland and land creation goals of the proposed Project.

Response ID: 16412

The commenter's concerns regarding the sediment load of the river and whether the river carries sufficient sediment to achieve the land projected to be built during diversion operation were considered in the Draft EIS. The Mississippi River carries much less sediment than it did in the past. It still carries a massive sediment load, but not as massive as before. As

explained in Chapter 3, Section 3.4.2.5 Sediment Transport, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes. Quantifying the relative contributions of multiple factors to the diminished sediment load is beyond the scope of the Draft EIS. The Draft EIS (Appendix E Delft3D Modeling, Delft3D Modeling Section 5.2.2) takes this diminished sediment load into account when computing the sediment that would be delivered to the Barataria Basin. To help clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations, discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

Concern ID: 61812

Commenters expressed concern that the proposed Project would have adverse water quality impacts in the Barataria Basin due to the introduction of nitrate and phosphate from the Mississippi River. Several commenters questioned whether the proposed Project would create harmful algal blooms and hypoxia in the Barataria Basin similar to the hypoxic “dead zone” in the Gulf of Mexico that exists due to nutrients in Mississippi River waters. One commenter expressed concern that the EIS does not adequately assess the potential for the proposed Project to create algal blooms and hypoxia in the basin, other than acknowledging it.

Response ID: 16425

The impacts raised by the commenters were considered in the Draft EIS. As discussed in the EIS, Chapter 4, Section 4.5 Surface Water and Sediment Quality, while increases in both nitrogen and phosphorus concentrations in the Barataria Basin are projected by the Delft3D Basinwide Model to occur as a result of proposed Project operations, monthly dissolved oxygen concentrations are not projected to fall below the water quality criterion of 5 mg/L at the six stations evaluated in the basin over the 50-year analysis period.

According to USEPA’s Mississippi River/Gulf of Mexico Hypoxia Task Force “Hypoxia 101” webpage, hypoxic waters have dissolved oxygen concentrations of less than 2 to 3 mg/L. Hypoxia can be caused by a variety of factors, including excess nutrients and waterbody stratification (layering) due to saline or temperature gradients. The hypoxic zone in the Gulf of Mexico is a result of excess nutrients from the Mississippi/Atchafalaya River and seasonal stratification (layering) of waters in the Gulf. As nutrient-laden water from the Mississippi flows into the Gulf, this fresh water is less dense and remains above the denser saline seawater. In addition to the saline gradient caused where the fresh water and saline water meet, the fresh water is warmer than the deeper ocean water, further contributing to the stratification. This stratification prevents the mixing of oxygen-rich surface water with oxygen-poor water on the bottom of the Gulf. Without mixing, oxygen in the bottom water is limited and the hypoxic condition remains. In the Gulf hypoxic zone “water near the bottom of the Gulf contains less than two parts per million of dissolved oxygen” (<https://www.epa.gov/ms-hf/northern-gulf-mexico-hypoxic->

[zone#:~:text=The%20hypoxic%20zone%20in%20the,condition%20referred%20to%20as%20hypoxia.\)](#)

Dissolved oxygen concentrations associated with the Applicant's Preferred Alternative are projected to generally increase in the Barataria Basin during the modeled period as compared to the No Action Alternative, which would decrease the potential for hypoxia to occur. Further, vegetative growth projected by the Delft3D Basinwide Model to occur due to Project operations is expected to utilize the nutrients diverted from the Mississippi River, resulting in lower concentrations of nutrients occurring in the Barataria Basin and reaching the Gulf through Barataria Bay than would reach the Gulf through the Mississippi River. As mentioned in Section 4.5.5.1 in Surface Water and Sediment Quality of the EIS, the majority of the Barataria Basin is shallow and not typically prone to stratification that promotes hypoxic conditions. The shallow nature of the Barataria Basin allows for full water column mixing by wind and tidal action, reducing the opportunity for algae to establish to the extent that would cause hypoxia. The Delft3D Basinwide Model's dissolved oxygen results do not suggest that Project implementation would result in oxygen concentrations below the 5 mg/L water quality criterion in Barataria Basin. To make this clearer in the Final EIS, language indicating that the Delft 3D Basinwide Model results do not suggest that a significant hypoxic zone will form in Barataria Basin due to project implementation has been added to Section 4.5.5.5.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS. Furthermore, as explained in Section 4.25.5.2 of the Cumulative Impacts section of the EIS, if the Mid-Breton Sediment Diversion is permitted, the combined impact of Mississippi River diversions operating simultaneously may reduce nutrient flow from the river to the Gulf, having a beneficial impact on the Gulf of Mexico hypoxic zone.

Aquatic resource impacts associated with algal blooms (caused by excess nutrients such as nitrate and phosphate) are addressed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. A reference to this section is included in Section 4.5.5.3 in Surface Water and Sediment Quality and has been added to Section 4.5.5.4.2 Applicant's Preferred Alternative of the Final EIS. Finally, the EIS acknowledges the potential for major adverse Project impacts from harmful algal blooms to occur, and that the formation of these blooms is not well understood by the scientific community (see Section 4.26.4 in Additional Considerations in Planning).

Appendix R2 Monitoring and Adaptive Management (MAM) Plan of the EIS includes monitoring of nutrients, as well as phytoplankton species composition (including harmful cyanobacterial/algal bloom species) if warranted, in the Barataria Basin during Project operations to guide CPRA's management actions.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the

proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61906

The MBSD Project would cause loss and detrimental impacts on the recreational and sport fishing industry in the Barataria Basin.

Response ID: 16236

The issues raised by the commenters were considered in the Draft EIS. EIS Chapter 4, Section 4.16.5.2 in Recreation and Tourism acknowledges that the proposed Project would impact recreational and sport fishing in the Barataria Basin. Relative to the No Action Alternative, the proposed Project would cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts on these species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips.

Concern ID: 61908

Commenters suggested that there will be detrimental impacts on the tourism economy and on restaurants, which are partly dependent on fisheries in the Barataria Basin. Commenters express concerns about adverse effects on Louisiana's attractiveness as a fishing area and place for swamp tours and authentic seafood.

Response ID: 16238

EIS Chapter 4, Section 4.16.5.2 in Recreation and Tourism describes how the MBSD Project would impact the tourism economy that is dependent on fisheries. Relative to the No Action Alternative, the proposed Project would cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts on these

species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips. As described in the EIS, these changes would not substantially impact the broad tourism economy, which includes more than fisheries.

While availability of shrimp and oysters from the basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's Preferred Alternative than under the No Action Alternative.

This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

Concern ID: 62011

Commenters are concerned about the impacts of the proposed MBSD Project operations on the coastal communities including Jean Lafitte, lower Lafitte, Barataria, Crown Point, and the island of Grand Isle.

Response ID: 16209

The impacts raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.13 Socioeconomics considers impacts on community populations, housing and property values, community infrastructure, as well as community cohesion and other potential socioeconomic impacts on affected communities in the proposed Project area. As described, communities near the immediate outfall area (within 10 miles north and 20 miles south) outside of flood protection are anticipated to experience increased tidal flooding and storm surge that may increase ongoing trends in outmigration and cause minor to moderate, permanent, adverse impacts on community cohesion in these areas. Long-term benefits of the proposed Project are also anticipated in communities in the west bank New Orleans area north of the diversion, where decreases in storm damages are anticipated over time due to the Project. The communities of Lafitte and Des Allemands are located in areas anticipated to experience permanent, minor to moderate beneficial impacts associated with storm hazards. The proposed Project is projected to increase surge heights by only up to 0.1 foot in the community of Grand Isle. Chapter 4, Sections 4.13 Socioeconomics, 4.14 Commercial Fisheries, and 4.15 Environmental Justice provide detailed analyses of impacts from the proposed Project. The Socioeconomics Technical Report in Appendix H1 provides additional details.

As part of its restoration planning efforts, the LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. The LA TIG believes the proposed MBSD Project is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Concern ID: 62071

The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.

Response ID: 16241

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62225

Plaquemines Parish could experience flooding from the diversion similar to flooding due to the Mississippi River Gulf Outlet. Commenter asked if the diversion would be closed if it causes such flooding.

Response ID: 15758

As described in Draft EIS Chapter 2, Section 2.8 Action Alternatives Carried Forward for Detailed Analysis, the proposed Project design includes earthen guide levees that would be constructed along both sides of the diversion conveyance channel. The portion of the guide levees on the protected side of the New Orleans to Venice Levee system (NOV-NF-W-05a.1) would be designed and built as hurricane and storm damage risk reduction levees against storm surges that may enter the diversion channel. A gated control structure would also be built on the Mississippi River side of the conveyance channel, and the gate would be closed prior to and during storm events. Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discusses the increased flooding impacts potentially caused by the operation of the diversion.

CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and

other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62692

The proposed Project would introduce or facilitate the spread of invasive species (for example, carp, zebra mollusks, apple snails, Asian clams, water hyacinth, giant salvinia, hydrilla, nutria, northern snakehead) and freshwater pathogens to the basin, which could affect other living resources and impede navigation.

Response ID: 16074

The commenter correctly notes the potential for the proposed Project to introduce or facilitate the spread of invasive species from the Mississippi River into the Barataria Basin and resulting from the alteration of existing habitat characteristics, which is consistent with discussions in the EIS in Chapter 3, Section 3.10.6 and Chapter 4, Section 4.10.4.6 in Aquatic Resources; Sections 3.6.3 and 4.6.5.2 in Wetland Resources and Waters of the U.S.; and Sections 3.9.4 and 4.9.4.2 in Terrestrial Wildlife and Habitat. The sections in Chapter 4 also identify how the introduction or spread of invasive species may negatively impact other living resources. The northern snakehead is not currently known to occur in Louisiana; however, if its presence is later identified in the Mississippi River, its introduction or spread via the proposed Project would result in similar impacts on the environment as those described in Section 4.10.4.6 Aquatic Invasive Species of the EIS. The potential introduction of pathogens (specifically, fecal coliform [not typically pathogenic, but an indicator for other pathogenic bacteria] and Enterocci) is discussed in Section 4.5.5.8 Fecal Coliform; a discussion of fecal coliform has been added to Section 4.10.4.4.2.5 Dissolved Oxygen of the Final EIS. Section 4.10.4.6.2.1 Aquatic Invasive Species has also been supplemented to discuss potential threats to navigation in the Final EIS.

Concern ID: 62702

The movement from an estuary to a delta-building system would adversely impact commercially-harvested species.

Response ID: 16080

The movement from an estuary to a delta-building system would result in either adverse or beneficial impacts on commercially-harvested species, based on habitat preferences and life histories, as summarized in Chapter 4, Section 4.10 Aquatic Resources, Table 4.10-6 of the Draft EIS. In the LA TIG's Draft Restoration Plan, commercially-harvested species that could experience collateral injury from the proposed Project were also described in Chapter 3, Section 3.2.1.5 in OPA Evaluation of the Alternatives, and species that could benefit from the proposed Project were discussed in Section 3.2.1.6 Benefits Multiple Resources.

Concern ID: 62703

The proposed Project would preclude larval recruitment of shrimp, oyster, crab and essential finfish.

Response ID: 16081

The proposed Project would preclude recruitment of certain larval species in certain areas of the basin (generally the outfall area and into the mid-basin) during certain portions of their transport period, as discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the

Draft EIS. For example, operations above base flow would vary year by year, but are generally expected to occur between December/January and June/July and would overlap the majority of the larval transport period for brown shrimp (late January to June), thereby precluding larval recruitment to the outfall area. However, Atlantic croaker larvae are transported into the estuary from October to May (with peaks in November and February), such that larval migration to the outfall area would be precluded only during a portion of its larval transport period.

Concern ID: 62784

Prior or proposed diversions and diversion-like projects (including the Caernarvon Diversion, MRGO, Mardi Gras Pass, Maurepas Bonnet Carré Spillway openings) did not work or caused adverse impacts on area resources.

Response ID: 16366

The commenter's concern regarding the effectiveness and adverse impacts of existing diversions and diversion-like structures is noted. A summary of select natural and man-made diversions (and diversion-like structures) in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary, which includes discussions on the Caernarvon Diversion, MRGO, Mardi Gras Pass, and Bonnet Carré Spillway, is available in Appendix U of the Final EIS. The Maurepas Diversion is subject to an ongoing NEPA analysis, which is anticipated to be finalized in 2022.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The referenced projects all had unique goals, and, where goals existed, each of those projects have achieved their goals. Those achievements increase confidence in the ability of the LA TIG to set goals and select approaches appropriate for achieving those goals. The proposed Project's goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the current geomorphological features of the Lower Mississippi River, as well as data and knowledge gained from the referenced projects.

Concern ID: 62806

Some commenters suggested that the data used for the proposed Project are flawed.

Response ID: 16380

The EIS was developed considering the best information and data available to USACE and the LA TIG at the time of writing. Where commenters have identified specific data used in the EIS as being potentially flawed, those concerns have been assessed and responded to. In addition, additional data and publications recommended for review by the public during the Draft EIS comment period have been reviewed and incorporated into the Final EIS where appropriate.

Concern ID: 62986

The Project would drive decreases in salinity that would reduce the overall health, survival, and reproduction of bottlenose dolphins that reside in the Barataria Basin, a species that was negatively affected by the Deepwater Horizon oil spill (NMFS, 2013).

Some commenters felt that because of this, the Project should either not move forward or its operation should be altered.

National Marine Fisheries Service (NMFS). 2013. Roy Crabtree (NMFS) to Elizabeth Davoli (CPRA). <https://s3.documentcloud.org/documents/726710/national-marine-fisheries-service-comments-on.pdf>

Response ID: 16701

The concerns raised by the commenters about the projected decreases in salinity and resulting effects on Barataria Bay dolphins were considered in the Draft EIS. More specifically, Chapter 4, Section 4.11.5.2 in Marine Mammals of the EIS acknowledges that the proposed Project would likely have significant, adverse impacts to Barataria Basin dolphins, a species that suffered significant impacts from the DWH oil spill. This section also discusses the physiological changes caused by exposure to low-salinity water, the duration of those changes that leads to mortality, and the anticipated mortality of a large portion of the dolphin population in the Barataria Basin within the first decade. These sections of the EIS provide a more in-depth analysis of potential impacts to dolphins than the letter cited by the commenter.

The concerns raised by the commenters were also considered in the LA TIG's Draft Restoration Plan (see Section 3.2.1.5 [Collateral Injury]); the Final Restoration Plan has been edited consistent with changes made to the Final EIS and see below regarding new, related content included in Appendix R.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources, like dolphins, that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the

proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible (if it is possible), the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins in Louisiana (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 64060

The proposed MBSD Project would result in a financial impact on the surrounding communities that support the coastal community. More work needs to be produced to address the economic impacts for Louisiana as a whole and the locally impacted parishes from the proposed Project. This should include all of the state-wide economic issues that would result from the loss of natural resources which are heavily marketed as a basis for the industries of tourism, hospitality, restaurants, etc. Any failure to consider the complete economic impact of the destruction of seafood is inadequate given the nature of this proposed Project and the natural resource results actually delineated in the Draft EIS.

Response ID: 16231

The Draft EIS considered the potential socioeconomic impacts of the Project; thus, no related changes have been made to the Final EIS. More specifically, the EIS acknowledges in Chapter 3, Section 3.14.7 in Commercial Fisheries that the seafood industry represents a major source of jobs and income in Louisiana, which includes commercial harvesters, seafood processors and dealers, seafood wholesalers and distributors, restaurants, tourism, and retail sales. Chapter 4, Section 4.14 Commercial Fisheries considers regional economic impacts and community impacts projected to result from the proposed Project on the shrimp, oyster, crab, and finfish fisheries, noting that communities with a high reliance on these landings may be most heavily impacted, and that indirect effects may include impacts to fish license holders, crew, dealers, suppliers, and seafood processors. While availability of shrimp and oysters from the Basin would decrease with the Project, shrimp and oysters from Louisiana would continue to be available to restaurants, though potentially at higher prices. Restaurants willing to pay a premium for local seafood would likely do so, and additional importing would likely also occur. Under both the Applicant's Preferred Alternative and the No Action Alternative, consumers in Louisiana would experience higher prices for locally caught seafood, or would consume additional imported shrimp over time. However, impacts would occur decades sooner under the Applicant's Preferred Alternative than under the No Action Alternative. This discussion has been added to Section 4.14 Commercial Fisheries in the Final EIS.

Correspondence ID:54

Darlene McGarry

My husband and I have a home in Happy Jack and have been there for over 20 years enjoying the plethora of wildlife, recreational fishing and marsh/wetlands. We have also reviewed the many power points from meetings and written documents available on-line regarding the Mid-Barataria Sediment Diversion Project. We see little benefit and far more harm with the opening of the diversion as only 13,500 acres (roughly 10 football fields) would be created by the end of the projects 50 years while destroying the shrimp, oyster and fish species in the project area including Happy Jack where our home is located. Spending \$1,400,000,000 or more to divert water with the end result creating such a small area of marsh at the maximum estimation of 13,500 acres while increasing the tidal flooding for areas including Happy Jack is a waste of funding. This project will cause damage to home owners properties and permanently damage the fisheries in the area. Why such a large diversion in this area as the other projects that area slated for permitting have diversion flows of 10,000CFS and 5,000CFS. A diversion flow of 75,000CFS will most certainly have a profound impact if not destroy more than its purpose in rebuilding the marsh, restoring the ecosystem, and the reduction of storm surge. The project's "collateral injuries" which include impacts to the Dolphin population, the destruction of the shrimp and oyster industries in our area, increased tidal flooding (causing flooded roads, property damage and decreased home values) and permanently destroy the recreational fishing in the area do not equate to the 13 acres (10 football fields) of marsh created not to mention disturbing the oil sediment in Barataria Bay from the DWH mishap. How much does it cost to create an acre of new marsh? It was done by the Gulf along Bay Long by pumping sand. If the project costs upwards from the \$1.4B that would be a minimum cost of \$140,000,000 per acre. If the project costs \$2B, that would be a cost of \$148,000,000 cost per acre. Smaller diversion projects along the Mississippi River would be far more effective and less destructive on properties, the fisheries, the environment and the ecosystem. Property owners who fish and enjoy this area we call our "Paradise" with our families, children and grandchildren will suffer substantial losses- - personal and financial. We ask that alternatives be considered that better preserve and protect the environment and ecosystem instead of moving ahead with a project that in the end as a projected end result of creating 13 acres in 50 years.

Concern ID: 61776

The commenter expressed concern that over recent decades, Louisiana has averaged losing a football field of land every 100 minutes. The proposed Project would take 8 years to construct and 20 years to build 17,400 acres of land. Meanwhile, the state would have lost 147,168 football fields (about 195,000 acres) of coastline waiting on this proposed Project.

Response ID: 16176

The commenter's concerns regarding the pace of land loss occurring in the region and the acres projected to be created by the proposed Project over the 50-year analysis period were considered in the Draft EIS. To provide further insight into these tradeoffs, a discussion has been added to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations. This discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS. Additionally, as stated in Chapter 2, Section 2.8.1.3 Project Construction Activities, the proposed Project is expected to require 5 years to construct.

Concern ID: 61826

Commenters expressed concern that proposed Project operations would disturb existing oil sediment (from the DWH oil spill) in Barataria Bay.

Response ID: 16431

As explained in Chapter 4, Section 4.4.4 in Surface Water and Coastal Processes, significant scour potential exists in the immediate outfall area of the diversion structure in the basin, which could disturb oiled sediments on water bottoms. However, based on surveys conducted during remediation efforts in the Barataria Basin in response to the DWH oil spill, oiling exposure did not occur in this area, as illustrated in Chapter 3, Section 3.10 Aquatic Resources, Figure 3.10-1 of the Draft EIS. With regard to DWH oiling exposure identified in remediation surveys throughout the rest of the Barataria Basin, proposed Project operations would deposit sediments on water bottoms, which would bury any oiled sediments. Where oiled sediment exists in the birdfoot delta, bed elevations are projected to decrease by 0.2 foot by 2070 as compared to the No Action Alternative (see Figure 4.4-3 in Section 4.4.4 in Surface Water and Coastal Processes) due to reduced sediment load reaching the delta in areas observed to be impacted by oil. Bed elevations in the birdfoot delta are projected to decrease under the No Action Alternative as well. Therefore, proposed Project operations are expected to negligibly disturb existing oil sediment from the DWH oil spill. Clarification has been added to Chapter 4, Section 4.5.5.10.2 Applicant's Preferred Alternative in Surface Water and Sediment Quality of the Final EIS.

Concern ID: 61852

The cost per acre of marsh creation by the diversion is far higher than a corresponding alternative of marsh creation through the use of dredged material. Marsh creation through a diversion takes 50 years unlike marsh creation through dredging. In addition, brackish/salt marshes (which would be created by dredging) are more resilient than freshwater marshes, and thus marsh created through dredging would be a more sound investment of restoration funding than a sediment diversion.

Response ID: 16617

The timing of marsh benefits created by the proposed diversion was considered in the Draft EIS in Chapter 4, Section 4.6.5 Wetland Resources, Operational Impacts. In response to these comments, additional detail has been added regarding the resiliency of fresh marsh compared to brackish marsh in the Final EIS, Sections 4.6.5.1.2.3 Soil Shear Strength and 4.6.5.1.2.4 Land Accretion. Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE

generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

While the commenters suggest that marsh creation through dredging would cost less than the proposed Project, the LA TIG does not believe that comparing the costs of a sediment diversion to marsh creation projects using dredged material is relevant for several reasons. Most importantly, as explained in the LA TIG's Restoration Plan, the goal of the Project is to create a long-term sustainable ecosystem through the reestablishment of deltaic process. Marsh creation through the use of dredged material would not bring fresh water or nutrients to the basin on an ongoing basis. The benefits of marsh created with dredged material would diminish over time without maintenance in the form of additional pumping events due to subsidence and sea-level rise; thus, the temporal nature of Project benefits in the absence of periodic maintenance would also be very different. The costs and benefits of the Project were fully considered by the LA TIG and are discussed in the Draft Restoration Plan in Section 3.2.1.2 Cost to Carry Out the Alternative.

Concern ID: 61879

Commenters questioned why other alternatives are not being considered other than No Action and a sediment diversion with various levels of flow rates. CEQ's regulations require that the EIS rigorously explore and objectively evaluate all reasonable alternatives, which is a requirement that the Draft EIS does not meet. Consider analyzing a range of other alternatives, options, and tools that better preserve and protect the environment and minimize the severe impacts to Louisiana fisheries, the communities, and the entire Gulf Coast ecosystems.

Response ID: 15835

The range of reasonable alternatives evaluated in the EIS was based on the purpose and need statement set forth in Chapter 1, Section 1.4 Purpose and Need of the EIS. As described in Chapter 2 of the Draft EIS (Alternatives), an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and its evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to

define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria were described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for details on why these alternatives were not carried forward for further evaluation in the EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

Prior to the development of the EIS and Restoration Plan, the LA TIG evaluated various restoration alternatives in its SRP/EA #3 and found that a combination of "marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats" (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in its Restoration Plan. The LA TIG has funded other marsh creation restoration efforts that provide ecosystem services lower in the basin (that is, Barataria Basin Ridge and Marsh Creation Project: Spanish Pass Increment and Queen Bess Island Project). These activities complement and reinforce the restoration that would be provided by the proposed MBSD Project. Section 2.3 of the LA TIG's Restoration Plan provides a detailed discussion of process used to identify restoration alternatives.

Concern ID: 62780

Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.

Response ID: 16362

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62797

Commenters questioned the goals and objectives for this Project. They noted that, given the potential for environmental and economic impacts on other resources from this Project, whether the MBSD meets the NRDA criteria to restore for damages caused by the DWH oil spill. They also questioned whether the proposed Project would be appropriate, given that the main driver of wetland loss is historical coastal oil and gas development, not the oil spill. They noted that 80 percent of the acreage projected to be reclaimed or built through the MBSD is privately owned by oil and gas companies.

Response ID: 16606

USACE is not evaluating the proposed Project for compliance with the OPA and is not involved in the process to restore the damage caused by the DWH oil spill. As explained in the Restoration Plan, the LA TIG is responsible for deciding the appropriate use of NRDA funds to restore natural resources injured by the DWH spill in the Louisiana Restoration Area. As explained in the Final EIS, Appendix B2 DEIS Public Review and Public Meetings, Section 2.0 Agency Roles in the Responses to Public Comments, response content pertaining to the LA TIG's Draft Restoration Plan, the OPA and/or NRDA processes, or other Trustee Planning was developed by the LA TIG and states only the LA TIG's views.

In the Restoration Plan, the LA TIG explained that the DWH oil spill resulted in the oiling of more than 1,100 kilometers of wetlands, nearly all of which were located in coastal Louisiana (DWH NRDA Trustees, 2016). The heaviest oiling occurred in the Barataria Basin, resulting

in substantial injuries to natural resources in the basin (DWH NRDA Trustees, 2016). Recognizing that the resulting loss of marsh productivity affected resources throughout the northern Gulf of Mexico ecosystem, the State of Louisiana and the federal Trustees that negotiated the DWH Natural Resource Damages settlement allocated \$4 billion, almost half of the total settlement amount, to restoring Louisiana's wetland, coastal, and nearshore habitats. The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree of collateral injuries, to natural resources injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the LA TIG's Restoration Plan). The intended restoration of fresh water flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, as noted in the LA TIG's Restoration Plan without the proposed Project, sea-level rise, subsidence, and other existing stressors would result in additional marsh loss over time reducing the suitability of habitat for many of the same species that occur in Barataria Basin.

The LA TIG must weigh the potential and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its potential benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that more closely resembles historic conditions. As described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan, this sustained ecosystem is expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative because the LA TIG believes it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

In its Strategic Restoration Plan for Barataria Basin (2018), the LA TIG evaluated the potential and extent of collateral injury for a range of restoration techniques. Unfortunately, almost all large-scale restoration comes with some potential for collateral injury. The LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54. In the Restoration Plan, the LA TIG strives to identify an alternative that would provide what it considers the right balance in terms of being cost-appropriate, meeting LA TIG goals, having

a high likelihood of success, and avoiding collateral injury. Again, see Section 3.2.4 of the Restoration Plan for a discussion of how the LA TIG came to its decision.

In recognition of the potential for collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, the LA TIG has designed and CPRA would implement a suite of mitigation and stewardship measures (see Section 3.2.1.1.5 [Associated Stewardship Measures] of the Restoration Plan and Appendix R1 to the EIS). The LA TIG is also committed through these measures to continuing efforts to restore the resources that would be adversely affected by the diversion, many of which were also injured by the DWH oil spill.

The LA TIG acknowledges the concern regarding wetland loss drivers related to oil and gas activity, as well as the concern over the private ownership of the lands upon which wetlands would be created by the proposed Project. Regardless of the historic drivers of wetland loss, as explained in the Strategic Restoration Plan for Barataria Basin, because the Barataria Basin received the heaviest oiling from the DWH oil spill, the LA TIG believes that restoration activities in that basin are imperative.

With regard to the land ownership issue, the LA TIG's Restoration Plan details the reasoning supporting the location of the proposed Project, which is based on optimizing land building within the basin, regardless of ownership of the underlying land (see Section 2.3.3 [Restoration Planning Process – Proposed MBSD Project Location Alternatives] in the Restoration Plan). Private lands in the outfall area would be subject to the regular permitting processes required to conduct activities in the coastal zone. Activities on private lands would need to be in conformity with the Louisiana Coastal Zone Management Program, La. R.S. 49:214.21 and would be required to comply with the permitting requirements under the program. All coastal use permitting under the program must be consistent with the CPRA Master Plan projects. Additionally, private landowners would be required to comply with any other permitting requirements applicable to the area, including Department of the Army (DA) CWA Section 404 permits.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the DA Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:56

Brett Trahan

What a waste of money on something that may produce a lil land in 30 years.

Put that money to dredges, its been done numerous times through out plaquemines parish already and is a proven land building technique with few months time.

I'm a commercial fishermen helping to support a family and this is the exact area i fish. Your going to wipe us out along with thousands of other families. Commercial fishing is about the only thing left in this parish since the oil field is about gone. Your going to kill a whole parish on something that people think might make land!

Concern ID: 61966

The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.

Response ID: 15971

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated

Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRa and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

Concern ID: 62077

The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.

Response ID: 16242

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRa has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for

compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Rene Martinez

I'm a commercial fisherman from Delacroix. I've seen first hand what a diversion will do. It will destroy our wetland habitat for our Seafood destroy the land. You can't build land with water that does not have the sediment in it like it did one thousand years ago. The force of the water is greater than the capability to build land. You can build more land by dredging and not kill all the dolphins with all the fresh water. I AM AGAINST BOTH DIVERSIONS THAT ARE IN PLANNING TO BE BUILT. Look at how much damage the Caernarvon.

Concern ID: 61782

Commenters expressed concern that there's not enough sediment in the river to achieve wetland and land creation goals of the proposed Project.

Response ID: 16412

The commenter's concerns regarding the sediment load of the river and whether the river carries sufficient sediment to achieve the land projected to be built during diversion operation were considered in the Draft EIS. The Mississippi River carries much less sediment than it did in the past. It still carries a massive sediment load, but not as massive as before. As explained in Chapter 3, Section 3.4.2.5 Sediment Transport, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes. Quantifying the relative contributions of multiple factors to the diminished sediment load is beyond the scope of the Draft EIS. The Draft EIS (Appendix E Delft3D Modeling, Delft3D Modeling Section 5.2.2) takes this diminished sediment load into account when computing the sediment that would be delivered to the Barataria Basin. To help clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations, discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

Concern ID: 61783

The force of the water coming out of the proposed MBSD diversion into the basin would be greater than the proposed MBSD diversion's capability to build land.

Response ID: 16413

The issue raised by the commenter was addressed in the Draft EIS. The Delft3D Basinwide Model used physics-based computations of the diversion flow's momentum (see Appendix E Delft3D Modeling, Section 5.1) to calculate the forces on sediment and resulting sediment movement (see Appendix E Delft3D Modeling Section 5.2). Those computations showed that the largest, heaviest sediment particles would settle out first and the smaller, lighter particles would be carried farther and deposited as the flow spreads out and slows down. These behaviors are consistent with the known physics of delta-building processes and demonstrate that the diversion would build land in the Barataria Basin.

Concern ID: 61966

The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.

Response ID: 15971

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process. CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

Concern ID: 62782

A large number of commenters expressed general opposition to the proposed Project.

Response ID: 16364

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 63016

The Caernarvon Diversion (and other diversions, such as the Naomi Siphon) did not build marsh but rather caused damage to the existing marsh, such as through the introduction of freshwater invasive plant species that clog available waterways, suffocating natural marsh grass, restricting water flow.

Response ID: 16029

A summary of select natural and man-made diversions in southeastern Louisiana, including the Caernarvon Diversion and Naomi Siphon, has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and discuss their recorded impacts on the natural environment. This summary, which includes a discussion on changes to marsh extent and the presence of invasive plants, is available in Appendix U of the Final EIS.

Correspondence ID:58

The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRAs and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

Concern ID: 62079

Commenters are concerned that impacts similar to those caused by the fresh water from Bonnet Carré Spillway openings would affect fisheries in the Barataria Basin with the proposed MBSD Project.

Response ID: 16244

The Project area for the MBSD EIS includes the Barataria Basin and the Mississippi River birdfoot delta. Existing operations and influences of rivers and diversions, including but not limited to the Bonnet Carré Spillway, were incorporated into the baseline conditions of the No Action Alternative and action alternatives assessed in the Draft EIS, Chapter 4 Environmental Consequences, Sections 4.2 through 4.24. Reasonably foreseeable future (but not existing) diversions, such as the Mid-Breton Diversion, were analyzed for impacts in combination with existing diversions and the proposed MBSD diversion in Chapter 4, Section 4.25 Cumulative Impacts.

A summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and to discuss their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS. Note that the Bonnet Carré Spillway is an emergency flood control structure that is not operated for ecological purposes.

Concern ID: 62782

A large number of commenters expressed general opposition to the proposed Project.

Response ID: 16364

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Charles Cook

please ensure that you are in coordination with the local floodplain administrators to obtain any needed local permits.

Concern ID: 62192

Commenter states that CPRA should coordinate with the local floodplain administrators to obtain any needed local permits.

Response ID: 15741

CPRA would be responsible for coordinating as needed with the appropriate floodplain administrator(s) regarding any necessary permits prior to Project commencement if the Project is approved by USACE and funded by the LA TIG.

Correspondence ID:60

Polly Glover

USACE

Louisiana is at a critical juncture in our history. Land loss and climate change along with sea level rise, storms, subsidence and other causes has my home State washing away. As a Conservation minded, concerned citizen I wholeheartedly support the Mid Barataria Diversion coming on line sooner than later. The benefit to our State far outweighs the concerns about fisheries, habitat changes etc.

I would ask that the dolphin population have increased monitoring but wholeheartedly support the Diversion and the benefits it brings to Louisiana.

Respectfully submitted

Polly Glover

Concern ID: 62917**Public comment suggested that there should be increased monitoring for the dolphin population.****Response ID: 16541**

The Monitoring and Adaptive Management (MAM) Plan included in the Draft EIS (Appendix R2) contained draft plans for monitoring marine mammals in Barataria Bay before and during Project operations. The LA TIG recognizes that pre-operation Project monitoring would be essential to understand the impacts of the Project on marine mammals and to inform adaptive management approaches to both monitoring and operational modifications that allow for the minimization of impacts, where practicable. The MAM Plan included in the Draft EIS identified a core marine mammal monitoring team that would be established to conduct year-round marine mammal monitoring. This core team would also provide stranding surveillance and response capacity. The monitoring plans included in the MAM Plan included in the Final EIS (Appendix R2) have been enhanced to allow for critical data collection capabilities. The MAM Plan in the Final EIS (Appendix R2) has also been updated to provide the marine mammal team important environmental data necessary to understand where monitoring should be focused and to inform operational adaptive management.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued.

Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63333

Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.

Response ID: 16289

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Correspondence ID:61

Form Letter 1

Dear U.S. Army Corps of Engineers, New Orleans District,

As someone who enjoys visiting Louisiana, in part because of the spectacular wildlife, I am concerned that Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend.

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

As the project advances, I urge federal and state decision-makers to consider the following:

*Commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders.

*Work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

Thank you for considering my comments.

Sincerely,

Elizabeth Pomper

Washington, DC 20002

Concern ID: 61711

Coastal land and wetlands along Louisiana's coast are very valuable to migratory songbirds because these lands are the first land fall after an exhausting flight across the Gulf of Mexico. As the coastline recedes, migratory birds must fly farther and farther from their southern launch point.

Response ID: 16025

The value of Louisiana's coastal wetlands to migratory songbirds was considered in the Draft EIS. The importance of Louisiana's coastal habitats to migratory birds, as well as the threats to these habitats, is discussed in Chapter 3, Section 3.9.3.1 in Terrestrial Wildlife of the EIS.

Concern ID: 61741

Louisiana’s coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40 percent of all migratory birds in North America spend a part of their life in coastal Louisiana.

Response ID: 16162

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment. The use of Louisiana’s coastal habitats by a large diversity of birds is discussed in Chapter 3, Section 3.9.3 in Terrestrial Wildlife of the EIS. The benefits that the Project would provide to birds are discussed in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.12 Threatened and Endangered Species of the EIS.

Concern ID: 61756

The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.

Response ID: 15891

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance

refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62015

Commenter supports implementation of the proposed MBSD Project to restore the wetlands. The Barataria Basin needs its infrastructure to return which would have a substantial economic impact, support birds and other wildlife, and also bring back jobs to this area.

Response ID: 16212

The commenters' support of the proposed Project is acknowledged. The EIS evaluates economic impacts of the proposed Project in Chapter 4.13 Socioeconomics, and Appendix H1, Socioeconomics Technical Report, including potential employment impacts. In addition,

Chapter 4, Section 4.16.5.2 in Recreation and Tourism describes how the proposed Project would impact recreational and sport fishing in the Barataria Basin.

Concern ID: 62326

Once the permafrost thaws past a certain point then the temperature of the Ocean will rise such that the methane hydrate frozen at the bottom of the continental shelves and Ocean will be released then there will be an oxygen-poor atmosphere above sea level.

Response ID: 15778

Ongoing impacts and future threats of climate change on wildlife habitat and wetlands were discussed throughout Draft EIS Chapter 3, including Section 3.6 Wetlands and Waters of the U.S., Section 3.7 Air Quality and Section 3.9 Terrestrial Wildlife and Habitat. Draft EIS Section 4.1.3.2 Sea-level Rise in Section 4.1 Overview of Delft3D Basinwide Model for Impact Analysis described how modeling used for the EIS impact analysis factors in sea-level rise.

Concern ID: 62334

The USACE has the skilled staff, needed knowledge, equipment and resources to save the coastline and protect people and wildlife.

Response ID:

The USACE acknowledges the commenter's endorsement. However, the Project is proposed by CPRA; for the proposed Project, the USACE is responsible for evaluation of CPRA's Section 404/10 permit application and Section 408 permission request.

Concern ID: 62339

What we do locally can affect the entire nation.

Response ID: 15786

Comment noted.

Concern ID: 62340

Staff and volunteers who worked to save birds and other wildlife from DWH effects are stakeholders in this decision.

Response ID:

The USACE and LA TIG appreciate the efforts of volunteers to save birds and other wildlife after the DWH oil spill, and recognize such volunteers among the many stakeholders in the decision whether to approve and fund the proposed Project.

Concern ID: 62342

National parks, monuments, lakes, streams, oceans and other picturesque areas should be left in their natural state.

Response ID: 15788

Comment noted. The purpose and need of the proposed Project is to restore injuries caused by the DWH oil spill by reestablishing deltaic processes to ultimately restore habitat and ecosystem services injured by the DWH oil spill.

Concern ID: 62344

Humans have no right to inhumanely kill animals, and humans depend on animals to live.

Response ID: 15790

Comment noted. The Draft EIS considered the effects of the Project on terrestrial and aquatic, and marine mammal species in Chapter 4, Section 4.10 Aquatic Resources, Section 4.9 Terrestrial Wildlife and Habitat, and Section 4.11 Marine Mammals, respectively.

Concern ID: 62357

Southern Louisiana has been losing habitat for many years.

Response ID: 15896

Comment noted. Chapter 3, Section 3.6.2.2 Causes of Wetland Loss of the Draft EIS described historic wetland losses in the Barataria Basin. Further, Sections 3.1.4.1 Mississippi River and 3.1.4.2 Barataria Basin of the Draft EIS addressed the deltaic processes that formed the proposed Project area; these sections have been supplemented in the Final EIS to further discuss historic conditions.

Concern ID: 62358

Commenter notes that racism has caused social distancing for years.

Response ID: 15848

Comment noted. Draft EIS Chapter 4, Section 4.15 Environmental Justice considered the impact of the proposed Project on minority and low-income populations.

Concern ID: 62801

State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.

Response ID: 16658

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances

where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62904

The loss of any single species would disrupt the local ecology, leading to harsher responses to natural disasters.

Response ID: 16201

As described in Chapter 4, Section 4.9 Terrestrial Wildlife and Habitat of the Draft EIS, wildlife would experience both adverse and beneficial impacts during proposed Project construction and operations, with specific impacts depending on the individual life history and tolerances of a given species. The proposed Project is not anticipated to result in the loss of individual species throughout the Barataria Basin, but rather would cause a shift in the species assemblages to account for the modified habitat present in the basin. For example, species with higher-salinity requirements that are currently present would remain during operation of the proposed Project, but would likely move further south to account for changing salinities. The potential impacts of the proposed Project on various species and wildlife groups are analyzed and described in detail in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat, 4.10 Aquatic Resources, 4.11 Marine Mammals, and 4.12 Threatened and Endangered Species of the EIS. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 63039

The proposed Project would create wetlands, which would in turn provide a myriad of benefits, including helping to protect the coastline from sea-level rise and flooding due to storms.

Response ID: 16046

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the Draft EIS disclosed the projected wetland gains. Associated benefits, such as building coastal resiliency, from the proposed Project are addressed throughout the Draft EIS. Also see a discussion of the proposed Project's benefits in Chapter 3, Section 3.2.1.6 Benefits Multiple Resources of the LA TIG's Final Restoration Plan.

Concern ID: 63337

A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.

Response ID: 16294

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 62677

A commenter identified that after all of the work that went into saving birds in the immediate time following the oil spill, it would be a waste of resources to let those efforts go to waste.

Response ID: 16498

The LA TIG agrees with the commenters that the immediate response efforts of saving birds and wildlife need to be followed by long-term restoration projects that benefit these resources. One of the primary goals of the Project is "to create, restore, and sustain wetlands and other deltaic habitats and associated ecosystem services." These habitats provide food, shelter, and nursery grounds for numerous ecologically and economically important species, including birds that were the focus of immediate response efforts after the DWH oil spill.

Concern ID: 63344

The proposed Project must be moved forward to naturally reverse the impacts of levees and oil and gas activities, as well as to combat sea-level rise and climate change.

Response ID: 16305

The commenter's support for the proposed Project is noted. The comment is consistent with Chapter 4, Section 4.2.3.2 in Geology and Soils of the Draft EIS, which identified the projected land gains over time from operation of the proposed Project; these land gains take into account anticipated sea-level rise.

Correspondence ID:62

Theodore Mackenroth

Have a few questions that I would like someone to answer for me.

MRGO was built years ago to help the shipping industry. They destroyed acres of good trees and marsh to build this. It was probably the biggest fresh water diversion that was ever built.

Can you tell me how much land was built by this diversion?

If it was building land then why close it?

They said it was closed to protect New Orleans. Why didn't they just raise the levees to protect New Orleans?

What is the difference between the MRGO and the MBSD other than size and MRGO was for shipping? Both are dumping river sediment into marsh areas.

Just like the MRGO flooded New Orleans. What will stop a storm surge from backing up the diversion and flooding Plaquemines Parish?

If I back my boat up to the marsh, tie it off and put it in gear pushing against the marsh, how long do you think it will take for me to wash out a hole in the Marsh?

When you open MBSD, what is stopping the force of that water from washing out the marsh?

How big of a hole will it wash out before we see any results of land building?

Why hasn't anyone reduce the size of Bay Long Pass and 4 Bayou Pass to slow the tide water? This would help reduce erosion.

Concern ID: 61885

Consider the alternative of reducing the size of Bay Long Pass and 4 Bayou Pass to slow the tide water and save land instead of implementing the proposed MBSD Project.

Response ID: 15981

This alternative as presented, specifically reducing or narrowing the passes, would not meet the goals and objectives as stated in the purpose and need as described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Section 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

Other similar restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan, which will be updated in 2023, and by the LA TIG through Natural Resource Damage restoration planning.

Concern ID: 62229

The storm surge could back up into the diversion and cause flooding in Plaquemines Parish.

Response ID: 15751

As described in the Draft EIS Chapter 2, Section 2.8 Action Alternatives Carried Forward for Detailed Analysis, the proposed Project design includes earthen guide levees that would be constructed along both sides of the diversion conveyance channel. The portion of the guide levees on the protected side of the New Orleans to Venice Levee system (NOV-NF-W-05a.1) would be designed and built as hurricane and storm damage risk reduction levee to reduce

risk against storm surges that may enter the diversion channel. A gated control structure would also be built on the Mississippi River side of the conveyance channel, and the gate would be closed prior to and during storm events.

Concern ID: 62639

The proposed Project is unlikely to succeed because similar types of projects have failed to build land, and have caused a range of other issues, like destroying habitat, exacerbating flooding, and reducing water quality. Specific examples of similar, problematic projects include the Mississippi River Gulf Outlet, Bonnet Carré Spillway, Caernarvon Freshwater Diversion, Davis Pond, West Bay, Baptiste Collette, Fort St. Philip, and Cubits Gap. In fact, data show that the Caernarvon Diversion in particular was unable to show sustained land gains in the face of Hurricane Katrina-driven losses in wetland habitat (Underwood 1994, Kearney et al. 2011). Davis Pond has seen increased land loss inside the diversion compared to a reference area (Couvillion et al. 2017). Fort St. Philip has lost large areas of wetlands (Suir et al. 2014). While the Atchafalaya River is building land in the Atchafalaya and Wax Lake Deltas, the Atchafalaya River carries more sediment than the Mississippi River does currently (Blum and Roberts 2009), and more of the Atchafalaya River is diverted to each of these deltas and marshes farther south. Additionally, one study identified poor performance of diversions due to many periods of inoperation due to socioeconomic uncertainties (Caffey et al. 2014).

Response ID: 16631

The issues raised by the commenters were considered in the Draft EIS. The EIS states in Chapter 2, Section 2.1.1 Overview of Sediment Diversions, that CPRA considered information from other diversions in its assessment of the Project alternatives, but because the projects mentioned by the commenters had been designed to discharge primarily water, not sediment, they are not fully comparable to the proposed Project. As explained in the EIS Chapter 4,

Section 4.1.3 (Environmental Consequences, Overview of Delft3D Basinwide Model for Impact Analysis), Delft3D Basinwide Modeling software was used to assess impacts of the Project on hydrology, land gains and losses, water quality, and vegetation in the Barataria Basin and birdfoot delta. Using standard professional practice, this physics-based model was validated to the West Bay Sediment Diversion. The West Bay Sediment Diversion is useful for validating the physical processes of erosion and deposition of sediment because it, like the proposed MBSD Project, is a sediment diversion that extracts relatively more sediment in the river. The other diversions cited were designed to primarily deliver water, not sediment, and are less useful comparisons.

The West Bay Sediment Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, “A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that diversions do not lead to appreciable sediment accumulation” (Kolker, A. S., Miner, M. D. and Weathers, H. D. 2012. Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, Estuarine, Coastal and Shelf Science, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005>).

Comparing diversions outside of physics-based numerical modeling has limited value because diversions and receiving environments often exhibit unique behaviors that correlations do not account for. For that reason, the physics-based Delft modeling, even with its limitations and uncertainties, is a better predictor than anecdotal comparisons to Fort St. Phillip or other sites. Uncertainties associated with the validation and application of the Delft3D Basinwide Modeling conducted for the proposed Project were assessed by the West Bay application, sensitivity tests, and by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in EIS Appendix E Delft3D Modeling and incorporated into the EIS conclusions throughout Chapter 4 Environmental Consequences. While most citations mentioned by commenters were already included in the Draft EIS, the Final EIS has been edited to include Caffey and Petrola (2014) to Chapter 4, Section 4.6.5.1.2.4 Land Accretion.

The likelihood of success of the Project and information from other freshwater diversions was also considered in the LA TIG’s Draft Restoration Plan, Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. The proposed MBSD Project’s goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the geomorphological features of the Lower Mississippi River as of 2012, including data from the referenced projects. All citations referenced by the commenters were included in the Final EIS and were considered by the LA TIG in the Final Restoration Plan.

Concern ID: 63029

The commenter states that, upon operation of the proposed MBSD Project, the force of the water would wash out the existing marsh and questions how much marsh would be washed out before the results of land building are seen.

Response ID: 16037

The high water velocities from the diversion structure into the Barataria Basin would contribute to localized wetland losses at the immediate outfall area; those impacts would be offset by later marsh building in the outfall area by 2030 (see Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS). The Final EIS has been updated to provide a discussion of that change in Chapter 4, Section 4.6.5.1.2.4 Land Accretion.

Correspondence ID:624

Candis Harbison

Dear U.S. Army Corps of Engineers, New Orleans District,
Louisiana's wetland destruction has occurred on a massive scale, so the solution must be BIG. Please support the Barataria Basin project.

Sincerely,

Candis Harbison

Panama City, FL 32401

Concern ID: 63339

The Mid-Barataria Sediment Diversion is the largest individual ecosystem restoration project in our country's history, which is fitting since the Barataria Basin is experiencing one of the highest rates of land loss on the planet. Large-scale projects like the Mid-Barataria Sediment Diversion are just the kind of bold actions that are needed if there is to be any hope of a truly sustainable coast.

Response ID: 16297

The commenters' support for the proposed Project is noted. Land and wetland loss along coastal Louisiana is described in EIS Chapter 3, Sections 3.1.4.1 and 3.1.4.2 in Introduction.

Correspondence ID:919

Nacho Pup

Please support this issue as it is vital for Virginians such as myself. Thank you.

Nacho Pup

[REDACTED]

Baltimore Maryland

[REDACTED]

Concern ID: 63332

A large number of commenters expressed general support for the proposed Project.

Response ID: 16288

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Correspondence ID:973

Roger Ingersoll

Dear U.S. Army Corps of Engineers, New Orleans District,

More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential.

I support the preferred alternative in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

Thank you.

Sincerely,

Roger Ingersoll

The Woodlands, TX 77389

Concern ID: 61741

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40 percent of all migratory birds in North America spend a part of their life in coastal Louisiana.

Response ID: 16162

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment. The use of Louisiana's coastal habitats by a large diversity of birds is discussed in Chapter 3, Section 3.9.3 in Terrestrial Wildlife of the EIS. The benefits that the Project would provide to birds are discussed in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.12 Threatened and Endangered Species of the EIS.

Concern ID: 63337

A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.

Response ID: 16294

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH

restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Correspondence ID:1074

Form Letter 2

Louisianas coast is in crisis. The ongoing loss of its coastal wetlands, which has already claimed an area equal in size to the state of Delaware, makes communities increasingly vulnerable to stronger hurricanes and sea level rise.

This loss, coupled with saltwater intrusion and sea level rise, threatens the health and stability of the entire Barataria Basin upon which a number of communities, wildlife and vital resources depend. This region continues to feel the impacts of the Deepwater Horizon oil spill, which further decimated wetlands and devastated wildlife more than 10 years ago.

In the face of these challenges, we have an opportunity to harness the natural land-building power of the Mississippi River to maintain vital wetlands and restore the health and vitality of the entire ecosystem. I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the Army Corps and Louisiana Trustee Implementation Group:

*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion: For decades, scientists and engineers have considered all the tools available and overwhelmingly agree that this project is the best long-term solution and necessary to meet the challenges we face from land loss, sea level rise and climate change. Reconnecting the river to nearby wetlands through this project provides our greatest opportunity to avoid a devastating future for Louisianas communities, wildlife and economy. The Mid-Barataria Sediment Diversion is the cornerstone of Louisianas Coastal Master Plan and will help support and enhance the lifespan of other coastal restoration and protection projects.

*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan: As Barataria Basin continues to recover from the devastating impacts of the oil spill, this project is vital to restoring the health and function of the entire ecosystem. The Mid-Barataria Sediment Diversion is the single largest ecosystem restoration project in the history of the United States. Combined with other proposed restoration projects, the Mid-Barataria Sediment Diversion would build and preserve more than 17,000 acres of wetlands over the next 30 years to restore critical wetland habitat injured by the oil spill. It is exactly the scale needed to address the very serious challenges facing Louisianas coast.

As the project advances, I urge federal and state decision makers to consider the following:

*Center community needs in planned mitigation and stewardship efforts. This project will have many positive, long-term benefits for coastal communities, including increased storm surge protection from restored wetlands, job creation and regional economic impact during construction, and increased productivity of natural resources. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. We applaud the commitment of the Federal Trustees and Louisianas Coastal Protection and Restoration Authority to address impacts that could result from the construction and operations of the project. Louisiana and the other Trustees will dedicate approximately \$300

million to fund a robust stewardship and mitigation plan, addressing any potential impacts that may occur. The Trustees must work proactively and collaboratively with potentially impacted communities to develop and implement ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning and implementation processes.

*Commit to developing a robust adaptive management program: To ensure the project meets its restoration goals in response to changing environmental conditions, I encourage the development and implementation of a robust adaptive management program that incorporates knowledge gained from monitoring of the project over time and also considers input from key stakeholders.

A future without the Mid-Barataria Sediment Diversion is a future we cannot afford, which is why I support the preferred alternative outlined in the draft Environmental Impact Statement and the expenditure of Deepwater Horizon settlement dollars to pay for the projects construction and associated mitigation and stewardship activities.

Concern ID: 61716

The ongoing loss of Louisiana's coastal wetlands makes communities increasingly vulnerable to stronger hurricanes and sea-level rise and threatens the health and stability of the entire Barataria Basin upon which a number of communities, wildlife, fish nurseries, sportsman culture, economy, and vital resources depend.

Response ID: 16026

The importance of maintaining wetlands for the protection of coastlines, coastal communities, wildlife resources, and recreation was considered in the Draft EIS in Sections 3.6 Wetland Resources and Waters of the U.S., 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, and 3.16 Recreation and Tourism.

Concern ID: 61756

The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.

Response ID: 15891

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the

impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62675

Commenters noted that the impacts of the DWH oil spill on wetlands, wildlife, birds, communities, and land loss are still felt by this region and in particular, Barataria Basin where 95 percent of the oiling occurred. These impacts are exacerbated by decades of saltwater intrusion, sea-level rise, and subsidence.

Response ID: 16497

The impacts of the DWH oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss of the EIS notes the ongoing impact of the DWH oil spill on wetlands, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species of the EIS provides an overview of the adverse impacts of the oil spill on key aquatic species within the Barataria Basin.

The LA TIG agrees with the commenters that the impacts of the DWH oil spill are significant in this region and thus the LA TIG is committed to continuing to plan and implement significant restoration projects like the LA TIG's Preferred Alternative in the Restoration Plan. The LA TIG's Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin. These habitats are critical components of the broader northern Gulf of Mexico ecosystem and suffered the greatest degree of oiling in Louisiana due to the DWH oil spill.

Concern ID: 62801

State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.

Response ID: 16658

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63179

Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.

Response ID: 16556

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

Concern ID: 63337

A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.

Response ID: 16294

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Correspondence ID:1116

The Save Louisiana Coalition

George Ricks

It is of our opinion that virtual meetings for this all important issue of a project that will drastically alter our estuary forever, is unfair to the hundreds that do not have computer skills or accessibility. At this point and time when the State of Louisiana is in a modified stage 3, and public gatherings are allowed, I feel there is no need to hold virtual meetings. I feel the USACE will take this into consideration.

Respectfully,

Capt. George Ricks

President, The Save Louisiana Coalition

Concern ID: 61760

Public meetings for this proposed Project, which would drastically alter our estuary forever, should have been in-person since the State of Louisiana is in a modified stage 3 and public gatherings are allowed. Holding virtual public meetings for a project of this importance is unfair to the hundreds that do not have computer skills or accessibility. Commenter requests that USACE and TIG hold in-person meetings regarding the proposed Project.

Response ID: 15895

USACE and the LA TIG held three joint public meetings for the Draft EIS and the LA TIG's Draft Restoration Plan in April 2021. These meetings were held virtually based on COVID-related restrictions in place at the time. Anyone interested in participating in the NEPA or OPA processes, or who wanted to learn more about the proposed MBSD Project and/or provide comments on the Draft EIS and/or the LA TIG's Draft Restoration Plan was able to participate in the meetings via an internet/web-based conferencing application or via toll-free telephone line. Spanish, Vietnamese, and Khmer translators facilitated participation by non-English speakers; key messages from the meeting presentations were translated during the meetings, and the translators were available to interpret participant comments in any of those languages.

At the beginning of the public comment period, CEMVN posted several pre-recorded presentation videos consisting of an explanation of how to comment on the Draft EIS and/or Draft Restoration Plan, an update on the proposed MBSD Project design, information concerning the ongoing restoration planning efforts and the LA TIG's Draft Restoration Plan, and details about how to navigate and review the contents of the Draft EIS on CEMVN's Project webpage. These pre-recorded presentation videos were then consolidated and played at the beginning of each of the three public meetings. This consolidated pre-recorded presentation was also translated into Spanish, Vietnamese, and Khmer and available on the Project webpage. In addition, dedicated toll-free numbers were provided during the public comment period on the Draft EIS and Draft Restoration Plan through which Spanish, Vietnamese, and Khmer-speaking individuals could listen to the translated pre-recorded presentation rather than watching the presentation on a computer.

Multiple ways to comment during the public review period were available including verbally during the virtual meetings, verbally by toll-free telephone number, written via the postal

service, and electronically via email and on the comment portal website. In addition, CPRA offered opportunities through local non-profit organizations for the public to sit with representatives from local non-profit organizations who assisted the public in preparing comments regarding the Draft EIS and LA TIG's Draft Restoration Plan.

Printed copies of the Executive Summary of the Draft EIS and the LA TIG's Draft Restoration Plan in English, Spanish, and Vietnamese were provided to libraries and community centers/organizations (see list in Chapter 7 Public Involvement of the Final EIS and Chapter 6 of the LA TIG's Restoration Plan) for those able to visit those locations in person.

All public comments received have been reviewed by both USACE and the LA TIG and will be considered as appropriate under relevant regulations by USACE and by the LA TIG, respectively, as each makes its decision on the proposed MBSD Project. Any future public engagement meetings held regarding the proposed MBSD Project would follow applicable agency guidance for the safety of all participants.

Correspondence ID:1125

Kenneth Teague

May I submit formal comments on the DEIS to this address? Or must I send them using the NPS online comment form? Note that the form is very awkward for submitting lengthy comments.

Kenneth G. Teague, PWS (emeritus), Senior Certified Ecologist

Austin, TX

Sent from Mail for Windows 10

Concern ID: 62350

The commenter asked whether they could submit formal comments on the Draft EIS in writing or if they must send them using the NPS online comment form.

Response ID: 15793

Comments on the Draft EIS were accepted via email, USPS, phone, as well as the PEPC online comment form.

Correspondence ID:1173

Robert Hyer II

Dear U.S. Army Corps of Engineers, New Orleans District,

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend.

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

As the project advances, I urge federal and state decision-makers to consider the following:

*Commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders.

*Work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

Beach renourishment projects dredging sand and all the animals onto a beach to support tourism is constantly disrupting ecosystems. Alabama stole Horizon funds to rebuild the Gulf State Park Resort during Robert Bentley's governorship who resigned for having sex with an employee. That's where Horizon money goes. They don't give a damn about migratory bird habitat or destroying ecosystems hence, our world is collapsing and we shall perish as obstinate non-conformists from the USCOE who sand New Orleans and made it easier to fill wetlands and flood adjacent subdivisions.

Habitat could be protected and restored but giving the Horizon money to the USCOE is like giving it away. You might as well bury it in the sand. Gone with the rest of our world. We're not bright enough to have a world. Have a nice day.

Thank you for considering my comments.

Sincerely,

Robert Hyer II

Lillian, AL 36549

Concern ID: 61741

Louisiana’s coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40 percent of all migratory birds in North America spend a part of their life in coastal Louisiana.

Response ID: 16162

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment. The use of Louisiana’s coastal habitats by a large diversity of birds is discussed in Chapter 3, Section 3.9.3 in Terrestrial Wildlife of the EIS. The benefits that the Project would provide to birds are discussed in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.12 Threatened and Endangered Species of the EIS.

Concern ID: 61756

The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.

Response ID: 15891

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance

refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62801

State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.

Response ID: 16658

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63337

A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.

Response ID: 16294

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its

potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 62804

Restoration funds are often misused by state and federal entities in a manner that does not protect or restore the environment.

Response ID: 16378

The restoration effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences of the Draft EIS. USACE does not oversee how NDRA restoration funds are expended.

The LA TIG assessed the reasonableness of costs associated with the proposed Project, as discussed in Chapter 3, Section 3.2.1.2 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan. The LA TIG established Standard Operating Procedures that apply to both restoration planning and project costs to ensure that funds are spent appropriately on restoration. This includes regular reporting on spending, as well as audit requirements. For more information on these procedures see

<https://www.gulfspillrestoration.noaa.gov/sites/default/files/wp-content/uploads/DWH-SOPs.pdf>.

Correspondence ID:1482

David Valle

Dear U.S. Army Corps of Engineers, New Orleans District,

as 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana and the Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend, especially as climate change is the centerpiece of everything involved in this society today,

In the looming waves of the climate change crisis in a timely manner that is still unnecessarily wasting away our world in any given basis, and an issue that is equivalent to an electric grid shockwave affecting the entire panorama that is all we have in the world, returning to the subject of Australia's Tarkine Forest, the country's largest temperate rainforest and the world's second largest, among a biodiverse oasis that is incomparable to anything we could imagine in the US, given its equally sensitive wildfires conditions since their own seasons, like ours, and Japan's Yakushima Forest, it's these two alone that are in the still endangered ecosystem of all, the Oceania and where there's no escaping any other way when it involves an all-water locked area but also because in Japan's WWII state, it managed to UNESCO-register this one and where like our own country managing several natural lands protections and where it's the same issue 100 years later but with a faster pace given everything and the S. 372 which is the crown jewel among this.

National Flood Insurance Program debt of \$20.5 billion but also the wildfires budget bill of \$2.3 billion, 10 times worse we've had since 1985, are the signs we've long overlooked the continued impacts of climate change and where we need to move next in the interests of future amendments and obligations we need to the future, and our government is immensely capable of it, I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion and I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

Minnesota (\$400) and Colorado (\$7.50) power outages have cost us in the climate change crisis in this winter season alone and its the flip sides of the pending spring season and a summer season, it can't be emphasized our government has a lot to handle and what is a live issue everywhere, and with that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

As the project advances, I urge federal and state entities responsible to consider the following:

*Commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders.

*Thoroughly work with impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

Sincerely,

David Valle

Carrollton, TX 75007

Concern ID: 61732

The climate change crisis has had devastating impacts to natural resources around the world.

Response ID: 16158

The impacts of climate change on the Project area were considered in the Draft EIS. Chapter 3, Section 3.1.3 Climate provides a general overview of climate change and associated impacts in the Project area, which include projected changes in weather patterns, along with continued saltwater intrusion due to sea-level rise contributing to loss and conversion of freshwater marshes. The effects of climate change via projected sea-level rise (see Chapter 4, Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the EIS) were incorporated into the Delft3D Basinwide Model for projecting the impacts of the Project. In addition, as noted in Section 4.7.4 in Air Quality of the EIS, the Project would result in permanent, indirect, minor, beneficial impacts on carbon sequestration and atmospheric greenhouse gas (GHG) concentrations due to wetland creation and restoration within the Barataria Basin.

Concern ID: 61740

Over time, Louisiana's natural environment is continuing to be destroyed by humans.

Response ID: 16161

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment of the EIS. Past, present, ongoing, and reasonably foreseeable actions and trends in the Project area are discussed throughout Chapter 4, Section 4.25 Cumulative Impacts, including how those actions have and may continue to affect Louisiana's natural environment. The proposed Project is a restoration action intended to restore and sustain wetlands in the Barataria Basin and compensate for damages to natural resources that resulted from anthropogenic causes, for example, the DWH oil spill.

Concern ID: 62801

State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.

Response ID: 16658

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63337

A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.

Response ID: 16294

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its

potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Correspondence ID:1636

Ellen Schock

Dear U.S. Army Corps of Engineers, New Orleans District,

This project will build more wetlands than any other individual restoration project in the world.

Thank you for considering my comments.

Sincerely,

Ellen Schock

Fort Myers, FL 33908

Concern ID: 63334

The proposed MBSD Project would maintain and restore coastal lands and should move forward.

Response ID: 16291

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Correspondence ID:1679

Michael Sharp

Hi, my name is Michael R. Sharp and I fully support the Mid-Barataria sediment project.

It's Michael R. Sharp and I fully support the Mid-Barataria settlement project and diversion project.

Concern ID: 63332

A large number of commenters expressed general support for the proposed Project.

Response ID: 16288

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Mike Nunmaker

I have owned my home in Myrtle Grove Marina Estates since September 2010. Since that time I have witnessed enormous change in the form of increased flooding at my property. Especially in the last 3 years. I attribute this to the raising of levees located to the north and to the south of our subdivision. I attribute a raise in the average tide of about 1 1/2' to this. Now with the major proposed Mississippi River diversion and expected increased sea level rise my \$ 650,000 investment will be deemed worthless. Our streets flood now with a 20 mph East to South to Southwest wind as Barataria bay fills in the marsh or what is left of the marsh instantly and floods our streets enough that we can't get to our properties. My concern is that this will increase drastically both in the height of the level of water and the frequency of occurrence. We were originally promised a flood gate for the levee project by previous parish leadership and when all was said and done we were left on our own literally. My main concern is that the combination of 12 foot high levees and the proposed giant River diversion and without a flood protection system for our neighborhood is doomed. I sincerely believe that every land owner in our area should be compensated for our loss of value since obviously we have been here long before any government sponsored changes were made. Especially since the Corp of engineers is known to do projects that negatively affect tax payers all the time. I understand that the shrimping and the oyster industries are to be compensated so I would be interested in learning why we would not be made whole.

Concern ID: 62013

The Myrtle Grove subdivision is a residential neighborhood composed of homes, not camps, many of which may not have access to flood insurance. The proposed MBSD Project would increase flooding of the properties which would severely impact access to property and property values in Myrtle Grove and other affected areas such as Lake Hermitage.

Response ID: 16210

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.13 Socioeconomics, which discusses impacts of the proposed Project on property values, and Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction which discusses flood and storm related impacts due to the Project. The EIS (Section 4.13.5.3 in Socioeconomics) finds that the proposed Project would result in minor to moderate, permanent, adverse impacts on housing and property values in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection. These affected areas include the communities of Myrtle Grove, Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, Happy Jack, and Grand Bayou, and to a lesser extent portions of Lafitte. In addition, negligible to minor increases in levee overtopping south of the immediate outfall area may occur in future years following delta formation (after approximately 20 years of Project operations) in the outfall area in communities inside levees, with the greatest increases in communities adjacent to the NOV-NFL Levee system.

The Final EIS discusses modeled impacts of the Project on water surface elevations and corresponding tidal inundation in Lafitte, Myrtle Grove, and Grand Bayou. These three communities are generally representative of other communities in the basin, including

Hermitage, Suzie Bayou North, Suzie Bayou South, Woodpark, and Happy Jack (see Figure 4.13-1 in Section 4.13.1 Area of Potential Impacts in Socioeconomics). Lafitte, Myrtle Grove, and Grand Bayou also represent varying levels of exposure to tidal flooding. As explained in Section 4.20.3 Public Health and Safety – Overview of Model for Impact Analysis, Grand Bayou has no structural protection and would experience similar tidal flooding as the unprotected communities of Hermitage, Suzie Bayou North, Suzie Bayou South, and Happy Jack. Myrtle Grove impacts would be similar to the neighborhood of Woodpark. Without implementation of the measures outlined in the Mitigation and Stewardship Plan (Appendix R1), the largest impact on tidal inundation frequency due to the diversion is projected to occur in Myrtle Grove, as this is the community that is closest to the immediate outfall area of the proposed diversion structure outside flood protection and thus is projected to see the greatest increase in water levels.

Section 4.13.5.3 Housing and Property Values has been revised in the Final EIS to provide additional discussion of potential effects of the proposed Project on the availability of flood insurance. The Final EIS concludes that the proposed Project would not impact the availability flood insurance, but may cause an increase in flood insurance premium for some properties in communities projected to experience increases in tidal flooding and storm hazards. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict how flood insurance premiums may change. Since issuance of the Draft EIS, CPRA has expanded and refined the mitigation measures intended to address the inundation projected in the communities south of the proposed Project's immediate outfall area including Myrtle Grove, Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack. CPRA plans to provide a combination of structural improvements (for example, improving bulkheads and raising roads and homes) and non-structural measures.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

In Woodpark, Suzie Bayou, Deer Range, Lake Hermitage, Grand Bayou, and Happy Jack, CPRA plans to purchase Project servitudes from landowners. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those

landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. See Section 6.3.2 of the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62224

Communities like Happy Jack, Lake Hermitage and Myrtle Grove, some of which have homes that are not above the new base flood elevation, already experience some degree of flooding which would be made worse by the diversion. This would affect the ability of residents to access and enjoy their homes and communities.

Response ID: 15757

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discuss the anticipated increased flooding impacts outside of federal levee systems to be caused by the operation of the diversion. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation. CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4)

providing landowners with funds to elevate their homes and other structures on private properties. In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes, which would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application, and if a permit is approved, would not be authorized under the DA permit. Many of these structural measures would require DA and other permits prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal

Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62951

CPRA must address how it will mitigate flooding in the EIS with specific plans and adequate funding. Commenters specifically asked whether there will be funding available to raise roads, homes, and properties; to compensate property owners for lost property value; to relocate people and businesses; to address increases in flood insurance costs; to provide a fair market buyout option; to pay for flood walls, gates, and maintenance; to compensate for loss of use and enjoyment of property; and to cover increased costs of providing emergency services.

Response ID: 16711

Impacts associated with inundation raised by the commenters were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS and in Appendix R1 Mitigation and Stewardship Plan. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

Concurrent with publication of the Draft EIS, CPRA held several meetings with the communities potentially affected to receive their input on how best to mitigate the Project effects on water levels. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of these public engagement meetings and other outreach efforts is in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures. CPRA also plans to prepare outreach materials in easy to read and understand formats for distribution to the public.

Based in part on the feedback received, CPRA expanded the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection. This includes a combination of structural measures (for example, raising roads, boat houses, docks, and utilities) and non-structural measures (for example, Project servitudes).

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plans to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision, which would reduce the incidence of tidal flooding in the Myrtle Grove Marina Estates Subdivision compared to future conditions if the proposed Project were not constructed.

In communities south of the diversion outside levee projection from Woodpark south to Grand Bayou and Happy Jack, CPRA plans to raise the road to improve access to the properties and purchase Project servitudes from property owners that would permit CPRA to add and/or increase the water flow on landowners' properties. CPRA would attempt to negotiate with the landowners to acquire this servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to acquire these servitudes and would compensate landowners for the value of any property interest acquired. Landowners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures.

CPRA also may consider purchasing an impacted property outright if requested by the owner. Decisions regarding buyouts would be made on a case-by-case basis depending on the particular circumstances. These potential measures are described in the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove community. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Marina Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Final Mitigation and Stewardship Plan.

The Final EIS concludes that the proposed Project would not impact the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the

LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:1718

Form Letter 3

Dear U.S. Army Corps of Engineers, New Orleans District,

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend.

I urge you to:

*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

*Commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders.

*Work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

Thank you for considering my comments.

Martha Steele

Sincerely,

Martha Steele

San Antonio, TX 78231

Concern ID: 61741

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40 percent of all migratory birds in North America spend a part of their life in coastal Louisiana.

Response ID: 16162

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment. The use of Louisiana's coastal habitats by a large diversity of birds is discussed in Chapter 3, Section 3.9.3 in Terrestrial Wildlife of the EIS. The benefits that the Project would provide to birds are discussed in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.12 Threatened and Endangered Species of the EIS.

Concern ID: 61756

The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the

ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.

Response ID: 15891

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in

instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62801

State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.

Response ID: 16658

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or

adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63337

A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.

Response ID: 16294

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Correspondence ID:1748

Owen Jones

This experiment in diverting polluted fresh water into a brackish water estuary is crazy. You are predicting 50 years out what SWAG might happen. Let us look at the facts:

1 Areas that have been prone to flooding are going to have to deal with at least a 1 foot rise in water permanently when this monster is opened. Is the state going to buy all the property that will be exposed to even more deliberate flooding. How much will that cost? Is the state ready for massive class action law suits due to loss of income and or property.

2 This country goes berserk over killing snail darters and other species because of construction. This project will deliberately kill all the brown shrimp habitat and most of the dolphins in Barataria bay. What if any brackish water species lives and thrives in the Mississippi river-NONE. The single most important species to the GIANT recreational fishing industry is the spotted sea trout. With no shrimp it is gone. When that goes so does the value of fishing camps, boats and new boat sales, tackle shops, marinas, etc. I guess we just have to get out of the way for the gitty scientist who want to return the river to the marsh for this giant experiment. It is an experiment when it has never been done on this scale any where in the world.

3 I have lived in the New Orleans area for most of my 75 years. I have seen how our area has benefitted from dredging. The entire residential area North of Robert E Lee Blvd was dredged about 100 years ago and it is still there. The sediment from the MRGO around Shell Beach and Hopedale have benefitted from this material. That was dredged 60 years ago. I have seen many major dredging projects around the world personally. The new HONG KONG airport was dredged from the sea. The massive islands of the coast of Dubai where 64000 people now live. One third of Singapore's land mass was dredged. How can a project like this NOT consider dredging. That where no models discussed nor any SWAG of the long term benefits of dredging.

4 What dredging will not do is pollute permanently the estuary that so much depends. Dredging has more benefits sooner that are more predictable than an experimental diversion. Our area has many dredging projects that allow engineers to accurately forecast the long term benefits without relying on a SWAG 50 years out.

5 The state will certainly lose any class action lawsuit that does not provide BILLIONS to compensate the thousands of people whose lives, income, and recreation will be permanently destroyed by this project. This is a total waste of money that could be spent on better engineering solutions without the permanent destruction that the MBSD will cause.

6 We as a community have a one time shot at getting this right thanks to the BP oil spill money. If we build this and it proves to be worse than projected [remember it is an experiment], we will be out of money to do what needs to be done.

Let us kill this project and DREDGE.

Concern ID: 63182

Proposed mitigation is insufficient and not guaranteed, and the amount of funding for mitigation is not clearly stated.

Response ID: 16559

Details regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, have been provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61906

The MBSD Project would cause loss and detrimental impacts on the recreational and sport fishing industry in the Barataria Basin.

Response ID: 16236

The issues raised by the commenters were considered in the Draft EIS. EIS Chapter 4, Section 4.16.5.2 in Recreation and Tourism acknowledges that the proposed Project would

impact recreational and sport fishing in the Barataria Basin. Relative to the No Action Alternative, the proposed Project would cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum, which are the most targeted species by recreational anglers in the basin (targeted in 87 percent of angler trips between 2014 and 2018). Other species that are targeted include southern flounder, largemouth bass, sheepshead, black drum, sand seatrout, gafftopsail catfish, and blue crab. Both adverse and beneficial impacts on these species are anticipated over time relative to the No Action Alternative, but are anticipated to have negligible effects on angling effort in the basin, as these species are targeted in less than 2 percent of angling trips.

Concern ID: 61966

The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.

Response ID: 15971

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated

Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRAs and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

Concern ID: 62659

The proposed Project is an experiment, and it is not possible to guarantee its alleged benefits.

Response ID: 16632

The uncertainties associated with the Project's success were considered in the Draft EIS. While the benefits of the Project cannot be guaranteed, the EIS uses state-of-the-art modeling, including but not limited to the Delft3D Basinwide Model, to project the Project's beneficial and adverse impacts. These modeling projections of Project impacts include uncertainties. Following standard professional practice, model uncertainties are clearly stated in the EIS with respect to the model's quantitative results. Uncertainties are incorporated into the EIS impact conclusions and are briefly summarized in EIS Chapter 4, Section 4.1.3.3 Model Limitations and Uncertainty, and in detail in Section 8.0 Model Limitations and Uncertainties of EIS Appendix E Delft3D Modeling.

The likelihood of success of the Project was also considered in the LA TIG's Draft Restoration Plan. While recognizing the innovative nature of the proposed Project, the Restoration Plan discusses in detail the factors that would contribute to the Project's success. More specifically, Sections 3.2.1.4 (Likelihood of Success - Alternative 1) and 3.2.2.4 (Likelihood of Success - Alternatives 2-6) of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. In addition, such a sediment diversion has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Section 3.2.1.4 [Likelihood of Success - Alternative 1] of the Restoration Plan). The Project

would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62785

This type of freshwater and sediment diversion project is unproven and there are uncertainties with respect to what the diversion would do (that is, if it would work and, if so, to what extent).

Response ID: 16367

The Delft3D Basinwide Model projections of future conditions include uncertainties. Uncertainties have been incorporated into the EIS impact conclusions and were briefly summarized in the Draft EIS in Chapter 4, Section 4.1.3.3 in Approach to Evaluation of Environmental Consequences, and in detail in Appendix E Delft 3D Modeling, Section 8.0 Model Limitations and Uncertainties.

Section 4.1.3 Overview of Delft3D Basinwide Model for Impact Analysis of the Draft EIS acknowledged that the outputs of the model are projections generated using defined inputs, often based on historical conditions. Because it is not possible to precisely predict future conditions such as weather patterns and degree of sea-level rise, the model inputs are necessarily based on trends, averages, and best professional judgment as well as reasonable assumptions about future behaviors. Readers of the EIS should not consider the model outputs as absolute values or as predictions of actual future conditions. The outputs are

instead used to compare the degree of difference between the impacts projected for each alternative as compared to the projected changes for the No Action Alternative.

In addition to the modeled data, Chapter 4 Environmental Consequences of the EIS includes additional analyses based on published literature and empirical data. USACE and the LA TIG considered the best information and data available to them in drafting the EIS. In response to public comments, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

Chapter 3, Sections 3.2.1.4 and 3.2.2.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan address the likelihood of success of the proposed Project and other action alternatives. The LA TIG recognizes and acknowledges that a controlled sediment diversion of this scale has not been constructed in Louisiana previously. However, a sediment diversion at this location has been extensively studied over several decades with the objective of designing and operating the proposed Project to provide a combination of land building and ecosystem benefits (see Chapter 3, Section 3.2.1.4 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan). The proposed Project would be monitored and adaptatively managed to meet its objectives (see the Monitoring and Adaptive Management [MAM] Plan, Appendix R2 of the EIS).

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63092

Further development of the Mitigation Plan is needed for properties that would be impacted by flooding caused by Project operations. Multiple commenters made specific requests for how their property should be handled (for example, through sales or easements), while others wondered why a more detailed, “real estate plan” for impacted communities was not available.

Response ID: 16511

The Draft Mitigation and Stewardship Plan included with the Draft EIS (Appendix R1) included CPRA’s initial framework for mitigation and stewardship measures to assist property owners in these communities impacted by increased tidal flooding and to address the Project impacts of Project operations on water levels. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

CPRA states that it is interested in assisting affected communities to remain in place as long as they would like. Mitigation would include a combination of structural measures (for example, raising roads, boat houses, docks and utilities) and non-structural measures. Structural measures in CPRA’s Mitigation and Stewardship Plan are not included in CPRA’s DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

Where the proposed Project would cause increased water levels and/or increased incidence of flooding, CPRA plans to acquire the right to add and/or increase water flow on landowners’ properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner’s property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to purchasing a flowage servitude, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property (rather than a servitude) would be made on a case-by-case basis depending on the particular circumstances.

A complete listing of the mitigation and stewardship measures that CPRA would implement if the proposed Project is approved and funded is included in CPRA’s Mitigation and Stewardship Plan included in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final

Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:1753

Lan Nguyen

Shrimping is my livelihood and the sole source of income for my family. The proposed measures in the draft mitigation plan doesn't address the loss of income along with the other measures. This loss of income from the diversion opening should be compensated to fishermen in the form of a check in the amount that they would have normally earned in that season pre-diversion.

Concern ID: 63131

Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.

Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.

Response ID: 16515

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiessy, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Sang Tran

I read over the mitigation measures and I think that all of them are good for the fisheries.

Concern ID: 63133**Commenters support the proposed mitigation measures for the commercial fishing industry.****Response ID: 16517**

The comments received in support of the Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) are acknowledged. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Zachary Mouton

I have been a resident since 2005. The levee around the development when I purchased my property was an inch or 2 below my slab. If water came in that high it would flow over the levee and I was fine. now they are raising the levee which now every time the water raises above the street and to the top of the new levee and above above it will flood my ground floor storage.

I did not buy my property with that problem. Also the new siphon will make the water get higher on a regular bases. I cannot sell to get back what I paid for it because everyone now knows what is going to happen.

Do you have a game plan for the residents that are there now.

Zach Mouton

Concern ID: 63096

Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).

Response ID: 16699

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its

eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Chamreon Kang

I am a commercial fisherman involving in the shrimping business for many years now. These changes will greatly affect my livelihood and many others in my community. It greatly concerning to me as I am so reliance on my occupation to make a living and survive. To put my concern at rest, I would like ways for me to continue as a commercial fisherman through support from the government. If the shrimping business continue to be profitable I would like a large boat to continue doing what I love best. If these changes means the decline of the shrimping business I would like financial support and care for my community and me.

Concern ID: 63131

Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.

Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.

Response ID: 16515

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)

- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Gerald Harper

Dear U.S. Army Corps of Engineers, New Orleans District,

Louisiana's coast is in crisis, putting birds and coastal communities at risk. The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

Thank you for considering my comments.

Sincerely,

Gerald Harper

Lakeland, FL 33803

Concern ID: 63337

A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.

Response ID: 16294

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

CONTINUED WATER QUALITY MONITORING MUST BE MAINTAINED and do not let any more dredging for oil or sonar booms in Florida waters. We are losing fresh water to NESTLE for \$150 dollars and cannot afford anymore water issues.

Also, take DOWN the RODHAM DAM which is impeding water here.

The OIL INDUSTRY has to stop drilling. Time for Solar and Wind power. We cannot afford to be ill and lose businesses for huge corporations to profit from our water.

Concern ID: 62325

There are many water issues including oil extraction, sonar booms, dams and corporate profit.

Response ID: 15777

Comments noted. The scope of this EIS is limited to areas in which the Project is expected to have more than negligible effects on the environment, which is limited to Louisiana, particularly the Barataria Basin and the Mississippi River birdfoot delta.

Concern ID: 62867

The Final EIS should not be published unless there are commitments to monitor the following parameters at the diversion site or in Barataria Bay: Project operations, the flow and quality of the water flowing through the diversion, wetland type coverage over time, water surface elevation, water quality in the basin, salinity, contaminant concentrations in diverted sediments, fish and shellfish abundance, oyster reef parameters, benthic community composition and abundance, SAV coverage, finfish and oyster contaminant concentrations, and shellfish harvest restrictions. These same data should also be collected in two reference basins.

Response ID: 16676

Basin-side monitoring of water surface elevation, water quality in the basin, salinity, fish and shellfish abundance, and benthic community composition and abundance to evaluate how the Project is meeting Project objectives were included in the Monitoring and Adaptive Management (MAM) Plan of the Draft EIS (Appendix R2). Riverside monitoring parameters include river discharge, suspended sediment concentrations, nutrient concentrations in water conveyed to the Barataria Basin, sedimentology of the Alliance South sand bar, and Mississippi River sediment load were also included in the MAM Plan of the Draft EIS. Additionally, in the Fish and Wildlife Coordination Act Report (CAR) section of Chapter 5 (Consultation and Coordination) of the Draft EIS, CPRA accepted USFWS' recommendation on pre- and post-construction periodic sampling of Contaminants of Concern in fish, shellfish, and wildlife from the outfall area and the Mississippi River (see Section 3.7.3.23 of the MAM Plan [Appendix R2 to the EIS]). Therefore, no changes were made in the Final EIS on these issues. The Louisiana Department of Health will continue to monitor shellfish harvest restrictions. Additionally, the majority of the parameters above are collected via the State's System Wide Assessment and Monitoring Program that will allow comparison of the Project variables within and among other estuarine basins across the Louisiana coast.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship,

monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:1871

Lee Lam

I would definitely need money to make my boat bigger so that I can go out further and stay. I will also say that a lot of commercial fishermen are old, so we can't really take advantage of the workforce trainings because employers don't want to hire older people.

Concern ID: 63134

Commenters suggested that job training would not be helpful for older workers or for those facing language or technological barriers. Direct payments should be considered for these fisherman that cannot change careers easily.

Response ID: 16518

The Draft EIS considered how changes in the Project area both with and without implementation of the Project would potentially impact commercial fisheries, including shrimp, in Chapter 4, Section 4.14 (Commercial Fisheries). In response to public comments and resource agency input about proposed mitigation and stewardship measures, CPRA has expanded and refined the fisheries mitigation and stewardship measures since the release of the Draft EIS. CPRA's mitigation and stewardship strategies and expenditures focus on establishing sustainable fisheries for oysters and shrimp rather than on compensating individual shrimpers or oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for fisheries in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to fisheries in the early years of the Project's operational life.

The revised mitigation and stewardship measures allocate approximately \$54 million to commercial fisheries, which supplement other restoration actions and programs being funded by the LA TIG and by the State through LDWF. This includes \$2 million for Workforce/Business training which can be used for older workers facing language or technical assistance barriers (see Appendix R1 to the Final EIS). Additionally, if the MBSD Project is permitted by the USACE and funded by the LA TIG, it would take approximately 5 years to complete construction of the Project and to begin operations. This relatively long period would provide affected senior fishers with the time and opportunity to decide how they want to go forward, ranging from taking advantage of the adaptation opportunities offered through the Mitigation and Stewardship Plan to transition out of the fishing industry. The final fishery mitigation plan can be found in the Mitigation and Stewardship Plan (Appendix R1 to the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated

Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:1872

Christi Lam

I would just like help with moving and for the government to buy my boat. I don't think job training would be good for me because I've been a fisherwoman for so long and I come from a different country and I'm scared that I can't learn anything new.

Concern ID: 63134

Commenters suggested that job training would not be helpful for older workers or for those facing language or technological barriers. Direct payments should be considered for these fisherman that cannot change careers easily.

Response ID: 16518

The Draft EIS considered how changes in the Project area both with and without implementation of the Project would potentially impact commercial fisheries, including shrimp, in Chapter 4, Section 4.14 (Commercial Fisheries). In response to public comments and resource agency input about proposed mitigation and stewardship measures, CPRA has expanded and refined the fisheries mitigation and stewardship measures since the release of the Draft EIS. CPRA's mitigation and stewardship strategies and expenditures focus on establishing sustainable fisheries for oysters and shrimp rather than on compensating individual shrimpers or oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for fisheries in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to fisheries in the early years of the Project's operational life.

The revised mitigation and stewardship measures allocate approximately \$54 million to commercial fisheries, which supplement other restoration actions and programs being funded by the LA TIG and by the State through LDWF. This includes \$2 million for Workforce/Business training which can be used for older workers facing language or technical assistance barriers (see Appendix R1 to the Final EIS). Additionally, if the MBSD Project is permitted by the USACE and funded by the LA TIG, it would take approximately 5 years to complete construction of the Project and to begin operations. This relatively long period would provide affected senior fishers with the time and opportunity to decide how they want to go forward, ranging from taking advantage of the adaptation opportunities offered through the Mitigation and Stewardship Plan to transition out of the fishing industry. The final fishery mitigation plan can be found in the Mitigation and Stewardship Plan (Appendix R1 to the EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated

Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. Form Letter 4

Louisianas coast is critical to not only the people who live, work, and recreate here, but to the entire nation. World-class fishing attracts people from all over the world. Our ports are a major player in international trade. The nations energy needs are largely supported by the oil and natural gas industry located along our coast.

Our coast is disappearing. Its vital that bold action is taken to help protect communities, businesses, and natural resources from the devastating effects of hurricanes, storm surge, and sea level rise. The single biggest thing that can be done to help mitigate some of this loss - and address this crisis - is to allow the Mississippi River to do what its done for thousands of years: build land with its sediment and nutrient-rich water.

In 2010, The Deepwater Horizon oil spill exacerbated our coastal crisis and severely impacted wildlife that depend on our estuaries. Approximately 95% of the marsh oiling along the Gulf occurred in Louisiana - the heaviest of that oiling was in the Barataria Basin. Already suffering from degradation prior to the spill, the basin was especially hard hit with land loss rates doubling or tripling after the oil spill. Without the Mid-Barataria Sediment Diversion (MBSD) project, this basins estuary will collapse.

A problem of this magnitude requires innovation. The MBSD project is one of the largest environmental infrastructure projects in the history of the United States. Reconnecting the Mississippi River to the Barataria Basin will maintain vital wetlands and restore the health and vitality of the entire ecosystem.

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

The Mid-Barataria Sediment Diversion is the cornerstone of Louisianas Coastal Master Plan and will help support and enhance the lifespan of other coastal restoration and protection projects. Combined with other proposed restoration projects, the Mid-Barataria Sediment Diversion would build and preserve more than 17,000 acres of wetlands over the next 30 years to restore critical wetland habitat injured by the oil spill. It is exactly the scale needed to address the very serious challenges facing Louisianas coast.

As the project advances, I urge federal and state decision makers to center community needs in planned mitigation and stewardship efforts. This project will have many positive, long-term benefits, including increased storm surge protection, job creation and regional economic impact during construction, and increased productivity of natural resources. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. The Trustees must work proactively and collaboratively with potentially impacted communities to develop and implement ideas and proposals for adaptation and mitigation, and be as detailed and transparent as possible throughout the process.

I encourage the development and implementation of a robust adaptive management program that incorporates knowledge gained from monitoring of the project over time and also considers input from key stakeholders.

A future without the Mid-Barataria Sediment Diversion is a future we cannot afford, which is why I support the preferred alternative outlined in the draft Environmental Impact Statement and the expenditure of Deepwater Horizon settlement dollars to pay for the projects construction and associated mitigation and stewardship activities.

Concern ID: 61735

Louisiana's coast is critical to not only the people who live, work, and recreate here, but to the entire nation. World-class fishing attracts people from all over the world. Our ports are a major player in international trade. The nation's energy needs are largely supported by the oil and natural gas industry located along our coast.

Response ID: 16160

The importance of Louisiana's coast to the people who live, work, and recreate here, as well as to the nation, was considered in the Draft EIS. The details about the importance of the Project area's recreational fishing, commercial navigation, and the oil and gas industry are included in Chapter 3, Sections 3.16 Recreation and Tourism, 3.21 Navigation, and 3.2.3 in Geology and Soils, respectively.

Concern ID: 61756

The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.

Response ID: 15891

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship

measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62675

Commenters noted that the impacts of the DWH oil spill on wetlands, wildlife, birds, communities, and land loss are still felt by this region and in particular, Barataria Basin

where 95 percent of the oiling occurred. These impacts are exacerbated by decades of saltwater intrusion, sea-level rise, and subsidence.

Response ID: 16497

The impacts of the DWH oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss of the EIS notes the ongoing impact of the DWH oil spill on wetlands, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species of the EIS provides an overview of the adverse impacts of the oil spill on key aquatic species within the Barataria Basin.

The LA TIG agrees with the commenters that the impacts of the DWH oil spill are significant in this region and thus the LA TIG is committed to continuing to plan and implement significant restoration projects like the LA TIG's Preferred Alternative in the Restoration Plan. The LA TIG's Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin. These habitats are critical components of the broader northern Gulf of Mexico ecosystem and suffered the greatest degree of oiling in Louisiana due to the DWH oil spill.

Concern ID: 62801

State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.

Response ID: 16658

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the

Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63179

Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.

Response ID: 16556

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

Concern ID: 63337

A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.

Response ID: 16294

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from

the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 63340

The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.

Response ID: 16298

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

Concern ID: 63352

The Mid-Barataria Sediment Diversion is the cornerstone of Louisiana's Coastal Master Plan and would help support and enhance the lifespan of other coastal restoration and protection projects. Combined with other proposed restoration projects, the Mid-Barataria Sediment Diversion would build and preserve more than 17,000 acres of wetlands over the next 30 years to restore critical wetland habitat injured by the DWH oil spill.

Response ID: 16314

The commenter's support for the proposed Project is noted. The cumulative impacts of the proposed Project and other restoration projects were discussed in Chapter 4, Section 4.25.6.4 in Cumulative Impacts of the Draft EIS. This section identified that, although sea-level rise and saltwater intrusion would generally offset the wetland gains of individual projects by 2070, there would be substantial interim benefits of these other past, present, and reasonably foreseeable restoration projects in the Barataria Basin, including benefits related to fisheries production and storm surge risk.

Correspondence ID:1895

Christopher Wilke

My address of record is in New Orleans but I own an off grid camp at [REDACTED] about 7 miles North of Barataria Bay. I also have waterfowl leases in the area. I have been boating, hunting and fishing the area for two decades or more. I have seen drastic loss of marsh and a deepening of the larger waterways over that time. If nothing is done the marsh around Barataria Bay will vanish and there will be nothing between the Mississippi River and the Gulf except the levee and Grand Isle. Commercial and recreational fishermen that oppose this project are selfish and short sighted. Their fathers and grandfathers ran much further south to find the salinity levels that produced the fishing they enjoy in much slower boats. I fully support this project as someone that owns and leases land within the area of the project.

Concern ID: 63333

Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.

Response ID: 16289

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Correspondence ID:1896

Richard Kuhlmann

I am 74 years old and been fishing the Louisiana coast since the 60's. It is unbelievable how much of it is gone. I have a camp at Dulac la. And last Island is just about gone. I think this diversion canal is a great idea

Concern ID: 63334

The proposed MBSD Project would maintain and restore coastal lands and should move forward.

Response ID: 16291

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Marine Mammal Commission

Peter Thomas

The Marine Mammal Commission would like to request that the US Army Corps of Engineers and the Louisiana Trustee Implementation Group extend, for a minimum of 30 days, the comment period for the Mid-Barataria Sediment Diversion (MBSD) draft environmental impact statement (DEIS) and the associated Restoration Plan (RP) #3.2.

The MBSD DEIS/RP provides a significant amount of information regarding the proposed diversion project and its projected environmental and economic consequences. The diversion project represents a novel effort to rebuild lost marsh land in Louisiana. The US Army Corps of Engineer's preferred alternative involves the construction of a large-scale sediment diversion to introduce freshwater and associated sediments from the Mississippi River into Barataria Bay. The use of large-scale sediment diversions to rebuild land in complex estuarine ecosystems has not been attempted anywhere else in the world, and its projected effectiveness and impacts are based largely on complex hydrographic modeling and associated assumptions regarding water flows, nutrient inputs, and ecological responses.

The alternatives considered in the DEIS are all expected to have significant adverse impacts on the resident population of common bottlenose dolphins in Barataria Bay. The extent and severity of impacts on bottlenose dolphins and their estuarine habitat has been modeled in part in Chapter 4.11 of the DEIS. The Marine Mammal Commission has requested that the National Marine Fisheries Service and the National Marine Mammal Foundation conduct additional analyses on the multi-year population trajectory of bottlenose dolphins, incorporating the projected annual survival rate resulting from the project that was presented in the DEIS. The Marine Mammal Commission is also evaluating the the effectiveness of the proposed mitigation and monitoring measures as well as the proposed stewardship measures. Given the complexity of the hydrographic and ecosystem modeling efforts, the severity of anticipated impacts to bottlenose dolphins, and the additional analyses that the Marine Mammal Commission has requested and is undertaking to understand the long-term impacts of the project on bottlenose dolphins, we are requesting the extension in order to ensure a thorough review of the DEIS/RP and the proposed mitigation and monitoring measures.

Please let us know as soon as feasible whether this request can be granted.

Concern ID: 62487**Several commenters requested additional time to submit comments on the LA TIG's Draft Restoration Plan and Draft EIS.****Response ID: 15768**

The public comment period for the LA TIG's Draft Restoration Plan and Draft EIS was originally 60 days (March 5, 2021 through May 4, 2021). On April 23, 2021, USACE and the LA TIG issued a special public notice, announcing a 30-day extension of the public comment periods. With this addition, the public comment period for both documents was 90 days (March 5, 2021 through June 3, 2021).

Correspondence ID:1903

Bolen, Parker, Brenner, Lee & Miller, Ltd

Madeline Lee

Please implement the Mid-Barataria Sediment Diversion project for the good of the state and the world. It's not often that one is given the opportunity to actually make the world a better place. Do it!

Madeline Lee

Concern ID: 63332

A large number of commenters expressed general support for the proposed Project.

Response ID: 16288

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Correspondence ID:1904

John Gasquet

Good Morning,

Will the Core be raising our boat dock, slab under our home, sewer treatment plant our street to Lake Hermitage road and raising it also?

Due to the small amount of land this project will build in 30 years only fools would go forward with such a project spending 2 billion dollars.

Pumping sand will build land now and provide hurricane surge protection to New Orleans and surrounding areas.

Diversion will only provide .5-1' of hurricane surge protect north of the diversion in 30 years and build 17,000 acres of land. This offers zero protection to New Orleans and surrounding areas.

2 billion dollars used to build, possible to build 100,000 acres.

Thus not killing more bottlenose dolphins, sea turtles, and the seafood industry in the Barataria Basin.

Concern ID: 61852

The cost per acre of marsh creation by the diversion is far higher than a corresponding alternative of marsh creation through the use of dredged material. Marsh creation through a diversion takes 50 years unlike marsh creation through dredging. In addition, brackish/salt marshes (which would be created by dredging) are more resilient than freshwater marshes, and thus marsh created through dredging would be a more sound investment of restoration funding than a sediment diversion.

Response ID: 16617

The timing of marsh benefits created by the proposed diversion was considered in the Draft EIS in Chapter 4, Section 4.6.5 Wetland Resources, Operational Impacts. In response to these comments, additional detail has been added regarding the resiliency of fresh marsh compared to brackish marsh in the Final EIS, Sections 4.6.5.1.2.3 Soil Shear Strength and 4.6.5.1.2.4 Land Accretion. Under relevant NEPA regulations, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that a permit applicant has undertaken its own economic evaluation of a proposed project and therefore, does not require a financial cost-benefit accounting for its decision. As part of its permitting decision, USACE conducts a public interest review, which weighs the probable harms of a project against its prospective benefits.

While the commenters suggest that marsh creation through dredging would cost less than the proposed Project, the LA TIG does not believe that comparing the costs of a sediment diversion to marsh creation projects using dredged material is relevant for several reasons. Most importantly, as explained in the LA TIG's Restoration Plan, the goal of the Project is to create a long-term sustainable ecosystem through the reestablishment of deltaic process. Marsh creation through the use of dredged material would not bring fresh water or nutrients to the basin on an ongoing basis. The benefits of marsh created with dredged material would diminish over time without maintenance in the form of additional pumping events due to subsidence and sea-level rise; thus, the temporal nature of Project benefits in the absence of periodic maintenance would also be very different. The costs and benefits of the Project were

fully considered by the LA TIG and are discussed in the Draft Restoration Plan in Section 3.2.1.2 Cost to Carry Out the Alternative.

Concern ID: 61966

The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.

Response ID: 15971

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts

and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

Concern ID: 62221

The Project would not provide substantial protection from hurricanes or storm surge, nor would storm surge protection be provided in a timely manner. The area most likely to experience some increase in protection would be subject to increased water levels from diversion operations. The current diversion Project needs to be reengineered to create meaningful storm surge protection. The Project is a misuse of funds based on what the diversion would do versus what it purports to do, in part due to the Mississippi River not having enough sediment to build substantial land.

Response ID: 15756

While the proposed Project would impact storm surge, the purpose and need of the Project is not storm surge protection. As described in the Draft EIS in Chapter 1, Section 1.4 Purpose and Need, the purpose of the Project is to restore injuries caused by the DWH oil spill and help restore habitat and ecosystem services injured by the spill by reestablishing deltaic processes. However, as described in the Draft EIS in Chapter 4, Section 4.20.4 Public Health and Safety, the Project would have the ancillary benefit of storm damage risk reduction on communities north of the diversion due to the creation and maintenance of wetland habitat within the delta formation area; the increase in topography and land acreage would induce greater hydraulic friction and resistance, reducing the inland extent of storm surge and limiting wave heights in some communities north of the diversion, as compared to the No Action Alternative. The EIS acknowledges that storm surge and wave height reduction benefits for some communities north of the diversion would not be instantaneous, but that these benefits would increase over time as more land is created and maintained within the delta formation area. The EIS also acknowledges that some of the same communities that would experience storm surge reduction benefits, such as Lafitte, would experience an increase in non-storm inundation frequency due to increased water levels from diversion operations. At the same time, operation of the Project would have permanent, minor to moderate, adverse impacts on storm hazards in communities south of the diversion, with anticipated increases in storm surge of up to 1.7 feet near Myrtle Grove (as compared to the No Action Alternative). Section 4.20.4.2.2.2 in Public Health and Safety of the Final EIS has been revised to include additional information and figures further explaining the impacts of the Project on storm surge and wave height.

The EIS recognizes the role of sediment load in land building. The river still carries a massive sediment load, but not as massive as it historically carried. As explained in Chapter 3, Section 3.4.2.5 in Surface Water and Coastal Processes, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes as described in Section 3.4.2.5 Sediment Transport. The Delft3D Basinwide Model used Mississippi River sediment loads when computing the sediment load that would be delivered to the Barataria Basin. This is described in detail in the EIS, Appendix E Delft3D Modeling, Section 5.2.2.

Concern ID: 62783

Commenters noted that the cost of designing and building the proposed MBSD Project is too high for the small amount of land anticipated to be built.

Response ID: 16365

The commenter's opposition to the cost of the proposed Project is noted. Under NEPA, a cost-benefit analysis is not required for the EIS unless such an analysis is relevant to the agency's decision. USACE generally assumes that the permit applicant has conducted its own economic evaluation of a proposed project. Consequently, a cost-benefit analysis is not relevant to USACE's permitting decisions. As part of evaluating the proposed Project, the LA TIG considered the costs associated with developing, constructing, and managing the Applicant's Preferred Alternative consistent with the Restoration Plan alternatives evaluation criteria in 15 CFR §990.54. This discussion is in Chapter 3, Section 3.2.1.2 in OPA Evaluation of the Alternatives of the LA TIG's Final Restoration Plan.

Concern ID: 63096

Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).

Response ID: 16699

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of

the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures

contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

New Orleans, LA 70118

To Mr. Laborde,

We are students at the University of Arizona, currently studying in a Natural Resource Policy and Law course. We have reviewed the Draft Environmental Impact Statement for the Proposed Mid-Barataria Sediment Diversion Project in Plaquemines Parish, Louisiana and have concerns regarding the effects the project will have on the species in both the Gulf of Mexico and in the delta that is proposed to be worked on and affected by the sediment diversion. Further, there may be adverse effects to the low-income and minority communities that reside in the area, and the project may make these areas more vulnerable to tidal flooding and storm surges.

As individuals with an interest in the outdoors, we have four points that we have a particular interest in: environmental justice, the effects on both terrestrial and aquatic wildlife, and how the project may affect threatened and endangered species.

In regards to environmental justice, there is a single, yet major, adverse effect that concerns us: The project's completion and operation would have a disproportionate impact on low-income and minority communities outside of federal levee protection that would leave them uniquely vulnerable to tidal flooding and storm hazards. These communities also rely on this area for both commercial and subsistence fishing, which would be drastically affected by the direction of this project.

Further, this project would have many permanent and adverse effects on the terrestrial ecosystems that currently reside there, chiefly the loss of wetlands in the birdfoot delta by 2070 as well as the negative effects it will have on the species better adapted to high-salinity environments, such as the diamond terrapin, as stated within Chapter 2.0 Alternatives (USACE, 2021). Other wildlife that would be affected by this includes small mammals such as the swamp rabbit, mink and raccoon. We would like to mention that in regard to the terrestrial ecosystems, we would be quite happy if you were to choose the 150,000 cfs alternative as it maximizes the benefits to the ecosystem while not increasing the adverse effects.

On the other hand, decreased salinity as a result of this project will have major adverse effects on the aquatic ecosystems downstream. Although the massive drop in salinity will be

temporary and will be followed by major beneficial effects, the toll this level of salinity will take on brown shrimp and eastern oysters will be permanent and it is not likely they will recover, as they are not well adapted to the salinity in the water (USACE, 2021). Perhaps most affected by the decrease in salinity will be the Barataria Bay Estuary System dolphins, which are expected to see major and significant effects on their populations as a result, with the decreased salinity affecting their overall health, survival, and reproduction.

Finally, we are concerned with the effects explained in the EIS that this project will have on threatened and endangered species in the area. There are likely to be minor to moderate adverse effects for the Kemp's ridley, loggerhead and green sea turtles, and the pallid sturgeon in the areas. Additionally, there are likely to be major indirect adverse effects on bald eagles, which may be exposed to contamination as a result of this project (USACE, 2021).

In regards to the purpose and need for the project, we could not agree more with the intentions and goals of this project. We acknowledge that beyond the simple reasoning of trying to correct the ecological damage done to the area as a result of the Deepwater Horizon oil spill that the No Action Alternative is not the environmentally superior alternative.

In the case of environmental justice, the current situation as presented in the draft EIS is that the communities involved will eventually be subject to the same major adverse effects from climate change as if the project was carried out. The No Action Alternative also has a major adverse effect on the terrestrial ecosystems, as it will do nothing to stop the constant and gradual degradation and conversion of wetlands that is taking habitat away from the native species. A similar effect will take place in aquatic ecosystems, with habitat being lost at a gradual, but constant, rate that will eventually have adverse effects on nearly every key species involved. To sum up, we fully believe that reparations of some kind do need to be made to prevent these delicate ecosystems from further damage, and we agree that cleaning damages from the Deepwater Horizon oil spill would be an ideal solution to the problem.

Although there is much to be said about restoring the natural ecosystem that was destroyed by the Deepwater Horizon oil spill, we simply ask that the project proceeds with caution. Please recognize that these situations are not as straightforward as they may always seem, and by modifying terrestrial ecosystems for the sake of a marine ecosystem can ultimately damage both. We believe that the environmental justice aspects of the project need further review. The coasts of Louisiana are already prone to flooding and this project states that one of the consequences of increasing freshwater flow in the Barataria river would be the increase in flood conditions in low income or minority communities.. Do not take these concerns as a condoning of the project, but rather a request that further thought is given to certain areas to ensure that the project results in a fair and environmentally secure decision for all involved.

Sincerely,

Caleb Miller, Timothy Burns, Josephine Lopez, Ryland Ayala

United States Army Corp of Engineers. (March 2021). Environmental impact statement for the proposed mid-barataria sediment diversion Plaquemines Parish, Louisiana. United States Environmental Protection Agency. <https://cdxnodengn.epa.gov/cdx-enepa-II/public/action/eis/details?eisId=323086>.

Concern ID: 61871

Alternative 5, Variable Flow up to 150,000 cfs, should be chosen for implementation because it provides substantially greater benefits at the higher flow, with only marginally increased adverse effects, most of which could be mitigated by the same measures being proposed for the 75,000 cfs Applicant's Preferred Alternative.

Response ID: 15944

CPRA submitted a joint Section 10/404 permit application and Section 408 permission request to USACE for the construction, operation, and maintenance of a 75,000 cfs sediment diversion (Applicant's Preferred Alternative). The EIS evaluates the Applicant's Preferred Alternative and five additional action alternatives as well as the No Action Alternative in order to inform USACE's permit and permission decisions and the LA TIG's NRDA decision in compliance with the statues, orders, and policies outlined in EIS Chapter 5 Consultation and Coordination.

In the Restoration Plan, the LA TIG evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54, and made every effort to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. As noted in the LA TIG's Restoration Plan, while the 150,000 cfs Alternative was projected to provide greater ecological benefits than the LA TIG's Preferred Alternative, it was also expected to cause greater collateral injury and greater risks to public health and safety. See Chapter 3, Section 3.2.4 of the Final Restoration Plan for a discussion of how the LA TIG came to its decision. Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

The Mitigation and Stewardship Plan (Appendix R1 to the EIS) has been designed by CPRA to mitigate the projected impacts of the 75,000 cfs sediment diversion (Applicant's Preferred Alternative). Different or additional mitigation could be needed to address the projected impacts of the proposed Project if a large capacity diversion (150,000 cfs) were to be selected.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be

required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61872

The purpose and need statement upon which the alternatives analysis was built meets the intentions and goals of the proposed Project and appropriately captures the need to restore injury by reestablishing deltaic processes between the Mississippi River and Barataria Basin.

Response ID: 15828

The commenter's support for and approval of the Project's purpose and need is acknowledged.

Concern ID: 61927

The environmental justice aspects of the Project need further review because of the increase in flood conditions that would have disproportionate impacts on low-income or minority communities, including an American Indian village, outside of federal levee protection. These disproportionate impacts include devastating impacts on community culture.

Response ID: 16276

The issues raised by the commenters were considered in the Draft EIS. The EIS Chapter 4, Section 4.15 Environmental Justice discusses potential impacts of the proposed Project on low-income and minority populations.

In addition, since the release of the Draft EIS, CPRA has engaged the public through outreach meetings with the communities projected to be impacted by the MBSD, including Grand Bayou, to solicit input on mitigation strategies, including reaching out to local non-profits to assist with and facilitate meetings with the impacted communities. Outreach efforts undertaken to better understand and address potential impacts on low-income and minority populations, including cultural impacts, are discussed in Chapter 7 of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the

final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61928

In the case of environmental justice, the No Action Alternative as presented in the Draft EIS results in the affected communities eventually being subject to the same major adverse effects from climate change as if the Project was carried out.

Response ID: 16278

As explained in Chapter 4, Section 4.15 Environmental Justice of the Draft EIS, this is correct for low-income and minority populations south of the diversion outside of flood protection. For other low-income and minority populations (for example, those residing in communities in the West Bank of New Orleans) and other resources (for example, commercial and subsistence fishing), Project impacts are projected to range from beneficial to adverse as compared to the No Action Alternative. Further details can be found in Section 4.15 Environmental Justice.

Concern ID: 61938

The EIS identifies and acknowledges that there are low-income and minority communities that might experience disproportionately high and adverse economic impacts as a result of the proposed Project, particularly as such impacts relate to commercial and subsistence fishing.

Response ID: 16296

The EIS Chapter 4, Section 4.15 Environmental Justice acknowledges that disproportionately high and adverse impacts on low-income and minority populations could occur in some communities where reductions in abundance of oysters, brown shrimp, and certain fish species are anticipated as a result of the proposed Project. These impacts would depend in part on the extent to which affected populations engage in or are heavily reliant on commercial and subsistence fishing for these species. The EIS Chapter 4, Section 4.15 Environmental Justice recognizes the presence of low-income and minority populations in communities that depend on shrimp and oyster fishing in Barataria Bay, including Grand Isle, Galliano, the Lafitte area, Barataria, Belle Chasse, Live Oak, West Pointe à la Hache, Ironton,

Grand Bayou, and Port Sulphur. However, as discussed in the EIS, there are insufficient data to correlate fisheries harvests with specific low-income and minority populations.

Consequently, the precise extent to which impacts on shrimp and oyster fisheries would affect specific low-income and minority populations cannot be determined.

CPRA has expanded and refined the Mitigation and Stewardship Plan, Appendix R1 to the EIS, since issuance of the Draft EIS and LA TIG's Restoration Plan based on community and resource agency input. The mitigation and stewardship measures now provide additional detail regarding specific efforts targeted at assisting low-income and minority populations in addressing the potential impacts of the Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62696

Oysters are not well adapted to prolonged periods of low salinity and would experience higher mortality and lower reproductive success as a result of the proposed Project.

Response ID: 16075

The commenter correctly notes the impacts on oysters from low salinity. As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the Draft EIS, operation of the proposed Project would result in a permanent, major adverse impact on oysters, due in large part to decreases in salinity.

To address Project impacts, CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). Mitigation measures aimed at oyster impacts include

establishment of new oyster seed grounds in appropriate areas of the basin, enhancing existing public and private seed ground, enhancement of broodstock reefs, and funding to support off-bottom oyster culture.

Although not being implemented to mitigate the effects of the MBSD, the LA TIG also continues to address oil spill related injuries to oysters through various non-Project-related restoration/fishery improvement actions, including: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, and the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS (Appendix R) were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62698

Brown shrimp are not well adapted to prolonged periods of low salinity and would experience higher mortality and lower reproductive success as a result of the proposed Project.

Response ID: 16076

The commenter correctly notes the impacts on brown shrimp from low salinity, as discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources; however, as noted in the Draft EIS, brown shrimp reproduce offshore and, although the number of shrimp surviving to reproduce may change, the reproductive success of surviving shrimp is not anticipated to change.

Overall, the Draft EIS anticipated a permanent, major adverse impact on brown shrimp from the proposed Project, due in part to reduced salinity in portions of the Barataria Basin.

Concern ID: 62777

Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).

Response ID: 16359

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62892

The proposed MBSD Project would create wetlands supportive of birds (bald eagles, spring and fall migrants, waterbirds, and marsh birds) and other wildlife that are experiencing a high rate of coastal land (habitat) loss.

Response ID: 16191

Chapter 4, Section 4.9.4.2 in Terrestrial Wildlife and Habitat of the Draft EIS, discussed the maintenance and creation of marsh that is projected to occur as part of the proposed Project, and identified that the net addition of wetlands would generally be beneficial to area birds. As identified in Section 4.12.3.2 in Threatened and Endangered Species of the Draft EIS, the creation and maintenance of wetlands could affect bald eagle aquatic foraging habitat and prey species, but would likely result in negligible effects on the bald eagle itself.

The potential benefits of the proposed Project to resources in the Gulf, including birds, are also described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan.

Concern ID: 62905

The wetlands in the birdfoot delta and species better adapted to high-salinity environments would be negatively affected.

Response ID: 16202

Wetlands in the birdfoot delta would be negatively impacted by the proposed Project as discussed in Chapter 4, Section 4.6.5 in Wetland Resources and Waters of the U.S. of the EIS. Brackish and saline marsh, as well as species better adapted to higher salinities, would generally be negatively affected in areas closer to the diversion where salinity decreases are expected to be pronounced (see Chapter 4, Section 4.10 Aquatic Resources of the EIS); however, as noted in Section 4.5.5.1 in Surface Water and Sediment Quality, the salinity in the birdfoot delta is actually anticipated to increase slightly with proposed Project operations. Adverse impacts to wildlife from operation of the proposed Project are also discussed in the EIS, and more information on these impacts can be found in Chapter 4, Section 4.9 Terrestrial and Wildlife Habitat. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62986

The Project would drive decreases in salinity that would reduce the overall health, survival, and reproduction of bottlenose dolphins that reside in the Barataria Basin, a species that was negatively affected by the Deepwater Horizon oil spill (NMFS, 2013). Some commenters felt that because of this, the Project should either not move forward or its operation should be altered.

National Marine Fisheries Service (NMFS). 2013. Roy Crabtree (NMFS) to Elizabeth Davoli (CPRA). <https://s3.documentcloud.org/documents/726710/national-marine-fisheries-service-comments-on.pdf>

Response ID: 16701

The concerns raised by the commenters about the projected decreases in salinity and resulting effects on Barataria Bay dolphins were considered in the Draft EIS. More specifically, Chapter 4, Section 4.11.5.2 in Marine Mammals of the EIS acknowledges that the proposed Project would likely have significant, adverse impacts to Barataria Basin dolphins, a species that suffered significant impacts from the DWH oil spill. This section also discusses the physiological changes caused by exposure to low-salinity water, the duration of those changes that leads to mortality, and the anticipated mortality of a large portion of the dolphin population in the Barataria Basin within the first decade. These sections of the EIS provide a more in-depth analysis of potential impacts to dolphins than the letter cited by the commenter.

The concerns raised by the commenters were also considered in the LA TIG's Draft Restoration Plan (see Section 3.2.1.5 [Collateral Injury]); the Final Restoration Plan has been edited consistent with changes made to the Final EIS and see below regarding new, related content included in Appendix R.

The LA TIG recognizes that any of the large-scale sediment diversion alternatives considered would potentially result in varying degrees of collateral injuries, including some high degree collateral injuries, to natural resources, like dolphins, that were injured by the spill (see the Executive Summary and Section 3.2.1.5 [Avoids Collateral Injury] of the Restoration Plan). The intended restoration of freshwater flows from the Mississippi River, which historically had characterized and shaped the Barataria Basin ecosystem before levee construction, would result in collateral injury to species that depend on the current higher-salinity conditions that exist without freshwater flows. However, without the proposed Project, there would also be adverse impacts to some of the same species due to large-scale wetland loss over time, as is anticipated from ongoing sea-level rise, subsidence, and other existing stressors, which is anticipated to reduce the suitability of habitat for many of the species that currently occur in Barataria Basin.

The LA TIG must weigh the potential for and extent of collateral injury against the benefits of the proposed Project (see Section 3.2.4 [Overall OPA Evaluation Conclusions] of the Restoration Plan for a discussion of how the LA TIG weighed the potential collateral injury of the proposed Project against its benefits). The LA TIG believes that a sediment diversion is the only way to achieve a self-sustaining ecosystem in the Barataria Basin that creates and maintains wetlands. As described in Section 3.2.1.6 (Benefits Multiple Resources – Alternative 1) of the Restoration Plan, this sustained ecosystem would be expected to benefit many fish and wildlife species in the basin, including many of those negatively affected by the spill, such as red drum, blue crab, white shrimp, Gulf menhaden, and migratory waterfowl. These benefits to fish and wildlife species also would translate to benefits to recreational users who watch, fish, or hunt those species. In addition, these benefits would not only accrue throughout the Barataria Basin but, through the transport of productivity, also in the offshore ecosystems of the northern Gulf of Mexico. By reestablishing deltaic processes, the proposed Project would be expected to enhance the ecological productivity of the estuary and improve food web dynamics that would provide benefit to the northern Gulf of Mexico ecosystem.

The LA TIG has selected the proposed Project as its Preferred Alternative in the Restoration Plan because it is critical to achieving the overall goals of the Wetlands, Coastal, and Nearshore Habitats Restoration Type in the Final PDARP/PEIS, which include providing benefits across the interconnected northern Gulf of Mexico ecosystem, and placing particular

emphasis on coastal and nearshore habitat restoration in the historical Mississippi River Delta plain in Louisiana.

Since release of the Draft EIS and the LA TIG's Draft Restoration Plan, the LA TIG has developed a new Marine Mammal Intervention Plan to further respond to and recognize expressed public concerns about the potential impacts of the proposed Project on marine mammals (see Appendix R5 to the Final EIS). The Plan outlines a spectrum of response actions ranging from recovery/relocation to no intervention to euthanasia. While the more severe actions (that is, euthanasia) may not offset the ultimate outcome of dolphin mortality associated with the proposed Project, it can alleviate animal suffering. Where relocation is possible (if it is possible), the goal would be to release dolphins into more hospitable habitat where any health impacts would be minimized.

In addition, in recognition that the proposed Project would likely result in significant marine mammal collateral injuries, and acknowledging the inability to fully avoid or mitigate collateral injuries, CPRA has designed and would implement a suite of stewardship measures to benefit dolphins in Louisiana (see Appendix R1 [Mitigation and Stewardship Plan] of the Final EIS for more details about these actions). CPRA has also updated marine mammal related monitoring and adaptive management activities since the release of the Draft EIS to include more details regarding strategies and protocols that would be used at the onset of operations to minimize impacts on dolphins, as well as the process through which operational data would be used to evaluate potential modifications to those strategies and protocols; see Appendix R2 (Monitoring and Adaptive Management Plan) to the Final EIS for more information.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans, including the additional Marine Mammal Intervention Plan, and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA

TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63013

The commenter asked that the Project proceed with caution, recognizing that these situations are not as straightforward as they may always seem. Modifying terrestrial ecosystems for the sake of a marine ecosystem can ultimately damage both. The commenter notes that their comments should not be considered as condoning the Project, but rather as a request that further thought be given to certain areas to ensure that the Project results in a fair and environmentally secure decision for all involved.

Response ID: 15960

The USACE and the LA TIG considered the best information and data available to them in the preparation of the EIS, which will be used by the USACE and the LA TIG in their respective decisions on the Section 10/404 permit application, the Section 408 permission request, and the LA TIG funding request. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. Appendix R2: Monitoring and Adaptive Management Plan provides details about the monitoring and adaptive management plans for the proposed Project.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63110

The commenters are concerned with the impacts that this proposed Project would have on threatened and endangered species in the area and indicated that there are likely to be minor to moderate adverse effects for the Kemp's ridley, loggerhead and green sea turtles, and the pallid sturgeon in the area.

Response ID: 16253

The adverse effects on these species from the proposed Project were further evaluated by the USFWS (pallid sturgeon) and the NMFS (sea turtles in Barataria Basin waters) in their Biological Opinions; the respective Biological Opinions have been included in Appendices O3 and O4 of the Final EIS. Both agencies have determined that the construction and operation of the proposed Project would not be likely to jeopardize the continued existence of these species. NMFS has authorized a take of up to 783 Kemp's ridley, loggerhead, and green sea turtles (total) per year (including up to 57 mortalities per year). The USFWS has authorized the loss (by death or serious injury) of 48 pallid sturgeon per year.

Concern ID: 63111

The EIS indicates that there are likely to be major indirect adverse effects on bald eagles, which may be exposed to contamination as a result of this proposed Project.

Response ID: 16255

No major impact is anticipated for bald eagles due to the proposed Project. As identified in Chapter 4, Section 4.12.3.2 in Threatened and Endangered Species of the Draft EIS, the proposed Project is anticipated to have a negligible to moderate, permanent, indirect, and adverse impact on bald eagles, with the potential for moderate adverse impacts if contaminants are present in the diverted water, the prey become contaminated, and bald eagles consume the contaminated prey; no related edits have been made in the Final EIS.

Appendix R1 (Mitigation and Stewardship Plan) of the EIS describes CPRA's proposed monitoring measures, including CPRA's agreement to monitor for contaminants, at the request of the USFWS. As discussed in Chapter 5, Section 5.3 Fish and Wildlife Coordination Act Report Recommendations of the EIS, CPRA has agreed to a conservation recommendation proposed by USFWS that requires CPRA implement an adaptive sampling plan to detect potential contamination that could impact bald eagles.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be

required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:1913

Andrew Mayer

We need to start taking actions to help save what is left of our marsh. the Barataria diversion is a reasonable plan. No plan will make everyone happy but we need to stop talking and start diverting

Concern ID: 63334

The proposed MBSD Project would maintain and restore coastal lands and should move forward.

Response ID: 16291

The commenter's statement of support is acknowledged. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Correspondence ID:1914

Form Letter 5

As a member of the Coalition to Restore Coastal Louisiana, I am writing in support of the Mid-Barataria Sediment Diversion.

CRCL was established over 30 years ago and has advocated for the construction of sediment diversions to restore coastal Louisiana from the time our first reports were published in the 1980s. These projects have been a cornerstone of restoration plans for decades. I am very excited that we have finally reached this important milestone.

I live in coastal Louisiana, and I am very concerned about the land loss that I have seen on the coast in my lifetime. I believe that it is critical to use the best available science to advance decision making and work to restore large areas of the coast as quickly as possible. Our coast is rapidly disappearing, and this loss threatens our communities and way of life.

The Barataria Basin was hit hard by the Deepwater Horizon oil spill, which exacerbated decades of saltwater intrusion, sea level rise and subsidence. The health and stability of this basin are vital for a range of ecosystems that provide habitat for wildlife and wetlands that offer protection from storms for communities to the north.

I believe that the preferred alternative as outlined in the Draft Environmental Impact Statement (DEIS) for the Mid-Barataria Sediment Diversion is the appropriate solution for rebuilding the Barataria Basin. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon oil spill settlement to construct this project, as ecosystems that were injured by the oil spill will greatly benefit from the diversion.

With that in mind, I ask the following of the Army Corps and Louisiana Trustee Implementation Group:

- Select the preferred alternative in the Draft Environmental Impact Statement: Reconnecting the river to nearby wetlands through this project provides our greatest opportunity to avoid a devastating future for Louisiana's communities, wildlife and economy. The Mid-Barataria Sediment Diversion is the cornerstone of Louisiana's Coastal Master Plan and will help support and enhance the lifespan of other coastal restoration and protection projects.
- Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan: As Barataria Basin continues to recover from the devastating impacts of the oil spill, this project is vital to restoring the health and function of the entire ecosystem. The Mid-Barataria Sediment Diversion is the single largest ecosystem restoration project in the history of the United States. Combined with other proposed restoration projects, the Mid-Barataria Sediment Diversion would build and preserve more than 17,000 acres of wetlands over the next 30 years to restore critical wetland habitat injured by the oil spill. It is exactly the scale needed to address the very serious challenges facing Louisiana's coast.

As the project advances, I urge federal and state decision makers to consider the following:

- Center community needs in planned mitigation and stewardship efforts. This project will have many positive, long-term benefits for coastal communities, including increased storm surge protection from restored wetlands, job creation and regional economic impact during construction, and increased productivity of natural resources. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. We

applaud the commitment of approximately \$300 million by the Federal Trustees and Louisiana's Coastal Protection and Restoration Authority to address impacts that could result from the construction and operations of the project. We encourage the development of a robust stewardship and mitigation plan that addresses any potential impacts that may occur and ensures that no communities or residents bear an unjust burden as a result of the project. The Trustees must work proactively and collaboratively with potentially impacted communities to develop and implement ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning and implementation processes.

- Commit to developing a robust adaptive management program: To ensure the project meets its restoration goals in response to changing environmental conditions, I encourage the development and implementation of a robust adaptive management program that incorporates knowledge gained from monitoring of the project over time and also considers input from key stakeholders. The adaptive management program should include protocols for transparent decision-making regarding project operations and accessible communication of how those decisions are changing the environment.

We have no time to lose to restore our coast, which is why I support the preferred alternative outlined in the DEIS and the expenditure of Deepwater Horizon settlement money to pay for the project's construction and associated mitigation and stewardship activities.

Concern ID: 61716

The ongoing loss of Louisiana's coastal wetlands makes communities increasingly vulnerable to stronger hurricanes and sea-level rise and threatens the health and stability of the entire Barataria Basin upon which a number of communities, wildlife, fish nurseries, sportsman culture, economy, and vital resources depend.

Response ID: 16026

The importance of maintaining wetlands for the protection of coastlines, coastal communities, wildlife resources, and recreation was considered in the Draft EIS in Sections 3.6 Wetland Resources and Waters of the U.S., 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, and 3.16 Recreation and Tourism.

Concern ID: 61756

The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.

Response ID: 15891

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment

Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not

know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62675

Commenters noted that the impacts of the DWH oil spill on wetlands, wildlife, birds, communities, and land loss are still felt by this region and in particular, Barataria Basin where 95 percent of the oiling occurred. These impacts are exacerbated by decades of saltwater intrusion, sea-level rise, and subsidence.

Response ID: 16497

The impacts of the DWH oil spill were considered in the Draft EIS. For example, Chapter 3, Section 3.6.2 Wetland Loss of the EIS notes the ongoing impact of the DWH oil spill on wetlands, as well as ongoing saltwater intrusion, sea-level rise, and subsidence. Section 3.10.5.2 Key Fish and Shellfish Species of the EIS provides an overview of the adverse impacts of the oil spill on key aquatic species within the Barataria Basin.

The LA TIG agrees with the commenters that the impacts of the DWH oil spill are significant in this region and thus the LA TIG is committed to continuing to plan and implement significant restoration projects like the LA TIG's Preferred Alternative in the Restoration Plan. The LA TIG's Restoration Plan focuses on restoring wetlands, coastal, and nearshore habitats in the Barataria Basin. These habitats are critical components of the broader northern Gulf of Mexico ecosystem and suffered the greatest degree of oiling in Louisiana due to the DWH oil spill.

Concern ID: 62801

State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.

Response ID: 16658

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63179

Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.

Response ID: 16556

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

Concern ID: 63337

A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.

Response ID: 16294

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 63693

Commenter requests that the EIS and Mitigation Plan include more details about EJ mitigation measures specifically related to the construction of the diversion.

Response ID: 16506

The Draft EIS considered impacts to low-income and minority communities due to Project construction in Chapter 4, Section 4.15.3 Construction Impacts in Environmental Justice. The majority of construction impacts would be experienced within 0.5 miles of the Project construction footprint. The nearest community to the construction footprint is Ironton, which has a majority African American population. As explained in the EIS, populations in Ironton would experience minor to moderate, temporary, adverse impacts due to increased noise levels, dust and transportation delays during the approximately five-year construction period (see Chapter 4, Section 4.15.3.2 Applicant's Preferred Alternative).

CPRA committed to implementing best management practices (BMPs) to minimize construction impacts in the EIS in Chapter 4, Section 4.27.1 (Avoidance and Minimization) and Appendix R1 (Mitigation and Stewardship Plan); additional information on BMPs is also included in the Mitigation Summary Table in Appendix R3. In addition, since publication of the Draft EIS and the LA TIG's Draft Restoration Plan, CPRA undertook additional outreach to low-income and minority communities potentially affected by the Project to solicit their feedback regarding the mitigation and stewardship measures proposed by CPRA. Based on the feedback received through that process and other sources of public comment, CPRA updated the Final Mitigation and Stewardship Plan to include those measures that CPRA would implement if the Project is approved and funded (see Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and

Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:2275

Adrian Burke

Dear U.S. Army Corps of Engineers, New Orleans District,

Please support the Mid-Barataria Sediment Diversion project to benefit the people and wildlife of Louisiana.

Sincerely,

Adrian Burke

New York, NY 10019

Concern ID: 63332

A large number of commenters expressed general support for the proposed Project.

Response ID: 16288

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Correspondence ID:3457

Lili Tran

My name is Lili Tran. I am 18 years old and I will be attending college next school year. With the release of freshwater, it will heavily affect my family's financial situation. My father is the only person who is supporting the family right now, so that means my life, my brother's life, and even my mom's life will be affected. My dad will be making less money because the production of fish will be less. Fishing for shrimp is our only source of income and I'm asking for the release of freshwater to be halted.

Thank you,

Lili Tran

Concern ID: 62077

The proposed MBSD Project would put an economic burden on local commercial fisherman and related businesses including those who fish for oysters, shrimp, crawfish, crabs, and alligators. Altogether, Louisiana's commercial fisheries provide approximately 35,000 jobs for Louisiana residents and produce and sell \$2.4 billion of seafood annually. Fisherman would lose their source of income and livelihood. The diversion would displace so many Louisiana workers, and would further dampen a weak south Louisiana economy.

Response ID: 16242

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated with the proposed Project. Negligible to minor beneficial impacts are anticipated on blue crab and white shrimp, and moderate beneficial impacts are anticipated on Gulf menhaden, under the Applicant's Preferred Alternative. As discussed in Chapter 4, Section 4.9.4.2.2.3 in Terrestrial Wildlife and Habitat, minor beneficial impacts are anticipated on alligator populations under the Applicant's Preferred Alternative. The EIS acknowledges that communities reliant on employment and expenditures associated with the shrimp and oyster fisheries would be adversely impacted by the proposed MBSD Project.

CPRA has developed a plan to mitigate some potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)

- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62782

A large number of commenters expressed general opposition to the proposed Project.

Response ID: 16364

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable

harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

April 8, 2021

Mr. Brad LaBorde
Attn: CEMVN-ODR-E, MVN-2012-2806-EOO
7400 Leake Avenue
New Orleans, LA 70118

Dear Mr. LaBorde:

I have reviewed the Draft Environmental Impact Statement for the Proposed Mid-Barataria Sediment Diversion Project, Plaquemines Parish, Louisiana, and I have the following comments:

- I support the proposed project. It reflects the correct approach to addressing the problem of wetland loss in the Mississippi River Deltaic Plain.
- However, this DEIS has many problems. First, the authors are clearly not objective about the questions/issues surrounding the proposed project, being clearly opposed to the proposed project. This is not appropriate. Second, the authors do not understand the environmental problem, or its solution. They seem ignorant of The Delta Cycle, and its implications.
- The DEIS consistently, incorrectly reiterates conclusions that the proposed project will exacerbate “tidal flooding”. While the proposed project may increase water surface elevations, this is not “tidal flooding”.
- The DEIS arbitrarily ignores potential project impacts to estuarine species with lower salinity tolerances, and even more problematic, ignores likely positive impacts to freshwater fish, shellfish, and wildlife.
- The DEIS preferentially favors perspectives on controversial scientific issues surrounding Mississippi River reintroduction, that assert that reintroduction will do more harm than good. This is not objective, and is unacceptable.
- Please see the attached comments for details. I would have provided even more detailed comments, but my life requires that I attend to something other than this review.
- Do not move forward with a Final EIS until these problems have been corrected.

Sincerely,
Kenneth G. Teague, PWS (emeritus), Certified Senior Ecologist
Austin, TX

Comments

Mid Barataria Sediment Diversion

Kenneth G. Teague, PWS (emeritus), Certified Senior Ecologist

General Comments

- I generally support the proposed action. However, this DEIS has many flaws, which should be corrected prior to finalization of the EIS.
- This DEIS was written by a team that is not objective regarding the proposed project. They clearly oppose it, while there are clearly reasons to support it. In addition, there are numerous examples of serious errors which appear to reflect a clear bias in opposition to the project, as well as a lack of understanding of the Mississippi River Delta.
- The DEIS fails to properly convey the significance of the problems this proposed action is intended to address, or of this proposed solution. More specifically, the DEIS fails to capture the significance of these within the context of The Delta Cycle. This idea has probably been best communicated by van Beek and Gagliano (1984; see Figs. 1, 2; paper forwarded). Do not underestimate the importance of putting both the problems and the proposed solution in proper context of this idea. Many of the conclusions made in the DEIS fail to consider the implications of this critically important idea. The entire DEIS, the entire proposed Mid-Barataria Sediment Diversion, and in fact, the entire Louisiana coastal protection and restoration program must be revised to acknowledge the fundamental importance of this idea, and to frame conclusions within this context.
- The DEIS repeatedly (*ad nauseum*) erroneously refers to water surface elevation increases that may be partly increased by operation of the diversion, as *tidal flooding*. These potential water surface elevation increases are the cumulative result of diverted Mississippi River water, true astronomic tide, and meteorologic tide (e.g. wind driven). To refer to this as *tidal flooding* is simply incorrect. Furthermore, the DEIS suggests that operation of the diversion is primarily responsible. This is not correct either. The DEIS must correctly and honestly attribute the risks of flooding due to various physical factors. Finally, the DEIS seems to assume that the diversion will be operated, regardless of flooding risk, which is not necessarily the case, and should not be the case. Flooding risk due to operation of the diversion should be estimated based on an assumption that predictable flooding risk would result in closing of the structure temporarily, reducing such risk attributable to operation of the diversion.
- I believe the DEIS massively overstates the negative impact of the proposed diversion on wetlands in the Mississippi River birdfoot delta. The information provided in Chapter 2 regarding diversion flows at given Mississippi River flows, is confusing, but I think it indicates:
 - At Mississippi River flows of 50,000 cfs or less, 5,000 cfs would be diverted.
 - At Mississippi River flows of 450,000 cfs, 25,000 cfs would be diverted.
 - At Mississippi River flows of 1,000,000 cfs, 75,000 cfs would be diverted.
 - This seems to suggest, at least from a simplistic analysis, that between 6 and 10% of the flow of the river would be diverted, with larger percentages during low flows in the river.
 - ***So how can a diversion of between 6 and 10% of the flow of the river, decrease wetlands in the birdfoot delta by 45%? This needs to be very carefully explained, in great detail.***
 - I strongly suspect that the negative effect of the proposed diversion on the bird foot delta wetlands has been vastly overestimated.

- The analysis of the proposed project's impacts on fish, shellfish, and wildlife, improperly focuses exclusively on estuarine/marine fisheries. The required objective analysis must include consideration of the proposed project's effects on freshwater fish and wetland and upland wildlife, including catfish, bass, crappie, sunfish, gar, *Rangia* clams, waterfowl, wading birds, colonial nesting birds, neotropical migrants (birds), furbearers, alligators, white tail deer.
- The proposed project is estimated to kill many dolphins. However, do we see similar dolphin deaths in and near the birdfoot delta? If not, why not? Similarly, do we see similar dolphin deaths in Atchafalaya and Fourleague Bays? If not, why not? Why would we expect to see many more dolphin deaths from the proposed project than from these Mississippi River outfalls?
- I did not have time to read all chapters and appendices, but I did not see references to commitments to monitor the proposed project effects. Do not publish a final EIS unless, and until it includes commitments to monitor the following:
 - Structure operations
 - Flow and water quality (TSS, DO, nutrients, fecal coliform) through the structure
 - Wetland types, area in Barataria Basin, over time
 - Water surface elevations in Barataria Bay
 - Water quality in Barataria Bay
 - Salinity, DO, nutrients, TSS, fecal coliform, chlorophyll a/other pigments
 - Sediment quality (contaminants) at areas accreting near the diversion
 - Fish and shellfish abundance (estuarine and freshwater) in Barataria Bay
 - Oyster reef parameters in Barataria Bay
 - Benthic community in Barataria Bay
 - SAV in Barataria Bay
 - Finfish, oyster contaminant concentrations (periodic)
 - Shellfish harvest restrictions
 - Identical monitoring programs in 2 additional reference basins- 1 representative of an abandoned delta lobe, and 1 representative of an active delta lobe

Specific Comments

Abstract

- Project purpose statement is odd.

Executive Summary

- Marsh terrace outfall features- Is there any proof these function as proposed? Have simulations been done? Has the concept and specific designs been reviewed by deltaic geomorphologists? If not, such efforts must be done prior to including these features. It is my impression these features are based on “best professional judgment” and may or may not work as imagined.
- ES. 4 Potential Environmental Impacts
 - p. ES-6; last paragraph in this section: This description of the nature of impacts is fundamentally flawed. Who decides whether an impact is adverse or beneficial? What are the criteria for these decisions?
 - In this case, the impacts cause the affected habitats and ecosystems to revert from those of an old delta lobe that was abandoned long ago, due to human intervention, and thus has been degrading for a long period of time, to those of a young, active delta lobe. The decisions regarding whether these ecosystems and habitats that are characteristic of either abandoned, degrading delta lobes, or active, growing ones, should be considered "adverse" or "beneficial", should only be made within the context of an understanding of natural deltaic processes, and specifically, the concept of "delta switching". Major delta lobes are naturally occupied and abandoned by the river, over and over, over geologic time. One or two active delta lobes are always required for the delta to persist over time. An active delta is dominated by freshwater, large sediment loads, and active sediment deposition. This results in an active deltaic, freshwater ecosystem/habitat. These ecosystems/habitats do not support the same fauna as do abandoned, degrading delta lobes. While a normally functioning delta includes one or more active delta lobes, it also includes several other, older, abandoned, degrading delta lobes. These latter delta lobes have higher salinity water, low sediment loads, and flora and fauna that are characteristic of higher salinity waters, including estuarine aquatic species of very high commercial and recreational value. It is the affects of proposed river diversions on these high value species, which typically result in conclusions that diversions will have adverse impacts. Such conclusions are fundamentally erroneous however, since functional deltas require some active deltas, and some abandoned, degrading ones, at all times, and these cannot remain fixed over very long periods of time.
 - See van Beek and Gagliano (1984) and Roberts (1997).
 - Geology and Soils: Really? What is the dredging for? It sounds like the impacts to the natural environment- separate from its intended effect of restoring deltaic function- are overstated here. This is also confusing as it is not clear whether this means the dredging will impact the artificial levee, or the natural environment.
 - p. ES-7; 1st complete paragraph; last 2 sentences: What this should also say, is that the diversion is expected to actually decrease the rate of loss of existing marsh, in addition to creating new marsh.

- Last paragraph (this section): I believe the DEIS massively overstates the negative impact of the proposed diversion on wetlands in the Mississippi River birdfoot delta. The information provided in Chapter 2 regarding diversion flows at given Mississippi River flows, is confusing, but I think it indicates:
 - At Mississippi River flows of 50,000 cfs or less, 5,000 cfs would be diverted.
 - At Mississippi River flows of 450,000 cfs, 25,000 cfs would be diverted.
 - At Mississippi River flows of 1,000,000 cfs, 75,000 cfs would be diverted.
 - This seems to suggest, at least from a simplistic analysis, that between 6 and 10% of the flow of the river would be diverted, with larger percentages during low flows in the river.
 - ***So how can a diversion of between 6 and 10% of the flow of the river, decrease wetlands in the birdfoot delta by 45%? This needs to be very carefully explained, in great detail.***
 - I strongly suspect that the negative effect of the proposed diversion on the bird foot delta wetlands has been vastly overestimated.
 - Last sentence (this paragraph): What kinds of projects does this allude to? Have they been demonstrated to work as proposed?
- Surface Water and Coastal Processes
 - What are “tidal values”? Are these related to the incorrect concept you repeatedly mention in the DEIS, “tidal flooding”?
- Bed Elevations: Explain what these are- bed of what? River? Estuary? Wetland?
- p. ES-8; 1st complete paragraph: Has this been observed at other diversions?
- Water Levels; 1st paragraph: Explain why we care about water levels first. If its because it can be associated with increased duration and intensity of flooding of wetlands, then also point out that absolute increases in water surface elevation may be deceptive, since accretion is occurring, and therefore the elevation of the sediment/soil surface is increasing as well. Or is it because of concerns for flooding of human infrastructure? Do these predictions represent only the water surface elevation increase attributable to the diversion?
- 2nd paragraph: Why would anybody care about this? Its very important to explain. It is not obvious.
- Tides, Currents, and Flow
 - 2nd sentence: Explain! Which aquatic species? Estuarine/marine? Well then while such changes might be considered adverse to these species, the change may not be adverse in general, since these species reflect an abandoned, and degrading delta lobe. Your correct understanding of the delta cycle is critical to an accurate presentation of whether the changes are adverse or beneficial.
 - 3rd sentence: But elsewhere you state repeatedly that the diversion will increase *tidal flooding*. What is *tidal flooding*? What are *tides*, in this context specifically? Your conclusion is not quite accurate- the diversion will dampen the tidal signal in close proximity to the diversion.

- p. ES-9
 - 1st complete paragraph; 1st sentence: Impacts on the flow of the river will not be permanent. They will be intermittent, and variable, since that is how the diversion will be operated.
 - Last sentence: How will these currents negatively affect the pallid sturgeon? Are you sure? Have you researched this adequately? Do you know what the current speeds will be? Do you know the swimming ability of pallid sturgeon? Demonstrate that you have properly drawn this conclusion, in detail.

- Surface Water and Sediment Quality
 - 2nd sentence: I seriously question the validity of this prediction. At high river flows, the birdfoot delta will be overwhelmed by freshwater, regardless of the 6-7% reduction in flows. At low flows the diversion still only represents a 10% reduction in river flow. Diversion at low flow is when the diversion is most likely to affect salinity in the birdsfoot delta, but even that is questionable, given the relatively low magnitude of the decrease. Prove your assertion, in detail.
 - 4th sentence: While this affect is likely to occur, it is not permanent- first, you acknowledge that fecal coliform concentrations would only occasionally exceed water quality criteria- second, it would not occur when you turn the diversion off, or down. You also are not clear about just what the effect actually is. Fecal coliform bacteria don't harm oysters- they consume them. They do harm people who eat uncooked or improperly cooked oysters though. The state will probably designate such areas as off limits for harvest. So it probably isn't a human health problem either. It is a fishery problem however. It is important to be clear about this.
 - 5th sentence: Just what will the impact of the proposed project be on nitrogen, phosphorus, dissolved oxygen (DO), total suspended solids concentrations, and sulfate? Will it increase or decrease each of them? How likely is it that water quality criteria will not be met? What other implications are there for these changes? This is very important and completely lacking here.
 - Last sentence: While I support diversion, I believe there is reason to believe this statement is too bold, and that there may be a risk of some degree of contaminated sediments being loaded into the receiving area near the diversion site. Sediments deposited in the Mississippi River in some locations in the birdfoot delta have concentrations of PAHs that are of concern. In addition, some have suggested that mercury could possibly pose a risk for higher predators, such as bald eagles. This question was crudely evaluated for the proposed Maurepas diversion, but the report (and several others) has been removed frm the CWPPRA projec web page. Sediment monitoring for a broad suite of contaminants is recommmended near sites of active deposition. It may be a good idea to occasionally (pre-project + every 5 years?) monitor mercury (or even multiple contaminants) in fish- specifically those species targeted by bald eagles in an active delta environment.

- Wetland Resources and Waters of the US
 - This section fails to properly convey the significance of the problems this proposed action is intended to address, or of this proposed solution. More specifically, it fails to capture the significance of these within the context of The Delta Cycle. This idea has probably been best communicated by van Beek and Gagliano (1984; see Figs. 1, 2; paper forwarded). Do not underestimate the importance of putting both the problems and the proposed solution in proper context of this idea.
 - 2nd sentence: The proposed project would also benefit brackish marshes.
 - 3rd sentence: The proposed project would also benefit wetlands by providing additional nutrients, as mentioned earlier in this paragraph.
 - p. ES-10; 1st paragraph: I seriously question the validity of this prediction. At high river flows, the birdfoot delta will be overwhelmed by freshwater, regardless of the 6-7% reduction in flows. At low flows the diversion still only represents a 10% reduction in river flow. Diversion at low flow is when the diversion is most likely to affect salinity in the birdfoot delta, but even that is questionable, given the relatively low magnitude of the decrease. Prove your assertion, in detail.
 - 2nd paragraph: This makes no sense. The operating plan for Davis Pond should be reconsidered, and should probably be changed to produce a new plan based on coordinated operation of both diversions to maximize environmental benefits. This EIS should consider several additional alternatives based on this concept.
 - 3rd paragraph: Define "beneficial impacts on the spread of invasive species". So then, this is actually an adverse impact on the environment. You need to be very clear about this. Currently, you are not. What invasive species do you have in mind?
 - You must also discuss the implications of not reconnecting the river to its delta, which you do not. What you are suggesting here is analogous to amputating your leg because the flow of blood to the leg might allow a pathogen in the blood to reach the leg. Your argument is ridiculous.
 - p. ES-11; Terrestrial Wildlife and Habitat: This section doesn't even mention any terrestrial wildlife species. It only mentions waterfowl and alligators, both of which are wetland/aquatic species. This is a really fundamental error. The proposed project's impacts on white tail deer and feral hogs should probably be assessed.
 - 2nd sentence: This is very confusing. I assume that what you are saying is that some species would be positively affected, and some would be negatively affected. You need to put this in context of the delta cycle- in other words, more salt tolerant species are reflective of an abandoned, degrading delta lobe, while less salt tolerant species are more representative of an active, freshwater delta.
 - 3rd sentence: First, see comment above. This entire discussion needs to be removed and placed under discussion of impacts to wetland/aquatic species. In addition, why did you limit your consideration to only these species? What about muskrat? Nutria (unfortunately)? Amphibians? Other reptiles? It wouldn't take much to more adequately characterize the actual ecological (biological) changes the diversion would create.
 - Aquatic Resources: First, the authors need to accurately classify the ecological habitats and species that are relevant to this proposed project. Aquatic resources include freshwater and estuarine aquatic habitats and organisms- not just estuarine. In addition, wetland habitats are aquatic, but are distinct from "open water" habitats. Second, this discussion must be fundamentally revised to explicitly acknowledge, and highlight, that these changes must all be considered in the context of the delta cycle.

- 2nd sentence: What hard bottoms will the proposed project create? I assert the proposed project will not create any hard bottoms. It will probably affect oyster reefs- some positively, some negatively. This represents a serious lack of understanding by the authors. Sorry, but aquatic fauna do not respond directly to nutrient concentrations. Remove this assertion. The Mississippi River Delta is not an oligotrophic stream, nor has it ever been.
- p. ES-12; 1st complete paragraph: Are you referring here to both animals and plants? In the paragraph above you refer only to animals. The paragraph below is also focused on animals only. If you did not intend to also focus on plants in this paragraph, why do you focus so much on SAV? It does not make sense. Secondly, you emphasize possible negative effects of the proposed project, but then acknowledge that over time the effects will be very positive. Sorry, but this is simply erroneous. It is common knowledge that Mississippi River water greatly stimulates SAV growth in the Delta. There are no seagrasses here, so there is no reason to be concerned with effects of river water on SAV. Once again, the authors demonstrate their lack of fundamental understanding of the Mississippi River Delta.
- 2nd complete paragraph; 1st sentence: As written, this is not correct. It is true for "recruitment of estuarine fauna", but not for freshwater fauna. Please explain why you are so fixated on effects on estuarine fauna, which are representative of an abandoned, degrading delta lobe? These effects can only be properly understood here within the context of the Delta Cycle. The DEIS must also assess the impacts of the proposed project on freshwater aquatic fauna, such as crawfish, several species of catfish, largemouth bass, crappie, sunfish, Rangia clams, alligator gar, amphibians, reptiles? By ignoring these species, the authors signal their clear bias.
- 2nd sentence: How would the diversion affect phytoplankton standing stocks and productivity, and how would this affect oysters? Increased fecal coliform concentrations will not adversely affect eastern oysters. They would adversely affect the people who eat them, and the economics of the oyster fishery. This is not a trivial matter. Your assertion is fundamentally wrong. You should also evaluate the potential impacts to white shrimp.
- Marine mammals; 2nd sentence: Do dolphins demonstrate low survival in the Atchafalaya Delta, Wax Lake Delta, Atchafalaya Bay, and birdfoot delta? Having personally spent many days in the Atchafalaya Delta and Atchafalaya Bay, I can tell you that there are no more-and probably fewer- dolphin carcasses observed in these environments than in more saline environments. My hypothesis is that dolphins avoid, or limit their use of freshwater environments. I have personally witnessed extensive dolphin use of the Oyster Bayou area of Fourleague Bay, an environment that experiences dramatic changes in estuarine/freshwater dominance on several time scales. There was no evidence of higher dolphin mortality in this area either, compared to more traditional higher salinity estuarine habitats. Again, my observations regarding dolphin use of Oyster Bayou supports my hypothesis that they avoid or limit their use of freshwater environments. I believe the DEIS's conclusions in this regard are unfounded and should be removed.
- 4th sentence: Please explain how wetland loss causes adverse impacts on health and reproduction of dolphins, in detail. Also explain how a project that creates wetlands, decreases wetland loss rates, and results in many more net acres of wetlands than the no action alternative, results in wetland loss which has an adverse impact on health and reproduction of dolphins. Exactly how does the proposed project cause adverse impacts on dolphin health and reproduction by affecting residual effects from the DWH oil spill?

- p. ES-13; Threatened and Endangered Species; 2nd paragraph; 1st-2nd sentences: Have pallid sturgeon been found here? If not, you should look for them before you proclaim they are at risk. I did. I was responsible for having the corps look for pallid sturgeon near the proposed Maurepas Diversion. I didn't go around loudly proclaiming this risk without having it investigated a little first. Remove any conclusions regarding pallid sturgeon risk until you confirm their presence near the proposed diversion location.
- 3rd sentence: Explain the assertion that the proposed project may "increase commercial shrimping interactions". Exactly what does this mean? Similarly, what exactly is meant by "presence of core use habitat in the Barataria Basin (Kemp's ridley)? It is not at all clear what either of these assertions mean. Explain how the proposed project will cause an increase in commercial shrimping interactions, presumably with sea turtles. Why would such an increase occur if shrimp populations in the estuary are expected to decline very significantly as a result of the proposed project? In addition, you have ignored a likely positive effects of the proposed project on Kemp's ridley sea turtle, due to the project's likely positive impacts on its preferred prey, blue crabs.
- 4th sentence: I strongly disagree with this conclusion- the proposed project will greatly increase mudflat and sand flat habitat in the new delta it creates. These habitats will be used by these species.
- 5th sentence: Provide detailed support for this conclusion. Elsewhere in this document you assert the proposed project would not load additional contaminants into the receiving area. I actually do think there is some risk of localized PAH loading, but there is a lot of uncertainty. Monitoring is needed. Note that EPA assessed this same question for the proposed Maurepas diversion and arrived at the opposite conclusion (i.e. no impact on bald eagles due to contaminants). Curiously, the reports have been removed from the project website. What evidence is your conclusion based on? EPA at least made a meager effort to try to estimate the risk objectively. This DEIS must make at least this much effort. I see no evidence that it has done so.
- 6th sentence: I strongly disagree with this conclusion that the proposed project will negatively impact manatee. Manatee like freshwater and feed on SAV. I believe it is almost certain that the proposed diversion will benefit manatee. This conclusion should be reviewed by an independent manatee expert.
- Socioeconomics: The proposed project does not affect "tidal flooding", so these conclusions are erroneous.
- p. ES-14; 1st paragraph: These conclusions are erroneous, since the proposed project does not affect "tidal flooding". Further, any risks of operating the diversion in advance of and during tropical storms can be mitigated by anticipating such storms and closing the structure until water levels have declined. Finally, the conclusion that the proposed project will adversely affect "subsistence fisheries" fails to acknowledge that there are subsistence fisheries based on freshwater fish and shellfish, which would benefit from the proposed diversion. Therefore, these conclusions are erroneous, or exaggerated.
- 3rd paragraph; last sentence: Shrimp fishermen do not limit their harvest to one species of shrimp. There is no preference for brown shrimp vs white shrimp. The DEIS clearly chose to focus on the proposed project's potential impacts to brown shrimp, and is all but silent regarding potential impacts to white shrimp. Coincidentally, impacts to white shrimp would be less than for brown shrimp, and may even be positive.

- p. ES-15; Commercial Fisheries; 2nd paragraph; last sentence: Shrimp fishermen do not limit their harvest to one species of shrimp. There is no preference for brown shrimp vs white shrimp. The DEIS clearly chose to focus on the proposed project's potential impacts to brown shrimp, and is all but silent regarding potential impacts to white shrimp. Coincidentally, impacts to white shrimp would be less than for brown shrimp, and may even be positive.
- 3rd paragraph; 2nd sentence: It is erroneous to suggest that substitution of white shrimp for brown shrimp by shrimpers would be limited. Shrimpers don't care if they catch brown shrimp or white shrimp- shrimp are shrimp to them!
- 3rd paragraph; last sentence: While this may be true, the authors fail to mention something that is equally true- without restoration of The Delta Cycle, all fisheries based on estuarine-dependent species eventually will crash, as the delta simply becomes part of the open waters of the Gulf of Mexico. To avoid discussing this is fundamentally irresponsible and unethical.
- Note that, again, consistent with the DEIS's general pattern of ignoring positive impacts of the proposed project, the DEIS fails to mention the proposed project's impacts on commercial trapping of furbearers.
- p. ES-16; 1st paragraph: This analysis and its conclusions is fundamentally flawed because it failed to consider potential impacts of the proposed project on freshwater finfish, which would likely benefit from the proposed project. Again, this is a reflection of the inherent bias of the DEIS and its supporting analyses. Is there a commercial fishery for bay anchovy? If not, potential project impacts on this species should not be discussed in this section.
- 2nd paragraph: I assert this conclusion seriously underestimates the likely true magnitude of these potential impacts, once again, reflecting the bias of this DEIS.
- 3rd paragraph; 1st sentence: First, again, the proposed project will not affect tidal flooding. Second, provide details supporting your assertion that water level changes due to the proposed project, and increased sedimentation will actually affect navigation.
- Recreation and Tourism; 1st paragraph: The authors must provide supporting evidence for their assertions. First, again, the proposed project will not affect “tidal flooding”. It may cause increased water surface elevations during operation, but the authors must provide supporting evidence for this assertion. In addition, they fail to mention that such effects can be minimized by proper operation of the diversion, such as by closing the structure when tropical storms are predicted, or when wind speeds and directions conducive to higher water surface elevations are predicted. In addition, the authors need to provide supporting evidence of their assertions that the proposed project will cause increased occurrence of invasive plant species.
- Once again, this DEIS fails to objectively and accurately assess the potential positive impacts of the proposed project. This section doesn't even mention the significant positive impacts of the proposed project on recreational waterfowl hunting or on whitetail deer hunting. This is a major omission.
- 2nd paragraph: The DEIS conveniently neglects to mention that the proposed project would have major beneficial impacts for freshwater recreational fishing. This reflects the DEIS's clear bias against the proposed project.
- p. ES-17; Public Lands; 1st paragraph; 4th sentence: This conclusion is erroneous. The proposed project would impact most of these public lands beneficially, by reducing the rate of wetland loss on them. Again, this is a reflection of the deep and consistent bias of this DEIS against the proposed project.

- Last sentence: Exactly how would the proposed project cause the loss of 35 acres of wetlands in Salvadore WMA? Timken is adjacent, so why Salvadore and not Timken? Both are far from any construction activity associated with the project. The proposed project will REDUCE wetland losses over a large area, so again, how could it cause this loss? I assert this is an erroneous conclusion, which should be changed. It is further evidence of the consistent bias of this DEIS against the proposed project.
- 2nd paragraph: While I agree that some loss here due to the proposed project is to be expected, the magnitude of the losses seems far in excess of the relatively minor reduction in Mississippi River flow and sediment load. I assert this is an erroneous conclusion, which must be changed. Again, this is consistent with the consistent bias in this DEIS against the proposed project. I do not believe this conclusion/assertion is supportable.
- Land Use and Land Cover; last paragraph, 1st incomplete paragraph p. ES-18: True, but it is also important to point out these preferences from the perspective of the delta cycle.
- p. ES-18; Public Health and Safety, Including Flood Risk Reduction and Shoreline Protection; 1st paragraph; 1st sentence: Again, the proposed project will not affect tidal flooding.
- p. ES-20; Hazardous, Toxic, and Radioactive Waste; 1st paragraph; 1st sentence: What is this risk assessment based on? My guess is its based on absolutely nothing. The Corps and the project sponsors have a responsibility to do a formal, limited phase 1 assessment of this risk. Did they do so? Firm conclusions such as provided here must only be provided when a formal, appropriately detailed assessment stand behind them.
- DEIS Chapter 4
 - 4.6.5 Operational Impacts
 - 4.6.5.1 Wetland Types and Extent
 - Applicant's Preferred Alternative
 - Nutrients, Soil Shear Strength: This discussion fails to properly capture the actual state of the science on these questions. The discussion ricochets between apparently strongly supporting the assertions of Turner, his students, and Swarzenski, that nutrient inputs will harm Louisiana coastal wetlands, to timidly acknowledging that perspective might not be correct. While this discussion includes robust citations supporting the Turner et al. Perspective, it includes few, if any citations of opposing views, though these exist. This is a tremendously important issue, which some will use to try to stop the project. The fact is, the science is not settled on this question, yet the Delta will degrade to marine conditions unless its connection to its river is restored. This analysis and presentation is seriously biased in favor of the Turner et al. concepts.
 - 4.10.4 Operational Impacts
 - 4.10.4.1 Submerged Aquatic Vegetation
 - Applicant's Preferred Alternative: While my review was very hurried, I did not see any acknowledgment of the well known fact that SAV in coastal Louisiana always responds very positively to Mississippi River diversion, and this fact is easily referenced. The DEIS has underestimated yet another major benefit of the proposed project.

- 4.10.4.4 General Impacts on Habitat and the Environment
 - Applicant's Preferred Alternative
 - Dissolved oxygen: Consistent with the entire approach of this DEIS, the assessment of potential project impacts on DO overestimate the likely impact. Barataria Bay is very shallow and well-mixed. Thus, it is unlikely low DO will occur, except in human-created deep holes. It is curious the authors chose to draw the conclusions they did on this, given that literally nobody ever acknowledges any impact of the ubiquitous dredging of giant holes all over coastal Louisiana to procure sediment for “marsh creation”. These holes almost certainly result in low DO, but nobody is willing to admit it, but propose a diversion, and its a different story.

Concern ID: 61720

The commenter requested that the EIS be revised to properly re-frame impact determinations within the context of the Delta Cycle. While a normally functioning delta includes one or more active delta lobes, it also includes several other older, abandoned, degrading delta lobes. These latter delta lobes have higher-salinity water, low sediment loads, and flora and fauna that are characteristic of higher-salinity waters, including estuarine aquatic species of very high commercial and recreational value. The proposed diversion's impact on these high-value species should not be considered adverse. Such conclusions are fundamentally erroneous because functional deltas require some active deltas, and some abandoned, degrading ones, at all times. One commenter explained that this idea has been best communicated by van Beek and Gagliano (1984) and Roberts (1997).

Van Beek, J.L., and S.M. Gagliano. 1984. *Renewal and Use of the Mississippi River Deltaic Plain*. *Water Science & Technology*. 16 (3-4), 699-705.

Roberts, H. 1997. *Dynamic Changes of the Holocene Mississippi River Delta Plain: The Delta cycle*. *Journal of Coastal Research*, 13 (3), 605-627.

Response ID: 16169

The commenter's suggestion to include a contextual description of the delta cycle was considered in the Draft EIS. Further, the commenter's concerns regarding the criteria used to evaluate the beneficial or adverse nature of impacts is acknowledged. To help address these concerns, additional discussions of the delta cycle, and the role that the diversion may play in this cycle, have been added to the Final EIS in Chapter 3, Sections 3.1.4.2 Barataria Basin and 3.2.1.1 Historical Context in Geology and Soils, and the literature mentioned in public comments has also been incorporated into this section. Additional discussion related to the Project's impacts on geomorphology and historic deltaic landforms has been added to the Final EIS in Chapter 4, Section 4.2.3.2.2.3 Geomorphology. It is important to note that, as identified in Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative, the No Action Alternative is compared to existing conditions to understand the anticipated changes in the environment that would occur irrespective of the proposed Project. Thereafter, the anticipated environmental consequences of the Project action alternatives are compared to the results of the No Action Alternative analysis. Section ES.1 Introduction and Authority of the Executive Summary in the Final EIS has been revised to include this clarification.

The EIS includes extensive resource-specific explanations of why impacts are considered either beneficial or adverse in Chapter 4, Section 4.2 Geology and Soils. Section 4.2.2 Guidelines for Geology and Soils Impact Determinations specifically explains resource-specific definitions for minor, moderate, and major impacts. To further address concerns related to the classification of impacts, the USACE has added text to the Final EIS in the Executive Summary, Section ES.4.1 Geology and Soils to provide a more thorough overview of both adverse and beneficial impacts. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the Project against its prospective benefits.

In making its NRDA decision for the proposed Project, the LA TIG would evaluate Project alternatives considering the OPA evaluation criteria in 15 CFR §990.54; public input; and proposed Project mitigation, stewardship, and monitoring and adaptive management measures.

Concern ID: 61768

The commenter stated that the Geology and Soils section of the Executive Summary is not detailed enough. For example, clarify what the 6 to 8 million cubic yards of dredging during construction is for and why it is described as a permanent, moderate, adverse impact; explain whether this dredging would impact artificial levees or the natural environment; and explain whether the dredged material placed in beneficial use sites would create as well as retain existing marsh. What this should also say is that the diversion is expected to actually decrease the rate of loss of existing marsh, in addition to creating new marsh.

Response ID: 16170

The commenter's concerns regarding dredging that would be undertaken for the proposed Project and the clarity of description of the proposed MBSD Project's impacts on land loss rates were considered in the Draft EIS. To help address the concerns related to dredging, additional details about the proposed Project's impacts on geology and soils during construction have been added to the Executive Summary, Section ES.4.1 Geology and Soils of the Final EIS. Chapter 4, Section 4.2.3.1 in Geology and Soils also includes details about why dredging during construction is required and an explanation of the intensity and adverse or beneficial nature of these impacts.

To address concerns related to descriptions of land-change impacts of the proposed Project, a discussion to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations has also been added. This discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

Concern ID: 61770

The commenter requested that the Geology and Soils section of the Executive Summary clarify what restoration projects the following sentence alludes to and whether those birdfoot delta restoration projects have been successful in the past: "These [landloss] impacts in the birdfoot delta may be partially abated by improving the capture of sediment that is lost to the Gulf through other targeted restoration projects."

Response ID: 16171

The issue raised by the commenter regarding the impact of other planned restoration projects that may abate projected land loss in the birdfoot delta due to diversion operations was addressed in the Draft EIS. Examples of reasonably foreseeable restoration projects aimed to retain sediment in the birdfoot delta are provided in Chapter 4, Section 4.25.2 (Geology and Soils section of Cumulative Impacts). The name of one of these restoration projects—the NRDA/CPRA-sponsored project Pass a Loutre Wildlife Management Area Crevasse Access Project approved in the LA TIG Final Restoration Plan and Environmental Assessment #4—has been added to the Geology and Soils section ES.4.1 of the Executive Summary and to Chapter 4, Section 4.2.3.2.1 in Geology and Soils, Operational Impacts in the Final EIS. The

successes of completed birdfoot delta crevasse restoration projects, such as the CWPPRA Delta Wide Crevasse Program, can be found on the CWPPRA website (<https://lacoast.gov/new/Default.aspx>).

Concern ID: 61771

The commenter expressed concern that the Geology and Soils section of the Executive Summary overstates the negative impact of the proposed diversion on wetlands in the Mississippi River birdfoot delta. Chapter 2 seems to suggest that between 6 and 10 percent of the flow in the river would be diverted from the birdfoot delta during operations. The commenter requested a more detailed explanation of how a diversion of between 6 and 10 percent of the flow of the river would decrease wetlands in the birdfoot delta by 45 percent. The commenter requested that this be explained in more detail.

Response ID: 16172

The commenter's concern regarding the percentage of Project-induced land loss in the birdfoot delta relative to the No Action Alternative was considered in the Draft EIS. To help clarify, a discussion to further explain currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations has been added to the Final EIS in the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology.

As pointed out by the commenter, the Applicant's Preferred Alternative would divert about 6 percent of the flow and about 6 percent of the sediment load of the river (as analyzed by the Water Institute of the Gulf). As shown in the EIS, Chapter 4, Section 4.2.3.2.2.1 Geology, Table 4.2-4, the Applicant's Preferred Alternative would result in increased land loss in the birdfoot delta by about 3 to 6 percent during the first 4 decades of diversion operations and by 45 percent after 50 years of diversion operations.

Concern ID: 61788

The commenter stated that the Surface Water and Coastal Processes section of the Draft EIS Executive Summary is not detailed enough and impacts summarized should be explained in more detail.

Response ID: 16418

The resource sections throughout Chapter 4 Environmental Consequences of the Draft EIS provide extensive detail for the impacts that are only summarized in the Executive Summary. The commenter should refer to Chapter 4 of the EIS for further explanations of the impact determinations and summaries presented in the Executive Summary. The requested level of detail is beyond the scope for the Executive Summary.

Concern ID: 61827

The Executive Summary, Section ES.4 (Surface Water and Sediment Quality) is not detailed enough. For example, clarify what criteria were used to classify proposed Project impacts on salinity, fecal coliform, and nutrients as minor, moderate, or major impacts. Also, compare potential water quality impacts with LDEQ water quality standards.

Response ID: 16432

The water quality information requested by the commenter was included in the Draft EIS. Chapter 4, Section 4.5 Surface Water and Sediment Quality provides detailed information regarding the guidelines for impact intensity determinations, the data reviewed to evaluate impacts, how proposed Project impacts on water quality compare to LDEQ water quality standards, and a detailed discussion of the evaluation of proposed Project impacts on surface water and sediment quality. These details are beyond the scope of the Executive Summary.

Concern ID: 61861

The description of the nature of impacts is fundamentally flawed. Clarify who decides whether an impact is adverse or beneficial and what the criteria for these decisions are.

Response ID: 15932

Early in the EIS process, USACE in coordination with the LA TIG and CPRA decided on an approach to evaluation of the environmental impacts for the EIS. As stated in Chapter 4, Section 4.1, Approach to Evaluation of Environmental Consequences, under NEPA, federal agencies must consider the potential environmental impacts, both beneficial and adverse, of the proposed Project and its reasonable alternatives, including direct, indirect, and cumulative impacts. During development of the EIS, it was considered whether the proposed Project would cause a significant adverse or beneficial impact on the human environment (defined as the natural and physical environment and the relationship of people with that environment [40 CFR 1508.14]). The CEQ regulations require consideration of both context and intensity when determining whether an effect is significant. Chapter 4, Sections 4.1.1 (Context) and 4.1.2 (Intensity) of the EIS set forth the criteria for context and intensity for determining impacts in the EIS. Resource-specific indicators for impacts are included for each resource in their corresponding sections within Chapter 4, Environmental Consequences of the EIS.

Concern ID: 61864

USACE and the Project sponsors have a responsibility to do a formal, limited Phase I Assessment of the Hazardous, Toxic, and Radioactive Waste risk. Firm conclusions must only be provided when a formal, appropriately detailed assessment stand behind them.

Response ID: 15931

The issues raised by the commenters were considered in the Draft EIS; therefore, no related edits have been made to the Final EIS. As indicated in EIS Chapter 3, Section 3.23 Hazardous, Toxic, and Radioactive Waste, a Phase I Environmental Site Assessment was conducted in January 2020 to identify any potential recognized environmental conditions (RECs) located in or adjacent to the Project area that have, or may have in the past, adversely impacted environmental conditions. The conclusions in Chapter 4 of the EIS are based on this assessment.

Concern ID: 61867

Commenter requested that the EIS explain whether there is any proof that the marsh terrace outfall features would perform and function as proposed in the Draft EIS.

Response ID: 15938

Chapter 2, Section 2.5 Step 3: Evaluation of Sediment Diversion Outfall Features of the EIS discusses the evaluation of sediment diversion outfall features as part of the screening

process for alternatives. Marsh terracing has been widely implemented in the past in the past as part of coastal restoration projects to build and retain marsh areas and the federal agencies represented on the LA TIG and CWPPRA Task Force have utilized or endorsed the use of marsh terraces. Marsh terraces are a design feature engineered to enhance deposition and retention of suspended sediments, reducing turbidity, increasing marsh-edge habitat, increasing overall primary and secondary productivity, and maximizing access for marine and estuarine organisms. To understand how the marsh terrace outfall features would perform as part of the MBSD Project, Delft3D Basinwide Modeling was used, which aided in informing the analysis as presented in Chapter 4 Environmental Consequences of the EIS.

Concern ID: 61875

The purpose and need is false and misleading and does not follow NEPA guidelines for a concise, basic, essential, and irreducible purpose. The statement is misleading by making the proposed Project itself part of the purpose. The DWH oil spill, including restoring for injuries caused by the DWH oil spill, has nothing to do with the proposed Project other than justifying its use as a source of funding.

Response ID: 15831

As described in Chapter 1, Section 1.4 Purpose and Need of the EIS, NEPA regulations (40 CFR 1502.13) state that an EIS “shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action.” The purpose and need statement should be clear and concise in order to facilitate development of a reasonable range of alternatives. USACE generally focused on CPRA’s purpose and need for the proposed Project and considered the public’s and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities), and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project’s purpose and need for the EIS.

Separate from the USACE process, as discussed in the PDARP/PEIS, the SRP/EA #3, and the Restoration Plan, the LA TIG found that impacts of the injuries from the DWH oil spill were particularly detrimental to the resources of the Barataria Basin, which were already in peril as a result of the separation of sediment-loaded river water by levees, subsidence and a changing climate. In the Barataria Basin, marshes already suffering from significant coastal erosion experienced heavy oiling and subsequently experienced double or triple the rate of marsh loss. The Final PDARP/PEIS (DWH NRDA Trustees, 2016a) documented the nature, degree, and extent of injuries from the DWH oil spill to both natural resources and the services they provide, and the nexus between those injuries and need for restoration within the Barataria Basin. Evaluating restoration strategies that could restore for injuries in the Barataria Basin, the SRP/EA #3 found that a combination of “marsh creation and ridge restoration plus a large-scale sediment diversion would provide the greatest level of benefits to injured Wetlands, Coastal, and Nearshore habitats and to the large suite of injured resources that depend in their life cycle on productive and sustainable wetland habitats” (LA TIG, 2018) in the basin and in the broader northern Gulf of Mexico. As a result, the LA TIG pursued the development of a large-scale sediment diversion, specifically the proposed Mid-Barataria Sediment Diversion evaluated in the EIS and Restoration Plan. The LA TIG’s Restoration Plan concludes that the proposed Project would best restore for injuries caused by the DWH oil spill by reconnecting and reestablishing sustainable deltaic processes

between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

Concern ID: 61886

Consider changing the operating plan for Davis Pond and coordinate both diversions to maximize environmental benefits.

Response ID: 15982

There are no plans at this time to change the operating plan for the Davis Pond Freshwater Diversion Project. As discussed in Chapter 5, Section 5.3 Fish and Wildlife Coordination Act Report Recommendations of the Draft EIS, as part of the Fish & Wildlife Coordination Act consultation, USFWS has recommended, and CPRA has agreed to develop a basin-wide operations and basin monitoring data repository to help in the general coordination among diversion operators, within their authorizations.

As part of the evaluation of the proposed Project and potential alternatives, the Delft3D Basinwide model runs and the EIS assumed operations of other diversions consistent with their current or anticipated operational protocols, including the Davis Pond Freshwater Diversion for the hydrodynamic and water quality simulations. The Davis Pond Freshwater Diversion was not included in the Delft 3D morphological modeling simulations.

Based on Delft3D Basinwide Modeling results, proposed MBSD Project operations are expected to reduce the frequency with which the Davis Pond Freshwater Diversion would be operated during certain months of the year to meet its current operational guidelines. Refer to Chapter 4, Section 4.5.7 in Surface Water and Sediment Quality of the EIS for further details on the projected number of days for the Davis Pond Freshwater Diversion opening. Potential impacts to the Davis Pond Freshwater Diversion will be further considered as part of the 408 process for the proposed MBSD Project.

Concern ID: 61910

The MBSD Project would help wildlife, fisherman, recreationalists, and hunters who depend on a healthy coast in the long term.

Response ID: 16240

EIS Chapter 4, Sections 4.16.4.2 and 4.16.5.2 in Recreation and Tourism describe anticipated effects of the MBSD Project on wildlife viewing, recreational fishing, hunting, and other recreational activities that utilize the Project area. As compared to the No Action Alternative, long term minor to moderate adverse impacts on-site accessibility, recreational boating, and boat-based recreational fishing due to increased tidal flooding at access points at Lafitte, Myrtle Grove, and Grand Bayou, as well as introduction and spread of invasive species, are anticipated. The proposed Project would also cause minor, permanent, adverse impacts on recreational fishing for spotted seatrout and moderate, permanent, beneficial impacts on recreational fishing for red drum throughout the basin. Beneficial impacts on hunting and wildlife watching due to an increase in wetland habitat in some areas of the Barataria Basin are also anticipated.

CPRA has developed a suite of mitigation and stewardship measures to help address and offset Project impacts, including those related to recreation (see the Draft Mitigation and

Stewardship Plan in Appendix R1 to the Draft EIS). In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 61914

The information provided in Chapter 2 Alternatives of the EIS regarding diversion flows at given Mississippi River flows is confusing.

Response ID: 16001

As described in the EIS, when the Mississippi River flows exceed 450,000 cfs, and the gates are fully opened, the diversion flow would increase to approximately 25,000 cfs, and thereafter flows would increase proportionally as the river flow increases up to maximum diversion capacity flow of 75,000 cfs when the river reaches a flow of 1,000,000 cfs. Chapter 2, Section 2.8.1.3 Project Operations in Action Alternatives Carried Forward for Detailed Analysis of the Final EIS has been revised to clarify the description of proposed Project operations.

Concern ID: 62098

Commenter expresses concern that the Draft EIS is biased against the Project, over emphasizing and/or over-reporting the potential negative impacts to certain fisheries (particularly brown shrimp) and understating the Project benefits and the likely outcomes if the Project is not implemented.

Response ID: 16252

The issues raised by the commenters were considered in the Draft EIS. The EIS follows NEPA guidance and presents the adverse as well as the beneficial impacts of the Project in an unbiased manner. The EIS was developed considering the best information and data available to USACE and the LA TIG at the time of writing.

In addition, the benefits of the Project are described in Section 3.2.1.6 Benefits Multiple Resources of the LA TIG's Restoration Plan.

Concern ID: 62188

The Draft EIS is not an objective analysis; the document has several errors which show a clear bias toward opposition to the proposed Project by favoring perspectives on controversial scientific issues surrounding Mississippi reintroduction that assert it would do more harm than good.

Response ID: 15767

The USACE and the LA TIG considered the best information and data available to them in their efforts to objectively evaluate the impacts of the proposed Project and its alternatives. Additionally, resource agencies with regulatory authority and subject matter experts for resources potentially impacted by the proposed Project engaged with USACE throughout the EIS development process to ensure an adequate and thorough analysis of Project impacts. Federal agencies that make up the LA TIG (NOAA, DOI, USEPA, and USDA) participated as cooperating agencies in the development of the EIS. The LA TIG intends to use the EIS to inform their decision under NRDA on whether to fund the implementation of the Project.

Concern ID: 62230

Commenter states that the EIS incorrectly characterizes an increase in water surface elevation as an increase in tidal flooding. Commenter notes that, in any case, increases in flooding are not due solely to the diversion, but instead are due to many factors.

Response ID: 15753

In the context of this EIS, the term "tidal flooding" is used to distinguish non-storm related coastal flooding from coastal flooding caused by storm surge and/or waves. The Draft EIS acknowledged that changes in water levels within the Barataria Basin are influenced by a number of factors, including winds, tides, sea-level rise, and subsidence. The Draft EIS also noted that floodplains within the Project area would continue to be subject to hydrological changes associated with relative sea-level rise, leading to increased water levels throughout the basin, regardless of the implementation of the proposed Project (see Section 4.20.4.2 Operational Impacts, Floodplains and Tidal Flooding). As described in the introduction of Chapter 4 Environmental Consequences the potential impacts of the proposed Project are projected by comparing the anticipated environmental consequences of the proposed Project to the anticipated consequences of No Action in order to isolate the potential impacts of the proposed Project. Therefore, the EIS acknowledges the role of other factors in increased water levels in the basin while recognizing the proposed Project as one of these factors.

Concern ID: 62232

Flooding risk due to operation of the diversion should be estimated based on an assumption that predictable flooding risk would result in closing of the structure temporarily, reducing such risk attributable to operation of the diversion.

Response ID: 15759

For the purposes of the impact assessment in the Draft EIS, it was assumed that the proposed Project would be operated according to CPRA's Preliminary Operations Plan, Draft EIS Appendix F MBSD Design and Operations Information. This Plan indicates that the diversion gates would be opened fully (above base flow) when flow in the Mississippi River at Belle Chasse exceeds the "trigger" of 450,000 cfs. The Plan includes criteria for modifying or ceasing operations, including damage to the diversion structure, spills of other hazardous discharges, severe impediments to navigation, tropical storm activity, or threats to public safety. Final EIS Appendix R1 Mitigation and Stewardship Plan describes mitigation and stewardship measures planned by CPRA for areas exposed to Project-related inundation.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62269

The commenter stated that the Public Lands section of the Draft EIS Executive Summary did not provide details on how public lands in the proposed Project area would be impacted by the proposed Project.

Response ID: 16441

Chapter 4, Section 4.17 Public Lands in the EIS provides a detailed discussion of potential impacts on public lands in the Project area.

Concern ID: 62327

The Commenter supports the proposed action, but states that there are flaws in the Draft EIS that should be corrected.

Response ID: 15779

As described in Chapter 1, Section 1.7 Public Involvement Summary of the Final EIS, changes between the Draft and Final EIS are identified through markings along the margins on the applicable pages. Table 1.7-1 lists the section numbers where substantial changes were made (see Chapter 1, Section 1.7).

Concern ID: 62328

The USEPA found that the Maurepas Diversion would have no impact on bald eagles due to contaminants, which is opposite of what this EIS says. This Maurepas document is no longer online.

Response ID: 15780

The USACE cannot speak to USEPA's findings on the Maurepas Diversion's impact on bald eagles. Details regarding the basis of the finding the commenter notes regarding potential effects of the MBSD on bald eagles due to contaminants were provided in Draft EIS Chapter 4, Section 4.12.3.2.2.2 in Threatened and Endangered Species.

A new monitoring parameter, periodic sampling for Contaminants of Concern in fish, shellfish, and wildlife (Section 3.7.3.23), has been added to the Monitoring and Adaptive Management (MAM) Plan, Appendix R2 in the Final EIS.

Concern ID: 62699

The Draft EIS ignores the beneficial effects of low-salinity waters on low-salinity-tolerant and freshwater species.

Response ID: 16077

The EIS acknowledges the beneficial effects of low-salinity waters on low-salinity-tolerant and freshwater species throughout Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.10 Aquatic Resources, which identify that the impacts on a given species are related to their salinity tolerance and habitat preferences. For example, the EIS indicates that low-salinity waters would directly benefit alligators, largemouth bass (and other freshwater fishes), and the biomass of SAV. Because this issue was addressed in the Draft EIS, no related edits were made to the Final EIS. These benefits, among others, are also described in Chapter 3, Section 3.2.1.6 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan; because this was described in the Draft Restoration Plan, no related edits were made to the Final Restoration Plan.

Concern ID: 62704

The Executive Summary for Aquatic Resources should clarify that wetland habitats are distinct from "open water" habitats.

Response ID: 16082

The Executive Summary for Aquatic Resources in the Draft EIS accurately identified wetlands as a habitat that benefits aquatic fauna due to the presence of vegetation and habitat structure. The Executive Summary in the Final EIS has been updated to distinguish structured habitat (such as wetlands) from open water habitats.

Concern ID: 62705

The Executive Summary for Aquatic Resources should acknowledge that the proposed Project impacts must be considered in the context of the delta cycle.

Response ID: 16083

The commenter's request regarding the evaluation of impacts on aquatic resources is acknowledged. To help address these concerns, additional discussions of the delta cycle, and the role that the diversion may play in this cycle, have been added to Chapter 3, Sections 3.1.4.2 Barataria Basin and 3.2.1.1 Historical Context of the Final EIS. Additional discussion related to the Project's impacts on geomorphology and historic deltaic landforms has also been added to Chapter 4, Section 4.2.3.2.2.3, Geomorphology. However, it is important to note that, as identified in Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative and discussed throughout Chapter 4 Environmental Consequences of the EIS, the No Action Alternative is compared to existing conditions to understand the anticipated changes in the environment that would occur irrespective of the proposed Project. Thereafter, the anticipated environmental consequences of the proposed Project action alternatives are compared to the results of the No Action Alternative analysis. Section ES.1 Introduction and Authority of the Executive Summary has been revised to include this clarification.

Concern ID: 62706

The proposed Project would not be likely to create hard bottom habitat, but would likely affect oyster reefs in both a positive and negative manner.

Response ID: 16084

The Executive Summary for Aquatic Resources has been revised in the Final EIS to indicate that no hard bottom would be created by the proposed Project. Oysters and oyster reefs would experience both beneficial and adverse effects, with overall effects expected to be adverse, as described in Chapter 4, Sections 4.10.4.4 and 4.10.4.5 in Aquatic Resources of the EIS.

Concern ID: 62707

The EIS does not acknowledge, or underestimates, the beneficial impacts of river water on the growth rates and density of SAV in coastal Louisiana.

Response ID: 16085

Chapter 4, Section 4.10.4.1 in Aquatic Resources of the EIS discusses the impacts of the proposed Project on SAV, including the overall beneficial impact of freshwater input on SAV biomass. Because this issue was addressed in the Draft EIS, no related edits were made to the Final EIS.

Concern ID: 62712

Aquatic fauna do not respond directly to nutrient concentrations and the Mississippi River Delta is not oligotrophic.

Response ID: 16090

The commenter correctly notes that aquatic fauna do not respond directly to nutrient concentrations. As discussed in Chapter 4, Section 4.10.4.4.2.4 in Aquatic Resources of the EIS, increased nutrient levels may result in increased primary productivity in the Barataria Basin, such that the increased nutrient loads would indirectly lead to benefits for aquatic fauna. Although the basin is not oligotrophic, Section 4.5 Surface Water and Sediment

Quality indicates that certain nutrients, such as total nitrogen and total phosphorus concentrations in the basin, would be elevated compared to the No Action Alternative, allowing for the increased primary productivity. Section 4.10.4.4.2.4 Nutrient Loading of the Final EIS has been revised to clarify this point. The EIS further acknowledges in Section 4.10.4.4.2.4, that increased nutrient loads also have the potential to cause adverse impacts on fauna through decreases in DO and harmful algal blooms that can be caused from increased phytoplankton biomass.

Concern ID: 62713

It is unclear whether the first complete paragraph on page ES-12 is intended to refer to both animals and plants. If it is unintended to focus on animals, clarify why there is such a focus on SAV.

Response ID: 16091

The first paragraph of the Executive Summary for Aquatic Resources identifies aquatic fauna as the focus, but also identifies SAV as a habitat type that aquatic fauna benefit from. As such, Chapter 4, Section 4.10.4.1 in Aquatic Resources has an SAV-specific assessment in the EIS. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62714

The Executive Summary for Aquatic Resources indicates a negative effect on SAV followed by a later positive effect. Mississippi River water greatly stimulates SAV growth in the delta. There are no seagrasses here, so there is no reason to be concerned with effects of river water on SAV.

Response ID: 16092

Chapter 3, Section 3.10.2.1 and Chapter 4, Section 4.10.4.1 in Aquatic Resources of the EIS discuss the SAV species likely present in the proposed Project area and the impacts to them from the proposed Project. Overall, the proposed Project would likely initially result in adverse impact on SAV in the basin from a relatively quick change in salinity, which may result in die-offs of species intolerant of the new salinity regime early in the Project life. However, the initial adverse impacts on SAV would be temporary, with permanent beneficial impacts to overall coverage and biomass of SAV once the salinity regime stabilizes. Consistent with the commenter's statement and the noted sections of the EIS, there are no seagrasses in the proposed Project area; however, there are multiple other species of SAV that may occur in the proposed Project area, such as hydrilla and wild celery. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62715

The Executive Summary for Aquatic Resources should indicate that high diversion flows adversely affect the larval recruitment of estuarine fauna, but not of freshwater fauna.

Response ID: 16093

Consistent with Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS, it is estuarine species for which the high diversion flows are a potential recruitment concern, not freshwater species. Therefore, the Executive Summary for Aquatic Resources has been revised in the

Final EIS to clarify that the potential for high diversion flows to adversely affect recruitment is specific to estuarine species.

Concern ID: 62716

Commenters asked for clarification of why estuarine species are the focus of the EIS in the context of an abandoned, degrading delta lobe.

Response ID: 16094

The commenter's concern regarding the evaluation of impacts on aquatic resources is acknowledged. To help address these concerns, additional discussions of the delta cycle, and the role that the diversion may play in this cycle, has been added to Chapter 3, Sections 3.1.4.2 Barataria Basin and 3.2.1.1 Historical Context of the Final EIS. Additional discussion related to the proposed Project's impacts on geomorphology and historic deltaic landforms has also been added to Chapter 4, Section 4.2.3.2.2.3, Geomorphology. However, it is important to note that, as identified in Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative and discussed throughout Chapter 4 Environmental Consequences of the EIS, the No Action Alternative is compared to existing conditions to understand the anticipated changes in the environment that would occur irrespective of the proposed Project. Thereafter, the anticipated environmental consequences of the proposed Project action alternatives are compared to the results of the No Action Alternative analysis. Section ES.1 Introduction and Authority of the Executive Summary has been revised to include this clarification. Therefore, although the EIS acknowledges that conditions have changed over time, anticipated Project impacts are compared to future conditions without the Project in the Barataria Basin, which is currently an estuarine ecosystem. Thus, the EIS has selected species representative of an estuarine system in assessing the proposed Project's potential impacts.

Concern ID: 62717

Discuss how the diversion would affect phytoplankton standing stocks and productivity, and how any such effects would impact oysters.

Response ID: 16095

Nutrient loading and its projected effects on the food web are discussed in Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS. As described, nutrient increases would stimulate primary productivity, which would contribute to increases in low trophic level species, such as shrimp, crabs, small planktivorous fish. As filter feeders, the increase in primary producers would also benefit oysters; Sections 4.10.4.4.2.4 Nutrient Loading and 4.10.4.5.2.11 Eastern Oysters of the Final EIS have been revised to acknowledge this benefit.

Concern ID: 62718

Fecal coliform concentrations adversely affect the people who eat contaminated oysters and the economics of the oyster fishery, not the oysters themselves.

Response ID: 16096

Anticipated changes in fecal coliform levels in the Barataria Basin from riverine inputs are discussed in Chapter 4, Section 4.5.5.8.2 in Fecal Coliform of the EIS. Section 4.14.4.2.3 Eastern Oyster Fishery in the Final EIS has been revised to discuss the potential impacts of increased fecal coliform levels on oyster propagation and harvest. Reference to fecal coliform

as an impact driver for oysters in the Executive Summary for Aquatic Resources has been removed in the Final EIS.

Additionally, Appendix R2 in the Final EIS includes CPRA's Monitoring and Adaptive Management (MAM) Plan, which includes monthly fecal coliform monitoring (Section 3.7.5.1) starting prior to construction and continuing during Project operations.

At the time of publication of the Draft EIS for public review, the Mitigation and Stewardship Plan and the MAM Plan (Appendix R) contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62719

The EIS should evaluate the potential impacts to white shrimp.

Response ID: 16097

Impacts on white shrimp from the proposed Project are discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the EIS. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62720

The EIS overestimates the likely impact of low dissolved oxygen because the Barataria Bay is shallow and well-mixed, likely allowing for low dissolved oxygen to occur only in the deeper areas/holes created by humans.

Response ID: 16098

Chapter 4, Section 4.10.4.4 in Aquatic Resources of the EIS indicates the potential impact of low DO to be adverse, but negligible to minor based on the Barataria Basin's depth and identification as a well-mixed estuary, which would likely only allow for pockets of low DO in deeper areas. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 62721

Dredging to obtain sediment for marsh creation has led to large holes in coastal Louisiana which almost certainly contain pockets of low dissolved oxygen; however, these pockets of low dissolved oxygen are not identified in the assessment of other projects.

Response ID: 16099

Comment noted. No changes to the EIS are warranted as the comment is directed to DO analyses for other projects. Including or excluding data from environmental analyses for coastal restoration not related to the proposed Project is outside the scope of this EIS.

Concern ID: 62867

The Final EIS should not be published unless there are commitments to monitor the following parameters at the diversion site or in Barataria Bay: Project operations, the flow and quality of the water flowing through the diversion, wetland type coverage over time, water surface elevation, water quality in the basin, salinity, contaminant concentrations in diverted sediments, fish and shellfish abundance, oyster reef parameters, benthic community composition and abundance, SAV coverage, finfish and oyster contaminant concentrations, and shellfish harvest restrictions. These same data should also be collected in two reference basins.

Response ID: 16676

Basin-side monitoring of water surface elevation, water quality in the basin, salinity, fish and shellfish abundance, and benthic community composition and abundance to evaluate how the Project is meeting Project objectives were included in the Monitoring and Adaptive Management (MAM) Plan of the Draft EIS (Appendix R2). Riverside monitoring parameters include river discharge, suspended sediment concentrations, nutrient concentrations in water conveyed to the Barataria Basin, sedimentology of the Alliance South sand bar, and Mississippi River sediment load were also included in the MAM Plan of the Draft EIS. Additionally, in the Fish and Wildlife Coordination Act Report (CAR) section of Chapter 5 (Consultation and Coordination) of the Draft EIS, CPRA accepted USFWS' recommendation on pre- and post-construction periodic sampling of Contaminants of Concern in fish, shellfish, and wildlife from the outfall area and the Mississippi River (see Section 3.7.3.23 of the MAM Plan [Appendix R2 to the EIS]). Therefore, no changes were made in the Final EIS on these issues. The Louisiana Department of Health will continue to monitor shellfish harvest restrictions. Additionally, the majority of the parameters above are collected via the State's System Wide Assessment and Monitoring Program that will allow comparison of the Project variables within and among other estuarine basins across the Louisiana coast.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or

adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62868

Sediment should be monitored for a broad suite of contaminants, including PAHs and mercury, near sites of active deposition.

Response ID: 16677

The sediment monitoring recommendation raised by commenters was considered in Chapter 5, Section 5.3 (Fish and Wildlife Coordination Act Report Recommendations) of the Draft EIS, where CPRA agreed to the USFWS' recommendation to undertake pre- and post-construction periodic sampling of Contaminants of Concern in fish, shellfish, and wildlife from the outfall area and the Mississippi River (see also Section 3.7.3.23 of CPRA's Monitoring and Adaptive Management (MAM) Plan [Appendix R2 to the Draft EIS]). Because sediment sampling is likely to be highly variable spatially and temporally, the recommendation from the USFWS and CPRA's commitment to sample fish and shellfish would give a more integrated picture of any contaminant concerns.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section

10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62889

The Draft EIS ignores or underestimates likely positive impacts to upland wildlife (deer, hogs, furbearers, nutria), wetland wildlife (waterfowl, wading birds, colonial nesting birds), and wildlife with lower salinity tolerances (alligators), as well as foraging habitat (migratory shorebirds and neotropical migrants), nesting habitat (marsh birds) and prey availability for a variety of species.

Response ID: 16189

The Draft EIS evaluated the effects of the proposed Project on terrestrial resources. The impacts of the proposed Project on upland species are discussed in Chapter 4, Section 4.9.4.2 in Terrestrial Wildlife and Habitat of the EIS, but are generally anticipated to be minor and adverse. Conversely, the effects of the proposed Project on wetland wildlife, wildlife with lower salinity tolerances, foraging/nesting habitat, and prey availability in the Barataria Basin are generally anticipated to be beneficial, as discussed throughout Section 4.9 Terrestrial Wildlife and Habitat.

In addition, the potential benefits of the proposed Project to multiple resources in the Gulf are described in Section 3.2.1.6 (Benefits Multiple Resources) of the LA TIG's Restoration Plan.

Concern ID: 62901

The executive summary for Terrestrial Wildlife and Habitat is confusing and should be put into the context of the delta cycle (that more salt tolerant species are reflective of an abandoned, degrading delta lobe).

Response ID: 16199

The commenter's request regarding the evaluation of impacts on terrestrial wildlife and habitat is acknowledged. To help address these concerns, additional discussions of the delta cycle, and the role that the diversion may play in this cycle, has been added to Chapter 3, Sections 3.1.4.2 Barataria Basin and 3.2.1.1 Historical Context of the Final EIS. Additional discussion related to the Project's impacts on geomorphology and historic deltaic landforms has also been added to Chapter 4, Section 4.2.3.2.2.3, Geomorphology. However, it is important to note that, as identified in Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative and discussed throughout Chapter 4 Environmental Consequences of the EIS, the No Action Alternative is compared to existing conditions to understand the anticipated changes in the environment that would occur irrespective of the proposed Project. Thereafter, the anticipated environmental consequences of the proposed Project action alternatives are compared to the results of the No Action Alternative analysis. Section ES.1 Introduction and Authority of the Executive Summary has been revised to include this clarification.

Concern ID: 63024

The Draft EIS failed to properly capture the state of the science on the effects of nutrient inputs on wetlands. While the views indicating the detrimental effects of nutrient input are included, few opposing views are described, and the science is not settled on this issue.

Response ID: 16034

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS acknowledges uncertainty regarding the effects of nutrient inputs on wetlands. Additional analysis regarding the impact of nutrients that would be transported by the proposed Project on vegetation communities and soil shear strength has been incorporated into Chapter 4, Section 4.6.5.1.2 Applicant's Preferred Alternative of the Final EIS.

Concern ID: 63030

The executive summary for Wetland Resources and Waters of the U.S. fails to capture the significance of wetland impacts within the context of the delta cycle (see van Beek and Gagliano 1984; Figs. 1, 2) and fails to discuss the implications of not reconnecting the river to the Barataria Basin.

Response ID: 16038

The implication of not reconnecting the Mississippi River to the Barataria Basin was considered in the Draft EIS. The No Action Alternative, assessed for each resource throughout the EIS, describes the projected future conditions without the proposed Project. Impacts on wetlands under the No Action Alternative are addressed in Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS, and comparisons of the change in wetland area during operations of the proposed Project as compared to conditions under the No Action Alternative are included in the Section ES.4, Wetland Resources and Waters of the U.S. in the Executive Summary. Further, Chapter 3, Sections 3.1.4.1 Mississippi River and 3.1.4.2 Barataria Basin of the EIS address the deltaic processes that formed the proposed Project area; however, Sections 3.1.4.2 and 3.2.1.1 Historical Context, have been supplemented in the Final EIS to further discuss historic conditions and include the referenced study (van Beek and Gagliano 1984).

Concern ID: 63031

The executive summary for Wetland Resources and Waters of the U.S. should indicate that the proposed Project would also benefit brackish marshes.

Response ID: 16039

As shown in Chapter 4, Section 4.6 Wetland Resources and Waters of the U.S., Table 4.6-3 of the EIS, the proposed Project is projected to reduce the total area of brackish marsh in the Barataria Basin when compared with the No Action Alternative over its operational period. As addressed in Section 4.6, some areas of brackish marsh that would be converted to open water under the No Action Alternative may be sustained by sediments transported by the proposed Project; however, some brackish marsh under the proposed Project would be converted to fresh water in the immediate outfall area. Because this issue was considered in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 63033

The executive summary for Wetland Resources and Waters of the U.S. should reiterate in the 3rd sentence of the first paragraph that the proposed Project would benefit wetlands by providing additional nutrients.

Response ID: 16040

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS includes an analysis of the proposed Project's impacts with respect to increased nutrients transported by the diversion to wetlands in the Barataria Basin and the benefits those nutrients would provide. Because this issue was considered in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 63034

The executive summary for Wetland Resources and Waters of the U.S. should provide additional detail on the impact of various river flow volumes on salinity in the birdfoot delta. The validity of this analysis is questionable because high river flows would overwhelm the birdfoot delta with freshwater regardless of a reduction in flow caused by the diversion, while at low flows, when the diversion is most likely to affect salinity in the birdfoot delta, the diversion still only represents a 10 percent reduction in river flow.

Response ID: 16041

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS provides a detailed analysis of the impacts of reduced sediment and freshwater flow to the birdfoot delta associated with the proposed Project. In addition, Figures 4.5-3 and 4.5-4 in Chapter 4, Section 4.5.5.1 in Surface Water and Sediment Quality, depict the average salinity projected under the proposed Project and No Action Alternatives in the Project area (including the birdfoot delta). Salinity was modeled using a historical representative hydrograph to quantify river flows; the representative hydrograph differs by each decade during Project operations. The results of the analysis find that the proposed Project would cause permanent, minor increases in salinity in the birdfoot delta during Project operations; the maximum increase would be 5 ppt above the No Action Alternative conditions. Finally, Appendix E Delft 3D Modeling provides a detailed description of the Delft3D Basinwide Model used to provide quantitative projections of proposed Project impacts. Because these issues were considered in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 63035

The executive summary for Wetland Resources and Waters of the U.S. should reconsider the operating plan for Davis Pond and how the Davis Pond Diversion would be affected by the proposed Project.

Response ID: 16042

Chapter 4, Section 4.6.5.1 in Wetland Resources and Waters of the U.S. of the EIS provides a detailed analysis of the impacts of operations of the proposed Project on the Davis Pond Freshwater Diversion. Because this issue was considered in the Draft EIS, no related edits have been made to the Final EIS. The operations plan for the Davis Pond Freshwater Diversion is outside the scope of this analysis. Further, there are no plans at this time to change the operating plan for the Davis Pond Freshwater Diversion Project. As discussed in Chapter 5, Section 5.3 Fish and Wildlife Coordination Act Report Recommendations of the Draft EIS, as part of the Fish & Wildlife Coordination Act consultation, USFWS has

recommended, and CPRA has agreed to implement, development of a basin-wide operations and basin monitoring data repository to help in the general coordination among diversion operators, within their authorizations.

As part of the evaluation of the proposed Project and potential alternatives, the Delft3D model runs and the EIS assumed operations of other diversions consistent with their current or anticipated operational protocols, including the Davis Pond Freshwater Diversion for the hydrodynamic and water quality simulations. The Davis Pond Freshwater Diversion was not included in the Delft 3D morphological modeling simulations.

Based on Delft3D Basinwide Modeling results, proposed MBSD Project operations are expected to reduce the frequency with which the Davis Pond Freshwater Diversion would be operated during certain months of the year to meet its current operational guidelines. Refer to Chapter 4, Section 4.5.7 in Surface Water and Sediment Quality of the EIS for further details on the projected number of days for the Davis Pond Freshwater Diversion opening. Potential impacts to the Davis Pond Freshwater Diversion will be further considered as part of the Section 408 permission request process for the proposed MBSD Project.

Concern ID: 63036

The executive summary for Wetland Resources and Waters of the U.S. should clarify whether the stated beneficial impacts on the spread of invasive species would be an adverse impact on the environment, and specify the invasive species considered in this paragraph.

Response ID: 16043

Chapter 4, Section 4.6.5.2 in Wetland Resources and Waters of the U.S. of the EIS analyzes the potential impacts on the spread of invasive species in wetlands in the proposed Project area, including identifying the species considered in the analysis. Chapter 4, Section 4.9.4 in Terrestrial Wildlife and Habitat and Section 4.10.4.6 in Aquatic Resources also analyze the potential for Project impacts on the spread of invasive plants and animals in uplands and aquatic habitats. The proposed Project could reduce the spread of invasive species in the birdfoot delta, which is considered a beneficial impact to the birdfoot delta. However, operation of the proposed Project could result in the introduction or spread of invasive wetland plant species in the Barataria Basin. The Executive Summary of the Final EIS has been revised to clarify the impact language.

Concern ID: 63066

It is not clear why the negative impacts to bottlenose dolphins are expected from the proposed Project when dolphin injuries and mortality have not been associated with other freshwater releases or diversion projects such as Wax Lake Delta. Dolphins may simply reduce their use of less saline environments as conditions change.

Response ID: 16589

The potential for dolphins to simply reduce their use of damaging, less saline environments by moving to higher saline environments was considered in the Draft EIS. More specifically, Chapter 4, Section 4.11 (Marine Mammals) of the EIS describes the impacts on bottlenose dolphins from freshwater exposure; these impacts are well documented and include observations and data collected in Louisiana associated with the release of fresh water. Most recently, a freshening event in 2019 resulted in the declaration of a bottlenose dolphin

unusual mortality event (UME) in the northern Gulf of Mexico. The Bonnet Carré Spillway, Pearl River, and Lower Mississippi River distributaries contributed to low salinity in the region, resulting in increased mortality and strandings of bottlenose dolphins. Existing data on low-salinity exposure were used to develop a dose-response model that forms the basis for the evaluation of impacts in the EIS (Booth et al., 2020). Existing populations of bottlenose dolphins in Louisiana are largely reflective of the predominant conditions in a given area. Within Barataria Bay, dolphins demonstrate site fidelity to small areas of the basin which, as described in the EIS, has led to the identification of distinct strata (for example, Takeshita et al., 2020). Some of the dolphins tolerate lower salinity waters within Upper Barataria Bay, but are not expected to survive the amount and duration of fresh water released from the diversion. The Barataria Bay bottlenose dolphin stocks' extreme site fidelity and estuarine nature also suggests the dolphins would not move to areas with higher salinity, such as near the barrier islands or Gulf of Mexico.

Concern ID: 63068

It is not clear why the Draft EIS suggests that the proposed Project would result in wetland loss that would harm dolphin health and reproduction. More specifically, observations suggest that the Project is actually projected to increase wetland habitat. It is not clear how wetland creation and a decrease in wetland loss rates affect residual health and reproduction effects from the DWH spill to dolphins.

Response ID: 16591

To clarify, although the diversion is expected to increase wetland habitat, the freshwater influx that would result from diversion operations is anticipated to be the primary driver of dolphin mortality and morbidity. The projected impacts of wetland changes and freshwater flows caused by the Project on dolphins were discussed in detail in Chapter 4, Section 4.11.5 (Marine Mammals - Operational Impacts) of the Draft EIS.

Concern ID: 63112

The EIS should exclude any conclusions regarding pallid sturgeon risk until their presence near the proposed Project is confirmed.

Response ID: 16256

As discussed in Chapter 4, Section 4.12.2.3 in Threatened and Endangered Species and Appendix O1 (Biological Assessment) of the Draft EIS, the EIS analysis recognizes that pallid sturgeon density in the Lower Mississippi River is believed to be extremely low. In accordance with NEPA and the ESA, the EIS appropriately includes an analysis and determination of impacts on the pallid sturgeon from the proposed Project, based on a range of possible local population sizes. The adverse effects on pallid sturgeon from the proposed Project were further evaluated by the USFWS in its Biological Opinion, which has been included as Appendix O3 of the Final EIS. The USFWS determined that the construction and operation of the proposed Project would not be likely to jeopardize the continued existence of the pallid sturgeon and authorized the loss (by death or serious injury) of 48 pallid sturgeon per year.

Concern ID: 63113

The Executive Summary for Threatened and Endangered Species should be supplemented to explain how the proposed Project may “increase commercial

shrimping interactions” with sea turtles given the expected decline in shrimp populations in the estuary.**Response ID: 16257**

The detailed assessment of impacts on sea turtles, including the potential for increased commercial shrimping interactions, was included in Chapter 4, Section 4.12.2.2 in Threatened and Endangered Species of the Draft EIS; therefore, no related edits have been made to the Final EIS. As stated in Section 4.12.2.2, changes in local shrimp populations (including a decrease in the brown shrimp population and a negligible to minor increase in the white shrimp population) may result in changes to the shrimp fishery in the proposed Project area. If these changes result in shrimp fishers focusing on locations lower in the basin or in nearshore/offshore waters (where more sea turtles would be present), it may increase the potential for interactions between fishers and sea turtles, which is a primary threat to sea turtles. Increased interactions could increase the rate of injury and mortality to sea turtles present in the proposed Project area.

Concern ID: 63114

Explain the statement in the Executive Summary for Threatened and Endangered Species that indicates the “presence of core use habitat in the Barataria Basin (Kemp’s ridley).”

Response ID: 16259

The detailed assessment of impacts on sea turtles, including a discussion of the Kemp’s ridley’s core use habitat in the Barataria Basin, was included in Chapter 4, Section 4.12.2.2 in Threatened and Endangered Species and Appendix O1 (Biological Assessment) of the Draft EIS. However, Chapter 3, Section 3.12.1.1.2.3 Kemp’s Ridley Sea Turtle of the Final EIS has been revised to clarify that “core use” habitat is a general term used to represent important foraging and migratory areas that have been identified for juvenile and post-nesting Kemp’s ridley sea turtles.

Concern ID: 63115

The Executive Summary for Threatened and Endangered Species ignores the likely positive effects of the proposed Project on Kemp’s ridley sea turtle, due to the Project’s likely positive impacts on its preferred prey, blue crabs.

Response ID: 16261

The detailed assessment of impacts on sea turtles, including the likely positive effects of increased blue crabs on Kemp’s ridley sea turtles, was included in Chapter 4, Section 4.12.2.2 in Threatened and Endangered Species in the Draft EIS; therefore, no related edits have been made to the Final EIS.

Concern ID: 63116

Commenter disagrees with the adverse conclusion for the piping plover, red knot, and black rail. The proposed Project would greatly increase mudflat and sand flat habitat in the outfall area, which would be used by these species.

Response ID: 16262

Comment noted. The EIS concludes in Chapter 4, Section 4.12.2.4 in Threatened and Endangered Species that the proposed Project is not likely to adversely affect piping plover and red knot, as any impact to those two birds or their prey would be negligible to minor

adverse. As identified in this section, sediment input would create mudflats prior to the establishment of wetland vegetation; however, this is considered a negligible benefit to the piping plover and red knot as they typically use the barrier islands for foraging. With regard to eastern black rail, which are generally believed to inhabit vegetated areas, Section 4.12.2.5 in Threatened and Endangered Species of the EIS concludes that the proposed Project would have both individually adverse and beneficial impacts on the species from changing habitats, including adverse, temporary to short-term impacts from salinity changes that may alter the presence of infaunal prey species, and positive, long-term effects from marsh creation and preservation. However, due to the low species density likely in the proposed Project area, the overall impact on the species would be negligible. The proposed Project is not anticipated to increase sandflat habitat. Because use of mudflats was discussed in the Draft EIS, no related edits have been made in the Final EIS.

Concern ID: 63117

The Executive Summary for Threatened and Endangered species should provide detailed support for the statement that bald eagles may be adversely impacted from potential contaminant uptake given the assertions elsewhere that the proposed Project would not load additional contaminants into the receiving area. There is likely some risk of localized PAH loading, but there is a lot of uncertainty. Monitoring is needed. The USEPA assessed this question for the Maurepas Diversion and determined that there was no impact on bald eagles due to contaminants.

Response ID: 16264

See Chapter 5, Section 5.3 Fish and Wildlife Coordination Act Report Recommendations of the EIS. CPRA has agreed to a Fish and Wildlife Coordination Act conservation recommendation identified by USFWS that CPRA implement an adaptive monitoring/sampling plan for fish and shellfish in the diversion outfall area and in the Mississippi River to detect potential contamination that could impact bald eagles. Because the issues raised by the commenter were addressed in the Draft EIS, no related edits have been made in the Final EIS.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently

contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63118

Commenter strongly disagrees with the adverse impact noted for the manatee as manatees like fresh water and SAV and suggests that an independent manatee expert should review the conclusion.

Response ID: 16266

Chapter 4, Section 4.12.2.1 in Threatened and Endangered Species of the Draft EIS acknowledged the potential benefits of decreased salinity and increased SAV; however, the Draft EIS also identified a potential for adverse impact from increased vessel movement and noise associated with construction and operation of the proposed Project, resulting in a negligible to minor adverse impact/not likely to adversely affect determination. Further, as noted in Appendix O3 Biological Opinion of the Final EIS, the USFWS considered the effects of the proposed Project on the West Indian manatee and concurred with the determination in the EIS for this species.

Concern ID: 63128

The impacts on land use and land cover should be discussed with reference to the delta cycle.

Response ID: 16275

The commenter's request regarding the evaluation of impacts on land use and land cover is acknowledged. To help address these concerns, additional discussions of the delta cycle, and the role that the diversion may play in this cycle, has been added to the Final EIS in Chapter 3, Sections 3.1.4.2 Barataria Basin and 3.2.1.1 Historic Context, and Chapter 4, Section 4.2.3.2.2.3 Geomorphology. However, it is important to note that, as identified in Chapter 2, Section 2.9 Summary of Environmental Consequences Under Each Alternative and discussed throughout Chapter 4 Environmental Consequences of the EIS, the No Action Alternative is compared to existing conditions to understand the anticipated changes in the environment that would occur irrespective of the proposed Project. Thereafter, the anticipated environmental consequences of the proposed Project action alternatives are compared to the results of the No Action Alternative analysis. Section ES.1 Introduction and Authority of the Executive Summary has been revised in the Final EIS to include this clarification.

Concern ID: 63332

A large number of commenters expressed general support for the proposed Project.

Response ID: 16288

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable

harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 64152

The conclusion that the proposed Project would adversely affect subsistence fisheries fails to acknowledge that there are subsistence fisheries based on freshwater fish and shellfish, which would benefit from the proposed MBSD Project. Therefore, these conclusions are erroneous, or exaggerated.

Response ID: 16303

The impacts raised by the commenters were considered in the Draft EIS in Chapter 4, Section 4.15 Environmental Justice. For clarity, Section 4.15.4.2.5 Subsistence Fishing and Hunting in the Final EIS has been revised to acknowledge that subsistence fisheries based on certain freshwater fish and shellfish may benefit from the proposed Project.

Concern ID: 64217

The EIS needs to provide supporting evidence of the assertion that the proposed Project would cause increased occurrence of invasive plant species.

Response ID: 16156

Chapter 4, Section 4.10.4.6 in Aquatic Resources of the EIS identifies literature reviewed, and the evaluation and impact conclusions reflect the best professional judgment based on sound science and expertise of the USACE and cooperating agencies, to determine the potential for increased occurrence of invasive plants due to the proposed Project. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

Concern ID: 64297

Commenters noted that Project-induced sedimentation affecting some Barataria Basin navigation channels and marine infrastructure would result in permanent, moderate, adverse impacts on commercial fishing vessels using the affected channels and marinas if no mitigation efforts are taken to maintain channel depths.

Response ID: 16270

The impacts raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS recognizes that Project-induced sedimentation affecting some Barataria Basin navigation channels and marine infrastructure would result in permanent, moderate, adverse impacts on commercial fishing vessels using the affected channels and marinas if no mitigation efforts are taken to maintain channel depths. Acknowledging concerns regarding maintenance of non-federal navigation channels and canals that could be impacted by sedimentation of the proposed diversion, CPRA's Mitigation and Stewardship Plan includes measures to mitigate impacts on navigation resulting from operation of the Project, including monitoring and dredging or other measures for certain non-federal navigation channels including Wilkinson Canal (see Appendix R1 [Mitigation and Stewardship Plan] to the Final EIS for additional details).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures

(collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 64507

The assertion that the proposed Project impacts “tidal flooding” is an improper use of the term. Additionally, effects of increased surface water elevation can be minimized by proper operation of the diversion, such as by closing the structure when tropical storms are predicted, or when wind speeds and directions conducive to higher water surface elevations are predicted.

Response ID: 15827

In the context of this EIS, the term “tidal flooding” is used to distinguish non-storm related coastal flooding from coastal flooding caused by storm surge and/or waves. For the purposes of the impact assessment in the Draft EIS, it was assumed that the proposed Project would be operated according to CPRA's Preliminary Operations (Water Control) Plan (see Draft EIS Appendix F MBSD Design and Operations Information). This Plan indicates that the diversion gates would be opened fully (above base flow) when flow in the Mississippi River at Belle Chasse exceeds the “trigger” of 450,000 cfs. The Plan includes criteria for modifying or ceasing diversion operations, including threats to public safety. The Plan also requires closure of the diversion gates and cessation of all diversion flows when tropical depressions or named storms are forecasted to impact the Barataria and Mississippi River Basins.

Correspondence ID:3489

The Salty Oyster Lodge, LLC

James Hill

Thank you for this comment period.

Comments:

This entire project can be best summed up with a few words -
TOO LITTLE , TOO LATE .

You need to add to your EIS the root cause of the Land Loss.

Which was the building of the Levees along the Mississippi , preventing the rivers natural flooding and building of land mass.

I find it very Ironic, that the Corps massive Levee construction projects are what caused this Huge problem in the first place. And now, the Corps believes the solution is 1 diversion project ? Wow !!

Maybe if you bulldoze all the Levees, in about 10,000 years the Coast will be restored.

These billions of budgeted dollars, are only "feel good dollars" for politicians and contractors and many others with greedy agendas.

Use some common sense ! I am sure General Honore would agree with me and my logic on this very important issue.

Concern ID: 62329

The EIS should discuss how the Mississippi River Levees are the root cause of land loss that cannot be corrected by a single diversion project.

Response ID: 15781

The EIS recognizes the role that the Mississippi River Levee has played in coastal land loss in the Barataria Basin, and does not describe the proposed Project as a solution to fully reverse ongoing land-loss trends. The Draft EIS recognized that the proposed Project is projected to create and maintain only a portion of the wetlands that would otherwise be lost in the absence of the proposed Project over the next 50 years. See EIS Chapter 4, Section 4.6 Wetlands and Waters of the U.S. for the discussion of projected future land loss under the proposed Project as compared to the No Action Alternative.

Correspondence ID:3524

Sky Eye Maps LLC

Douglas Schoewe

As a member of the Coalition to Restore Coastal Louisiana, I am writing in support of the Mid-Barataria Sediment Diversion.

I spent 4 years working for the USGS at the National Wetlands Research Center in Lafayette Louisiana during the BP Deepwater Horizon Oil Spill litigation updating the National Wetlands Inventory Maps from 2008 to 2010. It was astounding to witness first hand the effects the oil industry has had on the BTE, Barataria Terrebone Estuary system, not only the direct effects the oil spill had on the wildlife habitats but the devastation the oil exploration efforts have had in general through the decades of drilling near the coast of Louisiana. Key hole canal systems left abandoned without any thought of future cost to the environment and culture. Littered drilling equipment left to litter the landscape for hundreds of years to come. The benefits of drilling have costs and those that profit should be left accountable when the tides change outside of their favor.

Concern ID: 61727

One major cause for the loss of wetlands over the last 50 or 60 years is mining and drilling operations that were not required by regulatory agencies to replace the marsh loss they caused. So money from the oil and gas industries should be allocated for continued restoration efforts.

Response ID: 16027

The impacts of the oil and gas industry on wetland loss in the Barataria Basin were described in the Draft EIS. This EIS serves as the environmental review required by NEPA to inform USACE's decisions on the Section 10/404 permit and Section 408 permission and the LA TIG's OPA decision regarding funding the construction of the proposed MBSD Project via damages paid by BP following the DWH oil spill (see Section 1.6.1 The OPA and DWH NRDA Decisions of the EIS). USACE requires compensatory mitigation in the form of replacement habitat for its Section 10/404 permits (including those involving oil and gas exploration and production) that will result in wetland losses.

Concern ID: 63332

A large number of commenters expressed general support for the proposed Project.

Response ID: 16288

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Correspondence ID:3588

David Sharpe

I am a maritime attorney in New Orleans whose clients work on the lower Mississippi River and the coastal waters of South Louisiana. I am writing in my personal capacity, however, to support the Mid-Barataria Sediment Diversion. I have followed the project and spoken with stakeholders. I am convinced that the overall benefit will far exceed the adverse consequences. I am grateful to see that the project includes funding for people and businesses who derive income from fishing and oystering in the basin.

Concern ID: 63333

Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.

Response ID: 16289

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Woodlawn Investments, Inc.

Charles Lamar

I am writing in support of the Mid-Barataria Sediment Diversion

I visit the communities and fish in the marshes of coastal Louisiana, and I am very concerned about the land loss that I have seen on the coast in my lifetime. I believe that it is critical to use the best available science to advance decision making and work to restore large areas of the coast as quickly as possible. Our coast is rapidly disappearing, and this loss threatens our communities and way of life.

The Barataria Basin was hit hard by the Deepwater Horizon oil spill, which exacerbated decades of saltwater intrusion, sea level rise and subsidence. The health and stability of this basin are vital for a range of ecosystems that provide habitat for wildlife and wetlands that offer protection from storms for communities to the north.

I believe that the Mid-Barataria Sediment Diversion is the appropriate solution for rebuilding the Barataria Basin. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon oil spill settlement to construct this project, as ecosystems that were injured by the oil spill will greatly benefit from the diversion.

With that in mind, I ask the following of the Army Corps and Louisiana Trustee Implementation Group:

- Select the preferred alternative in the Draft Environmental Impact Statement: Reconnecting the river to nearby wetlands through this project provides our greatest opportunity to avoid a devastating future for Louisiana's communities, wildlife and economy. The Mid-Barataria Sediment Diversion is the cornerstone of Louisiana's Coastal Master Plan and will help support and enhance the lifespan of other coastal restoration and protection projects.
- Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan: As Barataria Basin continues to recover from the devastating impacts of the oil spill, this project is vital to restoring the health and function of the entire ecosystem. The Mid-Barataria Sediment Diversion is the single largest ecosystem restoration project in the history of the United States. Combined with other proposed restoration projects, the Mid-Barataria Sediment Diversion would build and preserve more than 17,000 acres of wetlands over the next 30 years to restore critical wetland habitat injured by the oil spill. It is exactly the scale needed to address the very serious challenges facing Louisiana's coast.

As the project advances, I urge federal and state decision makers to center community needs in planned mitigation and stewardship efforts. This project will have many positive, long-term benefits for coastal communities, including increased storm surge protection from restored wetlands, job creation and regional economic impact during construction, and increased productivity of natural resources. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. I encourage the development of a robust stewardship and mitigation plan that addresses any potential impacts that may occur and ensures that no communities or residents bear an unjust burden as a result of the project.

Thank you for your consideration.

Concern ID: 63179

Mitigation should be clear and adequate and should focus on community needs, which requires collaboration with potentially impacted communities and should be facilitated through community-based organizations.

Response ID: 16556

In developing its Mitigation and Stewardship Plan and its Monitoring and Adaptive Management (MAM) Plan, CPRA engaged the communities potentially impacted by the Project through public meetings to solicit input on mitigation strategies. CPRA also engaged community-based organizations to assist in soliciting additional feedback on the proposed mitigation and stewardship measures. A summary of CPRA's public engagement meetings and other outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation and stewardship measures that CPRA would offer if the Project is approved and funded.

Concern ID: 63337

A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.

Response ID: 16294

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 63340

The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.

Response ID: 16298

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

Correspondence ID:3825

Gail Merda

Dear U.S. Army Corps of Engineers, New Orleans District,

Please use the money to research, and to nurture the species mentioned below. Hire compassionate dedicated people to do this vital work. Do not let special interest groups and greed disregard the need of rejuvenating these species, Bring them home.

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40% of all migratory birds in North America spend a part of their life in coastal Louisiana. The Mid-Barataria Sediment Diversion is essential to rebuild vital habitats on which these birds depend.

I support the preferred alternative as outlined in the draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion. I also support the proposal in the draft Restoration Plan to use funds from the Deepwater Horizon Oil Spill settlement to implement this project, which will help to restore the overall health of the ecosystem that was injured as a result of the oil spill.

With that in mind, I ask the following of the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

As the project advances, I urge federal and state decision-makers to consider the following:

*Commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders.

*Work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

Thank you for considering my comments.

Sincerely,

GAIL MERDA

Cleveland, OH 44102

Concern ID: 61741

Louisiana's coast is in crisis, putting birds and coastal communities at risk. More than 400 species of birds call coastal Louisiana home, and 40 percent of all migratory birds in North America spend a part of their life in coastal Louisiana.

Response ID: 16162

The issues raised by the commenters were considered in the Draft EIS. Past and ongoing adverse human impacts on the Project-area ecosystem are discussed throughout Chapter 3 Affected Environment. The use of Louisiana's coastal habitats by a large diversity of birds is discussed in Chapter 3, Section 3.9.3 in Terrestrial Wildlife of the EIS. The benefits that the

Project would provide to birds are discussed in Chapter 4, Sections 4.9 Terrestrial Wildlife and Habitat and 4.12 Threatened and Endangered Species of the EIS.

Concern ID: 61756

The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.

Response ID: 15891

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders

and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 62801

State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.

Response ID: 16658

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public

through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Concern ID: 63337

A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.

Response ID: 16294

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

Concern ID: 62343

The commenter requests that agencies use DWH oil spill funds for research and restoration of bird species in the area.

Response ID: 15789

As was described in Draft EIS Chapter 4, Section 4.9 Terrestrial Wildlife and Habitats, the proposed Project would be beneficial to those bird species that use both terrestrial and emergent wetland habitats. Additionally, CPRA's Monitoring and Adaptive Management Plan includes monitoring of green-winged teal, mottled duck, gadwall, and brown pelican, as described in EIS Appendix R2.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Correspondence ID:3874

Lita Brown

I urge federal and state decision makers to center community needs in planned mitigation and stewardship efforts. This project will have many positive, long-term benefits, including increased storm surge protection, job creation and regional economic impact during construction, and increased productivity of natural resources. There are also foreseeable adverse effects possible as the project restores natural balance in a declining ecosystem. The Trustees must work proactively and collaboratively with potentially impacted communities to develop and implement ideas and proposals for adaptation and mitigation, and be as detailed and transparent as possible throughout the process.

Concern ID: 61756

The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.

Response ID: 15891

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance

refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Comments on the Proposed Mid-Barataria Sediment Diversion Project, Plaquemines Parish, Louisiana

Dear Army Corps of Engineers:

Thank you for the opportunity to submit comments.

~~~~~

~

Comment #1:

The over 6,000 pages of material you have prepared and made available for public study is the most comprehensive and well-prepared Environmental Impact Statement I have seen in my forty-something years of experience.

~~~~~

~

Comment #2:

I have tried to review as much of that material as my attention span would allow. It may take me some time to digest what I have read, go back and read more, but when I am satisfied that I can submit additional comments on the technical aspects you present in the EIS I will submit those new comments.

~~~~~

~

Comment #3: This proposed project will eventually and inevitably be made moot, as will all the other ongoing and proposed nature-control projects in Louisiana, when nature itself overrules them.

I see two possible scenarios that either each alone or both in combination with each other, will make enduring success impossible for all the planning and expenditures of resources intended to sustain human habitation in low-lying areas:

1) The acceleration of climate change will move forward the time when it will no longer be possible to save New Orleans. Either a river flood and/or rising sea level along with the increased hurricane frequency and intensity will overwhelm all the man-contrived protective measures, destroy New Orleans, and that event will finally delete protection of that city as a factor in all planning considerations.

2) Should a sufficiently-intense Mississippi River Watershed flooding occur leading to the long-overdue natural diversion of the river course into the Atchafalaya Basin, thereby making it impractical to sustain the Port of New Orleans for any economically-feasible length of time, again there would be no justification for doing anything with public resources other than relocating the people to higher ground north of Lake Pontchartrain.

Comment #3: Therefore, recognition of the futility of ongoing and proposed projects would be a wise thing for the Corps to do and for it to communicate to the people, to Congress, and to the President even though you are under orders to meanwhile continue your current exercises.

~~~~~  
~

I saw yesterday a news account on NOLA.com detailing opposition to the Mid-Barataria Sediment Diversion Project. The account was put together by a reporter named Mark Schlefstein. It was entitled "The host parish for the Mid-Barataria Diversion project voted against it; here's why".

The various objectors seemed to ignore the point that nature has always used diversions in distributing flood waters and sediments to build the plates upon which are now served the seafood resources the objectors say they fear losing.

As for one of their complaints, that the Corps did not consider a certain alternative that they would support: dredging the Mississippi River and using pipelines to lift sediments up and over the artificial levees and send the sediments farther out into the open waters of the Barataria Basin to rebuild marsh, that again seems to ignore the point that such dredging and pipelines would not be necessary if the big artificial levees were not there.

Comment #4: In place of their suggested alternative a more direct alternative would be to simply allow the levees to sink, erode, and collapse down to a normal height with annual widespread overflow distribution of the sediments in the historic and gentle way that would not have the sudden, disruptive impacts the objectors expressed about existing and planned diversions. Restoration of natural processes is the best way to replenish and preserve our renewable natural resources.

~~~~~  
~:

Again, thank you for having done a tremendous amount of good work to provide us with a very practical treasure of information and analyses from which to go forward in our cooperative and democratic way of addressing the serious and complex issues in our part of the planet.

I do plan to submit a later set of comments on the technical aspects of the EIS.

Sincerely,

Michael Tritico, Biologist and President of RESTORE  
Restore Explicit Symmetry To Our Ravaged Earth

---

**Concern ID: 61877**

**The proposed Project would eventually and inevitably be made moot due to nature itself so it is not needed.**

**Response ID: 15833**

The EIS acknowledges that the sediment deposition and land building that would occur as a result of the MBSD would occur against a backdrop of significant land loss in the basin and across the region due to subsidence and sea-level rise, so that even as diversion operations are increasing sediment deposition and land creation in the outfall area, some of this acreage would be lost over time due to these ongoing processes. Chapter 4, Section 4.2.3.2 in Geology and Soils of the EIS describes the land-building acreages projected over time due to the proposed Project. In the Final EIS, a discussion has been added to this section to clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations.

As part of its restoration planning efforts, LA TIG considers reestablishing deltaic processes (including deltaic sediment deposition and transport of nutrients and fresh water from the Mississippi River to the basin) a critical component of sustaining and restoring wetlands, coastal, and nearshore habitats to help address ecosystem-level injuries in the Gulf of Mexico and to decrease land loss.

The LA TIG agrees that, with or without the proposed Project, coastal Louisiana and the Barataria Basin would experience tremendous land loss. However, the LA TIG believes this background of large land loss makes the habitat created by the proposed Project even more important. Relative to other types of incremental approaches (for example, marsh creation through the application of dredged sediment), the proposed Project would reconnect and reestablish sustainable deltaic processes and support the long-term viability of existing and planned coastal restoration efforts. The proposed Project would reestablish deltaic processes that deliver sediment, fresh water, and nutrients; improve the function of existing habitats; and successfully develop deltaic habitats that connect nearshore and offshore ecosystems. The LA TIG expects that the Project would result in the creation of a maximum of 17,300 acres of land in the Barataria Basin by year 30 of operations; after 50 years of operation, the Project would result in the loss of 3,000 acres of land in the birdfoot delta but would create approximately 13,400 acres of land in the Barataria Basin, representing about 20 percent of the land remaining in the Barataria Basin at that time (see Section 3.2.1.1 of the LA TIG's Final Restoration Plan).

---

**Concern ID: 61888**

**Consider the alternative of allowing the levees to sink, erode, and collapse down to a normal height with annual widespread overflow distribution of the sediments in the historic and gentle way that would not have the sudden, disruptive impacts as seen with existing and planned diversions. Restoration of natural processes is the best way to replenish and preserve our renewable natural resources.**

**Response ID: 15983**

This alternative of removing levees and restoring natural processes is not feasible and was not considered further because levees are necessary for flood risk reduction for the communities and industries that line the Mississippi River in Barataria Basin. This alternative has been added to the Eliminated Alternatives Matrix in Appendix D2 of the Final EIS as an alternative considered based on public comments, but eliminated/not carried forward for detailed review.

---

**Concern ID: 61977**

**While other restoration project types, such as marsh creation, have been suggested in lieu of large-scale diversions, these project types would fail to build and sustain significant amounts of land in the Barataria Basin over the 50-year Project lifespan due to subsidence, sea-level rise, and erosion. Dredging alone cannot save the wetlands, the processes that originally built them must be reestablished. The power of the river allows more land-building potential to be harnessed than could be had with dredges at a fraction of the cost, and the benefits are long-lasting, even in the face of sea-level rise and hurricanes.**

**Response ID: 15977**

The commenter's support of the proposed Project is acknowledged. The EIS concludes that a large-scale sediment diversion meets the purpose and need of the proposed Project while large-scale marsh creation does not meet the purpose and need. Details on marsh creation alternatives including sustainability and the reasons for elimination from further detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. Additional information related to the marsh creation alternative have been added to Section 2.3.5 Large-Scale Marsh Creation for the Final EIS.

---

**Concern ID: 62331**

**The EIS is comprehensive and well-prepared, and used the best available information and data.**

**Response ID: 15782**

Acknowledged.

---

**Correspondence ID:3914**

Additional Comments on the Proposed Mid-Barataria Sediment Diversion Project,  
Plaquemines Parish, Louisiana

Dear Army Corps of Engineers:

Thank you for the opportunity to submit comments.

There are two brand new articles that have extremely relevant information that you should incorporate into your deliberations as you prepare the Final Environmental Impact Statement.

Both appear in the journal Water, Volume 13.

In the February 27, 2021 issue, beginning on Page 642 is a 31 Page article entitled "A Review of 50 Years of Study of Hydrology, Wetland Dynamics, Aquatic Metabolism, Water Quality and Trophic Status, and Nutrient Biogeochemistry in the Barataria Basin, Mississippi Delta-System Functioning, Human Impacts and Restoration Approaches." The authors are John W. Day, William H. Conner, Ronald D. DeLaune, Charles S. Hopkinson, Rachael G. Hunter, Gary P. Shaffer, Demetra Kandalepas, Richard F. Keim, G. Paul Kemp, Robert R. Lane, Victor H. Rivera-Monroy, Charles E. Sasser, John R. White, and Ivan A. Vargas-Lopez.

In the March 16, 2021 issue, beginning on Page 813 is a 26-page assessment of "The 'Problem' of New Orleans and Diminishing Sustainability of Mississippi River Management - Future Options" by John W. Day, Rachael Hunter, G. Paul Kemp, Matthew Moerschbaecher, and Christopher G. Brantley.

Sincerely,

Michael Tritico, Biologist and President of RESTORE

---

**Two recent (2021) studies should be reviewed and incorporated into the EIS, both of which appear in the journal *Water*, Volume 13. In the February 27, 2021 issue, the article entitled “A Review of 50 Years of Study of Hydrology, Wetland Dynamics, Aquatic Metabolism, Water Quality and Trophic Status, and Nutrient Biogeochemistry in the Barataria Basin, Mississippi Delta-System Functioning, Human Impacts and Restoration Approaches” by Day et al. In the March 16, 2021 issue, the article (also by Day et al.) entitled “The ‘Problem’ of New Orleans and Diminishing Sustainability of Mississippi River Management - Future Options.”**

**Response ID: 16044**

The EIS discloses the value of wetlands in the Barataria Basin, including as flood control and protection from storm surge, as well as the history of wetland losses in Barataria Basin described in the provided references (see Chapter 3, Section 3.6 Wetland Resources and Waters of the U.S. of the EIS). The Final EIS has been revised to include the recent studies provided by the commenter.

Jardel Costa

Hi there, do it!

---

**Concern ID: 63332****A large number of commenters expressed general support for the proposed Project.****Response ID: 16288**

The commenter's support for the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and the NEPA analysis of the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

HARVEY CANAL LIMITED PARTNERSHIP

Raymond Fuenzalida

Sirs:

I am strongly in support of this diversion project. As a landowner on the Westbank of New Orleans, the loss of coastal land is of great importance to me, our company and all of our tenants/users. Plus the loss of the marshlands as storm barriers/protection from storm events for all of South Louisiana has to be stopped and reversed.

It is known that the entire delta was built up over millennia via the regular flooding of the Mississippi river. Those silt deposits built up most of South Louisiana. However, when the Mississippi River was leveed all the way into the Gulf of Mexico, that silt - instead of replenishing the marsh - is wasted into the Gulf. And the land loss since then has been shocking. All you need do is look at a map from 100 to 75 to 50 years ago to today. This rate of land loss cannot be allowed to continue.

There is an incredible need for silt diversion to at least slow down the marshland loss. And yes, I understand that there may even be some short term negative effects to oyster and shrimp fishing, but to not do anything to prevent this marsh loss would be a crime against those millions of people who live in South Louisiana.

Not only does this diversion project need to continue, it needs to be expedited. The sooner we can start saving the marshland, the better.

Thank you.

---

**Concern ID: 61737**

**The construction of levees along the Mississippi River precluded land-building sediments from entering Louisiana estuaries, which has caused a loss of Louisiana's coastal wetlands and other problems, such as making properties more vulnerable to hurricane damage and decreasing property values.**

**Response ID: 16024**

The impacts raised by the commenters were considered in the Draft EIS. Information about historic causes of land loss can be found in Chapter 3, Section 3.1.4 Overview and History of the Project Area and Section 3.6.2 in Wetland Resources and Waters of the U.S. The importance of maintaining wetlands for the protection of coastlines, coastal communities, and wildlife resources is discussed in Sections 3.6 Wetland Resources and Waters of the U.S. and 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the EIS. As stated in Chapter 1, Section 1.4 Purpose and Need of the EIS, the purpose of the Applicant's Preferred Alternative is to implement a large-scale sediment diversion in the Barataria Basin that would reconnect and reestablish sustainable deltaic processes between the Mississippi River and the Barataria Basin through the delivery of sediment, fresh water, and nutrients to support the long-term viability of existing and planned coastal restoration efforts.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63340**

**The proposed Project would restore the natural processes of the previous river inputs into the Barataria Basin, which would result in wide-ranging benefits, including the creation of wetlands (important wildlife habitat and carbon sequestration), protecting coastal communities from storm events, and economic benefits from the general protection and maintenance of the proposed Project area.**

**Response ID: 16298**

The commenter's support for the proposed Project is noted. As explained in the Draft EIS, the proposed Project would result in both beneficial and adverse impacts on the extent of wetlands, protection from storm events, and the economy, depending on the wetland area, community, and industry considered; see Chapter 4, Sections 4.6 Wetland Resources and Waters of the U.S., 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, 4.13 Socioeconomics, and 4.14 Commercial Fisheries.

---

**Correspondence ID:3930**

Robert Gardiner

I strongly support the proposed alternative to build the Mid Barataria Sediment Diversion. I would prefer something even larger and want to express concern that the proposed plan not be compromised.

South Louisiana cannot afford to wait longer or accept lesser solutions. Our coastline is sinking and our fisheries and wildlife habitat is washing into the Gulf. Fortunately the Mississippi River offers a chance at salvation if we learn to use the river correctly. The MBSD is the most cost-effective way to address the problem in a sustainable way.

The negative impacts on fisheries and wildlife habitat are minor compared with the alternatives of doing nothing or a smaller project. The negative effects on fishermen and oyster growers are short term and ought to be compensated for, as the plan allows, but doing nothing would be devastating to their real interests in the long term.

The storm surge protection benefits of healthy and extensive wetlands are essential to millions of people who live near the coast. It is time to stop studying and debating, and it is time to move forward with the right solution.

---

**Concern ID: 63133****Commenters support the proposed mitigation measures for the commercial fishing industry.****Response ID: 16517**

The comments received in support of the Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) are acknowledged. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in

---

those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63353**

**The commenter strongly supports the Applicant's Preferred Alternative, but would prefer something larger. The commenter further notes that south Louisiana cannot afford to wait longer or accept lesser solutions because the coastline is sinking and local fisheries and wildlife habitat is washing into the Gulf. Fortunately, the Mississippi River offers a chance at salvation if the river is used correctly.**

**Response ID: 16315**

The commenter's support for the proposed Project is noted. The relative impacts, both beneficial and adverse, for the various capacity alternatives is explained throughout Chapter 4 Environmental Consequences of the EIS. Although the 150,000 cfs Alternative would result in the greatest degree of benefits (including the most land building), it also would result in the greatest degree of adverse impacts, particularly to marine mammals (see Section 4.11.5 in

Marine Mammals), shrimp and oysters (see Section 4.10.4.5 in Aquatic Resources), and public health and safety (through increased water levels and inundation in areas closer to the immediate outfall, see Section 4.20.4.2 in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction). The USACE has supplemented Section 4.10.4.5.3 in the Final EIS to further discuss the impacts of the 150,000 cfs Alternative to brown shrimp and oysters. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits.

The LA TIG's Restoration Plan evaluated each alternative against a variety of factors, including those outlined in 15 CFR §990.54 and strove to identify an alternative that would provide the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, and avoiding collateral injury. While 150,000 cfs diversion would be expected to deliver more ecological benefits in terms of land creation and marsh building than the LA TIG's Preferred Alternative, it would also incur more collateral injuries and pose a greater risk to human health and safety; thus, it was not selected as the LA TIG's Preferred Alternative. See Section 3.2.4 (Overall OPA Evaluation Conclusions) of the Final Restoration Plan for a discussion of how the LA TIG came to its decision. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Concern ID: 63354**

**The proposed MBSD Project is the most cost-effective way to address the current problems in a sustainable way.**

**Response ID: 16316**

The USACE and LA TIG acknowledge the commenter's support for the proposed Project. The LA TIG further notes that it strove to identify a preferred alternative that meets OPA's cost criteria and achieves the LA TIG's goals of comprehensive, integrated ecosystem restoration, through the creation of deltaic processes that supports an ecosystem that would be sustained over decades even in the face of rising sea levels and coastal erosion.

---

**Correspondence ID:3941**

Minh Vo

I am a commercial fisherman and probably have about 10 years left before I retire. If the brown shrimp will all die then that will be a significant decrease in my income. The state needs to set aside money to compensate us for at least 5 years or longer for our lost income in the brown shrimp season. The only way that we'll make it during the white shrimp season is if we get compensation. There should also be a business and boat buyout program for those of us who want to retire and/or transition out of the industry.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiessy, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Commenter

I own property in the Myrtle Grove Marina Subdivision which currently has no bulkhead or dwelling in place. Are there any recommendations on how high to install bulkhead when I begin construction. Also will there be any efforts to dredge the canals after they begin to silt in from the diversion?

---

**Concern ID: 63097**

**Commenter requested information regarding how high to install a new bulkhead on their lot in the Myrtle Grove Marina Subdivision.**

**Response ID: 16636**

Projected increases in water levels and corresponding tidal inundation in communities near the immediate outfall areas (within 10 miles north and 20 miles south) and outside of flood protection were considered in Chapter 4, Section 4.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction of the Draft EIS. See Table 4.20-2 of the Final EIS for the projected number of days that inundation would be experienced (based on fixed thresholds) at these communities including Myrtle Grove.

CPRA's Final Mitigation and Stewardship Plan includes structural measures that CPRA plans to implement to reduce some impacts of the proposed Project. In particular, CPRA has proposed, as part of the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to improve the bulkhead along the lots in the Myrtle Grove Marina Estates Subdivision to an elevation of 4.0 feet NAVD88 or greater.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but

not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63791**

**CPRA should monitor canals and dredge them as they begin to silt from the diversion.**

**Response ID: 16645**

The commenter's concerns regarding siltation and infill of Wilkinson Canal and other navigation channels in the Barataria Basin were considered in the Draft EIS in Chapter 4, Section 4.16.5.2 Recreation and Tourism - Operational Impacts and Section 4.21.5.2 in Navigation.

Siltation and infill of Wilkinson Canal was considered in the Draft Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. Since issuance of the Draft EIS, CPRA has revised its plan to address infill of Wilkinson Canal caused by Project operations. See Section 6.3.1 (Impacts to Navigation) of the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) for CPRA's final plan with regard to the siltation of Wilkinson Canal.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

---

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Bob Arnondin

Twice in 2020 the bonnie carrie spillway that river water created algae blooms and low oxygen deadly trail thru Lake Ponchartrain into lake Borne and Brenton Sound.

That poluted fresh waterhad lting effects on oysters and all other acquaticanimals and plant life.

Two other diversions hav also shown failure. Both caenarvon and Davis pond are examples. Your intent to build land failed, polluted those estuaries and your observations of how badly these diversions have helped are proven wrong.

Polluted water will kill our estuary and devastate ourseafood industry.

Land can be built by dredging!

Our barrier islands is our 1st defence against flood and storms. The inner islands also slows snows down the rising waters

Dredge and plant. Make land today!

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various

---

alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRa and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62639**

**The proposed Project is unlikely to succeed because similar types of projects have failed to build land, and have caused a range of other issues, like destroying habitat, exacerbating flooding, and reducing water quality. Specific examples of similar, problematic projects include the Mississippi River Gulf Outlet, Bonnet Carré Spillway, Caernarvon Freshwater Diversion, Davis Pond, West Bay, Baptiste Collette, Fort St. Philip, and Cubits Gap. In fact, data show that the Caernarvon Diversion in particular was unable to show sustained land gains in the face of Hurricane Katrina-driven losses in wetland habitat (Underwood 1994, Kearney et al. 2011). Davis Pond has seen increased land loss inside the diversion compared to a reference area (Couvillion et al. 2017). Fort St. Philip has lost large areas of wetlands (Suir et al. 2014). While the Atchafalaya River is building land in the Atchafalaya and Wax Lake Deltas, the Atchafalaya River carries more sediment than the Mississippi River does currently (Blum and Roberts 2009), and more of the Atchafalaya River is diverted to each of these deltas and marshes farther south. Additionally, one study identified poor performance of diversions due to many periods of inoperation due to socioeconomic uncertainties (Caffey et al. 2014).**

**Response ID: 16631**

The issues raised by the commenters were considered in the Draft EIS. The EIS states in Chapter 2, Section 2.1.1 Overview of Sediment Diversions, that CPRA considered information

---

from other diversions in its assessment of the Project alternatives, but because the projects mentioned by the commenters had been designed to discharge primarily water, not sediment, they are not fully comparable to the proposed Project. As explained in the EIS Chapter 4, Section 4.1.3 (Environmental Consequences, Overview of Delft3D Basinwide Model for Impact Analysis), Delft3D Basinwide Modeling software was used to assess impacts of the Project on hydrology, land gains and losses, water quality, and vegetation in the Barataria Basin and birdfoot delta. Using standard professional practice, this physics-based model was validated to the West Bay Sediment Diversion. The West Bay Sediment Diversion is useful for validating the physical processes of erosion and deposition of sediment because it, like the proposed MBSD Project, is a sediment diversion that extracts relatively more sediment in the river. The other diversions cited were designed to primarily deliver water, not sediment, and are less useful comparisons.

The West Bay Sediment Diversion has successfully deposited large amounts of sediment in the system and, in concert with beneficial uses of dredged material, built land. Kolker et al. (2012) reported, “A majority of the sediment transported through the West Bay Diversion apparently was deposited in the bay, and contributed to sub-aerial land formation, which contrasts with the view presented by Kearney et al. (2011) and Turner et al. (2007) that diversions do not lead to appreciable sediment accumulation” (Kolker, A. S., Miner, M. D. and Weathers, H. D. 2012. Depositional dynamics in a river diversion receiving basin: The case of the West Bay Mississippi River Diversion, *Estuarine, Coastal and Shelf Science*, 2012, <http://dx.doi.org/10.1016/j.ecss.2012.04.005> ).

Comparing diversions outside of physics-based numerical modeling has limited value because diversions and receiving environments often exhibit unique behaviors that correlations do not account for. For that reason, the physics-based Delft modeling, even with its limitations and uncertainties, is a better predictor than anecdotal comparisons to Fort St. Phillip or other sites. Uncertainties associated with the validation and application of the Delft3D Basinwide Modeling conducted for the proposed Project were assessed by the West Bay application, sensitivity tests, and by the use of a Base-to-Plan (No Action Alternative compared to Action Alternatives) comparison method as described in EIS Appendix E Delft3D Modeling and incorporated into the EIS conclusions throughout Chapter 4 Environmental Consequences. While most citations mentioned by commenters were already included in the Draft EIS, the Final EIS has been edited to include Caffey and Petrola (2014) to Chapter 4, Section 4.6.5.1.2.4 Land Accretion.

The likelihood of success of the Project and information from other freshwater diversions was also considered in the LA TIG’s Draft Restoration Plan, Sections 3.2.1.4 Likelihood of Success - Alternative 1 and 3.2.2.4 Likelihood of Success - Alternatives 2-6 of the Restoration Plan address the likelihood of success of the Project and other Action Alternatives. The proposed MBSD Project’s goal is ecosystem restoration through the reestablishment of sustainable deltaic processes, only one of which is land building. The computer and physical models used to analyze Project benefits consider the geomorphological features of the Lower Mississippi River as of 2012, including data from the referenced projects. All citations referenced by the commenters were included in the Final EIS and were considered by the LA TIG in the Final Restoration Plan.

**Concern ID: 62722**

---

**The release of polluted river water through Bonnet Carré, Caernarvon, and Davis Pond resulted in algal blooms, low dissolved oxygen, and lasting adverse effects on local flora and fauna.**

**Response ID: 16100**

Chapter 4, Sections 4.5.5.5 in Surface Water and Sediment Quality and 4.10.4.4 in Aquatic Resources of the EIS analyze the potential impact of Project operations on dissolved oxygen concentrations and the potential for algal blooms. In addition, a summary of select natural and man-made diversions in southeastern Louisiana has been developed to compare the purpose and/or characteristics of these diversions to the proposed MBSD Project, and their recorded impacts on the natural environment. This summary is available in Appendix U of the Final EIS.

Charlie Cook

This is Charlie Cook with FEMA Floodplain Management. My only comment is to make sure you are working with the local floodplain administrator to make sure that any pertinent local permits are obtained in relation to this project. Thanks. Take care. Bye.

---

**Concern ID: 62192**

**Commenter states that CPRA should coordinate with the local floodplain administrators to obtain any needed local permits.**

**Response ID: 15741**

CPRA would be responsible for coordinating as needed with the appropriate floodplain administrator(s) regarding any necessary permits prior to Project commencement if the Project is approved by USACE and funded by the LA TIG.

---

**Correspondence ID:3982**

Gene Vincent

As a commercial inland shrimper of 34 seasons operating my own vessel out of Lafitte, I am strictly opposed to the construction of the mid-Barataria diversion project for the simple reason that its benefit as far as restoring land does not outweigh the financial losses that will be incurred by me and thousands of other fishermen of all types. These fishermen who make their living in the outflow area south of the diversion will essentially be put out of business. I feel there are better processes which show faster results and less economic impact such as dredging. If these comments fall on deaf ears and bear no weight in stopping the diversions construction then at least prepare to compensate fishermen who will bear the brunt of the loss. Some suggestions would be to subsidize fishermen during months where the diversions output is at its peak and the most damage to commercial species is done. Grants should be made available for new construction, repowering, fuel efficient equipment, ice holds and refrigeration, to fishermen who will have to travel to and from other estuaries to harvest product. The waters of these other areas are much deeper and open than some fishermen are use to working and may not have sufficient size vessels. There should also be a website where anyone can see if the diversion is running and at what capacity.

---

**Concern ID: 61966**

**The Draft EIS did not provide adequate alternative proposals to a sediment diversion. Dredging was not considered as a viable alternative to diversions in the Draft EIS. It would be much better money spent to dredge material from the Mississippi River or the Gulf of Mexico and create land immediately. These options would create land immediately not 20 or 30 years from now which would be too late. Dredging has numerous and immediate beneficial results that do not entail generating the negative impacts of adding fresh water.**

**Response ID: 15971**

As described in Chapter 2 Alternatives of the Draft EIS, an alternatives screening process was conducted where screening criteria were identified and a range of alternatives were considered, including other available coastal restoration tools and methods. The screening criteria incorporated key concepts from the purpose and need statement (Chapter 1, Section 1.4) including: reconnecting and reestablishing deltaic processes between the Mississippi River and the Barataria Basin in a sustainable manner; delivering sediment, fresh water, and nutrients in a sustainable manner; supporting the long-term viability of existing and planned coastal restoration projects; helping to restore habitat and ecosystem services in the northern Gulf of Mexico injured by the DWH oil spill consistent with the SRP/EA #3; and consistency with the Louisiana Coastal Master Plan. CPRA's purpose and need for the Project was built on analyses in the LA TIG's SRP/EA #3, including screening of strategic restoration approaches including sediment diversions, large-scale marsh creation, ridge restoration, and breakwater construction, and evaluation of a range of restoration strategies that could restore for injuries in the Barataria Basin. USACE generally focused on CPRA's purpose and need for the proposed Project and considered the public's and other perspectives, including input from the LA TIG and cooperating agencies (identified in Section 1.8 Agency Roles and Responsibilities) and input from representatives of the Council for Environmental Quality (CEQ) and the Federal Permitting Improvement Steering Council (FPISC), in its process to define the Project's purpose and need for the EIS. After examining whether the various

alternatives met the screening criteria developed from the purpose and need, only large-scale sediment diversions with varying capacities were brought forward as alternatives to the Applicant's Preferred Alternative for detailed analysis in the Draft EIS. Details of the screening process including screening criteria are described in Chapter 2, Sections 2.2 through 2.5. The alternatives that did not meet the screening criteria were then eliminated from further detailed analyses as described in Section 2.6 Summary of Alternatives Considered But Eliminated From Detailed Analysis. Refer to Appendix D2 Eliminated Alternatives Matrix of the EIS for further details on why these alternatives were not carried forward for further evaluation in the EIS.

Details specific to marsh creation alternatives and the reasons for elimination from detailed analysis in the EIS can be found in Chapter 2, Section 2.3 Step 1: Evaluation of Functional Alternatives. As described in Section 2.3.5 Large-Scale Marsh Creation, a marsh creation (dredge) alternative does not meet the purpose and need for the proposed Project; such an alternative does not deliver enough fresh water, nutrients, and fine sediments to sustain adjacent wetlands beyond the marsh creation area and over time would require periodic lifts and maintenance through placement of additional dredged material. Additional information related to the marsh creation alternative and reasons for elimination have been added to Section 2.3.5 for the Final EIS.

Additional detail can be found in the LA TIG's Restoration Plan explaining the LA TIG's evaluation of a range of alternatives and its identification of a Preferred Alternative (sediment diversion with variable flow up to 75,000 cfs). The LA TIG believes that the Preferred Alternative provides the right balance in terms of the likely benefits the Project would achieve and the risks related to collateral injury for its NRDA decision. This evaluation was completed by the LA TIG for its restoration planning efforts. USACE did not participate in that process.

CPRA and the LA TIG are pursuing multiple dredge-based restoration projects in Barataria Basin and throughout coastal Louisiana (for example, the Spanish Pass Ridge and Marsh Creation Project). More details can be found in Louisiana's Coastal Master Plan and on the LA TIG's web page (see <https://la-dwh.com/restoration-plans/>).

---

**Concern ID: 62780**

**Although the proposed MBSD Project would provide some benefits, the adverse impacts described in the EIS outweigh those benefits.**

**Response ID: 16362**

The commenter's opposition to the proposed Project, even considering the projected beneficial impacts, is noted. The beneficial and adverse effects of the proposed Project were discussed throughout Chapter 4 Environmental Consequences. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

To address adverse Project impacts, CPRA would implement a series of mitigation and adaptive management measures if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63094**

**There should be a website that shows if the diversion is running and at what capacity.**

**Response ID: 16646**

In response to public and agency comments, CPRA would develop a web-based informational dashboard that would make operational information available to the public through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

This dashboard has been added to the Monitoring and Adaptive Management (MAM) Plan included in the Final EIS (Appendix R2). The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one

---

is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)

- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

The literature cited by a commenter, (Bourgeois, M., K. Chapiessy, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016) or (LDWF 2016), was considered as part of the analysis set forth in the Draft EIS and as part of developing the Mitigation and Stewardship Plan.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Correspondence ID:4011**

Form Letter 6

Dear U.S. Army Corps of Engineers, New Orleans District,

To the U.S. Army Corps of Engineers and Louisiana Trustee Implementation Group:

The Louisiana coast, its communities and wildlife, are in crisis. To support this vital ecosystem:

\*Select the preferred alternative in the Draft Environmental Impact Statement for the Mid-Barataria Sediment Diversion.

\*Fund the project using Deepwater Horizon settlement dollars as outlined in the draft Restoration Plan.

As the project advances consider the following:

\*Commit to developing a robust adaptive management program that incorporates knowledge gained from monitoring the project over time and also considers input from key stakeholders.

\*Work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation, and to be as detailed and transparent as possible throughout the mitigation planning process.

Thank you for considering my comments.

Sincerely,

Deborah Littrell

Cincinnati, OH 45206

---

**Concern ID: 61716**

**The ongoing loss of Louisiana's coastal wetlands makes communities increasingly vulnerable to stronger hurricanes and sea-level rise and threatens the health and stability of the entire Barataria Basin upon which a number of communities, wildlife, fish nurseries, sportsman culture, economy, and vital resources depend.**

**Response ID: 16026**

The importance of maintaining wetlands for the protection of coastlines, coastal communities, wildlife resources, and recreation was considered in the Draft EIS in Sections 3.6 Wetland Resources and Waters of the U.S., 3.20 Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, and 3.16 Recreation and Tourism.

---

**Concern ID: 61756**

**The proposed MBSD Project sponsors should work proactively and collaboratively with potentially impacted communities to develop ideas and proposals for adaptation and mitigation and be as detailed and transparent as possible throughout the mitigation planning process. Use local non-profits to facilitate any mitigation measures that are decided upon. CPRA and the LA TIG should continue to encourage, accept, and solicit ideas and specific recommendation for mitigation after the June 4 deadline for these comments. The opportunity for continued input to inform the ultimate spending of those funds should also be made very clear publicly. The commenter also urges early action, as possible, before there is damage to mitigate.**

**Response ID: 15891**

CPRA has sought and continues to seek engagement and participation from the public, agency, and stakeholder groups wishing to be involved in the coastal restoration process. Over the past several years, CPRA has conducted outreach associated with its Sediment Diversion Program, including Coastal Connections meetings throughout the proposed MBSD Project area. In addition, since the release of the Draft EIS, CPRA has engaged the public through meetings with the communities projected to be impacted by the proposed MBSD Project to solicit input on mitigation and stewardship strategies, including reaching out to local non-governmental/non-profit organizations to assist with and facilitate meetings with the impacted communities and groups. These efforts have included deploying several tools and forms of outreach to solicit feedback on mitigation and stewardship measures. Meeting formats included small group briefings, one-on-one individual discussions, open-house style meetings, and virtual webinars. CPRA states that it would provide additional opportunities for public engagement if the proposed Project moves forward including Coastal Connections meetings and use of community non-profit organizations to help ensure that diverse populations are aware of and take advantage of the mitigation and stewardship measures adopted as part of the proposed Project, if implemented. A summary of these public engagement meetings can be found in Chapter 7 Public Involvement of the Final EIS. Refer to the Final Mitigation and Stewardship Plan in Appendix R1 for mitigation and stewardship measures that would be implemented as a result of the public involvement and engagement efforts.

In addition, refer to Final EIS Appendix R2 for the Monitoring and Adaptive Management (MAM) Plan for details on the proposed Project operational and adaptive management governance if the Project is implemented. In the context of the proposed Project, governance refers to how CPRA, with input from other stakeholders, would make decisions over the life of the Project. Decisions would include, but not be limited to, continuation of and changes to proposed Project operations, riverside management, monitoring, maintenance, and adaptive management actions. CPRA would provide annual operations plans, annual operations performance reports, annual monitoring reports, and multi-year monitoring and adaptive management reports (at five-year intervals) on CPRA's CIMS website (<https://cims.coastal.louisiana.gov/default.aspx>), as well as, on NOAA's Data Integration, Visualization, Exploration, and Reporting (DIVER) Explorer tool and Trustee Council websites. These plans would be available to stakeholders and the public. The stakeholders and the public would have an opportunity to participate in public meetings held to solicit comments, perspectives, and insights on the annual operations plans.

The Mitigation and Stewardship Plan and the MAM Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department

of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62678**

**Commenters recognized the challenges facing Louisiana and the connection between stabilizing the coastline and restoring the overall health of the ecosystem, which is the goal of the Restoration Plan.**

**Response ID: 16499**

The LA TIG agrees with the commenters regarding the ecological challenges faced along Louisiana's coastline. The impacts of DWH oiling were ecosystem-wide and spanned multiple trophic levels, necessitating an ecosystem-scale restoration effort. One of the goals of the Project is "to create, restore, and sustain wetlands and other deltaic habitats and associated ecosystem services." That balance is discussed in Section 3.0 (OPA Evaluation of the Alternatives) of the LA TIG's Restoration Plan, where its OPA evaluation addresses both the Project's benefits to multiple resources as well as its ability to meet Trustee goals and objectives.

---

**Concern ID: 62801**

**State and federal decision makers should commit to developing a robust adaptive management program utilizing the best available science and that incorporates knowledge gained from monitoring the Project over time and also considers input from key stakeholders. The adaptive management program should engage affected communities in developing adaptation ideas, use protocols for transparent decision making regarding Project operations, and provide accessible communication regarding how Project operation decisions are changing the environment.**

**Response ID: 16658**

The issues raised by the commenters were considered in the Monitoring and Adaptive Management (MAM) Plan, which was issued with the Draft EIS (Appendix R2) and jointly developed by CPRA and its LA TIG federal partners based on best information available to them. The MAM Plan includes many of the specific provisions requested by the commenter, including input from key stakeholders (see Section 2.2.2.2 [Stakeholder Review Panel]) and transparent decision making (see Section 6.4 [Data Sharing] and Section 7 [Reporting]).

In addition, in response to public comments, CPRA intends to develop a web-based informational dashboard that would make operational information available to the public

---

through the internet in real time. This dashboard would allow CPRA to continue to keep stakeholders informed about Project progress, timing, construction, and operation.

The Mitigation and Stewardship Plan and the MAM Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63337**

**A large number of commenters expressed support for the Applicant's Preferred Alternative, as outlined in the Draft EIS, and the use of funds from the DWH settlement fund, as outlined in the LA TIG's Draft Restoration Plan, to protect and restore coastal resources in the proposed Project area that were affected by the DWH oil spill.**

**Response ID: 16294**

The USACE and LA TIG acknowledge the commenter's support for the Applicant's Preferred Alternative. The USACE is evaluating the projected impacts of the proposed Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. The LA TIG further acknowledges the commenters' support for using DWH restoration dollars to fund construction of the proposed Project. If approved, the proposed Project would be largely funded through funds provided by the DWH oil spill settlement as determined by the LA TIG. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:4012**

Kevin Edgecombe

It's time to stop talking and finally doing something! Build the damn thing and let's get moving! In the meantime we ALSO need to be dredging and pumping river sediment to build marsh as well. Put rocks around everything pumped because if you don't we'll be right back to where we are now. Realistically though you are years late in trying to save lower Plaquemines Parish!

---

**Concern ID: 63355**

**The proposed Project needs to be built, but in the meantime, there is also a need to dredge and pump river sediment to build marsh, then put rocks around to maintain those results.**

**Response ID: 16317**

The commenter's support for the proposed Project is noted. The action being considered in the EIS is described in Chapter 1, Section 1.4 Purpose and Need and Chapter 2, Sections 2.2.1 in Steps Taken to Identify and Evaluate Reasonable Alternatives and 2.8 Action Alternatives Carried Forward for Detailed Analysis. Because these issues were addressed in the Draft EIS, no related edits have been made to the Final EIS. Other coastal restoration strategies are being considered for implementation by CPRA in its Coastal Master Plan and the LA TIG through NRDA restoration planning.

---

**Correspondence ID:4024**

Myrtle Grove Marina Estates HOA

Conrad Lawrence

the proposed sediment diversion will inundate our subdivision with water levels 2-3 feet above normal high tides. The fresh water flow would devastate our shrimp, oyster, crab and fish industries. The majority of Plaquemine Parish residents are opposed to this project. The USACE should take a hard look at the depth of this project with respect to the Mississippi River levees, a failure during construction would have catastrophic consequences.

---

**Concern ID: 62071**

**The proposed MBSD Project would negatively impact the seafood industry, including shrimp, crab, and oyster fisheries. Commercial fisheries are directly linked to the favorable conditions of the estuary and its resources being healthy, abundant, and consistently available but that would be forever changed by the introduction of polluted Mississippi River water.**

**Response ID: 16241**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.14.4.2 in Commercial Fisheries of the Draft EIS discussed impacts of the proposed MBSD Project on commercial fisheries. As summarized in Section 4.14.5, as compared to the No Action Alternative, moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative.

The LA TIG's Final Restoration Plan also acknowledges these impacts, and notes that such impacts are also anticipated under the No Action Alternative, but on a longer timeline. The Restoration Plan also notes that some benefits to the blue crab fishery and some finfish are anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to public comments, CPRA has expanded and refined the Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)

- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62223**

**The alteration of Mississippi River flows and/or MRL could cause erosion or collapse of the MRL and result in catastrophic flooding.**

**Response ID: 15749**

Section 14 of the Rivers and Harbors Act of 1899 (33 USC 408), referred to as Section 408, authorizes the Secretary of the Army, through the Chief of Engineers, to grant permission for the alteration, occupation, or use of a USACE Civil Works project if the Secretary determines that the activity will not be injurious to the public interest and will not impair the usefulness of the project. Because the proposed Project has the potential to directly and/or indirectly impact the Mississippi River Levee, New Orleans to Venice Levee, and the Mississippi River Navigation Channel, which are USACE Civil Works projects, CPRA has requested Section

---

408 permission to construct and operate the Project. The USACE 408 Review process includes a review of the technical adequacy of the Project design, including all appropriate technical analyses, including geotechnical, structural, hydraulic and hydrologic, construction, safety and operations and maintenance requirements. A Section 408 permission would not be granted unless the proposed modifications to the civil works projects would not limit the ability of the USACE Project to function as authorized and would not compromise or change any authorized Project conditions or purposes. The USACE Section 408 review is ongoing and the findings of this review will be disclosed in the Record of Decision.

---

**Concern ID: 62227**

**The diversion would flood access roads, damage vehicles, cause siltation/sludge, cause cancellation of flood insurance, inundate cemeteries, stress levees, impact provision of emergency services, and increase the cost to raise homes, slabs and wharves.**

**Response ID: 15820**

Draft EIS Chapter 4, Section 4.13.5 in Socioeconomics and 4.20.4 in Public Health and Safety discusses the increased flooding impacts outside of federal levee systems, including road inundation and infrastructure damage, anticipated to be caused by the operation of the diversion. Sections 4.13.5.1.2.1 and 4.13.5.3.2.1 in Socioeconomics of the Final EIS has been updated to include potential impacts such as vehicle damage, accumulation of siltation and sludge, cemetery inundation and interruption of emergency services. Recognizing the potential for these impacts, CPRA has developed a comprehensive inventory of potentially affected properties and CPRA's land services planning is progressing to enable CPRA to mitigate for increased water levels caused by the proposed Project. CPRA's mitigation and stewardship measures would take the form of: (1) monitoring and adaptive management of operations, (2) structural mitigation (for example, elevating public roadways, utility upgrades, water control structures, or other structural measures to partially offset additional inundation), (3) paying landowners for a Project servitude, and/or (4) providing landowners with funds to elevate their homes and other structures on private properties.

In the communities south of the diversion starting at Woodpark and continuing south to Grand Bayou and Happy Jack, CPRA would acquire Project servitudes. A Project servitude would allow CPRA to flow water over the landowner's property at heights and duration that are greater than would be the case in the future without the Project. CPRA would compensate those landowners for the value of the Project servitude, which would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire the Project servitude. If CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the Project servitude. Property owners would be able to use the funds from the Project servitude to implement additional flood mitigation and stewardship measures. These mitigation and stewardship measures are described in the Final Mitigation and Stewardship Plan, Appendix R1 to the Final EIS.

Structural measures in the Mitigation and Stewardship Plan are not included in CPRA's MBSD DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits

---

prior to installation; such permits are not guaranteed and would take time for USACE and other agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

The Final EIS concludes that the proposed Project would not have impact on the availability of flood insurance, but may cause an increase in flood insurance premium for some properties. See Section 4.13.5.3.2.1 in Socioeconomics and Section 4.15.4.2.3 and 4.15.5.1.2 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62782**

**A large number of commenters expressed general opposition to the proposed Project.**

**Response ID: 16364**

---

The commenter's opposition to the proposed Project is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

---

**Correspondence ID:4027**

Gary Delahoussaye

Dear Corps of Engineers - -

I have been a LA resident my entire life. I have been avid fisherman for decades mostly in Venice LA.

I AM 100% SUPPORTING THE MID BARATARIA SEDIMENT DIVERSION PROJECT.

I have personally witnessed the incredible destruction and erosion over the last 40-50 years. This is a complex issue and I understand the challenges this poses to the commercial fishermen, crabbers, shrimpers and oystermen. Having said that I truly believe the good far outweighs the bad. And by not pursuing coastal restoration like the Mid Barataria Sediment Diversion will only lead to more and more erosion and less hurricane protections by building these "horizontal levees".

PLEASE PROCEED WITH THE DIVERSION AT THE EARLIEST POSSIBLE TIME.

Very sincerely,

Gary J. Delahoussaye

---

**Concern ID: 63333**

**Although the proposed MBSD Project would have adverse impacts the benefits described in the EIS outweigh those impacts.**

**Response ID: 16289**

The commenters' support for the proposed Project, even considering the projected adverse impacts, is noted. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate Project alternatives using the OPA evaluation criteria in 15 CFR §990.54 and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

**Correspondence ID:4029**

Kevin Crossen

My name is Kevin Crossen [REDACTED],

I attended the meeting at the BCMS on April 12th. I think I was the only resident in support of the sediment diversion. I am the one who asked about property valuations and the possibility of increasing the amount set aside for the possibility of a buyout. Speaking for myself I have a lot at stake to lose from this diversion, this is my home that I have raised my family in and also operate my business out of. I operate a charter fishing service that will be greatly affected by the diversion. As for me I'm not sure how I can adapt and maintain the same quality of life with the diversion at my back door. As of the EIS now it seems I will have to relocate my business in the next 5 years along with my home if the project goes on line. My family has a lot invested in this home and community. And yes I believe that the land creation as long term project will provide the storm protection we do desperately need as well as other benefits to our ecosystem. I say this with the understanding that there will be negative impacts.

Us as residence were asked to provide alternative solutions. I don't want to speak on behalf of all of the residence in our community but would like to say for myself that an increase in the property valuations need to be increase to gain support. Speaking for myself I would hope that the valuations were on par with the current appraisal that was just done on my home, anything less and I would be losing money. This increased seed money should be secure and set aside for the sole purpose of a buyout with a worst case scenario. These valuations should be done home by home as these are custom built homes and done in a timely manner. In my opinion the cost of a proper buyout is the best option compared to raising homes and streets. This may have to be done on a property by property basis. I believe this is the only option that makes sense and should be explored with an open checkbook. This would be a drop in the bucket compared to the overall cost of the project.

My reasons for an aggressive buyout are all based on a worst case scenario. Some residents would like the CPRA board to work with the USACE to build a flood gate. At worst case scenario this gate may be closed for up to six months, who would maintain the floodgate and at what cost? Who would dredge the Wilkinson Canal and at what cost? If the floodgate happened to be closed for six months or any length of time what would it do to the water conditions trapped inside the neighborhood?

As far as paying a flood easement, to the best of my knowledge this has never been done in a residential area. What and how will it effect emergency services or homeowners insurance, flood insurance and such.

Thank

Kevin Crossen  
[REDACTED]

---

**Concern ID: 62952**

**Commenter expressed concern about the efficacy of certain mitigation measures such as floodwalls, floodgates and flood easements.**

**Response ID: 16710**

Since issuance of the Draft EIS, CPRA has expanded and refined the Mitigation and Stewardship Plan (Appendix R1) based on community and resource agency input. Details

regarding the funding that will be available for aquatic/fisheries mitigation and stewardship measures is set forth in the Final Mitigation and Stewardship Plan, Appendix R1. Details regarding other mitigation and stewardship measures (e.g., mitigation for tidal flooding impacts) is also set forth in the Final Mitigation and Stewardship Plan, Appendix R1; however, final estimated costs for those measures continues under development. CPRA has stated that the total estimated cost of all mitigation and stewardship measures set forth in the Final Mitigation and Stewardship Plan exceeds \$300 million dollars. Details regarding the cost for the monitoring and adaptive management are set forth in Section 9 of the Final MAM Plan, Appendix R2. Section 3.2.1.2 of the Draft Restoration Plan includes estimates of project costs, including the cost for project design and construction and project monitoring. Updated cost estimates will be provided as part of the Final Restoration Plan, including project monitoring and stewardship measures.

If the LA TIG decides to fund the proposed Project, that funding authorization would also include funding for the mitigation and stewardship measures set forth in the Mitigation and Stewardship Plan.

With implementation of the structural mitigation included in the Final Mitigation and Stewardship Plan, access to the properties within the communities south of the outfall (beginning at Myrtle Grove and continuing south to Grand Bayou and Happy Jack) would be improved over future conditions without the proposed Project. In particular, roadways would either be protected from flooding by increasing the height of the community's bulkhead (Myrtle Grove) or elevating the access roadways (Woodpark south to Happy Jack). The result would be that property owners, tenants and guests, as well as emergency service workers, would have improved access to the potentially flooded properties. See the Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) for additional details.

As part of developing the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS), CPRA considered the possibility of installing a flood gate for the Myrtle Grove Marina Estates Subdivision. CPRA decided not to pursue this option for several reasons. While some property owners in the Myrtle Grove Estates Subdivision have suggested a flood gate, others do not support a flood gate due to the impacts that such a structure would have on immediate accessibility to the Barataria Basin. CPRA also considered a flood wall, but again, community members were not aligned regarding this potential solution, with some objecting to a flood wall on the grounds that it would block access to the basin. CPRA has developed instead other structural mitigation and stewardship measures to address the projected impacts of the proposed Project on water levels and boat accessibility in the Mitigation and Stewardship Plan.

In addition, changes in water levels due to Project operations would not be expected to change the Flood Insurance Rate Maps (FIRMs). See Section 4.13.5.3 in Socioeconomics and Section 4.15.4 in Environmental Justice of the Final EIS for further discussion of the potential effect of the Project on the cost of flood insurance. Due to the evolving implementation of FEMA's Risk Rating 2.0, it is difficult to predict whether or by how much premiums may change. Also, the proposed Project servitudes, which would permit CPRA to increase the water levels on the properties during Project operations in exchange for monetary compensation, would not restrict the provision of emergency services.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of

potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 63096**

**Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).**

**Response ID: 16699**

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina

---

Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.

These measures are described in CPRA's Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure

that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63791**

**CPRA should monitor canals and dredge them as they begin to silt from the diversion.**

**Response ID: 16645**

The commenter's concerns regarding siltation and infill of Wilkinson Canal and other navigation channels in the Barataria Basin were considered in the Draft EIS in Chapter 4, Section 4.16.5.2 Recreation and Tourism - Operational Impacts and Section 4.21.5.2 in Navigation.

Siltation and infill of Wilkinson Canal was considered in the Draft Mitigation and Stewardship Plan (Appendix R1) issued with the Draft EIS. Since issuance of the Draft EIS, CPRA has revised its plan to address infill of Wilkinson Canal caused by Project operations. See Section 6.3.1 (Impacts to Navigation) of the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) for CPRA's final plan with regard to the siltation of Wilkinson Canal.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the Final Mitigation and Stewardship Plan and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA

---

TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:4034**

Donald Landry

This project will environmentally destroy our precious delicate estuaries. Shrimping fishing and oysters will disappear in the Barataria basin because of the freshwater diluting the salinity to a level that cannot sustain breeding of these species. I don't know why an environmental group like the Sierra Club or another group is not fighting this on an environmental impact that destroys wildlife. The whole ecosystem of the Barataria basin will change from birds to minnows and everything in between. Please do not allow this project to be approved. There is very little sediment in the river to build any sustainable land. This project will make a lot of people rich at the cost of the environment.

---

**Concern ID: 61782**

**Commenters expressed concern that there's not enough sediment in the river to achieve wetland and land creation goals of the proposed Project.**

**Response ID: 16412**

The commenter's concerns regarding the sediment load of the river and whether the river carries sufficient sediment to achieve the land projected to be built during diversion operation were considered in the Draft EIS. The Mississippi River carries much less sediment than it did in the past. It still carries a massive sediment load, but not as massive as before. As explained in Chapter 3, Section 3.4.2.5 Sediment Transport, the river formerly carried over 400 million tons of sediment annually, but a more than 50 percent reduction in annual sediment load has occurred since the early 1900s. Studies show that from 1968 through 2007 the overall annual sediment reduction has been more gradual, with the rate estimated as a loss of 1.1 million metric tons per year. The possible causes of the diminished sediment load include trapping by dams, hardening of banklines, improved farming practices, and other processes. Quantifying the relative contributions of multiple factors to the diminished sediment load is beyond the scope of the Draft EIS. The Draft EIS (Appendix E Delft3D Modeling, Delft3D Modeling Section 5.2.2) takes this diminished sediment load into account when computing the sediment that would be delivered to the Barataria Basin. To help clarify currently ongoing and future projected land loss and the amount of land that would be created, sustained, or lost due to proposed diversion operations, discussion has been added to the Executive Summary, Section ES.4.1 Geology and Soils and to Chapter 4, Section 4.2.3.2.2.1 Geology of the Final EIS.

---

**Concern ID: 62083**

**Commenters suggested that shrimping, fishing, and oysters would disappear in the Barataria Basin because of the fresh water diluting the salinity to a level that cannot sustain breeding of these species.**

**Response ID: 16247**

The issues raised by the commenters were considered in the Draft EIS. Chapter 4, Section 4.10 Aquatic Resources of the Draft EIS described impacts of the proposed Project on finfish and shrimp and oyster species. As described, impacts may include those associated with changes in salinity. As summarized in EIS Section 4.14.5 in Commercial Fisheries, as compared to the No Action Alternative moderate to major adverse impacts on shrimp and oyster fisheries in the Project area are anticipated under the Applicant's Preferred Alternative, primarily by accelerating the decline of species abundance that is also anticipated under the

No Action Alternative sometime after 2050. While abundance of shrimp and oysters would decline under the Applicant's Preferred Alternative (as compared to the No Action Alternative), the EIS impact analysis does not anticipate shrimp and oysters would disappear from the basin. Benefits to the blue crab fishery and some finfish are also anticipated.

CPRA has developed a plan to mitigate the potential adverse Project impacts. The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)
- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the proposed Project through public meetings and community-based organizations to solicit input on mitigation and stewardship strategies. A summary of these public engagement meetings and outreach efforts can be found in Chapter 7 Public Involvement of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the proposed Project is approved and funded.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be

required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project. Impacts related to subsistence activities are discussed in Section 4.15 Environmental Justice.

---

**Concern ID: 62696**

**Oysters are not well adapted to prolonged periods of low salinity and would experience higher mortality and lower reproductive success as a result of the proposed Project.**

**Response ID: 16075**

The commenter correctly notes the impacts on oysters from low salinity. As discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources of the Draft EIS, operation of the proposed Project would result in a permanent, major adverse impact on oysters, due in large part to decreases in salinity.

To address Project impacts, CPRA would implement a fishery mitigation plan, which has been revised for the Final EIS in response to public comments (see the Mitigation and Stewardship Plan, Appendix R1 of the Final EIS). Mitigation measures aimed at oyster impacts include establishment of new oyster seed grounds in appropriate areas of the basin, enhancing existing public and private seed ground, enhancement of broodstock reefs, and funding to support off-bottom oyster culture.

Although not being implemented to mitigate the effects of the MBSD, the LA TIG also continues to address oil spill related injuries to oysters through various non-Project-related restoration/fishery improvement actions, including: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, and the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS (Appendix R) were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required

---

as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62698**

**Brown shrimp are not well adapted to prolonged periods of low salinity and would experience higher mortality and lower reproductive success as a result of the proposed Project.**

**Response ID: 16076**

The commenter correctly notes the impacts on brown shrimp from low salinity, as discussed in Chapter 4, Section 4.10.4.5 in Aquatic Resources; however, as noted in the Draft EIS, brown shrimp reproduce offshore and, although the number of shrimp surviving to reproduce may change, the reproductive success of surviving shrimp is not anticipated to change. Overall, the Draft EIS anticipated a permanent, major adverse impact on brown shrimp from the proposed Project, due in part to reduced salinity in portions of the Barataria Basin.

---

**Concern ID: 62777**

**Implementation of the proposed MBSD Project would result in unacceptable adverse impacts on the biota of the Barataria Basin (including but not limited to endangered species, dolphins, shrimp, crab, oysters, and finfish).**

**Response ID: 16359**

The commenter's opposition to the proposed Project is noted. As discussed throughout Chapter 4 Environmental Consequences of the Draft EIS, the proposed Project would result in impacts on the general character of the Barataria Basin, including, but not limited to, salinity, temperature, land accretion, and water quality. These impacts would generally be either adverse or beneficial on a given species depending on habitat tolerances of area plants and animals, with moderate to major adverse impacts anticipated for those plants and animals that are unable to tolerate the modified habitat. In many cases, impacts in the Barataria Basin resources would be higher near the diversion outfall, where land building/sedimentation, salinity, and water level impacts would be greatest, and would decrease with distance from the outfall. The USACE is evaluating the projected impacts of the Project in the EIS. As part of its Section 10/404 permitting decision-making process, USACE also conducts a public interest review, which weighs the probable harms of the proposed action against its potential benefits. In making its NRDA decision, the LA TIG will evaluate proposed Project alternatives using the OPA evaluation criteria in 15 CFR §990.54

and NEPA evaluation from the Final EIS, consider public input, and review proposed Project mitigation, stewardship, and monitoring and adaptive management actions.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in the Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring, or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Concern ID: 62794**

**This poorly planned and executed proposed Project is being pushed forward for the financial gain of politicians and contractors because taxpayer dollars are being used. Private investment dollars would entail more deliberation and a full impact study, including more natural options with less risk and more overall benefits.**

**Response ID: 16375**

The commenter's opposition to the proposed Project is noted. As discussed in Chapter 1, Section 1.6 Scope of the EIS, this EIS has been developed in accordance with applicable NEPA, CEQ, and USACE regulations and guidance and constitutes a full impact analysis. A variety of alternatives assessed in the EIS are identified in Chapter 2 Alternatives. Because this issue was addressed in the Draft EIS, no related edits have been made to the Final EIS.

If the proposed Project is permitted by USACE and approved by the LA TIG, construction would be funded from funds received from the DWH NRDA settlement, of which approximately \$4 billion was allocated for the restoration of wetlands, coastal, and nearshore habitat, as described in Section 1.1 Background and Summary of the Settlement of the LA TIG's Restoration Plan.

The LA TIG's Restoration Plan evaluated a reasonable range of alternatives under the factors outlined in 15 CFR §990.54. The LA TIG strove to identify an alternative that would provide

---

the right balance in terms of being cost-appropriate, meeting LA TIG goals, having a high likelihood of success, avoiding collateral injury, benefiting multiple resources, and protecting public health and safety. See Chapter 3, Sections 3.2.4.7, 3.2.1.5 and 3.2.2.5 in OPA Evaluation of the Alternatives of the LA TIG's Restoration Plan. The LA TIG recognizes that there are clear tradeoffs among the alternatives in terms of the likely benefits achieved and risks related to collateral injury and public health and safety. Given these tradeoffs, the LA TIG has selected Alternative 1 as the LA TIG's Preferred Alternative.

---

**Correspondence ID:4068**

Goimir Zupanovic

I am a 73 year old oyster fisherman and the proposed mitigation measures for my industry won't do any good for me because I'm too old to try new oyster harvesting techniques such as aquaculture. If I can't harvest anymore oysters then I'd like to be compensated for my losses until I retire which is not that far off. Thank you.

---

**Concern ID: 62961**

**Project mitigation must adequately compensate impacts on the oyster industry, including financial compensation for economic losses. Commenters provided suggestions for mitigation such as compensating for increased costs of travel, providing direct financial payments to lease holders whose areas become unproductive, supporting new oyster leases or lease swaps, investing in research and development, using devices to move oysters to higher-salinity water, providing loans to oystermen to develop alternative income streams, providing support for elderly fisherfolk and buying out boats and businesses.**

**Response ID: 16532**

The Draft EIS evaluates how the Project would impact commercial, recreational, and subsistence fishers as compared to No Action conditions in Chapter 4, Sections 4.10 (Aquatic Resources), 4.14 (Commercial Fisheries), 4.15 (Environmental Justice) and 4.16 (Recreation and Tourism).

In response to public comments and resource agency input about the proposed mitigation efforts, CPRA has expanded and refined the oyster mitigation and stewardship measures. CPRA's mitigation and stewardship strategies and associated expenditures would focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to oyster fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for oysters in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to oyster fisheries in the early years of the Project's operational life. The revised mitigation and stewardship measures include allocating \$4 million to establish new public seed grounds, \$15 million to enhance public and private oyster grounds, \$4 million to enhance broodstock reefs and \$8 million for alternative oyster culture.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA and the LA TIG intend to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances

---

where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

---

**Correspondence ID:4069**

Denice Fazende

My opinion of the diversion is that if this is built the majority of the shrimping industry will be destroyed along with recreational fishing. I am a commercial shrimper 68 years old and my husband is 71 years old and this has been our occupation for over 50 years. At our age we can NOT start over or buy bigger boats in order to go into deeper water. What good is it to put refrigeration equipment on our boats when the diversion will kill off the shrimp? The majority of the shrimping industry in Louisiana is worked by people over 50 years of age who have done this all their lives; it had passed on to generation after generation; but now it will die off if this diversion is built.

Thank you,

Denice Fazende

---

**Concern ID: 63726**

**Some commenters felt that the amounts allocated for mitigation were insufficient, while others felt that no amount of mitigation would suffice, for example for the more senior fishers who won't be in a good position to adapt to the changing environment.**

**Response ID: 16702**

The Draft EIS considered how changes in the commercial fisheries, both with and without implementation of the proposed Project, would impact more senior fishers in Chapter 4, Section 4.14.4 in Commercial Fisheries. In response to public comments and resource agency input about the proposed mitigation efforts, CPRA has expanded and refined its fisheries mitigation and stewardship measures. CPRA's mitigation and stewardship strategies and associated expenditures would focus on establishing sustainable fisheries for oysters rather than on compensating individual oyster harvesters for their particularized economic losses (see the Mitigation and Stewardship Plan in Appendix R1 to the Final EIS). Without the Project, adverse impacts to fisheries would be expected over the next 50 years. Prior to 2050, those changes would be minor and gradual. After 2050, more drastic changes are anticipated, leading to a steep decline in suitability for fisheries in a large portion of the currently suitable habitat. With implementation of the diversion, the Project would cause significant adverse impacts to fisheries in the early years of the Project's operational life. The provisions of the fishery mitigation and stewardship plan, valued at approximately \$54 million, would help to achieve that goal and to mitigate the impacts of the proposed Project on oyster fishers. While not mitigation for the Project impacts, examples of other restoration/fishery improvement actions include: the LA TIG's funding of \$10 million in public and private oyster reef enhancement through the Living Coastal and Marine Resources funding allocation, the LA TIG's funding of \$9.7 million in oyster broodstock reef enhancement through the Living Coastal and Marine Resources funding allocation, CPRA's allocation of \$2 million in adaptive management funding to support off-bottom oyster culture, the LA TIG's allocation of \$5.8 million in Living Coastal and Marine Resources funds to support the operations of the Voisin Hatchery and the LA TIG's allocation of \$38 million in recreational use funds to support subsistence and recreational fisheries. The Final Mitigation and Stewardship Plan is included in Appendix R1 to the Final EIS.

The comments of more senior fishers who expressed concern about their ability to adapt to changing fishery conditions are acknowledged. If permitted by USACE and funded by the LA

TIG, it would take CPRA approximately 5 years to complete construction of the proposed Project and to begin operations. This relatively long period provides those affected with the time and opportunity to decide how they want to go forward, ranging from taking advantage of the adaptation opportunities offered through the Mitigation and Stewardship Plan (Appendix R1 to the EIS) to transitioning out of the fishing industry or retiring.

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

Thanary Oum

I am a Cambodian fisherwoman harvesting shrimp out of Buras, LA. I would like the government to help me by buying my smaller boat and financial assistance with buying a new bigger boat so that I can go out further and stay out longer. Of course having a bigger boat will incur more expenses, so I'd need some help with those expenses for at least 5 years. Also, there's an organization that helps so many fishermen like myself and especially for those who don't speak a lot of English and that place is Coastal Communities Consulting. I would even like to see the government set aside funds for them so that they can continue doing the work they do because without them I'd be lost regarding my fishing business and so would a lot of other fishermen too.

**Concern ID: 63131**

**Mitigation must be adequate, clearly explained and developed through collaboration with impacted communities. Commenters suggested multiple examples of mitigation measures, including: developing a formula to calculate lost income, providing financial and technical assistance for alternative business ventures, providing job training for alternate jobs, tuition assistance for fishers and their children, providing funding for larger boats and/or boat improvements like refrigeration (including maintenance for such improvements), improving facilities like docks, providing money for lost income, offering boat, license and job buyout programs, loan programs, providing subsidies for things like fuel, R&D for collaborating with fishers to innovate and change the way their operations work, creating a MBSD Fisheries Mitigation Fund, offering targeted mitigation for inshore fishers who rely on brown shrimp and could not easily transition to catching white shrimp (LDWF, 2016), and providing low cost internet.**

**Bourgeois, M., K. Chapiesky, L. Landry, J. Lightener, and J. Marx. 2016. Louisiana Shrimp: Fishery Management Plan. Louisiana: Louisiana Department of Wildlife and Fisheries, Office of Fisheries. Updated April 11, 2016.**

**Response ID: 16515**

The Draft Mitigation and Stewardship Plan (Appendix R1 to the Draft EIS) included measures focused on establishing a sustainable fishing industry in the long term, rather than measures for compensating the short-term economic losses of individual fishers. In response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1). The Final Mitigation and Stewardship Plan includes the following measures aimed at supporting and sustaining the fishing industry:

- Providing financial and technical assistance for alternate business ventures and job training for alternate jobs (Workforce/Business training -- \$2 million allocation)
- Funding for shrimp vessel improvements, including, potentially, larger boats, and improving docks (shrimp Vessel/Facility improvements -- \$15 million allocation)
- Establishing new oyster seed grounds (\$4 million allocation)
- Enhancing public and private oyster grounds (\$15 million allocation)
- Enhancing oyster broodstock reefs (\$4 million allocation)

- R&D for collaboration with fishers to innovate and change the way their operations work (Alternative Oyster Culture techniques -- \$8 million allocation)
- Marketing and outreach support (\$5 million allocation including oysters, brown shrimp, finfish, and crab).

CPRA engaged the fishing community potentially impacted by the Project through public meetings and community-based organizations to solicit input on mitigation strategies. A summary of these public engagement meetings and outreach efforts is in Chapter 7 (Public Involvement) of the Final EIS. CPRA plans to continue utilizing community-based organizations to help ensure that diverse populations become aware of and take advantage of the mitigation measures that CPRA would offer if the Project is approved and funded.

Gavin Parria

Life-long fisherman here based out of Lafitte, LA. I think the government should implement a boat buyout program for those of us who want to sell to either get out the business or have to purchase bigger vessels. I'd consider the vessel refrigeration grant program but I definitely would like to be compensated for my brown shrimp losses. The white shrimp just aren't as profitable as the brown shrimp and they also don't hold up as well as the brown shrimp. As far as property concerns, I own 280 acres in Bayou Dupont and I'd be open to flowage easement rather than outright acquisition and I'd like to because I know that I wouldn't get much for it. Lastly, I wouldn't want to move and I know that flooding would be an issue, so home elevation would be a must in addition to road work too.

---

**Concern ID: 63092**

**Further development of the Mitigation Plan is needed for properties that would be impacted by flooding caused by Project operations. Multiple commenters made specific requests for how their property should be handled (for example, through sales or easements), while others wondered why a more detailed, "real estate plan" for impacted communities was not available.**

**Response ID: 16511**

The Draft Mitigation and Stewardship Plan included with the Draft EIS (Appendix R1) included CPRA's initial framework for mitigation and stewardship measures to assist property owners in these communities impacted by increased tidal flooding and to address the Project impacts of Project operations on water levels. Since publication of the Draft EIS and in response to comments, CPRA has expanded and refined this Mitigation and Stewardship Plan in the Final EIS (Appendix R1).

CPRA states that it is interested in assisting affected communities to remain in place as long as they would like. Mitigation would include a combination of structural measures (for example, raising roads, boat houses, docks and utilities) and non-structural measures. Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

Where the proposed Project would cause increased water levels and/or increased incidence of flooding, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation measures. As an alternative to purchasing a flowage servitude, CPRA may consider

purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property (rather than a servitude) would be made on a case-by-case basis depending on the particular circumstances.

A complete listing of the mitigation and stewardship measures that CPRA would implement if the proposed Project is approved and funded is included in CPRA's Mitigation and Stewardship Plan included in the Final EIS (Appendix R1).

The Mitigation and Stewardship Plan and the Monitoring and Adaptive Management (MAM) Plan provided in Draft EIS Appendix R were submitted by CPRA and represent a range of potential mitigation, stewardship, monitoring and adaptive management measures (collectively, measures). At the time of publication of the Draft EIS for public review, Appendix R contained draft Plans and CPRA had not identified which of the measures contained in those Plans it intended to implement. CPRA expanded and refined the Final Mitigation and Stewardship Plan in response to community and resource agency input. The Final EIS Appendix R contains the final Plans and specifies which measures CPRA intends to implement. Generally, impact determinations discussed in the EIS represent anticipated Project effects without implementation of these measures except in instances where such measures are identified in the discussion. If any mitigation, monitoring or adaptive management measures are required by USACE as part of its approval of the proposed Project, such measures would be required as special conditions of the Department of the Army (DA) Section 10/404 permit and would be listed in the permit, if one is issued. Implementation of specific measures contained in either Plan, but not included in the Section 10/404 permit as special conditions, would not be required by USACE. USACE does not know whether any particular measure that is not a DA permit condition would be implemented. Measures that USACE currently contemplates as conditions of a DA Section 10/404 permit, if one is issued, are provided in Chapter 4, Section 4.27 Mitigation Summary of the EIS.

The LA TIG explains in Section 1.5 of the Final Restoration Plan that it anticipates requiring implementation of the Mitigation and Stewardship Plan, MAM Plan, and Marine Mammal Intervention Plan as components of the proposed Project, if the Project is approved by the LA TIG for funding. Decisions regarding which measures would be required as part of the LA TIG's funding decision would be set forth in the LA TIG Record of Decision related to the proposed Project.

**Concern ID: 63096**

**Commenters request information and mitigation to compensate for impacts to properties, especially in Myrtle Grove and Happy Jack, (including compensation for acquisition; compensation for raising docks, roads, property, and facilities; relocation expenses; and insurance costs).**

**Response ID: 16699**

Chapter 4, Sections 4.13.5 Operational Impacts in Socioeconomics and 4.20.4.2 Operational Impacts in Public Health and Safety, Including Flood and Storm Hazard Risk Reduction, of the Draft EIS considered the increased water levels and corresponding inundation outside of federal levee systems potentially caused by the proposed Project.

CPRA is interested in assisting affected communities to remain in place as long as they would like. In response to public comments, CPRA expanded its Final Mitigation and Stewardship

---

Plan (Appendix R1 to the Final EIS) to include mitigation and stewardship measures to partially offset some of the projected effects of the proposed Project on water levels in the communities south of the outfall outside of levee protection from Myrtle Grove south to Grand Bayou and Happy Jack.

The particular mitigation and stewardship measures vary based on the community, taking into consideration the degree of effect from the proposed Project, as well as the characteristics of the community. For example, the Final Mitigation and Stewardship Plan (Appendix R1 to the Final EIS) explains CPRA's plan to improve the bulkhead around the Myrtle Grove Marina Estates Subdivision which should reduce the incidence of tidal flooding in Myrtle Grove compared to future conditions without the proposed Project. In Grand Bayou and Happy Jack, where the increased water levels due to the proposed Project are projected to be less, CPRA plans to raise the road to improve access to the communities. In addition, CPRA plans to acquire the right to add and/or increase water flow on landowners' properties through the purchase of Project servitudes from landowners in these communities. The Project servitude would allow CPRA to flow water over the landowner's property at heights and durations that are greater than would be in the case in the future without the Project. The Project servitude would be recorded against title to the property and would run with the land. CPRA would attempt to negotiate with the affected landowner to acquire this servitude. If the CPRA and the landowner were unable to reach a negotiated agreement, CPRA would exercise its eminent domain authority to purchase the servitude. CPRA would compensate those landowners for the value of the Project servitude. A property owner would be able to use the funds received in exchange for the servitude to implement flood mitigation and stewardship measures.

As an alternative to these measures, CPRA may consider purchasing an impacted property outright (that is, in fee) if requested by the owner. Decisions about whether to purchase a property would be made on a case-by-case basis depending on the particular circumstances.

Structural measures in CPRA's Mitigation and Stewardship Plan are not included in CPRA's DA permit application and if this permit is approved, would not be authorized under the DA permit. Many of these structural measures would require additional DA and other permits prior to installation. Such permits are not guaranteed and would take time for USACE and other regulating agencies to process.

A DA permit does not convey any property rights and does not authorize any injury to property or invasion of rights or any infringement of Federal, state or local laws or regulations. The applicant's signature on an application is an affirmation that the applicant possesses or will possess the requisite property interest to undertake the activity proposed in the application.
